Activity CO-2.2: Improve human resources and organizational capacity.	Expanded	Planning/administrative
Activity CO-3.1: Regularly assess current status and future needs for infrastructure and facilities.	Expanded	Planning/administrative
Activity CO-3.2: Maintain and improve infrastructure and facilities.	Expanded	Infrastructure and development
Activity CO-3.3: Improve information technology infrastructure.	Expanded	Infrastructure and development

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.19.1 Expanded planning and administrative activities**

Expanded central operations planning and administrative activities include human resource and infrastructure needs assessments and capacity building. Monument staff would continue to regularly assess human resource needs for individual agencies. They would continue to identify and prioritize capacity building opportunities and regional capacities and opportunities to coordinate and share resources with partners (CO-2.1). As Monument staff grows, so would the human resource development capacity, including staff recruitment, retention, recognition, training, communication, regular meetings, time and attendance, and staff safety (CO-2.2). In conjunction with assessments of human resource needs, infrastructure and facilities needs would also be reviewed to optimize facilities utilization. These assessments would aim to organize and

better use existing facilities and infrastructure, to identify physical resource overlaps and gaps, and to identify needs to support projected future growth and collocation (CO-3.1).

**1.6.19.2 Expanded infrastructure and development activities**

Expanded central operations infrastructure and development activities include resource sharing among the MMB agencies and acquiring new computer technology to support Monument activities. Use of assets among MMB agencies would be assessed to determine more efficient use of available resources and to plan for cooperative growth (CO-3.2). Appropriate computer equipment would be acquired, upgraded, and maintained to meet management needs, and new technologies would be integrated as warranted (CO-3.3).

**1.6.20 Information Management**

Proposed information management activities are described in the Monument Management Plan and include planning and administrative activities (see Monument Management Plan, section 3.6.2, Information Management Action Plan). All activities described in the No Action alternative would continue, but several activities would be expanded. In addition, new activities are proposed to consolidate and make accessible relevant information to meet educational, management, and research needs for the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action: Information Management</b>	<b>Status</b>	<b>Activity Type</b>
Activity IM-1.1: Develop and implement a data discovery, inventory, and acquisition strategy.	New	Planning/administrative
Activity IM-1.2: Develop appropriate data management protocols, procedures, and agreements with partner agencies.	New	Planning/administrative
Activity IM-1.3: Continue to design, build, and maintain the Papahānaumokuākea Information Management System (PIMS).	Expanded	Planning/administrative
Activity IM-1.4: Begin incorporating information into PIMS.	New	Planning/administrative
Activity IM-2.1: Design tools for accessing the PIMS.	New	Planning/administrative
Activity IM-2.2: Assess data access needs and provide training for PIMS users.	New	Planning/administrative
Activity IM-2.3: Develop interfaces to feed data to repositories, such as National Biological Information Infrastructure, Pacific Basin Information Node, Coral Reef Information System, and Integrated Ocean Observing System.	New	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.20.1 Expanded planning and administrative activities**

Expanded information management planning and administrative activities include the continued development of the Papahānaumokuākea Information Management System (PIMS), which would be refined, configured, and maintained to meet a spectrum of needs of the MMB (IM-1.3).

**1.6.20.2 New planning and administrative activities**

New information management planning and administrative activities include the development of a data acquisition strategy, data management protocols, tools and training on accessing PIMS, and interfaces to major data repositories. A data discovery, inventory, and acquisition strategy would be developed and implemented to identify the types, format, and sources of new and existing information and data sets (IM-1.1). Once the data sources have been identified, protocols for how data would be collected, documented, stored, and shared would be developed and implemented (IM-1.2). A shipboard data collection tool, under development, would facilitate data capture, standardization, and chain-of-custody.

While PIMS stores some data that is not already maintained by other partner agencies, it is primarily intended to be a portal to a decentralized data storage and management system. Data entry, formatting, and review would be formulated in conjunction with data providers as data and information is incorporated into PIMS (IM-1.4). The MMB would develop tools and training for accessing, updating, analyzing and receiving PIMS data (IM-2.1 and IM-2.2). Interfaces would be developed to feed data to other data repositories, such as the National Biological Information Infrastructure and the Integrated Ocean Observing Systems (IM-2.3).

**1.6.21 Coordinated Field Operations**

Proposed coordinated field operations activities are described in the Monument Management Plan and include planning and administrative, field, and infrastructure and development activities (see Monument Management Plan, section 3.6.3). All activities described in the No Action alternative would continue, but several activities would be expanded. In addition, new activities are proposed to coordinate field activities and to provide adequate infrastructure to ensure safe and efficient operations while avoiding effects on the ecosystems in the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Coordinated Field Operations</b>	<b>Status</b>	<b>Activity Type</b>
Activity CFO-1.1: Initiate and complete necessary planning to implement the Midway Atoll Conceptual Site Plan.	Expanded	Planning/administrative
Activity CFO-1.2: Develop conceptual site plans for Hawaiian Islands National Wildlife Refuge and State Seabird Sanctuary at Kure Atoll to enhance management and restoration capabilities.	New	Planning/administrative
Activity CFO-1.3: Develop alternative energy systems and waste reduction strategies for the Monument within 2 years.	Expanded	Planning/administrative
Activity CFO-1.4: Plan for use of sustainable engineering, technology, and landscape architecture for facilities and assets throughout the Monument.	Expanded	Planning/administrative
Activity CFO-2.1: Develop interagency agreements to facilitate effective field coordination throughout the Monument.	Expanded	Planning/administrative
Activity CFO-2.2: Develop and implement standardized field operation protocols.	New	Planning/administrative
Activity CFO-2.3: Assess threats that field activities pose to Monument resources.	Expanded	Planning/administrative

<b>Proposed Action Alternative: Coordinated Field Operations</b>	<b>Status</b>	<b>Activity Type</b>
Activity CFO-2.5: Develop a staff coordination agreement between Midway Atoll NWR and the State Seabird Sanctuary at Kure Atoll.	New	Planning/administrative
Activity CFO-3.1: Design and construct a pilot low-impact shelter.	New	Infrastructure and development
Activity CFO-3.2: Use the existing footprint of Bravo Barracks for replacement housing at Midway Atoll.	New	Infrastructure and development
Activity CFO-3.3: Use the existing footprint of Charlie Barracks for replacement housing at Midway Atoll.	New	Infrastructure and development
Activity CFO-3.4: Rehabilitate “Officers Row” Housing at Midway Atoll.	Expanded	Infrastructure and development
Activity CFO-3.5: Maintain and enhance, where appropriate, the infrastructure at Kure Atoll.	Expanded	Infrastructure and development
Activity CFO-3.6: Maintain and enhance, where appropriate, the infrastructure at French Frigate Shoals.	Expanded	Infrastructure and development
Activity CFO-3.7: Evaluate, maintain, and enhance the small tent field camp at Pearl and Hermes Atolls on Southeast Island.	Expanded	Infrastructure and development
Activity CFO-3.8: Maintain and enhance the existing tent field camp at Laysan Island to support operations to protect and management Monument resources.	Expanded	Infrastructure and development
Activity CFO-4.2: Develop biodiesel fuel capacity or other sustainable fuel types at Midway Atoll within 2 years.	New	Infrastructure and development
Activity CFO-5.1: Rehabilitate water catchment and distribution systems.	Expanded	Infrastructure and development
Activity CFO-5.2: Rehabilitate septic and wastewater systems.	Expanded	Infrastructure and development
Activity CFO-5.3: Treat all wooden historic structures at Midway Atoll for termites.	Expanded	Infrastructure and development
Activity CFO-5.4: Evaluate and optimize food services as necessary.	Expanded	Infrastructure and development
Activity CFO-5.5: Rehabilitate seaplane hangar.	Expanded	Infrastructure and development
Activity CFO-5.6: Repair inner harbor seawall.	Expanded	Infrastructure and development
Activity CFO-6.1: Inventory, maintain, and coordinate the use of small boats and related field resources.	Expanded	Planning/administrative
Activity CFO-6.2: Within 2 years, station additional vessels at Midway for use during the summer marine research field season.	Expanded	Infrastructure and development
Activity CFO-6.3: Within 5-10 years, station a small research/enforcement vessel at Midway Atoll.	New	Infrastructure and development
Activity CFO-6.4: Construct new finger piers inside of Midway’s inner harbor.	New	Infrastructure and development
Activity CFO-6.5: Redevelop existing boathouse at Midway into a multi-use facility.	New	Infrastructure and development
Activity CFO-6.6: Evaluate needed improvements to Pier No. 1 in the ship basin and the Tug Pier at Midway Atoll.	New	Planning/administrative

<b>Proposed Action Alternative: Coordinated Field Operations</b>	<b>Status</b>	<b>Activity Type</b>
Activity CFO-6.7: Make needed improvements to or replace the pier at Eastern Island.	New	Infrastructure and development
Activity CFO-7.1: Identify a reliable, efficient, cost-effective aircraft service to improve the delivery capacity of personnel and cargo between Honolulu and Midway.	Expanded	Planning/administrative
Activity CFO-7.2: Within 5-10 years, evaluate the need for a dedicated aircraft for transportation, research, evacuation, education, surveillance, management, and enforcement in the Pacific region.	New	Planning/administrative
Activity CFO-7.3: Within 15 years, acquire appropriate aircraft to service the Monument and the Pacific region.	New	Infrastructure and development
Activity CFO-8.1: Refurbish or replace the dive recompression chamber at Midway.	Expanded	Infrastructure and development
Activity CFO-8.2: Investigate acquisition of portable dive recompression chamber for use on a small research vessel.	Expanded	Infrastructure and development
Activity CFO-8.3: Incorporate a dive operations center into refurbished boathouse facility at Midway.	Expanded	Infrastructure and development
Activity CFO-9.1: Design a marine laboratory at Midway and develop in phases.	New	Infrastructure and development
Activity CFO-9.2: Complete planning for and construct a captive care monk seal facility on Sand Island.	New	Infrastructure and development
Activity CFO-9.3: Provide logistical, infrastructure, and transportation support for threatened and endangered species recovery actions.	Expanded	Infrastructure and development
Activity CFO-9.4: Complete Phase I rehabilitation of Midway Mall and the commissary building.	Expanded	Infrastructure and development
Activity CFO-9.5: Construct airport welcome center on Sand Island within 2 years.	New	Infrastructure and development

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.21.1 Expanded planning and administrative activities**

Expanded coordinated field operations planning and administrative activities include necessary site planning to ensure coordinated field operations to achieve the purpose of the Monument, the Midway and Hawaiian Islands National Wildlife Refuges, NWHI Coral Reef Ecosystem Reserve, the State Seabird Sanctuary at Kure Atoll, and the State of Hawai‘i Marine Refuge. Other activities are to incorporate “green” methods and technologies into future Monument operations and infrastructure. The completion and implementation of conceptual site plans for the Midway Atoll National Wildlife Refuge, the State Seabird Sanctuary at Kure Atoll, and the Hawaiian Islands National Wildlife Refuge is fundamental to fulfilling the purpose and needs of these various needs. Co-Trustees would coordinate on Midway Site Plan priorities, conduct detailed planning, initiate budget requests, and implement actions as planning and compliance is completed and funding is available (CFO-1.1). Co-Trustees also would work together to develop alternative energy systems and waste reduction strategies including evaluating biodiesel fuel capacity or sustainable fuel types to meet future fuel requirements for aircraft, vessel, utility,

and equipment needs at Midway (CFO-1.3) and to develop programs using sustainable engineering, technology and landscape architecture for future operations and infrastructure improvement projects (CFO-1.4).

Interagency agreements to coordinate field operations, share resources, and commit to joint implementation of field priorities would be developed, as appropriate (CFO-2.1). Permitted activities would continue to be monitored through field activity reports. In addition, data from these reports would be managed in a geographic information system to provide adaptive management for the MMB in conducting or authorizing future field activities (CFO-2.3). Small boats and support equipment would be inventoried Monument-wide to determine whether the Co-Trustees could use these resources more effectively and reduce duplicative efforts (CFO-6.1). New planning and administrative activities

New coordinated field operations planning and administrative activities include conceptual site plan development for other parts of the Monument and evaluation of transportation needs. Similar to Midway, conceptual site plans need to be developed for the Seabird Sanctuary at Kure Atoll and at various locations within the Hawaiian Islands National Wildlife Refuge to identify long-term infrastructure requirements and priorities (CFO-1.2). Standardized environmental, safety, and preparedness protocols for field operations would be developed consistent with partner agency standards to provide resource protection and safe field operations. A Field Operations Manual would be drafted and distributed to principal investigators and managers working in the NWHI (CFO-2.2). A staff coordination agreement would be developed between Midway Atoll National Wildlife Refuge and the State Seabird Sanctuary at Kure Atoll to ensure coordination of habitat restoration and management activities and wildlife monitoring activities between the state and FWS (CFO-2.5).

Pier 1 in the ship basin and the tug pier in the inner harbor at Midway would both be evaluated for needed improvements (CFO-6.6). Within five to ten years, the need for a dedicated aircraft for transportation, research, evaluation, education, surveillance, management, and enforcement in the Pacific region would be evaluated (CFO-7.2).

#### **1.6.21.2 Expanded infrastructure and development activities**

Expanded coordinated field operations infrastructure and development activities include maintaining or rehabilitating additional facilities. Housing and facilities would be replaced as needed on a case-by-case basis, with any construction occurring within the existing development footprint, so there would be no loss of wildlife habitat. The ten houses in Officers Row would be rehabilitated at Midway Atoll (CFO-3.4). Infrastructure at French Frigate Shoals, Kure Atoll, Pearl and Hermes Atoll, and Laysan Island would be maintained and enhanced, where appropriate (CFO-3.5, CFO-3.6, CFO-3.7, CFO-3.8).

At Midway, critical utility systems and ailing structures and facilities would be rehabilitated within five to fifteen years. Specific projects include rehabilitating the water catchment and distribution system (CFO-5.1), septic and wastewater systems (CFO-5.2), food services (CFO-5.4), the seaplane hangar (CFO-5.5), and the inner harbor seawall (CFO-5.6). Wooden historic structures at Midway would be treated for termites (CFO-5.3). Food service facilities would be evaluated and expanded, as necessary (CFO-5.4).

NOAA would add additional small boats as needed to facilitate research, management, and education conducted by the MMB (CFO-6.2). Within five years, inter-island aircraft transportation options would be identified (CFO-7.1).

The dive chamber at Midway Atoll has not been serviced in over five years and needs to be assessed and refurbished or replaced. This chamber would be maintained by an on-site chamber operator/dive technician (CFO-8.1). Advanced recovery efforts, particularly efforts to address juvenile survival, would be met by developing logistical, infrastructure, and transportation capability to transport threatened and endangered species, equipment, and personnel among the various atolls more reliably (CFO-9.3). Phase 1 Rehabilitation of Midway Mall and the Commissary building would be completed as well (CFO-9.4).

### **1.6.21.3 New infrastructure and development activities**

New coordinated field operations infrastructure and development would increase housing, field camp, and transportation capacity. Housing and field camp capacity would be maintained and enhanced through various infrastructure projects, such as at Midway, the construction a low-impact pilot project for housing, replacement of Bravo Barracks (CFO-3.2), replacement of Charlie Barracks (CFO-3.3).

A small research/enforcement vessel would expand research, enforcement, education, response, and restoration capabilities from French Frigate Shoals to Kure Atoll. Repair and maintenance facilities would be established at Midway, and full-time support personnel would be identified to properly manage this asset (CFO-6.3). The boathouse, dive center, seaplane ramp and pier, and storage facility would be redeveloped. The facility would have maintenance bays for servicing small boats and a dive locker, including a compressor, recompression chamber, appropriate storage, and work area. The building would be resited and potentially raised to address concerns over flooding on the seaplane pad (CFO-6.5). Improving or replacing the pier at Eastern Island is proposed to ensure continued access for researchers and field workers (CFO-6.7). Aircraft to serve the Monument and the Pacific region would be acquired within 15 years (CFO-7.3).

A small, portable recompression chamber would be evaluated for use aboard the small research vessel referenced in CFO-6.3 to extend research capacity (CFO-8.2). A dive center would be incorporated into a newly refurbished boathouse, complete with storage, maintenance facility, compressor, recompression chamber, dive locker, and tool shed (CFO-8.3).

A marine laboratory at Midway would be designed and developed in phases to serve as a hub for coordinated research (CFO-9.1). A captive care Hawaiian monk seal facility is planned for Sand Island (CFO-9.2), and an airport welcome center would be constructed to handle visitor arrival and departures from Midway (CFO-9.5). This facility would provide a welcome and briefing area for visitors and would contain restrooms, baggage handling, and a waiting area out of the weather.

### **1.6.22 Evaluation**

Proposed evaluation would continue, as described in the Monument Management Plan, and include planning and administrative activities. All activities described in the No Action alternative would continue, but several new activities are proposed to determine the degree to

which management actions are achieving the goals of the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Evaluation</b>	<b>Status</b>	<b>Activity Type</b>
Activity EV-1.1: Prepare a comprehensive Monument evaluation strategy.	New	Planning/administrative
Activity EV-1.3: Conduct comprehensive evaluation and prepare a State of the Monument Report.	New	Planning/administrative
Activity EV-1.4: Conduct a management plan review.	New	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.22.1 New planning and administrative activities**

New evaluation planning and administrative activities include conducting a comprehensive evaluation. The successful management of the Monument by multi-agency partners is measured by implementing a comprehensive evaluation process. New evaluation activities include preparing the Monument evaluation strategy (EV-1.1), conducting a comprehensive evaluation in the fifth year of plan implementation and preparing a State of the Monument Report (EV-1.3), and conducting a review of the Monument Management Plan (EV-1.4). The review of recommended changes identified during the comprehensive evaluation would be reflected in a revised Monument Management Plan and revised Monument regulations (if needed).

**1.7 COMPARISON OF ALTERNATIVES**

The Monument Management Plan includes a range of activities to achieve the vision of the Monument. This section highlights new and expanded field and infrastructure and development activities described in the Proposed Action alternative; activities are highlighted in tables by action area (see section 1.6). This section also includes a comparison of these activities to current activities described in the No Action alternative (see section 1.8). Overall, new and expanded activities described in the Proposed Action alternative are designed to address priority management needs in all action areas. A comparison of key features of the No Action and Proposed Action alternatives is provided in Table 1.1.

<b>Table 1.1 Comparison of Key Elements of No Action and Proposed Action Alternatives</b>		
	<b>No Action</b>	<b>Proposed Action</b>
<b>PMN 1 - Understanding and Interpreting the Northwestern Hawaiian Islands</b>		
<b>Marine Conservation Science</b>		
Planning	Continue to conduct research according to agency-specific priorities.	Develop and implement a Monument natural resources science plan to prioritize marine and terrestrial research needed for Monument management.
Research	Continue to characterize shallow-water and deepwater marine habitats using scuba diving, submersibles, remotely operated vehicles, underwater cameras,	Same as No Action plus use technical diving in mapping and monitoring deepwater habitats.

**Table 1.1  
Comparison of Key Elements of No Action and Proposed Action Alternatives**

	<b>No Action</b>	<b>Proposed Action</b>
	and multibeam and side scan sonar.	
Information Management	Continue to integrate data and information in the Monument information management system.	Same as No Action plus regular update of information management systems and protocols.
Education and Outreach	Coordinate research update and annual meetings to present current research.	Same as No Action plus integrate education component in research expeditions.
<b>Native Hawaiian Culture and History</b>		
Research	Continue to identify cultural research priorities.	Same as No Action plus provide berthing space on research vessels and logistical support.
Cultural access	Continue to support Native Hawaiian cultural access.	Same as No Action plus provide Native Hawaiian cultural access to ensure cultural lessons can be learned at specific sites.
Monument management	Continue OHA support informational meetings of the Native Hawaiian Cultural Working Group and cultural experts.	Same as No Action plus integrate consultations and traditional knowledge and practices into Monument management and Native Hawaiian cultural information into education and outreach for Monument permittees.
Cultural resource management for Nihoa and Mokumanamana	National Register of Historic Places listing for Nihoa and Mokumanamana.	Same as No Action plus implement preservation plans for Nihoa and Mokumanamana.
Monument Cultural Resources Program	No Monument cultural resources program.	Develop and implement a Monument cultural resources program.
<b>Historic Resources</b>		
Historic Preservation Plan for Midway	Continue to implement Midway Preservation Plan and maintain volunteer program at current levels.	Same as No Action plus reconcile Midway Preservation Plan with Midway Visitor Services Plan, lead paint abatement plan, and other facilities maintenance; recruit additional volunteers for work at Midway Atoll, seek private funding to restore and preserve a representative number of historic items at Midway Atoll. Complete surveys and restoration efforts within 15 years.
Field survey and documentation	Plan and conduct field survey and documentation as funding permits.	Midway Atoll Historic Preservation Plan, survey and documentation completed within two years.
Repair and maintenance treatments	Promote through volunteer programs and trained specialists at present levels and funding.	Repair and maintenance treatments complete within six years.
Remodel museum	Remodeling dependent on sufficient funding.	Complete remodel within seven years.

**Table 1.1  
Comparison of Key Elements of No Action and Proposed Action Alternatives**

	<b>No Action</b>	<b>Proposed Action</b>
Archaeological site surveys	Complete surveys at existing levels, as budgets permit.	Complete archaeological surveys within 15 years.
Commercial Pacific Cable Station Survey and Restoration	Complete surveys and restoration at existing levels, as budgets permit.	Complete surveys and restoration within 10 years.
<b>Maritime Heritage</b>		
Field mapping and surveys	Continue field work and complete progress reports annually.	Same as No Action.
<b>PMN 2- Conserving Wildlife and Habitats</b>		
<b>Threatened and Endangered Species</b>		
General	Continue threatened and endangered species research and management with current funding levels.	Dedicate more resources to threatened and endangered species management and subsequently increase the numbers and locations of threatened and endangered species throughout Monument.
Marine debris	Continue to support marine debris removal activities.	Same as No Action plus target marine debris prevention, characterize and address the effects of marine debris; develop proactive methods to remove marine debris at sea in areas where it is concentrated; and expand educational and outreach programs domestically and internationally to prevent debris from entering the ocean.
Endangered species consultations	Conduct adequate endangered species consultations.	Add additional Monument staff as needed to more efficiently conduct endangered species consultations.
Hawaiian monk seal	Maintain current level of protection for seals and their pupping and habitat.	Evaluate the loss of habitat from erosion and other factors; restore nesting, breeding, and pupping habitat for seals; develop standardized interagency protocols for emergency response for Hawaiian monk seal; increase juvenile survivorship through appropriate management tools, such as supplemental feeding through NOAA monk seal captive care programs.
Cetaceans	Continue to monitor spinner dolphin populations by photo-identification surveys and DNA sampling.	Same as No Action plus conduct annual censuses of cetacean populations and minimize human interactions with cetaceans; respond to any suspected infectious disease incidents affecting cetaceans; and explore the use of remote sensing to survey cetaceans.
Green turtles	Protect and manage green turtle nesting and basking habitat; monitor nest nesting	Same as No Action plus identify areas of high turtle foraging activity in benthic

**Table 1.1  
Comparison of Key Elements of No Action and Proposed Action Alternatives**

	<b>No Action</b>	<b>Proposed Action</b>
	<p>or breeding female abundance using standardized and consistent protocols; and maintain current level of protection for turtles and their nesting habitat.</p>	<p>habitats; map high use corridors used by turtles migrating between their breeding and foraging sites outside the Monument; ensure that nesting populations of green turtles at source beaches are stable or increasing; assess distribution of nesting activity throughout the Monument; and take action to reduce night lighting effects on nesting turtles.</p>
Birds	<p>Mark and recapture surveys of Laysan duck; monitor Laysan duck reproductive success and survival for population modeling, disease screening, and prevention; avoid translocating unhealthy individuals and genetic research to prevent loss of genetic diversity; and conduct annual censuses of populations of Laysan finch, Nihoa finch, and Nihoa millerbird and monitor their food and habitat.</p> <p>Maintain quarantine protocols and standard operating procedures for those permitted entry onto the islands and for the supplies shipped into islands within the Monument.</p> <p>Conduct annual censuses of passerine species and monitor their food and habitat requirements; continue monitoring reproductive success and productivity of albatrosses, tropicbirds, boobies, frigates, and other breeding seabird species, as funding permits, at French Frigate Shoals, Laysan Island, and Midway Atoll and continue to monitor all other species of nonbreeding migratory birds through surveys as funding permits.</p>	<p>Same as No Action plus restore breeding populations of short-tailed albatross; restore or create habitat for the Laysan duck; transport juvenile Laysan ducks from established populations to additional islands, and conduct post-release monitoring; maintain stable or increasing populations of Laysan finch on Laysan Island.</p> <p>Maintain stable populations of Nihoa finch and Nihoa millerbird.</p> <p>Conduct annual censuses of passerine species and monitor their food and habitat requirements; identify habitat suitability, prioritize sites for establishing new populations, and restore habitat if necessary; develop techniques for capture, translocation, and release; continue monitoring reproductive success and productivity of albatrosses, tropicbirds, boobies, frigates, and other breeding seabird species, as funding permits, at French Frigate Shoals, Laysan Island, and Midway Atoll and continue to monitor all other species of nonbreeding migratory birds through resite surveys, as funding permits.</p> <p>Encapsulate lead-based paint on structures to reduce likelihood of ingestion by birds.</p>
Plants	<p>Continue efforts to increase the numbers and locations of <i>Amaranthus brownie</i> and <i>Schiedea verticillata</i> on Nihoa and establish a self-sustaining <i>Pritchardia remota</i> population on Laysan Island.</p>	<p>Same as No Action plus establish populations of each listed plant species on one to three additional Monument islands and ensure the genetic material of all endangered plant species from Nihoa and Laysan Island are preserved in perpetuity. Hire additional two to four additional biological technicians to eradicate 90 percent of <i>Verbesina enceliodes</i> and other invasive plants at Midway Atoll in the next 15 years.</p>

**Table 1.1  
Comparison of Key Elements of No Action and Proposed Action Alternatives**

	<b>No Action</b>	<b>Proposed Action</b>
<b>Migratory Birds</b>		
Alien species	Maintain rigorous quarantine protocols to prevent the introduction of alien species	Same as No Action plus eradicate nonnative species at all sites where they have a negative effect on the survivorship or reproductive performance of migratory birds.
Avian diseases	Conduct surveillance for evidence of avian disease outbreaks.	Same as No Action.
Effects from commercial and sport fisheries	Continue efforts to reduce the effect of commercial and sport fisheries occurring outside Monument on migratory bird populations; teach seabird identification skills to fishers and fisheries observers; and assist with the development of techniques to minimize bycatch.	Same as No Action.
Conservation	Continue efforts to monitor migratory bird populations.	Same as No Action plus assess the population size and trends of overwintering and migrating Pacific golden plovers, bristle-thighed curlews, wandering tattlers, and ruddy turnstones; monitor a suite of 15 focal seabird species; and restore native coastal mixed grass and shrub communities.
<b>Habitat Management and Conservation</b>		
General	Continue to monitor and restore habitats of the Monument	Same as No Action plus expand restoration efforts to shallow-water marine areas, cleanup of contaminated sites, and feasibility studies for restoring beach and crest habitats.
Contamination	Monitor oil and other anthropogenic contamination.	Same as No Action plus within 10 years, investigate and inventory sources of known contamination from post-contact historic human use of the NWHI; and coordinate with responsible parties to develop plans and complete cleanup actions, conduct risk assessment to determine acceptable levels of lead (from lead-based paint) in soils; conduct risk assessment to determine acceptable levels of contaminants, such as PCBs and dioxin, for Laysan ducks; investigate contamination levels in both terrestrial and marine species, especially threatened and endangered species; investigate contaminant effects on wildlife.
Alien species	Continue to remove alien and invasive species.	Same as No Action plus within 10 years investigate and inventory sources of known contamination from post contact

**Table 1.1  
Comparison of Key Elements of No Action and Proposed Action Alternatives**

	<b>No Action</b>	<b>Proposed Action</b>
		historic human use of the NWHI; coordinate with responsible parties to develop plans and complete cleanup actions; conduct risk assessment to determine acceptable levels of lead (from lead-based paint) in soils; conduct risk assessment to determine acceptable levels of contaminants, such as PCBs and dioxin, for Laysan ducks; investigate contamination levels in both terrestrial and marine species, especially threatened and endangered species; investigate contaminant effects on wildlife.
Restoration	Propagate and out-plant extant native species.	Same as No Action plus within 10 years, develop and implement a plan for restoring shallow reefs and shoals; protect and restore beach and crest habitats at French Frigate Shoals, Laysan Island, Lisianski Island, and Pearl, Hermes, Midway, and Kure Atolls for 15 years; and within 10 years restore and maintain coastal mixed grasses and shrublands on basalt islands in the Monument (Nihoa, Mokumanamana, La Perouse and Gardner Pinnacles).
Conservation	Monitor changes in species composition and habitat structure.	Same as No Action plus inventory and monitor all Monument habitats, evaluate potential for development of additional freshwater sources for translocation sites for Laysan duck, Nihoa finch, and Nihoa millerbird; remove ironwood on Sand Island and Midway Atoll to provide nesting and roosting habitat for migratory birds; and protect and maintain areas of vertical rocky cliff face habitat at Nihoa and Mokumanamana for nesting terns, black noddies, brown boobies, and white-tailed and red-tailed tropicbirds.
<b>PMN 3- Reducing Threats to Monument Resources</b>		
<b>Marine Debris</b>		
Research activities	Research marine debris sources, types and accumulation rates.	Same as No Action plus complete within five years.
Debris removal activities	Continue to remove hazardous materials on beaches and marine debris onshore and in shallow waters.	Same as No Action plus catalog and remove hazardous materials on beaches and expand marine debris removal activities to offshore waters.
<b>Alien Species</b>		

**Table 1.1  
Comparison of Key Elements of No Action and Proposed Action Alternatives**

	<b>No Action</b>	<b>Proposed Action</b>
Monitoring and surveillance	Continue to monitor alien species annually, using existing protocols; identify existing snowflake coral infestation.	Same as No Action plus refine or develop new protocols for monitoring alien species and survey new infestations of snowflake coral and incipient marine invasive species.
Species prevention, control and eradication	Continue programs to prevent and control alien species introductions into the Monument; collect climate data and measure gray bird locust abundance on Nihoa, Mokumanamana, French Frigate Shoals, and Lisianski Island.	Same as No Action plus implement eradication plans for the house mouse on all of Sand Island, Midway, within 15 years; two species of mosquitoes at Midway Atoll within 10 years; gray bird locust on Nihoa, Mokumanamana, French Frigate Shoals, and Lisianski Island; and invasive red algae from waters near Mokumanamana.
Research	Continue research on alien species.	Conduct toxicant trials on high priority invasive species within five years and develop appropriate baits for gray bird locust.
<b>Maritime Transportation and Aviation</b>		
Aircraft and vessel hazards studies	Continue studies on aircraft hazards.	Same as No Action plus conduct comprehensive assessment of threats posed by aircraft and vessels on Monument resources.
Boundaries and zoning	Continue to work with the IMO on designations and protocols for domestic and international shipping.	Develop boundary and zoning information materials and updates to nautical charts to enhance notice to mariners of Monument boundaries and zoning.
Aircraft and vessel conservation measures	Continue recycling and energy saving activities and investigating the use of nonpetroleum-based hydraulic fluids on NOAA ships.	Same as No Action.
<b>Emergency Response and Natural Resource Damage Assessment</b>		
Contingency planning	Continue implementing contingency plan and protocols.	Update and improve the Area Contingency Plan.
Incident command systems (ICS)	Continue incident response.	Establish Monument Emergency Response Team for ICS responses and a non-ICS response team.
Certification, training and drills	Continue training.	Provide additional training for incident Command System and Hazards Waste Operations and Emergency Response, boat safety, first responder, and drills for emergency response in the Monument and ensure Emergency Response Team maintains appropriate certifications.

<b>Table 1.1 Comparison of Key Elements of No Action and Proposed Action Alternatives</b>		
	<b>No Action</b>	<b>Proposed Action</b>
<b>PMN 4 - Managing Human Uses</b>		
<b>Permitting</b>		
Permit review and tracking	Continue to review and track permit applications and reports.	Same as No Action plus engage additional outside experts in permit application review; develop GIS-based permit tracking systems.
Pre-access training and briefing	Continue multiple agency-specific pre-access training and briefing programs.	Develop and conduct a unified pre-access training and briefing programs that incorporates a Native Hawaiian cultural education program.
<b>Enforcement</b>		
Midway Atoll	No on-site enforcement presence.	Establish on-site enforcement presence at Midway Atoll to address increase in operational and recreational activities.
Monument	Continue informal collaboration among enforcement entities and operation of Vessel Monitoring System for vessels conducting permitted activities.	Establish a chartered Monument law enforcement working group to enhance communication and collaboration among law enforcement entities; integrate additional automated monitoring systems for vessels transiting the Monument.
Enforcement platforms	Continue enforcement using nondedicated platforms.	Increase number of platforms dedicated to enforcement; and research and development of remote surveillance technologies and deployment in 10 years.
<b>Midway Atoll Visitors Services</b>		
Wildlife-dependant recreation opportunities	Continue to offer limited visitor opportunities.	Expanded educational opportunities through tours and other recreational activities.
Opportunity for cultural and historic resources information and interpretation	Continue focus on the human history in Midway and the Monument.	Expand focus to include information on the importance of the NWHI in the Native Hawaiian culture.
Monitoring visitor effects and satisfaction	Continue limited monitoring of the effects of visitors and surveys on visitor experience.	Expand monitoring visitor effects and visitor satisfaction surveys.
Visitor satisfaction surveys	Survey information is compiled on a monthly basis.	Activities would be adjusted on a monthly basis based on feedback received in surveys.
<b>PMN 5 - Coordinating Conservation and Management Activities</b>		
<b>Agency Coordination</b>	No field activities anticipated.	Same as No Action.
<b>Constituency Building and Outreach</b>		
Materials and exhibits	Continue to use multiple agency-specific	Establish a unified Monument Web site,

**Table 1.1**  
**Comparison of Key Elements of No Action and Proposed Action Alternatives**

	<b>No Action</b>	<b>Proposed Action</b>
	Web sites and prepare informational materials to provide the public with information on the Monument.	identity, integrated communications strategy, and education and outreach themes; develop new exhibits on the Battle of Midway and other historic events and a network of interpretative sites in partnership with existing and new sites.
Volunteer programs	Continue to support limited volunteer opportunities.	Enhance support for volunteer programs and Monument Alliance to engage a broad range of constituents in Monument activities
<b>Native Hawaiian Community Involvement</b>	Continue to foster partnerships with existing Native Hawaiian groups.	Same as No Action plus formalize and expand the Native Hawaiian Working Group, and use and integrate Native Hawaiian traditional knowledge in Monument management.
<b>Ocean Ecosystems Literacy</b>		
Formal education	Continue to conduct teacher workshops on main Hawaiian Islands on Navigating Change curriculum four times a year.	Same as No Action plus develop new curriculum and conduct educator workshops at Midway Atoll biennially.
Interpretative facilities	Continue educational opportunities for school groups at the Mokupāpapa Discovery Center.	Same as No Action plus expand educational opportunities for school groups to 10 groups per month.
Research and Technology	Continue education and outreach through video and teleconferencing.	Same as No Action plus identify and prioritize research and development projects to increase ocean literacy and expand education with innovative technologies, such as telepresence, to bring the place to the people.
<b>PMN 6 - Achieving Effective Monument Operations</b>		
<b>Central Operations</b>	Continue to coordinate annual site operations planning and implementation.	Same as No Action plus assessment and enhancement of human resource and organizational capacity and physical infrastructure and facilities.
<b>Information Management</b>	Continue to update and maintain a Monument Information Management System; GIS-based database of past habitat characterization and field research; participate in National Marine Sanctuary's IMAST program; and develop a field-based data collection tool.	Same as No Action plus conduct workshops to facilitate data sharing, access, security, and use; develop protocols for data collection, documented, stored and shared; and develop educational materials that interpret data and make the information accessible and understandable.
<b>Coordinated Field Operations</b>		
Planning	Continue to conduct multiple agency-specific field operations planning, field	Same as No Action plus develop interagency agreements to facilitate

**Table 1.1  
Comparison of Key Elements of No Action and Proposed Action Alternatives**

	<b>No Action</b>	<b>Proposed Action</b>
	activities, and infrastructure and development.	effective field coordination throughout the Monument and develop a comprehensive dive operations program and research, education, visitor, and administrative facilities Monument-wide.
Midway Atoll	Continue to maintain infrastructure in suboptimal operating condition.	Same as No Action plus transform Midway into the operational hub for the Monument; implement Midway Conceptual Site Plan; replace and maintain rehabilitating critical utility systems and ailing structures and facilities at Midway Atoll; strategy for long-term sustainability using alternative energy, waste reduction, and low impact construction; meet fuel requirements for aircraft, vessel, utility and equipment needs at Midway Atoll; improve the small boat operational capacity; develop a monk seal captive care facility.
Other field camps	Continue to maintain field camps in suboptimal condition.	Enhance and maintain field camps at Kure Atolls, French Frigate Shoals, Pearl and Hermes Atolls, and Laysan Island.
<b>Evaluation</b>	Continue to evaluate program activities by conducting agency-specific annual program review.	Develop and implement a comprehensive Monument evaluation strategy and Monument Management Plan review.

**1.8 ACTIONS DESCRIBED REQUIRING FUTURE NEPA/HRS CHAPTER 343 ANALYSIS**

The Monument Management Plan includes a description of strategies and activities that the MMB agencies propose to implement over the next 15 years. These are grouped into the following categories for evaluating their potential environmental impacts: planning and administrative, field-based, and infrastructure and development. Although this EA describes these activities and their potential effects in general terms, it cannot for the most part be a full analysis of the effects of each action that will be taken or authorized over the next 15 years because some activities are still being developed. As such, each agency activity will be assessed individually for future NEPA analysis. If these activities are developed beyond the conceptual stage, they may require additional assessment under NEPA (such as a supplemental EA or an Environmental Impact Statement), as well as HRS Chapter 343 compliance. These activities (see Table 1.2) include some of the proposed infrastructure projects to make Midway a safe, efficient, and environmentally friendly operational hub for the Monument. Proposed infrastructure needs include increasing boat storage, constructing new piers, and building a marine laboratory at Midway Atoll. Infrastructure improvements are also proposed to support visitors, volunteers, researchers, and managers at Midway. Proposed habitat restoration, such as that for Hawaiian

monk seal haul-out areas at FFS, and to species, such as the black-lipped oyster, would require assessment and feasibility studies before specific activities could be defined.

Activity	Activity Type	
Activity MCS-2.1: Develop a prioritized Natural Resources Science Plan within 1 year.	New	Planning/administrative
Activity MCS-2.4: Implement research priorities identified in the Monument Natural Resource Science Plan.	New	Field activity
Activity HMC-1.3: Where feasible, implement appropriate restoration activities.	New	Field activity
Activity HMC-4.4: Formulate and implement a restoration plan for Lisianski Island using guidelines established for neighboring Laysan Island.	New	Field Activity
Activity HMC-4.6: Implement coordinated ecosystem restoration on Kure Atoll	New	Field Activity
Activity P-1.3: Coordinate appropriate environmental review for all permitted activities.	New	Field Activity
Activity EN-2.4: Increase available platforms to support law enforcement.	Expanded	Infrastructure and development
Activity CFO-3.1: Design and construct a pilot low-impact shelter.	New	Infrastructure and development
Activity CFO-3.2: Use the existing footprint of Bravo Barracks for replacement housing at Midway Atoll.	New	Infrastructure and development
Activity CFO-3.3: Use the existing footprint of Charlie Barracks for replacement housing at Midway Atoll.	New	Infrastructure and development
Activity CFO-3.5: Maintain and enhance, where appropriate, the infrastructure at Kure Atoll.	Expanded	Infrastructure and development
Activity CFO-3.6: Maintain and enhance, where appropriate, the infrastructure at FFS.	Expanded	Infrastructure and development
Activity CFO-3.7: Evaluate, maintain, and enhance the small tent field camp at Pearl and Hermes Atolls on Southeast Island.	Expanded	Infrastructure and development
Activity CFO-3.8: Maintain and enhance the tent field camp at Laysan Island to support on the ground management and restoration capacity.	Expanded	Infrastructure and development
Activity CFO-4.2: Develop biodiesel fuel capacity or other sustainable fuel types at Midway Atoll within two years.	New	Infrastructure and development
Activity CFO-5.1: Rehabilitate water catchment and distribution system.	Expanded	Infrastructure and development

Table 1.2  
Activities That May Be Addressed in Future NEPA/HRS Chapter 343 Compliance

Activity	Activity Type	
Activity CFO-5.2: Rehabilitate septic and wastewater systems.	Expanded	Infrastructure and development
Activity CFO-5.4: Evaluate and optimize food services, as necessary.	Expanded	Infrastructure and development
Activity CFO-5.5: Rehabilitate seaplane hangar.	Expanded	Infrastructure and development
Activity CFO-5.6: Repair inner harbor seawall.	Expanded	Infrastructure and development
Activity CFO-6.4: Construct new finger piers inside of Midway’s inner harbor.	New	Infrastructure and development
Activity CFO-6.5: Redevelop boathouse at Midway into a multiuse facility.	New	Infrastructure and development
Activity CFO-6.7: Make needed improvements to or replace the pier at Eastern Island.	New	Infrastructure and development
Activity CFO-9.1: Design a marine laboratory at Midway and develop it in phases.	New	Infrastructure and development
Activity CFO-9.2: Complete planning for and construct a captive care monk seal facility on Sand Island.	New	Infrastructure and development
Activity CFO-9.5: Construct airport welcome center on Sand Island within two years.	New	Infrastructure and development

**1.9 REGULATORY FRAMEWORK**

The following federal laws, proclamations, and state constitutional provisions and statutes or regulations are the most relevant to coordinated management of the Monument:

- Antiquities Act of 1906, 16 USC § 431, et seq., provides statutory authority for the establishment of national monuments;
- Presidential Proclamations 8031, June 15, 2006 (71 FR 36443) and 8112, February 28, 2007 (72 FR 10031), establishing the NWHI as a marine national Monument;
- Papahānaumokuākea Marine National Monument, codifying regulations, 50 CFR Part 404;
- State of Hawaii Organic Act of April 30, 1900, c339, 31 Stat.141 § 2, and Hawaii Admission Act of March 18, 1959, Pub. L. 86-3, 73 Stat. 4 § 2;
- Constitution of the State of Hawai‘i, Article XI, §§ 1,2,6,9 and Article XII § 7, including Hawaii Administrative Rules Title 13, Chapter 60.5 Northwestern Hawaiian Islands Marine Refuge. Hawaii Administrative Rules Title 13 Rules Regulating Wildlife Sanctuaries;
- Hawaii Revised Statutes, Title 1, Chapter 6E; Title 10, Ch. 128D; Title 12, Chs. 171, 183C, 183D, 187A, 188, 190195D, 200; Title 13, Ch. 205A; Title 19, Chs. 339, 342D,

343; and Hawaii Administrative Rules, Title 11, Chs. 54, 55, 60.1, 200; Title 13, Chs. 5, 60.5, 75, 76, 124, 125, 221, 275, 277, 280, and 300;

- National Marine Sanctuaries Amendments Act of 2000, Pub. L. 106-513 § 6(g) (2000);
- Endangered Species Act of 1973, as amended, 16 USC § 1531 et seq.;
- Marine Mammal Protection Act of 1972, 16 USC § 1361 et seq.;
- National Historic Preservation Act of 1966, as amended through 2000, 16 USC § 470 et seq.;
- Magnuson-Stevens Fishery Conservation and Management Act of 1976, 16 USC § 1801 et seq.;
- National Wildlife Refuge System Administration Act of 1966, as amended, 16 USC §§ 668dd-ee;
- Refuge Recreation Act of 1962, 16 USC § 460k-3;
- Fish and Wildlife Act of 1956, 16 USC § 742f; and
- Fish and Wildlife Improvement Act of 1978, 16 USC § 742l.

**CHAPTER 2:**  
**AFFECTED ENVIRONMENT**

# CHAPTER 2

## AFFECTED ENVIRONMENT

---

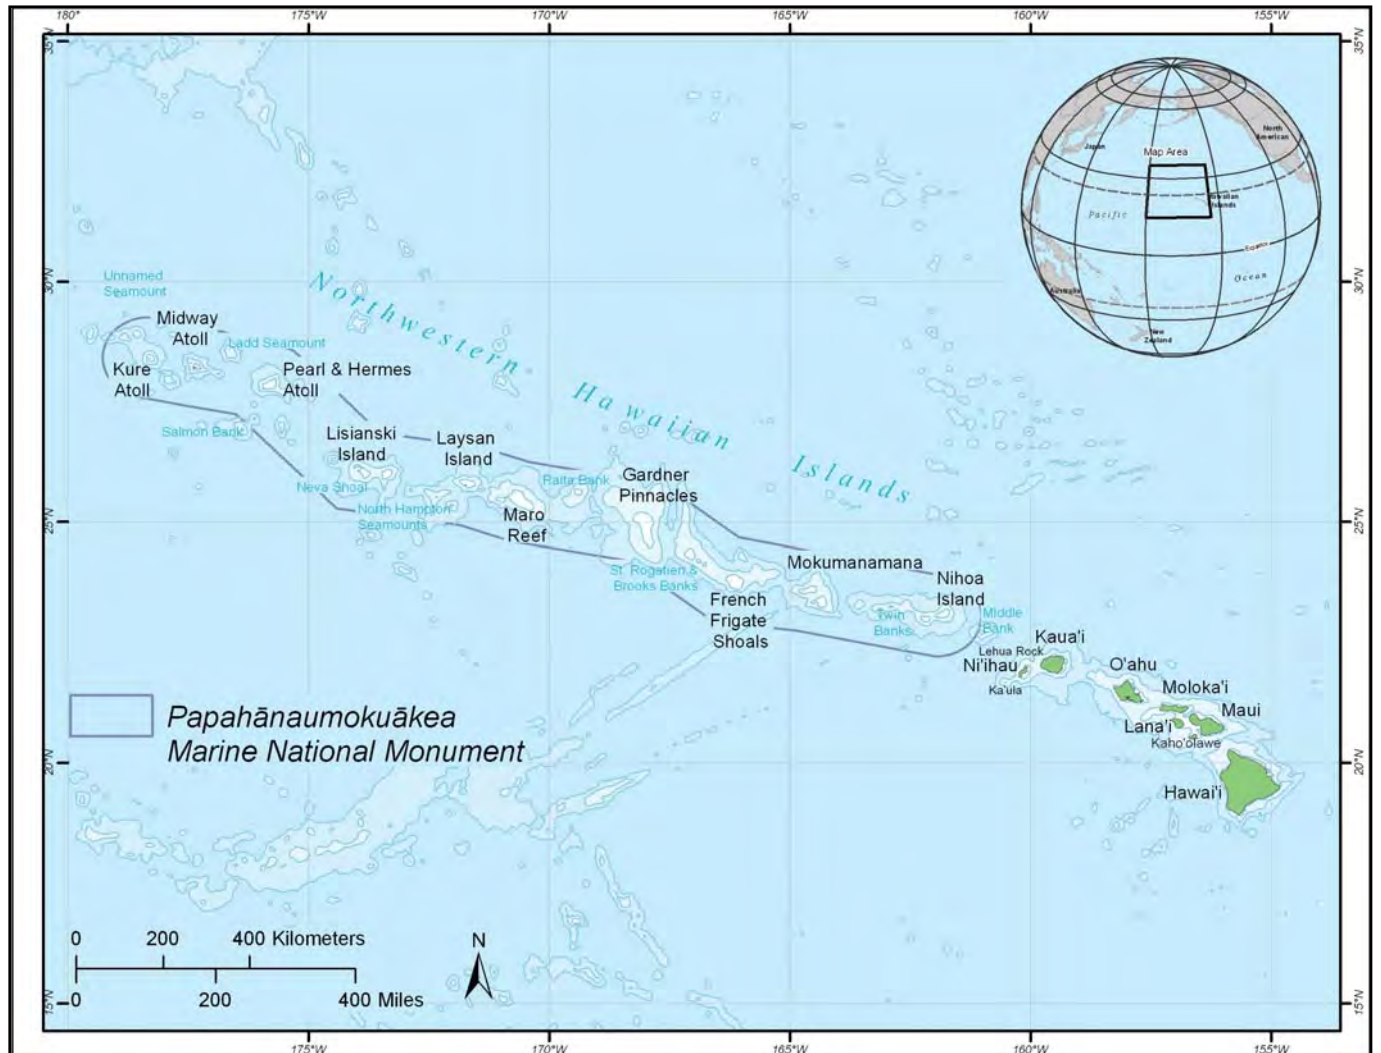

### 2.1 INTRODUCTION

This chapter describes the physical, biological, social, and economic conditions that occur within the region of influence (ROI) of the Proposed Action alternative. Only those conditions relevant to the Proposed Action alternative are presented. Resource areas discussed include natural resources, cultural and historic resources, human uses and activities, human health, safety, and hazardous materials, land use economic and social conditions, water quality, transportation and communications infrastructure, and utilities.

Chapter 2 is organized by resource area. Each resource area discussion includes an overview of the resource area with background on how the resource is related to the Proposed Action alternative, a general overview of relevant legislative requirements governing the resource, where applicable, and a discussion of the conditions of the resource within the ROI.

The ROI discussed in this report varies for each resource evaluated. For example, the ROI for water resources primarily includes those islands where specific actions take place, whereas the ROI for socioeconomics includes the entire state of Hawai‘i; therefore, the regions of influence are not the same for all potentially affected resource areas. Figure 2.1 includes the Northwestern Hawaiian Islands, the boundaries of the Monument, and the main Hawaiian Islands, all of which may be included in the ROIs for each resource area.

Figure 2.1 Hawaiian Archipelago Including the Northwestern Hawaiian Islands (Nihoa to Kure Atoll) and Main Hawaiian Islands (Hawai'i to Kaua'i). Inset shows the Hawaiian Archipelago in the Pacific Ocean.

## 2.2 NATURAL RESOURCES

### 2.2.1 Introduction/Region of Influence

The NWHI, together with the main Hawaiian Islands, are classified as the Insular-Pacific Hawaiian Large Marine Ecosystem (LME), one of 64 LMEs in the world (NOAA 2003a). Due to the interconnectivity between land and sea throughout the Hawaiian archipelago, the ROI for natural resources is the Insular-Pacific Hawaiian LME, which includes the Monument. The waters surrounding the NWHI support a diversity of marine life inhabiting a complex array of shallow and deepwater marine environments. Emergent lands include the many small islands and islets of the NWHI; these lands, the surrounding shallow reef, deepwater benthic, and pelagic habitats, form an integrated ecosystem that supports abundant endemic, threatened, and endangered wildlife.

### 2.2.2 Regulatory Environment

The natural resources within the Monument are protected under numerous federal and state laws and regulations, the most pertinent of which are as follows:

- Antiquities Act (16 USC 431-433);
- Presidential Proclamations 8031, June 15, 2006 (71 FR 36443) and 8112, February 28, 2007 (72 FR 10031);
- Papahānaumokuākea Marine National Monument codifying regulations (50 CFR Part 404);
- National Marine Sanctuaries Act of 1972, as amended (16 USC 1431-1445c);
- Endangered Species Act of 1973, as amended (16 USC 1531-1544);
- Marine Mammal Protection Act of 1972, as amended (16 USC 1361-1421h);
- Migratory Bird Treaty Act of 1918, as amended (16 USC 703-712);
- Magnuson-Stevens Fishery Conservation and Management Act of 1976, as amended (16 USC 1801-1882);
- National Wildlife Refuge System Administration Act of 1966, as amended (16 USC 668dd-668ee);
- Refuge Recreation Act of 1966, as amended (16 USC 460k-460k-4);
- Fish and Wildlife Act of 1956, as amended (16 USC 742a-742m);
- Fish and Wildlife Improvement Act of 1978, as amended (16 USC 742l);
- Coastal Zone Management Act of 1972, as amended (16 USC 1451-1465);
- Executive Order 13022—Administration of the Midway Islands, November 1, 1996 (61 FR 56875);
- Executive Order 13112—Invasive Species, February 3, 1999 (64 FR 6183);
- Executive Order 13089—Coral Reef Protection, June 11, 1998 (63 FR 32701);

- Executive Order 13158—Marine Protected Areas, May 26, 2000 (65 FR 34909);
- Executive Order 1019—Hawaiian Islands Reservation, February 3, 1909;
- Executive Orders 13178 and 13196—Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, December 4, 2000 (65 FR 76903) and January 18, 2001 (66 FR 7395);
- State of Hawaii Organic Act of April 30, 1900 (c339, 31 Stat.141 § 2) and Hawaii Admission Act of March 18, 1959 (Pub. L. 86-3, 73 Stat. 4 § 2);
- Constitution of the State of Hawai‘i, Article XI, §§ 1, 2, 6, and 9 and Article XII § 7;
- Hawaii Revised Statutes, Title 1, Ch. 6E; Title 10, Ch. 128D; Title 12, Chs. 171, 183C, 183D, 187A, 188, 190, 195D, 200; Title 13, Ch. 205A, and Title 19, Chs. 339, 342D, 343;
- Hawaii Administrative Rules, Title 11, Chs. 54, 55, 60.1, 200; Title 13, Chs. 5, 60.5, 75, 76, 124, 125, 221, 275, 277, 280, and 300;
- Hawaii Revised Statutes Title 1, Ch. 6E, Sections 1,7,11,12, 43, 43.5, & 46.5 - Hawaii Historic Preservation Program; and
- Hawaii Administrative Rules, Title 13, Ch. 275 - 284, & 300—Hawaii Historic Preservation Assessment Guidelines.

### 2.2.3 Resource Overview

Natural resources of the Monument are described in detail in the Monument Management Plan. This section provides an overview of the terrestrial and marine resources and special status species in the ROI.

#### 2.2.3.1 Terrestrial Resources

There are ten main islands and atolls in the NWHI. The two southernmost islands, Nihoa and Mokumanamana, are basaltic islands. Four of the five middle landmasses are open atolls (French Frigate Shoals [FFS] and Maro Reef) and sandy islands (Laysan and Lisianski). La Perouse Pinnacle (at FFS) and Gardner Pinnacles are small basaltic outcrops, remnants of islands similar to Nihoa and Mokumanamana. The three northernmost landmasses, Pearl and Hermes, Midway, and Kure, are classical atolls. This emergent land is vital habitat to the 14 million resident and migratory seabirds, which rely on these islands for roosting and breeding habitat and on the surrounding waters for food and which are protected under the Migratory Bird Treaty Act. Included in the 5.5 million seabirds that nest on these islands annually are more than 95 percent of the world’s Laysan (*Phoebastria immutabilis*) and black-footed (*Phoebastria nigripes*) albatross (Naughton and Flint 2004). Four endangered endemic bird species that are not seabirds (Laysan duck [*Anas laysanensis*], Laysan finch [*Telespiza cantans*], Nihoa finch [*Telespiza ultima*], and Nihoa millerbird [*Acrocephalus familiaris kingi*]) also breed on the islands (Table 2.2-2).

Nihoa’s seabird colony boasts one of the largest populations of Tristram’s storm-petrel (*Oceanodroma tristrami*), Bulwer’s petrel (*Bulweria bulwerii*), and blue noddies (*Procelsterna*

*cerulea*) in the Hawaiian Islands and very possibly the world. The island is a unique example of a lowland native community, resembling those lowland communities that once occurred on the main Hawaiian Islands but are now almost completely gone (Wagner et al. 1999). The island's vegetation can be classified as part coastal mixed community (*Sida* mixed shrub and grassland) and coastal dry shrubland dominated by 'ilima (*Sida fallax*), 'aweoweo (*Chenopodium oahuense*), and 'ohai (*Sesbania tomentosa*). The island supports 21 native plant species, including 3 endemics: a palm or loulou (*Pritchardia remota*), an amaranth (*Amaranthus brownii*), and an herb (*Scheidea verticillata*) (Wagner et al. 1999). The avifauna of the island includes two endemic passerine birds, the Nihoa finch and the Nihoa millerbird, both listed as endangered under the federal ESA and HRS 195D. The arthropod fauna of the island includes 33 species of mites, 3 species of spiders, and 182 species of insects, 17 of which are endemic, including a katydid (*Banza nihoa*), a giant tree cricket (*Thaumtogryllus conantae*), 2 species of endemic seed bugs (*Nysius nihoae* and *Nysius suffusus*), and an endemic trapdoor spider (*Nihoa mahina*) (Evenhuis and Eldredge 2004). Nihoa also has a rich cultural heritage, with at least 88 known wahi kupuna (ancestral sites), constructed by pre-contact Hawaiians, who inhabited the island for 700 years until 1700 AD, and listed on the NRHP. In Nihoa's Loulu Coastal Forest Community, *Pritchardia remota* assumes complete dominance with a closed canopy and thick layers of fallen fronds in the understory. Native plants growing nearby include *Chenopodium oahuense*, *Sesbania tomentosa*, *Solanum nelsonii*, and *Sida fallax*. Lichens grow on the trunks of the trees (U.S. Fish and Wildlife Service 1998). In this system, *P. remota* provides nesting habitat for red-footed boobies (*Sula sula*) and perching space for brown noddies (*Anous stolidus*), which are two resident seabirds at Nihoa (U.S. Fish and Wildlife Service 1998).

Because of its limited size, Mokumanamana supports only 5 indigenous plant species and no land birds but does harbor 3 species of mites, 2 species of spiders, and 70 species of insects, 11 of which are endemic, including a large weevil (*Rhycogonus biformis*), 2 species of seed bugs (*Nysius neckerensis* and *N. chenopodii*), and a trapdoor spider (*Nihoa hawaiiensis*) (Evenhuis and Eldredge 2004). Sixteen species of seabirds breed here, including the black noddy (*Anous minutus*), which historically was called the Necker Island tern.

Hawaiian monk seals utilize most of the Monument, including the atolls, islands, and waters of the Monument, with varying population (numbers and age structure) and some exchange within the NWHI and the main Hawaiian Islands. The sandy islets of FFS provide nesting sites for 90 percent of the threatened green turtle (*Chelonia mydas*) population breeding in the Hawaiian Archipelago. In addition, 19 of Hawai'i's 22 seabird species are found on the island, giving it the highest species richness of breeding seabirds within the Monument. The dry coastal shrublands of the larger islets within the atoll also support an endemic seed bug (*Nysius frigateensis*), moth (*Agrotis kerri*), and mite (*Phauloppia bryani*) (Usinger 1942; Nishida 2002).

Due to the limited size of the Gardner Pinnacles, they support only a single species of land plant (*Portulaca lutea*) and a few terrestrial arthropod species, but they are by contrast excellent habitat for seabirds (Clapp 1972). Guano from such seabirds gives the peaks a "frosted" appearance, indicating their importance as roosting and breeding sites for at least 12 subtropical species. Landings and terrestrial surveys rarely take place due to the difficulty of getting ashore under all but the calmest ocean conditions.

Maro Reef is a largely submerged open atoll (Clague 1996), with less than 1-acre (4,046.8 square meters) of periodically emergent land. At very low tide, only a small coral rubble outcrop of a former island is believed to break above the surface; as a result, Maro supports no terrestrial biota.

Laysan Island's ring of sandy dunes surrounds a 173-acre (0.7square kilometers) hypersaline interior lake, a feature unique within the Hawaiian Archipelago and rare within the Pacific as a whole. Because of its elevation of about 40 feet (12 meters), Laysan is well vegetated, supporting at least 30 species of flowering plants, including 5 subspecies that were endemic prior to human contact (Athens et al. 2007), many of which were driven to extinction by the misguided introduction of rabbits (*Oryctolagus cuniculus*) in 1902 during the guano mining era (Ely and Clapp 1973). The plant community is divided into five different associations arrayed in concentric rings around the interior hypersaline lake: coastal shrubs, interior bunchgrass, vines, interior shrubs, and wetland vegetation (Newman 1988). The island also previously harbored five endemic birds, two of which, the Laysan finch and the Laysan duck still survive (Pratt et al. 1987). In addition, approximately two million seabirds nest here, including boobies, frigatebirds, terns, shearwaters, noddies, and the world's second-largest black-footed and Laysan albatross colonies. The island also supports a relatively rich collection of arthropods, including a large endemic weevil (*Rhyncogonus bryani*), four endemic moths, an endemic wasp, and three endemic mites. A successful 12-year eradication project to remove the sandbur (*Cenchrus echinatus*), a plant that had displaced native vegetation over 30 percent of the island, has been completed, and an active ecological restoration project is under way to bring back a number of other plants and animals that were lost after the introduction of rabbits (Morin and Conant 1998).

Lisianski supports no endemic land plant or bird species, although it does harbor an endemic seed bug (*Nysius fullawayi flavus*) and an endemic moth (*Helicoverpa minuta*) (Usinger 1942; Nishida 2002). The island also hosts large Bonin petrel (*Pterodroma hypoleuca*) and sooty tern (*Onychoprion fuscata*) colonies, as well as a variety of other seabirds. Lisianski has the only grove of *Pisonia grandis* trees in the entire Hawaiian Archipelago; this tree is dispersed by seabirds and is favored as a nesting site for many tree-nesting seabird species.

Pearl and Hermes Atoll is a true atoll, fringed with shoals, permanent emergent islands, and ephemeral sandy islets. These features provide vital dry land for Hawaiian monk seals, the Hawaiian population of green sea turtles, and a multitude of seabirds, with 16 seabird species breeding here. The permanent islands with higher dunes support an endemic subspecies of native seed bug (*Nysius fullawayi infuscatus*) (Usinger 1942). Pearl and Hermes also hosts a small population of endangered Laysan finches that were translocated here in the 1960s.

Although Midway's native vegetation and insects have been greatly altered by more than a century of human occupation, the island boasts the largest nesting colonies of Laysan and black-footed albatrosses in the world, forming the largest colony of albatrosses in the world. The Navy, FWS, and U.S. Department of Agriculture-Wildlife Services (USDA Wildlife Services) successfully eradicated black rats (*Rattus rattus*), accidentally introduced during World War II, from Midway, removed a small forest of mature ironwood trees (an alien invasive species) from Eastern Island and new ironwood seedling from the remaining seedbank are removed as they are detected. Currently the cover on all of the islands at Midway is approximately 30 percent paved

or with structures, 23 percent grass and forbs, 18 percent woodland, 7 percent sand and bare ground, 22 percent shrublands, and less than 0.23 percent wetland. Midway Atoll also supports the first successful reintroduced population of endangered Laysan ducks, translocated from Laysan Island in 2004-2005. Laysan ducks utilize both the largely introduced vegetation of Midway Atoll and restored patches of native vegetation. This reintroduction is significant because Island ducks are globally threatened taxa, and because the Laysan duck is the most endangered waterfowl in the Northern Hemisphere and the U.S. Introduced canaries (*Serinus canaria*) breed among historic buildings that mark the beginning of cable communication across the Pacific near the beginning of the 20<sup>th</sup> century

Kure Atoll is an important breeding habitat for Christmas shearwaters (*Puffinus nativitatis*), Laysan and black-footed albatross. Kure has at least 11 terrestrial arthropods endemic to Hawai'i and one that is apparently endemic to Kure.

### 2.2.3.2 Current Status of the Resources

A number of these islands have been significantly altered from their natural state. Tern Island, part of FFS, was transformed from an 11-acre (.04-square-kilometer) sandy island into a 42-acre (.17-square-kilometer) naval airstrip by building a steel retaining wall, blasting and dredging a channel around the island, and using the blasted coral to fill in the wall (Amerson 1971). Barracks, a fuel depot, and a LORAN station were constructed over the years, with the barracks still housing five to ten people, including FWS managers, volunteers, researchers, and Hawaiian monk seal field teams. Laysan Island, at 1,015 acres (4.1 square-kilometers), is the second largest landmass in the NWHI. In the middle of the island lies a 173-acre (0.7 square-kilometers) hypersaline lake. During the late 1800s, Laysan experienced great ecological changes from guano miners and feather harvesters. Introduced rabbits and guinea pigs (*Cavia porcellus*) quickly devastated the island's vegetation. FWS has undertaken an ecological restoration project that includes eradicating invasive plants and insects and returning native plant, insect, and bird species extirpated previously (Flint and Rehkemper 2002). A short-lived black-lipped pearl oyster (*Pinctada margaritifera*) industry at Pearl and Hermes Atoll led to the construction of several buildings and the harvest of at least 150,000 oysters (Keenan et al. 2006). Today, 70 years after cessation of commercial harvest, only about a thousand individual pearl oysters have been documented in the lagoon. Midway Atoll, the largest landmass in the NWHI, at 1,535 acres (6.2 square-kilometers), has been significantly altered from its natural state. In 1871, efforts were begun to clear a channel into the lagoon. In 1903, workers for the Commercial Pacific Cable Company added 9,000 tons of soil from Honolulu and Guam and introduced hundreds of new species of flora and fauna. Infrastructure was built, including fuel depots, an airstrip, and housing for as many as 5,000 military personnel. The base was closed in 1993, and the atoll was put under Department of the Interior jurisdiction in 1996 (U.S. Fish and Wildlife Service 2005a). Today, approximately 60 people are stationed at Midway. Kure Atoll, a state wildlife refuge with no permanent population, is the northernmost coral atoll in the world. The USCG built a runway and LORAN station on Green Island in 1960 and 1961. The USCG controlled the runway until 1993 and had a peak of 24 personnel. After 1993, the runway began deteriorating and is no longer useable. Biologists conduct wildlife surveys, restore habitat, and remove marine debris.

At Midway and Tern, aircraft pose a risk to wildlife from collisions. At Midway, the greatest risk of bird/aircraft collision is from the two resident albatross species. Nearly two million migratory seabirds, representing 18 species, nest on Midway's three islands each year. The most abundant species is the Laysan albatross, with a population in excess of one million. Because of its size, its distribution on Sand Island, and its flight activity over the 7,900-foot ETOPS runway, the Laysan albatross represents the greatest bird/aircraft collision hazard. Other species that are involved in bird/aircraft strikes, albeit less frequently, are the black-footed albatross, Bonin petrel, black noddy, brown noddy (*Anous stolidus*), and white tern (*Gygis alba*). Very few seals have ever been observed on the runway, so the frequency of this hazard is low. A barrier of the native vegetation *Scaevola* and *Aerograstis* helps to prevent seals from reaching the runway.

For more than 50 years, the Navy attempted to mitigate the bird/aircraft collision problem by discouraging nesting and bird flight activity near the Sand Island runways. Since Midway became a National Wildlife Refuge in 1988, other steps have been taken to mitigate the collision hazard. Reducing the number of landings and takeoffs during the most hazardous times of day and year has proven to be the most successful mitigation strategy. Albatross are found at Midway in large numbers from November through July, but the peak of activity appears to be in February through May, when both juvenile and adult birds are in abundance.

In March of 2004, the FWS completed a wildlife assessment for the airport operations (American Airports Corporation 2003; Klavitter 2004), as an FAA certification requirement. The objectives of the assessment were as follows:

- Analyze past bird strike data at Midway Atoll;
- Identify the species, numbers, locations, local movements, and daily and seasonal occurrences of wildlife;
- Identify and locate features on and near the airport that attract wildlife;
- Describe the wildlife hazard to air carrier operations; and
- Discuss additional wildlife concerns associated with the airfield.

The primary management implications from this assessment were as follows:

- Runway sweeps are conducted before aircraft departures and arrivals to ensure that all birds are carefully removed from the active runway;
- Flights occur during nighttime from late November to mid-July each year;
- All unnecessary lights are turned off at the airport operations building at night immediately following flight operations; and
- All unnecessary poles, signs, and antennas over three feet (one meter) tall around the airfield are removed.

At Tern Island, FFS, the species most commonly killed during aircraft operations is the sooty tern, but occasionally wedge-tailed shearwater (*Puffinus pacificus*), great frigatebird (*Fregata minor*), and albatrosses of both species are also hit. Tern Island does not have runway lights, so all operations are done during daylight. Just before landings and takeoffs, all the staff on the

island make a sweep to drive the birds from the runway. Flight activities have a slight negative effect on migratory birds, but they have a beneficial effect on all natural resources by facilitating management actions that benefit wildlife and habitats.

Because these island ecosystems have evolved with little contact with the rest of the world, they are particularly vulnerable to the introduction of invasive species. Invasive plants and introduced mammals are a primary threat to nesting seabirds, indirectly by altering the ecosystem and directly by eating eggs and chicks. The number of alien land plants in the NWHI varies from only 3 introduced at Nihoa to 249 introduced at Midway Atoll. The level of threat from introduced plants also varies between species. For example, the invasive plant golden crownbeard (*Verbesina encelioides*) displaces almost all native vegetation in some nesting areas at Kure, Midway, and Pearl and Hermes Atolls. This plant causes entanglement of albatross adults and chicks and increases chick mortality due to heat stress by reducing the birds' ability to use convective cooling for thermoregulation.

A variety of alien plants, animals, and most likely fungi and bacteria have made it to the Northwestern Hawaiian Islands. Some of them have proven to be particularly invasive and dangerous to native species. These include such plants as Sandbur, *Verbesina*, and ironwood (*Casuarina equisetifolia*), and such animals as the black rat, rabbit, gray bird locust (*Schistocerca nitens*), house mouse (*Mus musculus*), and several ant species. Much of the routine management of this area revolves around eradicating or controlling existing invasives and preventing the introduction of new ones.

Marine alien species can be defined as nonnative aquatic organisms that have been intentionally or unintentionally introduced into new ecosystems, resulting in negative ecological, economic, or human health effects. Twelve marine alien invertebrate, fish, and algal species have been recorded in the NWHI. Alien species may be introduced unintentionally by vessels, marine debris, or aquaculture, or intentionally, as in the case of some species of groupers and snappers and algal species (Table 2.2-1). Eleven species of shallow-water snappers (Family *Lutjanidae*) and groupers (Family *Serranidae*) were purposely introduced to one or more of the main islands of the Hawaiian Archipelago in the late 1950s and early 1960s. Two snappers, the bluestripe snapper (taape, *Lutjanus kasmira*) and the blacktail snapper (*L. fulvus*), and one grouper, the peacock grouper (*Cephalopholis argus*), are well established and have histories of colonization along the island chain that are reasonably well documented (Randall 1987). Bluestripe snappers have been by far the most successful fish introduction to the Hawaiian coral reef ecosystem. Approximately 3,200 individuals were introduced on the island of O'ahu in the 1950s. The population has expanded its range by 1,491 miles (2,400 kilometers), until it has now been reported as far north as Midway in the NWHI. These records suggest an annual dispersal rate of about 18 to 70 nautical miles (33 to 130 kilometers). The other two species have been recorded only as far north as FFS and are present in much lower numbers than bluestripe snappers.

**Table 2.2-1  
Probable Mechanisms of Introduction of Marine Invertebrates to Hawai'i**

Mechanism	Species	Percent Established
Hull fouling	212	90%

Solid ballast	21	90%
Ballast water	18	89%
Intentional release	18	28%
Parasites on nonindigenous species	8	88%
Associated with commercial oysters: unintentional	7	100%
Aquarium release	3	67%

Source: Eldredge and Carlton 2002

It is often difficult to determine the specific vector of accidental introduction in the marine environment because there is generally a pronounced lag time between introduction and first observation as an invasive species.

According to the Bishop Museum Hawai'i Biological Survey, the total observed alien marine species in Hawai'i is 343, including 287 invertebrates, 24 algae, 12 flowering marine plants, and 20 fish. The presence of any of these or other potentially invasive species, even in their current benign state, illustrates the fact that these pristine reefs can be invaded.

A 2002 survey documented the first example of an invasive species attached to marine debris in the NWHI. The Asian anemone *Diadumene lineata* was identified from a derelict fishing net at the reefs of Pearl and Hermes Atoll (Zabin et al. 2003). To date, only a few of the 582 metric tons of debris collected have been analyzed for attached species. In addition, an estimated 1,000 tons (907 metric tons) of debris have accumulated in the NWHI over the past 20 years, with an estimated annual accumulation rate of 40 to 60 tons (36 to 54 metric tons) (Asher 2006).

In addition to the current threats posed by alien plant and animal species, several historic buildings on Sand Island contain hazardous materials, such as lead-based paint or asbestos. These toxic materials pose health and safety concerns for humans and wildlife. Lead paint flakes are ingested by albatross chicks, causing growth deformities and mortality. Currently, the Old Bulky Waste Landfill on the south shore of Sand Island, Midway Atoll National Wildlife Refuge (NWR) is eroding, and the soil placed on top is sifting into the debris, causing large holes to open up around the edge and in the center of the landfill. As a result, burrowing birds are bringing up buried and potentially contaminated soil and are nesting in that contaminated soil. Over 500 bird burrows have been counted in the landfill.

Marine debris, especially derelict fishing nets and gear, plastics, and hazardous materials, is a severe chronic threat to shallow ecosystems, such as Midway Atoll, and negatively affects albatrosses, Hawaiian monk seals, marine turtles, and other species that become entangled in or ingest these materials.

Recent decades have brought increased awareness of the changing global environment and the implications this change may have on ecological processes. The increase in average global temperatures, sea level rise, and change in chemical concentrations in the world's oceans are typically cited as the results of global climate change. Changes in the global climate are being brought about by three factors: increasing concentrations of carbon dioxide and other gases in the atmosphere, commonly referred to as the greenhouse effect; alterations in the biogeochemistry of the global nitrogen cycle; and ongoing land use and land cover change. Change in the land use is considered the single most important component of global change affecting ecological systems (Vitousek 1994). While there is some debate about the extent of the

effect these changes will have on Earth's environment, several trends have been well documented. The four areas of impact linked to global climate change that may have the greatest potential effect on the Monument are weather changes, coral bleaching, sea level rise, and oceanic chemical composition change.

### **2.2.3.3 Marine Resources**

#### **Shallow Reef**

As with the definition of ecosystem, the depth to which the shallow reef is defined is subjective. For this EA, this ecosystem is defined as all waters to a depth of 98 feet (30 meters). Because reef-building corals have a symbiotic relationship with microalgae that allows them to grow and thrive in the nutrient-poor waters of the tropics, these reefs have a depth limit based on the penetration of sunlight into the water column. Generally, coral reefs grow in water less than 98 feet (30 meters) (Grigg and Epp 1989), although non-reef-building corals are able to grow in much deeper waters (Maragos and Jokiel 1986; Veron 1986). In addition, there is a much better understanding of the shallow reef, as most coral reef assessment and monitoring is done in waters shallower than 98 feet (30 meters) (Maragos et al. 2004).

Coral reef ecosystems consist of much more than the reef-building corals for which they are named, including sand and unconsolidated sediments, colonized hardbottom, non-reef-building corals, and macroalgae. Reefs make up approximately 50 percent of the biomass, providing habitat structure, refuge, and food to the diverse group of organisms (Garrison 1999). Even in this relatively pristine coral reef habitat, the percentage of coral cover varies widely. A recent assessment of this habitat determined that coral cover for individual islands ranges from 4.4 percent to 64.1 percent across the chain, and less than 1 percent to close to 100 percent within the various habitats of the islands (Friedlander et al. 2005). The highest diversity and highest percent coral cover occurs in the middle of the Monument, at the large open atolls of FFS and Maro Reef. Reef, hardbottom, and sediment habitat are interspersed to create a variety of environmental niches and resources for the diverse array of species.

The shallow reef is a dynamic environment, experiencing constant wave surges and powerful winter storms. Tropical storms and hurricanes can generate extreme wave energy that can damage shallow coral reef habitat. These events are the primary natural force in altering and shaping coral reef community structure (Dollar 1982; Dollar and Grigg 2004). They represent potential but infrequent threats to the shallow coral reef ecosystems of the NWHI. There is a growing concern that global warming and the concurrent acidification of the ocean may cause drastic changes to corals in the coming century (Hoegh-Guldberg 1999). While the northern extent of the NWHI, from Kure to Pearl and Hermes Atolls, experiences sea surface temperatures from less than 64° Fahrenheit (18° Celsius) in winter to summer highs exceeding 82° F (28° C), a temperature anomaly of only 1.8° F (1°C) in the summer of 2002 resulted in widespread mass coral bleaching (Hoeke et al. 2006). Acidification, caused by increased levels of CO<sub>2</sub> in the ocean, inhibits the deposition of calcium carbonate, the primary component of the coral skeleton (Kleypas et al. 2006). Events such as these may be more devastating in the NWHI because these reefs grow more slowly than most other reefs (Friedlander et al. 2005).

Fifty-seven species of coral have been identified in the NWHI, with 30 percent of them being endemic. To date, 355 species of algae and 838 species of invertebrates have been documented in a thorough assessment of the Monument’s living resources (Friedlander et al. 2005).

Characteristics of the shallow water coral reef habitat change with both island geology and reef orientation to the island. Due to strong wave action and currents, the basalt islands in the southern portion of the Monument have no fringing reef. The underwater habitat is composed primarily of vertical walls and wave-cut benches (Friedlander et al. 2005). Caves, overhangs, and trenches provide small-scale habitat for corals, although basalt blocks, boulders, and pavement are the principal bottom cover. Species diversity is low, relative to the middle and northern atolls. The shallow reef habitat in the middle of the Monument (FFS, Maro Reef, and Lisianski Island) is a series of open atolls that exhibit the highest levels of coral abundance and diversity (Friedlander et al. 2005). The largest pod found in the NWHI of spinner dolphins (*Stenella longirostris*) occurs at FFS (Andrews et al. 2006). The northernmost atolls (Pearl and Hermes, Midway, and Kure) are formed by a continuous barrier reef, where the lagoon is connected to the outside ocean through a series of channels and grooves.

Structurally, apex predators, such as sharks and jacks, dominate fish communities on the reefs in the NWHI. In addition, abundance and biomass estimates indicate that the reef community is characterized by a smaller proportion of herbivores, such as surgeonfish (Family *Acanthuridae*), and more carnivores, such as damselfish (Family *Pomacentridae*), goatfish (Family *Mullidae*), and scorpionfish (Family *Scorpaenidae*). A comparison of both biomass and trophic structure between reef fish communities in the NWHI and main Hawaiian Islands (Figure 2.2-1) was conducted in 2000. Across similar habitats, biomass was 260 percent greater in the NWHI (Friedlander and DeMartini 2002). Additionally, 54 percent of the biomass in the NWHI was composed of apex predators, compared to 3 percent in the main Hawaiian Islands.

**Figure 2.2-1 Comparison of Biomass in Major Trophic Guilds between NWHI and Main Hawaiian Islands**

## Deep Reef—Banks, Shoals and Slopes

Approximately 30 submerged banks are within the Monument (Miller et al. 2004). Deepwater banks, seamounts and the abyssal plain are among the least studied environments of the NWHI.

Submersible surveys on South Pioneer Ridge (Pioneer Bank) and two unnamed seamounts, one east of Laysan Island and the other east of Mokumanamana, have revealed the presence of various substrate types, deposited when these geologic features were at sea level (Smith et al. 2004). In some areas, dense communities of corals (ahermatypic [non reef building]) and sponges at depths approaching 1,000 fathoms (6,000 feet, or 1.8 kilometers) obscured the underlying substratum. The deepwater marine plants of the area are a mixture of tropical species, species with cold-temperature affinities, and species with disjunctive distributions, suggesting alternative biogeographical patterns and dispersal routes from the main Hawaiian Islands (McDermid and Abbott 2004).

Mega- to macro-scale descriptions of bottomfish habitats made on Raita Bank, West St. Rogatien Bank, Brooks Bank, and Bank 66 indicate the distribution and abundance of bottomfish are patchy and appear to be associated with high relief and topographic features, including crevices and caves (Kelley et al. 2004). Telemetry studies of Hawaiian monk seals unexpectedly have revealed that these animals spend considerable foraging time at depths on these banks where light does not penetrate, particularly in areas that have high levels of relief, such as pinnacles and walls (Parrish and Abernathy 2006).

Hawaiian monk seals are foragers that eat a broad range of prey items, including bottomfish and associated fish species, as well as other types of fish and animals. Such banks also support populations of spiny (family *Palinuridae*) and slipper (Family *Scyllaridae*) lobsters and colonies of precious gold (*Gerardia* spp.), pink (*Corallium* spp.), and black (Family *Antipathidae*) corals. These deep-living corals, below the depth where enough light penetrates for photosynthesis, rely on the capture of plankton from the water column with their tentacles rather than deriving energy from symbiotic dinoflagellate algae, known as zooxanthellae, that virtually all shallow-water reef-building corals harbor in their cells. Submersible surveys conducted at depths of 656 to 1,148 feet (199.9 to 349.9 meters) on Raita, West St. Rogatien, and Brooks Banks found little evidence of physical disturbances by bottomfishing from anchors and fishing gear (Kelly, Moffit, and Ikehara 2006).

## Pelagic and Deep Water Habitats

Most of the Monument's area can be considered pelagic (open sea) habitat. The estimated area of all parts of the Monument with depths greater than 1,000 fathoms (6,000 feet, or 1.8 kilometers) is 117,375 square miles (304,000 square kilometers) or about 84 percent of the entire monument (Miller et al. 2006).

The Final EIS for the Fishery Management Plan: Pelagic Fisheries of the Western Pacific Region states:

Pelagic species are closely associated with their physical and chemical environments. Suitable physical environment for these species depends on

gradients in temperature, oxygen, or salinity, all of which are influenced by oceanic conditions on various scales. In the pelagic environment, physical conditions, such as isotherm and isohaline boundaries, often determine whether the surrounding water mass is suitable for pelagic fish, and many of the species are associated with specific isothermic regions. Additionally, fronts and eddies, which become areas of congregation for different trophic levels, are important habitat for foraging, migration, and reproduction for many species (Bakun 1996). Oceanic pelagic fish, including skipjack (*Katsuwonus pelamis*), yellowfin tuna (*Thunnus albacares*), and blue marlin (*Makaira nigricans*) or black marlin (*M. indica*), prefer warm surface layers, where the water is well mixed by surface winds and is relatively uniform in temperature and salinity. Other pelagic species—albacore, bigeye tuna (Ahi; *Thunnus obesus*), striped marlin (*Tetrapturus audax*), and broadbilled swordfish (*Xiphias gladius*) — prefer cooler, more temperate waters, often meaning higher latitudes or greater depths.

The oceanic Scombroid fish (billfish, tuna, wahoo) have zoogeographies much more like that of plankton than benthic fish. Most are cosmopolitan and occur in all oceans within the tropical and subtropical zones but may have very specific water temperature preferences (Longhurst and Pauly 1987). The yellowfin tuna, for instance, prefers water no cooler than 64° to 70° F (18° to 21° C), which coincides with the northern boundary of the Monument. All species undertake seasonal and age-related migrations, traveling between spawning grounds and feeding grounds appropriate for their sizes. They prey on medium-sized pelagic fish, crustaceans, and cephalopods. Tagging studies of yellowfin tuna and bigeye tuna have demonstrated that while these species have enormous capacity to travel huge distances, they show very specific attraction to fish-aggregating devices, island reef ledges, seamounts, and other elements of structure (Itano and Holland 2000). Lowe et al. (2006) similarly found that while two species of large sharks, tiger sharks (*Galeocerdo cuvier*) and Galapagos sharks (*Carcharhinus galapagensis*), are capable of long-distance travel, they showed more site fidelity than expected throughout the year, with 70 percent of tiger sharks exhibiting year-round residence at FFS. Some of the study subjects did make long-distance movements, with sharks marked at FFS showing up at Midway and on the Kona coast of the island of Hawai‘i. The tremendous economic value of these fishes has resulted in serious declines of most populations due to industrialized fishing.

The estimated 5.5 million seabirds breeding in the Monument are primarily pelagic feeders that obtain the fish and squid they consume by associating with schools of large predatory fish, such as tuna and billfish (Fefer et al. 1984; Au and Pitman 1986). These fish—yellowfin tuna, skipjack tuna, mahimahi (*Coryphaena hippurus*), wahoo (*Acanthocybium solandri*), rainbow runner (*Elagatis bipinnulatus*), broadbilled swordfish, and blue or black marlin—are apex predators of a food web existing primarily in the epipelagic zone. While both the predatory fish and the birds are capable of foraging throughout their pelagic ranges (which encompass the entire Monument and tropical Pacific Ocean), the birds are most successful at feeding their young when they can find schools of predatory fish within easy commuting range of the breeding colonies (Ashmole 1963; Feare 1976; Flint 1990).

The five species of sea turtles that occur in the NWHI are loggerhead (*Caretta caretta*), green, olive ridley (*Lepidochelys olivacea*), leatherback (*Dermochelys coriacea*), and hawksbill (*Eretmochelys imbricata*). All of these species are protected by the ESA. The Hawaiian population of green turtles has been monitored for 30 years, following the cessation of harvesting in the 1970s, and has shown a steady recovery from its depleted state (Balazs and Chaloupka 2004). The transition zone chlorophyll front, located north of Monument waters most years, occasionally moves southward, along with one of the species tightly associated with it, the loggerhead turtle. These turtles breed in Japan but feed on buoyant organisms concentrated at the convergent front in these high-chlorophyll waters, which support a complex food web, including cephalopods, fishes, and crustaceans, which albacore tuna and a variety of billfish also feed on (Polovina et al. 2001).

The waters of the Monument are also home to 20 cetacean species, 6 of them federally recognized as endangered under the ESA and recognized as depleted under the Marine Mammal Protection Act (MMPA).

#### **2.2.3.4 Connections Among Ecosystems**

The most obvious connection between the above ecosystem classifications is that many primarily marine species need emergent land for reproduction. Many of the emergent lands within the NWHI have been designated critical habitats. Designated critical habitat is a specific geographic area(s) that is essential for the conservation of a threatened or endangered species and that may require special management and protection. Critical habitat may include an area that is not currently occupied by the species but that will be needed for its recovery.

FFS is the primary nesting site for the Hawaiian stock of the threatened green turtle. Females lay an average of two nests per season, with a mean time between laying nests of 13 days. The mean incubation period is approximately 65 days (Balazs 1980).

These islands are also vital as the primary haul-out, pupping, and weaning habitat for the endangered Hawaiian monk seal. Hawaiian monk seals give birth on land and begin to teach their pups to swim after about three weeks (NOAA 2003b). Hawaiian monk seals that haul out to rest regularly spend two weeks every year on land to molt.

A total of approximately 5.5 million seabirds nest annually on nearly every island in the NWHI. For seabirds, a parent's proximity to a reliable food source when raising chicks is directly related to their survival (Polovina et al. 1994). Global atmospheric events (such as El Niño and the

Pacific Decadal Oscillation) appear to lower the productivity of the waters around the NWHI and have been correlated to low chick survival rates and the decline in the Hawaiian monk seal population (Polovina et al. 1994). While albatross come to the NWHI to breed, departing for the open ocean after their chicks have fledged, resident seabirds (e.g., boobies, frigates) spend a good percentage of their time on land.

Even the coral claim the islands, as they subside under the sea, creating the atolls that support the abundant and unique ecosystems found within the Monument. The connections between the shallow reef, where light penetration and coral growth dominate the environment, and the deep reef, where algal meadows and bottomfish prevail, are an important area of study. Some species of juvenile bottomfish inhabit much shallower waters than adults (Parrish 1989). The depth range of both spiny and slipper lobsters spans the deep and shallow reef (DiNardo and Marshall 2001). These lobster species are important links between the shallow and deep reef, as they are among the largest mobile invertebrates in the coral reef ecosystem. As such, they may represent a vital link in the trophic food web. Hawaiian monk seals are known to forage in both shallow and deep reef environments and have been documented at 1,640 feet (500 meters) deep, presumably foraging, for a significant duration (Parrish et al. 2000). These are only a few of the known connections that exist between the habitats defined as deep and shallow reef; many more may exist and are yet to be discovered.

The pelagic habitat is the realm of the highly migratory species, including tunas, sharks, billfish, and hatchling green sea turtles. The deep waters are also important insofar as they support an offshore mesopelagic boundary community (Benoit-Bird et al. 2002), a thick layer of pelagic organisms that rest in the deep ocean (1,300 to 2,300 feet [400 to 700 meters]) during the day, then migrate up to shallower depths (from near zero to 1,300 feet [400 meters]) at night, providing a critical source of nutrition for open-ocean fishes, seabirds, and marine mammals. This community is composed of small fishes, shrimps, and squids, which serve as an important food resource for many animals, including spinner dolphins, bottomfish, tunas, and billfish. Future research will provide more details and interconnections between pelagic and shallow water ecosystems.

### 2.2.3.5 Special Status Species

Table 2.2-2 is a list of selected endangered plant species and resident and/or occasional (transient) bird and/or marine mammal species which can be found at the Monument and which are protected under either the ESA or MMPA. Only species protected under the ESA that are considered to be regularly occurring at the Monument are listed below. Some species protected under the MMPA that are known to occur in the western Pacific and could occur within the Monument are not listed for brevity's sake and because no management action would specifically affect these species.

#### Plants

Six endangered plant species found in the Hawaiian Islands have populations in the NWHI (Table 2.2-2), and three of these are endemic species on Nihoa. *Amaranthus brownii*, *Pritchardia remota*, and *Schiedea verticillata* were listed as endangered under the ESA in 1996. Critical habitat was designated for five plant species in the Monument in 2003.

**Table 2.2-2**  
**Special Status Species in the NWHI**

Common Name	Taxonomic Name	Protection	Occurrence
<b>Land plants</b>			
Loulu/fan palm	<i>Pritchardia remota</i>	ESA	Resident
Kamanomano	<i>Cenchrus agrimoniodes</i>	ESA	Resident
‘Ohai	<i>Sesbania tomentosa</i>	ESA	Resident

Sei whale	<i>B. borealis</i>	ESA/MMPA	Rare
North Pacific right whale	<i>Eubalaena japonica</i>	ESA/MMPA	Rare
Spinner dolphin	<i>Stenella longirostris</i>	MMPA	Resident
Bottlenose dolphin	<i>Tursiops truncatus</i>	MMPA	Resident

Source: NOAA 2004b

*A. brownii* is the rarest native plant on Nihoa (FWS 1998); its populations are scattered in two valleys, and a few individuals grow at the bases of basaltic cliffs on the steep outer slopes of the two valleys. *P. remota* grows on valley floors and at the bases of basaltic cliffs, areas that are subject to flash floods. *P. remota* is known from approximately 680 plants scattered in four colonies in each of two valleys that are on opposite sides of Nihoa (FWS 1998). *S. verticillata* typically grows in soil pockets and cracks on coastal cliff faces between 100 and 800 feet (30 and 242 meters). All historically known colonies of *S. verticillata* are known to be extant and have remained relatively stable.

Threats to *A. brownii* on Nihoa include competition with the nonnative plant *Portulaca oleracea* (pigweed), herbivory by introduced grasshoppers (*Schistocerca nitens*), alteration of substrate, fire, potential introduction of rats and mice, human disturbances, a risk of extinction from naturally occurring events (such as hurricanes), and reduced reproductive vigor due to the small number of extant individuals (U.S. Fish and Wildlife Service 1998). Although the current

population of *P. remota* appears to be stable, this species may have experienced declines resulting from Polynesian settlement of Nihoa. Contemporary threats may include alien plant, insect, and mammal species. Flash floods, fire, and human disturbances may also pose potential threats. As a consequence of small population sizes, many of these species are at risk to random events and face reduced reproductive vigor (U.S. Fish and Wildlife Service 1998).

Three additional endangered plants that are found in the main Hawaiian Islands are also found in the NWHI—*Cenchrus agrimonioides* var. *laysensis*, *Mariscus pennatiformis* ssp. *bryannii*, and *Sesbania tomentosa* (U.S. Fish and Wildlife Service 1999). *C. agrimonioides* var. *laysensis* was historically known from Laysan, Kure, and Midway but has not been seen since 1973 (U.S. Fish and Wildlife Service 1999). *M. pennatiformis* ssp. *bryannii* is known only from Laysan Island where the population has fluctuated between 1 and 200 since 1980. *S. tomentosa*, the only endemic Hawaiian species in this genus, occurs on Nihoa and Mokumanamana; the largest population occurs on Nihoa and consists of several thousand individuals (U.S. Fish and Wildlife Service 1999). Threats to these species include competition with alien plants, herbivory by introduced grasshoppers (*Schistocerca nitens*) and other invasive animals, risk of extinction from natural events, and reduced reproductive vigor due to the small number of individuals.

## Birds

Both the Nihoa finch and the Nihoa millerbird reside year-round on the steep-sided, rocky, and shrub-covered island of Nihoa. Laysan finches are restricted to the low-elevation vegetated area of Laysan Island, although translocated populations have occupied the vegetated areas of Southeast Island and Grass Island at Pearl and Hermes Atoll. The Nihoa millerbird is the least abundant of the endangered passerines, numbering between approximately 150-350 birds (Mitchell et al. 2005). The Laysan and Nihoa finch populations have been surveyed most years since 1966, and their mean populations vary from over 11,000 to over 3,000 respectively (Mitchell et al. 2005). No clear population trends have been observed (Mitchell et al. 2005). Factors limiting Nihoa finch and millerbird populations are primarily weather, variations in food supply, and availability of appropriate nest sites. Additional threats include invasive alien arthropod and plant species, a sudden increase in arthropod population, introduced mammals, small population size, and associated demographic, random, and genetic risks. Landmass loss accompanying sea-level rise also poses a potential risk to the Laysan finch population.

The total Laysan duck population on Laysan Island has fluctuated from seven to more than 600 adult birds in the last century. The most recent (2005) population estimate of adult birds is approximately 600 birds (Reynolds et al. 2006). The population at Midway was founded with a total of 42 wild birds translocated from Laysan in 2004 and 2005. Of this original total, 25 or 26 birds are believed to have bred. After successful breeding seasons in 2005 through 2007, the number of ducks at Midway had increased to nearly 200 animals (Reynolds et al. 2007). Another successful breeding season at Midway in 2008 added significantly to the population, but an outbreak of avian botulism in August 2008 caused the death of more than 130 ducks and a temporary set-back to this new population.

The short-tailed albatross is listed as endangered under the ESA and is the smallest population of any albatross species in the North Pacific. Short-tailed albatrosses once ranged throughout most of the North Pacific Ocean and Bering Sea but were harvested to near extinction at their breeding

colonies in Japan. The current worldwide population is approximately 1,700 individuals, and due to habitat management and stringent protection, the population has increased by approximately six percent per year (U.S. Fish and Wildlife Service 2000). The primary range of this species is along the coasts, traveling between its breeding colonies in Japan, along Russia, the Aleutian Islands, and down the coast of North America. Land-based sighting records indicate that at least 15 short-tailed albatrosses have visited the NWHI over the past 60 years. Most of these sightings have been at Midway Atoll (U.S. Fish and Wildlife Service 2000), where two individuals are present every breeding season.

**Sea Turtles**

There are five listed sea turtles that could occur in the waters of the Monument. The Hawaiian population of the green turtle, loggerhead, and olive ridley are listed as threatened under the ESA. The leatherback and hawksbill turtles are listed as endangered under the ESA. The green turtle is common in the NWHI; the other turtles are rarely sighted in the Monument and therefore are not listed in Table 2.2-2 or considered in this analysis.

The NWHI are the primary nesting grounds for the Hawaiian population of the green turtle, while the main Hawaiian Islands are the primary foraging grounds. Although scattered low-level nesting occurs throughout the Hawaiian archipelago, over 90 percent of the nesting is at a few sandy islets within FFS (NMFS and U.S. Fish and Wildlife Service 1998). Nearshore waters contain adults that migrate to breed at these key sites. Mating occurs in the water, yet both males and females arrive on land to bask. Approximately 200 to 700 adult green turtle females nest on FFS annually. Since protection by state law in 1974 and by the ESA in 1978, the nesting population of the Hawaiian population of the green turtle has increased dramatically, as shown in Figure 2.2-2.

## Hawaiian Monk Seal

The Hawaiian monk seal is listed as endangered under the ESA and as depleted under the MMPA. It is the most endangered pinniped in U.S. waters and the second most endangered marine mammal after the northern right whale. The Hawaiian monk seal is so named for its solitary nature, with the closest social bond being between mother and pup (Reeves et al. 1992).

Little is known about the Hawaiian monk seal population before the 1950s, although the species is thought never to have numbered more than a few thousand (Ragen and Lavigne 1999). Reduction of the seals' range may have begun with the arrival of the first Polynesians to Hawai'i. Two activities in historic times are believed to have caused major declines in population: a short-lived sealing venture of the 1800s and military activities on Kure, Midway, and FFS in the second half of the twentieth century. Population surveys conducted since 1959 indicate that non-pup populations have declined by 60 percent (NOAA 2003d). Today, the total population is estimated at 1,200 individuals (NOAA 2004g). A variety of management actions have been implemented to improve the population trends, including removing aggressive males, relocating males to equalize the sex ratio, and rehabilitating undersized pups to improve survival.

## Other Marine Mammals

The great whales occur throughout the Pacific. Five baleen whales—blue whale, fin whale, humpback whale, sei whale, and Pacific right whale—and one toothed whale, the sperm whale, are listed under the ESA. Four of the five baleen whales are known to occur in this area of the north Pacific, but with the exception of the humpback whale, they are all considered relatively rare in Hawaiian waters. Humpback whales occur consistently in the winter but are found mainly in waters surrounding the seven main Hawaiian Islands. Recent research by Johnston et al. (2007) reveals that the Monument hosts many more humpback whales than originally thought. Sperm whales have been sighted around several of the Northwest Hawaiian Islands, and their sounds have been recorded throughout the year in Hawaiian waters. A summer/fall 2002 shipboard survey of waters within the U.S. Exclusive Economic Zone of the Hawaiian Islands resulted in 43 sperm whale sightings throughout the study area (NOAA 2004).

Spinner and bottlenose (*Tursiops truncatus*) dolphins are year-round residents of the Hawaiian Islands. They are not considered threatened or endangered under the ESA or depleted under the MMPA though they are protected under the MMPA. While both species are widely distributed throughout the world in tropical and warm temperate waters, they are considered separate stocks from other populations due to their isolation in the Hawaiian archipelago (NOAA 2000). Both species occur from the island of Hawai'i to Kure Atoll. There are an estimated 743 bottlenose dolphins and 3,184 spinner dolphins within 28.7 miles (25 nautical miles, 46.3 kilometers) of the main Hawaiian Islands. Because waters beyond 28.7 miles (25 nautical miles, 46.3 kilometers) of the coast or the waters of the NWHI were not surveyed, this number is considered an underestimate of the population size (NOAA 2000). The largest pod of spinner dolphins within the Monument occurs at FFS, with approximately 500 individuals (Andrews et al. 2006). Smaller pods occur at Pearl and Hermes Atoll, Midway Atoll, and Kure Atoll. While spinner dolphins have a capacity for high mobility, it appears that movements between islands are relatively infrequent, with each pod having a high affinity to a specific atoll (Karczmarski et al. 2005).

## 2.3 CULTURAL AND HISTORIC RESOURCES

### 2.3.1 Introduction/Region of Influence

The ROI or area of potential effect for cultural and historic resources includes all lands and waters within and adjacent to the Monument. Historic and current maps, cultural resources reports, public meetings, and archival records were reviewed to identify cultural resources. The NRHP and state and local inventories of historic places were reviewed for prehistoric and historic resources. Native Hawaiian groups were consulted, and public meetings were held to identify and locate traditional Hawaiian resources. In addition to the cultural properties formally evaluated within the Monument, the NWHI contains resources that, from a broad cultural perspective, have added meaning and significance to Native Hawaiian groups and other members of the public.

### 2.3.2 Regulatory Environment

Cultural resources are defined as historic properties, landscapes, cultural items, archaeological resources, sacred sites, or collections subject to protection under the NHPA, the Archaeological Resources Protection Act (ARPA), and the guidelines on Curation of Federally Owned and Administered Collections (36 CFR Part 79).

Cultural and historic resources are regulated through a number of laws, beginning with the NHPA, which is the basis for a process that considers the effects of federal undertakings on cultural and historic resources. The procedure an agency takes to comply with this legislation is commonly called the Section 106 process. Although the NHPA was created primarily in response to numerous federally funded urban renewal projects in which old neighborhoods and historic homes were demolished, it also applies to any actions an agency may take that would affect historic or cultural resources, as they are defined in the law. The intent of the process is to require the federal agency, in consultation with other affected parties, to make an informed decision as to the effect its actions would have on something that may be important to our heritage. In addition to the federal regulations, there are also state regulations protecting cultural resources. These regulations, administered under the DLNR's Historic Preservation Division, not only protect the cultural resources but more importantly also provide a process for reintering *iwi*, or bones of Native Hawaiians. Included in this process is consultation with the islands' burial councils and affected parties. Depending on the resources identified, the following legislation could apply within the Monument:

- Abandoned Shipwreck Act of 1987 (PL 100-298; 43 USC 2101-2106);
- Sunken Military Craft Act (HR 4200, Title XIV, Sec. 1401-1408);
- Preserve America Executive Order (2003);
- National Marine Sanctuary Act (16 USC 1431 et seq.);
- American Antiquities Act of 1906 (16 USC 431-433);
- Archaeological and Historic Preservation Act of 1974 (16 USC 469-469c);
- Archaeological Resources Protection Act of 1979, as amended (16 USC 470aa-mm);

- Historic Sites, Buildings, Objects, and Antiquities Act of 1935 (16 USC 461-467);
- Native American Graves Protection and Repatriation Act of 1990 (25 USC 3001-3013);
- Department of the Interior Secretary’s Order 3217 – Battle of Midway National Memorial, September 13, 2000;
- Protection and Enhancement of the Cultural Environment Executive Order 11593;
- National Wildlife Refuge System Administration Act of 1966, as amended (16 USC 668dd-ee);
- Hawai‘i Historic Preservation Program (HRS Title 1, Ch. 6E, Sections 1, 7, 11, 12, 43, 43.5, and 46.5);
- Hawai‘i Historic Preservation Assessment Guidelines (HAR, Title 13, Ch. 275-284, and 300);
- Executive Order 13022 – Administration of the Midways Islands, November 1, 1996 (61 FR 56875);
- National Historic Preservation Act of 1966 (16 USC 470 et seq.); and
- American Indian Religious Freedom Act, as amended (42 USC 1996 and 1996a).

Monument regulations define Native Hawaiian practices as cultural activities conducted for the purposes of perpetuating traditional knowledge, caring for and protecting the environment, and strengthening cultural and spiritual connections to the NWHI that have demonstrable benefits to the Native Hawaiian community. In addition to the findings that must be made for any category of Monument permit (see 404.11[d]), permits for conducting Native Hawaiian cultural practices may be issued (50 CFR 404.11 [c][4] and [e]; Presidential Proclamation 8112), provided that activities are noncommercial and do not involve the sale of any organism or material collected. The purpose and intent of a Native Hawaiian practice or activity must be appropriate and deemed necessary by traditional standards in the Native Hawaiian culture, must benefit the resources of the NWHI and Native Hawaiian community, and must support traditional knowledge and ancestral connections of Native Hawaiians to the NWHI. Any Monument resource harvested from the Monument must be consumed in the Monument.

### **2.3.3 Resource Overview**

Cultural and historic resources of the Monument are described in detail in the Monument Management Plan. This section is an overview of these resources in the ROI.

#### **2.3.3.1 Native Hawaiian History in the Northwestern Hawaiian Islands**

Native Hawaiians’ ancestors were the first discoverers of the Hawaiian archipelago. They inhabited these islands for thousands of years before Western contact. The NWHI are considered a sacred place, a region of primordial darkness from which life springs and spirits return after death (Kikiloa 2006). Much of the information about the NWHI has been passed down from generation to generation through oral and written histories, genealogies, songs, dance, and archaeological resources.

In the past, Nihoa played an important role in a larger subsistence network between Ni‘ihau and Kaua‘i. The traditions of Ni‘ihau tell of how the people would frequent Nihoa to collect loulu palm wood for spears and mākiuki grass, which could be used for cordage and stuffing (Tava and Keale 1989). A reciprocal and interdependent relationship developed between these three islands (Tava and Keale 1989; Maly 2003). Annual visits from Ni‘ihau and Kaua‘i to Nihoa were made during the spring and summer trade wind season. Ni‘ihau traditions suggest that “the Ni‘ihauans sailed to Nihoa in the spring, returning to Ni‘ihau in the fall on the Kona winds” (Tava and Keale 1989; Maly 2003). Other documented accounts tell of how fishermen in the late 1800s from O‘ahu and Hawai‘i island would make special trips to the NWHI for four months at a time, from May to August, which was the special sailing season. They fished for ‘ōpelu (mackerel scad, *Decapterus macarellus*) and aku (skipjack tuna, *Katsuwonus pelamis*) (Johnson and Mahelona 1975). These accounts highlight the importance of the NWHI in the lives of pre-contact Native Hawaiians who regularly sailed to and from this region.

During the post-contact historical period of Hawai‘i, the Kingdom of Hawai‘i exhibited strong interest in the NWHI, as title to the islands and waters were acquired throughout the 1800s through the Doctrine of Discovery (Mackenzie and Kaiama 2003). During this time, there were a number of written records of visits to the NWHI made by monarchs of the Hawaiian Kingdom. In 1822, Queen Ka‘ahumanu organized and participated in an expedition to locate and claim Nihoa under the Kamehameha Monarchy. On March 16, 1856, Nihoa was reaffirmed as part of the territory of the Kingdom of Hawai‘i in a circular by authority of Alexander Liholiho, Kamehameha IV (March 16, 1856, Circular of the Kingdom of Hawai‘i). In April of 1857, Kamehameha IV traveled to Nihoa and instructed Captain John Paty on the Manuokawai to explore the rest of the northwest region to verify the existence of land. Kamehameha IV instructed him to annex any lands he discovered on his expedition. Captain Paty traveled to Nihoa, Mokumanamana, Gardner, Laysan, Lisianski, and Pearl and Hermes. Later that year, the Privy Council passed a resolution declaring the islands of Laysan and Lisianski as new lands to be included into the domain of the Kingdom (Kingdom of Hawai‘i 1857). By authority of Kamehameha IV, a notification of annexation ran for a period of three months announcing possession of the islands. In 1885, the most famous visit by any Hawaiian royalty was made by Lydia Lili‘uokalani (princess at the time) and her two-hundred-person party that visited Nihoa on the ship Iwalani. Finally in 1886, King David Kalākaua, through Special Commissioner Colonel James Harbottel, annexed Kure Atoll (Ocean Island) and announced formal possession of the island (Boyd 1886). While Nihoa and Mokumanamana are thought to have been frequented until about 700 years ago, voyages to these islands and others in the NWHI for gathering turtles, fish, bird feathers, and eggs continued into the 20<sup>th</sup> century, particularly from Kaua‘i and Ni‘ihau (Tava and Keale 1989; Maly 2003).

Today, Native Hawaiians maintain their strong cultural and spiritual ties to the NWHI. In recent years, Native Hawaiian cultural practitioners traveled there to honor their ancestors and to perpetuate traditional practices. In 1997, Hui Mālama I Nā Kūpuna O Hawai‘i Nei repatriated sets of human remains to Nihoa and Mokumanana that were collected by archaeologists in the 1924-1925 Bishop Museum Tanager Expeditions (Ayau and Tengan 2002). In 2003, a cultural protocol group, Nā Kupu‘eu Paemoku, traveled to Nihoa on the voyaging canoe *Hōkūle‘a* to conduct traditional ceremonies. In 2004, *Hōkūle‘a* sailed over 1,200 miles (1,043 nautical miles, 1,931 kilometers) to the most distant end of the island chain to visit Kure Atoll as part of a

statewide educational initiative called Navigating Change. In 2005, *Nā Kupu 'eu Paemoku* sailed to Mokumanamana to conduct protocol ceremonies on the longest day of the year, June 21, the summer solstice. Cultural practitioners from the Kamakakūokalani Center for Hawaiian Studies and the Edith Kanaka'ole Foundation continued this in 2006 and in 2007.

### **2.3.3.2 Recent History**

In more recent history, the NWHI were used for their natural resources, and commercial fishing began in the 1800s. Whaling ships and sampans had fishing ranges that included the NWHI. Westerners recorded their discovery of Midway Atoll in 1859 and claimed the atoll for the U.S. based on the Guano Act of 1856, which authorized Americans to temporarily occupy uninhabited islands to obtain guano. The U.S. took formal possession of the atoll in 1867. Transformation began almost immediately, with projects to blast the reef and create a port on Sand Island. Other islands and atolls were discovered and rediscovered by crews of various sailing ships.

Due to a lack of quality charts for the area, the NWHI and its low-lying reefs and atolls were a navigational hazard for ships and navigators, and shipwrecks were common. Maritime activities by the American, British, French, and Japanese during the nineteenth and twentieth centuries are marked by submerged historic resources and wreck sites found throughout the archipelago (VanTilburg 2002). There are 52 known shipwreck sites throughout the NWHI, the earliest dating back to 1822 (NOAA 2005).

In 1867 the U.S. took possession of Midway and in 1940 constructed a naval air facility there. From 1939 to 1943, Midway functioned as a naval air base, but by 1943 it had been converted to a major submarine base. During World War II, the NWHI played an important role as a strategic location. Following the Battle of Midway, the U.S. Navy established a Naval Air Facility at FFS and created a 3,300-foot landing strip at Tern Island. The facility operated until 1946. Between 1952 and 1979, the USCG operated a LORAN station on Tern Island, FFS.

The naval air facility at Midway was closed in 1992 under the Base Realignment and Closure Act of 1990. As part of the base closure process, the Navy was obligated to consider the effects of the closure on historic sites and structures. The Navy determined that 78 structures, buildings, or objects were eligible for inclusion on the NRHP, including the structures associated with the Battle of Midway NHL, which were designated in 1986 under the World War II in the Pacific theme (U.S. Fish and Wildlife Service 2005a). In 2000, the entire National Wildlife Refuge was designated as the Battle of Midway National Memorial.

### **2.3.3.3 Other Areas of Importance**

There are areas within the Monument that are of cultural importance to native, aboriginal, or local groups that might not otherwise be recognized as significant under the NHPA. These areas have been identified through initial research or are associated with other cultural or natural sites and features. These areas are not historic or cultural properties, which are defined as sites that have undergone formal analysis, evaluation, and consultation in accordance with Sections 106 and 110 of the NHPA, but may be of cultural significance and they may or may not qualify as historic or cultural properties once they undergo formal evaluation and consultation.

Other areas of importance in the Monument may include the following:

- Cultural landscapes (defined below);
- Areas of traditional religious, spiritual, or ceremonial importance to a Native Hawaiian group that are used for maintaining connections to ancestors, nature, cosmology, and creation;
- Areas meant to be kapu (prohibited), which are often wild areas that are meant to be off limits through consecration and are valued for their restrictions;
- Areas of cultural importance for the perpetuation of traditional practices and use or for reviving old practices that are used for subsistence, access for gathering resources, taking care of resources for arts, crafts, and ho‘okupu (offerings), ceremonies, inspiration, meditation, and ‘ike (insight and traditional knowledge); and
- Areas of archaeological importance and prehistoric and historic sites, which may include dwellings and burials, that contribute to western knowledge about the indigenous peoples of the past.

Some natural features and resources may have cultural significance, although they can be difficult to specify and to describe in terms of location and physical place; thus, they may be specific landforms and places that cannot be physically identified, yet clearly have significance in oral traditions. Some areas can derive traditional importance from oral histories that describe ancestral or mythical events, many of which explain how places or landscapes were named or created. These affiliations also illustrate how Native Hawaiian spirituality and worldview intertwines Hawaiian ancestry with life history of islands, landforms, plants, waters, oceans, skies, mountains, and all things natural and supernatural. Many of these intangible elements or connections may not be readily apparent by people unfamiliar with the native worldview or traditional cultural practices.

These areas also may be associated with flora and fauna. For example, Native Hawaiians recognize a spiritual and even genealogical connection to natural resources, specifically kalo (*Colocasia esculata*), or taro, because it plays a large role in some of their creation stories (concerning the sky and earth). One version of this story describes how Wākea, the sky father, coupled with his daughter, resulting in a stillborn and misshapen male fetus named Hāloanakalaukapalili (the quivering leaf of Hāloa) that was buried in the earth on the east side of their house (Enos 1998). From out of the ground where the baby was buried the kalo grew, nourished by the tears of his mother. When Wākea’s daughter became pregnant again, she bore another child that was human and was named Hāloa in honor of his older brother. All future Hawaiians descended from Hāloa, highlighting Native Hawaiians’ familial relationship with the kalo as their older brother, and also teaching the responsibility of mālama ‘āina (Enos 1998; Kameeleihiwa 1992).

More appropriately, in regard to the NWHI, the Kumulipō also highlights man’s relationship and responsibility to nature (Beckwith 1951). This creation chant begins in a time of darkness, and born first is the coral polyp, which became the eldest sibling in a long line of evolution of biological species. While the Kumulipō chant has largely been interpreted as a lineal account for the evolution of biological species through time, this chant also highlights biogeographically the

migration and distribution of these species spatially throughout the Hawaiian archipelago, moving eastward. The western half of the archipelago holds a position of prominence in Hawaiian traditions because it represents the ancestral beginnings of Native Hawaiians and the source of origin for all life (Kikiloi 2006).

Native Hawaiian oral traditions often refer to the islands beyond the main Hawaiian Islands and recall the travels of seafaring ancestors on their way to and from the Hawaiian archipelago. In one significant journey, Pele, the Hawaiian goddess of fire and volcanoes, migrates with her family from their distant homeland to Ni‘ihau in the main Hawaiian Islands. They travel by way of Mokumanamana (Emerson 1915). Other oral traditions recall migrations of Native Hawaiians passing through the Northwestern shoals. Therefore, these areas may include more than specific areas where identifiable activities occurred. Because of the interconnected nature of Native Hawaiian beliefs, they may represent links in a chain of places, such as the entire NWHI.

#### **2.3.3.4 Native Hawaiian Cultural Landscapes**

Federal guidelines recognize four cultural landscape categories; the following three are most relevant to this discussion (Stoffle et al. 1997):

- Historic vernacular landscapes that illustrate peoples’ values and attitudes toward the land and that reflect patterns of settlement, use, and development over time;
- Historic sites that are significant for their association with important events; and
- Ethnographic landscapes associated with contemporary groups that are typically used or valued in traditional ways.

National Park Service (NPS) Cultural Resource Management Guidelines describe cultural landscapes as complex resources that range from rural tracts to formal gardens, further defined by the way the land is organized and divided, settled, and used, including the types of structures that are built on it (Stoffle et al. 1997). Natural features, such as landforms, soils, and vegetation, provide the framework within which the cultural landscape evolves. In its broadest sense, a cultural landscape is a reflection of human adaptation to and use of natural resources (Stoffle et al. 1997).

In Western cultures, it is difficult to define what cultural landscapes mean to Native Hawaiians; labeling and evaluating geographic units that are usually loosely defined and based on interdependent and intermingled cultural traditions present only a part of the overall picture. Although a number of different terms may be used to describe these cultural areas, the term cultural landscape is used here because it is widely understood and has official standing in federal cultural resources law and regulation.

Applying federal guidelines to Native Hawaiian cultural landscapes, a culturally specific set of components reflecting Native Hawaiian spiritual, religious, and cultural values has been identified. In *Kalo Kanu o Ka ‘Āina*, a report on the cultural landscape for Ke‘anae and Wailua Nui, five somewhat overlapping types of sites were identified (McGregor 1998). These categories necessarily reflect the importance of culturally significant natural resources, in addition to human-made archaeological sites (McGregor 1998), and include the following:

- Areas of naturally occurring or cultivated resources used for food, shelter, or medicine;
- Areas that contain resources used for expression and perpetuation of Hawaiian culture, religion, and language;
- Places where known historical and contemporary religious beliefs or customs are practiced;
- Areas where natural or cultivated endangered terrestrial or marine flora and fauna used in Native Hawaiian ceremonies are located or where materials for ceremonial art and crafts are found; and
- Areas that provide natural and cultural community resources for the perpetuation of language and culture, including place names and natural, cultural, and community resources for art, crafts, music, and dance.

Before Western contact, Native Hawaiians developed a complex system of resource management and a specialized set of skills to survive on remote islands. Resource management revolved around a native worldview that guided the actions and practices of the people. Lands were divided vertically from mountain to ocean into resource management parcels known as ahupua‘a, primarily on the main Hawaiian Islands. These divisions typically included the ridges on both sides of a valley and the offshore area to hundreds of miles from shore. The inclusion of both mountain and ocean lands in a typical ahupua‘a ensured residents access to resources from the mountains and the sea and provided a balance between the two regimes (Abbott 1992). Certain areas were designated to be left alone and wild in their naturally occurring state and were called wao akua (realm of the gods), a pristine region of the mountains, which contained a greater variety of trees and biodiversity. The wao akua regions were seldom accessed by people because of the priority of promoting new growth by not disturbing seed-producing forest areas (Kanahele 2003). On a larger scale of resource management, the NWHI may have functioned in much the same way traditionally, because it too was designated as wao akua, or divine islands (or realm of gods). In essence, this remote region was left wild and pristine because it was viewed as having an important role in the continual cycle of life (creation) and death (afterlife) (Kikiloi 2006).

#### **2.3.3.5 Traditional Cultural Properties**

The NPS defines Traditional Cultural Properties (TCPs) as those of traditional religious and cultural significance that, at a minimum, are “eligible for their inclusion in the [NRHP] because of [their] association with cultural practices or beliefs of a living community that (a) are rooted in the community’s history and (b) are important in maintaining the continuing cultural identity of the community” (Parker and King 1990).

Remnants of human presence can be found on the islands of Nihoa and Mokumanamana, all of which are listed on the NRHP. Nihoa has at least 88 archaeological sites and Mokumanamana has at least 52, which include residential features, ceremonial sites, shelters, agricultural terraces, and cairns.

Cultural research involving archival searches, ethnographic interviews, cultural practices, and archaeological studies are ongoing and have identified a number of areas of importance, as discussed above, that may be eligible as TCPs. The process for determining this includes

consultation among FWS, NOAA, the Hawai‘i State Historic Preservation Officer (SHPO), and other interested groups. Special consideration is given to those properties designated as having national significance.

### 2.3.3.6 Archaeological Sites

The Monument contains a significant number of archaeological sites. Nihoa and Mokumanamana are recognized as culturally and historically significant and are listed on the National Register of Historic Places and are protected by the U.S. Fish and Wildlife Service in accordance with the NWRSA of 1966, as amended. Archaeological surveys on Nihoa and Mokumanamana have documented numerous archaeological sites and cultural material (Emory 1928; Cleghorn 1988; Ziegler 1990; Graves and Kikiloi, in prep.).

Nihoa, the closest of the islands from the main Hawaiian chain, contains over 88 archaeological sites (including residential features, shelters, ceremonial features, agricultural terraces, and cairns) (Emory 1928; Cleghorn 1988; Kawaharada 2001; Kikiloi and Graves 2005). The island has significant soil development, and the number of constructed terraces suggests some expenditure for agricultural production. The diversity in site types has led archaeologists to conclude that a wide range of cultural activities took place on Nihoa. Previous surveys also uncovered two burials containing the remains of adults and children (Emory 1928). This has led to the conclusion that Nihoa once had a resident population that was either permanent or semipermanent, spanning a period from AD 1000 to 1700 (Emory 1928; Cleghorn 1988).

Mokumanamana (Necker Island), the second closest island to the main Hawaiian chain, has very limited soil development. There are 52 archaeological sites (33 of which are ceremonial structures) that have been recorded; there are no substantial habitation sites or agricultural sites on the island. Mokumanamana has the highest concentration of ceremonial sites anywhere in the Hawaiian archipelago. Researchers have hypothesized that this island plays a significant role in the Native Hawaiian tradition regarding the process of creation and afterlife, as it lies directly on the Tropic of Cancer and on an axis between two Hawaiian spiritual realms (Liller 2000; Kikiloi 2006).

A number of artifacts have been collected from both islands, including fishhooks, sinkers, cowry shell lures, hammerstones, grindstones, adzes, coral rubbing stone, and unique stone images (Emory 1928; Cleghorn 1988; Kikiloi and Graves 2005). These artifact collections are stored at the Bernice Pauahi Bishop Museum and at the University of Hawai‘i Archaeology Laboratory. More recent paleo-botanical research by Athens (2007) on Laysan Island has revealed the possibility that coconuts (*Cocos nucifera*) may have been brought to the island by Native Hawaiians who ventured up the archipelago. The presence of coconut pollen from deep within a salt lake in the middle of the island has led to two possible alternatives: This plant was brought purposefully by humans or it arrived on Laysan by itself accidentally. This would be the first and earliest documented case of either accidental or purposeful introduction of the coconut in the Hawaiian Islands (TenBruggencate 2005b).

At present, evaluations are continuing for archaeological sites throughout the Monument. According to NPS regulations (36 CFR § 60.4), a property could be eligible for listing on the NRHP if it meets the following criteria:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and:

- A. that are associated with events that have made a significant contribution to the broad patterns of our history;
- B. that are associated with the lives of persons significant in our past;
- C. that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- D. that have yielded, or may be likely to yield, information important in prehistory or history.

Identified archaeological sites can have additional cultural importance as locations where Hawaiian ancestors lived, worked, worshipped, or engaged in other activities. It has been clearly documented through archival research and ethnographic studies that Native Hawaiians were consistently going to the Northwestern Hawaiian Islands in pre-contact times and into the post-contact historic period (NOAA 2004b; Tava and Keale 1989; Maly 2003; Kikiloi 2006). Archaeological features on the landscape, as well as the numerous artifacts collected, are also indications of maritime seafaring and resource gathering throughout the region. Furthermore, historic western-made anchors and fishing implements can be found throughout the ROI (Van Tilburg 2002). Lisianski, Nihoa, and Mokumanamana have been formally surveyed for pre-contact Hawaiian archaeological sites (Emory 1928; Cleghorn 1988; Zeigler 1990; Graves and Kikiloi, in prep.), and paleo-botanical studies were conducted on Laysan Island (Athens 2007).

Cultural resources in the Monument are being studied through a historical landscape study, in contrast to site-specific individual and unrelated projects, in which a high priority is placed on the interaction between these resources and the immediate environment. Wrecks can provide artificial reef environments but can also leach metals, cargo, and fuel into the ecosystem. A broader historical approach is more compatible with an ecosystem approach to management that examines human impacts on the ecosystem rather than just the individual events. Ongoing work emphasizes a low-impact approach.

### **2.3.3.7 Paleontological Resources**

Paleontological resources in the form of flora remnants can be expected to be present in the Monument. In paleo-botanical studies conducted at Laysan Lake, coconut pollen was found in sediment cores. Evidence of pollen could be interpreted as proof that early Hawaiians extended their explorations of the Hawaiian chain beyond Nihoa and Mokumanamana.

### 2.3.3.8 Submerged Cultural and Historic Resources

Hawai‘i has approximately 1,500 years of continuous and intensive maritime activities, and hundreds of wreck sites from the nineteenth and twentieth century are scattered throughout the whole Hawaiian archipelago (NOAA 2004b).

For the purposes of this document, submerged cultural resources is defined as submerged archaeological or culturally significant sites over fifty years old. These sites may include shipwrecks, downed airplanes, or submerged structures within the more recent historic period, or may include harder to identify prehistoric sites, consisting of campsites with stone tools or stones used for grinding. Because of their low and uncharted nature, the NWHI have numerous historic shipwrecks (Van Tilburg 2002). Field surveys and management for historic shipwreck and aircraft sites are ongoing. Because of the vast expanse of the NWHI, plans for the maritime heritage survey and management are projected to five and ten years. Shipwrecks are treated as potentially eligible for the NRHP (Van Tilburg 2002).

### 2.3.3.9 Buildings and Historic Sites

Midway Atoll NWR’s lands and water were designated as a National Memorial in 2000 because of their significance in American history. The NPS began studying Midway’s heritage resources in 1986 when it conducted a survey of World War II-era properties eligible for designation as a NHL. Nine structures, all defensive positions, were identified on Midway that convey a close association with the pivotal Battle of Midway (June 4-6, 1942), including ammunition magazines (ARMCO huts), a pillbox, and gun emplacements (Thompson 1986). All of the resources are on the west side of Sand Island, on relatively undisturbed terrain. A buffer zone around the individual structures was included in the NHL. No resources were identified on Eastern Island for inclusion in the NHL.

Between 1992 and 1994, the U.S. Navy sponsored studies of the Naval Air Facility on Midway carried out in conjunction with the Department of Defense Legacy Resources Management Program. These investigations, which consisted of archival research, interviews, and field surveys, are presented in several documents, including *Cultural Resources Overview Survey at Naval Air Facility, Midway Island* (Yoklavich 1993), a *Supplemental Cultural Resources Overview Survey* (Yoklavich et al. 1994), and the *Cultural Resources Management Plan* (Helber, Hastert, & Fee 1995). The following is a synopsis of the results as reported in these documents.

#### Architectural Studies

The initial field effort consisted of an architectural history survey of the structures, buildings, and objects located on Sand and Eastern Islands. A military historian specializing in Cold War history performed archival research and surveyed resources on Eastern and Sand Islands that were constructed after 1945. The historian concluded that none of the Cold War facilities at Midway were eligible for the NRHP because they lacked the exceptional importance necessary for resources less than 50 years old (Yoklavich et al. 1994). Severe weather conditions prohibited the study of Eastern Island during the fieldwork phase in 1992. Therefore, a supplemental survey was conducted in 1994 to complete work on Eastern Island. The 1994 fieldwork included large-format photography of historic properties following standards of the

Historic American Buildings Survey (HABS). In addition to the nine NHL structures, the NRHP determined as eligible under its criteria 69 buildings, structures, and objects from the 1903-1945 period on Sand and Eastern Islands. The properties evaluated as significant are associated with three major themes—colonization, initial years of base construction and the Battle of Midway, and 1942-1945 base construction.

*Colonization:* The first evidence of habitation on Midway is the buildings associated with the Commercial Pacific Cable Company, constructed in 1903-1904. San Francisco-based architect Henry H. Meyers designed these unique two-story buildings. The innovative design advanced the use of concrete with an embedded steel frame and steel posts. The main four buildings are arranged around a courtyard and are reminders of technological innovations in communication, colonial expansion, and early steel and concrete architecture.

*Initial Years of Base Construction and Battle of Midway:* Defensive construction before World War II includes more than just the NHL structures. An example is the Power Station building that was hit during the December 7, 1941, attack, which stands as a reminder of that pivotal moment when the United States entered World War II. Approximately half of the historic properties inventoried on Midway are related to this period between 1940 and 1942. Eastern Island sustained heavy damage during the Battle of Midway; historic resources from this period are limited to the runways, a couple of defensive positions, and revetments. Construction of Midway Naval Air Base began in earnest in 1940, with construction battalions and civilian contract workers. Detroit architect Albert Kahn developed plans for many of the buildings, including barracks, Senior Officers Quarters, shops, the motor pool, the seaplane hangar, and the theater. Kahn was well known for his steel and concrete factories. His use of natural light to create buildings with comfortable interior spaces is reflected in the shop buildings on Midway. The Officers Quarters reflects Kahn's design versatility; the houses are functional and stylish, with covered patios, fireplaces, large sliding doors and windows, servant's quarters, and portal window porch details. Most of the buildings designed by Kahn are still in use.

*1942-1945 Base Construction:* Between 1942 and 1945, after the Battle of Midway, emphasis shifted to creating a Naval Air Station on Sand Island. Eastern Island was heavily damaged during the battle and was left in rather rough condition, although it continued to be the base of operation for marine air squadrons. Only a few buildings remain on Sand Island that were constructed during this period; these include an electric switch station, public works storehouse, radar buildings and radar tower base, diesel power plant, brackish water reservoirs, and command post. Properties that transcend a particular theme or period include the three Japanese grave markers, the cemetery, and the Midway Mall Memorial. The Japanese markers date from about 1911 to 1916. Translations of the markers indicate that they are memorials to fishermen who died and were buried at sea. The location of the markers is not original; they were moved in the early 1970s. The small cemetery is an anomaly because all U.S. military personnel killed in battle or during duty were either buried at sea or transported back to Pearl Harbor. The dates on the gravestones range from 1906 to 1950. Four of the five individuals buried there were medical doctors. The Midway Memorial Mall encompasses several plaques, a large gooney bird statue, and two five-inch guns. One of the plaques was erected in 1941, just a few months after the battle. The guns were probably used during the battle and later were moved to this location.

## Archaeological Studies

Dr. Fred Reinman conducted an archaeological survey of Sand Island in 1992 as part of the *Cultural Resources Overview Survey* (Yoklavich 1993). The field investigations consisted of a pedestrian survey of Sand Island, augmented by 20 subsurface core samples. The surface inspections and core samples produced no indication of prehistoric settlement on Sand Island. A literature review of Hawaiian legends was conducted to determine if Midway was included in any travel accounts. While references to distant low-lying islands with abundant birds and turtles were found, no clear tie to Midway was detected (Maly 1994, in Yoklavich et al. 1994:A-1 to A-4). The poor field conditions that hindered study of Eastern Island in 1992 prompted an additional study in 1994 by Paul H. Rosendahl, PhD, Inc., on both Sand and Eastern Islands for the *Supplemental Cultural Resources Overview Survey* (Yoklavich et al. 1994). The intent of this supplemental survey was to achieve uniform coverage of Eastern Island. The sample included 45 auger cores and two contiguous 1.0-meter by 1.0-meter shovel-test units excavated on Eastern Island and three auger cores and three 1.0-meter by 2.0-meter shovel-test units excavated on Sand Island (Yoklavich et al. 1994:7). No evidence of Polynesian/Hawaiian or pre-AD 1900 historic period cultural remains was found.

The conclusion of the studies was that there is no evidence of prehistoric Polynesian/Hawaiian occupations or historic period occupations on either island. The subsurface archaeological investigations observed very disturbed deposits, with as much as two meters of fill or redeposited sediment over a thin layer of undisturbed sand.

Polynesians/Hawaiians may have used Midway in their extended travels, but the atoll has experienced such pervasive ground-disturbing activities that finding evidence of prehistoric use is problematic. Even before the mid-twentieth century construction, the low-profile islands were periodically scoured by storms and high winds that may have removed or buried evidence of use.

Tern Island of the FFS was developed as a naval air facility, and the USCG operated LORAN stations there between 1949 and 1970. Many of these structures remain in use for refuge and partner operations.

Past activities at many sites in the Monument, combined with known shipwrecks and sunken naval aircraft, can be defined by state and federal preservation law as historically and nationally significant (NOAA 2004b).

## **2.4 SOCIOECONOMICS**

### **2.4.1 Human Uses**

#### **2.4.1.1 Introduction/Region of Influence**

This section describes human uses and activities in the Monument. The ROI for human uses and activities includes all lands and waters within and adjacent to the Monument. This section of the DEA also fulfills the resource assessment requirements of 16 USC 1434 (a)(2)(B) by documenting present and potential uses of the area.

The waters of the NWHI are used for a variety of activities, such as research and management, Navy and DoD training and testing activities, cultural practices, fishing, recreation, ecotourism, and education.

#### **2.4.1.2 Regulatory Environment**

While the following description of the regulatory environment describes the separate and often overlapping responsibilities of the Co-Trustees, the No Action alternative includes the December 2006 MOA, which has a primary purpose of facilitating coordinated management. This coordination includes developing a single overarching set of regulations for the Monument, a single permitting system for Monument users, and sharing resources to enforce regulations and carry out management activities. The Co-Trustees are currently addressing these issues. This coordinated management is considered part of the No Action alternative.

### **Federal Regulations**

Monument regulations promulgated in 50 CFR Part 404 primarily relate to prohibiting or regulating human uses within the Monument to ensure the protection of Monument resources. Section 404.4 addresses how access will be granted into the Monument and requires notification prior to entering and after departing. All U.S. vessels passing through the Monument without interruption will be required to provide notification at least 72 hours before entering and within 12 hours of leaving the Monument and must include intended and actual route through the Monument and general categories of any hazardous cargo on board. Section 404.5 describes the VMS requirements for all vessels operating in or transiting through the Monument. Section 404.6 lists all prohibited activities within the Monument. Prohibited activities include exploring for oil, gas, or minerals or using poison or explosives. Section 404.7 describes all regulated activities that are prohibited unless specifically allowed by one of the Monument-issued permits. Sections 404.8 and 404.9 provide exemptions from prohibited activities for emergency response and law enforcement activities (404.8) and armed forces actions (404.9). Section 404.10 describes Monument-specific regulations for commercial fishing activities, essentially prohibiting all commercial fishing immediately, except for bottomfishing, which will be prohibited as of June 15, 2011. Section 404.11 describes the six permit types issued to access and conduct activities otherwise prohibited by Monument regulations. These permit types are 1) research, 2) education, 3) conservation, 4) Native Hawaiian practices, 5) special ocean uses, and 6) recreational activities. Specific requirements for issuance of Native Hawaiian practices,

special ocean uses, and recreational activities are included in the regulations. Section 404.12 ensures that these regulations will be carried out in accordance with international law.

In addition to Monument-specific regulations, FWS has regulations specific to Midway Atoll NWR (50 CFR Part 38), special conditions for cruise ship visits to Midway, and permitting requirements for both Midway Atoll and Hawaiian Islands NWRs under 50 CFR Parts 13, 18, and 25 (general permitting procedures, marine mammal permitting, and administrative provisions, respectively).

NOAA, in association with the Western Pacific Fisheries Management Council, has jurisdiction over the ongoing bottomfish fishery through 50 CFR Part 665. As this permitted activity will be prohibited as of June 15, 2011, as discussed above, prohibition of bottomfishing is considered part of the No Action alternative and effects from fishing will not be analyzed.

On April 3, 2008, the IMO designated the Monument as a PSSA. The PSSA and associated protective measures were adopted to provide additional protection to the exceptional natural, cultural and historic resources in the Monument. Requiring vessels to notify NOAA upon entering the reporting area will help make the operators of these vessels aware that they are traveling through a fragile area with potential navigational hazards such as the extensive coral reefs found in many shallow areas of the Monument. Sovereign immune vessels are not subject to the reporting requirements but all vessels are encouraged to participate.

### **State Regulations, Policies, and Programs**

The DLNR has stewardship responsibility for managing, administering, and exercising control over the coastal and submerged lands, ocean waters, and marine resources under state jurisdiction around each of the NWHI, except Midway Atoll, under Title 12, Chapter 171 Hawaii Revised Statutes. The State is the lead agency for management of the emergent lands at Kure Atoll, a State Wildlife Sanctuary. DLNR's Division of Conservation and Resources Enforcement (DOCARE) maintains full police powers, including the power of arrest, within all lands and waters within the state's jurisdiction. In 2005, the DLNR's Division of Aquatic Resources established the Northwestern Hawaiian Islands Marine Refuge (0-3 nm [3.5 mi, 5.5 km] around all emergent lands, except Midway Atoll) through Hawaii Administrative Rules, Chapter 13-60.5. Unless otherwise authorized by law, it is unlawful for any person to enter the refuge without a permit except for freedom of navigation, passage without interruption, interstate commerce, and activities related to national defense, enforcement, or foreign affairs and in response to emergencies.

The state currently holds the submerged and ceded lands of the NWHI in trust. Established by a 1978 amendment of the Constitution of the State of Hawai'i, OHA serves as the principal agency working for Native Hawaiians. OHA was created for various purposes including bettering the conditions of Native Hawaiians. OHA manages a property and monetary trust, creating its fiduciary duty to Native Hawaiians. The OHA trust is funded in part by a pro rata share of income derived from the ceded lands portion of the public land trust.

### 2.4.1.3 Resources Overview

The area the Monument encompasses has a long history of use. Native Hawaiians explored these waters, established settlements, and conducted religious ceremonies for hundreds of years prior to the arrival of the first Europeans. Most extractive uses, including guano mining, egg and feather collection, rabbit farming, whaling, and a variety of fishing ventures, ended by the early 1900s. The U.S. military used FFS and Midway Atoll, which are equipped with runways, as permanent bases during and after World War II. The USCG built a LORAN station with a 4,000-foot runway at Kure Atoll in 1960. The Navy conducts training and testing within the Hawai‘i Operating Area, which includes a portion of the Monument. In addition, the DoD conducts missile defense testing, including missile intercepts, in and around the Monument. The earliest intensive scientific expedition in the Northwestern Hawaiian Islands was the Rothschild Expedition in 1891 (Ely and Clapp 1973). Research continues to be one of the primary activities occurring within the Monument. Management activities conducted by the State of Hawai‘i, FWS, and NOAA have been ongoing for decades. Human activities and use of the Monument resources are carefully managed, considering historical uses and new threats through permitting, enforcement, and managing specific human uses, including Native Hawaiian cultural practices and visitors at Midway Atoll.

#### Historical Uses

The waters and islands of the Monument have been visited and inhabited by Native Hawaiians since at least 1000 AD. Other documented accounts tell of how fishermen in the late 1800s from the main Hawaiian Islands would make special trips to the NWHI for four months at a time – from May to August, which was the special sailing season. These accounts highlight the importance that the waters of the NWHI played in the lives of pre-contact Native Hawaiians who regularly sailed to, through and from this region. Further details on Native Hawaiian uses of the Monument are available in section 2.3, Cultural and Historic Resources.

The impacts of guano mining, egg and feather collection, rabbit farming, dredge and fill, importation of soil to Midway, and invasive species that occurred in a few of the islands in the late 1800s and 1900s caused serious environmental damage to these fragile places (NOAA 2005). In the 1800s and 1900s, western sailing ships exploited the area for seals, whales, reef fish, turtles, sharks, birds, pearl oysters, and sea cucumbers (WPFMC undated). The pearl oyster population (*Pinctada margaritifera*) on Pearl and Hermes Atoll was nearly extirpated in a few short years and has yet to recover to pre-exploitation levels (Keenan et al. 2006). Japanese vessels harvested bird skins, eggs, and feathers until 1909, when the area was designated the Hawaiian Island Reservation by President Theodore Roosevelt. Fishing continued largely unregulated until the late 1970s, when the Magnuson-Stevens Act established U.S. sovereignty over fishery resources in the Exclusive Economic Zone, out to 200 nm, leading to the development of four federally administered fishery management plans for precious corals, crustaceans, pelagic species, and bottomfish. Today, only eight bottomfish vessels are grandfathered in and allowed to continue fishing until June 15, 2011, after which all commercial extraction of Monument resources will be prohibited. Additional regulations limiting the total allowable catch, areas open to the fishery, and general vessel conditions are aspects of the baseline conditions.

The first military presence occurred at Midway Atoll, which President Theodore Roosevelt put under the control of the U.S. Navy in 1903. Midway was subsequently managed by the Commercial Pacific Cable Company, which laid the first trans-Pacific communications cable. Prior to World War II, Pan American World Airways flew weekly Clipper plane flights to Midway. On August 1, 1941, U.S. Naval Air Station Midway was commissioned. Midway was the site of two major battles, the attack on December 7, 1941, and the Battle of Midway on June 4 to 7, 1942. On July 15, 1942, the submarine base at Midway was commissioned, providing a strategic outpost in the Pacific during World War II and the Cold War. After World War II, Midway was an active navy base supporting a population of up to 4,000 people. The naval air facility was closed in 1992, and in 1997 the last U.S. Navy personnel departed, following the completion of environmental cleanup and mitigation measures (NOAA 2003a).

In 1942, the Navy transformed the 11-acre (4.5-hectare) Tern Island in FFS into a 42-acre (17-hectare) airstrip and fuel depot, housing 118 servicemen. It served as an emergency landing strip and refueling stop and provided surveillance of the surrounding area. The atoll was swept clean by a tidal wave in 1946, after which the Navy closed its base there. In 1952, the USCG built a LORAN beacon tower on Tern, along with a 20-person support facility. Several cold war operations were conducted at FFS such as the recently declassified ‘Corona Project,’ the first operational space photo reconnaissance satellite system. FFS served as a tracking and recovery station for this project in the early 1960s. An additional 100 people were stationed at FFS to monitor the aboveground nuclear testing at Johnston Atoll. During the Cold War, FFS housed up to 300 personnel at a time in support of the different classified and unclassified missions (Wood 2001). The USCG continued to operate the installation until 1979, when it was turned over to FWS (Amerson 1971). In 1960, the USCG built a LORAN C station with a single 625-foot-high (190.5-meter-high) transmitter tower. In addition to the transmitter tower, the USCG built a 4,000-foot runway, a pump house, a pier, seven aboveground storage tanks, and living and working quarters for 24 personnel. The station was decommissioned in 1992 and was abandoned in 1993. Today, all but two buildings and a cistern have been demolished and buried on the island.

### **Current Human Uses and Activities**

Compared to the past, there is little human activity in the Monument today. With the departure of the military and the phasing out of all commercial fishing by 2011, the main marine-related activities are research, wildlife management, and transiting ships (for a discussion of transiting ships please refer to section 2.8). Regulations in 50 CFR Part 404 provide access to the Monument under six types of permitted activities: 1) research, 2) education, 3) conservation, 4) Native Hawaiian practices, 5) special ocean uses, and 6) recreational activities. In addition, access by the armed forces for emergency response, enforcement, and passage without interruption are allowed without permit by regulation. Commercial bottomfishing by eight federally permitted vessels will be allowed to continue through June 15, 2011, after which it will be prohibited.

### ***Understanding and Interpreting the Northwestern Hawaiian Islands***

In order to best protect the NWHI, the need for understanding and documenting the historical significance of the area has been growing. Research efforts in ethnographic studies, archaeology,

and archived information have provided a wealth of cultural information pertaining to the practices and traditions of Native Hawaiians in the NWHI. In order to allow access to this historical information, steps have been taken by NOAA, FWS, the State of Hawai‘i, and other partnerships through the program “Navigating Change” to provide students with engaging materials that convey the importance of these traditions and cultural values. In addition to the cultural research conducted on the NWHI, research has been done on historic resources (nonmarine sites, structures, artifacts, culture, and places) within the Monument associated with the period after 1778 when Western contact was made with Native Hawaiians. The Midway Atoll Historic Preservation Plan, implemented in 1999, focuses on long-term management and treatment of historic sites and identifies procedures for new historic finds. This plan also offers ways of interpreting historic data and releasing it through public outreach. With the exception of Midway Atoll, the current historical record of the NWHI is minimal because limited historical research has been conducted in this area.

### ***Reducing Threats to Monument Resources***

A variety of management practices to reduce threats to Monument resources have been implemented. This includes alien species control conducted by FWS and a multi-agency effort to remove marine debris led by NOAA. Between 1996 and 2006, 563 tons of marine debris was removed from the NWHI. Areas considered “High Entanglement Risk Zones” for Hawaiian monk seals are cleaned and have been designated accumulation rate zones. The Marine Debris Program, established in 2005 under NOAA’s Office of Response and Restoration, was made permanent in 2006 by the Marine Debris Research, Prevention, and Reduction Act. NOAA is to work in conjunction with other agencies such as the EPA and the USCG to find sources of marine debris pollution and act in removing this debris. Awareness of this threat to the NWHI, in particular to the coral reef ecosystem, is fostered through publications and public outreach displays in NOAA’s Mokuapāpapa Discovery Center, as well as in the “Navigating Change” program Teacher’s Guide.

FWS has an ongoing program to eradicate invasive terrestrial species and restore native ecosystems. This effort focuses on the most invasive and harmful pest species of plants such as sandbur, golden crownbeard, and ironwood; insects such as various ant species and the gray bird locust; and introduced mammals such as black rats.

Research and monitoring conducted by federal and state agencies, academic institutions, and other organizations over the last 30 years have increased our understanding of the structure and function of ecosystems of the NWHI and the interconnectedness between the NWHI and the main Hawaiian Islands. Early research efforts include the Tanager expedition in 1923, the Smithsonian’s Atoll Research Bulletin publications of the mid 1960s, and the Tripartite expeditions of the late 1970s and early 1980s. The integrated research by the Tripartite Cooperative Program, led by NMFS, FWS, Hawai‘i Division of Fish and Game (now Division of Aquatic Resources), and the University of Hawai‘i Sea Grant College Program, encompassed all resources on land, in the air, and in the sea. The research that resulted from this multi-agency effort provided a seminal understanding of the NWHI ecosystem and continues to inform research efforts.

Monitoring select stocks of commercially fished species, such as bottomfish and lobsters, and of protected species, such as Hawaiian monk seals and the Hawaiian population of green sea turtles, has been conducted by NMFS Pacific Islands Fishery Science Center for several decades. Ecosystem-level characterization and monitoring has been a more recent endeavor. The Northwestern Hawaiian Islands Reef Assessment and Monitoring Program (NOWRAMP, now known as NWHIRAMP) was a multi-agency program initiated in 2000 to characterize and monitor the coral reefs of the NWHI using a consistent set of sampling protocols and to establish a baseline for future data gathering and for monitoring change over time. Similar annual multi-agency efforts have been supported by a variety of agencies and institutions in the ensuing years. Mapping efforts, led by NOAA, have provided detailed maps of the NWHI seafloor and are consolidated into two documents, *The Draft Atlas of the Shallow-Water Benthic Habitats of the NWHI* and *The Bathymetric Atlas of the NWHI*. These documents begin to describe the marine habitats and bathymetry of the NWHI and establish important baseline information for resource managers. This high interest in research and mapping activities in the NWHI, concurrent with the availability of more funds for coral reef ecosystem research, has increased the activity level in the Monument.

In May 2003, a multi-agency partnership workshop was convened to identify information and science needs and resources for effective conservation and management of the NWHI. The results were analyzed and summarized in the report *Information Needs for Conservation Science and Management of the Northwestern Hawaiian Islands* (Gittings et al. 2004). In November 2004, the *Third Scientific Symposium on Resource Investigations in the NWHI* was convened to provide a forum for the review and synthesis of recent research and to identify knowledge gaps and delineate future research needs. This symposium highlighted the need for agencies to develop more cooperative research programs. Most participants recognized the need to develop a more coordinated research plan in the NWHI that will address the management needs of the Monument Co-Trustees. These efforts have provided a foundation for the development of a coordinated Monument Natural Resources Science Plan, which is being drafted.

### ***Managing Human Uses***

NOAA, FWS, and the State of Hawai‘i have played a major role in organizing research expeditions that serve dual purposes of collecting necessary baseline data and information for management combined with media coverage to introduce the region’s resources to the general public. Multi-agency educational programs include outreach for the 2002 and 2004 NOWRAMPs, the “Navigating Change” program, and “Hawai‘i’s Living Reef” program. A five-part video, educational curriculum, and teleconferences with the traditional Polynesian voyaging canoe Hōkūle‘a during its 2004 expedition to the NWHI were completed in partnership with several agencies and organizations. Teacher workshops on the “Navigating Change” program have been held since 2003 across Hawai‘i, and an outreach coordinator has been hired to launch the curriculum in schools statewide. The Co-Trustees and other partners also created and facilitated a number of education-at-sea initiatives and developed new standard-based curriculum on the NWHI now being introduced to Hawai‘i’s fourth and fifth grade teachers. In addition to educational programs, the MMB currently develops informational materials such as fact sheets and brochures for educational purposes that are able to reach those that are not participating in these programs.

NOAA also built a visitor center collocated with its Hilo office to spur greater public awareness of the region and ocean conservation issues. Mokuāpāpapa: Discovery Center for Hawaii's Remote Coral Reefs was conceived and built in 2003 to interpret the natural science, culture, and history of the NWHI and surrounding marine environment. The 4,000-square-foot (372-square-meter) center brings the region to people by proxy, since most will never have the opportunity to visit it. The center has served as a physical hub of learning, regularly hosting well attended educational talks and activities, while drawing a constant stream of field trips co-organized by Monument staff and by school and community groups from around the state and beyond. To date, nearly 100,000 visitors have been exposed to the wonders of the NWHI and have developed an informed appreciation of the region's resources and the Monument's ongoing effort to restore and preserve them.

In conjunction with a private contractor, FWS operated Midway Atoll NWR as a combined refuge and ecotourism/historical destination between 1996 and 2002. The contractor provided the infrastructure and visitor services to operate ecological and historic preservation service projects, guided tours, diving and snorkeling trips, and sport fishing operations. In all, 12,262 people visited Midway between 1997 and 2001, with an average visitation of around 200 people per month. In 2002, FWS and the contractor ended their cooperative agreement. In May 2007, FWS approved an interim visitor services program to guide a small-scale visitor program. A regularly scheduled visitor program was established in January 2008 that allows limited visitor opportunities for people to experience the wildlife and history of Midway and the Monument. Recreational activities in this interim visitor service plan include wildlife observation, photography, environmental education, and interpretation.

Remote location and hazardous environmental conditions in the NWHI have discouraged recreational activities in the past. Since the departure of the USCG from FFS, ocean recreation has been limited to offshore snorkeling by resident staff and researchers. Anecdotal reports indicate that trans-Pacific yachts may occasionally traverse the NWHI, possibly lingering at various reefs and atolls along the way.

The size, remote location, and hazardous navigational conditions of the Monument present significant enforcement challenges. The USCG has long been the primary enforcement agency conducting surface and aerial patrols in the NWHI. However, with their broad mandates and large enforcement area, the USCG has few resources to allocate to NWHI patrols. In addition to frequent aerial patrols, each year the USCG sends a buoy tender to the NWHI (Havlik 2005). USCG operations in this region cover a broad range, including search and rescue, servicing aids to navigation, response to oil and hazardous chemical spills, inspecting commercial vessels for safety and environmental regulations compliance, interdiction of illegal narcotics and migrants, and enforcement of fisheries management laws (Mathers 2005). In addition to the USCG, NOAA, the State of Hawai'i, and FWS all have authority to enforce regulations within the Monument. These entities are expected to share resources to fulfill the common goals discussed in the December 2006 MOA.

## **2.4.2 Human Health, Safety and Hazardous Materials**

### **2.4.2.1 Introduction/Region of Influence**

This section addresses issues related to the Proposed Action alternative that are associated with human health and safety, hazardous material management, hazardous waste management, and environmental contamination. The ROI is the marine waters within the Monument, adjacent open-ocean areas outside of the Monument, and islands within the Monument as they may affect the marine environment.

### **2.4.2.2 Regulatory Environment**

Human safety in the work place and the management of hazardous materials and waste are already highly regulated under a number of federal and state laws. These laws are administered by various federal agencies, including the U.S. Department of Labor Occupational Health and Safety Administration (OSHA), the U.S. Department of Transportation (DOT), the U.S. Environmental Protection Agency (EPA), the State Department of Labor and Industrial Relations, and the State Department of Health.

Hazardous and toxic substances are defined as those workplace chemicals that are capable of causing harm. In this definition, the term “chemicals” includes dusts, mixtures, and common materials, such as paints, fuels, and solvents. A hazardous chemical, as defined by the Hazard Communication Standard, is any chemical that can cause a health hazard. This determination is made by the chemical manufacturer, as described in 29 CFR Section 1910.1200(d).

Hazardous material is defined by the DOT as a substance or material that is capable of posing an unreasonable risk to health and safety or property when transported in commerce and has been designated as hazardous under the federal Hazardous Materials Transportation Law (49 USC 5103). The term includes hazardous substances, hazardous wastes, marine pollutants, elevated temperature materials, materials designated as hazardous in the Hazardous Materials Table, 49 CFR, Section 172.101, and materials that meet the defining criteria for hazard classes and divisions in 49 CFR Part 173. The Resource Conservation and Recovery Act (RCRA) specifically defines a hazardous waste as a solid waste (or combination of wastes) that, due to its quantity, concentration, physical, chemical, or infectious characteristics, can cause or significantly contribute to an increase in mortality. RCRA further defines a hazardous waste as one that can increase serious, irreversible, or incapacitating reversible illness or pose a hazard to human health or the environment when improperly treated, stored, disposed of, or otherwise managed. A solid waste is a hazardous waste if it is listed in 40 CFR Part 261 as a hazardous waste or if it exhibits any ignitable, corrosive, reactive, or toxic characteristics, as defined in 40 CFR Part 261.

Congress enacted the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as Superfund, on December 11, 1980, and the Superfund Amendments and Reauthorization Act (SARA) amended CERCLA on October 17, 1986. Superfund is the federal government’s program to clean up the nation’s uncontrolled hazardous waste sites.

In addition, Monument regulations specifically prohibit some activities, such as exploration for oil, gas, or minerals and use of poisons or explosives to collect or harvest Monument resources, that could affect human safety or result in the release hazardous materials or wastes into the environment (50 CFR Section 404.6). Monument regulations require a permit for all access to and activities conducted in the Monument. All vessels operating in the Monument must possess VMS. VMS enables law enforcement to monitor and identify unauthorized entry of vessels to the Monument and to respond quickly to emergencies involving human safety or hazardous material release.

Emergency response in the NWHI is coordinated under a series of plans and systems, including the National Response Plan and the National Incident Management System. The National Response Plan establishes a comprehensive all-hazards approach to enhance the ability of the United States to manage domestic incidents, including oil and hazardous chemical spills. This plan incorporates the National Contingency Plan and its regulations governing how pollution response is conducted by the USCG, EPA, the affected state, and resource trustees, including NOAA and FWS. The NWHI are also covered by a more specific Area Contingency Plan for the Hawaiian Islands.

FWS and NOAA have designated representatives who are federal members of the Regional Response Team, which makes response recommendations to the Federal On-Scene Coordinator. DLNR and the Hawai'i Department of Health are the designated state representatives for all marine injury events. The Department of Health is the State On-Scene Coordinator. These representatives work closely with all parts of FWS, NOAA, the state, and the MMB in making recommendations on the use of alternative response technologies, such as dispersants. Unlike the state, NOAA and the Department of the Interior can only make consultative recommendations; they do not have a formal vote in that process.

While the Monument and state regulations regulate access, they also provide a general exemption for activities necessary to respond to emergencies. The general exemption for emergencies allows for individuals responding to emergencies threatening life, property, or the environment to conduct necessary activities without the need for a permit. The general exemption only applies to the emergency response activity itself and does not apply to ancillary activities such as training for emergency response, salvage operations, remediation, or restoration. These ancillary actions also require timely response and would be covered under the appropriate agency's conservation and management permit.

### **2.4.2.3 Resources Overview**

This section provides an overview of the human health and safety in marine and land areas within the region of influence.

#### **Activities within Marine Areas in and adjacent to the Monument**

##### ***Diving Safety***

Self-Contained Underwater Breathing Apparatus (SCUBA) diving for research and management activities is routinely conducted in the Monument. Co-Trustee agencies and other partner organizations have diving requirements specific to that agency; however, these requirements are

aligned through reciprocity agreements. The Monument supports coordinated dive operations through such agreements.

### ***Hazardous Material and Hazardous Waste Management***

All hazardous material and hazardous waste management activities within the marine areas of the Monument are on marine vessels. With the prohibition of commercial bottomfishing in the Monument, research vessels and vessels used in restoration activities, such as the removal of marine debris, make up the predominant vessel activity. In addition, no more than three cruise ships per year are permitted entry to the Midway Atoll Special Management Area. The controlled environment onboard these vessels allows for proper containment of chemical substances. In a shipboard environment there are numerous engineering and management controls that prevent hazardous chemicals or materials from contaminating crew, passengers, and the environment. Any hazardous waste generated aboard a marine vessel, such as mercury-containing light bulbs, waste paint, dry cleaning and photo-processing operations, batteries, or solvents, is required by RCRA to offload hazardous waste to land-based treatment or disposal facilities (NOAA 2004a). Monument regulations and permit conditions provide additional safeguards on hazardous material and waste management including requirement for VMS and reporting all incidents.

### ***Environmental Contamination***

Maritime accidents are the only known major source of environmental contamination within the waters of the Monument. The first known Western shipwrecks in the NWHI occurred in 1822. Since then, many more known and unidentified marine vessels have been lost in the NWHI. A maritime cultural survey conducted by NOAA in 2002 lists over 50 shipwreck sites (NOAA 2002). At least five of these ships were lost within the past 25 years.

The three most notable recent wrecks in the NWHI are the Swordman I, the Paradise Queen II, and the Casitas. The 85-foot-long (26-meter-long) line fishing vessel Swordman I, carrying more than 6,000 gallons (22,712 liters) of diesel fuel and hydraulic oil, ran aground at Pearl and Hermes Atoll in 2000. In October 1998, the Paradise Queen II ran aground off Kure Atoll after catching 3,000 pounds (1,360 kilograms) of lobster. The boat was carrying about 11,500 gallons (43,530 liters) of diesel fuel and oil, over a thousand plastic lobster traps with lead weights, 11 mi (9.5 nm; 18 km) of fishing line, and an assortment of boating equipment (Parks 2004). The 145-foot ship Casitas ran aground on the northern side of Pearl and Hermes Atoll on July 2, 2005 with more than 33,000 gallons (124,900 liters) of diesel fuel on board (TenBruggencate 2005a). Very little data are available on the extent or effects of contamination from shipwrecks in the NWHI. However, iron that erodes from ships acts as a nutrient in marine waters, causing localized growth of “blue-green algae” (cyanobacteria) and invasive soft corals that can smother reefs and surrounding wrecks.

### **Activities in Land Areas within the Monument**

#### ***Hazardous Material and Hazardous Waste Management***

Most of the hazardous materials and hazardous wastes in the Monument are at FWS facilities within the Midway Atoll Special Management Area. Facilities at Midway are maintained and operated by a FWS contractor, Chugach Industries. Facilities and infrastructure at Midway are similar to any small city or town. A variety of hazardous materials are used to maintain and

operate the facilities and infrastructure at Midway Atoll. Material safety data sheets and a hazardous material inventory are kept at each location where hazardous materials are stored, in compliance with OSHA hazardous communication requirements (Christenson 2005). All hazardous waste generated by Chugach Industries at Midway is shipped by an EPA-approved transporter to an EPA-approved disposal or treatment facility. Chugach Industries manages the airfield, wastewater treatment facility, electrical power plant, potable water storage and delivery system, harbor, housing areas, dining facilities, and the fuel farm, with a capacity of 450,000 gallons. Chugach Industries manages a spill prevention, control, and countermeasures plan and an aboveground storage tanks monitoring program for the fuel farm, as required by the EPA (Christenson 2005).

The maintenance of the smaller FWS facility at FFS and the DLNR facility at Kure Atoll requires some hazardous material and generates small amounts of hazardous waste. Both FWS and DLNR have an environmental compliance program and properly transport hazardous waste to the main Hawaiian Islands, in compliance with hazardous material and hazardous waste regulations (Horvath 2005; Smith 2005). The other islands have seasonal camps that require very little hazardous materials, and all wastes are shipped back to Honolulu at the end of each season.

### ***Environmental Contamination***

#### ***Building Materials***

Green Island at Kure Atoll and Tern and East Islands at FFS have former USCG stations and associated PCB contamination. Pearl and Hermes Atoll served as a refueling site for seaplanes. Midway Atoll bears the most contamination of any of the NWHI, most of which is associated with previous military activities. Several buildings on Sand Island contain hazardous materials such as lead-based paint, arsenic-treated wood, or asbestos. These toxic materials pose potential health and safety concerns for humans and wildlife. Lead-based paint flakes are ingested by albatross chicks, causing growth deformities and mortality. Some of the other islands had guano mining operations on them during the late 1800s, but no known contamination was left behind.

At Midway Atoll, the Navy excavated and treated 1,390 cubic yards of PCB-contaminated soils that was excavated from five sites (U.S. Navy 1998). Long-term monitoring revealed PCB contamination leaking from the landfill and around a beached tug and barge, which have been removed along with the surrounding soil (U.S. Navy 2001a, 2001b).

During Navy base closure, 111 buildings and other structures were demolished. Large amounts of metal debris were removed from shorelines and other wildlife habitats, and deteriorating asbestos materials and lead-based paint were removed from dozens of structures. Hundreds of batteries, compressed gas cylinders, and other metal debris were removed from nearshore waters (U.S. Fish and Wildlife Service 2005b).

A USCG LORAN station operated on East Island, FFS, from 1944 to 1952. LORAN is a terrestrial-based navigation system using low-frequency radio transmitters. Before the popularity of satellite-based global positioning system, LORAN was a widely used marine navigation system. Cleanup activities at the USCG station took place in 1965 and 1973. The USCG initiated a geophysical investigation of the island in 1998, looking for possible landfills. Based on the anomalies recorded, 23 five-foot-deep pits were dug. No contamination requiring cleanup was

found (Silberman 2005). A USCG LORAN station operated on Tern Island, FFS, from 1952 until 1979, when it was turned over to FWS. The USCG removed part of the landfill containing high levels of PCB-contaminated soil in October 2001 (Silberman 2005). The remaining portion of the dump contains PCB-contaminated soil that is tidally washed and visited by turtles, seals, and migratory birds.

### *Storage Tanks*

At Midway Atoll, the Navy removed 132 underground and aboveground storage tanks, some as large as 2.2 million gallons (8.327 million liters). Several miles of petroleum pipeline was drained and removed, and 10,657 cubic yards (8,438 cubic meters) of petroleum-contaminated soils were excavated and treated. Ninety thousand gallons (340,650 liters) of petroleum product were extracted from the groundwater (U.S. Fish and Wildlife Service 2005b). In addition, beach erosion exposed two underground storage tanks on Eastern Island, both of which have been removed (USDOD 2003).

In early February 2003, monitoring results from an aboveground storage tank indicated a release of approximately 100,000 gallons (378,500 liters) of JP-5 aviation fuel on Sand Island. This release did not come in contact with the marine environment and caused no effect to wildlife. The cause of the leak was identified as corrosion failure of fittings on a fuel delivery line. Dozens of test pits were dug to define the limits of the release. Recovery trenches and recovery and monitoring wells were then put in place. An automated product recovery system was installed to automate and enhance recovery. From January 20-27, 2005 the WS and its contractor deactivated the fuel recovery system following recovery of 80,000 gallons of fuel. A Remedial Investigation Report was submitted documenting that additional remediation was not necessary. All but eight wells were removed or abandoned in place. The remaining eight wells were cut off six inches below the surface and fitted with surface-mounted well boxes. These were then designated as monitoring wells. Based on the high costs of off-site disposal of both fuel and recovered product, soils were remediated by aerobic biodegradation in an aboveground soil farm, and recovered fuel was used for cogeneration to burn other wastes at the island in a customized incinerator. All recovered fuels were disposed of in this manner by early 2007 (Ragain 2004; Christenson 2008) (Jan. 25, 2005 Project Close-Out Activities Report, Geo Engineers).

### *Pesticides*

With the exception of an uncontrolled release of insecticide at Laysan Island, the other islands and atolls have not been significantly contaminated by insecticides. In 1988, biologists first detected unexplained mortality of carrion flies and ghost crabs at a beach crest site on Laysan Island. These scavengers were coming in to feed on dead albatross chicks, commonly seen in summer months at Laysan. Upon entering the area later referred to as the “Dead Zone,” they would abruptly die. The cause was finally identified by FWS as the pesticide Carbofuran, and the area was cleaned by removing and treating on-site contaminated sand. In 2001, insecticide-contaminated soil was removed from Laysan Island and transported to the mainland for disposal. FWS suspects that the release resulted from an abandoned container, which washed ashore and deteriorated, releasing its contents (Woodward 2005).

During Navy closure at Midway Atoll, 1,578 cubic yards of DDT-, DDE-, and DDD-contaminated soil were excavated from six sites (U.S. Navy 1998).

### *Landfills*

'No Dig' areas are Land Use Controls (LUCs) remaining from the closure of the Navy base. These areas had soil contamination removed to a depth of 4 feet and backfilled with clean soil. The remaining control is that no digging may occur below 4 feet, or the Service assumes all responsibility. Additionally, Midway has several landfills left behind by the Navy. Some of these landfills were created during base closure for the disposal of construction rubble and asbestos. Other landfills were created during Navy occupancy for disposal of materials associated with operations. Two active landfills at Midway Atoll were investigated, capped, and closed (U.S. Fish and Wildlife Service 2005b).

There are 'No Dig' areas on both Sand Island and Eastern Island. One area on Sand Island that needs continued monitoring and potentially further remediation is known as the Old Bulky Waste Landfill. This site is an uncharacterized landfill that was created by the disposal of scrap metal, used equipment, and unconsolidated waste off the south shore of Sand Island to create a peninsula approximately 1,200 feet long by 450 feet (average) wide by 9 feet high (Navy 1995). It is surrounded on the three seaward sides by an approximately 10-foot-thick band of concrete and stone rip-rap. Wastes known to have been deposited in the landfill are metals (lead, cadmium, chromium, and nickel), gasoline, battery acid, batteries, mercury, lead-based paint, solvents, waste oil (including burning of petroleum, oil, and lubricants), PCBs, dioxins, furans, transmission and brake fluids, vehicles, equipment, tires, and miscellaneous debris (BRAC SI 1996 Volume 1). The landfill was covered in approximately 2 to 2.5 feet of soil in an attempt to contain the waste. The Old Bulky Waste Landfill is eroding, and the soil placed on top is sifting into the debris, causing large holes to open up around the edge and in the center of the landfill. Additionally, burrowing birds are bringing up buried soil and nesting below the cover.

The USCG Kure Atoll LORAN station landfill, on Green Island, was used to dispose of old electrical components and scrap metal during the USCG's 33-year tenure, which ended in 1993. The landfill was cleaned out as part of the station closure process. The USCG remediated the landfill on Kure in 1994. The USCG excavated and put into containers soil from the landfill that exhibited a concentration equal to or greater than 25 mg/kg PCB. A total of 36 cubic yards of soil were removed from the landfill. This soil, along with six 95-gallon overpack drums of corroded capacitors, was transported off-island for disposal at the TSCA-permitted U.S. Ecology Facility at Beatty, Nevada. Scrap metal, cable, non-liquid-containing drums, and the remaining soil in the landfill that contained debris were removed from the landfill and reinterred in a reburial pit (USCG 1994b). The depth of the reburial pit was set 15 feet bgs, which was 2 feet above the groundwater. All metal debris and soils with concentrations below 25 mg/kg PCB were placed in the reburial pit, which was then graded to a minimum depth of 5 feet bgs, covered with a nonwoven puncture-resistant geotextile fabric, then covered with clean soil from 5 feet bgs to original grade (USCG 1994b). The clean up level at Tern Island was 2 mg/kg.

### *Emergency Medical and Aviation Infrastructure*

Monument staff have access to resources-at-risk information that is of interest during contingency planning and spill response through the Sanctuaries Hazardous Incident Emergency Logistics Database System, a web-based decision support tool commonly referred to as "SHIELDS." This tool includes regulatory information, contact lists, geographic information system (GIS) maps, environmental sensitivity indexes, information on resources at risk, and

significant terrestrial and submerged historic and cultural resource and hazards data. Environmental Sensitivity Indices were last produced by NOAA for this area in 2001. Environmental Sensitivity Indices identify resources at risk on a seasonal and location basis and facilitate decisions about response options given threats to specific resources at risk.

FWS facilities at Midway Atoll serve as an emergency stop for marine vessels in distress in the mid-Pacific Ocean. The deep draft harbor at Sand Island can handle large vessels, and Henderson Airfield at Midway has the only runway that can handle large aircraft within a large swath of the mid-Pacific Ocean. Marine vessels periodically bring fishers and researchers with medical emergencies to Midway. FWS maintains emergency medical supplies, and an on-island medic can treat patients with emergency problems before the USCG transports them to Honolulu for treatment (Honolulu Advertiser 2003; Associated Press 2004).

Henderson Airfield is an FAA Part139-certified airport and is an important emergency landing site for aircraft en route from the west coast of North America to East Asia. Extended twin-engine aircraft operations (ETOPS) over the mid-Pacific Ocean use routes that keep them close enough to an FAA Part139-certified airport to meet FAA requirements for alternate landing sites. According to the FAA Advisory Circular 120-42A on ETOPS, "These suitable en route alternates serve a different purpose than the destination alternate airport and would normally be used only in the event of an engine failure or loss of primary airplane systems."

Though the focus of en route alternate airports is primarily for twin-engine aircraft, these airports are important for the safety of all long-range operations regardless of the number of engines. Alternate airports support unscheduled landings from such emergencies as cargo fire, decompression, fuel leak, passenger illness, or severe turbulence. On several occasions, aircraft on non-ETOPS routes have diverted to various islands in the Pacific, namely Adak, Midway, Shemya, and Wake. Reasons for these diversions included passenger or crew medical emergency, an unanticipated headwind requiring additional fuel, and an engine fire warning (Boeing Company 1998). As recently as January 2004, a commercial passenger jet used Henderson Field for an emergency landing after suffering oil pressure drop in one engine (Honolulu Advertiser 2004).

### **2.4.3 Land Use**

#### **2.4.3.1 Introduction/Region of Influence**

This section addresses issues related to the Proposed Action alternative that are associated with land use. The ROI for land use includes all lands within the Monument. This section of the DEA also fulfills the resource assessment requirements of 16 USC 1434(a)(2)(B) by documenting present and potential uses of the area.

#### **2.4.3.2 Regulatory Environment**

##### **Federal Regulations**

Monument regulations promulgated in 50 CFR Part 404 primarily relate to prohibiting or regulating human uses within the Monument to ensure the protection of Monument resources.

Section 404.4 addresses how access will be granted into the Monument and requires notification prior to entering and after departing. All U.S. vessels passing through the Monument without interruption will be required to provide notification at least 72 hours before entering and within 12 hours of leaving the Monument and must include intended and actual routes through the Monument and general categories of any hazardous cargo on board. Section 404.5 describes the VMS requirements for all vessels operating in or transiting through the Monument. Section 404.6 lists all prohibited activities within the Monument. Prohibited activities include exploring for oil, gas, or minerals or using poison or explosives. Section 404.7 describes all regulated activities that are prohibited unless specifically allowed by one of the Monument-issued permits. Sections 404.8 and 404.9 provide exemptions from prohibited activities for emergency response and law enforcement activities (404.8) and armed forces actions (404.9). Section 404.11 describes the six permit types issued to access and conduct activities otherwise prohibited by Monument regulations. These permit types are 1) research, 2) education, 3) conservation, 4) Native Hawaiian practices, 5) special ocean uses, and 6) recreational activities. Specific requirements for issuance of Native Hawaiian practices, special ocean uses, and recreational activities are included in the regulations. Section 404.12 ensures that these regulations will be carried out in accordance with international law.

In addition to Monument-specific regulations, FWS has regulations specific to Midway Atoll NWR (50 CFR Part 38), special conditions for cruise ship visits to Midway, and permitting requirements for both Midway Atoll and Hawaiian Islands NWRs under 50 CFR Parts 13, 18, and 25.

### **State Regulations, Policies, and Programs**

The DLNR has stewardship responsibility for managing, administering, and exercising control over the coastal and submerged lands, ocean waters, and marine resources under state jurisdiction around each of the NWHI under Title 12, Chapter 171 Hawaii Revised Statutes. The State is the lead agency for managing the emergent lands at Kure Atoll, a state wildlife sanctuary. DLNR's Division of Conservation and Resources Enforcement (DOCARE) maintains full police powers, including power of arrest, within all lands and waters within the state's jurisdiction. In 2005, the DLNR's Division of Aquatic Resources established the NWHI State Marine Refuge (0-3 nm [3.5 mi, 5.5 km] around all emergent lands, except Midway Atoll) through Hawaii Administrative Rules, Chapter 13-60.5. Unless otherwise authorized by law, it is unlawful for any person to enter the refuge without a permit except for freedom of navigation, passage without interruption, interstate commerce, and activities related to national defense, enforcement, or foreign affairs and in response to emergencies.

The state currently holds the submerged and ceded lands of the NWHI in trust. Established by a 1978 amendment of the Constitution of the State of Hawai'i, OHA serves as the principal agency working for Native Hawaiians. OHA was created for various purposes including bettering the conditions of Native Hawaiians. OHA manages a property and monetary trust, creating its fiduciary duty to Native Hawaiians. The OHA trust is funded in part by a pro rata share of income derived from the ceded lands portion of the public land trust.

The Hawai'i Coastal Zone Management Program (HCZMP) was promulgated in 1977 in response to the federal CZMA. The coastal zone area encompasses the entire state, including all

marine waters seaward to the extent of the 14-mi (12-nm, 22-km) territorial sea and all archipelagic waters. The HCZMP is charged with protecting waters within the coastal zone and includes a permit system to control development within a coastal zone and a shoreline setback area, which serves as a buffer against coastal hazards and erosion and protects views. The CZMA requires direct federal activities and development projects to be consistent with approved state coastal programs to the maximum extent practicable.

In compliance with the federal Coastal Zone Act Reauthorization Amendments of 1990, the State of Hawai‘i prepared the Hawai‘i Coastal Nonpoint Pollution Control Program in 1996, the year that NOAA and EPA approved the program. In July 2000, the state completed an implementation plan for polluted runoff control, which established long-term and short-term goals and activities to control nonpoint source pollution, as required for implementing the Coastal Nonpoint Pollution Control Program. It also established five-year implementation plans to address polluted runoff in six categories: agriculture, forestry, urban, marinas and recreational boating, hydromodification, and wetlands and riparian areas. The nonpoint source pollution control programs are intended to be consistent with the Native Hawaiian approach to resource management.

The State Department of Health has regulatory oversight for maintaining high standards of water quality throughout the NWHI, which is classified as Class AA waters, via the Clean Water Branch. In addition, the Department of Health’s Hazard Evaluation and Emergency Response Office is the on-scene coordinator for all responses to hazardous material, chemical, and oil spill response.

### **2.4.3.3 Resources Overview**

#### **Current Land Use**

Land use in the Monument has been minimal throughout history, although some areas, such as Midway Atoll and the FFS, were used during World War II and after for military training and exercise grounds. Most of the islets and reef formations of the Monument have small land areas and do not offer much area for development or human use. Under the Proposed Action alternative, the ROI would require permits for visiting the islands and reefs.

#### ***Kure Atoll***

Kure Atoll is an oval-shaped atoll located at the farthest northwestern end of the NWHI chain. Green Island is the only permanent island within the atoll. In 1960, the USCG built a LORAN station with a 4,000-foot runway, a 625-foot transmitter tower, and working and living quarters for 24 personnel. The station was decommissioned in 1992 and was abandoned in 1993. Today all but two buildings and a cistern have been demolished and buried on the island.

#### ***Midway Atoll***

In 1996 the remaining Naval base on Midway Atoll was turned over to FWS to be managed as Midway Atoll National Wildlife Refuge. Today, full-time NWR staff administer a small visitors program, care for wildlife, restore native plant life, and protect historic resources. Those historic resources that remain on Midway Atoll are protected under the Midway Atoll Historic Preservation Plan, approved in 1999, that focuses on long-term management and treatment for

the 63 historic properties. The airstrip on Midway Atoll is still active and averages about 45 flights per year. The USCG also uses Midway as a refueling stop. Today approximately 65 people reside on Midway year round. The maximum capacity for all overnight people is 150 with no more than 50 visitors at any one time. The Midway Atoll Visitor Services Plan also allows 3 large group (50-800 people) day-use visits per year, with no more than 400 people on the island at a time unless refuge management has approved a higher number (e.g. for very limited and special circumstances such as to participate in a ceremony commemorating the anniversary of the Battle of Midway).

### ***Pearl and Hermes Atoll***

The low islets of Pearl and Hermes Atoll are exposed to occasional overwashing by high seas. Resource managers occupy a seasonal field camp at the atoll.

### ***Lisianski Island***

Lisianski is a small island; its highest point is a sand dune that rises 40 feet above sea level and is relatively undisturbed. Resource managers occupy a seasonal field camp on the island.

### ***Laysan Island***

Laysan Island was used by guano traders and feather harvesters in the late 1800s and early 1900s but these activities were stopped after President Theodore Roosevelt declared the Hawaiian Islands Reservation in 1909. A year-round field camp of three to six people supporting ecological restoration work has been maintained at Laysan Island since 1992.

### ***French Frigate Shoals***

The FFS is an open atoll with several small, sandy islets. One of the small islands, Tern Island, was formed into a 42-acre airstrip in 1942 to serve as a refueling stop for planes going to Midway Atoll during World War II. Today, the original seawall, runway, and some buildings remain. The FFS average about 27 charter flights per year on the existing runway. FWS maintains a field station that is staffed by two permanent year-round employees and some volunteers.

### ***Mokumanamana (Necker Island)***

The Tanager Expedition came to Mokumanamana, also known as Necker Island, in 1923 for biological and cultural research. There is significant evidence of human habitation on Mokumanamana, with 52 archaeological sites. Mokumanamana is visited occasionally on day trips for wildlife monitoring, Native Hawaiian practices, and cultural research.

### ***Nihoa***

Native Hawaiians are thought to have used Nihoa at least between AD 1000 and AD 1700, as over 88 archaeological sites have been found on the island. The Tanager Expedition stopped at Nihoa, in addition to Mokumanamana, for biological and cultural research. Occasionally, short-term field camps are established for wildlife monitoring and invasive species management.

**2.4.4 Economics**

**2.4.4.1 Introduction/Region of Influence**

The State of Hawai‘i forms the economic ROI and defines the geographic area in which the predominant economic and social effects from the Proposed Action alternative are likely to take place. The geographic area of the ROI was defined based on the home location of individuals directly affected by research, management, recreation, education, and cultural activities or other activities in the Monument.

The baseline year for the effects analysis is 2005, except for fishing, which is 2011; however, most of the economic and demographic data for the ROI are available only through 2003. Wherever possible, the most recent data available are presented so that the affected environment descriptions reflect current conditions in the ROI.

**2.4.4.2 Resources Overview**

***Population***

The population of Hawai‘i increased by almost nine percent between 1990 and 2000 and by another 5.4 percent between 2000 and 2005 (Table 2.4-1). Among the fifty states and the District of Columbia, Hawai‘i was ranked the forty-first most populous state, as of the 2000 Census (U.S. Census Bureau 2001). By 2030, Hawai‘i’s population is projected to increase to 1.63 million people, an average rate of growth of slightly less than 1.0 percent per year between 2000 and 2030. The natural population growth—the net increase from births over deaths—has previously

**Table 2.4-1  
Hawai‘i Population**

	<b>1990</b>	<b>2000</b>	<b>2005 (estimated)</b>	<b>% Change 1990-2000</b>	<b>% Change 2000-2005</b>
Hawai‘i	1,113,491	1,212,670	1,277,950	8.9	5.4

Sources: DBEDT 2004a

been the more important contributor to total population growth. However, Hawai‘i’s population is aging, and forecasts project that in-migration will provide the larger share of population growth over the next 25 years (DBEDT 2004a).

***Employment and Industry***

*State Overview.* Total earnings by industry for Hawai‘i was about \$30 billion (BEA 2005). The state has a civilian labor force of almost 626,000 people (Table 2.4-2). The state’s civilian labor force and number of persons employed has increased between 1990 and 2005. The unemployment rate is at a low 2.7 percent, compared to the national unemployment rate of 5.4 percent (BLS 2005). Total civilian employment in Hawai‘i is expected to increase to 725,850 by 2030, an annual growth rate of 0.8 percent (DBEDT 2004a).

**Table 2.4-2**  
**Hawai‘i Labor Market Information**

Year	Civilian Labor Force	Employment	Unemployment	Unemployment Rate
1990	550,300	534,300	16,000	2.9
2000	604,000	578,200	25,800	4.3
2005	625,950	608,900	17,050	2.7

Source: HIWI 2005

Note: 2005 data as of February 2005.

The State of Hawai‘i calculated employment and industry forecasts by major industry for 2005. Table 2.4-3 presents the distribution of employment among the various industry sectors and the changes projected in these sectors between 2003 and 2005. Education and health services, trade, leisure and hospitality, professional and business services, and the government sector will employ the greatest number of workers in 2005. Between 2003 and 2005, construction and mining, professional and business services, educational and health services, leisure and hospitality, and trade, transportation, and utilities will account for 92 percent of the job growth over the two-year period. Educational and health services and trade, transportation, and utilities will be the major contributors in job expansion, adding nearly half of the employment growth. Construction is projected to have the largest percentage of growth of all industries. Employment losses are expected in information and in agriculture, forestry, and fishing (HIWI 2004).

**Table 2.4-3**  
**Hawai‘i Industry Employment and Growth Rates, 2003–2005**

Industry	2003	2005	Change in Employment	Average Annual Growth Rate
Agriculture, forestry, and fishing	7,460	7,350	-110	-0.7%
Construction and mining	27,780	29,390	1,610	2.9%
Manufacturing	14,840	14,950	120	0.4%
Trade, transportation, and utilities	109,300	113,200	3,890	1.8%
Trade	79,940	82,830	2,890	1.8%
Wholesale	16,680	17,120	440	1.2%
Retail	63,260	65,710	2,450	1.9%
Transportation	26,660	27,650	990	1.9%
Utilities	2,700	2,720	20	0.4%
Information	11,070	10,630	-450	-2.0%
Financial activities	28,210	28,750	540	1.0%
Professional and business services	69,010	71,700	2,690	1.9%
Educational and health services	109,650	114,070	4,420	2.0%
Leisure and hospitality	98,870	101,250	2,380	1.2%
Other services	23,140	23,490	360	0.8%
Government	67,900	68,730	840	0.6%
Federal	28,700	29,090	390	0.7%
State	22,290	22,690	400	0.9%
Local	16,900	16,960	60	0.2%
Total employment	567,230	583,510	16,290	1.4%

Industry	2003	2005	Change in Employment	Average Annual Growth Rate
----------	------	------	----------------------	----------------------------

Source: HIWI 2004

Note: Data as of the end of second quarter 2003 and 2005. Totals are rounded to the nearest ten. Totals may not add up to 100 percent due to rounding.

Retail trade will account for nearly two-thirds of the boost in employment in the trade, transportation, and utilities industry sector, with several shopping centers undergoing renovations and upgrades and the opening of big-box retailers (HIWI 2004).

Increasing military presence in Hawai‘i, driven by national counterterrorism efforts, will add to the demand for jobs in the construction industry. In addition, the relocation of the Army’s Stryker Brigade to Hawai‘i has created a need for construction projects such as residential housing, which will bring further economic benefits to the industry (HIWI 2004).

Employment in the agriculture, forestry, and fishing industry is predicted to decline by 0.7 percent. This general trend is a result of the transition from large-scale plantation crops to smaller crops in diversified farming (HIWI 2004).

Hawai‘i industry employment and growth rate projections through 2012 predict that construction, professional and business services, and education and health services sectors will continue to expand and will have the largest percentage increases of the state’s total employment growth. The agriculture, forestry, and fishing industry sector is projected to decline by 0.2 percent between 2002 and 2012, losing 180 jobs (DLIR 2005). The agriculture, forestry, and fishing industry employs the smallest share of the state’s workforce at 1.3 percent.

*Research and Management in the Monument.* Research and management activities in the Monument include assessment and long-term monitoring of resources, genetic and ecological research, restoration activities such as marine debris removal, listed species recovery and protection, enforcement, and other conservation activities. An estimated \$7.5 million is spent annually in research and management of the Monument. All access to the Monument is regulated through permits issued by the Monument Management Board.

*Commercial Fishing in the Monument.* Commercial bottomfishing in the Monument is prohibited after June 15, 2011. Until that date, Monument regulations establish total landings for the eight permitted fishermen at 350,000 pounds of bottomfish and 180,000 pounds of pelagic species. The NWHI commercial bottomfishing industry has on average landed approximately 300,000 pounds of bottomfish each year, with an ex-vessel value of about \$1 million (WPFMC 2004a). Twenty people are directly employed in the NWHI commercial bottomfish fishery. Four of the bottomfish operations are on O‘ahu, two are on Kaua‘i, one is on Maui, and one is on the island of Hawai‘i. No other commercial fishing is allowed in the Monument. Commercial fishing is not considered in the socioeconomic baseline for the Monument, as it has already been prohibited by Monument regulations.

*Tourism Industry in Hawai‘i.* Ocean tourism and recreation in the Monument are regulated under special ocean use and recreational permits. Due to the remote location of the Monument, few ocean tourism and recreational activities have occurred in the NWHI. FWS permitted a

cooperator to operate an ecotourism operation based on Midway Atoll from 1996 to 2002, drawing approximately 250 sportfishers and divers to the refuge each year. FWS has completed a tourism feasibility study and a visitor's services plan for Midway, which will guide future decisions on these types of activities in the area. Tourist and recreational opportunities on the eight main Hawaiian islands, in particular on O'ahu, Maui, Hawai'i, and Kaua'i, are abundant and satisfy the demand for tourism and recreation activity. Almost 6.4 million people visited the main Hawaiian Islands in 2003, spending more than \$10 billion (DBEDT 2004b).

***Income***

Total personal income for the State was about \$37 billion in 2002. The average annual personal income growth rate was 7.5 percent from 1969 through 2002, just below the national average growth rate of 7.7 percent. The per capita personal income for Hawai'i was \$29,875 in 2002, slightly below the national per capita personal income of \$30,906 (BEA 2004).

Hawai'i's median annual family income was \$67,564 as of 2002, thirteenth among the fifty states and the District of Columbia. The cost of living in Hawai'i for a family of four has been estimated to be about 25 percent higher than the United States average for a comparable standard of living (DBEDT 2004b).

## **2.5 OTHER RESOURCES**

### **2.5.1 Water Quality**

#### **2.5.1.1 Introduction/Region of Influence**

This section addresses issues related to the Proposed Action alternative that are associated with the water quality of marine and terrestrial waters and water resources. Due to the continuous mixing of water masses within the marine environment, the ROI for water quality includes Monument waters. Additionally, the ROI for water quality includes the terrestrial waters and water resources of the NWHI. This section also identifies threats to water quality in the affected environment.

#### **2.5.1.2 Regulatory Environment**

##### **Federal Regulations**

The regulations promulgated in 50 CFR Part 404 during the establishment of the Monument include numerous specific regulations aimed at the protection of water quality. In addition to monitoring vessel traffic through the issuance of permits, all U.S. vessels passing through the Monument without interruption will be required to provide notification at least 72 hours before entering and within 12 hours of leaving the Monument and include intended and actual route through the Monument and general categories of any hazardous cargo on board. In addition, prohibited activities, including exploring for oil, gas, or minerals or using poison or explosives, specifically protect the water quality of the Monument. Regulated activities, including discharging or depositing material into Monument waters, are designed to minimize the effect of vessel activity on water quality.

In addition, general federal regulations relevant to marine water quality include the following:

- Federal Water Pollution Control Act, commonly known as the Clean Water Act (CWA), as amended (33 USC 1251-1382);
- Marine Protection, Research, and Sanctuaries Act (MPRSA), also known as the Ocean Dumping Act, as amended (33 USC 1401-1421, 1441-1445, and 2801-2805 and 16 USC 1447-1447f);
- Oil Pollution Control Act (OPA 90), as amended (33 USC 2701-2761);
- Act to Prevent Pollution from Ships (APPS) (33 USC 1901-1912);
- Coastal Zone Management Act of 1972 (CZMA), as amended (16 USC 1451-1465);
- Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended (42 USC 9601-9675);
- Resource Conservation and Recovery Act (RCRA), as amended (42 USC 6901-6992k);
- Non-indigenous Aquatic Nuisance Prevention and Control Act of 1990, as amended (16 USC 4701-4728);

- National Wildlife Refuge System Administration Act of 1966, as amended (16 USC 668dd-668ee); and
- Toxic Substances Control Act of 1976, as amended (15 USC 2601-2692).

Congress passed the Federal Water Pollution Control Act in 1972, and amended it with the Clean Water Act in 1977. Under CWA Section 402, anyone discharging a pollutant from a point source to the navigable waters of the U.S. must obtain a National Pollutant Discharge Elimination System permit, which requires compliance with technology- and water quality-based treatment standards. The State of Hawai‘i has been delegated authority over discharges to state waters (HAR Chapter 11-55).

Under CWA Section 403, any discharge to the territorial seas or beyond also must comply with the Ocean Discharge Criteria established under CWA Section 403. CWA Section 312 contains regulations protecting human health and the aquatic environment from disease-causing microorganisms that may be present in sewage discharged from vessels. A marine sanitation device (MSD) on board a vessel is designed to receive, retain, treat, control, or discharge sewage. Pursuant to Section 312 of the CWA, all recreational boats with installed toilet facilities must have an operable MSD on board (33 USC 1322). Vessels 65 feet (20 meters) and under may use a Type I, II, or III MSD. Operators of vessels over that length must install a Type II or III MSD. The USCG must certify all installed MSDs.

The MPRSA regulates the dumping of wastes into marine waters and is the primary federal environmental statute governing transportation of dredged material for disposal into ocean waters. CWA Section 404 governs the discharge of dredged or fill material into waters of the U.S. In 1983, a global ban on dumping radioactive wastes was implemented. The MPRSA and the CWA regulate materials that are disposed of in the marine environment, and only sediments determined to be nontoxic by U.S. Environmental Protection Agency (EPA) standards may be disposed of in the marine environment. The EPA and the U.S. Army Corps of Engineers share responsibility for managing the disposal of dredged materials.

The Oil Pollution Control Act of 1990 requires extensive planning for oil spills from tank vessels and onshore and offshore facilities and places strict liability on parties responsible for oil spills.

The discharge of solid wastes is regulated under the CWA and the APPS, as amended by the Marine Plastic Pollution Research and Control Act of 1987. The APPS regulates the disposal of plastics and garbage for the U.S. Annex V of the International Convention for the Prevention of Pollution from Ships, 1973, as modified by the Protocol of 1978 (MARPOL 73/78). Under these regulations, disposing of plastics is prohibited in all waters.

The CZMA provides incentives for coastal states to develop and implement coastal area management programs. It is significant with regard to water pollution abatement, particularly concerning nonpoint source pollution. In 1990, Congress enacted the Coastal Zone Act Reauthorization Amendments by adding Section 6217, entitled Protecting Coastal Waters. It requires that states with coastal zone management programs develop and implement coastal nonpoint pollution control programs. Section 6217 requires states to submit a coastal nonpoint pollution control management plan and is intended to strengthen links among federal, state, and

county coastal zone management and water quality programs. The purpose of the plan is to describe the programs and actions taken to control polluted runoff and to maintain water quality standards.

CERCLA addresses cleanup of hazardous substances and mandates liability for environmental cleanup on those who release hazardous substances into the environment. In conjunction with the CWA, it requires preparation of a National Contingency Plan for responding to oil or hazardous substances release.

RCRA addresses hazardous waste management, establishing duties and responsibilities for hazardous waste generators, transporters, handlers, and disposers. The NWRSA and the regulations and policies developed to implement the act address the quality and quantity of water impacting management of fish and wildlife and their habitats on refuges. The TSCA was enacted by Congress to give EPA the ability to track industrial chemicals currently available, produced, or imported into the United States. EPA controls these chemicals for health and human safety.

### **State Regulations, Policies, and Programs**

In Hawai‘i, key state regulations relevant to marine water quality are as follows:

- Water Quality Standards (Hawaii Administrative Rules [HAR] Chapter 11-54);
- Water Pollution Control (HAR Chapter 11-55);
- Coastal Zone Management Program;
- Point-Source Discharge Requirements; and
- Ballast Water Management (HAR Chapter 13-76).

The regulations governing water quality in Hawai‘i are primarily contained in Title 11, Chapter 54 of the Hawaii Administrative Rules (HAR Chapter 11-54), Water Quality Standards. The Hawai‘i State Department of Health, Clean Water Branch administers and enforces state water pollution laws and regulations that are outlined in Hawaii Administrative Rules Chapter 11-55. The State of Hawai‘i also has delegated authority under the CWA for any discharges into state waters through the administration of the National Pollutant Discharge Elimination System (NPDES) permits.

All waters are subject to an anti-degradation policy, which states that “Waters whose quality [is] higher than established water quality standards shall not be lowered in quality unless it has been affirmatively demonstrated to the director [of the Department of Health] that the change is justifiable as a result of important economic or social development and will not interfere with or become injurious to any assigned uses made of, or presently in, those waters” (HAR Section 11-54-01.1).

In general, all waters must be free of substances resulting from domestic, industrial, or other controllable sources of pollution. This includes sediments resulting from erosion caused by construction or agricultural activities, floating or sinkable materials, thermal pollutants, pathogens, biocides, excessive nutrients, toxic compounds, and other pollutants. All discharges

to state waters are subject to laboratory testing to determine if the discharge meets standards for acute or chronic toxicity. These standards are published in HAR Title 11, Chapter 54.

Marine waters are classified as either Class AA or Class A, based on protection of water quality (HAR Chapter 11-54). The open coastal waters around the NWHI are classified as Class AA waters (HAR Section 11-54-6[b][2][A][ix] and [x] from the shoreline to a depth of 183 meters or 600 feet). The objective of Class AA waters is that they remain as nearly as possible in their natural pristine state, while Class A waters are maintained for multiple uses, with lower water quality standards applied to them.

The water quality standards regulations also contain special classifications and standards for marine bottom ecosystems, and these areas are designated as Class I or Class II areas. All beaches, marine pools and protected coves, and reef flats and reef communities (e.g., Kure Atoll Lagoon, Pearl and Hermes Lagoon, Lisianski Island, Maro Reef, Laysan Island, and French Frigate Shoals Lagoon) in the NWHI are considered Class I areas. The objective of Class I marine bottom ecosystems is to keep them in the most pristine and natural state possible, and only nonconsumptive uses are allowed in these areas. Class II marine bottom ecosystems allow for multiple uses.

The Hawai'i Coastal Zone Management Program (HCZMP) was promulgated in 1977 in response to the federal CZMA. The coastal zone area encompasses the entire state, including all marine waters seaward to the extent of the 14-mi (12-nm, 22-km) territorial sea and all archipelagic waters. The HCZMP is charged with protecting waters within the coastal zone and includes a permit system to control development within a coastal zone and a shoreline setback area, which serves as a buffer against coastal hazards and erosion and protects views. The CZMA requires direct federal activities and development projects to be consistent with approved state coastal programs to the maximum extent practicable.

In compliance with the federal Coastal Zone Act Reauthorization Amendments of 1990, the State of Hawai'i prepared the Hawai'i Coastal Nonpoint Pollution Control Program in 1996, the year that NOAA and EPA approved the program. In July 2000, the state completed an implementation plan for polluted runoff control, which established long-term and short-term goals and activities to control nonpoint source pollution, as required for implementing the Coastal Nonpoint Pollution Control Program. It also established five-year implementation plans to address polluted runoff in six categories: agriculture, forestry, urban, marinas and recreational boating, hydromodification, and wetlands and riparian areas. The nonpoint source pollution control programs are intended to be consistent with the Native Hawaiian approach to resource management (ahupua'a management).

In 2007, Chapter 76, Non-Indigenous Aquatic Species (Subchapter 2, Ballast Water Management) was added to Hawaii Administrative Rules. These rules are intended to work in coordination with and complement federal regulations to prevent the introduction and spread of invasive species in Hawai'i waters by regulating vessel ballast water. Regulations include the adoption of a ballast water management program, ballast water exchange program, reporting requirements, and compliance monitoring.

### 2.5.1.3 Resources Overview

#### Existing Water Quality Conditions

Water quality in the marine and terrestrial environments of the Monument is important to the survival of the various species of biota and the coral reef ecosystems.

##### *Marine*

The marine environment in the ROI is generally considered to be relatively pristine. This is due to the remoteness of the NWHI, the fact that most of the islets and shoals remain uninhabited, and the oceanographic conditions of the central Pacific Ocean. While there have been very few studies done on contamination in the ROI, the lack of major pollution sources and the health and productivity of the coral reef ecosystems in the area are strong evidence of the relatively unpolluted marine environment (Friedlander et al. 2005a). However, several localized areas of contamination exist along the shorelines and islands in the NWHI. This contamination includes PCBs, dioxin, PAHs, and metals. Some fish and other biota sampled in these areas have PCB levels that rivaled levels found in fish near major PCB manufacturers on the mainland.

A considerable amount of research has been done on the oceanographic conditions of the NWHI. Characteristics of the marine environment of the ROI include highly variable sea surface temperatures, both nutrient-rich and nutrient-poor waters, and seasonal high-energy waves (Friedlander et al. 2005a). Sea surface temperatures around the NWHI fluctuate greatly, particularly in the northwest end of the island chain, ranging from less than 64 °F (18 °C) in the winter to greater than 82 °F (28 °C) in the summer. Sea surface temperature also varies greatly from year to year over longer periods, including those characterized by ENSO (Friedlander et al. 2005a).

Satellite observations of the ROI indicate a significant chlorophyll front in the area, with seasonal and annual migrations (northward in the summer and southward during the winter). When these nutrient-rich waters cross through the NWHI, productivity in the coral reef ecosystems is expected to become elevated, and trophic changes in the ecosystem may occur (Friedlander et al. 2005a).

There is a pronounced annual cycle of ocean wave energy in the ROI, with over 10-foot (3.3-meter) waves occurring annually, resulting from extratropical winter storms. Most storms approach the NWHI from the northwest, shaping the assemblages of species that exist in the northwest-facing reef areas. There is also evidence of variability in cumulative wave energy and wave energy events between years and over longer periods, including Pacific Decadal Oscillation (PDO) events (Mantua et al. 1997).

However, despite the rare pristine conditions of the ROI, the area has not been completely untouched by human influences. Vessel discharges, spills, shipwrecks, marine debris, and land-based military activities have all contributed to contamination in the ROI. These sources and their effects on water quality are discussed in the Pollution Sources section below.

### ***Terrestrial***

The terrestrial environment in the ROI varies among the different islands in the Monument. The only permanent surface water in the NWHI is on Laysan Island. Laysan Island has a 173-acre (0.7square-kilometer) hypersaline interior lake. A small brackish groundwater lens exists below the surface of some of the islands (U.S. Fish and Wildlife Service 2007a [IVSP, Midway Atoll NWR]). Freshwater sources are found at Nihoa, Mokumanamana, and Laysan Island, and Midway and Kure Atolls. Rainwater percolates through the sand rapidly. Fresh water, being slightly lighter, tends to float on salt water below the ground or is trapped by cap rock of phosphatized coral. The coral cap rock overlays the basaltic volcanic base. Historic records reveal that potable brackish water could be found 5 to 10 feet below the ground surface on several of the sandy NWHI. On the rocky islands, rain water percolates though the porous basalt until it reaches layers of dike material. Groundwater flows along the upper surface of dense materials, and fresh water seeps are found where it reaches the ground surface (U.S. Fish and Wildlife Service 1986).

### ***Water Resources***

The potable water is supplied via rainwater catchment and treatment systems on Midway, Tern, and Laysan and is imported or made from sea water using reverse osmosis at camps on other islands. See the Utilities section for further information on potable water systems.

### **Marine Pollution Sources**

#### ***Marine Sources***

Cargo vessels and research vessels transit the ROI regularly, and cruise ships, USCG ships, and recreational boats pass through the ROI occasionally. Research vessels sometimes anchor in designated areas near the shore of various islands, while recreational boaters and cruise ships occasionally visit Midway. During the course of normal operations, seagoing vessels produce a multitude of wastes, which, when disposed of into the marine environment, can affect the water quality of the Monument. Potential discharges from vessels include sewage, gray water, bilge water, hazardous wastes, and solid materials and toxic compounds. These are discussed below.

#### *Sewage*

Sewage includes vessel sewage and other wastewater. Sewage discharge may contain bacteria or viruses that cause disease in humans and in other wildlife. Chemicals and deodorants often used in MSDs include chlorine, ammonia, or formaldehyde and may also affect water quality. The CWA requires the use of MSDs for all offshore vessels 3.5 mi (3 nm, 5.5 km) or closer. Monument regulations prohibit the discharge of MSD effluent within the Special Preservation Areas (SPA) or Midway Atoll Special Management Area (SMA) but allow discharge in the rest of the Monument; dumping of raw sewage is prohibited throughout the Monument and in waters outside the Monument if the sewage would subsequently drift into Monument waters.

Type I MSDs shred and disinfect the waste prior to its discharge into the water. Type II MSDs provide an advanced form of the same type of treatment used by Type I devices and discharge wastes with lower fecal coliform counts and reduced suspended solids. Type III MSDs, commonly called holding tanks, flush sewage into a tank containing deodorizers and other chemicals. The contents of the holding tank are stored until they can be properly disposed of at a shore-side pump-out facility. Type III MSDs can be equipped with a discharge option, usually

called a Y-valve, that allows the boater to direct the sewage either into the holding tank or directly overboard.

#### *Gray water*

Gray water from vessels includes wastewater from kitchens, showers, and laundries. Pollutants in gray water include suspended solids, oil, grease, ammonia, nitrogen, phosphates, copper, lead, mercury, nickel, silver and zinc, detergents, cleaners, oil and grease, metals, pesticides, and medical and dental wastes. Monument regulations prohibit the discharge of gray water in all SPAs and the SMA.

#### *Bilge Water*

Bilge water may contain fuel, oil, wastewater, other chemicals, and materials that collect at the bottom of the ship's hull with fresh water and sea water. Under the Oil Pollution Act and the CWA, vessels are prohibited from releasing any water with an oil content of greater than 15 parts per million (ppm) of oil to water within 14 mi (12 nm, 22 km) of the coastline. Beyond 14 mi, discharges with oil content greater than 100 ppm are prohibited.

#### *Hazardous Materials*

Various hazardous materials are generated during the course of vessel operations, including cleaning and photo processing chemicals, paints and solvents, batteries, and fluorescent light bulbs containing mercury. RCRA requires that vessels generating or transporting hazardous wastes offload these wastes at treatment or disposal facilities (NOAA 2003b). Release of any of these materials is prohibited within the Monument and in waters outside the Monument if these materials would subsequently drift into Monument waters.

#### *Spill and Release Incidents*

There is a persistent threat to water quality from an accidental oil spill or cargo release from a vessel within or outside of Monument boundaries. Offshore spills have the potential to severely impair water quality and sensitive nearshore ecosystems. Floating debris from vessels is also a significant threat to the resources of the Monument, and there have been a number of such incidents. The most noteworthy example was in 1987, when a container of the pesticide Carbofuran is believed to have washed ashore at Laysan Island. The pesticide killed all invertebrates and the endangered Laysan finches that came into contact with or consumed contaminated sand.

#### *Ship and Aircraft Wrecks*

The NWHI region has been a significant center of maritime activity historically and of aircraft activity during World War II. As such, a number of ships and aircraft have been wrecked in the area. There are 52 known shipwrecks, 14 of which have been located. There are also 67 known aircraft wrecks in the area, only two of which have been located. While most of the shipwrecks are sailing vessels and pose little threat to the marine water quality, more modern ship and aircraft wrecks are likely to pose a threat of petroleum contamination (Friedlander et al. 2005a).

One of the more harmful ship groundings occurred in 1998, when the Paradise Queen II, an 80-foot (24-meter) lobster fishing vessel, ran aground on a coral reef at Kure Atoll, spilling approximately 4,000 gallons (15,140 liters) of diesel fuel and other petroleum hydrocarbons into the marine environment. The remaining 7,000 gallons (26,500 liters) of fuel were recovered from

the vessel during salvage operations (Maragos and Gulko 2002). More recently, the 85-foot-long (26-meter-long) line fishing vessel *Swordman I*, carrying more than 10,000 gallons (37,800 liters) of diesel fuel and hydraulic oil, ran aground at Pearl and Hermes Atoll in 2000 (NOAA 2001a). The 145-foot (45-meter) ship *Casitas* ran aground on the northern side of Pearl and Hermes Atoll on July 2, 2005, with more than 33,000 gallons (124,900 liters) of diesel fuel on board (TenBruggencate 2005a). Additionally, iron that erodes from the ships acts as a nutrient in the marine waters, often causing growths of invasive algae and soft corals that smother the reefs surrounding the wrecks.

### ***Land-Based Sources***

Early extractive activities in the NWHI occurred around the turn of the twentieth century, with guano mining at Laysan Island. Later, the islands became strategically important for the U.S., which constructed a naval base at Midway Atoll and FFS during the first half of the twentieth century. During World War II, FFS and Pearl and Hermes Atoll were used for seaplane refueling. After World War II, the USCG constructed LORAN stations at Kure Atoll and FFS. Midway Atoll's U.S. Navy Airfield, which was in operation from 1941 to 1996, is the island's most significant source of land-based marine pollution (Friedlander et al. 2005a).

Land-based pollution sources from these early developments include lead and mercury batteries, transformers, capacitors, barrels, and landfills (uncharacterized and unlined). There is suspected petroleum on FFS and Pearl and Hermes Atoll from the historic refueling operations on those islands. Kure Atoll, Midway Atoll, and FFS are known point sources for PCBs from the former LORAN stations (Friedlander et al. 2005a).

On Midway Atoll, historic contamination includes petroleum in groundwater and coastal waters, pesticides, PCBs, metals, including lead and arsenic, and unknown contaminants that continue to leak and erode from landfills. As part of the base realignment and closure process, the U.S. Navy remediated much of the historic contamination. PCBs, dichloro-diphenyl-trichloroethane/dichloro-diphenyl-dichloroethylene- (DDT/DDE-), and petroleum-contaminated soils were excavated and treated, and petroleum-contaminated groundwater was remediated. In addition, a large number of underground and aboveground storage tanks and several miles of petroleum pipeline were drained and removed. However, despite extensive remediation efforts, several areas may warrant continued monitoring for potential releases (U.S. Fish and Wildlife Service 2005b; Friedlander et al. 2005a). In 1997, a FWS contractor installed a septic system for Sand Island and closed the Navy's sewage outfall pipe.

Some pollution studies in the NWHI have been performed in areas where conditions and historical use indicate the potential for elevated levels of contaminants (Miao 2000a, Miao 200b, Miao 2001). In addition, the U.S. Navy and USCG conducted investigations to document the scope and extent of contamination at their installations to aid in remediation efforts. Evidence of terrestrial and aquatic contamination is present in wildlife in the NWHI (PCBs, PAHs, lead, and other metals).

There are several point sources of pollution throughout the Monument. It appears that most of the negative effects of these contaminants are localized. Studies are on-going to determine upper trophic level effects of some of the persistent compounds. The remoteness of the NWHI, the low level of development on the islands, and the oceanographic conditions of the region have

ensured that the marine environment remains relatively pristine, as strongly indicated by the health of the coral reef ecosystems in the NWHI. Potentially, the most persistent and significant threat to water quality in the ROI is the vessels that transit the area. Vessel traffic presents the risk of a large oil spill or release of cargo that could greatly impair the marine water quality of the affected environment.

## **2.5.2 Transportation and Communication Infrastructure**

### **2.5.2.1 Introduction/Region of Influence**

The ROI for the marine transportation and communication infrastructure analysis is the area inside the Monument and open ocean areas within the U.S. EEZ, which extends 230 mi (200 nm, 368 km) from land.

### **2.5.2.2 Regulatory Environment**

A number of acts in Congress govern the movements of commercial vessels in specified waterways. These acts include the Ports and Waterways Safety Act (1972), the Port and Tanker Safety Act (1978), and the Oil Pollution Act (1990). However, these acts have little jurisdiction in the open seas. For this reason, the traffic lanes used by commercial vessels transiting the waters surrounding NWHI are the result of vessels following the most direct routes (great circle routes) to and from major ports between the west coast of North America and East Asia (Franklin 2006). The first international law to address submarine cables was the 1884 Convention for the Protection of Submarine Cables. This agreement is still in force today and has provisions to ensure the safety of cable repairs and to prevent interference with and from other ocean uses.

Entering the Monument is prohibited except for passage without interruption, when responding to emergencies, for law enforcement, and activities and exercises of the armed forces (50 CFR, Sections 404.8 and 404.9) or unless permitted under 50 CFR, Sections 404.10 or 404.11. All U.S. vessels passing through the Monument without interruption are subject to the prohibitions in 50 CFR, Sections 404.5, 404.6, and 404.7 and must provide notification prior to entering and after leaving the Monument (50 CFR, Section 404.4 (b)). VMS is required under 50 CFR, Section 404.5 for any vessel that is issued a permit to enter the Monument. Only VMS approved by NOAA's Office of Law Enforcement (OLE) may be used. The USCG may enforce all applicable federal laws within the boundaries of the Monument. The USCG has the authority to enforce Monument regulations and restrictions concerning ship traffic under 14 USC 2 and 14 USC 89. Prohibitions in the Monument regulations do not apply to activities necessary to respond to emergencies threatening life, property, or the environment, or to activities necessary for law enforcement purposes (50 CFR, Section 404.8).

In response to national concern regarding introduction of aquatic nuisance species, the National Invasive Species Act of 1996 was enacted, which reauthorized and amended the Nonindigenous Aquatic Nuisance Prevention and Control Act of 1990.

On December 22, 2006, the Marine Debris Research, Prevention, and Reduction Act was signed into law. The act makes the Marine Debris Program permanent and directs NOAA to work in

conjunction with federal agencies such as EPA and the USCG to identify the origin, location, and projected movement of marine debris within navigable waters of the United States and within the U.S. exclusive economic zone.

### **2.5.2.3 Resources Overview**

On April 3, 2008, the IMO designated the Monument as a PSSA. As part of the PSSA designation process, the IMO adopted U.S. proposals for associated protective measures consisting of (1) expanding and consolidating the six existing recommendatory Areas to be Avoided (ATBA) in the Monument into four larger areas and enlarging the class of vessels to which they apply; and (2) establishing a ship reporting system for vessels transiting the Monument, which is mandatory for ships 300 gross tons or greater that are entering or departing a U.S. port or place and recommended for other ships. The vessel reporting system requires that ships notify the U.S. shore-based authority (i.e., the USCG; NOAA will be receiving all messages associated with this program on behalf of the USCG) at the time they begin transiting the reporting area and again when they exit. Notification is made by e-mail through the Inmarsat-C system or other satellite communication system. It is estimated that almost all commercial vessel traffic will be able to report via Inmarsat-C. The Armed Forces are not subject to the access restrictions and reporting requirements in the Monument when they are conducting activities and exercises. Sovereign immune vessels also are not subject to the reporting requirement, but all vessels are encouraged to participate.

The PSSA and associated protective measures were adopted to provide additional protection to the exceptional natural, cultural and historic resources in the Monument. Requiring vessels to notify NOAA upon entering the reporting area will help make the operators of these vessels aware that they are traveling through a fragile area with potential navigational hazards such as the extensive coral reefs found in many shallow areas of the Monument. The PSSA is now in effect, and the IMO has provided for an effective date for the associated protective measures of May 1, 2008. These measures have been codified in Federal Law (50 CFR Part 404). Sovereign immune vessels are not subject to the reporting requirement but all vessels are encouraged to participate.

### **Vessel Activity**

With the exception of a few small boats at Midway Atoll and Tern Island, no vessels have home ports in the NWHI. For this reason, almost all marine traffic in the waters surrounding the NWHI is made up of Department of Defense vessels conducting training and testing activities, transiting vessels, research vessels, and fishing vessels, with cruise ships, USCG ships, and recreational boats occasionally visiting. An estimated 50 vessels pass through the EEZ surrounding the NWHI each day (Mathers 2005; Franklin 2006). On average, the range of vessel types include 20- to 60-foot fishing and recreational vessels, 150- to 250-foot research vessels, 500- to 700-foot passenger cruise ships and freighters, 700- to 1,000-foot tankers, and USCG, military, and international ships of all sizes and types.

#### ***Research Vessels***

Research vessels have been visiting the NWHI in increasing numbers over the past ten years. However, the number of days spent at sea in the Monument has remained fairly constant over the

last four years (Table 2.5-1). Several research vessels regularly visit the NWHI, including ships operated by NOAA, FWS, the University of Hawai‘i, and private charter vessels. Three vessels in the NOAA fleet operate in the NWHI, the *Oscar Elton Sette*, *Hi‘ialakai*, and *Ka‘imimoana*. The NOAA fleet spends more time within the boundaries of the Monument than any other research organization. Table 2.5-1 shows the number of sea days each NOAA vessel spent in the Monument from 2003 to 2007. These vessels are most active in the NWHI from April through November. They average 200 feet in length, weigh 2,300 tons, and carry 50 crew, researchers, and other staff.

**Table 2.5-1  
Number of Days Spent in the Monument from 2003 to 2007**

NOAA Vessel	Number of Days Spent in the Monument				
	FY 2003	FY 2004	FY 2005	FY 2006	FY 2007
Oscar Elton Sette	80	113	154	177	138
Hi‘ialakai	N/A	18	144	97	120
Charter Vessels	120	120	90	2	2

The University of Hawai‘i has two blue-water research vessels on which it occasionally conducts research in the waters surrounding the NWHI, the R/V *Kilo Moana* and R/V *Kaimikai-O-Kanaloa*. The university conducted research in the Monument twice in 2003 and once in 2004, spending about a month in the Monument on each cruise. There were no cruises to the NWHI planned for University of Hawai‘i ships in 2005 (Winslow 2005).

***Fishing Vessels***

The only commercial fishery occurring in the Monument is the federal bottomfish fishery. This fishery operates according to the management regime specified in the Fishery Management Plan for Bottomfish and Seamount Groundfish Fisheries in the Western Pacific Region. In the NWHI, the bottomfish fishery is a hook and line fishery that targets a range of snappers, jacks, emperors, and groupers that live on the outer reef slopes, seamounts, and banks at depths of approximately 50 to 400 fathoms.<sup>1</sup> The management regime includes several precautionary measures that minimize potential effects of this fishery. For instance, the bottomfishery participants do not operate in the presence of the Hawaiian monk seals so as to avoid any direct or indirect effects of the fishery on the species.<sup>2</sup> Also, it is known that the vessels operations do not negatively affect habitat.<sup>3</sup> Finally, the annual catch limit in the NWHI is set by regulation at 300,000 lbs of bottomfish and 180,000 lbs of pelagic species (50 CFR Part 404). In practice, bottomfish harvest

<sup>1</sup> For a full list of bottomfish management unit species or BMUS, see DEIS Draft Amendment 14 to the Fishery Management Plan for Bottomfish and Seamount Groundfish Fisheries of the Western Pacific Region, June 27, 2007, Table 5.

<sup>2</sup> 50 CFR Part 665.61(2007) Subpart E – Bottomfish and Seamount Groundfish Fisheries and the Endangered Species Act Consultation on the Fishery Management Plan for the Bottomfish and Seamount Groundfish Fisheries in the Western Pacific Region, March 8, 2002.

<sup>3</sup> See the finding of no significant impact for the environmental assessment, “Issuance of a Conservation and Management Permit to the National Marine Fisheries Service Pacific Islands Regional Office for Anchoring in Non-coral Areas by the Northwestern Hawaiian Islands Bottomfish Fishery,” issued July 6, 2007.

is below catch limits and is not thought to affect the status of the bottomfish stocks in the NWHI or throughout the Hawaiian archipelago.

The fishery management plan divides the fishery into two zones, the Mau and Ho‘omaluku. Four vessels fish the Mau zone, which includes areas east of the 165° longitude, and four vessels fish the Ho‘omaluku zone, which includes areas west of the 165° longitude. All vessels offload their catch in Honolulu. A small number of foreign fishing companies use the open seas to the north and south of the EEZ surrounding the NWHI. These companies often fish the open ocean north or south of the EEZ, then transit through the island chain to fish the open ocean on the other side. Foreign fishing vessels in the open ocean also transit the Monument en route to Honolulu (Franklin 2006).

Eight commercial fishing permits are eligible for use in the Monument. The fishermen average 2 to 10 trips per year per vessel, with duration ranging from 3 to 22 days per trip. For the most part, these vessels bottomfish around the atolls and banks at the 100-fathom depth, and troll in deep water and across banks as they transit between islands. Crew size ranges from one to four people. Presidential Proclamation 8031 allows this fishery to continue operating until June 15, 2011 (50 CFR, Section 404.10 [b][3]), at which time the commercial fishery will cease altogether in the Monument.

### ***Cruise Ships***

A small number of cruise ships have visited Sand Island in the Midway Atoll National Wildlife Refuge. The Seven Seas Voyager visited Midway once, and the Pacific Princess visited twice in 2004. In 2005, 2006, and 2007, one cruise ship visited the atoll each year (Maxfield 2007 personal communication). Due to their size and the narrow width of the entrance channel at Midway, as well as port security requirements, cruise ships offload passengers 3 to 4 miles outside the lagoon and transport them ashore in small boats. Cruise ship passengers participate in a guided tour of the historical section of Sand Island led by FWS staff or volunteers. Typically, a cruise ship visit begins in mid-morning, and all passengers have returned to the ship by 4:00 pm. The ship departs the SMA before sunset.

Worldwide, cruise ships constitute a large and growing industry, and like other ships, they present a potential environmental threat to the Monument. Large cruise ships can carry thousands of passengers and crew, producing hundreds of thousands of gallons of wastewater and tons of garbage each day. Monument regulations and permit requirements (which are more restrictive than other open ocean sites) appear to have discouraged cruise ship visits, and none are scheduled for 2008.

### ***Marine Debris Removal Vessels***

The USCG provides ship support for marine debris activities and sends a buoy tender once a year. This mission also serves as a law enforcement patrol. In addition, the USCG may send other ships to the area as needed (Havlik 2005). Since 1997, regular marine debris removal efforts have been conducted through a multi-agency effort led by NOAA, in collaboration with FWS, the State of Hawai‘i, City and County of Honolulu, Honolulu Waste Disposal, USCG, U.S. Navy, University of Hawai‘i Sea Grant College Fund, Schnitzer Steel Hawai‘i Corporation (formerly Hawai‘i Metals Recycling Company), The Ocean Conservancy, and other local agencies, businesses, and nongovernmental partners. Since then, this effort has resulted in the removal of

more than 563 tons (502 metric tons) of derelict fishing gear and other marine debris from the coral reef ecosystems of the NWHI (figure 1.24) and put one ship on the reef. Marine debris survey and collection activities have been conducted at Kure Atoll, Midway Atoll, Pearl and Hermes Atoll, Lisianski Island, Laysan Island, and FFS. Removal operations have targeted areas where marine debris has accumulated over the past several decades. Long-term average accumulation rates are estimated at 45 to 79 tons (40 to 71 metric tons) per year. Until substantial efforts are made to significantly reduce the sources of debris and until debris can be effectively removed at sea, similar amounts are expected to continue accumulating indefinitely in the reef ecosystems of the NWHI.

### ***Native Hawaiian Vessels***

Between 2003 and 2007, several trips for Native Hawaiian cultural practices, education, and documentary film and photography projects were conducted on vessels in the Monument. Vessel size varied, as did anchoring and waste discharge practices. Such trips normally include a representative from FWS or NOAA.

### ***Support Vessels***

FWS maintains permanent facilities on Tern Island at FFS, Sand Island, and Midway Atoll and a field camp at Laysan Island, while NMFS maintains seasonal camps at Pearl and Hermes Atoll and Lisianski Island. A fuel barge makes a port call at Midway once a year, and supply barges provision Midway and the other refuge islands at least twice each year.

The DLNR maintains permanent facilities on Green Island at Kure Atoll. The DLNR does not operate or charter vessels to transport people or supplies to or from the NWHI; instead, it uses other agency vessels to access the Kure Atoll station (Smith 2005).

There are deteriorating deep-water piers to accommodate between two and four large visiting ships. Midway Atoll annually authorizes two supply barges, one fuel barge, and two visiting large ships (NOAA, USCG, university, or charter). There are also deteriorating small boat finger piers and a boat ramp that are exposed to incoming wind chop.

The deep water cargo pier (Pier 1 on charts) is in functional condition and can handle ships up to 450 feet but will need maintenance in the next 3 to 4 years to remain serviceable for the long term. It can safely handle one ship at a time. The fuel pier is in unsafe condition and is no longer operational. Midway Atoll normally has one barge per year associated with ongoing construction projects that brings supplies for those projects and general materials for island operation. With the new fuel farm capacity, FWS expects to have a fuel barge delivery to Midway every 11-14 months, depending on usage. NOAA ships transiting the Monument typically stop at Midway 3 to 5 times per year. FWS maintains a fleet of 11 small boats for routine operational and research needs. These include several 21 to 23-foot fiberglass skiffs and two aluminum SAFE boats, one 23-foot and one 31-foot with a full cabin. Both SAFE boats have full electronic packages, including RADAR. The existing small boat maintenance facility is in poor condition and needs replacement within the next 5 years.

### ***Vessel Routes***

Container ships, bulk carriers, and tankers regularly transit the waters of the Monument. Although it is estimated that 50 vessels transit the EEZ surrounding the Monument each day, most traffic passes to the north of the island chain, following great circle routes to and from ports

on the west coast of North America and East Asia. Occasionally vessels will transit farther south, passing within the Monument. Vessels have been observed using the pass between Pearl and Hermes Atoll and Lisianski Island because it allows vessels to maintain an east-west heading while transiting through the island chain (Franklin 2006). Periodically, accidental loss of cargo overboard causes marine debris or hazardous materials to enter sensitive shallow-water ecosystems.

A preliminary analysis of vessel traffic patterns in the NWHI was performed using positional information collected by the Volunteer Observing Ship program (VOS) from March 2004 to November 2005 (Franklin 2006). The VOS program has collected geo-referenced data from a set of selected non-research vessels that make frequent and regular crossings of all major ocean basins and has provided access to these data through the International Comprehensive Ocean-Atmosphere Data Set (ICOADS; NOAA 2006). The vessel names and call signs collected from ICOADS were then used to search for vessel attributes such as service type, length, and tonnage through the USCG Maritime Information Exchange (USCG 2006). During the 21-month study period, there were 132 vessels that reported from within the Monument. The 132 vessels comprised 104 freighters, 8 tankers, 4 research vessels, 2 passenger vessels, 2 school vessels, 1 recreational vessel, 1 towing vessel (with a 666-foot vessel in tow), and 10 vessels with service unidentified. The mean vessel length was 651 feet, and mean gross tonnage was 43,452 tons. The vessels hailed from 23 countries, with Liberia, Panama, and Germany flying the most common foreign flags. There were 17 U.S.-flagged vessels. The study was limited to vessels participating in the VOS program; therefore, these results do not describe the total vessel traffic through the Monument but rather suggest a limited level of vessel activity over a given time period.

### **Aircraft Activity**

A relatively small number of flights are conducted in the Monument. The MMB agencies charter an average of 27 flights to FFS. Henderson Airfield on Sand Island handles approximately 45 chartered flights to Midway Atoll annually. Aircraft transport goods, materials, and passengers. The USCG conducts regular enforcement overflights, often landing at Midway Atoll for refueling. A few research and management activities associated with remote sensing, mapping, wildlife survey, and marine debris detection may be conducted by aircraft each year.

Henderson Field Airport (PMDY), a 7,900-foot runway, is on Sand Island at Midway Atoll. A contractor maintains the infrastructure associated with the airfield under a base operations service contract with FWS. The airport operator and FWS, as the airport owner, jointly hold and maintain the FAA-issued Part 139 Airport Operating Certificate for PMDY (14 CFR Section 139.3337). The airport provides logistical support for the refuge and is an emergency landing strip for commercial extended twin-engine operation jets that traverse the Pacific. Congress provides partial funding for the operation and maintenance of the airfield because of its function as an emergency landing strip. The USCG also uses the airfield to refuel during fisheries enforcement missions and to evacuate injured crew members from fishing and cargo vessels traveling in the north Pacific. In a 1996 environmental assessment, completed before the FWS took over its management, the airport and its operations were found to have no effects (U.S. Fish and Wildlife Service 1996). As part of continued maintenance of the airport, a new airport building was constructed during 2007 and 2008, and new runway lighting and runway painting

are planned for 2008-2009. Midway's 7,900-foot runway is capable of handling almost any type of aircraft. A new FAA operations center was constructed southwest of the existing hangar in 2007. At least three flights per month bring personnel and supplies to the refuge. The plane seats 19 passengers. A separate charter cargo aircraft is used to bring up to 25,000 lbs of cargo three times per year.

At Pearl and Hermes Atoll, visiting NOAA, USCG, or contract ships are used for cargo and personnel delivery from either Honolulu or Midway. The timing is subject to cruise schedule and berth availability. Ship and field camp small boats are used to shuttle supplies. The field camp has two small boats. The weight of present cargo drop off is 13,000 lbs (12 boat loads); pickup is 5,000 lbs.

FFS accepts eight flights per year for personnel transfers. There is an existing runway and seaplane ramp. The area permits three visiting large ships per year for cargo supplies and personnel transfers. Visiting ships may also deliver limited cargo and personnel depending on schedule and berth availability. Small boats are used to shuttle supplies to the island. The field camp has between two and three small boats.

At Nihoa, Laysan Island, and Lisianski Island, visiting NOAA, USCG, or contract ships are used for cargo and personnel delivery from Honolulu or Midway Atoll. The timing is subject to cruise schedule and berth availability. Small boats are used to shuttle supplies to the island. The weight of present cargo drop-off is 3,000 lbs (3 boat loads); pickup is 3,000 lbs.

### **Communication Infrastructure**

Minimum communication infrastructure exists in the Monument. Before satellite communication, ocean cables were used to transmit data across the Pacific Ocean. In July 1903, the first trans-Pacific cable was completed. It was routed along the NWHI, coming ashore at Midway Atoll. The only actively used cable, the Trans-Pacific Cable No. 1, was installed in 1964 and linked Hawai'i to Guam. The cable runs the length of the island chain from O'ahu to Midway, where it comes ashore. From Midway it continues to Wake Island before terminating in Guam. The cable continues to be used for scientific purposes (ICPC 2004).

A new fiber optic distribution system was constructed during 2006/2007 in the core area of Sand Island, Midway Atoll. The satellite antenna was relocated and refurbished in October 2007. Satellite service was upgraded to T-1, and work to install a new VOIP phone system was completed in March 2008. These upgrades will markedly improve telecommunications for the current island population but do not add capacity for a large population increase.

### **Terrestrial Transportation**

The Midway Atoll interim visitor services plan designates areas that are both open and closed to the public. Closed areas ensure public safety and maximum protection for wildlife. Most roads are open to the public. Trails are listed as closed, open by guided tour only, or open. Trails generally follow existing paths, roads, or the edges of aircraft runways. Visitors are free to walk on paved and gravel roads, walkways, and marked trails, but areas such as the fuel farm and pier,

power plant/utility building complex, construction and rehabilitation sites, and aircraft runways and service areas are off limits to visitors. Bikes and golf carts are also used.

At other islands in the Monument, transportation is almost exclusively on foot.

### **2.5.3 Utilities**

#### **2.5.3.1 Introduction/Region of Influence**

This section addresses issues related to the Proposed Action alternative that are associated with utilities. The ROI is the utilities and infrastructure systems on the islands within the Monument.

#### **2.5.3.2 Resources Overview**

The ROI for the utilities and infrastructure systems in the NWHI are limited to Midway Atoll (Sand Island). Field stations located on FFS, Kure Atoll, and Laysan Island rely on satellite communications and field camp utilities such as solar power and desalinated and imported water. All trash generated is shipped off-island. The following section describes the existing utilities and infrastructure at these field camp-style locations and on Midway Atoll.

#### **Potable Water Supply and Fire Protection**

The drinking water source on Midway Atoll consists of a rainwater collection and distribution system. Rainwater is collected in a pond then pumped to storage tanks following a significant rainfall event. The storage volume is approximately 12,000,000 gallons. A new drinking water treatment system and distribution main were constructed and became operational in October 2005. The design daily use rate for the new system is 100 gallons per day/person, or 20,000 gallons per day total for a design capability of 200 people. This new water distribution pipeline was connected to existing lateral pipes at selected buildings through the core area of town but need to be extended to serve newly constructed or remodeled facilities located outside of the new water main.

The old system was left in place to provide water for fire-fighting activities and to serve the Inner Harbor and Cargo Pier areas. This water is not treated to drinking water standards. The storage tanks in the R-1 area provide water for both the new and old systems, but the old system leaks approximately 10,000 gallons per day, which reduces the stored volume of water.

Drinking and other fresh water at Tern Island, FFS, and Laysan Island is produced by desalination and rain catchment systems. Tern Island has the capacity to hold up to 58,000 gallons of rain catchment water and up to 14,500 gallons of desalination treated water. Rain water is collected from an abandoned tennis court and from the roofs of two large buildings on the island. Drinking water is drawn from a brackish water well for desalination. Laysan has holding tanks for 1,000 gallons of rain catchment water, which is collected from the roofs of the living and working tents, and 110 gallons of desalination treated water, which is drawn from a well. Desalination at both locations is conducted using reverse osmosis equipment.

## **Sanitary Wastewater Management**

The existing sanitary wastewater system at Midway Atoll is composed of central septic tanks and drainfields. Stormwater intrusion and suspected groundwater infiltration has overloaded the current system. Work has been performed to eliminate stormwater intrusion, and a new sewer system and treatment and disposal system have been designed for certain facilities located in the core area of town. The estimated construction cost for a new wastewater treatment system is approximately \$2,000,000. A dispersed septic design is preferred over the existing central septic in sensitive habitat areas and bird nesting sites.

Tern Island has two septic tanks to collect the sewage and wastewater from the barracks. These tanks together hold approximately 3,200 gallons of sewage.

## **Stormwater System**

The Navy designed the existing stormwater system on Sand Island to work in conjunction with the sewage disposal system that simply discharged raw sewage into the ocean. The existing septic/leach field system was installed in 1998 and it connected to the old Navy system. The stormwater component floods the leach field during heavy rainfall events which reduces the long term viability of the system by moving solids into the drainfield. The stormwater system collects runoff from streets and the many buildings on Sand Island that were designed with direct downspout discharge into the drains throughout the island. To minimize the stormwater influx into the leach field, the FWS has been disconnecting building downspouts from the system and reducing the hard surface areas that collect rainfall, allowing for more groundwater percolation.

## **Energy**

Electrical power at Midway Atoll is supplied by a diesel generator power plant. Two generators that operate in automatic duplex mode were installed and began operating in 2005. In most cases, only one generator is needed to meet the island's demand. If one generator exceeds capacity, the second generator automatically comes online and automatically shuts off when electrical demand reduces. The current system for generating electricity is sufficient for the existing population. Midway has two electrical distribution grids. A new electrical distribution grid was constructed and placed into service in 2006. This system serves most of Sand Island. The old grid still provides power to the old airport hangar, the old fuel farm, and the finger pier area. Materials and equipment of the old grid are aging and need replacing. Constructing new developments or renovating existing facilities would require the new grid to be extended.

Tern Island and Laysan Island electrical power systems are primarily supported by photovoltaic systems, and generator power is used in emergencies and to supplement low-sun days, as needed. These systems have been in place for several years and are being upgraded and replaced as funding becomes available.

## **Communication System**

Telecommunication is provided by satellite service. A new fiber optic distribution system was constructed during 2006/2007 in the core area of Sand Island, Midway Atoll. The satellite

antenna was relocated and refurbished in October 2007. Satellite service was upgraded to T-1, and work to install a new VOIP telephone system was completed in March 2008. These upgrades will markedly improve telecommunications for the existing island population but will not add capacity for a large population increase.

Primary communications on Tern Island and Laysan are provided by satellite telephone and associated e-mail service. Single-side band radio is used as a secondary means of communicating with the Honolulu office from these field camps. Currently, Tern Island has high speed internet access through a satellite link provided by NMFS.

### **Solid Waste Management**

Solid waste disposal practices in Midway Atoll include the temporary storage of waste in open plastic containers with periodic collection via stake bed truck. The solid waste is then burned in an oil-fired incinerator, dependent on the availability of waste fuel, or burned in an unlined open-aired pit and ashes are disposed of in the existing landfill/dump. The existing incinerator has been modified to burn waste oil, but the island does not generate enough waste oil to operate the incinerator on a daily basis. Alternatively, daily waste is burned in an open pit. Aluminum cans are collected, compacted and sent to a recycling facility in Hawai'i. Glass is collected, crushed, and buried in the landfill/dump. The existing landfill used for solid waste disposal is limited in its capacity and the types of waste it can safely handle. The landfill, which is only used when an item cannot be incinerated, contains general household/food waste or wood materials.

Because of concerns specific to asbestos and lead in many buildings on Sand Island, any major renovations or remodeling must take worker safety and hazmat disposal into consideration in accordance with appropriate OSHA guidelines.

The Bulky Waste Landfill, located on the south shore of Sand Island, is an uncharacterized landfill that was created by the disposal of scrap metal, used equipment, and unconsolidated waste. This landfill is no longer utilized for waste disposal, but continued monitoring and further remediation may be required. Wastes known to have been deposited in the landfill are metals, gasoline, battery acid, batteries, mercury, lead-based paint, solvents, waste oil, PCBs, dioxins, furans, transmission and brake fluids, vehicles, equipment, tires, and miscellaneous debris (BRAC SI 1996 Volume 1). The landfill is eroding, and soil placed on top is sifting through the debris, causing large holes to open up around the edge and in the center of the landfill. Additionally, burrowing birds are bringing up buried soil and nesting below the cover.

Both Tern and Laysan Islands burn all food and paper waste produced on island. Ashes, plastics, glass, metals, and other non-burnable waste is shipped off island to be disposed of or recycled in Honolulu.

### **Fueling Facilities**

A new fuel tank farm was constructed in 2007 with a capacity of 450,000 gallons. The tank farm stores a sufficient amount of fuel to operate electrical generators, vehicles, and aircraft for a year. Of this total capacity, 100,000 gallons were purchased by the USCG for their use in search and

rescue or law enforcement flights. The USCG and FWS have an interagency agreement that covers this cooperative effort and outlines shared costs.

While Laysan Island has very little need for fuel storage or use (up to 40 gallons per year), Tern Island requires storage of several hundred gallons of gasoline, diesel fuel, and aviation gasoline. All fuel is transported to Tern Island in 55-gallon drums and stored in spill containment lockers. This provides spill containment, shelter from the elements, and minimizes fuel handling by allowing fuel storage and shipment in the same containers. Both FWS and NMFS conduct small boat operations at FFS, which requires separate fuel reserves for each agency.

**CHAPTER 3:**  
**ENVIRONMENTAL EFFECTS**

# CHAPTER 3

## ENVIRONMENTAL EFFECTS

---

### 3.1 INTRODUCTION

This section discusses the potential effects of the Proposed Action on the natural and human environment compared to the No Action alternative. A discussion of cumulative projects and effects is presented in Chapter 4.

Each section in this chapter includes the methods used for effects analysis and a discussion of factors used to determine the significance of direct and indirect effects (40 CFR, Section 1508.8). Direct effects are those that are caused by the Proposed Action and occur at the same time and place. Indirect effects are those caused by the Proposed Action but that occur later or are farther removed in distance from the Proposed Action.

#### 3.1.1 Terminology

To determine whether an effect is significant, Council on Environmental Quality (CEQ) regulations require the consideration of context and intensity of potential effects (40 CFR, Section 1508.27). Context normally refers to the setting, whether local or regional, and intensity refers to the severity of the effect. Effects are categorized as follows:

- Significant – Effects would result in substantial consequences, either “beneficial or adverse” to cultural resources, populations, plant and animal communities within the local area and region, recreation opportunities, or visitor experiences;
- Minor negative effect – Adverse but not significant;
- Beneficial – A positive effect as a result of the Proposed Action; and
- No effect.

The effects analysis assumes that selecting the No Action alternative would maintain the current management regime provided by federal, state, and Monument regulations, and ongoing activities and uses, beneficial or negative, would continue at current levels. It assumes that

effects are presently occurring and would continue to occur under the No Action alternative, but that choosing the No Action alternative would not result in additional effects.

In the effects analyses, effects of the Proposed Action alternative are measured against those of the No Action alternative. A beneficial effect determination means that the Proposed Action would reduce detrimental effects on the natural environment or improve socioeconomic conditions compared to the No Action alternative. How the categories are determined is described in the following subsections for each resource area. A brief summary of the effects is listed at the beginning of each resource section (Sections 3.2 to 3.5).

### **3.1.2 Summary of Effects**

This section provides a summary of potential effects of the Proposed Action on the natural and human environment compared to No Action. The Proposed Action to implement the Monument Management Plan would result, overall, in beneficial effects or no effects on most resource areas compared to the No Action alternative. Short-term negative effects could occur when animals or vegetation are being restored, protected, or enhanced. These effects are inherently of short duration and are limited to the site where the activities occur. Affected resources are expected to return to predisturbance conditions shortly after activity ceases, so this does not constitute a significant effect. In addition, these negative effects are minimized through the use of the BMPs described in Volume III, Appendix F. Therefore, while there may be short-term negative effects as a result of some activities, the long-term beneficial effects almost always offset the negative effects.

Beneficial effects of the Proposed Action on the ecosystem would result from improved planning and coordination of research, monitoring, and management actions by the Co-Trustees, compared to the No Action alternative. Although it is expected that plan implementation will result in overall beneficial effects to the human environment, these beneficial effects do not represent a significant impact. This is because the magnitude of benefits expected to result from plan implementation will be incrementally modest within in the context of the essentially uninhabited pristine lands and waters of the Monument. Research priorities would be developed to address gaps in managing the Monument based on ecosystem principles. There were no significant negative effects found as a result of any of the activities described for the Proposed Action alternative. The Proposed Action's environmental effects are summarized in the following tables: natural resources, (Table 3.2.1), cultural and historic resources (Table 3.3.1), socioeconomic resources (Table 3.4.1) and other resources (water quality, transportation and communications, infrastructure and utilities (Table 3.5.1).

## 3.2 NATURAL RESOURCES

### 3.2.1 Effects Analysis Methodology

In the description of the No Action and Proposed Action alternatives (Chapter 1), activities presented in the Monument Management Plan were divided into three categories: (1) Planning and Administrative, (2) Field, and (3) Infrastructure and Development. Planning and administrative activities are not considered to directly affect natural resources, either because they relate to development of the coordination mechanisms described in the December 2006 MOA and Presidential Proclamation, or they are specifically administrative in nature. However, many activities identified as a result of these planning and administrative actions ultimately would have a direct effect and to the extent adequate information is currently available they are analyzed below. For activities proposed within the Monument or intended to improve management of the Monument, the methodology used to determine the effect on natural resources is as follows:

- Review and evaluate existing and past activities to identify their potential effect on natural resources;
- Review and evaluate activities within the Monument Management Plan to identify their potential to beneficially or negatively affect the ecosystem and its component parts within the Monument; and
- Assess the compliance of each activity within the Monument Management Plan with applicable federal, state, or local laws, regulations, and policies.

In addition, all proposed activities that may affect species protected under the ESA, MMPA, Migratory Bird Treaty Act, or other federal or state law would only proceed after compliance with applicable laws, including as necessary consultation, receipt of permits, and compliance with all permit terms and conditions.

### 3.2.2 Effects Common to Human Interactions with Natural Resources of the Monument

Possible effects from entry to the Monument include (1) effects on nesting and resting seabirds and other migratory birds, (2) effects on Hawaiian monk seals or Hawaiian population of the green turtle swimming and feeding in the nearshore marine environment or resting on beaches, (3) effects on spinner dolphins, (4) effects on fish, cetaceans, marine invertebrates, and corals, (5) effects on Laysan ducks, Nihoa finches, Nihoa millerbirds, and Laysan finches, (6) trampling of native plants and insects, (7) damage to corals, (8) accidental release of pollution and contaminants, and (9) the accidental introduction and establishment of nonnative species. All activities would be designed and managed using BMPs, described in Volume III Appendix F of the Monument Management Plan, to avoid or minimize these effects. However, even with proper management and execution of a well planned project, certain behavioral responses in wildlife may occur that are not easily recognized by the casual observer.

There are a number of adverse consequences, including possible disturbance and mortality, every time a human or humans enter a seabird colony. Human activity or human presence in the Monument could result in detrimental effects which can be characterized as either mechanical,

thermal, or biological in nature. Mechanical effects include accidental crushing of eggs, chicks, or nest burrows and blockage of access to nest sites with gear. They also include equipment and man-made materials brought into the colony which may result in collisions or entanglement, and artificial lights at night which increase collision hazards by disorienting flying birds. Thermal effects can occur to either the eggs and/or very young chicks of seabirds that are vulnerable to exposure. Thermal stress could occur if attending adults are flushed from the nest and kept away for more than 3 minutes, so human activities that require staying in one place and in proximity to the bird nests are hazardous to birds and their young nesting in the vicinity of the operation. Biological effects include negative interspecies interactions between birds. These may be exacerbated by human presence in the colony in cases where an incubating bird is frightened away from its nest and the egg or hatchling is preyed upon by another species. If young ground-nesting terns (<1 week of age) flee their nest-site when humans approach, they may not be able to find their way back and could starve. The MBTA prohibits many of the aforementioned effects.

Stress reactions (elevated heart rate, elevated levels of corticosterone, and behavioral responses) have been documented in several species of nesting seabirds at several ecotourism locations as a result of human activities in nesting colonies (Jungius and Mirsch 1979; Fowler 1995; Nimon et al. 1995; Kitaysky et al. 2003). However, no studies have been conducted to document cumulative effects of human disturbance. Participants observing albatrosses, terns, boobies, Laysan ducks, or other species in the less visited areas could have the potential of greatly elevating stress hormone levels if the duration of the disturbance is excessive. Kitaysky et al. (2003) showed that limited-duration disturbance, however, has only minor, short-term effects. For this reason, BMPs for access would be implemented.

BMPs to avoid or minimize effects on seabirds and to limit access (See Monument Management Plan, Volume III, Appendix F) require several actions. These include when a person first approaches a seabird colony they must look for any nests or for adults flushing from inconspicuous nests. Searching for nests before approaching an area and avoiding any nests will increase protection for the birds and minimize effects from disturbance. Also, all activities would be planned to avoid displacing adults from their eggs or chicks for any longer than 3 minutes. Planning such as timing maintenance work for periods when the fewest birds are in the area or during non-seasonal windows is also important. In addition, BMPs include restricting observation periods for any particular bird or group of birds to 15 minutes or less (though observations occurring from a blind can continue for up to 1 hour) and incorporating quarantine protocols. It is important to note that even wildlife photography by professionals or amateurs can often be disturbing depending on the manner in which it is pursued. Another method to reduce the effects of human operations is in advance of the planned work, to exclude that season's nesting birds by laying down geotextile fabric that prevents seabirds from burrowing or nest-building, as well as applying special terms and conditions in the Monument permitting process.

Human activities have played a major role in determining the status and population trends of Hawaiian monk seals over the past two centuries (Ragen 1997). From the 1960s to the 1990s, decreases in Hawaiian monk seal populations at several locations (French Frigate Shoals, Midway Atoll, and Kure Atoll) have been associated with human disturbance (Gerrodette and

Gilmartin 1990). Recreational beach activities caused Hawaiian monk seals to alter their pupping and hauling patterns, and survival of pups in suboptimal habitats was low, leading to gradual population declines (Kenyon 1972). Human activity and disturbance caused substantial declines at Midway Atoll (Kenyon 1972). Beach counts of Hawaiian monk seals at Midway Atoll averaged 56 animals in the late 1950s, but declined severely by the late 1960s, with only a single seal observed during an aerial survey in 1968. It is clear from these examples that Hawaiian monk seals are very sensitive to disturbance, and proposed activities would be carefully reviewed and, as appropriate, restricted so no further effects on seals would occur.

All water and land activities could continue to be conducted in accordance with BMPs (See Monument Management Plan, Volume III, Appendix F) that avoid the potential for any effects on protected species. For example, should a Hawaiian monk seal or other listed species be observed during a dive trip or operations by humans, the standard procedure is to cease all activity until the animal departs the area. These procedures have been implemented for decades, with the result being no effects on listed wildlife, and only minimal disturbance with no lasting effects on other wildlife (such as to fish that may temporarily avoid or aggregate around divers).

Increased use of Monument waters also increases the potential for introductions of nonnative species, and the potential for negative interactions between humans and Hawaiian monk seals, sea turtles, spinner dolphins, cetaceans, and live corals. Data from research cruises in 2000, 2002 and 2003 have confirmed that at least 11 invasive species of fish, invertebrates and algae have been established in the NWHI. These introductions can have negative short and long-term effects on native species and ecosystems. Any action of pursuit or annoyance from boats potentially disturbs marine mammals in the wild by causing disruption of their behavioral patterns or displacement from essential habitat areas, especially if the cetaceans or seals are in a resting phase (Bejder et al. 1999) and these activities are prohibited under the MMPA. Snorkel or dive operations also include the added risk of damaging living coral (Hawkins et al. 1999). Improper boat operation could result in significant localized effects on the coral reef from repeated anchoring, touching, standing, or other avoidable physical disturbance to the coral.

Maintenance and repair for management operations at all sites where seasonal or year-round personnel reside may sometimes temporarily disturb or displace nesting seabirds or native plants. Examples of these activities are painting, maintaining septic and wastewater systems, keeping runways, roads, and trails clear, and repairing structures and real property assets. These effects are reduced by using standard BMPs, such as timing maintenance work for periods when the fewest birds are nesting in the area. Another method to reduce the effects of operations is, in advance of the planned work, to exclude that season's nesting birds by laying down geotextile fabric that prevents seabirds from burrowing or nest-building.

BMPs used to reduce the risk of bird air strike vary between Midway and French Frigate Shoals because of different species compositions of seabird colonies next to the runways, different types of aircraft used at the two sites, and different constraints based on the runway facilities at each site. The two million seabirds that use Midway during the peak season make aircraft flights to the island potentially hazardous to both the birds and the aircraft personnel. Both Laysan and black-footed albatross use the runway as a soaring area on their way to feed during the day. However, bird use of the runway declines dramatically at night (363 versus 6 seabird runway

crosses per minute, according to Dolbeer and Arrington [1996]), so night flights have a greatly reduced chance of hitting birds (Kenyon et al. 1958). During the primary albatross season, i.e. November through July, flights are scheduled to arrive and depart after dark, thus minimizing effects on albatross and other seabirds (U.S. Fish and Wildlife Service 2004b). During August, September, and October, flights arrive during the day and may occasionally hit a white tern or brown noddy (U.S. Fish and Wildlife, No date). It is not possible to reduce the bird strike risk at Henderson Airfield to zero at any time of day or year, short of suspending all administrative and nonadministrative flight operations. However, the overall effects on natural resources becomes minimal with the small number of annual flights to the island, the requirement of night flights for most of the year, management of lights, advisory to pilots regarding flight paths, and runway clearing. Additionally, vegetation management along the runways modifies bird flight and nesting behavior, and therefore the runway is swept before each flight arrival or departure to remove or disperse birds.

At Tern Island and French Frigate Shoals, the species most commonly killed during aircraft operations is the sooty tern, but occasionally wedge-tailed shearwaters, great frigatebirds, and both species of albatross are also hit. Tern Island does not have runway lights, so all operations are done during daylight. Just before landings and takeoffs, all the staff members on the island frighten birds way from the runway. Flight activities could have a minor negative effect on migratory birds because of increased noise disturbance and potential air strike interaction. However, they also have a beneficial effect on all natural resources by facilitating management actions that benefit wildlife and habitats.

### **3.2.3 No Action**

This section briefly describes activities that are currently under way in the Monument and provides analysis of the effects associated with these activities. Only those activities that could have an effect on natural resources are included in the analysis. The analysis describes the projected beneficial and negative effects that could be expected to continue under the No Action alternative, should this alternative be selected for implementation. Implementation of the No Action alternative could result in no change to the current situation; however, current activities could continue under the Proposed Action alternative, and their effects are summarized under the Proposed Action in Table 3.2-1 at the end of this section.

#### **3.2.3.1 Understanding and Interpreting the Northwestern Hawaiian Islands**

##### **Maritime Heritage Action Plan**

###### ***Planning and Administrative Activities***

As part of the No Action alternative, efforts are under way to plan for conservation of selected maritime artifacts (MH-1.4). Artifacts would be recovered only when this activity can proceed in a manner that respects the integrity of the ecosystem and the goals of the Monument. These activities could have a short-term minor negative effect on terrestrial and marine native species and habitat during recovery actions due to land disturbance, human disturbance, and noise. Operations to recover maritime heritage artifacts occur over a short period of time, and once the recovery is completed, the disturbed areas would be restored as part of BMPs.

***Field Activity***

The effort to monitor, map, and characterize existing resources includes maritime heritage as well as biological and ecological resources are identified in activity MH-1.2. Shoreline terrestrial surveys and inventories, marine remote sensing using magnetometer, and side-scan sonar would continue to be used to locate potential maritime heritage targets, and noninvasive diving surveys would continue for assessing and inventorying sites. All in-water and on-land activities are and would continue to be conducted in accordance with BMPs (See Monument Management Plan, Volume III, Appendix F) that avoid the potential for any effects on threatened and endangered species. For example, should a Hawaiian monk seal or other listed species be observed during a dive, the standard procedure is to cease all activity until the animal departs the area. In addition, any person who encounters a Hawaiian monk seal on a beach while conducting an activity not related to Hawaiian monk seal population monitoring and recovery actions must not come within 150 feet (46 meters) of the seal. The 150 foot (46 meter) buffer around these animals is a general minimum distance, but for certain activities greater distance may be necessary to avoid take. These BMPs have been in effect for decades to avoid negative effects on the Hawaiian monk seal. The agencies also commit to consultation under either the ESA or the MMPA before beginning any action that could affect any marine mammal or federally listed species or designated critical habitat.

Prior to implementation of this activity, additional compliance may be required. There may be a short-term minor negative effect on threatened and endangered species, migratory birds, and marine species from vessels and diver presence during annual maritime heritage field surveys. However, affected individuals could be expected to resume normal behavior within a short period of time, with no lasting negative effects. (See section 3.2.2 for detailed discussion of effects.) The agencies also commit to consultation under either the ESA or the MMPA before beginning any action that could affect any marine mammal or federally listed species or designated critical habitat.

**3.2.3.2 Conserving Wildlife and Habitats****Threatened and Endangered Species Action Plan*****Planning and Administrative Activities***

Plans are under way for education, training, and regular interaction with species and habitat experts to build the capacity of the consulting agencies to conduct consultations and coordinate with action agencies (TES-8.3). NMFS and FWS will investigate the possibility to provide targeted workshops explaining the requirements for project specific and programmatic ESA consultations and work with partners to develop "best practices" and other protocols to avoid effects on listed species and habitats. Implementation of these best practices and protocols developed during the workshops would impose conditions on all future activities for additional protection of listed species and habitat, resulting in long-term beneficial effects on natural resources of the Monument.

***Field Activities***

The No Action alternative includes efforts to reduce marine debris within the Monument and to continue with large-scale efforts to remove debris from critical aquatic habitats (TES-1.1).

There could be short-term minor negative effects on seabirds from boats and humans during marine debris removal activities. Common effects that occur when humans enter a seabird colony are discussed in section 3.2.2. These effects could be reduced by adhering to operational protocols and implementing standard BMPs (see Volume III, Appendix F). However, there could be an overall beneficial effect on the endangered Hawaiian monk seal by reducing injuries and mortality from entanglement in marine debris. Entanglements of migratory birds could also decrease. Marine habitat could benefit from minimizing damage to coral and other marine species from scouring by tangled nets.

Annual spinner dolphin mark/recapture photo identification surveys would be continued at Midway, Kure, and Pearl and Hermes Atolls (TES-2.2) under the No Action alternative. Understanding the population trends of this species could aid in evaluating the success of management activities. Being able to adapt management actions based on real-time data could allow managers to make changes more quickly and could ultimately benefit spinner dolphin populations.

Activities in place to conserve green turtle nesting and basking habitat (TES- 3.2) through the use of BMPs (see Monument Management Plan, Volume III, Appendix F) currently prevent the introduction of mammalian predators on eggs and hatchlings, reduce artificial lighting near nesting beaches, prohibit undesirable habitat alteration, and control human access. Limited-entry policies would be continued, and human activities would be strictly regulated at islands and reefs used by the Hawaiian population of green turtles. Implementation of these activities would comply with ESA recovery permits that include terms and conditions to avoid or minimize effects. Protection and management of nesting habitats could increase nesting success for the green turtle, resulting in long-term beneficial effects on green turtle populations.

Laysan duck population monitoring on Laysan Island and Midway Atoll would continue through mark-recapture and monitoring of reproductive success and survival, disease screening and prevention to avoid translocation of unhealthy individuals, and genetics research to prevent loss of genetic diversity during population translocation (TES-5.1). During mark-recapture and recovery efforts, handling and marking individual ducks could disturb individual organisms, possibly causing them to temporarily leave a nest or other habitat, discontinue feeding, preening, basking or other behavior. While mark-recapture activities may disturb individuals of a population, resulting in short-term negative effects, the long-term beneficial effects of increasing the number and health of the entire population of Laysan ducks would more than offset the short-term negative effects.

Monitoring is a critical element and could be used for adaptive management. Before monitoring takes place, all necessary compliance requirements would be completed. During monitoring, trampled vegetation, human presence, and noise could have short-term minor negative effects on native habitat and could disturb other bird species present. Every effort would be made to minimize effects, and affected individuals would be expected to resume normal behavior within a short period, with no lasting negative effects.

Annual censuses of passerine populations and monitoring of their food and habitat would continue under the No Action alternative. This includes monitoring the status of native plant and

terrestrial invertebrate populations (TES-6.1). This could result in a long-term beneficial effect on passerines by enabling managers to identify changes in population dynamics early so that additional management activities could be implemented to preserve passerine populations. Field activities associated with monitoring passerines could have a short-term minor negative effect on passerine birds and native habitat through human presence and minor trampling of vegetation. These effects could be reduced by adhering to the operational protocols and implementing standard BMPs (see Volume III, Appendix F). Endangered passerines in the Monument (Nihoa finches, Nihoa millerbirds, and Laysan finches) are inquisitive and exploratory and thus can be at risk from human materials and equipment on their breeding islands; for example, curious birds can drown in open containers, such as buckets and cooking pots that catch rainwater; strings, netting, and loose fibers on tarps can entangle their feet; tent openings can attract birds, which become trapped and succumb to overheating. All activities would be planned to ensure that tent openings would remain tightly closed, and the types of materials described above would not be left unattended in campsites at Nihoa, Laysan Island, and Pearl and Hermes Atoll. In addition, the agencies would commit to consultation under the ESA, or MMPA, as appropriate, for any action began that could affect any bird, marine mammal, federal listed species, or designated critical habitat.

Activity TES-7.3 continues actions for the preparations necessary for the establishment of a self-sustaining *Pritchardia remota* population on Laysan Island, including eliminating alien species (TES-7.3). Seeds of native species, e.g., *Pritchardia remota* and *Mariscus pennatiformis*, would continue to be collected from the wild (taking no more than 15 percent of the seeds from any one plant) and reared in a greenhouse on Laysan Island. Strict protocols are followed during seed collection and propagation to avoid transport of pests, diseases, and pathogens. The Monument staff would also continue to propagate approved seed sources collected on Laysan Island in the greenhouse on Sand Island (TES-7.4). These activities could result in a beneficial effect on threatened and endangered species, native habitat, and migratory and passerine birds that use the habitat for cover, nesting, and feeding because they would provide high value habitat to the species that use these fauna and thus would be an important part of the overall protection of the species. To protect *Pritchardia remota* from catastrophic events and achieve recovery objectives, this species is being established outside its known native range on Laysan Island and Eastern and Sand Islands at Midway Atoll (TES-7.5). Effects on native species and risk of hybridization with closely related species would be evaluated before sites are chosen and species are translocated. The goal is to create three colonies with at least 100 mature individuals per colony. In addition, during restoration the actions of replacing vegetation, human presence, and increased noise could have a short-term minor negative effect on native habitat and could disturb other bird species. (Common effects that occur when humans enter a seabird colony are discussed in Section 3.2.2.) Every effort would be made to minimize effects, and affected individuals would be expected to resume normal behavior within a short period, with no lasting negative effects.

## **Migratory Birds Action Plan**

### ***Planning and Administrative***

The Monument staff will work with partners to reduce the effect of commercial and sport fisheries outside the Monument on migratory bird populations (MB-2.5). The black-footed

albatross and Laysan albatross that nest almost exclusively in the Monument are most affected by bycatch mortality (Flint 2004). The FWS, NMFS, and the Regional Fisheries Management Councils have worked cooperatively to implement the National Plan of Action to reduce seabird bycatch, which has reduced mortality from the U.S. based commercial fleet. The agencies are working to extend these efforts to reduce mortality from foreign-based fishing fleets. Continued implementation of this plan could reduce incidents of bycatch mortality in fisheries inside and outside the Monument, resulting in long-term beneficial effects on migratory bird populations in general and the black-footed albatross and Laysan albatross in particular.

## Habitat Management and Conservation Action Plan

### *Field Activities*

Efforts are under way to collect and “fingerprint” oil found washed ashore and on wildlife from mystery spills to determine its origin and build an oil sample archive for possible use as evidence to assign liability (HMC-2.5). The ability to identify the primary sources of oil spilled into the marine environment could provide knowledge needed for developing measures to prevent future spills, thereby reducing the number of future spills, which could lessen the overall effects of oil in the long term. Fingerprinting the source could also provide potential funding as the vessel owners could be made to pay for the spill and cleanup, as is standard if proof can be made, which would provide more income for conservation actions. However, it is important to note that none of these post spill practices outweigh the detrimental effects of oil in the marine environment. Past experience in similar circumstances indicate there are beneficial effects on ocean, nearshore, and shoreline habitats to be had by reducing illness and death of associated marine species that use these habitats (including threatened and endangered species, migratory and resident birds, and marine mammals), and by minimizing the fouling of plants in the nearshore and shoreline beaches.

Under the No Action alternative, monitoring would continue in the area at Laysan Island that was contaminated by the insecticide carbofuran (HMC-2-6). Carbofuran was causing mortalities in carrion flies and ghost crabs at a beach crest site at Laysan Island. The area was cleaned and treated on-site. Continued monitoring to detect evidence of carbofuran resurfacing at Laysan Island would provide managers with the necessary information to quickly institute a cleanup plan to prevent or minimize any future losses. This could result in a long-term beneficial effect on endangered Laysan finches, the dune habitat, and associated insects and other arthropods on Laysan Island.

A plan is in place to propagate and outplant native species, chosen on the basis of historical records at Midway and historical and pollen records from Laysan Island, on 250 acres of vegetated area at Midway Atoll, focusing on the original footprint of the islets of Midway Atoll. Target species for outplanting include bunchgrass (*Eragrostis variabilis*), naupaka (*Scaevola sericea*), morning glory (*Ipomoea pes caprae* and *I. indica*), *Solanum nelsonii*, *Capparus sandwichiana*, *Chenopodium oahuense*, and *Lepidium bidentatum* (HMC-4.1). The restoration of native habitats through propagating and outplanting native species on Midway Atoll could result in long-term beneficial effects on threatened and endangered species, migratory birds, and other native plants and insects. During restoration, the actions of replacing vegetation, human presence, and increased noise could have a short-term minor negative effect on native habitat

and/or could disturb other bird species. Common effects that occur when humans enter a seabird colony are explained in Section 3.2.2. Every effort would be made to minimize effects, and affected individuals would be expected to resume normal behavior within a short period, with no lasting negative effects. In addition, the agencies would commit to consultation under the ESA or MMPA, as appropriate, before any action began that could affect any marine mammal or federally listed species or designated critical habitat.

Current efforts to reestablish 60 acres of native shrub community on Laysan Island would continue under activity HMC-4.3. Reestablishing native shrubs is preceding the removal of the alien plant *Pluchea indica* to avoid an interim loss of nesting substrate for red-footed boobies, great frigatebirds, and black noddies. The restoration effort on Laysan Island would continue to focus on restoring plants, terrestrial arthropods, and avian components of the biological community that occurred before human contact. Reestablishing the native shrub community could result in a beneficial effect on threatened and endangered species, migratory birds, terrestrial arthropods, and native habitat by expanding and improving the quality of habitat. During restoration, human presence and increased noise could have a short-term, minor negative effect on native habitat and could also disturb other bird species. These effects could be reduced by adhering to operational protocols and by implementing standard BMPs (see Volume III, Appendix F). Endangered Laysan finches are inquisitive and exploratory and thus can be at risk from human materials and equipment on their breeding islands; for example, curious birds can drown in open containers, such as buckets and cooking pots that catch rainwater; strings, netting, and loose fibers on tarps can entangle their feet; tent openings can attract birds, which become trapped and succumb to overheating. All activities would be planned to ensure that tent openings would remain tightly closed, and the types of materials described above would not be left unattended. Common effects that occur when humans enter a seabird colony are explained in Section 3.2.2. Every effort would be made to minimize effects, and affected individuals would be expected to resume normal behavior within a short period, with no lasting negative effects. In addition, the agencies commit to consultation under the ESA and MMPA, as appropriate, before beginning any action that could affect any marine mammal or federally listed species or designated critical habitat.

Changes in species composition and structure of the coastal shrub and mixed grass communities on basaltic islands in the Monument would continue to be monitored under activity HMC-4.7. Field activities associated with monitoring vegetation communities could have a short-term minor negative effect on seabirds and native habitat through human presence and minor trampling of vegetation. Common effects that occur when humans enter a seabird colony are explained in Section 3.2.2. These effects could be reduced by adhering to operational protocols and implementation of standard BMPs (see Volume III, Appendix F). Endangered passerines on Nihoa (Nihoa finches, Nihoa millerbirds,) are inquisitive and exploratory and thus can be at risk from human materials and equipment on their breeding islands; for example, curious birds can drown in open containers, such as buckets and cooking pots that catch rainwater; strings, netting, and loose fibers on tarps can entangle their feet; tent openings can attract birds, which become trapped and succumb to overheating. All activities would be planned to ensure that tent openings would remain tightly closed, and the types of materials described above would not be left unattended in campsites at Nihoa, Laysan Island, and Pearl and Hermes Atoll to avoid effects on these species. Every effort would be made to minimize effects, and affected individuals

would be expected to resume normal behavior within a short period after the activity has ended, with no lasting negative effects. In addition, the agencies would commit to consultation under the ESA or MMPA, as appropriate, before any action that could affect any marine mammal or federally listed species or designated critical habitat. Monitoring data could be used to determine future needs through adaptive management, resulting in a beneficial effect on the coastal shrub and mixed grass communities.

Under activity HMC-6.1, water quality monitoring would continue, including monitoring water level, salinity, and other water quality parameters of Laysan Lake and mudflats on Laysan Island and ‘ākulikuli (*Sesuvium portulacastrum*) flats at Southeast Island, Pearl and Hermes Atoll, and Spit Island at Midway Atoll, and documenting any loss of lake area. Monitoring changes in such environmental factors as lake water level and salinity currently provide data used to plan restoration and to assess its efficacy. As needed, dune habitat on Laysan Island would be restored to stabilize movement if lake loss started to occur, as identified in activity HMC-6.2. Common effects that occur when humans enter a seabird colony are explained in Section 3.2.2. Overall, these activities listed above could result in a beneficial effect on threatened and endangered species, migratory and passerine birds, and native vegetation by protecting existing freshwater and saline water sources, and by reducing lake loss from encroaching dunes. There could be short-term minor negative effects on species, such as migratory shorebirds and Laysan ducks, using the mudflats and lakes due to human disturbance during monitoring. However, affected individuals would be expected to resume normal behavior within a short period, with no lasting effects once the activity was finished assuming aforementioned BMPs would be in place. In addition the agencies would commit to consultation under the ESA or MMPA, as appropriate, before any action that could affect any marine mammal or federally listed species or designated critical habitat.

### 3.2.3.3 Reducing Threats to Monument Resources

#### Alien Species Action Plan

##### *Field Activities*

Under activity AS-3.2, hull inspection and cleaning of all vessels, SCUBA gear, marine construction material, and instruments deployed in the Monument would continue to be required. Current quarantine protocols to prevent the introduction of invasive terrestrial species to the Monument would continue under activity AS-3.1. The absence of activities to adequately control and eradicate invasive species, such as *Verbesina* sp., grey bird locust, and house mouse, would cause negative effects on migratory birds, endangered plant and bird species, and other native species and their habitats. Requiring hull inspections and following quarantine protocols would greatly reduce the potential to introduce invasive species into the Monument. Reducing competition with and predation by invasive species would protect the health and condition of all habitat and species in the Monument and would have a beneficial effect on these resources.

#### Maritime Transportation and Aviation Action Plan

##### *Infrastructure Development Activities*

Efforts would continue to encourage the energy and water efficiency of vessels operating in the Monument under activity MTA-2.4. For example, the NOAA ship Hi‘ialakai began a recycling

program and installed water-saving devices to reduce inputs to the Monument as much as possible. Plans are in place to test the use of biofuels and nonpetroleum-based hydraulic fluid. Increased efficiency would not have a direct beneficial effect on natural resources, but as global habitats and resources are conserved, indirect beneficial effects on natural resources would result.

#### **3.2.3.4 Managing Human Uses**

##### **Permit Action Plan**

###### ***Planning and Administrative Activities***

Coordination of appropriate environmental review for all permitted activities would continue under activity P-1.3. Permitting activities would ensure that permittees are aware of all protocols and operating requirements, and the required environmental review of all proposed activities would assess any potential effects of the activities on the resources of the Monument.

Coordinating appropriate environmental review to consider the effects of both federal and state actions could result in a beneficial effect by protecting the natural resources of the Monument.

##### **Enforcement Action Plan**

###### ***Planning and Administrative Activities***

Under the No Action alternative, operation of the VMS for all permitted vessels (EN-2.2) would continue. Additional automated monitoring systems and ship reporting systems for all vessels transiting the Monument would continue to be integrated under activity EN-2.3. In addition regulations briefings in pre-access training required for all Monument users would continue (EN-3.1). The ability to monitor all permitted vessels transiting the Monument would allow enforcement personnel to ensure vessels are following procedures identified in the pre-access training and are operating within their permit area. Additionally, enforcement personnel would be able to respond quickly to vessels engaged in activities that constitute a violation. This could result in a beneficial effect on all resources of the Monument by reducing the potential of vessel groundings vessel dumping, oil spills, etc.

##### **Midway Atoll Visitors Services Action Plan**

###### ***Planning and Administrative Activities***

Activity VS-2.2 includes visitor services specialists and Midway Atoll staff continuing to review the visitor program every two years. The team would review the visitor services to evaluate whether the program is meeting its objectives. This information would inform on such planning decisions as the extent of visitor interactions with wildlife that would be permitted in the future. Reviewing the visitor program every two years would provide a consistent and relatively frequent way to identify potential problems with any existing planning actions and also allows for changes to be made to the plan to additionally minimize any effects visitors might have on the Monument's natural resources, resulting in a long term beneficial effect. The effects of implementing the Interim Midway Atoll Visitor's Plan are evaluated in the associated final EA for the Interim Visitor Services Plan (U.S. Fish and Wildlife Service 2007b). That document may be found at <http://www.fws.gov/midway/VSP/AppendixG.pdf> and is incorporated by

reference herein. The effects of the No Action alternative are the same as those set out in the EA for the Interim Plan.

### **3.2.3.5 Coordinating Conservation and Management Activities**

#### **Constituency Building and Outreach Action Plans**

##### ***Planning and Administrative Activities***

Under activity CBO-1.2 the Monument staff would continue to refine and implement the Monument Media Communications Protocol to engage news media in informing the public about the Monument's natural, cultural, and historic resources and on-going activities. The MMB agencies would continue seeking out and participating in events that reach a broader audience and provide constituents with knowledge of the Monument (CBO-3.1). The Monument staff would continue participating in the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve Advisory Council through NOAA's ONMS until the Monument Alliance is established (CBO-3.8). Engaging Monument constituencies through integrated communications and interactive experiences could result in a beneficial effect on the Monument's natural resources because Monument staff, MMB agencies and members of the Council would be able to more easily provide input from stakeholders and to share information that might be useful in managing natural resources and supporting future programs.

#### **Ocean Ecosystems Literacy Action Plan**

##### ***Planning and Administrative Activities***

At least four teacher workshops per year would be conducted in the main Hawaiian Islands to introduce and support the elementary school and middle school and high school environmental education programs (OEL-1.4). Teacher workshops could increase awareness of the importance of natural resources among teachers and students alike, and possibly among students' families, and would likely increase interest in the Monument and generate support for conservation of its resources. These workshops could result in a beneficial effect on Monument natural resources by creating opportunities to expand public involvement in, enhancing cultural awareness of, and increasing support for protection and restoration efforts, including volunteer participation in Monument activities.

### **3.2.4 Proposed Action**

This section describes the effects of the activities that would be conducted under the Proposed Action. Those activities described above for the No Action alternative, and their beneficial and negative effects, would continue. The effects of the Proposed Action are summarized in Table 3.2-1 and include those effects that would occur with the continuation of actions described in the No Action alternative.

In the subsections that follow, the component activities of the Proposed Action are briefly described, followed by a discussion of the effects of each activity.

### 3.2.4.1 Understanding and Interpreting the Northwestern Hawaiian Islands

#### Marine Conservation Science Action Plan

##### *Field Activities*

The Proposed Action alternative includes measuring connectivity and genetic diversity of key species to compare the similarity or differences of populations (MCS-1.5). Understanding the genetic diversity of species groups, and the way in which the populations in areas change could be helpful to forecast, prepare for and mediate potential threats to populations within the Monument. The Monument staff would implement management-driven research priorities identified in the Monument Natural Resources Science Plan under activity MCS-2.4, which would include monitoring both marine and terrestrial environments. Before implementing this activity, additional compliance might be required. Establishing research priorities would allow researchers to focus on and evaluate areas of greatest importance to the health and protection of the Monument, thereby more effectively applying needed resources to the most critical areas, resulting in long-term beneficial effects on ocean and nearshore habitats. These data could also feed into an adaptive management strategy to improve research results.

#### Native Hawaiian Culture and History Action Plan

##### *Planning and Administrative Activities*

The Proposed Action alternative includes the preparation of a Cultural Resources Program Plan (NHCH-4.1) and the integration of Native Hawaiian values and cultural information into general outreach and education programs (NHCH-5.1). The Proposed Action also calls for the development of a culturally based strategy for education and outreach to the Native Hawaiian community (NHCH-5.2) and integration of Native Hawaiian values and cultural information into Monument permittee education and outreach program (NHCH-5.3). Native Hawaiian culture and history activities proposed under the NHCH Action Plan would increase access to Monument islands for observing Native Hawaiian cultural practices. These activities may result in effects such as temporary disturbance or displacement of native wildlife and plants. Common effects that occur when humans enter a seabird colony are discussed in Section 3.2.2. These short-term minor negative effects are reduced by using BMPs mentioned in Section 3.2.2. These activities would also educate the public as to the importance of the natural environment to Native Hawaiian culture and would ensure that efforts to maintain and restore the natural environment within the Monument take into account traditional Native Hawaiian values and culture. Native Hawaiians and the general public would see that conservation management and respect for traditional beliefs and practices can work together. This in turn could generate greater public support efforts to maintain, restore, and protect the environment, resulting in a beneficial effect on the natural resources within the Monument.

#### Historic Resources Action Plan

##### *Planning and Administrative Activities*

Activity HR-1.1 proposes to reconcile the Historic Preservation Plan with the Midway Visitor Service Plan, lead-based paint abatement plan, and other facilities maintenance and use plans. HR-1.2 proposes to submit the updated Historic Preservation Plan for approval to the Advisory Council on Historic Preservation and Monument partners, and activity HR-2.1 proposes that

within three years, a dedicated capacity to implement the updated Historic Preservation Plan would be created. The Proposed Action alternative proposes to train Monument staff and the Midway contractors annually on the content of the Historic Preservation Plan and implementation of appropriate treatments (HR-2.2). The Historic Preservation Plan includes protocols for not only carrying out historic resource preservation and restoration activities but protocols to ensure that actions taken as part of the plan would be done to avoid any effects on protected species and generally to minimize effects on the Monument's natural resources. The removal of the lead-based paint from buildings and adjacent soil, and following the protocols to minimize effects of preservation and restoration work, would result in a beneficial effect on all natural resources, including on threatened and endangered species and terrestrial habitats. It is estimated that over the life of the project, 6,745 to 9,900 Laysan albatross chicks would be saved from lead poisoning a year (Finkelstein 2006).

### **Maritime Heritage Action Plan**

#### ***Planning and Administrative Activities***

A status report on potential environmental hazards would be completed within a year and updated annually under activity MH-1.3. This activity would identify wreck sites and other debris that represent potential environmental hazards, such as leaking fuel, debris-containing hazardous material, and debris with unknown contaminants. The plan not only identifies these sites but identifies plans for containment, cleanup, removal, and remediation to minimize the potential contamination to ocean, nearshore, and shoreline habitats. The long-term beneficial effects of implementing the plan are to protect and improve the health of these habitats and the species found there, including threatened and endangered species, marine mammals, and migratory birds.

#### **3.2.4.2 Conserving Wildlife and Habitats**

##### **Threatened and Endangered Species Action Plan**

#### ***Planning and Administrative Activities***

Activities that are proposed under the Threatened and Endangered Species Action Plan include planning activities designed to conserve Hawaiian monk seal habitat (TES-1.3) and to reduce the likelihood and effect of human interactions on monk seals (TES-1.4). Before these activities were implemented, additional compliance might be required. The goal of these proposed activities is to restore seal habitat for resting, breeding, and rearing pups and to educate Monument users on proper implementation of standard operating protocols and BMPs (see Monument Management Plan, Volume III, Appendix F). These activities could have a beneficial effect on the endangered Hawaiian monk seal by improving the health of adults and improving breeding success and juvenile survival rates. In addition, using existing BMPs to control activities and reduce disturbance along the beaches could provide benefits to other species as well, such as migratory birds using these areas for nesting and feeding.

Activity TES-1.5 includes actions that would support outreach and education on Hawaiian monk seals. Educating the public and interest groups with information to understand the critical status of the Hawaiian monk seal population would result in better protection of the seal while outside the Monument; for example, the public would know to give space to Hawaiian monk seals

resting on beaches on the main Hawaiian Islands. Increased awareness through outreach and education could have a long-term beneficial effect on the recovery of the Hawaiian monk seal population by reducing incidents of human interaction and harassment, thereby allowing the seal to conserve energy for activities like feeding and reproduction.

Under activity TES-4.1, the FWS would work with Japanese ornithologists on ways to establish one or more breeding populations of the endangered short-tailed albatrosses on Midway Atoll. The goal is to have two colonies of at least 250 breeding pairs per colony (U.S. Fish and Wildlife Service 2005a). Collaborative efforts would also include satellite tagging projects studying feeding patterns, how weather systems and winds influence short-tailed albatross movements, and how ocean productivity and seafloor bathymetry affect their distribution. This would protect the species by establishing nesting colonies on islands free from volcanic activity and mammal predators, resulting in a beneficial effect on the endangered short-tailed albatross species. Activity TES-4.3 would create and disseminate information on fisheries bycatch and bycatch reduction to all fisheries occurring outside the Monument. Bycatch of endangered and migratory birds and nontarget marine species during commercial fishing by foreign fleets outside the Monument is a serious problem. This activity would make information on bycatch avoidance measures available to commercial fishers and would result in a beneficial effect on endangered species, migratory birds, and other marine species that inhabit the Monument by reducing bycatch mortality when they are migrating outside the Monument.

To protect *Amaranthus brownii*, *Schiedea verticillata*, and *Prichardia remota* from catastrophic events and to achieve recovery objectives, the potential for establishing these species outside their known native range on Mokumanamana, Laysan Island, Kure Atoll, and Eastern and Sand Islands at Midway Atoll would be assessed under activity TES-7.5. To minimize the negative effects on native species, the potential for displacement and risk of hybridization with closely related species would be evaluated before sites were chosen and species translocated. The goal is to create three colonies with a minimum of 500 mature individuals per colony of *Amaranthus brownie*, 300 mature individuals per colony of *Schiedea verticillata*, and 100 mature individuals of *Prichardia remota* (U.S. Fish and Wildlife Service 1998). Evaluating the potential to translocate *Amaranthus brownii*, *Schiedea verticillata*, and *Prichardia remota* could result in a beneficial effect on the species once translocation occurs by establishing new populations and providing increased protection from catastrophic events. Before this activity is implemented, additional compliance may be required.

### **Field Activities**

Activities supporting and facilitating emergency response for the endangered Hawaiian monk seal would put into place standardized protocols that could ensure a rapid and well-organized response to situations in the Monument that threaten endangered Hawaiian monk seals (TES-1.2). Improved coordination and collaboration among agencies to facilitate effective and rapid emergency response to ship groundings, oil spills, disease outbreaks and other events would minimize effects on Hawaiian monk seals. Additionally, Monument staff would continue to monitor predation of sharks on Hawaiian monk seals and its effects and develop and implement methods to deter predation as appropriate (TES-1.6). These activities could have a beneficial effect on the endangered Hawaiian monk seal by decreasing population loss. There could also be beneficial effects on migratory birds, marine mammals, and terrestrial and marine habitat by

reducing exposure to oil spills. There may be short-term minor negative effects on marine mammals due to disturbance from response activities. However, emergency response activities would be temporary, and affected individuals would be expected to resume normal behavior within a short period after the activities were completed. In addition, the agencies commit to consultation under the ESA or MMPA, as appropriate, before any action that could affect any marine mammal or federally listed species or designated critical habitat.

Expanding field activity for collecting biological information on nesting turtle populations (TES-3.1) could improve the health of the green sea turtle. Understanding the abundance of nesting sea turtles and their life history needs could result in more effective management of existing populations. In addition, a new activity, protecting and managing marine turtle habitat, including foraging areas and migration routes (TES 3.2), could reduce losses due to disturbance. This could result in the additional management of such potentially detrimental activities as anchoring and effects from vessel transit, could minimize the effects on foraging areas, reduce potential exposure to hazardous materials, and minimize vessel hazards to turtles in open waters. Both of these activities could have a long-term beneficial effect on the Hawaiian population of the threatened green sea turtles by ensuring the health of sea turtles and minimizing losses from shipping and boating interactions.

As a surrogate for estimating contaminant body-burdens in short-tailed albatrosses, the feathers, eggs, and dead chicks of black-footed albatrosses at Midway Atoll (TES-4.2) would be analyzed to determine the level of persistent environmental contaminants. This information could be used to determine a correlation between contamination levels and nesting success and could assist in developing plans to reduce contaminant exposure of the short-tailed albatross by targeting cleanup of areas where albatross feed and nest. Common effects that occur when humans enter a seabird colony are explained in Section 3.2.2. Reducing exposure to contaminants could result in a beneficial effect on the endangered short-tailed albatross through improved nesting success rates. Similar beneficial effects on other migratory birds could also occur. Collection of feather, eggs, and dead chicks could cause a short-term negative effect on seabirds from human interactions and a short-term negative effect on terrestrial vegetation from trampling plants during collection activities. (See section 3.2.2 for detailed discussion of effects.) However, collection would occur infrequently at any given location, and the short-term negative effects could be minor. These effects would be reduced by adhering to the standard operational protocols and implementing standard BMPs mentioned in section 3.2.2 and by implementing accepted BMPs (see Monument Management Plan, Volume III, Appendix F).

Restoration or creation of habitat to support translocation of the endangered Laysan duck to other sites in the Monument would be implemented under activity TES-5.2. This would include transporting juveniles to additional islands and conducting post release monitoring. The goal is to have a total of at least 240 breeding adults at these sites (U.S. Fish and Wildlife Service 2004a). By monitoring the populations, changes could be made through adaptive management that could improve the success of translocating Laysan ducks. Providing improved monitoring practices or adaptive management techniques could further assist in meeting recovery plan criteria. This would occur several ways, including by creating practices that would allow for the expansion of the population throughout its range, by protecting the population from a catastrophic event (resulting in a long-term beneficial effect on the endangered Laysan duck),

and by increasing overall protective measures for this species. During restoration, human presence and noise at translocation sites could result in short-term minor negative effects. Common effects that occur when humans enter a seabird colony are discussed in Section 3.2.2. These effects would be reduced by adhering to the standard operational protocols and implementing standard BMPs mentioned in section 3.2.2 and by implementing accepted BMPs (see Monument Management Plan, Volume III, Appendix F).

Five endangered plant species are restricted to Nihoa and Laysan Island and are subject to extinction from catastrophic events. To protect all endangered plant species on Nihoa and Laysan Island from extinction, seeds would be collected and maintained in off-Monument locations (TES-7.1). This could allow for the restoration of these native plants if such a catastrophic event were to occur. Overall, this activity could result in a beneficial effect on these plants and terrestrial plant communities on Nihoa and Laysan Island and to the Laysan finch, Nihoa finch, and Nihoa millerbird that depend on the native plant community for food, cover, and nesting. Short-term minor negative effects on the terrestrial plant community could occur during seed collection through trampling and reduced seed drop. Seed collection would occur over a short period, and affected individuals would be expected to recover once the activities were completed. These effects would be further reduced by adhering to the standard operational protocols and implementing standard BMPs mentioned in section 3.2.2 and by implementing accepted BMPs (see Monument Management Plan, Volume III, Appendix F).

Existing colonies of *Amaranthus brownii* and *Schiedea verticillata* on Nihoa would be supplemented, and factors restricting colony expansion, such as herbivory by alien species, would be addressed (TES-7.2). This would increase numbers and locations of these species on Nihoa where they are endemic. The goal is to have 300 to 500 individuals per colony. Outplanting *Amaranthus brownii* and *Schiedea verticillata* could result in a beneficial effect on these species once outplanting occurs by expanding the existing colonies, eliminating competition from alien species, and establishing new populations.

## **Migratory Birds Action Plan**

### ***Planning and Administrative Activities***

Activity MB-2.3 would ensure that all spill response plans have adequate coverage of actions necessary to minimize mortality to migratory birds. Monument staff would coordinate with and provide technical information regarding migratory birds to those responsible for multiagency spill prevention and pre-spill activities, as well as actual response actions. This could allow agencies to develop plans that would minimize effects of spills on migratory birds and to develop recovery plans that would include protocols for handling birds that have been affected by spills. This could prevent mortalities and speed rescue efforts. This beneficial effect would help prevent reduction of migratory bird populations that might otherwise result from releases of oil or hazardous materials or from the responses to such releases.

## **Habitat Management and Conservation Action Plan**

### ***Planning and Administrative Activities***

The Proposed Action alternative includes activities that would identify and prioritize restoration needs in shallow-water reef habitats affected by anthropogenic disturbances within five years

(HMC-1.1) and could evaluate costs to ecosystem function and benefits of removing anthropogenic iron sources, such as metal from shipwrecks and discarded debris from reefs, throughout the Monument (HMC-2.4). Managers would investigate opportunities for restoration and would prioritize actions so that they could focus funds and resources to address the most important needs. This attention to conservation and recovery actions could result in a beneficial effect on marine and terrestrial habitats within the Monument.

An ecological risk assessment would be conducted to determine allowable lead levels in soils at Midway and would remove lead from buildings and soils to nonrisk levels under activity HMC-2.7. The ecological risk assessment could determine the cleanup level necessary to reduce risks to human and wildlife health. The beneficial effects of this effort could be to improve the health of nesting migratory birds suffering from droop-wing and other lethal and sublethal effects.

Activity HMC-4.4 would formulate and implement a restoration plan for Lisianski Island using guidelines established for neighboring Laysan Island. This plan calls for investigating the botanical history of Lisianski and Laysan Island and could aid in native habitat restoration efforts, resulting in a beneficial effect on native plant species and on migratory and resident birds and other species that depend on the habitat that would be restored.

Planning activity HMC-7.2 would evaluate the potential to restore and create, as needed, freshwater sources at proposed translocation sites for Laysan duck, Nihoa finch, Laysan finch, and Nihoa millerbird. Before this activity is implemented, additional compliance might be required. This action would provide an important habitat feature presently lacking in these areas, thereby improving the chance of a successful translocation effort. These freshwater sources could also provide benefits to other migratory birds, native invertebrates, freshwater algae, terrestrial arthropods, and native habitat by expanding important habitat and improving reproductive success.

Other federal and state agencies would be educated about overflight rules and would promote compliance regarding overflights and close approaches at the Monument under activity HMC-9.1. This effort could reduce the potential for aircraft collisions with birds, resulting in a beneficial effect on migratory and resident birds, as well as on the crews of the aircraft that might otherwise be injured in collisions with the birds.

Aircraft operations occur at two Islands in the Monument, Sand Island at Midway Atoll and Tern Island at French Frigate Shoals. At both sites there are occasional bird strikes during aircraft takeoff and landings. Between August 2007 and August 2008, there were 6 bird strikes at Midway Atoll NWR. Four Laysan albatross, 1 Brown noddy & 1 Red-tailed tropicbird were hit and killed by aircraft. Flights arrive and depart at night when the albatross are present (November - July) which limits collisions. Additionally, very few seabirds are killed each year by aircraft collisions, because birds are hazed from the runway by trained personnel prior to aircraft operations. Unfortunately, a low number of Bonin Petrels are killed when they crash into lights at the airport hangar building. We do not currently have an estimate of the number killed, but USFWS plans to quantify this impact in the future. The lights are turned on for human safety and are turned off immediately after the aircraft operations are completed. These incidents cause mortality to birds (most often seabirds) and in some cases increase the risk to the aircraft

as well as to crew and passengers. The frequency at which these bird strikes occur varies by site, bird species, time of day, wind velocity, month of the year, and level of breeding activity in the bird colony. BMPs (see Monument Management Plan, Volume III, Appendix F) to reduce risk of bird air strikes vary between Midway and French Frigate Shoals. They were developed because of different species compositions of seabird colonies adjacent to the runways, types of aircraft used at the two sites, and constraints based on the runway facilities at each site. At Midway, the greatest risk of bird aircraft collision is from the two resident albatross species. Because they fly primarily during daylight hours, routine flight takeoffs and landings are scheduled to occur after sundown or before sunrise. Additionally, vegetation management along the runways modifies bird flight and nesting behavior, and the runway is swept or hazed of birds before each flight arrival or departure.

At Tern Island, French Frigate Shoals, the most commonly killed species is the sooty tern but occasionally wedge-tailed shearwaters, great frigatebirds, and albatrosses of both species are also hit. Tern Island does not have runway lights, so all operations are done during daylight hours. Just before landing and takeoffs, staff on the island make a sweep of the runway to haze birds from the runway. Flights would not be scheduled from June to August, when sooty terns are most numerous and most likely to be hit. Loads on takeoff could be minimized to improve the pilots' ability to get above the bird hazard zone as soon as safely possible, and flights could be curtailed on windless days when bird casualty has historically been highest. Flight activities could have a minor negative effect on migratory birds, but efforts to reduce effects would be made before the activities occur. Facilitating management actions that benefit birds, and also a wide variety of plant and wildlife species and habitats could have long-term beneficial effects on the natural resources of the Monument.

### ***Field Activities***

Field personnel would evaluate the effects of contamination in terrestrial and nearshore areas from shoreline dumps at French Frigate Shoals and at Kure, Midway, and Pearl and Hermes atolls. They would prioritize cleanup action based on risk assessments (HMC-2.1) and would work with partners and responsible parties to verify the integrity of known landfills and dumps and to conduct additional remediation if necessary (HMC-2.2). They would investigate the extent of contamination at these sites and would assess their integrity, containment effectiveness, and hazard potential. Based on this information, the highest priority sites would be removed, remediated, or sealed. Monitoring would continue to assess whether further action is needed. Some proposed activities would require further analysis and compliance by the agencies as more detailed information on these potential actions becomes available and specific plans are developed. These requirements may include additional analysis, in accordance with NEPA, and consultation under ESA, MMPA, NHPA, and other relevant laws.

Possible short-term negative effects from these actions could include: (1) disturbance to nesting and resting seabirds and other migratory birds; (2) effect on Hawaiian monk seals or the Hawaiian population of green turtles swimming and feeding in the nearshore marine environment or resting on beaches; (3) effect on spinner dolphins; (4) effect on fish, cetaceans, marine invertebrates, and corals; (5) disturbance to Laysan ducks, Nihoa finches, Nihoa millerbirds, and Laysan finches; (6) trampling of native plants and insects; (7) damage to corals; (8) accidental release of pollution and contaminants; and (9) the accidental introduction and

establishment of nonnative species. Effects of these activities would be reduced by adhering to the standard operational protocols and implementing standard BMPs mentioned in section 3.2.2 and by implementing accepted BMPs (see Monument Management Plan, Volume III, Appendix F). Overall, evaluating the effects of contamination from shoreline dumps and verifying the integrity of known landfills and dumps could result in beneficial effects on marine, coastal, and terrestrial habitats, as well as to marine mammals, migratory birds, and threatened and endangered species, by reducing exposure to hazardous materials from the dump sites.

The proposed activity HMC-2.3 would locate historic disposal sites at French Frigate Shoals and at Kure, Midway, and Pearl and Hermes atolls, and they would be investigated for contamination. Efforts include searching for documented but not yet located landfills and underground storage tanks and evaluating their contamination levels. These sites would be evaluated, and remediation actions would be planned.

Possible short-term minor negative effects from these remediation actions could include: (1) disturbance to nesting and resting seabirds and other migratory birds; (2) effect on Hawaiian monk seals or Hawaiian populations of green turtles swimming and feeding in the nearshore marine environment or resting on beaches; (3) effect on spinner dolphins; (4) effect on fish, cetaceans, marine invertebrates, and corals; (5) disturbance to Laysan ducks, Nihoa finches, Nihoa millerbirds, and Laysan finches; (6) trampling of native plants and insects; (7) damage to corals; (8) accidental release of pollution and contaminants; and (9) the accidental introduction and establishment of nonnative species.

Common results of the effects of human interactions with natural resources are explained in Section 3.2.2. These effects are expected to be reduced by using standard BMPs listed in Section 3.2.2. Another method mentioned in this section to reduce the effects of operations is, in advance of the planned work, to exclude that season's nesting birds by laying down geotextile fabric that prevents seabirds from burrowing or nest-building, as well as applying special terms and conditions in the Monument permitting process. Overall, locating and investigating disposal sites could result in long-term beneficial effects on marine, coastal, and terrestrial habitats, marine mammal, migratory birds, and threatened and endangered species by preventing exposure to and providing adequate protection from contaminants, such as PCBs.

A proposed activity on 34-acre Southeast Island at Pearl and Hermes Atoll would restore native plant vegetation that is critical to the survival of several native plants (HMC-4.5). After the invasive alien plant *Verbesina encelioides* is removed, native species would be propagated and outplanted. This restoration is considered critical to the survival of several native plant species and a small population of endangered Laysan finch. This activity could have beneficial effects on threatened and endangered species by improving the viability of the endangered Laysan finch and native plants. The beneficial effects would occur after a short-term minor negative effect from removing invasive alien vegetation that may currently provide cover or food for Laysan finches.

Coordinated ecosystem restoration activities on Kure Atoll would be implemented (HMC-4.6), including prioritizing and eliminating ecosystem threats caused by past human disturbance, removing invasive species, and increasing the range of and reintroducing native plant species.

The beneficial effects include improving nesting, foraging, and resting (loafing) habitat for migratory birds and improving the chances of survival of the translocated endangered Laysan finch and Laysan duck populations. There could be a short-term minor negative effect by removing invasive alien vegetation that may currently provide cover or feed to migratory birds. This could be offset in the long term by the resultant improved foraging, resting, and nesting conditions which the restored native habitat would afford.

Inventoried and documenting the life histories of endemic terrestrial invertebrates on Nihoa and Mokumanamana (HMC-5.1) would aid in identifying and controlling those species that affect the native vegetative communities, including the five endangered plant species found there. This could have the beneficial effect of preserving the most intact native coastal plant assemblages in the state. Field activities for the plants could however have a short-term minor negative effect on migratory bird species due to increased human presence and resultant disturbance and noise effects. Common effects that occur when humans enter a seabird colony are explained in Section 3.2.2. However, affected bird individuals would be expected to resume normal behavior within a short period after the activity has ended, with no lasting effects if BMPs are utilized.

### **3.2.4.3 Reducing Threats to Monument Resources**

#### **Emergency Response and Natural Resource Damage Assessment Action Plan**

##### ***Planning and Administrative Activities***

Damage assessment is an important component of any emergency response plan (ERDA-1.4). The Monument Emergency Response and Assessment Team would coordinate with the appropriate agencies to ensure that appropriate response, injury assessment, and restoration take place for any given emergency throughout the Monument. This could result in beneficial effects on all threatened and endangered species, migratory birds, marine mammals, marine and terrestrial species, and habitat by minimizing damage from the event and facilitating restoration. An example of this is minimizing unintentional damage that might otherwise result from response and restoration efforts, thereby allowing a faster recovery of any affected population. Any response, by either boat or vehicle, could disturb marine mammals, migratory birds, and other native species, and could include effects on the species ranging from disturbance to potential mortality every time a seabird colony is entered. These effects are explained in Section 3.2.2. The short-term negative effects could be offset by implementing BMPs. In the long term, the benefits provided by the response actions, which could minimize damage from any event and aid in recovery, would offset the short term negative effects. In addition, the agencies commit to consultation under either the ESA or the MMPA before beginning any action that could affect any marine mammal or federally listed species or designated critical habitat.

#### **Marine Debris Action Plan**

##### ***Field Activities***

The Proposed Action alternative calls for Monument staff to work with partners to remove marine debris in the Monument and to reduce additional debris entering the Monument (MD-1.1); to catalog, secure, contain, and properly remove hazardous materials that wash ashore in the NWHI (MD-1.2); and to work with partners on marine debris studies (MD-2.1). These efforts could reduce the potential for species in marine and terrestrial habitats being exposed to

dangerous debris, such as abandoned nets, and to hazardous material. All water and land activities would continue to be conducted in accordance with BMPs (See Monument Management Plan, Volume III, Appendix F) that avoid the potential for any effects on threatened and endangered species. For example, should a Hawaiian monk seal or other listed species be observed during a dive, the standard procedure would be to cease all activity until the animal departs the area. In addition, any person who encounters a Hawaiian monk seal on a beach while conducting an activity not related to Hawaiian monk seal population monitoring and recovery actions must not come within 150 feet (46 meters) of the seal. These BMPs have been in effect for decades to avoid negative effects on the Hawaiian monk seal.

During net removal, breakage, abrasion, and infaunal disturbance could result in short-term negative effects from mechanical damage to the reef ecosystem. Every effort would be made to avoid reef ecosystems and to minimize lasting effects from these activities.

These effects would be reduced by adhering to the standard operational protocols and implementing standard BMPs mentioned in section 3.2.2 and by implementing accepted BMPs (see Monument Management Plan, Volume III, Appendix F). Among other actions these require that a person approaching a seabird colony first look for any nests or for adults flushing from inconspicuous nests. Also, all activities could be planned to avoid displacing adults from their eggs or chicks for more than three minutes. There could be a beneficial effect on natural resources by reducing injury or mortality and improving the health of the reef and associated species.

## **Alien Species Action Plan**

### ***Field Activities***

Surveying distributions and populations of known alien species at regular intervals (AS-2.1) and developing and implementing monitoring protocols for early detection and characterization of new infestations (AS-2.3) would assist in understanding the distribution and populations of known alien species. This would allow for prioritizing control and eradication efforts and in monitoring the success of previous efforts. Instituting monitoring protocols would provide measures for collecting data that are meaningful and useful to managers. This could result in a beneficial effect on all native species within the Monument that are harmed by competition or predation by alien species.

Under activity AS-4.2, rodenticide would be used to eradicate the house mouse from all of Sand Island (1,128 acres) at Midway Atoll. Beforehand, though, additional compliance might be required. Common effects of human interaction with natural resources are explained in Section 3.2.2. Through active management, every effort would be made to prevent negative effects on nontarget native species from the use of rodenticide. Eradication of the house mouse would remove a potential vector for diseases and would eliminate competition for seed and other food items that native species require, resulting in an overall beneficial effect.

To protect nontarget species, Activity AS-5.2 proposes to conduct toxicant trials on pesticides to evaluate their efficacy and to document ecological effects at selected islands on highest priority invasive species of ants and wasps. Common effects that occur when humans enter a seabird colony are explained in Section 3.2.2. Determining the toxicant and treatment levels that would

be least likely to negatively affect nontarget species and reduce or eliminate target invasives could benefit native species by preventing mortality from treatment methods and by eliminating alien species that may compete for food or directly prey on native species. Conducting toxicant trials on pesticides is likely to result in a short-term negative effect on tested native invertebrates. However, additional agency analysis and targeted use of toxicants could reduce or eliminate the potential for harm, resulting in long-term beneficial effects on natural resources.

Activity AS-5.3 would control and possibly eradicate the two introduced mosquito species at Midway Atoll within 10 years, using methods prescribed in the Integrated Pest Management Plan. The mosquito is a vector for avian pox that affects nesting seabirds, the endangered Laysan duck, and other endangered bird species that may be established on Midway Atoll. Eliminating or controlling the mosquito could reduce mortality of these species and nonlethal effects of the pox. This could result in a long term beneficial effect on the Laysan duck and migratory birds and could improve the chances of success for future introductions of other endangered species. Some techniques for eliminating mosquitoes could have a short-term negative effect on native arthropods. However, additional agency analysis and targeted use of toxicants could reduce or eliminate the potential for harm.

Actions under Activity AS-5.4 would develop and implement a plan to control and possibly eradicate the invasive gray bird locust on Nihoa, Mokumanamana, French Frigate Shoals, and Lisianski Island. Additionally, Activity AS-5.5 could protect endangered plants threatened by gray bird locust outbreaks at Nihoa by developing appropriate baits for localized application of toxicants to protect specific high priority plant sites. The locust feeds on native plants, including endangered species, and during periodic outbreaks can strip plants of their leaves and seed. Actions to control and/or eradicate the invasive gray bird locust could have temporary negative effects on native invertebrates. However, additional agency analysis and targeted use of toxicants could reduce or eliminate the potential for harm to other listed species. Controlling and possibly eradicating the invasive gray bird locust could provide long-term benefits to endangered plants by removing stressors. This could also benefit endangered birds that depend on the vegetation for cover, nesting, and feeding.

The Proposed Action alternative includes activities to control and eventually eradicate golden crownbeard (AS-6.1) and weedy shrubs on Kure, Midway, and Pearl and Hermes Atolls. Also, in all areas where they occur, the alternative could control or eradicate the invasive grass sandbur from Kure, Midway, and Pearl and Hermes Atolls, Lisianski Island, and French Frigate Shoals (AS-6.2) and could also control or eradicate Indian pluchea (*Sporobolus pyramidatus*) and swine cress (*Coronopus didymus*) from Laysan Island (AS-6-3). Activity AS-6.4 would also control and eventually eradicate prioritized alien plant species from Kure Atoll. All of these are fast-growing prolific invasives that crowd out native species. Eradicating them could have beneficial effects on native plant species by allowing the natives to expand into areas where they historically occurred. Common effects that occur when humans enter a seabird colony are explained in Section 3.2.2. This eradication could also benefit migratory and endangered birds dependent on the native vegetation for cover, nesting, and feeding.

Eradication could cause short-term negative effects on seabirds from human interactions, increased noise, and from trampling vegetation reducing habitat value. Common effects that

occur when human enter a seabird colony are explained in Section 3.2.2. Endangered passerines in the Monument (Nihoa finches, Nihoa millerbirds, and Laysan finches) are inquisitive and exploratory and thus can be at risk from human materials and equipment on their breeding islands; for example, curious birds can drown in open containers, such as buckets and cooking pots that catch rainwater; strings, netting, and loose fibers on tarps can entangle their feet; tent openings can attract birds, which become trapped and succumb to overheating. All activities could be planned to ensure that tent openings would remain tightly closed, and the types of materials described above would not be left unattended in campsites at Nihoa, Laysan Island, and Pearl and Hermes Atoll to avoid effects on these species. Additional agency analysis and targeted use of toxicants could reduce or eliminate the potential for harm to seabirds.

Under AS-7.1, invasive red algae would be mapped, controlled and eventually eradicated where it occurs (AS-7.1). The red algae grow in dense mats and can cover and smother coral and other marine species. Mapping the location of these infestations could assist in eradication efforts. All water and land activities would continue to be conducted in accordance with operational protocols and BMPs (See Monument Management Plan, Volume III, Appendix F) that avoid the potential for any effects on threatened and endangered species. While removal of red algae might have short-term negative effects on reef ecosystems from mechanical damage to the reef, such as breakage, abrasion, and infaunal disturbance, the long-term beneficial effect of reducing the extent of the red algae infestation could allow native marine corals and marine species that depend on that coral to return to their historic levels.

Activity AS-7.2 proposes to conduct surveillance at appropriate sites for snowflake coral and other incipient marine invasives. Snowflake coral can overgrow corals and hard reef surfaces and eat zooplankton that native corals depend on. Understanding this coral and sites of likely infestation could prepare managers to move quickly to eradicate this invasive before it spreads to large areas. The beneficial effect of this effort could be to protect existing corals, reef, and associated species.

The Proposed Action would support and conduct research on alien species detection and effects of invasive species on native ecosystems (AS-8.1) and would support and conduct research on invasive species prevention, control methods, and eradication techniques (AS-8.2). Understanding alien species and how they affect native species and researching effective control and eradication methods could allow managers to take measures to prevent their establishment and to minimize the effects on native species. The beneficial effect of this effort could be to protect native habitats and the species that depend on them.

#### **3.2.4.4 Managing Human Uses**

##### **Permitting Action Plan**

###### ***Planning and Administrative Activities***

Certain strategies would improve the effectiveness of permit activities through reviewing and revising the permit process and establishing a Monument-wide reporting process. Specifically, these activities are engaging outside experts to review permit applications (P-1.4), analyzing permit data to inform management decision making (P-2.2), developing and implementing a Monument reporting process (P-2.4), and developing and implementing a permit and regulatory

education program (P-3.1). By improving the effectiveness of the permitting process, permit requirements could be improved to ensure that Monument resources are being protected. This could provide beneficial effects for all Monument natural resources.

Developing and implementing a Native Hawaiian cultural education program for all permit recipients (P-3.2), coordinating permitting outreach (P-3.3), and developing a pre-access training and briefing program (P-3.4) could result in beneficial effects on all Monument natural resources. Coordinating information, outreach, and education could minimize and prevent negative effects on the Monument's natural resources by ensuring that all permittees are aware of all protocols and requirements designed to protect the cultural, historic, and natural resources of the Monument.

### **Midway Atoll Visitor Services Action Plan**

#### ***Field Activities***

Activity VS-1.1 would provide visitors with opportunities for wildlife-dependent recreation to enhance their knowledge and appreciation of the Monument's natural resources. Visitors could be given the opportunity to view wildlife on Midway Atoll only and would be required to follow rules and protocols to ensure that their activities are carried out in ways to minimize negative effects.

Continuously monitoring the effects of visitors and other users on wildlife and historic resources to ensure their protection (VS-1.3) would support an adaptive management approach to visitor use of the Monument. Under this scenario, data reflecting visitor effects would inform management decisions on the extent of visitor use that could be permitted in the future. Providing visitors with opportunities for wildlife-dependent recreation and monitoring the effects of visitors and other users on wildlife and historic resources could have beneficial effects by minimizing negative effects on resources, increasing public awareness of native species and listed species, and by protecting natural resources in the Monument. More specific descriptions of the effects of visitors at Midway Atoll are contained in the Environmental Assessment for the Interim Midway Visitors Service Plan and in relevant compatibility determinations.

### **3.2.4.5 Coordinating Conservation and Management Activities**

#### **Constituency Building and Outreach Action Plan**

##### ***Planning and Administrative Activities***

Increased public awareness of and interest in the Monument and in conservation of its natural resources could result from the following: Incorporating new perspectives for understanding the value of NWHI ecosystems, including socioeconomic studies, to increase ocean ecosystem literacy and conservation in the Monument within five years (CBO-1.4); Continuing to develop and update printed materials to aid Monument constituencies in understanding key aspects of the Monument (CBO-2.2); As needed, holding focused forums on various Monument-related issues or topics to inform and engage a broader range of constituents (CBO-3.2); Continuing to seek out and support partnership opportunities that focus on Oceania-related issues (CBO-3.3); Within one year, establishing and supporting a Papahānaumokuākea Marine National Monument Alliance to engage a broad range of constituents, who will regularly provide recommendations

and information on specific management issues (CBO-3.5); Continuing to work with the Friends of Midway Atoll National Wildlife Refuge, through FWS and supporting the establishment of a Monument-related “friends” group (CBO-3.7); and Continuing to convene the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve Advisory Council through NOAA’s ONMS until the Monument Alliance is established (CBO.3.8).

This might generate volunteers and support for ongoing Monument activities. Increased volunteer efforts and support for activities in the Monument could result in a beneficial effect on Monument natural resources by creating opportunities to expand protection and restoration efforts.

### **Ocean Ecosystem Literacy Action Plan**

#### ***Planning and Administrative Activities***

Activity OEL-1.1 would expand and improve the NWHI educational partnership’s Navigating Change curriculum for elementary and middle school students, with increased focus on ocean ecosystems literacy, within three years. As curricula are developed, Activity OEL-1.2 proposes for Monument staff to work with Hawaiian-language immersion schools to ensure the curricula meet their needs, including translation into the Hawaiian language. Activity OEL-1.3 would develop an ocean stewardship program for middle school and high school students within five years. Educating school-age children could result in increased awareness of the importance of natural resources among teachers and students alike and possibly among the students’ families. Increased interest in and support for the conservation of Monument resources could result in a beneficial effect on Monument natural resources by creating opportunities to expand protection and restoration efforts.

### **3.2.4.6 Achieving Effective Monument Operations**

#### **Coordinated Field Operations Action Plan**

#### ***Planning and Administrative Activities***

Additional planning activities would target managing, maintaining, and coordinating the use of small boats and identifying aircraft service that would increase operation efficiency and delivery capacity (CFO-6.1). These planning activities could indirectly benefit natural resources by providing for the most efficient and least detrimental use of available resources to transport researchers and staff engaged in habitat restoration and other Monument management activities to the locations where their work is to be done, and by potentially avoiding or minimizing potential disturbance to or collisions with birds and marine mammals from transportation activities.

#### ***Infrastructure and Development Activities***

Within five to ten years, a small research/enforcement vessel would be stationed at Midway Atoll (CFO-6.3). This would allow enforcement personnel to respond to activities that represent a hazard to terrestrial or marine habitats. Additionally, Monument management staff would have the ability to rapidly respond to potentially hazardous events and to avoid or at least minimize any damage that might be caused. This could result in both a short and long term beneficial

effect on marine and terrestrial natural habitat, threatened and endangered species, marine mammals, migratory birds, and other native species.

Providing logistical, infrastructure, and transportation support for threatened and endangered species recovery actions (CFO-9.3) would enhance the ability to transport threatened and endangered species, equipment, and personnel among the various atolls to aid in recovery efforts. Being able to capture, transport, treat, and return threatened and endangered animals to the wild is important for maintaining a healthy population, and increasing the efficacy of this action would result in a beneficial effect.

### 3.2.5 Summary of Effects

Table 3.2-1 summarizes the effects on natural resources from the Proposed Action. The effects are listed by Action Plan and action areas (planning/administrative, field, or infrastructure and development activities). The Proposed Action could have beneficial and negative effects on natural resources of the Monument. The natural resources of the Monument, includes, but is not limited to, terrestrial and marine resources, native plants and wildlife, seabirds, migratory birds, marine species and special status species.

### **3.3 CULTURAL AND HISTORIC RESOURCES**

#### **3.3.1 Effects Analysis Methodology**

The method for assessing potential effects on cultural and historic resources involves identifying sensitive resources in the ROI, identifying activities that could affect those resources, and determining the type and magnitude of potential effects on those resources. Only cultural resources that are determined to be eligible for listing under the NRHP are subject to protection under the NHPA; however, additional protection for cultural resources is provided under ARPA, American Indian Religious Freedom Act (AIRFA), the Native American Graves Protection and Repatriation Act (NAGPRA), and several executive orders. Resources that are pending evaluation for NRHP eligibility have been treated and would continue to be treated as eligible until formal determinations are made.

The types of effects that would be difficult to quantify or qualify are those that certain activities may have on the spiritual and cultural values of cultural resources and their inseparability from the natural environment. Traditional Native Hawaiian practices tie current generations to their ancestors through genealogies that link them to the earliest creation in Hawai‘i. These ties hold that their ancestors become familial deities shortly after death and are personified in the natural and physical elements. Because of this familial relationship to these elements, the traditional values view of the world is that it is sacred and to be treated with high reverence. These values center on the integral nature of the cultural and ecological environment. Maintaining this principle is done through pono (righteous, necessary, appropriate) actions toward the natural environment/ecosystem, and more specifically by taking care of wahi kūpuna (ancestral sites), which provide a means to maintain connection with the maui ola of their ancestors (spiritual life force, essence, literally “breath of life”).

#### **3.3.2 Effects Common to Proposed Actions on Cultural and Historic Resources**

Section 106 of the NHPA requires federal agencies to consider the effects of their actions on properties listed on or eligible for listing on the NRHP. These properties also include those ATI that have been evaluated and determined to be eligible. Pending formal evaluations, all cultural resources and potential components of cultural landscapes could be treated as though they are eligible.

NHPA and NEPA compliance are separate and parallel processes, and the standards and thresholds of the two acts are not precisely the same. A negative effect on a historic property, as defined by the NHPA, is not necessarily a significant effect under NEPA. While mitigation under the NHPA does not necessarily negate the negative nature of an effect, mitigation measures identified under NEPA could reduce the significance of an effect. NHPA and NEPA compliance are separate and parallel processes, and the standards and thresholds of the two acts are not precisely the same.

Section 106 and its implementing regulations, 36 CFR Part 800, state that an undertaking has an effect on a historic property (i.e., NRHP-eligible resource) when it could alter those characteristics of the property that qualify it for inclusion on the NRHP. An undertaking is considered to have a negative effect on a historic property when it diminishes the integrity of the

property's location, design, setting, materials, workmanship, feeling, or association. Section 106 negative effects include the following:

- Physical destruction, damage, or alteration of all or part of the property;
- Isolation of the property or alteration of the character of the property's setting when that character contributes to the property's qualifications for the NRHP;
- Introduction of visual, audible, or atmospheric elements that are out of character with the property or changes that may alter its setting;
- Neglect of a property, resulting in its deterioration or destruction; and
- Transfer, lease, or sale of a property without adequate provisions to protect its historic integrity.

A broader range of Native Hawaiian sites, including sacred sites, burials, and cultural items and other areas of traditional importance that might not necessarily be considered eligible for protection under NRHP, may still be protected under AIRFA, ARPA, or NAGPRA.

Activities that are not currently covered by a state cultural impact assessment (CIA) or that have not undergone Section 106 consultations may cause a short-term negative effect on both cultural and historic resources. Activities proposed to identify, collect, and review publications, data sets, and documents to identify cultural resources beyond Midway Atoll within 12 years are not covered under a CIA. Negative effects could be minimized by exercising the NHPA Section 106 process, which includes review and consultation among the Co-Trustees, the State Historic Preservation Officer, OHA, and Native Hawaiian organizations. See Section 3.3.2.2 for further discussion of the CIA.

Historic properties at Midway Atoll NWR are managed according to a 1999 Historic Preservation Plan (Speulda et al. 1999). The plan was drafted with recommendations from interest groups, historic preservation specialists, and the Advisory Council on Historic Preservation. The Midway Historic Preservation Plan prescribes one of six different treatment categories for each of the 63 historic properties on the atoll: reuse, secure, leave as-is, fill in, demolish, or relocate. The plan also identifies procedures for treating new discoveries and caring for museum collections and includes recommendations for interpretation, education, and public outreach.

### **3.3.2.1 Paleontological Resources**

Paleontological sensitivity or potential is a qualitative measure of the density and scientific value of a site's fossils. It also gauges the probability that site development would directly or indirectly destroy a unique scientifically significant paleontological resource. Such a resource is generally considered to consist of vertebrate remains, of unusual, useful, or exceptionally well-preserved trace fossils or invertebrate/plant remains or of exceptionally rich or diverse fossil assemblages. Paleontologists use a three-part classification of paleontological sensitivity

outlined by the Society of Vertebrate Paleontology (1995). It includes high sensitivity, low sensitivity, and undetermined sensitivity rankings. Within this classification scheme, a high sensitivity site has one of the following characteristics:

- It is underlain by or contains exposures of sedimentary rocks or some types of volcanic rocks that are of the right age, origin, and location to *potentially* contain significant fossils;
- It is underlain by or contains exposures of sedimentary rock or some types of volcanic rocks that are *known* to contain significant fossils; or
- It contains potentially datable remains older than the historic period, including nests and middens (a deposit of shells, bones, and other artifacts that suggest previous human settlement).

Sites that do not contain the characteristics listed above are not considered sensitive.

### **3.3.2.2 State of Hawai‘i Cultural Impact Assessment**

Native Hawaiian customary and traditional subsistence, cultural, and religious practices are protected under Section 7 of Article XII of the Constitution of the State of Hawai‘i. Chapter 6E, Hawaii Revised Statutes, and rules adopted thereunder also protect historic and cultural sites and property found within the State.

The state has a number of laws and programs to protect cultural rights and locations. Chapter 6E of the Hawaii Revised Statutes establishes the Historic Preservation Program for ongoing historical and archaeological research and development. This program includes statewide surveying and inventorying historic properties, aviation artifacts, and burial sites; preparing, reviewing, and revising a state historic preservation plan; providing interpretive programs for historic properties; holding burial sites in trust; and regulating archaeological activities. Section 6E-7 maintains that all historic property on lands and under waters owned or controlled by the state shall be property of the state and that property is not allowed to be transferred without consultation with the appropriate island burial council. Section 6E-43 states that discovery of prehistoric and historic burial sites over 50 years old requires consultation with the appropriate island burial council. Section 6E-61 establishes a Hawai‘i biological survey consisting of an ongoing natural history inventory of the Hawaiian archipelago to locate and identify flora and fauna for a wide range of uses. Chapter 6E also defines violations regarding activities that take, excavate, injure, destroy, or alter any historic property, aviation artifact, and burial site, including manipulation of human remains.

Chapter 300 of Hawaii Administrative Rules outlines the practices and procedures of Native Hawaiian burial sites to ensure their care and protection. It establishes the Island Burial Councils, which determine the preservation or relocation of previously identified Native Hawaiian burial sites. These rules, along with Sections 6E-11, 6E-12, 6E-43, 6E-43.5, and 6E-43.6, HRS, were amended or enacted to provide additional protection for Native Hawaiian burial sites.

In addition to the above, the state requires an assessment of potential impacts on cultural practices and features as part of the environmental review process. In assessing cultural effects, the CIA was developed following the Guidelines for Assessing Cultural Impacts by the State of Hawai'i's Department of Health's Office of Environmental Quality Control. A CIA for the Papahānaumokuākea Marine National Monument Management Plan was prepared in accordance with state laws and is found in Appendix A.

### **3.3.3 No Action**

This section is a brief description of activities that are underway in the Monument and an analysis of the effects associated with these activities. Only those activities that could have an effect on cultural and historic resources are included. Analyzed are the projected beneficial and negative effects expected to continue under the No Action alternative. Should this alternative be selected for implementation, it could result in no change to the current situation. Nevertheless, current activities could continue under the Proposed Action alternative, and their effects are summarized under the Proposed Action in Table 3.3-1 at the end of this section.

#### **3.3.3.1 Understanding and Interpreting the Northwestern Hawaiian Islands**

##### **Native Hawaiian Culture and History Action Plan**

###### ***Planning and Administrative Activities***

Monument regulations define Native Hawaiian practices as cultural activities conducted for the purposes of perpetuating traditional knowledge, caring for and protecting the environment, and strengthening cultural and spiritual connections to the NWHI that have demonstrable benefits to the Native Hawaiian community. Monument staff would identify cultural research needs, priorities and opportunities as they arise (NHCH-1.2) and would continue to manage cultural and historic resources through planning and administrative activities that could increase the staff's capacity to carry out strategies and activities (NHCH-3.1). These activities could have beneficial effects on cultural and historic resources by increasing the Monument staff's knowledge base, understanding, and interpretive values of cultural and historic resources, providing for better protection and management of cultural and historic resources.

Research needs that could be accomplished through Hawaiian cultural methods would be identified and used to increase staff knowledge. Such research could be conducted through ethnographic interviews, researching oral traditions, and archival searches (NHCH-1.1). The MMB would continue to support Native Hawaiian cultural research needs and facilitate research on issues and priorities identified by providing grants, logistical support, and berthing space aboard research vessels (NHCH-2.2). Native Hawaiian traditional knowledge and management concepts would be identified and incorporated into the management of Monument resources (NHCH-3.4). Identifying research needs, supporting Native Hawaiian cultural access, and incorporating Native Hawaiian traditional knowledge and associated practices into Monument management could have beneficial effects on cultural and historic resources. This would come about by enhancing, incorporating, and perpetuating understanding of Native Hawaiian culture and knowledge, in an effort to better manage and protect the resources.

## **Maritime Heritage Action Plan**

### ***Planning and Administrative Activities***

Preserving maritime heritage resources, such as submerged and beached shipwrecks, aircraft, and other sites of historical, cultural, and archaeological significance, provides records of the historical activities in the NWHI and allows increased protection and management of the resources. The MMB would continue to carry out activities under the Maritime Heritage action plan and would complete a Monument Maritime Heritage Resource Research Plan (MH-3.3). Efforts would be made to collect and review maritime publications and to develop regular status reports to develop a maritime heritage database (MH-1.1, MH-1-4). Maritime archaeologists would develop and maintain this internal maritime heritage resource database to prioritize target sites (MH-1.5). All new data and findings, including recovered and conserved maritime artifacts, would be incorporated into education and outreach materials through the participation of Monument maritime archaeologists in coordinating and participating in public outreach regarding Monument heritage resources and maritime history (MH-2.1) and participating in select presentations, conferences, and events (MH-2.2). Protecting and managing maritime heritage resources through inventorying, evaluating, and interpreting them would increase maritime heritage preservation in the Monument and awareness of these resources. This could have beneficial effects on cultural and historic resources.

For more effective use of facilities and equipment, the MMB would coordinate interagency communication regarding maritime resources management (MH-3.1). Protective status for specific sites would be sought as needed using federal recognition under the NHPA and the NRHP. Preservation measures of the DLNR would be implemented for resources on state bottomlands (3 nautical miles from emergent lands) via the SHPD (MH-3.2). Under the No Action alternative, there could be beneficial effects on cultural and historic resources as a result of improved management, preservation, and protection of cultural and historic resources.

### ***Field Activities***

Locating and preserving heritage sites within the Monument increases the understanding of these resources and fosters effective and protective management of historic sites. Monument staff would continue to coordinate and carry out annual field mapping surveys and complete progress reports of select heritage sites to better understand and interpret heritage sites (MH-1.2). Knowledge gained from mapping would contribute to understanding and interpreting heritage sites and would lead to better management and protection; therefore, these activities could have beneficial effects on cultural and historic resources.

## **3.3.3.2 Conserving Wildlife and Habitats**

### **Threatened and Endangered Species Action Plan**

#### ***Planning and Administrative Activities***

Through proper planning, implementation, and inclusion of established management practices, the protection of cultural and historic sites could be incorporated as appropriate into natural resource management plans. Increasing the capacity of NMFS and FWS (TES-8.1) and working

with federal agencies proposing activities within the Monument (TES-8.3) to facilitate ESA consultation would ensure protection of threatened and endangered species by improving the consultation process for all persons involved. Through protection of the natural environment, cultural and spiritual values of the Native Hawaiian culture in the Northwestern Hawaiian Islands can be maintained. This preserves intangible elements of the Hawaiian culture, such as their recognized spiritual and genealogical connections to the natural environment, the integrity of Native Hawaiian sacred sites, and the ability of people to perpetuate traditional practices. Protecting the surrounding natural habitats could have beneficial effects on the integrity of cultural and historic resource sites.

### ***Field Activities***

The natural environment and its resources are seen as an integral part of Hawaiian culture and many of its practices. Field activities that are carried out to conserve, manage, monitor, and document natural habitats include supporting activities to advance recovery of Hawaiian monk seals removing marine debris from critical habitats (TES-1.1); encouraging increasing populations of Laysan ducks through monitoring (TES-5.1); and maintaining stable populations of passerine species by conducting annual censuses of populations and their required food and habitats (TES-6.1).

These activities aim to protect surrounding natural resources and to increase or stabilize species' populations, thereby having beneficial effects on cultural and historic resources.

Intangible elements of the Hawaiian culture, such as its recognized spiritual and genealogical connections to plants, would be maintained by establishing populations of listed plant species. Species abundance is increased and the natural environment is restored by increasing the number and locations of *Amaranthus brownii* and *Schiedea verticillata* on Nihoa (TES-7.2), establishing a self-sustaining *Pritchardia remota* population on Laysan Island (TES-7.3), and continuing greenhouse operations on Laysan Island to propagate and outplant rare plant taxa (TES-7.4). These activities aim to protect surrounding natural resources and to increase or stabilize species' populations, thereby having beneficial effects on cultural and historic resources and traditional practices.

## **Migratory Birds Action Plan**

### ***Field Activities***

Protecting the natural environment can maintain cultural and spiritual values of Native Hawaiian culture in the NWHI. Field activities to conserve, manage, monitor, and document natural habitats and to minimize the impact of threats to migratory birds include maintaining rigorous quarantine protocols to prevent the introduction of alien species, such as invasive plants or animals that may damage migratory bird habitats (MB-2.4). Protecting natural habitats for migratory birds could have beneficial effects on cultural and historic resource site integrity by maintaining natural values important to Native Hawaiian culture.

## Habitat Management and Conservation Action Plan

### *Field Activities*

Restoring and maintaining native ecosystems supports the traditional practices of Native Hawaiians for protecting and maintaining natural resources. Investigating and inventorying known contamination from historic human use in the NWHI include collecting and characterizing oil found washed ashore and on wildlife, building an oil sample archive (HMC-2.5), and monitoring the area at Laysan Island that was contaminated by carbofuran (HMC-2.6). The investigation and inventories of contaminated sites in the NWHI could have beneficial effects on cultural and historic resources by protecting and restoring native ecosystems from the numerous effects of known contaminants.

Restoring and maintaining coastal mixed grasses and shrubs on all the coralline islands and atolls of the Monument includes propagating and outplanting native species (HMC-4.1), implementing the Draft Restoration Plan (HMC-4.2), and replacing 60 acres of introduced shrub *Indian pluchea* at Laysan Island with native species (HMC-4.3). The maintenance and better understanding of the Monument's wetland and mudflat habitats include monitoring water level, salinity, and other water quality parameters of Laysan Lake, documenting any loss of lake area (HMC-6.1), and restoring dune habitat on Laysan Island to minimize sand movement (HMC-6.2). These activities could have beneficial effects on cultural and historic resources by preserving the native ecosystems and natural habitats, thereby supporting traditional Hawaiian values of protecting and maintaining natural resources.

### 3.3.3.3 Reducing Threats to Monument Resources

#### Marine Debris Action Plan

##### *Planning and Administrative Activities*

Culture and historic resources that may be submerged or located on coastal sites provide evidence of historical activities in the NWHI. The MMB will work with fishery management councils to assess and address fishing practices or domestic fishing gear that contribute to marine debris problems (MD-1.5) The results of this planning activity would include coordinating with the Councils for an accountability requirement for all vessels using the type of gear that contributes to marine debris in the NWHI. Planning for the removal of debris, detecting and preventing incoming debris, and educating the public to prevent future generations of debris in the Monument could prevent the destruction or desecration of undiscovered cultural and historic resources. This could result in beneficial effects on cultural and historic resources.

#### Alien Species Action Plan

##### *Field Activities*

Detecting, controlling, eradicating, and preventing the introduction of alien species supports the traditional Native Hawaiian values of protecting and maintaining natural resources. Measures taken to enforce the use of current quarantine protocols and hull inspections and cleaning to prevent the introduction of invasive terrestrial species to the Monument could have a beneficial effect on cultural resources (AS-3.1, AS-3.2). Preventing alien species invasions could reduce

the need to work on, near, or at cultural sites to eradicate alien species. This could have a beneficial effect on cultural and historic resources. While eradication of pests could yield a beneficial effect on cultural and historic resources, there is a potential for short-term minor negative effects through site disturbance during activities requiring work on, near, or at cultural sites. During eradication, every effort would be made to minimize effects from disturbance on cultural sites. Additionally, exercising the NHPA Section 106 process, if appropriate, could further reduce the potential for negative effects.

#### **3.3.3.4 Managing Human Uses**

##### **Permitting Action Plan**

###### ***Planning and Administrative Activities***

The natural environment is protected and strong cultural and spiritual ties of the Native Hawaiians to the NWHI are maintained through an effective and integrated permit program to manage human access and to minimize and prevent negative impacts on the Monument. This is achieved by promptly reviewing permit applications to ensure informed permit-related decision making across Co-Trustee agencies (P-1.1); refining and updating the permit application, instructions, and permit template through feedback from permittees and other users (P-1.2); coordinating appropriate environmental review for all permitted activities (P-1.3); and regularly updating the public on proposed and permitted activities (P-3.5).

These activities provide additional oversight of Monument activities, contributing to a well-informed resource management staff, who would be better equipped to manage and protect cultural and historic resources. This could result in beneficial effects on cultural and historic resources.

##### **Enforcement Action Plan**

###### ***Planning and Administrative Activities***

The natural environment is protected and strong cultural and spiritual ties of the Native Hawaiians to the NWHI are maintained through an effective compliance and enforcement program within the Monument. Such activities as conducting a comprehensive threat assessment, drafting an enforcement plan (EN-2.1), and operating the mandatory VMS for all permitted vessels (EN-2.2) would provide additional oversight of Monument activities. This contributes to a well-informed resource management staff, who would be better equipped to manage and protect cultural and historic resources. This could result in beneficial effects on cultural and historic resources.

#### **3.3.3.5 Coordinating Conservation and Management Activities**

##### **Constituency Building and Outreach Action Plan**

###### ***Planning and Administrative Activities***

Public outreach for managing activities within the Monument helps maintain the connection between cultural and conservation practices. Outreach is improved by MMB agencies

collaborating to reach a broader audience (CBO-3.1), to support partnership opportunities that focus on Oceania-related issues (CBO-3.3), and to convene the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve Advisory Council to provide formal advice on management activities (CBO-3.8). Through public outreach, the Monument could garner public support for protecting and properly managing cultural and historic resources. This could result in beneficial effects on cultural and historic resources.

### **Native Hawaiian Community Involvement Action Plan**

#### ***Planning and Administrative Activities***

The unique biological, cultural, scientific, educational, historical, and recreational values of the NWHI require that the region be carefully managed to ensure these values are not diminished for future generations. Such activities as identifying how traditional knowledge could be integrated into Monument activities (NHCI-3.1) would further engage the Native Hawaiian community in management activities in the Monument. Native Hawaiian involvement would perpetuate the relationship between their spirituality and the natural and physical elements of the NWHI, resulting in beneficial effects on cultural and historic resources.

### **Ocean Ecosystem Literacy Action Plan**

#### ***Planning and Administrative Activities***

The natural environment would be protected and the strong cultural and spiritual ties of the Native Hawaiians to the NWHI would be maintained by developing and implementing educational programs to increase ocean ecosystems literacy and promote stewardship values. Activities to accomplish this include expanding and improving the NWHI educational partnership's Navigating Change curriculum for elementary and middle school students, with increased focus on ocean ecosystems literacy, within three years (OEL-1.1). Through public outreach, the Monument could garner public support for protecting and properly managing cultural and historic resources. This could result in beneficial effects on cultural and historic resources.

#### ***Field Activities***

The natural environment and its resources are an integral part of the Hawaiian culture and many of its practices. The natural environment would be protected and the strong cultural and spiritual ties of the Native Hawaiians to the NWHI would be maintained through educational expeditions to the NWHI. An example of this is activities that continue to provide educational opportunities for teachers and students at the NWHI (OEL-1.5, OEL-1.8). Through public outreach, the Monument could garner public support for protecting and properly managing cultural and historic resources. This could result in beneficial effects on cultural and historic resources.

### **3.3.3.6 Achieving Effective Monument Operations**

#### **Evaluation Action Plan**

##### *Planning and Administrative Activities*

An annual program review would include a description of the status of activity implementation and any recommended adjustments that would be provided in an annual report (EV-1.2). This review, including tracking the progress of the actions plans, would ensure ongoing protection and proper management of cultural and historic resources. This could result in beneficial effects on cultural and historic resources.

#### **3.3.4 Proposed Action**

The Proposed Action would expand current activities and includes new activities described in the Monument Management Plan; the effects of these activities are described below. Implementation of the Proposed Action includes continuing those activities described for the No Action alternative, described in Section 3.3.3 above. The effects of these activities would also continue under the Proposed Action. Only those activities that would have an effect on cultural and historic resources are included in this analysis.

The Proposed Action would require additional conditions of permittees accessing the Monument. The permittee and any person entering the Monument must attend a cultural briefing or view designated cultural informational materials outlining the region's cultural significance and Native Hawaiians' spiritual and genealogical connection to the natural and cultural resources. Disturbance of any cultural or historic property is prohibited under the conditions of a Monument permit. The Proposed Action could result in additional funding for educational programs and exhibits for historic resources in the Monument. Further public outreach provided through new programs, visitor centers, and educational materials would bring heightened public awareness for historic resources within the Monument and a greater constituency base for support and protection of cultural resources. Repairing, maintaining, and restoring historic structures would prolong their integrity and would protect cultural and historic resources into the future.

#### **3.3.4.1 Understanding and Interpreting the Northwestern Hawaiian Islands**

##### **Native Hawaiian Culture and History Action Plan**

##### *Planning and Administrative Activities*

Monument regulations define Native Hawaiian practices as cultural activities conducted to perpetuate traditional knowledge, to care for and protect the environment, and to strengthen cultural and spiritual connections to the NWHI that have demonstrable benefits to the Native Hawaiian community. In partnership with the Native Hawaiian Cultural Working Group, cultural practitioners, and other experts, the MMB would develop a Cultural Resources Program Plan (NHCH-4.1). The purpose would be to identify cultural resources, sites, and other locations within the Monument that are appropriate for use in contemporary Native Hawaiian culture. The Cultural Resources Program Plan would address protocols, policies, and procedures for

collecting, curating, and disposing of archaeological materials, artifacts, and human remains. Monument staff would continue to work with partners to compile existing information about the region and initiate new cultural and historic research (NHCH-2.1). The MMB would support Native Hawaiian cultural research needs through additional partnership contracts, grants or formal agreements with Native Hawaiian organizations (NHCH-2.2). Increasing the understanding of Native Hawaiian histories and culture and documenting the archaeological sites and sacred resources of the NWHI by developing a formal plan and facilitating research could have beneficial effects on the cultural and historic resources of the Monument by recognizing the significance of the NWHI to Native Hawaiians.

As part of the Cultural Resources Program Plan, the MMB would work toward establishing agreements with local universities and museums to provide proper stewardship of cultural resources and artifacts through curation, research, use, return, and repatriation of collections (NHCH-2.7). A Native Hawaiian nomenclature working group would also be established to evaluate newly discovered regions, islands, and geographical and oceanic features and sites (NHCH-2.4). Information developed through this working group would be recorded in the forthcoming Monument Information Management System (NHCH-2.5). Increasing the understanding and documentation of Native Hawaiian histories and culture through research could have beneficial effects on the cultural and historic resources of the Monument. This would be done by enhancing and perpetuating understanding of Native Hawaiian culture and knowledge so as to better manage and protect the resources.

The MMB would work toward increasing resource managers' knowledge base of Native Hawaiian values and cultural information through "in-reach" programs. Monument resource managers and staff and MMB members would participate in informal and formal briefings, cultural workshops, and cultural exchanges in cooperation with other marine protected area sites that integrate traditional knowledge into their management (NHCH-3.3). This activity could have a beneficial effect on cultural and historic resources by increasing the Monument staff's knowledge base, understanding the interpretive values of cultural and historic resources, and providing for better protection and management of cultural and historic resources.

Native Hawaiian values and cultural information would be used to guide outreach and the development of educational materials (NHCH-5.1). Traditional ways of storytelling, such as hula, mele, and oli, would be encouraged to develop a culturally based strategy for education and outreach (NHCH-5.2). Native Hawaiian values and cultural information would be integrated into Monument permittee education and outreach programs and would foster a deeper respect for the NWHI through better understanding of, and respect for, Hawaiian values and the cultural significance of the place (NHCH-5.3). Increasing the understanding and documentation of Native Hawaiian histories and culture practices through education and public outreach could have beneficial effects on the cultural and historic resources of the Monument. This would come about by recognizing and addressing the significance of the NWHI to Native Hawaiians and by preserving their traditional and familial connections to their natural environments by implementing similar resource management practices.

### ***Field Activities***

The MMB would continue to support, provide, and facilitate research and educational activities on issues and priorities identified and to make opportunities available to students, teachers, and researchers in the form of grants, logistical support, and berthing space aboard research vessels (NHCH-2.3). In an effort to support access for Native Hawaiian practices and to ensure that cultural research needs are met, partnership contracts, grants, or formal agreements with Native Hawaiian organizations would be created (NHCH-2.6). Conducting and supporting cultural and historical research and facilitating access to the NWHI could have beneficial effects on cultural and historic resources by providing Native Hawaiians with the opportunity to engage in the cultural traditions, practices, and histories of the NWHI, while educating the broader public on the significance of these resources. The MMB would engage the Native Hawaiian Cultural Working group and other Native Hawaiian cultural practitioners to develop and implement the Monument's management activities (NHCH-3.2). This could have beneficial effects on cultural and historic resources by integrating the traditional ecological knowledge of Native Hawaiian practitioners and experts.

Specific preservation and access plans would be developed to further protect cultural sites on and collections from Nihoa and Mokumanamana (NHCH-4.2). The plans would address monitoring and stabilization of cultural sites and curatorship or potential return and repatriation agreements with museums and institutions that house artifact collections. A Cultural Resources Program Plan would fully integrate cultural resource protection and would be initiated and implemented by the MMB (NHCH-4.3). Planning, developing, and implementing a Monument Cultural Resources Program could have long-term beneficial effects on cultural and historic resources by protecting the cultural resources in the Monument and acknowledging and preserving their cultural significance.

### **Historic Resources Action Plan**

#### ***Planning and Administrative Activities***

Preserving historic resources, including nonmarine sites, structures, artifacts, culture, and places from the Monument's historic period, provides records of past activities and increases protection and management of the resources. Through the MMB, management plans under the different agencies would be reconciled to address Monument management needs as a whole, including the needs of the Historic Preservation Plan, Midway Visitor Service Plan and the lead paint abatement plan (HR-1.1). The consolidation of plans would allow for more effective use of facilities and equipment, while preserving the integrity of historic sites, thereby resulting in beneficial effects on historic resources.

The Midway Atoll Historic Preservation Plan and the NHL would be updated and submitted to the Advisory Council on Historic Preservation (HR-1.2, HR-3.3). Capacity would be built for a staff dedicated to implementing the Midway Atoll Historic Preservation Plan, which would include archival research and data collection on the Battle of Midway NHL and improvement of the function and capacity of the Midway Museum (HR-2.1, HR-3.1, HR-4.1). The Midway Museum collection would undergo organization and curation, and oral histories of life on Midway would be compiled, collected, curated, and published to ensure a record of alternative perspectives and unique history of life on Midway (HR-4.3, HR-5.1, HR-6.1). These efforts

would improve the understanding and interpretation of the history and natural history of Midway Atoll, possibly resulting in beneficial effects on cultural and historic resources.

Monument staff would undergo annual training on the treatments identified in the Historic Preservation Plan to be aware of the responsibilities and procedures on the atoll (HR-2.2). The staff would also plan, conduct, and report on field surveys and documentation of selected sites within 15 years (HR-5.2). Standard historic archaeological practice would be exercised in this activity. Protecting and managing historic resources through staff training and planning historic resource surveys would increase historic preservation and awareness of the Monument resources. This could have beneficial effects on cultural and historic resources.

### ***Field Activities***

Opportunities for visitors and volunteers would be incorporated into Midway Atoll visitor services program to implement historic preservation treatments. Volunteers, under expert supervision, would be able to maintain historic properties, such as painting, restoring windows, and landscaping (HR-2.3). The adaptive reuse of historic properties at Midway Atoll would foster increased preservation of historic sites, thereby resulting in beneficial effects on historic resources.

Selected NHL sites would be documented through field surveys, using standard historic archaeological practices (HR-3.2). Additional field surveys and documentation of selected NHL mark sites and features would be conducted, including an archaeological investigation of the Commercial Pacific Cable Station site to learn about the lifestyle of Midway's earliest permanent residents (HR-6.2). Performing field surveys and conducting archaeological investigations provides insight into the rich history of the Monument, while preserving the resources. This could have beneficial effects on cultural and historic resources.

### ***Infrastructure and Development Activities***

The Midway Museum would be remodeled to meet professional curation standards, which would better preserve the artifacts and historic materials and would enhance visitors' experience with historic resources (HR-4.2). Under the Proposed Action, repair and maintenance treatments on NHL features would be accomplished through volunteer work, unskilled labor, and specially trained historic preservation architects and engineers, when required (HR-3.4). Renovating museums and visitors centers would bring heightened public awareness for historic resources within the Monument and a greater constituency base for supporting and protecting cultural resources. This could have beneficial effects on cultural and historic resources. Repairing and maintaining historic structures would maintain the integrity of these sites for longer periods, thereby having beneficial effects on the historic resources.

## **Maritime Heritage Action Plan**

### ***Planning and Administrative Activities***

Preserving maritime heritage resources, such as submerged and beached shipwrecks, aircraft, and other sites of historical, cultural, and archaeological significance, provides records of past activities and increases protection and management of the resources. A status report would be

compiled and updated annually to document wreck sites and other debris, which represent potential environmental hazards (MH-1.3). Protecting maritime heritage resources by assessing the need for responding to or remediating potential environmental hazards would increase maritime heritage preservation. This could have beneficial effects on cultural and historic resources.

### **3.3.4.2 Conserving Wildlife and Habitats**

#### **Threatened and Endangered Species Action Plan**

##### ***Planning and Administrative Activities***

Through proper planning, implementation, and inclusion of established management practices, cultural and historic site protection could be incorporated into natural environment, cultural, and spiritual resources. Planning and administrative activities to support the recovery of the Hawaiian monk seal include evaluating the loss of critical habitat (TES-1.3); ensuring that all users of the NWHI are aware of the impacts of disturbing Hawaiian monk seals on breeding beaches and in nearshore waters to reduce the likelihood of impacts from human interaction (TES-1.4); and increasing outreach and education activities focusing on Hawaiian monk seals (TES-1.5).

These activities would protect surrounding resources and would increase species populations, thereby having beneficial effects on cultural and historic resources.

Other ways to further reduce the potential threats to threatened and endangered species are cooperating with international recovery teams and governments to increase short-tailed albatross populations by establishing one or more breeding populations on islands free of threats (TES-4.1) and disseminating public outreach information on fisheries bycatch and bycatch reduction to fisheries outside the Monument (TES-4.3). There could be beneficial effects on cultural and historic resource site integrity by increasing the awareness of irreplaceable resources in the Monument in order to provide better protection and management. This could be done by reducing negative effects on threatened and endangered species through outreach and education and by exchanging data with domestic and international groups.

##### ***Field Activities***

Field activities that are carried out to conserve, manage, monitor, and document species and their natural habitats include facilitating emergency response activities for Hawaiian monk seals (TES-1.2); determining the status of cetacean populations (TES-2.1); verifying and managing potential threats to cetaceans (TES-2.3); preventing negative human-cetacean interactions (TES-2.5); ensuring that nesting populations of green turtles at source beaches are stable or increasing (TES-3.1); protecting marine habitats used by green turtles for foraging and migration routes (TES-3.3); and conducting studies to protect short-tailed albatross and contaminant loads (TES 4.2).

These activities aim to protect surrounding natural resources, increase or stabilize species populations, and protect critical habitats. This could have beneficial effects on cultural and historic resources.

Maintaining stable populations of species by relocating Laysan ducks (TES-5.2) and finches, Nihoa finches, and Nihoa millerbirds (TES-6.2) to other sites in the Monument would protect surrounding natural resources and critical habitats and would increase or stabilize species' populations. This could have beneficial effects on cultural and historic resources.

Developing ecological baselines of listed species and critical habitat (TES-8.2) would assist Monument managers, consulting agencies, and action agencies in determining whether activities may affect listed species. The activities described above would contribute to a well-informed management staff who would be better equipped to manage and protect surrounding natural resources, increase or stabilize species' populations, and protect critical habitats. This could have beneficial effects on cultural and historic resources.

### **Migratory Birds Action Plan**

#### ***Field Activities***

Protecting the natural environment and surrounding natural resources maintains the strong cultural and spiritual values of the Native Hawaiians to the NWHI. Field activities that are carried out to conserve, manage, monitor, and document natural habitats and minimize the negative effects of threats to migratory birds include controlling or eradicating nonnative species that have a negative effect on migratory birds (MB-1.1); restoring components of the native plant communities that are important to seabird nesting (MB-1.2); and monitoring other conditions that might limit the success of existing colonies, hinder restoration efforts, or change the quantity or quality of habitat on which migratory birds depend (MB-2.2, MB-3.1, and MB-3.2, MB-3.3).

Protecting natural habitats for migratory birds and their populations could have beneficial effects on cultural and historic resource site integrity by increasing the awareness of irreplaceable resources in the Monument and by preserving the natural environment.

### **Habitat Management and Conservation Action Plan**

#### ***Planning and Administrative Activities***

Restoring and maintaining native ecosystems supports the traditional Native Hawaiian practices of protecting and maintaining natural resources. Planning activities include identifying and prioritizing restoration needs in shallow reef habitats (HMC-1.1); evaluating the costs to ecosystem function and benefits of removing scrapped iron debris from reefs in the Monument (HMC-2.4); and conducting ecological risk assessments of lead-based paint to determine necessary cleanup levels (HMC-2.7).

These activities would increase the protection of the native ecosystems and natural resources in the Monument and therefore could have beneficial effects on cultural and historic resources.

Developing and implementing culturally appropriate and innovative remote and direct techniques and methods for monitoring plant and animal populations on cliff habitats in the Monument (HMC-9.2) could have beneficial effects by minimizing the amount of on-site management near cultural sites.

### ***Field Activities***

Restoring and maintaining native ecosystems supports the traditional Native Hawaiians practices for protecting and maintaining natural resources. Changes in the species composition and structure of mixed grass and shrub plant communities would be monitored on all the coralline islands and atolls of the Monument (HMC-4.7). Increasing or stabilizing the mixed grass and shrub plant communities and protecting critical habitat could have long-term beneficial effects on cultural and historic resources through increased protection and maintenance of natural resources. Work on, near, or at cultural sites could result in a short-term minor negative effect on cultural and historic resources from site disturbance during monitoring. This could be minimized through a programmatic agreement.

Field activities to investigate and inventory known sources of contamination and to restore and maintain indigenous ecosystems include conducting remedial actions at shoreline dumps at FFS and at Kure, Midway, and Pearl and Hermes Atolls (HMC-2.3); restoring native vegetation on the 34-acre Southeast Island at Pearl and Hermes Atolls (HMC-4.5); implementing coordinated ecosystem restoration on Kure Atoll (HMC-4.6); inventorying and documenting life histories of endemic terrestrial invertebrates at Nihoa and Mokumanamana (HMC-5-1); and removing ironwood on 50-acres on Sand Island.

Investigating, inventorying, restoring, and maintaining contaminated sites could have long-term beneficial effects on cultural and historic resources by increased protection of natural resources. However, these activities could result in short-term minor negative effects on cultural and historic resources from physical disturbance during remediation. Effects could be minimized by exercising the NHPA Section 106 process.

### **3.3.4.3 Reducing Threats to Monument Resources**

#### **Marine Debris Action Plan**

##### ***Planning and Administrative Activities***

Cultural and historic resources that may be submerged or located on coastal sites provide evidence of historical activities in the NWHI. Protecting the historic resources by reducing the amount of debris entering the North Pacific Ocean is critical to preserving the history of the Monument. Gaining international cooperation and involvement for the marine debris issue (MD-1.3), developing standard marine debris monitoring protocols and outreach (MD-2.2, MD-3.1, MD-1.4), and removing hazardous materials that wash ashore (MD-1.2) would further protect the cultural and historic resources that may be submerged or located on coastal sites. Destruction or desecration of known and undiscovered cultural and historic resources could be minimized by heightening awareness through working with groups at an international level, through the Monument staff gaining knowledge from investigative marine debris studies, and through continuing outreach of multiagency partnerships. This could have beneficial effects on cultural and historic resources.

### ***Field Activities***

Cultural and historic resources that may be submerged or located on coastal sites provide evidence of historical activities in the NWHI. Protecting the historic resources by reducing the amount of debris entering the North Pacific Ocean is critical to preserving the history of the Monument. The MMB would work with partners and with fishery management councils and other partners to remove marine debris in the Monument and to reduce additional debris entering the Monument (MD-1.1, MD-1.5, MD-2.1). Removing debris, detecting and preventing incoming debris, and preventing future generations of debris entering the Monument could prevent destruction or desecration of existing and undiscovered cultural and historic resources. This could result in a beneficial effect on cultural and historic resources.

### **Alien Species Action Plan**

#### ***Planning and Administrative Activities***

Detecting, controlling, eradicating, and preventing the introduction of alien species supports the traditional Native Hawaiian values for protecting and maintaining natural resources. Activities aimed at preventing, controlling, and eradicating alien species include developing management practices through integrated management plans (AS-1.2); maintaining a GIS database of marine and terrestrial alien species (AS-2.2); encouraging participation in statewide and Pacific regional alien species efforts (AS-10); and integrating alien species information into the overall outreach program for Monument permittees and outreach materials (AS-9.1, AS-9.2).

These activities to prevent alien species invasions would reduce the need to work on, near, or at cultural sites and therefore could have beneficial effects on cultural resources. While pest eradication would yield beneficial effects on cultural and historic resources, there is a potential for short-term minor negative effects through site disturbance. Activities may require work on, near, or at cultural sites. Known and yet-to-be-found cultural and historic resources could be unintentionally harmed through alien species eradication. Resource managers would be required to use BMPs while working at these sites to minimize effects.

#### ***Field Activities***

Detecting, controlling, and eradicating alien species supports the traditional Native Hawaiian values for protecting and maintaining natural resources. By protecting the natural environment, strong cultural and spiritual values of the Native Hawaiian culture in the NWHI may be maintained. Activities aimed at preventing, controlling and eradicating alien species include surveying distributions and populations of known alien species (AS-2.1); detecting and characterizing new infestations (AS-2.3); eradicating the house mouse (AS-4.2); conducting toxicant trials (AS-5.2); controlling and eradicating two mosquito species (AS-5.3); controlling and eradicating the gray bird locust with toxicants (AS-5.4, AS-5.5); controlling and eradicating invasive grass sandbur (AS-6.2); controlling and eradicating *Indian pluchea*, *Sporobolus pyramidatus*, and *swine cress* (AS-6.3); controlling and eradicating prioritized alien plant species (AS-6.4); mapping, controlling, and eradicating invasive red algae (AS-7.1); and conducting surveillance of snowflake coral and other incipient marine invasives (AS-7.2).

Controlling and eradicating alien species could have beneficial effects on cultural and historic resources by protecting and maintaining the natural environment and resources. While eradication of pests could yield beneficial effects on culture and historic resources, there is potential for short-term minor negative effects from the potential disturbance of cultural and historic sites while controlling alien species, such as removing vegetation and applying pesticides. Known and yet-to-be-found cultural and historic resources could be unintentionally harmed. Resource managers would be required to use BMPs while working at these sites to minimize effects.

## **Maritime Transportation and Aviation Action Plan**

### ***Planning and Administrative Activities***

Through proper planning, implementation, and inclusion of established management practices, cultural and historic sites would be protected. Activities aimed at reducing potential threats from maritime transportation and aviation include improving the pre-access information for inclusion on the Monument Web site and in permit application instructions (MTA-2.3) and updating nautical charts (MTA-1.3). These activities would increase Monument users' awareness and knowledge of cultural and historic sites within the Monument, reducing the potential for their activities to affect undiscovered resources. This could result in beneficial effects on cultural and historic resources.

## **Permitting Action Plan**

### ***Planning and Administrative Activities***

Protecting the natural environment and the strong cultural and spiritual ties of the Native Hawaiians to the NWHI is maintained through an effective and integrated permit program to manage human access and minimize and prevent negative effects on the Monument. Implementing an effective and integrated permit program includes external review of Monument permit applications (P-1.4); investigations of individual and vessel insurance (P-1.5); analyzing permit data for management decision making and for patterns of compliance (P-2.2, P-2.3); implementing a Monument reporting process (P-2.4); developing and implementing education programs (P-3.1, P-3.2); coordinating permitting outreach (P-3.3); and developing a pre-access training and briefing program.

These activities would provide additional oversight of Monument activities, contributing to a well-informed resource management staff who would be better equipped to manage and protect cultural and historic resources and through public outreach, the public could develop a greater understanding of the values of the Monument, thereby resulting in beneficial effects on cultural and historic resources.

## **Enforcement Action Plan**

### ***Planning and Administrative Activities***

The natural environment and strong cultural and spiritual ties of the Native Hawaiians to the NWHI are protected by chartering a Monument law enforcement working group (EN-1.1); developing interagency agreements (EN-1.2); developing an integrated law enforcement training program (EN-1.3); assessing law enforcement capacity and program effectiveness (EN-1.4); integrating additional automated monitoring systems and ship reporting systems (EN-2.3); and integrating regulations briefings into pre-access training (EN-3.1).

These activities would provide additional oversight of Monument activities, contributing to a well-informed resource management staff who would be better equipped to manage and protect cultural and historic resources, thereby resulting in beneficial effects on cultural and historic resources.

## **Midway Atoll Visitors Service Action Plan**

### ***Field Activities***

The natural environment and strong cultural and spiritual ties of the Native Hawaiians to the NWHI would be protected by offering visitors opportunities to enhance their knowledge and appreciation of the Monument's resources. Activities to enhance the visitor's service program include providing visitors with opportunities for wildlife-dependent recreation (VS-1.1); providing opportunities to learn about cultural and historic resources (VS-1.2); monitoring impacts of visitors and other users on wildlife and historic resources (VS-1.3); and monitoring visitor satisfaction surveys (VS-2.1).

Through these activities, visitors would have the opportunity to enhance their knowledge and appreciation of the Monument's natural resources and to learn about and appreciate cultural and historic resources at the Monument. Additionally, continuous monitoring to determine effects from Monument visitors would help resource managers manage and protect cultural and historic sites. This could result in beneficial effects on cultural and historic resources.

### **3.3.4.4 Coordinating Conservation and Management Activities**

#### **Agency Coordination Action Plan**

##### ***Planning and Administrative Activities***

Involving Native Hawaiian entities in the coordinated management of the Monument helps preserve and maintain the connection between cultural and conservation practices. The Proposed Action alternative includes exploring the potential of developing new agreements, including the possibility of amending the 2006 MOA to increase Native Hawaiian involvement in the management of the Monument. (AC-2.1). The involvement of a Native Hawaiian governing entity in the management of the Monument would enhance coordinated management in the Monument by providing added authority for increased protection of cultural and historic resources, therefore having a beneficial effect.

## **Constituency Building and Outreach Action Plan**

### ***Planning and Administrative Activities***

The following activities involve efforts to cultivate an informed constituency that supports the conservation of the natural, cultural, and historic resources of the Monument: engaging in efforts to increase ocean ecosystem literacy and conservation (CBO-1.4); establishing a Monument Web site for Monument-related information (CBO-2.1); developing and updating printed material to aid in understanding key aspects of the Monument (CBO-2.2); supporting other entities' efforts to broaden knowledge of and appreciation for Monument resources and management priorities (CBO-2.3); continuing support of the Native Hawaiian Cultural Working Group through OHA (CBO-3.6); and developing interagency Monument interpretive themes to guide all interpretive products and activities (CBO-4.1).

Through public outreach, the Monument could garner public support for the protection and proper management of cultural and historic resources. This could result in a beneficial effect by generating an increased interest in restoration and protection of cultural and historic resources in the Monument.

### ***Field Activities***

The natural environment and the strong cultural and spiritual ties of Native Hawaiians to the NWHI would be protected by involving the public in the activities at the Monument. Researching and implementing new technologies and tools to increase public understanding of the NWHI ecosystems (CBO-1.5), including telepresence technology, would allow people to feel as if they were present. Through such technologies, Monument staff would be able to provide the public with an opportunity to experience the cultural and historic resources of the Monument, without risking negative effects from physical access, resulting in beneficial effects on cultural and historic resources.

### ***Infrastructure and Development Activities***

Involving constituents in managing the Monument through public outreach enhances the connection between cultural and conservation practices. Initiatives to develop an engaged constituency to enhance management of the Monument include developing partnerships with the National Park Service and other key entities. These partnerships would develop off-site exhibits on the Battle of Midway and the associated National Memorial, to be integrated into World War II memorial sites of the Pearl Harbor Historic District (CBO-4.5). Through public outreach, the Monument could garner public support for protecting and properly managing cultural and historic resources. Through the availability of off-site exhibits, Monument staff would be able to provide the public with an opportunity to experience the cultural and historic resources of the Monument, without risking negative effects of allowing access to the Monument. This could result in beneficial effects on cultural and historic resources.

## **Native Hawaiian Community Involvement Action Plan**

### ***Planning and Administrative Activities***

The Proposed Alternative includes activities that would expand and convene the Native Hawaiian Cultural Working Group (NHCI-1.1); develop and annually maintain partnerships with Native Hawaiian organizations and institutions (NHCI-1.2); establish an annual cultural resources exchange (NHCI-1.3); expand and explore opportunities to partner with institutions serving Native Hawaiians (NHCI-2.1); and use and integrate Native Hawaiian traditional knowledge in Monument management activities (NHCI-3.2).

Native Hawaiian involvement would perpetuate the relationship between their spirituality and the natural and physical elements of the NWHI, which could increase support for future protection or restoration, thereby resulting in beneficial effects on cultural and historic resources.

## **Ocean Ecosystem Literacy Action Plan**

### ***Field Activities***

The natural environment and the strong cultural and spiritual ties of Native Hawaiians to the NWHI would be protected by developing and implementing educational programs to increase ocean ecosystems literacy and promote stewardship values. Activities included are those that provide educational opportunities for formal and informal educators and community and conservation leaders at Midway Atoll (OEL-1.7) and using telepresence technologies for educational and outreach activities (OEL-2.2). Through public outreach, the Monument could garner public support for the protection and proper management of cultural and historic resources. Through such technologies, the public could experience cultural and historic resources of the Monument, without risking negative effects of physical access, resulting in beneficial effects on cultural and historic resources.

### **3.3.4.5 Achieving Effective Monument Operations**

#### **Coordinated Field Operations Action Plan**

##### ***Infrastructure and Development Activities***

Preserving historic resources provides a record of the historical activities in the NWHI and allows increased protection and management of these resources. Activities to preserve historic structures include rehabilitating Officers Row Housing at Midway Atoll (CFO-3.4, CFO-9.4) and treating all wooden historic structures at Midway Atoll for termites (CFO-5.3).

Rehabilitating historic structures would preserve the integrity of historic sites, resulting in a beneficial effect on historic resources. Known and undiscovered cultural and historic resources could be unintentionally harmed through infrastructure and development work under this or any of the other infrastructure operations called for in the sections analyzed in this chapter. Resource managers would be required to use established management practices while working at these sites to avoid such harm. Short-term minor negative effects that might result from infrastructure and development activities generally could be minimized by exercising the NHPA Section 106 process, as explained in section 3.3.2.

**3.3.5 Summary of Effects**

Table 3.3-1 summarizes the effects on cultural and historic resources from the Proposed Action. The effects are listed by Action Plan and action areas (planning/administrative, field, or infrastructure and development activities). The Proposed Action could have beneficial and short-term minor negative effects on cultural and historic resources of the Monument. The cultural and historic resources of the Monument, includes historic properties, landscapes, cultural items, archaeological resources, sacred sites, or collections subject to protection under the NHPA, the ARPA, and the guidelines on Curation of Federally Owned and Administered Collections (36 CFR Part 79).

**Table 3.3-1

### 3.4 SOCIOECONOMICS

#### 3.4.1 Effects Analysis Methodology

In the description of the No Action and Proposed Action alternatives, activities presented in the Monument Management Plan were divided into three categories: planning and administrative, field, and infrastructure and development. Planning and administrative activities are not considered to directly affect socioeconomic resources (human use, human health, safety and hazardous materials, land use, and economics), either because they relate to the development of the coordination mechanisms described in the December 2006 MOA and Presidential Proclamation 8031 or they are specifically administrative in nature. However, many activities identified as a result of these planning and administrative actions ultimately would have a direct effect and to the extent adequate information is currently available they are analyzed below. For activities proposed within the Monument or intended to improve management of the Monument, the method used to determine the effect on socioeconomic resources is as follows:

- Review and evaluate current and past activities to identify their potential effect on socioeconomic resources (human use, human health, safety and hazardous materials, land use and economics);
- Review and evaluate activities within the Monument Management Plan to identify their potential to beneficially or negatively affect socioeconomic resources (human use, human health, safety and hazardous materials, land use, and economics) and its components within the Monument; and
- Assess whether or not each activity within the Monument Management Plan is consistent with applicable federal, state, or local laws, regulations, and policies.

#### 3.4.2 No Action

This section briefly describes activities that are underway in the Monument and analyzes the effects associated with these activities. Only those activities that would have an effect on human health, safety and hazardous waste, human uses and land use are included in the analysis. The analysis describes the projected beneficial and negative effects that would be expected to continue under the No Action alternative, should it be selected for implementation. The No Action alternative would not change the current situation. However, these activities would continue under the Proposed Action alternative, and their effects are summarized under the Proposed Action in Table 3.4-1 at the end of this section.

##### 3.4.2.1 Understanding and Interpreting the Northwestern Hawaiian Islands

###### Marine Conservation Science Action Plan

###### *Planning and Administrative Activities*

###### *Human Uses*

Characterizing types and spatial distributions of shallow-water marine habitats (MCS-1.1) and monitoring shallow-water coral reef ecosystems (MCS-1.2) provides a framework for biogeographical assessments that would offer up-to-date research findings for the project area.

These research and monitoring activities have a beneficial effect on the use of the area by research personnel because the activities offer the opportunity for more effective use of resources while conducting research activities in the project area.

### **Maritime Heritage Action Plan**

#### ***Planning and Administrative Activities***

##### *Human Uses*

Field mapping surveys and status reports would continue under the Maritime Heritage Action Plan (MH-1.2). Different phases of research on Maritime Heritage include shoreline terrestrial surveys and inventories, as well as remote sensing using state of the art technology, such as sidescan sonar and magnetometers in order to locate potential heritage areas. These activities have a beneficial effect on use of the area by research personnel because they offer the opportunity for more effective use of resources while personnel are conducting continuing research activities.

### **3.4.2.2 Achieving Effective Monument Operations**

#### **Central Operations Action Plan**

#### ***Planning and Administrative Activities***

##### *Human Health, Safety, and Hazardous Materials*

There is currently coordination and implementation of an annual operating plan (CO-1.1), which includes several administrative tasks, such as budget tracking, in addition to field activity planning. Specifically, the annual plan includes functional information about emergencies to ensure staff safety. This coordination adds to the efficiency of safety operations throughout the Monument, as well as the health of staff persons. Under the No Action alternative, this coordinated plan would continue to be implemented, so this activity would have a beneficial effect on human health and safety within the Monument.

### **3.4.3 Proposed Action**

The Proposed Action would expand current activities and includes new activities described in the Monument Management Plan; the effects of these activities are described below. Implementation of the Proposed Action includes continuation of those activities described for the No Action alternative described in section 3.4.2 above. The effects of these activities would also continue under the Proposed Action. Only those activities that would have an effect on human uses, human health, safety and hazardous materials, and land use are included in this analysis.

### **Economics and Environmental Justice**

The economic effects of the Proposed Action alternative are analyzed based on the entire budget of all activities. This is because personnel may work on more than one activity and budget dollars may be shared between activities. Therefore, the effects by activity are not analyzed here.

### ***Economics***

The Proposed Action would provide an integrated framework for Monument management among the Co-Trustees. While this coordination could save money, it is anticipated that activities needed to address priority management needs will never be fully funded. As such, savings achieved through coordination would be channeled into research and management. A few additional jobs would be generated as a result of the Proposed Action, such as facilities repair and construction at Midway. An integrated approach presented in the Monument Management Plan could result in increased funding for research and management. However, overall, the total level of funding would still be subject to annual budgetary process and would likely experience increases or decreases, depending on overall federal spending. The cost of implementing the Proposed Action is estimated to average \$23 million a year over 15 years, but because funding is subject to federal and state budget and appropriations and private donations, it is not possible to determine in advance what level of funding may be available in any given year, or over the life of the plan. Overall, the Proposed Action alternative is not expected to have an effect on population, employment, industry, income or the broader Hawai‘i economy, compared to the No Action alternative.

### ***Environmental Justice***

The Proposed Action would not result in a disproportionate placement of negative environmental or health effects on minority or low-income populations compared to the No Action alternative. The proposed activities in the Monument Management Plan would be conducted largely in the Northwestern Hawaiian Islands, away from human population. Since potential changes in environmental, health, or economic conditions are not expected to disproportionately affect any particular low-income or minority groups, as in accordance with EO 12898, no effects on environmental justice are anticipated from the Proposed Action compared to the No Action alternative.

## **3.4.3.1 Understanding and Interpreting the Northwestern Hawaiian Islands**

### **Marine Conservation Science Action Plan**

#### ***Field Activities***

##### *Human Uses*

With the establishment of data collection protocols, statistical sampling design, and site selection criteria, new research opportunities would arise for research personnel within the Monument. In establishing these new research techniques and using the shallow-water ecosystem monitoring protocols as a guide, the goal of monitoring deepwater ecosystems would be achieved (MCS-1.4). With new research activities being conducted, the opportunity to include live Web sites from research vessels using written updates, imagery, and video is possible (MCS-3.3). These activities would have beneficial effects on research personnel who could benefit from new research opportunities. The public, especially students and teachers, could benefit from new activities aboard NOAA research vessels because they would be given an inside look at up-to-date research techniques and research findings that were not previously available.

## **Historic Resources Action Plan**

### ***Planning and Administrative Activities***

#### *Human Health, Safety, and Hazardous Materials*

Within the Historic Resources Action Plan, the Midway Atoll Historic Preservation Plan would be updated within one year, including reconciling it with the current lead-based paint abatement plan (HR-1.1). This activity would require consultation and coordination among refuge program specialists and Monument staff to balance the needs of each plan. The preservation efforts regarding historic resources, coupled with revitalization efforts involved with visitor service centers, would provide the impetus for increased planning for removing hazardous building materials from structures. The eventual removal of these hazardous materials would decrease the risk of human exposure and therefore could have a beneficial effect on human health and safety within the Monument.

## **Maritime Heritage Action Plan**

### ***Planning and Administrative Activities***

#### *Human Health, Safety, and Hazardous Materials*

Within the Maritime Heritage Action Plan, a status report on potential environmental hazards is to be completed within one year and would be updated annually (MH-1.3). This report would identify wreck sites and other debris through field work. The report would also identify any potential hazards in order to assess the need for response and remediation. Because most accidental oil spills occur due to vessel groundings and accidents, this status report could have a beneficial effect by reducing the likelihood of hazardous materials being released from vessel groundings and accidents. The identification of hazards could also have a beneficial effect on vessel safety because operators would be able to avoid incidents with more accuracy.

## **Historic Resources Action Plan**

### ***Field Activities***

#### *Human Uses*

Opportunities currently available for volunteers include assisting with historic preservation tasks, working with FWS on historic restoration projects, and, for well-qualified volunteers, assisting Monument staff with the operation of visitors services programs. With the expansion of current volunteer programs, there would be opportunities available to visitors to continue these activities and to participate in new historic preservation treatments deemed necessary by the agencies (HR-2.3). With continuing archaeological investigations throughout the Monument, new archaeological and historical research would be necessary. New research opportunities within the next 10 years could include excavation in such areas as the Commercial Pacific Cable Station (HR-6.2). These research opportunities would provide visitors and research personnel with an insight into Midway Atoll's earliest residents. These activities under the Historic Resources Action Plan could have minor beneficial effects on research personnel because they would be able to participate in new research that would help in understanding the history of the NWHI. The activities could have a minor beneficial effect on the public because, with new visitor and volunteer opportunities, the public would be given more opportunities and different reasons to

visit the Monument. These opportunities would not increase the total number of visitors and volunteers on Midway but could shift some focus from habitat restoration toward historic preservation and restoration activities.

## **Native Hawaiian Culture and History Action Plan**

### ***Field Activities***

#### ***Human Uses***

The expansion of current research activities in the Monument would include field research and cultural education opportunities for students, teachers, and cultural specialists. Specifically, these researchers would be provided with space aboard research vessels and logistical and technical support from personnel on the research vessels and from the agencies (NHCH-2.3). This activity would have a beneficial effect on students, teachers, and cultural specialists because new cultural education opportunities would be made available.

In support of Native Hawaiian cultural research, Activity NHCH-2.6 would offer Native Hawaiian organizations contracts, grants, or formal agreements for cultural access needs. These needs include access to Mokumanamana for cultural practices and regular access for Polynesian voyaging canoes for cultural practices training. This activity could be beneficial to the Native Hawaiian community because it would ensure that cultural practice needs were met.

In order to develop management activities for the Monument that include understanding the history of the Monument and its peoples, Activity NHCH-3.2 allows for the Native Hawaiian community and the Native Hawaiian Cultural Working Group to participate in developing these management needs. This would include engaging younger generations of Native Hawaiians in cultural research field activities. This would be beneficial to the Native Hawaiian community because it would allow them more access to preserving the cultural and historic resources of the NWHI through research opportunities and consultations with the agencies.

In developing and implementing specific preservations plans, including the Monument Cultural Resources Program, it would be possible for new sites to be listed on the NRHP on Nihoa and Mokumanamana Island (NHCH-4.2 and NHCH-4.3). This would result in no effect on human use of the area because these two islands would remain closed to general public access. Native Hawaiian use of these areas is allowed only under trip-specific permits from the MMB. Increased educational material that would result in the research of cultural resources and new historic sites could have a beneficial effect on the public, who would gain more knowledge of the history of the Monument.

### **3.4.3.2 Conserving Wildlife and Habitats**

#### **Threatened and Endangered Species Action Plan**

##### ***Planning and Administrative Activities***

###### ***Human Uses***

Various practices are instituted by the agencies that work to eliminate human interactions with marine mammals, seabirds, sea turtles, and other endangered or threatened species. These

practices include “Best Practices for Minimizing the Impact of Artificial Light on Sea Turtles,” “Precautions for Minimizing Human Impacts on Endangered Land Birds in Papahānaumokuākea Marine National Monument,” “Special Conditions and Rules for Moving between Islands and Atolls and Packing for Field Camps in Papahānaumokuākea,” “Human Hazards to Seabirds in Papahānaumokuākea Marine National Monument” (all found in Appendix F). Other practices include “Disease and Introduced Species Prevention Protocol for Permitted Activities in the Marine Environment, Papahānaumokuākea Marine National Monument” (PIRO 2007), “Marine Wildlife Viewing Guidelines (NOAA-NMFS, undated), and compatibility determinations for activities on the refuges. In order to reduce the likelihood and negative effect of human interactions on Hawaiian monk seals (*Monachus schauinslandi*), Activity TES-1.4 would include the extensive permit review process of any activities (including nearshore ship traffic, beach use, noise, research, and any other effect that could negatively affect the marine or terrestrial habitat of the seal) and thus could have a negative effect on human use in any areas that include the marine or terrestrial habitat of the monk seal. At the same time, to the extent these restrictions contribute to the recovery of the monk seal, these actions could result in a beneficial effect on human uses because of increased observational opportunities at Midway and the main Hawaiian Islands.

### ***Field Activities***

#### *Human Uses*

Currently, limited entry policies, no-access areas, and BMPs (See Volume III, Appendix F) are in place for avoiding threatened and endangered species and human interactions. Most beaches on the western side of Sand Island at Midway Atoll are closed to public access to protect the Hawaiian monk seal from human disturbance. “Turtle Beach,” on the east side of Sand Island, is inhabited by the endangered Laysan duck (*Anas laysanensis*) and is therefore closed to public use. Spit Island and Eastern Island at Midway are closed to visitors, with the exception of FWS-trained escorts conducting scheduled trips to Eastern Island. The critical habitat of the Hawaiian monk seal covers all beach areas, lagoon waters, and ocean waters to a depth of 20 fathoms, with the exception of Sand Island and its harbor. Therefore, these areas are strictly regulated by the agencies. Activities TES-2.5 and TES-3.3 would continue to prevent human interactions with cetaceans and sea turtle nesting habitat through controls that would make off limits such areas as sea turtle nesting areas and Monument lagoons and nearshore areas where cetaceans rest. Both of these activities would therefore increase limits on current human use. Green turtle (*Chelonia mydas*) nesting habitat occurs throughout the beaches of the NWHI. Continuing efforts do not limit human use overall, but beaches (deemed public use areas) could be temporarily closed. Because there are currently controls limiting public access, these activities could result in a long-term minor negative effect on human use.

#### *Human Health, Safety, and Hazardous Materials*

The Threatened and Endangered Species Action Plan includes facilitating emergency response for Hawaiian monk seals (TES-1.2). Although the response would be focused specifically on Hawaiian monk seals, the protocols include ensuring that a rapid and well-organized response is possible. Incidents that threaten Hawaiian monk seals include oil spills, disease outbreak, and ship groundings. The interagency coordination involved with improving emergency response logistical capabilities and transportation could increase the efficiency of the current emergent vessel capacity. Although instituting protocols for monk seal rescue would not directly reduce

the occurrence of the incidents described above, the coordination and planning efforts could have a beneficial effect on safety operations within the Monument.

Protecting and managing marine habitat includes identifying and mapping foraging areas and migration routes in and around the Monument (TES-3.3). By identifying and mapping turtle foraging areas, necessary information would be obtained to manage anchoring and vessel transit activities.

## **Migratory Bird Action Plan**

### ***Planning and Administrative Activities***

#### *Human Health, Safety, and Hazardous Materials*

To minimize migratory bird mortality during oil spills, the Migratory Bird Action Plan calls for adequate coverage of appropriate actions in all spill response plans (MB-2.3). This would include multiagency coordination during spill prevention planning and actual spill response actions. Although this activity is not a direct human-related emergency response, the coordination and planning efforts could have a beneficial effect on the emergency response operations and therefore safety within the Monument.

## **Habitat Management and Conservation Action Plan**

### ***Planning and Administrative Activities***

#### *Human Health, Safety, and Hazardous Materials*

The Habitat Management and Conservation Action Plan calls for a cost evaluation for the removal of iron sources, such as shipwrecks, from Monument waters (HMC-2.4). This would include cataloging all the existing sources. The plan would also build an oil sample archive from oil washed ashore, as well as wildlife affected by mystery spills (HMC-2.5). This inventory would be used to determine liability and understanding of the primary sources of oil pollution. These two activities would increase the knowledge of hazardous materials within the Monument and help decision makers determine the best course of action for their removal. The oil sample archive would also help Monument staff determine appropriate preventative measures for oil spill occurrence by discovering the key factors in mystery cases. Therefore, these two activities could have beneficial effects on hazardous material practices within the Monument.

### ***Field Activities***

#### *Human Health, Safety, and Hazardous Materials*

There are several activities in the Habitat Management and Conservation Action Plan focused on reducing the effects of human actions. The first activity is to evaluate the effects of contamination from shoreline dumps and landfills at French Frigate Shoals, Kure Atoll, Midway Atoll, and Pearl and Hermes Atolls and to prioritize cleanup action based on risk assessments (HMC-2.1). The risk assessments would evaluate the effects of runoff, erosion, and seepage from hazardous waste sites. The plan would also work to verify the integrity of known landfills and to conduct additional remediation where necessary (HMC-2.2). This activity would occur at the old bulky waste landfill and the “Rusty Bucket” at Midway. The dump site material would continue to be removed from Tern Island and French Frigate Shoals. The investigations and

cleanup efforts would target PCB contamination. Finally, under the plan, historic disposal sites would be located at FFS and Kure, Midway, Pearl, and Hermes Atolls, the sites would be investigated for contamination (HMC-2.3).

These assessment activities could help characterize the nature and extent of contamination within the Monument. Appropriate cleanup and remediation actions could then be determined from information obtained through these studies. These activities could increase compliance with regulations and could reduce the likelihood of further contamination or release. There could be a benefit to human health because of the decreased risk of human exposure to and release of potentially hazardous materials within the Monument.

There would also be an ecological risk assessment performed at Midway to determine the levels of lead in the soil for possible removal. Field activities include removing flaking lead-based paint from buildings and effectively removing lead-contaminated soils on Midway Atoll (HMC 2.7). This includes conducting an ecological risk assessment to determine the allowable lead levels in the soils. Paint removed from buildings is stored short term in sealed 55-gallon barrels in a secure, dry storage area on Sand Island. Due to the extremely high cost of transporting these materials off island, current plans call for storing the barrels at Midway until all lead-based paint is removed. At that time, a fully licensed hazardous waste contractor would be hired to repack if necessary and then ship all wastes to a licensed disposal site on the mainland.

While the ecological risk assessment to determine soil lead-based paint cleanup levels at Midway would not be affected under the No Action alternative, the proposed activity under the Proposed Action alternative could result in a faster clean up and therefore could reduce the long-term exposure time. Except for a few employees that have lived at Midway for 10 to 25 years, most staff members do not live at Midway for more than three to five years, and most visitors and researchers stay for only a few weeks to months. This could help bring the Monument into compliance with hazardous waste regulations and could decrease the risk of human exposure; therefore, it could have a long-term beneficial effect on human health and safety within the Monument.

### **3.4.3.3 Reducing Threats to Monument Resources**

#### **Marine Debris Action Plan**

##### ***Planning and Administrative Activities***

##### ***Human Health, Safety, and Hazardous Materials***

The Marine Debris Action Plan includes an activity to catalog, secure, contain, and properly remove hazardous materials that wash ashore (MD-1.2). These materials include unidentified chemical containers, unexploded ordnance, oceanographic instruments, and objects that regularly wash ashore. The items would be documented, identified, and secured until removed and disposed of by approved contractors. The proper handling of hazardous materials within the Monument would increase compliance with hazardous materials regulations. It would also decrease the likelihood of threats to human health. Therefore, this activity could have a beneficial effect on hazardous materials and human health within the Monument.

## Alien Species Action Plan

### *Planning and Administrative Activities*

#### *Human Health, Safety, and Hazardous Materials*

There are several activities within the Alien Species Action Plan that aim to eradicate pests and alien species. The eradication of the house mouse would require treatment with rodenticide, which falls under the Federal Insecticide, Fungicide, and Rodenticide Act (PL 95-516; U.S.C. 136-136y) (AS-4.2). Toxicants would be used on invasive species of ants and wasps (AS-5.2) and gray bird locusts (AS-5.5). Glyphosate would be applied to reduce and eradicate various invasive plant species (AS-6.1, AS-6.2); Garlon (AS-6.3) and Garlon 4 (AS-6.4) would be painted on stumps to prevent further growth of additional invasive species. These hazardous chemicals would be applied in accordance with the Alien Species Management Plan and therefore would comply with all applicable local, state, and federal laws. Although the use of toxic chemicals could have short-term minor negative effects on human health and safety from an increased risk of exposure or spills, all applicable rules and procedures, including use of personal protective clothing, would be followed to safeguard the health of the person applying them. The use of toxicant applications to eradicate pests and alien species could have beneficial effects on species and humans by reducing future threats from invasive species (such as wasps, mosquitoes, and ants).

The Alien Species Action Plan also calls for controlling and possibly eradicating two introduced mosquito species that pose risks to humans and special status species health (AS-5.3). This activity could decrease threats to human health by minimizing mosquito breeding habitat and killing larvae in freshwater ponds. Therefore, this activity could have a beneficial effect on human health within the Monument.

### *Field Activities*

#### *Human Uses*

The Alien Species Action Plan includes a field activity to control and, if possible, eradicate the two mosquito species that were introduced to Midway Atoll (AS-5.3). In order to eradicate these insects, staff members would kill mosquito larvae in freshwater ponds and would eliminate mosquito breeding habitat by getting rid of standing water sources where possible and appropriate. The eradication measures that would generally be used are draining standing water, stocking mosquito-eating fish, and using biological controls. If chemical agents are used in the eradication process, staff members would be properly trained and would be provided with appropriate protective gear; thus there would be no effect on staff members from this activity. Human visitors and staff living on the island could benefit from this activity because it could minimize the possibility of mosquito-vector diseases, such as West Nile virus and avian pox. Therefore, controlling and possibly eradicating the two mosquito species at Midway Atoll could result in a beneficial effect on human uses by protecting public health.

## **Maritime Transportation and Aviation Action Plan**

### ***Planning and Administrative Activities***

#### *Human Uses*

Developing boundary and zoning information tools (MTA-1.2), including updates to nautical charts and Notices to Mariners (MTA-1.3), would provide Monument permittees with up-to-date information on vessel and airplane allowances in the Monument. Pre-access information would be improved, and these informational materials would be provided to Monument users and vessel operators in trip training (MTA-2.3). Informational materials provided and trip training exercises include waste discharge locations and types, preventing the introduction of nonnative species and preventing and reporting interactions with federally and state protected species, as well as other wildlife. Providing updates to navigational charts, informational materials, and notices to mariners is a beneficial effect because it enhances public safety and awareness of the environment. These activities are proposed in order to reduce the effects of marine and air traffic on the Monument, but, because these are planning activities, they would not create new limits on use of the Monument in relation to permittees.

#### *Human Health, Safety, and Hazardous Materials*

The Maritime Transportation and Aviation Action Plan would improve pre-access information including pre-trip training that would cover regulations and compliance, navigation hazards, zoning designations, including waste discharge locations and types, preventing light and noise pollution, and preventing anchor damage to coral reefs and other benthic (bottom-dwelling) organisms and their habitats (MTA-2.3). All vessel operators, captains, crews, and trip participants would have access to this information. The Monument staff would work with the ICC to convene a group of vessel and aircraft personnel to discuss safety for boating and flight operations (MTA-2.2). These suggestions would be incorporated into the pre-trip training. By increasing access and training opportunities concerning hazards and potential pollution pathways, the likelihood of accidental vessel groundings and hazardous waste discharge could decrease. The MMB would benefit from expert experience by convening a group of seasoned operators, thus further improving the communication and implementation of Monument regulations for safety and spill prevention. Therefore, this plan could have a beneficial effect on hazardous materials and safety within the Monument.

### ***Field Activities***

#### *Human Health, Safety, and Hazardous Materials*

The Maritime Transportation and Aviation Action Plan outlines several activities to assess potential aircraft and vessel hazards and effects (MTA-2.1). There are many research studies, including an assessment of how discharge from vessels affects the environment. If needed, protocols and restrictions would be modified. The research conducted for this study may decrease the likelihood of effects from discharge by discovering where current practices can be improved. Therefore, these activities could have a beneficial effect on human health and safety by implementing practices to reduce the potential release of hazardous materials from vessels within the Monument.

## **Emergency Response and Natural Resource Damage Assessment Action Plan**

### ***Planning and Administrative Activities***

#### *Human Health, Safety, and Hazardous Materials*

The Emergency Response and Natural Resource Damage Assessment Action Plan includes activities to plan for and respond to an emergency within the ICS for the region, or other unanticipated events that fall outside the scope of the Area Contingency Plan for the Hawaiian Islands. The plan would create an ERAT for ICS responses (ERDA-1.1). ERAT members would be required to acquire and maintain training and certifications appropriate for response preparedness (ERDA-1.2, ERDA-2.3), to participate in emergency response drills (ERDA-1.3), and to participate in damage assessment programs and training (ERDA-1.4). These activities would properly prepare the ERAT for emergencies and disasters within the ICS.

In the second year of the plan, the appropriate type and response to non-ICS emergencies would be determined (ERDA-2.1). Monument staff would be designated for each non-ICS response team, including species experts for protected species incidents (ERDA-2.2). The plan would require an update and, if needed, improvement of the Area Contingency Plan and the Environmental Sensitivity Indexes (ERDA-3.1). Finally, within three years, the ERAT would create damage assessment criteria and protocols for non-ICS incidents.

These activities could not only increase the efficiency of response to special status species incidents but increase response efficiency to emergency and safety hazard occurrences as well. This could increase the speed of emergency vehicle response time by streamlining protocols and adequately training team members. The ERAT would be well qualified to assist region-wide incidents as well as local emergencies. Therefore, the plan could have a beneficial effect on safety, human health, and hazardous materials practices within the Monument.

### **3.4.3.4 Managing Human Uses**

#### **Permitting Action Plan**

### ***Planning and Administrative Activities***

#### *Human Health, Safety, and Hazardous Materials*

The Permitting Action Plan outlines several activities that develop tracking, evaluation, and outreach components. A GIS-based permit tracking system would allow each agency to input and track activities within the Monument that pertain to individual requirements (P-2.1). A system would then be instituted to analyze this data to inform management decisions (P-2.2) and discover patterns of compliance (P-2.3). In conjunction, a Monument reporting process would be developed to ensure adherence to regulations and, if necessary, issue compliance visits from enforcement agents (P-2.4). A permit and regulatory education program would be required for all permit applicants (P-3.1). Outreach efforts would be coordinated between agencies to avoid delays and to ensure the highest level of regulatory understanding by permittees (P-3.3). Finally, pre-access training for first time Monument visitors to communicate regulations, permit requirements, and best conduct would be implemented (P-3.4).

These activities could increase accountability and compliance with permits required to enter the Monument. The outreach component would integrate understanding of regulations by all Monument users, which could decrease the likelihood of accidents and hazardous waste spills. This could decrease the demand on emergency response, as well as risks to human health from vessel groundings and hazardous material exposure. Therefore, this plan could have a beneficial effect on human health, safety, and hazardous materials practices within the Monument.

### ***Field Activities***

#### *Human Uses*

Midway Atoll is the main gateway to the Monument. Because it is outside the State of Hawai‘i, regulations at 50 CFR Part 38 were put in place to provide for public safety at Midway. Increased law enforcement capacity on Midway Atoll would include the presence of credentialed officers (EN-1.5) in order to develop means of understanding enforcement and to share resources between the different enforcement agencies. These officers would ensure safety, regulatory compliance, and enforcement, which could benefit Monument visitors and staff because of the assurance of their safety while visiting or living at Midway.

### **Midway Visitors Services Action Plan**

#### ***Planning and Administrative Activities***

##### *Human Uses*

With the current, expanded, and new activities that are possible through this management plan for visitors to come to the Monument, it becomes necessary to have a way to assess the visitor programs in order to provide the most beneficial services to the public. Activities VS-2.2 and VS-2.3 would create a team of visitors services members at Midway Atoll who would review the visitors program every other year and would use the results from these reviews to improve the visitors programs. These activities could have a beneficial effect on visitors to the Monument because of the assurance that Monument staff are providing and offering the most beneficial programs and activities in the NWHI.

### ***Field Activities***

#### *Human Uses*

Activity VS-1.1 would provide opportunities for additional visitors to enjoy wildlife-dependent recreation. These opportunities include guided interpretive tours, wildlife photography, snorkeling, diving, kayaking, and self-guided walks. Currently, 25 percent of visitors staying three days or longer are given the opportunity to assist with wildlife population monitoring as volunteers. Seven compatibility determinations are in place that allow activities on Midway. The covered activities are allowed under agreed-on terms and conditions that comply with state and federal policies. Additional compatibility determinations allow for other beach use activities for visitors, such as swimming, volleyball, nonadministrative airport operations, bicycling, jogging, and amateur radio use. While most of these activities are currently available to Midway Atoll visitors, this activity in the Monument Management Plan outlines opportunities for additional recreational activities for a slightly greater number of visitors. These activities would be evaluated, monitored, and implemented in accordance with the preservation and conservation of the Monument’s biological, cultural, and historic resources. The goal of this activity is to

provide recreation for visitors that would educate them about the environment and would allow them to gain knowledge of all of the resources the Monument has to offer. This activity could be beneficial to visitors by providing them with a variety of opportunities to experience the resources of Midway Atoll and the Monument.

Visitors' effects on the various resources of the Monument are being monitored through the MVSP. In addition to a visitors services review team outlined in planning Activity VS-2.2, Activity VS-2.1 would monitor visitor satisfaction surveys completed by visitors leaving Midway Atoll. Based on these satisfaction surveys, in addition to monitoring Monument resources, this activity also includes the monthly adjustment of activities, facilities, and maintenance schedules to provide the best possible visitor services. While continuing to comply with the preservation and protection of Monument resources, this activity could be beneficial to visitors because it would provide assurance that they were given the best possible experiences while visiting Midway.

### **3.4.3.5 Coordinating Conservation and Management Activities**

#### **Ocean Ecosystems Literacy Action Plan**

##### ***Field Activities***

###### ***Human Uses***

The "Navigating Change" program is an educational program that focuses on raising awareness of marine ecosystems and their conservation in the Hawaiian Islands. Over the past few years, over 15 workshops have been conducted throughout the Hawaiian Islands to provide teachers with the educational materials and methods for effectively teaching this material. The Navigation Change Curricula would provide wildlife-dependent educator workshops at Midway Atoll, targeting a mix of formal and informal educators and community and conservation leaders (OEL-1.7). These annual workshops would provide teachers with major themes of the ocean ecosystem-based curriculum. Moreover, teaching materials, such as telepresence and ocean stewardship programs, would be developed. These workshops could be beneficial to the teachers of the Hawaiian Islands, who would be given hands-on experience and the opportunity to learn the most effective way of presenting this material to their students.

### **3.4.3.6 Achieving Effective Monument Operations**

#### **Central Operations Action Plan**

##### ***Planning and Administrative Activities***

###### ***Human Uses***

Regularly assessing the current status and future needs for human resources (CO-2.1) would enhance human resources and organizational capacity in the Monument. Currently, human resources capacities are examined regularly in order to organize and make better use of current staff. Alternative human resources capacity-building activities could include internships, volunteer programs, and partnerships, all of which could benefit researchers and the public because they would be given additional opportunities for helping to conserve Monument resources.

## **Coordinated Field Operations Action Plan**

### ***Planning and Administrative Activities***

#### *Human Uses*

Originally, Midway's infrastructure was built to service a population of up to 5,000 individuals. The current population of Sand Island is less than 100 people, with future projections of no more than 200 individuals. This includes interagency personnel, volunteers, researchers, and visitors. In order to be efficient for this population, FWS has allotted the time, money, and resources to downsizing the infrastructure on Sand Island. In order to meet this downsizing goal, such activities as developing a strategy for long-term sustainability for operations throughout the Monument using alternative energy systems and waste reduction would be implemented within two years (CFO-1.3) and would benefit those researchers and visitors. Also, sustainability activities would help keep the human presence in the Monument at the levels anticipated under either alternative. The facilities on Midway would require less energy, would grow limited amounts of produce (at Midway only), and perhaps would use sustainable fuel types, in addition to other sustainable efforts. This could require fewer shipments of fuel and materials to and from the main Hawaiian Islands. Thus, these activities could have a beneficial effect on sustaining the human presence within the Monument for management, research, and visitation purposes.

#### *Human Health and Hazardous Materials*

Planning and administrative activities in the Coordinated Field Operations Action Plan include the integration of alternative energy systems and waste reduction strategies within two years (CFO-1.3) and the use of sustainable engineering, technology, and landscape architecture throughout the Monument (CFO-1.4). These sustainable development activities could decrease the likelihood of hazardous materials release and subsequent human exposure by integrating nontoxic building materials and lubricants for Monument building and operations. Thus, this plan could have a beneficial effect on human health and hazardous materials practices within the Monument.

### ***Infrastructure Development Activities***

#### *Human Uses*

In relation to the downsizing plan described above, several infrastructure activities in the Proposed Action would help in achieving this goal. These activities include rehabilitating "Officer's Row" Housing at Midway Atoll (CFO-3.4), which would increase the housing capacity for increased agency and partner personnel; maintaining and enhancing the infrastructure at Kure Atoll (CFO-3.5), which would maintain, expand, or replace communications equipment, solar and water power equipment, sewage treatment, and buildings and facilities on Green Island; and completing Phase I rehabilitation of Midway Mall and Commissary (CFO-9.4), which would offer space for Monument staff and partner offices, classrooms, storage, visitor services, and laboratories. These activities could benefit management, research, and visitation in the Monument by providing sufficient housing for an increased number of staff and visitors. Researchers at Kure Atoll who rely on housing and facilities for permanent biological monitoring and restoration programs would be provided with these necessities. The Visitors Services Program could benefit from a better and well-maintained space to hold such events as lectures and training.

In order to improve transportation, education, evacuation, research, surveillance, management, and enforcement within the Monument, it is necessary to have improved aircraft services, perhaps including an aircraft dedicated to Monument purposes. Activity CFO-7.3 proposes to acquire an aircraft dedicated to these activities within 15 years following the implementation of the Monument Management Plan. This activity could benefit the human presence within the Monument for research and management purposes, as well as visitors, because it would allow more frequent and perhaps less expensive access to Midway, including transport of people, equipment, and supplies necessary for activities outlined in the Monument Management Plan.

#### *Human Health and Hazardous Materials*

Infrastructure Development activities in the Coordinated Field Operations Action Plan include replacing Bravo Barracks and Charlie Barracks at Midway Atoll (CFO-3.2 and CFO-3.3), rehabilitating the Officers Row Housing at Midway (CFO-3.4), maintaining infrastructure at Kure Atoll (CFO-3.5), and rehabilitating the Midway mall and commissary building (CFO-9.4). Replacing Bravo and Charlie Barracks would include demolition and facilities construction to provide safe housing for island visitors and transient personnel and housing for operations and maintenance personnel. Rehabilitation at Midway would result in increased housing capacity to accommodate increased agency and partner personnel. At Kure Atoll, this would apply to the ongoing need to maintain, expand, or replace communications equipment, solar power and water units, sewage treatment infrastructure, buildings, and equipment. Because the structures at both Midway and Kure Atolls were built with materials that may contain hazardous materials, these activities increase the likelihood of release and subsequent human exposure. However, structures would be demolished or rehabilitated in accordance with Monument regulations and protocols, including the handling of PCB-containing materials, lead-based paint, and other such toxic substances. Disposal of hazardous materials through proper EPA and Hawai'i Department of Health protocols could decrease the overall quantity of hazardous materials within the Monument and, thus, the risk of human exposure. Therefore, these activities could have a beneficial effect on hazardous materials and human health within the Monument.

With the increased number of research activities that would be taking place according to this Monument Management Plan, the opportunities for new vessels to operate in the Monument would be addressed by activities in the Coordinated Field Operations Action Plan. One or possibly more new vessels would be stationed at Midway Atoll for expanded or new field activities and to act as a stepping stone to establish research and monitoring programs in the northern end of the Monument (CFO-6.2). A new, small research vessel would be stationed at Midway to service field activities from French Frigate Shoals to Kure Atoll (CFO-6.3). This new vessel would expand research, education, enforcement, and emergency response capabilities. These activities could be beneficial to the current and projected future human presence in the Monument for management and research purposes because they could provide equipment for carrying out new and expanded field activities outlined in this Monument Management Plan and emergency and law enforcement response capabilities that do not currently exist.

Currently, nonintrusive research diving is allowed within the Monument. Activities CFO-8.1, CFO-8.2, and CFO-8.3 include replacing the dive recompression chamber at Midway Atoll, investigating the acquisition of a portable dive recompression chamber, and incorporating a dive

operations center at Midway Atoll. Developing a comprehensive dive program to carry out marine research, emergency response, and management of dive operations could benefit researchers and diving visitors by providing a more effective and better managed program. This includes having additional safety equipment available to effectively perform dive operations.

Currently at Midway, humans living and working in buildings are potentially exposed to lead-based paint. Under the No Action alternative, replacing Bravo (CFO-3.2) and Charlie (CFO-3.3) barracks, rehabilitating Officer’s Row at Midway Atoll (CFO-3.4), and rehabilitating Midway Mall (CFO-9.4) would take many more years than it would under the Proposed Action alternative, so the risk to humans would last longer. Except for a few employees that have lived at Midway for 10 to 25 years, most staff members do not live there for more than three to five years, and most visitors and researchers stay for only a few weeks to months. Therefore, this extension of the time to replace or rehabilitate the buildings would not prolong exposure to most individuals, but it could expose more individuals.

**3.4.4 Summary of Effects**

Table 3.4-1 summarizes the effects on socioeconomic resources from the Proposed Action. The effects are listed by Action Plan and action areas (planning/administrative, field, or infrastructure and development activities). The Proposed Action could have beneficial and minor negative effects on socioeconomic resources (human uses, human health, safety and hazardous materials, land use, and economics) of the Monument. The socioeconomic resources of the Monument includes historical uses, current human uses and activities, activities within marine areas in and adjacent to the Monument, activities in land areas within the Monument, current land uses, population, employment and industry, and income.

### **3.5 OTHER RESOURCES**

#### **3.5.1 Effects Analysis Methodology**

In the description of the No Action and Proposed Action alternatives, activities presented in the plan were divided into three categories: 1) Planning and Administrative, 2) Field, and 3) Infrastructure and Development. Planning and administrative activities are not considered to directly affect water quality, transportation, and utilities either because they relate to development of the coordination mechanisms described in the December 2006 MOA and Presidential Proclamation 8031, or because they are solely administrative in nature. However, many activities identified as a result of these planning and administrative actions ultimately will have a direct effect and to the extent adequate information is currently available are analyzed below. For activities proposed within or intended to improve management of the Monument, the methodology used to determine whether effects on water quality, transportation, and utilities would occur is as follows:

- Review and evaluate ongoing and past activities to identify the action's potential effect on water quality, transportation, and utilities;
- Review and evaluate activities within the plan to identify their potential to beneficially or negatively affect the ecosystem and its component parts within the Monument; and
- Assess the compliance of each activity within the plan with applicable federal, state, or local regulations.

In addition, all proposed activities that may affect water quality under the Clean Water Act or other federal or state law will only proceed after compliance with applicable laws, including, as necessary, consultation, receipt of permits, and compliance with all permit terms and conditions.

#### **3.5.2 Effects Common to Human Interactions on Water Quality, Transportation, and Communications and Utilities in the Monument**

Possible effects from increased air, marine, and terrestrial transportation traffic associated with the Monument to general transportation within and to the Monument include: 1) potential effects from delays to transiting vessels, 2) infrastructure improvements to accommodate increased traffic within the Monument, 3) potential conflicts between research vessels, cruise ships, and transiting vessels, and 4) effects of increased air traffic to and from Midway Atoll. All activities would be designed and managed using BMPs to avoid or minimize these effects, as analyzed below.

#### **3.5.3 No Action**

This section briefly describes activities that are underway in the Monument and provides analysis of the effects associated with these activities. Only those activities that would have an effect on water quality, transportation, and utilities are included in the analysis. The analysis describes the projected beneficial and negative effects that would be expected to continue under the No Action alternative, should this alternative be selected for implementation. Implementing the No Action alternative would result in no change to the current situation. However, these

activities would continue under the Proposed Action alternative, and their effects are summarized under the Proposed Action in Table 3.5-1 at the end of this section.

### **3.5.3.1 Understanding and Interpreting the Northwestern Hawaiian Islands**

#### **Maritime Heritage Action Plan**

##### ***Field Activities***

###### *Transportation*

Efforts to monitor, map, and characterize maritime heritage and biological and ecological resources are ongoing (MH-1-2). Shoreline terrestrial surveys and inventories, marine remote sensing using magnetometer, and side-scan sonar would continue to be used to locate potential maritime heritage targets, and noninvasive diving surveys would continue to assess and inventory sites. Field activities may require a small increase in vessel traffic within the Monument. Existing marine, air, and terrestrial traffic associated with ongoing activities at the Monument currently have no effect on transportation outside and through the Monument. Under the No Action alternative, transiting vessels would still be able to pass through the Monument with no delays.

### **3.5.3.2 Conserving Wildlife and Habitats**

#### **Threatened and Endangered Species Action Plan**

##### ***Field Activities***

###### *Transportation*

Efforts to reduce marine debris within the Monument also continue, along with large-scale efforts to remove debris from sensitive aquatic habitats (TES-1.1). Sites would continue to be prepared for establishing a self-sustaining *Pritchardia remota* population on Laysan Island, including eliminating alien species and ensuring the purity of seed stocks (TES-7.3). To protect *Pritchardia remota* from catastrophic events and to achieve recovery objectives, this species is being established outside its known native range on Laysan Island and on Eastern and Sand Islands at Midway Atoll NWR (TES-7.5). These activities may require a small increase in vessel traffic within the Monument. Existing marine, air, and terrestrial traffic associated with ongoing activities at the Monument currently have no effect on transportation outside and through the Monument.

#### **Habitat Management and Conservation Action Plan**

##### ***Field Activities***

###### *Transportation*

The Habitat Management and Conservation Action Plan includes the following field activities: 1) Continue collecting and fingerprinting oil found washed ashore and on wildlife from mystery spills to determine its provenance, and build an oil sample archive for possible use as evidence in liability assignment (HMC-2.5); 2) Continue monitoring the area at Laysan Island that was contaminated by the insecticide Carbofuran (HMC-2.6); 3) Propagate and outplant native species (HMC-4.1); 4) Continue efforts to reestablish 60 acres of native shrub community on Laysan

Island (HMC-4.3); and 5) Monitor changes in species composition and structure of the coastal shrub and mixed grass communities on basaltic islands in the Monument (HMC-4.7). The general effects of these field activities on transportation would be a small increase in vessel traffic within the Monument. Existing marine, air, and terrestrial traffic associated with ongoing activities at the Monument currently have no effect on transportation outside and through the Monument. Under the No Action alternative, transiting vessels would still be able to pass through the Monument with no delays.

### **3.5.3.3 Reducing Threats to Monument Resources**

#### **Alien Species Action Plan**

##### *Field Activities*

###### *Transportation*

The Alien Species Action Plan includes the following continuing field activities: 1) Continue to require hull inspection and cleaning of all vessels, SCUBA gear, marine construction material, and instruments deployed in the Monument (AS-3.2); and 2) Enforce the use of current quarantine protocols to prevent the introduction of invasive terrestrial species to the Monument (AS-3.1). These activities may generate a slight inconvenience to vessels harboring within the Monument. Existing marine, air, and terrestrial traffic associated with ongoing activities at the Monument currently have no effect on transportation outside and through the Monument. Under the No Action alternative, transiting vessels would still be able to pass through the Monument with no delays.

#### **Maritime Transportation and Aviation Action Plan**

##### *Infrastructure Development Activities*

###### *Transportation*

Efforts would continue to encourage the energy and water efficiency of vessels operating in the Monument (MTA-2.4). For example, the NOAA ship *Hi'ialakai* began a recycling program and installed water-saving devices to reduce effects on the Monument. Plans are in place to test the use of biofuels and nonpetroleum-based hydraulic fluid. Increased efficiency would not have a direct beneficial effect on transportation but would create a benefit as resources are conserved. Existing marine, air, and terrestrial traffic associated with ongoing activities at the Monument currently have no effect on transportation outside and through the Monument. Under the No Action alternative, transiting vessels would still be able to pass through the Monument with no delays.

### **3.5.3.4 Achieving Effective Monument Operations**

#### **Central Operations Action Plan**

##### *Planning and Administrative Activities*

###### *Utilities*

As part of the No Action alternative, coordination and implementation of annual operating plans would continue (CO-1.1). Annual operating plans are guided by site-specific needs and are

designed to increase efficiencies and establish standard operating procedures, where possible. The administrative procedures and functions included in the annual operating plans address required maintenance of communication equipment, including telephones, cellular phones, satellite phones and connections, and radios in the Monument. The Monuments' staffs continued coordination and implementation of annual operating plans provides beneficial effects on Monument communications by extending the life of the communications systems, identifying system deficiencies and identifying needs for system upgrades.

### **Coordinated Field Operations Action Plan**

#### ***Infrastructure and Development Activities***

##### *Utilities*

As part of the No Action alternative, maintenance of the fuel farm at Midway would continue (CFO-4.1). The recent replacement fuel farm constructed at Midway Atoll was designed to meet current FWS, FAA, and USCG needs. Efforts are underway to increase the capacity of gasoline and biodiesel or other sustainable fuel types available to multi-agency partners. The new fuel farm provides beneficial effects on the environment at Midway by eliminating the threats of spills associated with the aging system, including storing the fuel in multiple smaller tanks rather than one or two extremely large tanks and providing new easily maintained tanks and infrastructure. The new fuel farm also contributes to the overall beneficial effects of Monument management activities under both alternatives by supporting the current scale of human presence at Midway, including operation of the airfield and refueling capacity, while being capable of ready expansion, as needed.

#### **3.5.4 Proposed Action**

The Proposed Action would expand current activities described above under the No Action alternative, while implementing the new activities described in the Monument Management Plan. The effects of these activities on water quality, transportation, and utilities are described below.

##### **3.5.4.1 Understanding and Interpreting the Northwestern Hawaiian Islands**

#### **Marine Conservation Science Action Plan**

##### ***Field Activities***

##### *Transportation*

The Marine Conservation Science Action Plan would implement management-driven research priorities identified in the Monument Natural Resources Science Plan (MCS-2.4), including implementing monitoring activities. The effect of increased science-based activities may result in a minor increase in the number of research cruises. Considering the current low levels of vessel traffic, this minor increase would not have an effect on transportation.

## **Native Hawaiian Culture and History Action Plan**

### ***Field Activities***

#### *Transportation*

Within the Native Hawaiian Culture and History Action Plan, one activity provides for regular access for Polynesian voyaging canoes for wayfinding and navigational training (NHCH-2.6). The trips would likely occur once or twice per year and would include a canoe and support vessel. Considering the current low levels of vessel traffic, this minor increase would not have an effect on transportation.

## **Maritime Heritage Action Plan**

### ***Planning and Administrative Activities***

#### *Water Quality*

Wreck sites and other debris can represent potential hazards that may contribute hydrocarbons, chemicals, or iron to the marine ecosystem. Iron has been shown to be a limiting nutrient and may cause increased growth of algae or corallomorphs that smother surrounding reefs. The MMB would be informed of any discovered potential hazards in order to assess the need for response or remediation (refer to section 3.3.4 of the Monument Management Plan). A status report on potential environmental hazards would be completed within one year and would be updated annually thereafter (MH-1.3). While planning and administrative activities would not directly affect physical water quality changes, there could be beneficial effects on water quality by removing debris that could contain hazardous materials and could have a negative effect on water quality.

### **3.5.4.2 Conserving Wildlife and Habitats**

#### **Threatened and Endangered Action Plan**

### ***Planning and Administrative Activities***

#### *Transportation*

Activities proposed under the Threatened and Endangered Action Plan include planning activities designed to conserve Hawaiian monk seal habitat (TES-1.3) and to reduce the likelihood and effects of human interactions on Hawaiian monk seals (TES-1.4). The plan also would support outreach and education on Hawaiian monk seals (TES-1.5). Under activity TES-4.1, Monument staff would work with Japanese ornithologists to establish one or more breeding populations of the endangered short-tailed albatrosses on Midway Atoll NWR. To protect *Amaranthus brownii*, *Schiedea verticillata*, and *Pritchardia remota* from catastrophic events and to achieve recovery objectives, the potential for establishing these species outside their known native range on Mokumanamana (Necker Island), Laysan Island, Kure Atoll, and Eastern and Sand Islands at Midway Atoll is being assessed (TES-7.5). This could result in a minor increase in small vessel traffic. Considering the current low levels of vessel traffic, this minor increase would not have an effect on transportation.

## ***Field Activities***

### *Transportation*

Supporting and facilitating emergency response for the endangered Hawaiian monk seal would put into place standardized protocols that would ensure a rapid and well-organized response to situations in the Monument that threaten Hawaiian monk seals (TES-1.2). Although the response would be focused specifically on Hawaiian monk seals, the protocols include ensuring that a rapid and well-organized response to groundings and oil spills is possible. The interagency coordination involved with improving emergency response logistical capabilities and transportation would increase the efficiency of the existing emergency vessel capacity. Although instituting protocols for Hawaiian monk seal rescue would not directly reduce the occurrence of the incidents described above, the coordination and planning efforts could reduce the number of vessel trips required. Therefore, this could have a beneficial effect on vessel operations and transportation within the Monument.

To reduce the potential for cetaceans to be negatively affected by marine debris, the MMB would monitor, characterize, and address the effects of marine debris on cetaceans (TES-2.3). This measure would augment the activities within the Marine Debris Action Plan that are aimed at reducing the quantity of marine debris introduced into the Monument. The overall effects of proposed marine debris activities would result in a minor increase in vessel trips within the Monument to collect the debris. Considering the current low levels of vessel traffic, this minor increase would not have an effect on transportation.

Protecting and managing marine habitat, including foraging areas and migration routes (TES 3.2), would manage activities such as anchoring and vessel traffic within the Monument to minimize disturbance to foraging areas, reduce potential exposure to hazardous materials, and minimize vessel hazards to turtles in open waters. This activity would have a negligible effect on transportation.

## **Habitat Management and Conservation Action Plan**

### ***Planning and Administrative Activities***

#### *Water Quality*

Planning and administrative activities would evaluate costs to ecosystem function and benefits of removing anthropogenic iron sources such as metal from shipwrecks and discarded debris from reefs throughout the Monument (HMC-2.4). An ecological risk assessment would be conducted to determine allowable lead levels in soils at Midway and lead-based paint would be removed from buildings and soils to nonrisk levels (HMC-2.7). Ecological risk assessments, cost evaluation efforts, and other planning activities would work to improve water quality and thus could have a beneficial effect on water quality.

#### *Transportation*

The Habitat Management and Conservation Action Plan would identify and prioritize restoration needs in shallow-water reef habitats affected by anthropogenic disturbances within five years (HMC-1.1) and would evaluate the costs to ecosystem function and the benefits of removing anthropogenic iron sources such as metal from shipwrecks and discarded debris from reefs throughout the Monument (HMC-2.4). Managers would investigate opportunities for restoration

and would prioritize actions so that funds and resources would be focused to address the most important needs. The activity also calls for an ecological risk assessment to determine allowable lead levels in soils at Sand Island on Midway Atoll NWR and removing lead from buildings and soils to nonrisk levels (HMC-2.7); an ecological risk assessment to determine the cleanup level necessary to reduce risks to human and wildlife health; formulating and implementing a restoration plan for Lisianski Island using guidelines established for neighboring Laysan Island (HMC-4.4); and evaluating the potential to restore, and create as needed, freshwater sources at proposed translocation sites for Laysan duck, Nihoa finch, Laysan finch, and Nihoa millerbird (HMC-7.2). Implementing these planning activities may involve field activities that could result in a minor increase in vessel and air traffic. Considering the current low levels of vessel and air traffic, this minor increase would not have an effect on transportation.

An effort to educate other federal and state agencies about overflight rules and to promote compliance regarding overflights and close approaches (HMC-9.1) would increase safety awareness and may reduce the potential for aircraft collisions with birds, thus resulting in a beneficial effect on air traffic.

### ***Field Activities***

#### *Water Quality*

Field activities would include efforts to evaluate the effects of contamination in terrestrial and nearshore areas from shoreline dumps at FFS and at Kure, Midway, and Pearl and Hermes Atolls and to prioritize cleanup action based on risk assessments (HMC-2.1); to work with partners and responsible parties to verify the integrity of known landfills and dumps and to conduct additional remediation, if necessary (HMC-2.2); and to locate historic disposal sites at FFS and at Kure, Midway, and Pearl and Hermes Atolls and investigate them for contamination (HMC-2.3). Contamination evaluation, risk assessment, and remediation efforts would work to remove or encapsulate contaminants, thereby improving water quality and resulting in a beneficial effect on water quality.

Additional field activities would include efforts to monitor salinity, parasites, contaminants, and native arthropods associated with groundwater, freshwater seeps, and ponds (HMC-7.1) and to evaluate the potential for developing and creating additional freshwater sources at potential translocation sites for avifauna species, as needed (HMC-7.2). These field activities would provide data to support improvement to terrestrial water and groundwater quality; therefore, there could be a beneficial effect on water quality.

#### *Transportation*

The Habitat Management and Conservation Action Plan includes field activities to evaluate effects of contamination in terrestrial and nearshore areas from shoreline dumps at FFS and at Kure, Midway, and Pearl and Hermes Atolls and prioritize cleanup action based on risk assessments (HMC-2.1) and work with partners and responsible parties to verify the integrity of known landfills and dumps and to conduct additional remediation, if necessary (HMC-2.2). These activities would investigate the extent of contamination at these sites and would assess their integrity, containment effectiveness, and hazard potential. Based on this information, the highest priority sites would be removed, remediated, or sealed. Monitoring would continue to assess if further action is needed. Coordinated ecosystem restoration activities on Kure Atoll

would be implemented (HMC-4.6), as would inventorying and documenting the life histories of endemic terrestrial invertebrates on Nihoa and Mokumanamana (HMC-5.1). The effects of these activities would be minor increase in vessel traffic. Considering the current low levels of vessel traffic, this minor increase would not have an effect on transportation.

### **3.5.4.3 Reducing Threats to Monument Resources**

#### **Marine Debris Action Plan**

##### ***Planning and Administrative Activities***

###### *Water Quality*

Activities proposed under the Marine Debris Action Plan include planning activities to develop and implement a five-year marine debris removal and prevention strategy for the Monument (MD-1.3); working with the U.S. Department of State to gain international cooperation and involvement for marine debris issues (MD-1.4); developing and standardizing marine debris monitoring protocols for marine and terrestrial habitats (MD-2.2); and working with partners to continue to develop and implement an outreach strategy for marine debris (MD-3.1). These activities would work to improve water quality and to prevent potential degradation to water quality; therefore, these activities would have a beneficial effect.

###### ***Field Activities***

###### *Water Quality*

Activities that are proposed under the Marine Debris Action Plan include field activities that would allow Monument staff to continue working to remove marine debris in the Monument and to reduce additional debris entering the Monument (MD-1.1); catalog, secure, contain, and properly remove hazardous materials that wash ashore in the NWHI (MD-1.2); and work with partners on marine debris studies (MD-2.1). These activities would work to improve water quality and to prevent potential degradation to water quality; therefore, these activities would have a beneficial effect.

###### *Transportation*

Activities to institute measures for preventing marine debris from entering the Monument include gear modifications, gear loss reporting requirements, dockside gear accountability inspections of vessels prior to their departure on fishing trips and upon their return, working with the fishery and management councils to reduce illegal fishing and destructive fishing practices, and pursuing technological means to detect and retrieve lost gear (MD-1.1). The MMB would continue to participate in multiagency cleanup efforts of current infrastructure, protocols, and experience and would work with fishery management councils, including the Western Pacific and North Pacific Fishery Management Councils, to assess and address fishing practices and gear that contribute to marine debris (MD-1.4). This collaborative effort may include inspections, technological requirements, and implementing incentive programs. In addition, the MMB would work with the Marine Debris Program to determine the sources of marine debris and to support studies that determine economical and biological effects of marine debris. Finally, the MMB would continue working with partners to remove marine debris in the Monument and to reduce additional debris entering the Monument (MD-1.1), catalog, secure, contain, and properly remove hazardous materials that wash ashore in the NWHI (MD-1.2); and

work with partners on marine debris studies (MD-2.1). These activities may result in a minor increase in vessel traffic and prolong their duration of stay in the Monument, but the effects on transportation would be negligible. Removing marine debris may benefit vessel traffic by reducing the potential of prop fouling from nets and other debris.

### *Utilities*

Under the Proposed Action, expanded marine debris removal activities would include retrieving existing debris at sea and continuing reef and beach cleanup efforts. The MMB would continue working with partners to remove marine debris and reduce additional debris from entering the Monument (MD 1.1). Currently, a small quantity of the collected marine debris is burned in the incinerator at Midway Atoll, and the remaining marine debris is stored for eventual shipping and disposal in the Main Hawaiian Islands. The limited capacity of the existing landfill on Sand Island precludes its use for disposal of marine debris; therefore, no marine debris is deposited in the landfill at Midway. No effects on the landfill in Midway Atoll are expected from waste collected during marine debris removal activities; however, long-term minor negative effects from increased solid waste are expected at the respective disposal sites in the main Hawaiian Islands.

## **Alien Species Action Plan**

### *Field Activities*

#### *Transportation*

The Alien Species Action Plan contains a number of actions to reduce the presence of alien species in the NWHI, including surveying distributions and populations of known alien species at regular intervals (AS-2.1); developing and implementing monitoring protocols for early detection and characterization of new infestations (AS-2.3); implementing and completing house mouse eradication (AS-4.2); conducting toxicant trials to evaluate their efficacy and documenting ecological effects at selected islands on highest-priority invasive species of ants and wasps (AS-5.2); controlling, and, if possible, eradicating the two introduced mosquito species at Midway Atoll NWR within 10 years using methods prescribed in the Integrated Pest Management Plan (AS-5.3); and developing and implementing a plan to control and, if possible, eradicate the invasive gray bird locust on Nihoa, Mokumanamana (Necker Island), FFS, and Lisianski Island (AS-5.4).

Additionally, the plan would protect endangered plants threatened by gray bird locust outbreaks at Nihoa by developing appropriate baits for localized application of toxicants to protect specific high-priority plant sites (AS-5.5) and would control and eventually eradicate golden crownbeard (AS-6.1) and co-occurring weedy shrubs on Kure, Midway, and Pearl and Hermes Atolls. In all areas where they occur, the plan would control and eradicate the invasive grass sandbur from Kure, Midway, and Pearl and Hermes Atolls, Lisianski Island, and FFS (AS-6.2); Indian pluchea, *Sporobolus pyramidatus*, and swine cress from Laysan Island (AS-6.3); and prioritized alien plant species from Kure Atoll (AS-6.4).

The plan would map, control, and eventually eradicate invasive red algae where it occurs (AS-7.1); conduct surveillance at appropriate sites for snowflake coral and other incipient marine invasives (AS-7.2); support and conduct research on alien species detection and effects of

invasive species on native ecosystems (AS-8.1); and support and conduct research on invasive species prevention, control methods, and eradication techniques (AS-8.2). Research regarding the introduction, control, and eradication of species under the Alien Species Action Plan would focus on determining the likely introduction patterns to aid prioritization of control and eradication efforts (AS-7.1, AS-7.2, and AS-8.1). Specifically, research documenting the effectiveness of preventative methods would aid decision makers in quarantine protocol choices (AS-8.2).

Activities under the Alien Species Action Plan would result in an increase in vessel traffic and would extend the duration of time vessels that would stay in the Monument to conduct invasive species removal and associated activities. Considering the current low levels of vessel traffic, this increase could have a minor negative effect on transportation.

## **Maritime Transportation and Aviation Action Plan**

### ***Planning and Administrative Activities***

#### *Water Quality*

Activities proposed under the Maritime Transportation and Aviation Action Plan include planning activities that would develop protocols and practices as needed and that would integrate with current protocols for safe aircraft and vessel operations (MTA-2.2). Providing pretrip training and implementing standard protocols would work to prevent potential degradation to water quality by reducing the likelihood of incidence occurring during flight and boat operations; therefore, these activities would have a beneficial effect.

#### *Transportation*

The Maritime Transportation and Aviation Action Plan is aimed at establishing a framework for evaluating the effects of various activities conducted by ships and aircraft. There are several planning activities within the plan that would have a beneficial effect on transportation within the Monument. The MMB would develop boundaries and zoning information tools to help all Monument users comply with maritime transportation requirements (MTA-1.2). The MMB would also provide updates to nautical charts and Notice to Mariners to reflect Monument boundaries, zones, and other pertinent designations (MTA-1.3). These updates may require coordination with research vessels already conducting other research within the Monument. This would be accomplished through dual-purpose surveying and cost-sharing, which would increase the efficiency of current research ventures in addition to the maritime and aircraft benefits from such research.

The plan would also improve pre-access information, including a pre-trip training that would cover regulations and compliance; navigational hazards; zoning designations, including waste discharge locations and types; and information on preventing the introduction of alien species, preventing and reporting interactions with protected species and other wildlife, preventing light and noise pollution, and preventing anchor damage to coral reefs and other benthic habitats and organisms (MTA-2.3). All vessel operators, captains, crews, and trip participants would have access to this information. The MMB would work with the International Code Council to convene a group of vessel and aircraft personnel to discuss safety for boating and flight operations (MTA-2.2). These suggestions would be incorporated into the pre-trip training.

The activities would address aircraft and airfield equipment hazards to wildlife and would minimize these hazards at Midway Atoll and Tern Island. At Midway, actions taken to minimize hazards include reducing the height of airport signs to prevent bird collisions, using striped painting and lighting to make airport equipment more visible to birds, scheduling nighttime flights during albatross nesting season, and turning off unnecessary lighting around the airfield that disorients seabirds. At Tern Island, wildlife hazards are minimized for take-offs and landings by maintaining small wildlife exclusion areas at the ends of the runway and removing birds from the runway before aircraft take-offs or landings. Contracted pilots must follow strict flight guidelines for minimizing impacts on wildlife. Using these BMPs to minimize hazards could have a minor negative effect on transportation activities from increased constraints on aircraft timing and loads.

The coordination and outreach efforts within the Maritime Transportation and Aviation Action Plan would increase the efficiency and effectiveness of current and future transportation needs. Combining research efforts, costs, and beneficial knowledge will benefit vessel and aircraft operations. The outreach components will also improve compliance with Monument transportation guidelines. Therefore, these activities could have a beneficial effect on transportation within the Monument.

### ***Field Activities***

#### *Water Quality*

Activities that are proposed under the Maritime Transportation and Aviation Action Plan include field activities that would conduct studies on potential aircraft and vessel hazards and effects (MTA-2.1). These activities would work to prevent potential degradation to water quality; therefore, these activities could have a beneficial effect.

#### *Transportation*

The Maritime Transportation and Aviation Action Plan outlines several field activities aimed at studies of potential aircraft and vessel hazards and effects (MTA-2.1). The studies include anchoring and mooring location feasibility, hull inspections, alien species introduction pathways, wildlife strikes by aircraft, and the effects of permit reporting requirements on protected species, light and noise, and discharge. These assessments will determine transportation effects on resources within the Monument and suggest possible improvements to be implemented. The research conducted for these studies will increase the efficiency and effectiveness of many transportation activities within the Monument, including alien species introduction prevention, minimizing bird strikes by aircraft anchoring locations and practices, hull inspections, and light and noise regulations. The effectiveness of current practices will be evaluated and improved upon, thus increasing the ease and efficiency of vessel and aircraft traffic within the Monument. Therefore, the plan could have a beneficial effect on transportation within the Monument.

## **Emergency Response and Natural Resource Damage Assessment Action Plan**

### ***Planning and Administrative Activities***

#### *Water Quality*

Activities proposed under the Maritime Transportation and Aviation Action Plan include creating a Monument Emergency Response and Assessment Team for ICS responses (ERDA-

1.1); acquiring and maintaining training and certification to complement and support the Regional Response Team (ERDA-1.2); participating in emergency response and preparedness drills and meetings (ERDA-1.3), and implementing damage assessment programs and training throughout the life of the plan (ERDA-1.4); in the second year, determining the non-ICS emergencies and the necessary type and scope of responses (ERDA-2.1); designating appropriate Monument personnel for each non-ICS response team (ERDA-2.2); ensuring that appointed personnel acquire and maintain training and certifications throughout the life of this plan (ERDA-2.3); updating and improving upon the Area Contingency Plan and the Environmental Sensitivity Indices (ERDA-3.1); and within three years, creating damage assessment criteria and protocols (ERDA-3.2). While these planning and administrative activities would have no direct and immediate effect on water quality, they would work to prevent potential degradation to water quality by improving emergency response to water quality threats. This improved response could reduce the duration of and level of potential degradation of water quality and would therefore have an overall beneficial effect.

#### *Transportation*

Damage assessment is an important component of any emergency response (ERDA-1.4). The Monument Emergency Response and Assessment Team would coordinate with the appropriate agencies to ensure that appropriate response, injury assessment, and restoration activities take place for any given emergency throughout the Monument, including an Unusual Mortality Event in Hawaiian monk seals or other species. The effects of these activities would be a minor increase in vessel traffic. Considering the current low levels of vessel traffic, this minor increase would not have an effect on transportation. However, there would be beneficial effects on transportation safety and emergency response to vessel, aircraft, or vehicle accidents.

### **3.5.4.4 Managing Human Uses**

#### **Permitting Action Plan**

##### *Planning and Administrative Activities*

#### *Transportation*

The Permitting Action Plan outlines several activities that develop tracking, evaluation, and outreach components. A GIS-based permit tracking system would allow each agency to input and track activities within the Monument that pertain to individual requirements (P-2.1). A system would then be instituted to analyze these data to inform management decisions (P-2.2) and discover patterns of compliance (P-2.3). In conjunction, a Monument reporting process would be developed to ensure adherence to regulations and, if necessary, issue compliance visits from enforcement agents (P-2.4). A permit and regulatory education program would be required for all permit applicants (P-3.1). Outreach efforts would be coordinated between agencies to avoid delays and to ensure the highest level of regulatory understanding by permittees (P-3.3). Finally, pre-access training for first-time Monument visitors to communicate regulations, permit requirements, and best conduct would be implemented (P-3.4).

These activities would increase accountability and compliance with permits required to enter the Monument. The outreach component would integrate understanding of regulations by all Monument users, which would decrease the likelihood of accidents. It would also familiarize

Monument users with quarantine protocols, hull inspection regulations, and alien species introduction prevention methods. In turn, vessel operators would not be delayed, disrupted, or displaced by noncompliance with regulations. Therefore, this plan would have a beneficial effect on transportation within the Monument.

## **Enforcement Action Plan**

### ***Planning and Administrative Activities***

#### *Water Quality*

Planning and administrative activities would include creating a Monument law enforcement working group (EN-1.1); developing an integrated law enforcement training program (EN-1.3); assessing Monument law enforcement capacity and program effectiveness (EN-1.4); and integrating additional automated monitoring systems and ship reporting systems for all vessels transiting the Monument (EN-2.3). While these planning and administrative activities would have no direct and immediate effects on water quality, they would work to improve water quality by improving enforcement to prevent anthropogenic water quality threats, resulting in an overall beneficial effect.

#### *Transportation*

One tenant of the Enforcement Action Plan is to integrate briefings into pre-access training of Monument users that would inform users of regulations, permit requirements, and best management practices (EN-3.1). Similar to the outreach component of the Permitting Action Plan, this activity would increase compliance with regulations and thus have a beneficial effect on transportation within the Monument.

## **Midway Atoll Visitor Services Action Plan**

### ***Field Activities***

#### *Transportation*

The Midway Atoll Visitor Services Action Plan would provide visitors with opportunities for wildlife-dependent recreation to enhance their knowledge and appreciation of the Monument's natural resources (VS-1.1). Visitors would be given the opportunity to view wildlife on Midway Atoll NWR only, and the effects of visitors and other users on wildlife and historic resources would be continuously monitored to ensure their protection (VS-1.3). The indirect effects of these activities may be a minor increase in vessel and air traffic as a result of improving the visitor experience and potentially attracting more visitors to the Midway Atoll NWR. Considering the current low levels of vessel and air traffic and planned improvements for mooring and to the airport, this increase could have a minor negative effect on transportation.

More specific descriptions of the effects of visitors at Midway Atoll are contained in the Environmental Assessment for the Interim Midway Visitors Service Plan and in relevant compatibility determinations.

### 3.5.4.5 Achieving Effective Monument Operations

#### Coordinated Field Operations Action Plan

##### *Planning and Administrative Activities*

###### *Transportation*

The Coordinated Field Operations Action Plan calls for developing interagency agreements to facilitate effective field coordination throughout the Monument (CFO-2.1). It also calls for the inventory, maintenance, and coordinated use of small boats and related field resources (CFO-6.1). Generally, this activity would increase transportation efficiency by increasing communication between agencies that use and manage the Monument. The coordination of field resources would also logistically improve transportation operations. Therefore, this activity could have a beneficial effect on transportation.

This plan outlines the development of an aircraft capacity within the Monument. The USFWS charters a twin-engine aircraft (Gulf Stream 1 or G-1) to transport people and supplies to Midway. The G-1 would continue to provide service through fiscal year 2008 (CFO-7.1). Within five years, an inter-island aircraft transportation carrier would be identified to deliver passengers and cargo between Honolulu and Midway (CFO-7.1), followed by an evaluation of the need for a dedicated aircraft for transportation, management, research, evacuation, education, surveillance, and enforcement (CFO-7.2). These planning mechanisms would increase the capacity of aircraft transportation within the Monument incrementally. The ability of staff to accomplish many of the tasks outlined within this document, such as emergency response improvements, data collection, and research, would be augmented by this new aircraft capacity. Therefore, these activities could have beneficial effects on transportation within the Monument.

###### *Utilities*

Planning and administrative activities would include initiating and completing necessary planning for implementing the draft Midway Atoll Conceptual Site Plan (CFO-1.1); developing conceptual site plans for the Hawaiian Island National Wildlife Refuge and the State Seabird Sanctuary at Kure Atoll (CFO-1.2); developing alternative energy systems and waste reduction strategies for the Monument within two years (CFO-1.3); and planning for sustainable engineering, technology, and landscape architecture throughout the Monument (CFO-1.4). While these planning and administrative activities would have no direct and immediate effects on utilities, they would work to improve the utilities services in the Monument by conducting necessary site planning and infrastructure development and could therefore have an overall beneficial effect.

##### *Infrastructure Development Activities*

###### *Transportation*

The Coordinated Field Operations Action Plan outlines infrastructure improvements in the future. These improvements include additional vessels at Midway for summer marine research (CFO-6.2), a small research/enforcement vessel at Midway (CFO-6.3), and an appropriate aircraft to service the Monument and Pacific region (CFO-7.3). The plan would also improve dive capabilities by acquiring a portable dive recompression chamber for a research vessel (CFO-8.2) and incorporating a dive operations center at a boathouse at Midway (CFO-8.3). The

plan also provides for improved logistical, infrastructure, and transportation support for endangered species recovery actions (CFO-9.3). Finally, there are provisions for the construction of an airport welcome center on Sand Island within two years, including capacity to handle passenger arrival and departures from Midway Atoll NWR.

These infrastructure developments will increase the efficiency of many current and future transportation demands within the Monument. The ability of staff to accomplish many of the tasks outlined within this document, including emergency response improvements, data collection, and research, would be augmented by these new vessels and facilities. Therefore, these activities would have a beneficial effect on transportation within the Monument.

#### *Utilities*

Restoration activities would include rehabilitating “Officers Row” Housing at Midway Atoll (CFO-3.4) and existing housing and facilities on Green Island at Kure Atoll (CFO-3.5). These activities would increase the housing capacity and would provide maintenance, expansion, or replacement of existing utility systems. Additional demands on utilities, including electricity, wastewater, potable water supply, solid waste and communications, would result from increased housing capacity. The current utilities are adequate for the existing demands at Midway Atoll, but expanded operations and housing that is currently planned will require additional analysis to determine which system upgrades are necessary. Additional compliance associated with Midway site infrastructure improvements may be required as planning and design details are developed.

Minor negative effects are expected from increased demands on utilities but would be offset by rehabilitation and replacement of existing infrastructure with more sustainable and efficient systems, having beneficial effects overall.

Constructing an airport welcome center on Sand Island (CFO-9.5) would include restroom facilities construction. The current utilities are adequate for the existing demands at Midway Atoll, but planned expanded operations would require additional analysis to determine which system upgrades are necessary. Additional compliance associated with Midway site infrastructure improvements may be required as planning and design details are developed.

### **3.5.5 Summary of Effects**

Table 3.5-1 summarizes the effects on other resources from the Proposed Action. The effects are listed by Action Plan and action areas (planning/administrative, field, or infrastructure and development activities). The Proposed Action could have beneficial and negative effects on other resources (water quality, transportation and communications, and utilities) of the Monument. The other resources of the Monument includes: the water quality conditions of marine, terrestrial and potable water resources; sources of marine pollution; vessel and aircraft activity; communications infrastructure; terrestrial transportation; potable water supply and fire protection; wastewater management; stormwater management; energy; communication systems; solid waste management; and management of fueling facilities in the Monument.

---

---

**CHAPTER 4:**  
**OTHER NEPA ANALYSES**

# CHAPTER 4

## OTHER NEPA ANALYSES

---

### 4.1 INTRODUCTION

In addition to the analyses discussed in Chapter 3, this chapter discusses additional environmental analyses, including:

- Cumulative effects;
- Significant unavoidable negative effects;
- The relationship between short-term uses and long-term productivity; and
- Any irreversible or irretrievable commitment of resources.

Issues related to environmental justice and the protection of children are addressed in section 2.4.4 of this document.

### 4.2 CUMULATIVE EFFECTS ANALYSIS

A cumulative effect is an “impact on the environment which results from the incremental effect of the action when added to other past, present, and reasonably foreseeable future actions” (40 CFR Section 1508.7; NOAA 1999). Cumulative effects can result from individually minor but collectively significant actions taking place over time (40 CFR Section 1508.7).

The CEQ’s guidance for considering cumulative effects states that NEPA documents “should compare the cumulative effects of multiple actions with appropriate national, regional, state, or community goals to determine whether the total effect is significant” (CEQ 1997). Cumulative projects considered below in Section 4.2.2 are similar to the Proposed Action, large enough to have far-reaching effects, or are in proximity to the Proposed Action with similar types of effects.

#### 4.2.1 Cumulative Effects Evaluation Methodology

The CEQ's cumulative effects guidance sets out several different methods to determine the significance of cumulative effects, such as checklists, modeling, forecasting, and economic effect assessment, where changes in employment, income, and population are evaluated (CEQ 1997). Very little definitive data are available at this time for determining cumulative effects of potential future projects (see Table 4-1). As a result, this EA looks primarily at resource trends and the expected effects the cumulative projects would have based on the individual project purpose; for example, a project that is expected to bring additional visitors to the Monument might be expected to result in minor disturbances to terrestrial species. In general, past, present, and future foreseeable projects are assessed by resource area.

Cumulative effects may arise from single or multiple actions and may result in additive or interactive effects. Interactive effects may be countervailing, where the negative cumulative effect is less than the sum of the individual effects, or synergistic, where the net negative cumulative effect is greater than the sum of the individual effects (CEQ 1997). Where applicable, the resource sections below include a discussion of whether project effects will accelerate any ongoing trends of resource degradation. The ROI for cumulative effects is often larger than the ROI for direct and indirect effects. The cumulative effect ROI is defined for each specific resource.

#### 4.2.2 Past, Present, and Reasonably Foreseeable Future Projects

Cumulative effects include the analysis of the following:

- Present effects of past projects, which are represented by the conditions described in Chapter 2;
- Effects of the Proposed Action, which are analyzed in Chapter 3; and
- Potential effects from reasonably foreseeable future projects, which are listed in Table 4-1.

The analysis of cumulative effects considers the present effects of past actions to the extent that they are relevant and useful in analyzing whether the reasonably foreseeable effects of, the Proposed Action, and future projects would collectively result in a significant effect on the environment.

The project information provided in Table 4-1 was compiled from a number of sources, including NOAA, FWS, DLNR, USCG, the Navy, and the University of Hawai'i. The initial list of identified projects was reviewed and revised to include only those with some potential to contribute to cumulative effects.

#### Filling at Whale-Skate Island

Whale-Skate Island has been shrinking over the last decade and is now an ephemeral island. NOAA is evaluating a filling project to restore Hawaiian monk seal haul-out areas.

## Establish Regular Visitation at Midway Atoll

FWS was unable to offer a visitor program from early 2002 until early this year. FWS goal is to maintain Midway as the only remote island National Wildlife Refuge open to public visitation, primarily for wildlife and ecotourism tours. An Interim Visitor Services Plan, with a final EA, was approved in May 2007 and implemented in January 2008. A draft plan for a long-term visitor program based on this is included in the Monument Management Plan and analyzed in this document. Both the interim and proposed visitor plans include on-going monitoring and evaluation of effects.

**Table 4-1  
Cumulative Projects**

<b>Project</b>	<b>Related Project Location</b>	<b>Project Sponsor</b>	<b>Project Description</b>
Filling at Whale-Skate Island	French Frigate Shoals	NOAA Protected Species Division	NOAA is evaluating a filling project to restore Hawaiian monk seal haul-out areas.
Establish regular visitation at Midway	Midway Atoll	FWS	The goal is to re-establish public visitation at Midway on a regular basis.
New water treatment system	Midway Atoll, Sand Island	FWS	Upgrades to treatment system to accommodate future demands.
New wastewater treatment system	Midway Atoll	FWS	Upgrades to treatment system to accommodate future demands.
Airport runway resurfacing and restriping	Midway Atoll	FWS	Upgrade runway to meet FAA Part 139 standards.
Develop Biodiesel or Appropriate Alternative Fuel Capacity	Midway Atoll	FWS	To advance sustainable use at Midway Atoll.
Design and Construct a Low Impact Shelter	Midway Atoll	FWS	To develop housing with low impact on natural resources.
Replace Bravo Barracks	Midway Atoll	FWS	To provide safe housing for residents and transients working on future projects.
Complete Phase I Rehabilitation of the Commissary building and Midway Mall	Midway Atoll	FWS	To provide needed office, classroom, storage, and basic laboratory space.
Termite treatment on all wooden/historic structures	Midway Atoll	FWS	To extend the life of existing structures for future uses and to protect historic resources.
Redevelop Existing Boathouse into New Boathouse, Dive Center, and Water-based Storage Facilities	Midway Atoll	FWS	Convert existing structure to a multipurpose boathouse, dive center, and storage facility.
Construct New Finger Piers along North Wall of Inner Harbor	Midway Atoll	FWS	Construct piers for fueling, loading, and short-term in-water storage of vessels.
Design and Construct Marine Laboratory	Midway Atoll	FWS	To meet research and educational needs of future users.

<b>Project</b>	<b>Related Project Location</b>	<b>Project Sponsor</b>	<b>Project Description</b>
Complete Full Rehabilitation of Midway Mall	Midway Atoll	FWS	To provide office space, visitor services, and classrooms.
Rehabilitate Officers' Row Housing	Midway Atoll	FWS	To provide housing for projected increased Monument personnel.
Remodel or Replace Clipper House	Midway Atoll	FWS	To provide expanded food service needs.
Rehabilitate Seaplane Hangar	Midway Atoll	FWS	Work would be primarily to restore this historic structure.
Replace Charlie Barracks	Midway Atoll	FWS	Provide safe housing for visitors and transient personnel
Repair Inner Harbor Sea Wall	Midway Atoll	FWS	To protect the harbor repair of this seawall is needed.

**New Wastewater Treatment System, Midway Atoll**

The wastewater treatment system at Midway Atoll includes 20,280 feet (6,181.3 meters) of underground line and lift stations, and a septic and leach field system that was added in 1997. FWS is rehabilitating and replacing the existing wastewater collection and treatment system as required to adequately service the buildings. Work will include constructing a new wastewater treatment system, including septic tanks and drain fields, eliminating rainfall entry into the system, and replacing distribution lines as required. Any major site work would take place August through October to minimize wildlife effects.

**Airport Runway Resurfacing and Restriping, Midway Atoll**

The Midway Island runway is 7,904 feet (2,409 meters) by 200 feet (61 meters), with an asphalt surface. It is subject to the following weight limitations: 195,000 lbs for single wheel aircraft, 260,000 lbs for double wheel aircraft, and 390,000 lbs for double tandem aircraft. In the past, an average of 226 aircraft landed at Midway every year. This project is not yet funded in its entirety. Proposed construction will be beyond 2008.

**Develop Biodiesel or Appropriate Alternative Fuel Capacity ad Midway Atoll**

In an effort to advance the use of sustainable technologies at Midway, small boats, vehicles, and heavy equipment will be evaluated and where feasible, transitioned to the use of biodiesel. Ideally, this fuel would be stored on the existing concrete pad along the north wall of the inner harbor near the location where new finger piers will be constructed. Alternatively tanks would be located near the newly constructed fuel farm on the southwest corner of the inner harbor.

**Design and Construct a Low Impact Shelter**

Construct low impact shelter for short term housing in the housing zone. The housing will be constructed as a sustainable design pilot project intended to showcase the synergistic potential of innovative design on the island. The design will elevate the building off the ground, providing for human habitation while increasing the total amount of available wildlife habitat, and providing environmental security from tsunamis and storm surges. This structure will

incorporate Pacific Island regional design principles to consider local wind and sunlight patterns, will aim to be nonpolluting and will incorporate recycled materials. The use of solar power, composting toilets, and, if needed, a small rain catchment system will be explored in an effort to sustain the building off the power grid and minimize wildlife impacts.

### **Replace Bravo Barracks**

Demolition costs for existing building must be included in construction cost. Bravo Barracks replacement is essential in order to provide safe housing for permanent island residents and transients working on future maintenance/construction projects.

### **Complete Phase I Rehabilitation of the Commissary building and Midway Mall**

Collectively the commissary building and the Midway Mall present ideal central locations for Co-Trustee and partner office, classroom, storage, and basic laboratory space. Phase I rehabilitation of the commissary will include cleaning and maintenance, construction of office and classroom space, and a feasibility study of how best to incorporate solar power and other sustainable design principles. The Midway Mall will require more substantial design and a preservation plan for renovation to provide basic office and storage space along with visitor information.

### **Termite treatment on all wooden/historic structures**

By treating all wooden/historic structures immediately we buy ourselves 5-10 more years to find funding for ultimate rehabilitation/restoration. Without treatment these structures either need to be rehabilitated immediately or abandoned forever.

### **Redevelop Existing Boathouse into New Boathouse, Dive Center, and Water-based Storage Facilities**

Redevelop the existing boathouse at Midway into a multipurpose boathouse, dive center, and storage facility to support agency operations in the northwestern end of the Monument. The facility will have maintenance bays and equipment for servicing small boats; a dive locker including a compressor, recompression chamber; and appropriate storage and work areas. The dive center may also support the visitor program. The building will be re-sited or reconstructed and potentially raised to address concerns of flooding on the seaplane pad.

### **Construct New Finger Piers along North Wall of Inner Harbor**

To meet small boat needs, within 5 years construct three finger piers along the north wall of the inner harbor across from the existing concrete pad. These piers may be used for fueling, loading, and short term in-water storage of vessels. These vessels will be used to support programs at Midway and neighboring atolls in the future.

### **Design and Construct Marine Laboratory**

A variety of needs will be met by a marine laboratory at Midway. An evaluation and planning effort will help determine if the research and educational needs of potential users will be best met by developing several small facilities over time, or by a modular design that allow new requirements to be filled as they arise. Initially the lab would provide basic amenities to augment research and education capacity including field schools, seasonal research, and long-term monitoring. A Hawaiian monk seal captive care facility, wet/dry lab infrastructure, quarantine standards, and possibly freezer space will be included in the plan. Several locations are well suited for a small laboratory including the old commissary building adjacent to the Midway Mall as well as several sites on the seaplane apron. The commissary building may be ideal for a first phase location, but would have to be reevaluated in order to accommodate a captive care facility.

### **Complete Full Rehabilitation of Midway Mall**

Midway Mall would be rehabilitated as the “Midway Atoll Visitor Center” and would be used as office space for FWS, NOAA, State of Hawai‘i and other potential partner personnel; as well as a hub for visitor services, classrooms, and education. Phase I rehabilitation would allow for agency offices and be completed within 3 years.

### **Rehabilitate Officers’ Row Housing**

The 10 historic Officers’ row houses serve as examples of historic Albert Kahn architecture and will be restored. This increased housing capacity will accommodate increased agency and partner personnel

### **Remodel or Replace Clipper House**

The Clipper House presently serves as the primary food service facility for Midway. Overall food services will need to be expanded to accommodate future population increases and enlargement of the Clipper House, reuse of older existing food service facilities, or construction of a new dining facility will be evaluated.

### **Rehabilitate Seaplane Hangar**

Due to its size (large enough to hold such things as heavy equipment, boats, and workshops), its location (short distance from inner harbor and boat ramp) and its historic significance (designed by Albert Kahn, still contains scars from the Battle of Midway), this building needs to be utilized and preserved. Rehabilitation work will be guided by a detailed preservation plan.

### **Replace Charlie Barracks**

Charlie Barracks replacement is essential in order to provide safe housing for island visitors and transient personnel. Demolition costs for the existing building must be included in the construction cost. This replacement is expected to take place within 10 years.

**Repair Inner Harbor Sea Wall**

The harbor is critical to operations at Midway. Any future expansion of docking/pier facilities in the southwest corner of the harbor must be preceded by the repair of the existing sea wall.

**4.2.3 Cumulative Effects**

**Summary of Cumulative Effects**

The contributions of the No Action and Proposed Action to cumulative effects on various resource areas are summarized in Table 4-2. It is anticipated that the cumulative projects would have overall beneficial cumulative effect for all resource areas with the exception of cultural and historic resources and Environmental Justice, where the project will have no effects.

**Table 4-2  
Summary of Potential Contribution of the No Action and  
Proposed Action Alternatives to Cumulative Effects**

Resource Area	Effects
Natural Resources	Beneficial
Cultural and Historic Resources	None
Socioeconomics	Beneficial
Other	Beneficial
Environmental Justice	None

**Natural Resources**

For the evaluation of cumulative effects relative to natural resources, the ROI is the same as that described in section 2.2. The cumulative projects described above would not have an effect beyond the Monument boundary.

Cumulative effects for natural resources use are assessed based on the past trends described in section 3.2. These trends are important because they are used as the context for determining whether the project alternatives would contribute to negative trends occurring in the ROI. The effects of the project alternatives are then added to the past, present, and reasonably foreseeable future project effects to determine if the incremental effects of all the projects would add to the historical or existing trends in land use and recreation.

The impacts of the Proposed Action on natural resources were analyzed in Section 3.2. While some activities would have a minor negative effect on natural resources, the effects are inherently of short duration and are limited to the site where activities occur. Although it is expected that plan implementation will result in overall beneficial effects to the human environment, these beneficial effects do not represent a significant impact. This is because the magnitude of benefits expected to result from plan implementation will be incrementally modest within in the context of the essentially uninhabited pristine lands and waters of the Monument. Beneficial effects to natural resources by the cumulative projects are anticipated under both the No Action and Proposed Action alternatives. The infrastructure projects, which will be built on existing disturbed area, will improve waste treatment, communications, water treatment,

housing, and will result in better management of fuels and more efficient power generation. These projects will reduce potential pollution from wastewater discharges and fuel spills.

### **Cultural and Historic Resources**

For cumulative effects on historic, cultural, and archeological resources including Midway's historic context, the ROI would be the same as described in section 2.3, which includes all the islands and surrounding waters of the Monument. Hawai'i's rich history produced a large collection of historic properties on several of the islands. Since Western contact, commercial and military operations and natural forces have destroyed or damaged many cultural and historic resource sites and have caused negative cumulative effects. Today more is known about historic and cultural resources, their importance, and how to minimize effects on them. No other projects were identified in the foreseeable future that would result in cumulative effects to cultural and historical resources under the No Action or Proposed Action alternatives.

### **Socioeconomic Resources**

#### ***Human Uses and Activities***

For cumulative effects on human uses and activities, the ROI would be the same as described in section 2.4.1, which includes all the islands and surrounding waters of the Monument. Historic events have resulted in various levels and types of human use and activity. The height of human activity likely occurred in the 1940s during World War II, when military construction and use was at its highest. Over the past 65 years, the level of human use has decreased, with the military pulling out of Midway Atoll. Human use is now limited to Department of Defense training, testing, and missile defense activities, managers, contractors, researchers, and visitors of the Monument. Controlling human use will have a beneficial cumulative effect.

Under the No Action alternative, the cumulative effects to human use and activities would be beneficial. Activities may include SCUBA diving, snorkeling, bird watching, ecotours, and cruise ship visits, as safe mooring becomes available.

#### ***Human Health, Safety, and Hazardous Materials***

The ROI for the cumulative effects on hazardous materials and conditions is the same as described in section 2.4.2. Past activities and actions have caused spills of hazardous materials and conditions that threaten human health and safety. Hazardous conditions have included spills of oil and fuels from commercial and military activities, and hazardous conditions on commercial vessels are compounded by the remote location of the Northwestern Hawaiian Islands, making rescue and response operations difficult. The cumulative effects of past activities on human health and safety and hazardous materials are considered significant. However, present and future cumulative projects would improve conditions, particularly with the improvement of the infrastructure on Midway Atoll NWR. For example, improvement to the lodgings would improve living conditions, and improvements to the airfield would improve aircraft safety.

#### ***Land Use***

The ROI for the cumulative effects on land use is the same as described in section 2.4.3. Past activities have caused a major shift in land use from undisturbed native habitat to military uses.

This change is most notable at Midway Atoll, French Frigate Shoals, and Kure Atoll. The cumulative effects of past activities on land use are considered significant. However, present and future cumulative projects would take place on the existing footprint of buildings or facilities presently in place, with no changes in land use. The Proposed Action would result in a beneficial cumulative change as some developed area would be restored to native habitat.

### ***Economics***

For cumulative effects on socioeconomics, the ROI would be the same as described in section 2.4.4, which would include all the islands and surrounding waters of the Monument. Under the No Action and Proposed Action alternatives, the cumulative effects to socioeconomics would be beneficial, with the re-establishment of public visitation and construction of the infrastructure facilities at Midway Atoll. The increase in visitation could provide very minor increased income to cruise lines, air charter services, the service industry supporting these activities on the main Hawaiian Islands, and the agencies responsible for management activities.

### **Other Resources**

#### ***Water Quality***

For cumulative effects on marine water quality, the ROI would be the same as described in section 2.5.1, which includes all the islands and surrounding waters of the Monument. Historic activities and actions have resulted in discharges to the marine waters from wartime activities, including oils and fuels from downed aircraft and sunken vessels, to spills from fishing boats and other vessels that have sunk or run aground throughout the island chain. However, because of the long time span between events, in some cases decades, and the frequent exchange of waters surrounding the location of discharges, these past activities have had a minor negative cumulative effect.

Existing Federal laws and Monument regulations already provide safeguards for protecting marine water quality. The Monument Management Plan, which fulfills Comprehensive conservation planning requirements for the Midway Atoll NWR by FWS, and the upgrade of sanitation systems at Midway Atoll will allow for further control of vessel traffic and discharges. The net result is that there would be a beneficial cumulative effect on marine water quality.

#### ***Traffic and Communication Infrastructure***

For cumulative effects on marine traffic, the ROI would be the same as described in section 2.5.2, which includes all the islands and surrounding waters of the Monument. Historic activities and actions have had little effect on marine traffic. Commercial traffic has historically avoided the Northwestern Hawaiian Islands because of grounding hazards. Some ships do transit the chain between Pearl and Hermes Atoll and Laysan Island, but most skirt the chain to the north. Past and present projects have had no cumulative effect on marine traffic. The future cumulative projects listed in Table 3-1 would not affect marine traffic. There would be a beneficial effect on communications with the construction of the communications network proposed by FWS at Midway. This would provide a higher level of services in the area than presently exists. Neither these projects nor the Proposed Action would restrict marine commercial vessel transit; therefore, they would have no cumulative effects.

### **Utilities**

The ROI for the cumulative effects on utilities is the same as described in section 2.5.3. Past activities included construction of a power plant, water treatment facility, sewage treatment, and fuel storage tanks as a result of military use, and more recently, FWS operations. These facilities can be found on Sand Island at Midway Atoll and Tern Island, FFS. There were no cumulative effects of past activities on utilities, as adequate capacity was constructed based on demand. However, some of the present and future cumulative projects would place a demand on the utilities that might exceed capacity. The balance of the proposed project is designed to upgrade sewage treatment to meet future demands. Therefore, the present and proposed projects would have no cumulative effect on utilities.

### **Environmental Justice**

For cumulative effects on environmental justice, the ROI would be the same as described in section 2.4.4, which includes all the islands and surrounding waters of the Monument. The cumulative projects listed in Table 3-2 would have no effect on environmental justice. No disproportionate negative environmental or health effects from the cumulative projects would occur on minority or low-income populations.

#### **4.3 SIGNIFICANT UNAVOIDABLE NEGATIVE EFFECTS**

No significant unavoidable negative effects have been identified.

#### **4.4 RELATIONSHIP BETWEEN LOCAL SHORT-TERM USES OF THE ENVIRONMENT AND LONG-TERM PRODUCTIVITY**

The short-term uses of the environment relating to the No Action and Proposed Action alternatives would improve the health and quality of the environment by managing vessel traffic through a permit system, requiring VMS on all vessels, and requiring hull inspections, thereby reducing the potential for groundings and hazardous spills, reducing the potential for the spread of invasive species, and reducing human activities and disturbance of special status species. In addition, control of terrestrial invasive species, restoration of native habitat and species populations, upgrades to infrastructure, and establishment of a permit process to control access and activities would reduce the potential of the spread of alien species, reduce stressors to special status species, reduce potential hazardous events, and improve health and safety for researchers, management staff, and visitors.

The long-term productivity related to the No Action and Proposed Action alternatives is based on the Presidential Proclamation 8031 establishing the Monument; prohibitions and regulated activities codified in Monument regulations; the December 2006 MOA between Co-Trustees that establishes the vision, mission, and guiding principles for the Monument; and the Monument Management Plan that defines strategies and activities to achieve long-term productivity of the resources.

#### **4.5 IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF RESOURCES**

The No Action and Proposed Action alternatives would require minor commitments of both renewable and nonrenewable energy and material resources for the management, public use, and research activities associated with the Monument. The Proposed Action alternative in the Monument Management Plan would also commit substantial resources, staff time, and funds for conservation and management activities. Nonrenewable resources that would be used during management and research activities include fuel, water, power, and other resources necessary to maintain and operate the equipment and facilities at the field stations, field camps, vessels, and offices of the Monument.

---

---

**CHAPTER 5:**  
**AGENCY AND PUBLIC PARTICIPATION**

## CHAPTER 5

# AGENCY AND PUBLIC PARTICIPATION

---

The establishment of the NWHI Coral Reef Ecosystem Reserve (Reserve), and steps taken to designate it as a proposed sanctuary, represent a long and extensive history of public consultation and involvement. As a result of this outreach, nearly 52,000 public comments were received in support of strong protection of NWHI.

Since 2000, NOAA conducted over 100 meetings with interagency partners, the Reserve Advisory Council, Western Pacific Fishery Management Council, Native Hawaiian community groups, stakeholders, and the general public. The purpose of the meetings was to identify issues related to designating a proposed sanctuary and to solicit input on developing the alternatives to be considered in a draft environmental impact statement. Furthermore, these stakeholder groups helped prepare a draft management plan for the proposed sanctuary, which serves as the basis for the Monument Management Plan.

Monument regulations established as a result of Presidential Proclamations 8031 and 8112 and codified in 50 CFR Part 404 reflect input received during agency and public participation. After the Monument was established, public informational meetings were held on all main Hawaiian Islands to inform the public. A total of 471 people attended. Overall, the establishment of the Monument and the regulations codified under 50 CFR Part 404 were well received by the public, most of whom supported strong protection of the ecosystem of the Monument.

In addition, in December 2006, FWS released the draft Midway Atoll NWR Interim Visitor Services Plan proposing small-scale visitation at Midway. The draft Interim Visitor Plan was publicly distributed and received over 6,000 comments during the review. This interim plan was finalized in May 2007 and a final plan is incorporated in the Monument Management Plan.

On April 4, 2007, FWS and NOAA issued a *Federal Register* notice (72 FR16328) to prepare the Monument Management Plan and associated EA for the Monument. The notice stated that “It is the intent of the Co-Trustees to integrate agency planning and operational needs into a single Monument Plan. A draft Monument Plan [and associated environmental assessment] will be distributed for public review and comment early in 2008.” The public was directed to focus additional comments “on any new environmental issues identified as a result of new information

or changed circumstances since the comment periods identified above.” The public comment period for this notice ended on June 4, 2007. A scoping report was prepared that summarized all issues raised over the course of this process and a September planning update was publicly distributed that described the primary issues identified during the scoping process.

NOAA, the FWS, and the State of Hawai‘i released the Draft Monument Management Plan and the associated EA for public comment on April 22, 2008. The documents were made available on the Internet at <http://papahanaumokuakea.gov>, at local libraries in Hawai‘i, and by calling the Fish and Wildlife Service. The federal public comment period was from April 23 to July 8 and later was extended to July 23, 2008, at the request of members of the public during a series of ten public meetings in June.

**Public Meetings**

The co-trustees hosted public meetings in nine locations throughout Hawai‘i and one in Washington, DC. Table 5-1 lists the locations of the public meetings, the number of persons attending, and the number of speakers providing testimonials.

Public comments on the Draft Monument Management Plan and EA were submitted by individuals, organizations, and agencies via mail, hand delivery, e-mail, and testimony at the public meetings (Table 5-1). A total of 6,434 comments were received, including 27 letters, 6,246 form letters as e-mails, 74 e-mails, and 87 testimonials. A summary of comments and responses and agency comments and responses is provided in Volume V, Response to Comments, and a list of commenters, including federal, state and local agencies and organizations is provided in Table 5-2 below.

**Table 5-1  
Public Meetings**

<b>Date</b>	<b>Location</b>	<b>Number of Attendees</b>	<b>Number of Speakers</b>
June 9, 2008	Wai‘anae Parks and Recreation Complex 85-601 Farrington Highway, Wai‘anae, O‘ahu	12	3
June 11, 2008	Auditorium, Main Interior Building 1849 C Street NW, Washington, DC	10	1
June 12, 2008	Maui Arts and Cultural Center One Cameron Way, Kahului, Maui	15	7
June 13, 2008	Lāna‘i High and Elementary School 555 Frasier Avenue, Lāna‘i City, Lāna‘i	3	2
June 16, 2008	Kūlana ‘Oiwī Hālau 610 Maunaloa Highway, Kaunakakai, Moloka‘i	12	9
June 17, 2008	He‘eia State Park 46-465 Kamehameha Highway, Kāne‘ohe, O‘ahu	20	6
June 18, 2008	King Kamehameha Hotel 75-5660 Palani Road, Kailua-Kona, Kona, Hawai‘i	35	22
June 19, 2008	Mokupāpapa Discovery Center 308 Kamehameha Ave., Suite 109, Hilo, Hawai‘i	36	9
June 23, 2008	Hilton Kaua‘i Beach Resort 4331 Kauai Beach Drive, Līhu‘e, Kaua‘i	28	11
June 24, 2008	Japanese Cultural Center 2454 South Beretania Street, Honolulu, O‘ahu	60	17

## 1.0 INTRODUCTION

### 1.1 Project Background

The State of Hawai‘i Department of Land and Natural Resources (DLNR), Division of Aquatic Resources has prepared this Cultural Impact Assessment (CIA) associated with the proposed implementation of the Papahānaumokuākea Marine National Monument Management Plan (MMP), and the Environmental Assessment (EA) for proposed MMP activities. The MMP and EA were prepared in compliance with the statutory requirements of the Federal National Environmental Policy Act (NEPA), the State of Hawai‘i Revised Statute (HRS) Chapter 343 Environmental Impact Statements law, and in accordance with the State of Hawai‘i Department of Health’s Office of Environmental Quality Control (OEQC) Guidelines for Assessing Cultural Impacts as adopted by the Environmental Council, State of Hawai‘i, on November 19, 1997.

Papahānaumokuākea Marine National Monument (Monument) is a very sacred and spiritual place to the Kānaka Maoli (Native Hawaiian) and is the largest protected area in the United States, as well as the world’s largest fully protected marine area. It was created by Presidential Proclamation under the authorities of the Antiquities Act, 16 U.S.C. §§ 431-433. Creation of the Monument was based on extensive public input, including hearings and the involvement of a broad spectrum of stakeholders and interested persons. Nearly 52,000 public comments were received, the majority of which supported strong protection for the Northwestern Hawaiian Islands (NWHI). Based upon this extensive public input, and in order to provide additional immediate protection to the NWHI, the Monument was created on June 15, 2006, by Presidential Proclamation 8031. National Monument status ensures the immediate, comprehensive, strong, and lasting protection of the resources of the NWHI.

The three principal entities with responsibility for managing lands and waters of the Monument are the Department of Commerce, via the National Oceanic and Atmospheric Administration (NOAA), the Department of the Interior, via the U.S. Fish and Wildlife Service (USFWS), and the State of Hawai‘i (collectively, the Co-Trustees). The Co-Trustees work cooperatively and consult to administer the Monument. The Proclamation provides that the Co-Trustees shall develop a management plan for the region, based upon the draft management plan developed during the sanctuary designation process. The management plan will include provisions for coordinated permitting, research, education, enforcement, cultural practices, and other management related activities. In December 2006, Governor Lingle and the Secretaries of Commerce and the Interior signed a Memorandum of Agreement (MOA) that outlined the roles and responsibilities for the Co-Trustee agencies for coordinated conservation and management of the Monument. The MOA created a governance structure for the Monument and established the Monument Management Board (MMB), which is composed of representatives from the Federal and State agency offices that carry out the day-to-day management and coordination of Monument activities. In addition to the Co-Trustee agencies, the Office of Hawaiian Affairs (OHA) is a member of the MMB and participates in management activities.

## 1.2 Scope of Work

The scope of work for this CIA includes:

- Examination of cultural and historical resources, including historic maps, and previous research reports and interviews, with the specific purpose of identifying traditional Hawaiian activities including religious practices, fishing, voyaging, gathering of plant, animal, and other resources, or agricultural pursuits as may be indicated in the historic or oral history records;
- A review of previous archaeological work that may be relevant to reconstruction of traditional land use activities; and the identification and description of cultural resources, practices, and beliefs associated with Papahānaumokuākea;
- Consultation and interviews with knowledgeable parties regarding traditional cultural practices, present and/or past uses of the area; and
- Preparation of a report summarizing the results of these research activities.

## 1.3 Physical and Natural Setting

Papahānaumokuākea Marine National Monument is located in the northwestern portion of the Hawaiian Archipelago, and encompasses the NWHI (Fig. 1). The Monument is located between approximately 22°N and 30°N latitude and 161° W and 180°W longitude, and is roughly 1,200 miles long and 100 miles wide, totaling an area of approximately 140,000 square miles.

Beginning 125 miles from the main Hawaiian Island of Kaua‘i, the ten islands and atolls are referred to as the NWHI, or in past decades as the Leeward Islands (Fig. 2). None of these islands are more than 2–3 square kilometers in size, and all but four have an average mean height of less than 10 m. As a group, they represent a classic geomorphological sequence, consisting of highly eroded high islands, near-atolls with volcanic pinnacles jutting from surrounding lagoons, true ring-shaped atolls with roughly circular rims and central lagoons, and secondarily raised atolls, one of which bears an interior hypersaline lake. The region also includes numerous submerged banks and seamounts. This geological progression along the Hawaiian Ridge continues northwestward beyond the last emergent island, Kure Atoll, as a chain of submerged platforms that makes a sudden northward bend to become the Emperor Seamounts, and extend across the entire North Pacific to the base of the Kamchatka Peninsula in Russia.

The Monument contains a wide range of marine and terrestrial habitats ranging from ocean basins more than 15,000 feet below sea level, to emergent land with hills and cliffs rising to 900 feet above sea level. These habitats include deep and shallow coral reefs, lagoons, littoral shores, dunes, dry grasslands, and shrub lands that support a wide variety

of plants and animals. More than 7,000 marine species are found in the NWHI, of which 25% are endemic (NOAA 2006). High densities of apex predators such as sharks, groupers, and jacks dominate the marine environment. These species thrive because of minimal anthropogenic stressors. Friedlander et al. (2005) noted that the NWHI are one of the few large-scale, intact predator dominated reef ecosystems in the world. The physical isolation of the Hawaiian Archipelago explains the relatively low species diversity and high endemism levels of its biota (DeMartini and Friedlander, 2004) and the direction of flow of surface waters explain biogeographic relationships between the NWHI and other sites such as Johnston Atoll to the south as well as patterns of endemism and population structure and density of reef fish within the archipelago (DeMartini and Friedlander, 2006).

The majority of the Monument consists of deep pelagic waters that surround the island platforms. At least 13 banks lie at depths between 100 and 1,300 feet (30 and 400 meters) within the Monument, providing important habitat for bottomfish and lobster species, although only a few of these banks have been studied in any detail (Kelley and Ikehara, 2006). These waters represent important deep water foraging grounds for endangered Hawaiian monk seals, as well as a spatial refugium for pelagic fishes such as tunas and their allies that are currently in declared states of overfishing throughout the Pacific region.

Scientists using deep-diving submersibles have recorded the presence of deep-water precious coral beds within the Monument at depths of 1,200-1,330 feet (365–406 m); these include ancient gold corals whose growth rate is now estimated to be only a few centimeters every hundred years and whose ages may exceed 2,500 years (Roark et al., 2006). At depths below 1,640 feet (500 meters), a diverse community of octocorals and sponges flourish. These deepwater sessile animals prefer hard substrates devoid of sediments (Baco-Taylor et al., 2006). Even deeper yet, the abyssal depths of the Monument, while harboring limited biomass, are home to many poorly documented fishes and invertebrates with remarkable adaptations to this extreme environment. The deep-waters are also important insofar as they support an offshore mesopelagic boundary community (Benoit-Bird et al. 2002), a thick layer of pelagic organisms that rests in the deep ocean (1,300-2,300 feet or 400–700 m) during the day, then migrates up to shallower depths (from near zero to 1,300 feet or 400 m) at night, providing a critical source of nutrition for open-ocean fishes, seabirds, and marine mammals. Overall, the fauna of the Monument's waters below standard SCUBA diving depths remains poorly surveyed and documented, representing an enormous opportunity for future scientific research in a system largely undisturbed by recent trawling or other forms of resource extraction.

The marine and coastal areas of the Monument are home to several species of marine mammals. Over 20 species of whales and dolphins are found in the Monument, of which 6 species are listed as endangered or threatened under the federal Endangered Species Act. The NWHI support the majority of the critically endangered Hawaiian monk seal population. Additionally, 90% of the Hawaiian green turtles nest in these islands.

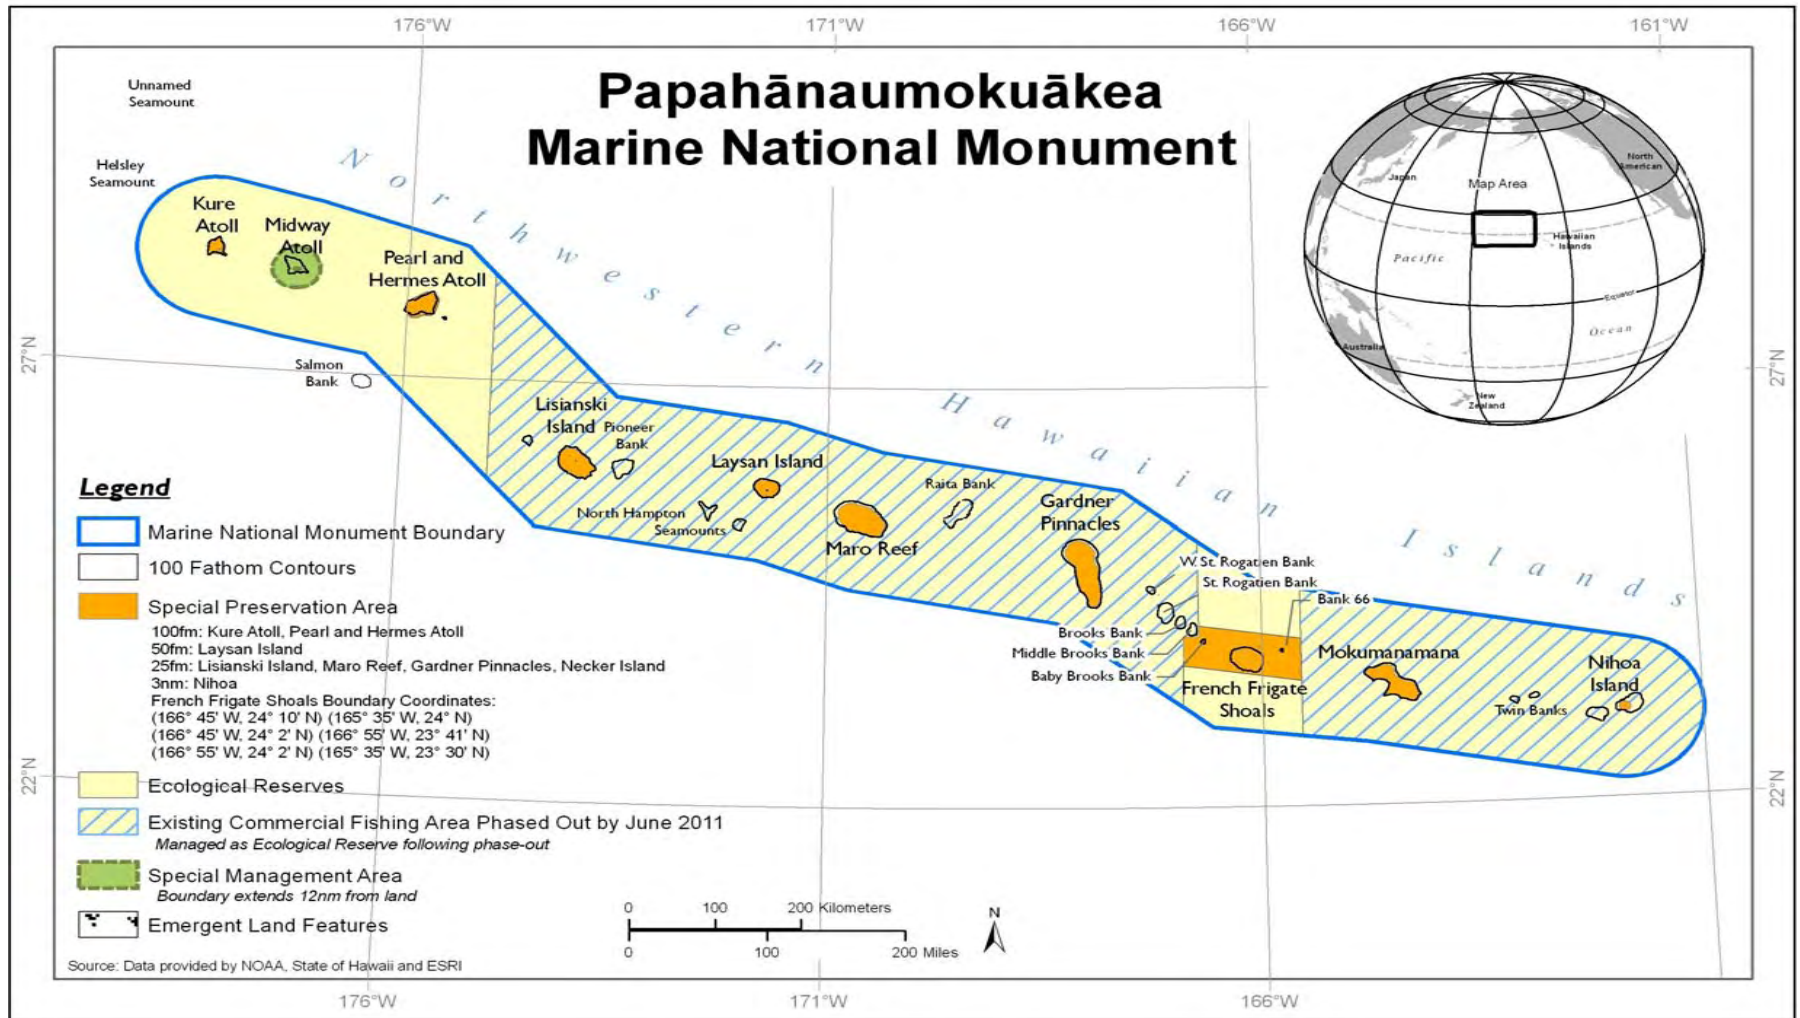

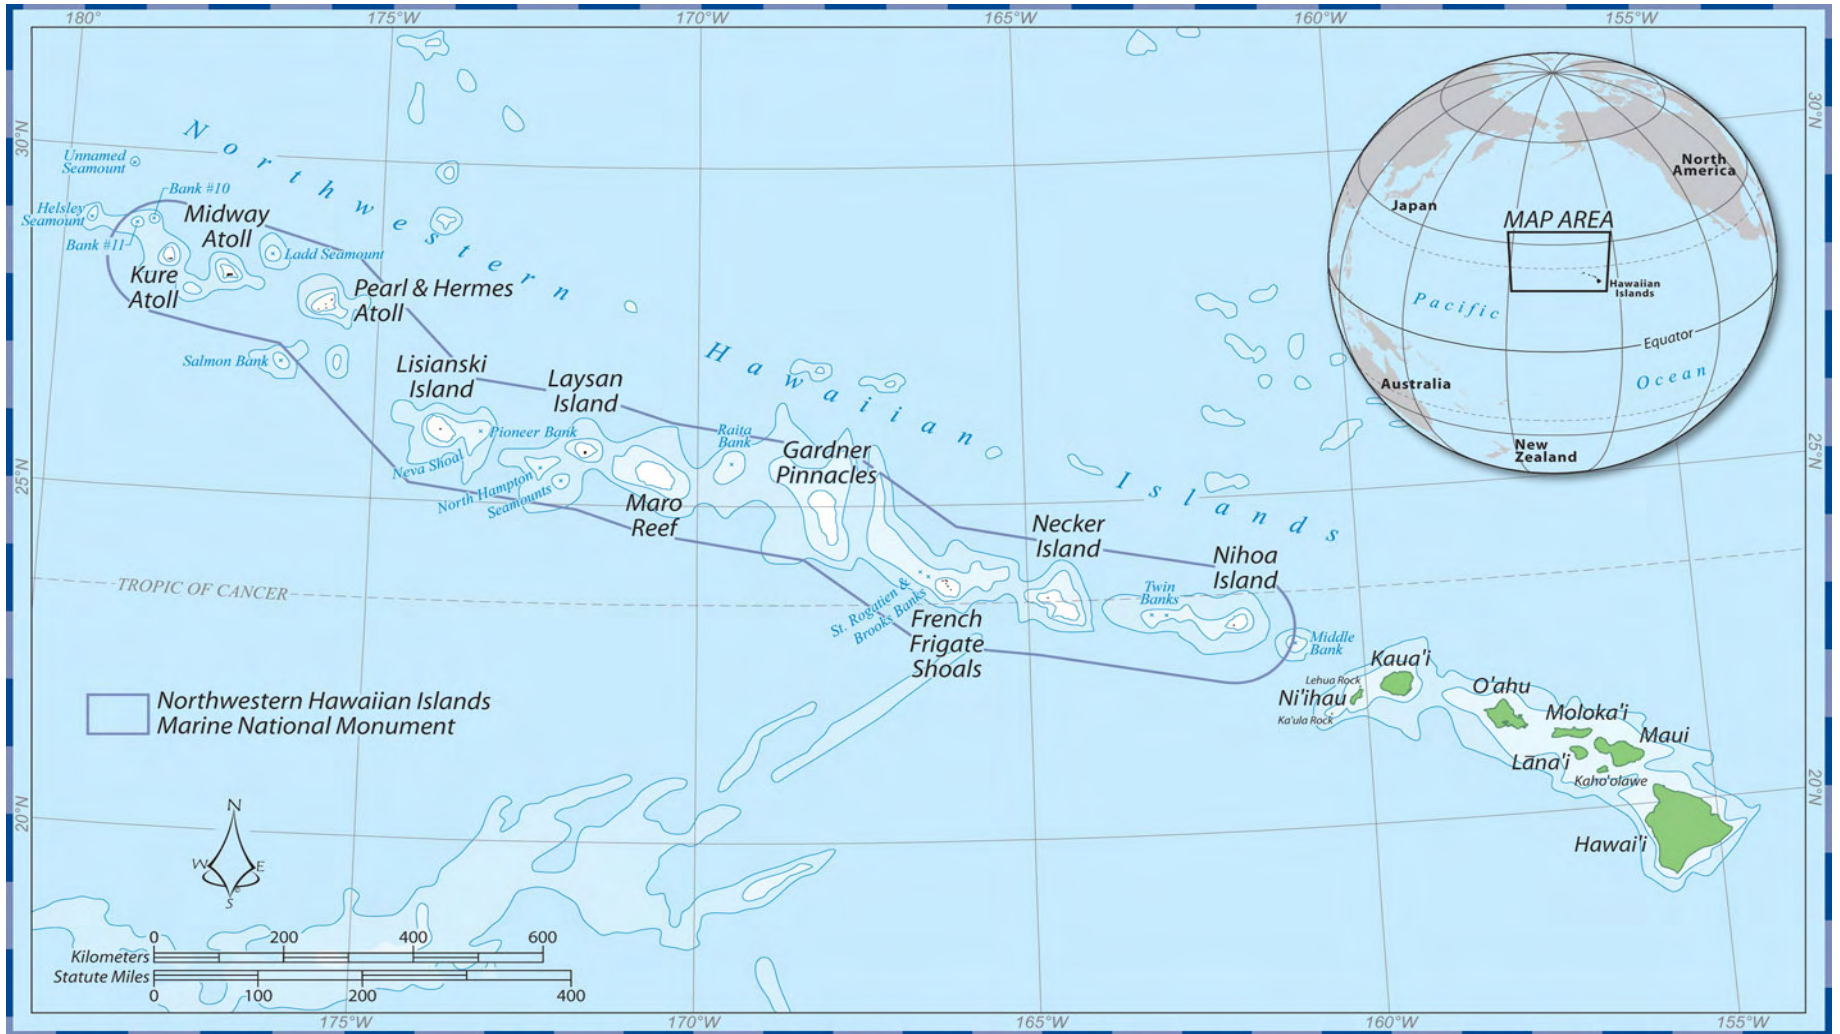

Figure 1. Papahānaumokuākea Marine National Monument Management Area

**Figure 2.** Papahānaumokuākea Marine National Monument Boundary

The rates of marine endemism in the NWHI are unparalleled in the world. In addition, the mass of apex predators in the marine system is simply not seen in areas subject to higher levels of human impact. The Monument represents one of the last unspoiled marine wilderness areas remaining on the planet. The sheer isolation of the islands, 3,000 kilometers from the nearest continent, causes them to function as a miniature evolutionary universe. This has resulted in a phenomenally high degree of endemism – for marine fishes alone endemics comprise over 50 percent of the population in terms of numerical abundance in the northernmost atolls. In addition, Papahānaumokuākea is a critically important habitat for in-situ conservation of twenty-three endangered or threatened species, many which are listed as species of global concern.

In contrast to its marine systems, the terrestrial area of the Monument is comparatively small but supports significant endemic biodiversity. This includes six species of endemic plants, including a palm, and four species of endemic birds, including remarkably isolated species such as the Nihoa finch, Nihoa millerbird, Laysan finch, and Laysan duck, one of the world's rarest ducks. In addition, over 14 million seabirds nest on the tiny islets in the chain, including 99 % of the world's Laysan albatrosses and 98 % of the world's black-footed albatrosses, making it the world's largest tropical seabird rookery in the world. Although still poorly documented, the terrestrial invertebrate fauna also shows significant patterns of precinctive speciation, with endemic species present on Nihoa Island, Mokumanamana Island, French Frigate Shoals, Laysan Island, Lisianski Island, Pearl and Hermes Atoll, and Kure Atoll.

## **2.0 TRADITIONAL AND HISTORIC BACKGROUND**

### **2.1 Cultural Setting**

More than 1,500 years ago, Polynesian voyagers arrived in the Hawaiian Archipelago, the Polynesian Triangle's most northern point, where they found islands filled with all the natural resources needed to sustain a vibrant society, from fertile soil to reefs rich with fish. Over the next millennia, Native Hawaiians, the descendents of the first Polynesians who discovered Hawai'i, would alter the islands' landscapes, creating agricultural terraces along the hillsides; extensive water paddies for their staple food, kalo (taro), in the valleys; and impressive fishponds over the shallow reefs.

The first discoverers of the Hawaiian Archipelago, Native Hawaiians inhabited these islands for thousands of years prior to Western contact. During this time, Native Hawaiians developed complex resource management within these islands. Native Hawaiians continue to maintain their strong cultural ties to the land and sea and continue to understand the importance of managing the islands and waters as inextricably connected to one another (Beckwith 1951; Lili'uokalani 1978). Poetically referred to as ke kai popolohua mea a Kāne (the deep dark ocean of Kāne), the ocean was divided into numerous smaller divisions and categories, beginning from the nearshore to the deeper pelagic waters (Malo 1951). Likewise, channels between islands were also given names and served as connections between islands, as well as a reminder of their larger oceanic history and identity.

More specifically the ocean played an important role to Native Hawaiians as it was used for resources and physical and spiritual sustenance in their everyday lives. In Hawaiian traditions, the NWHI are considered a sacred place, a region of primordial darkness from which life springs and spirits return after death (Kikiloi, 2006). Much of the information about the NWHI has been passed down in oral and written histories, genealogies, songs, dance, and archaeological resources. Through these sources, Native Hawaiians are able to recount the travels of seafaring ancestors between the NWHI and the main Hawaiian Islands. Hawaiian language archival resources have played an important role in providing this documentation, through a large body of information published over a hundred years ago in local newspapers (e.g., *Kaunamano 1862 in Hoku o ka Pakipika*; *Manu 1899 in Ka Loea Kalai‘aina*; *Wise 1924 in Nupepa Kuoko‘a*). In Hawaiian *mo‘olelo* (stories, historical narratives, mythologies) there are many of versions of the epic of Pele and Hi‘iaka. In one account by N.B. Emerson, Pele migrated from Kuaihelani to Hawai‘i to escape conflict between her and her sister Nāmakaokaha‘i, a deity of the sea. Their journey led them through the Northwestern Hawaiian Islands. In the Emerson version, Pele first stopped at the island of Nihoa and decided to leave Kāneapua, her younger brother, behind. Pele’s journey continued down the island chain from place to place, until she found comfort in the pit of Halema‘uma‘u crater on the island of Hawai‘i. These travels of Pele and her family are recognized as the migration of gods to Hawai‘i and each version of the *mo‘olelo* gives us important information about the cultural significance of these islands in the northwest.

*... ‘O Nihoa ka ‘āina a mākou i pae mua aku ai  
 Lele a‘e nei mākou kau i uka o Nīhoa  
 ‘O ka hana nō a ko‘u pōki‘i o Kāneapua  
 ‘O ka ho‘oli ka ihu o ka wa‘ a nou i ke kai  
 Waiho anei ‘o Kamohoali‘i iā Kāneapua i uka o Nīhoa*

**Translation:**

... Nīhoa is the first land that we disembark upon  
 We land on the shore of Nīhoa  
 Then the charge that was given to my brother Kāneapua  
 Was to keep the stern of the canoe positioned towards the sea  
 Then Kamohoali‘i left Kāneapua in the uplands of Nīhoa (Tsuha 2007).

More recent ethnological studies (Maly 2003) highlight the continuity of Native Hawaiian traditional practices and histories in the NWHI. Only a fraction of these have been recorded, and many more exist in the memories and life histories of *kūpuna* (elders). Native Hawaiians made detailed observations of the oceanic environment, its interrelation to the terrestrial environment, seasonal and lunar patterns, and species life cycles, and used this information to develop and conserve their resources (Kamakau 1976; Malo 1951; Beckwith 1951). *Kapu*, or restrictions, on resource extraction were implemented based on these ecological understandings (Pukui and Handy 1950; Handy et al. 1972). Other traditional strategies were set up to naturally enhance marine resources through increased protection, growth, and reproduction (Kikiloi 2003).

## **The Naming of Papahānaumokuākea**

The process to give a Hawaiian name to the Northwestern Hawaiian Islands Marine National Monument began during the Sanctuary designation process as an initiative of the Northwestern Hawaiian Islands Native Hawaiian Cultural Working Group. In 2006 the group chose two distinguished members of the Hawaiian community to contribute names - Uncle Buzzy Agard and Auntie Pua Kanahēle. Once the names were put forth, the Cultural Working group would select among them for an appropriate name for the Northwestern Hawaiian Islands managing entity and region.

Uncle Buzzy Agard, an esteemed kupuna and long time fisherman in the Northwestern Hawaiian Islands was instrumental in the establishment of the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve in 2000, and a long time advocate for the protection of this special place. Uncle Buzzy Agard, who is also affiliated with the Office of Hawaiian Affairs (OHA), was one of three Native Hawaiian representatives on the Reserve Advisory Council. Auntie Pua Kanahēle, is a well known and respected kumu hula, scholar, and spiritual practitioner from Hilo, Hawai‘i. Since 2003, she has been the main catalyst for the revival of cultural access trips to the Northwestern Hawaiian Islands in partnership with the voyaging canoe Hōkūle‘a.

The names offered by both Auntie Pua and Uncle Buzzy were brought to the Cultural Working Group in September 2006. Other names were also offered by Keoni Kuoha from the Kamakākūkalani, U. H. Center for Hawaiian Studies and by Ka‘i‘ini Kaloi of the Department of Interior’s Office of Hawaiian Relations. Three subsequent meetings were held to discuss the names, their meanings and purpose. On January 4, 2007 the group selected Papahānaumokuākea.

The Northwestern Hawaiian Islands Native Hawaiian Cultural Working Group is comprised of members with long standing interest and involvement in the region. Members come from varied relevant backgrounds, and include academic scholars, teachers, cultural practitioners, community activists, and resource managers that have experience in working directly with issues concerning the Northwestern Hawaiian Islands. Representatives from the National Oceanic Atmospheric Administration (NOAA), U.S. Fish and Wildlife Service (USFWS), Office of Hawaiian Relations, State of Hawai‘i’s Department of Land and Natural Resources (DLNR), Kaho‘olawe Island Reserve Commission (KIRC), and Office of Hawaiian Affairs (OHA) were involved in the meetings and discussions that led up to the final decision.

### ***The meaning of the name***

The name Papahānaumokuākea (pronounced Pa-pa-HA-now-mo-ku-AH-kay-uh) comes from an ancient Hawaiian tradition concerning the genealogy and formation of the Hawaiian Islands. Papahānaumoku (who is personified in the earth) and Wākea (who is personified in the expansive sky) were two of the most recognized ancestors of our people. Their union resulted in the creation or “birthing” of the entire archipelago. “Papa” which means “foundational earth,” provides the imagery of the numerous low flat islands that stretch across into the northwest. “Ākea” provides the imagery of the “expanse – of

space.” From Mauna “Ākea” on Hawai’i Island to the low flat “Papa” of the northwest, the physical features define our homeland and Hawaiian identity. The preservation of these names, together, as Papahānaumokuākea, strengthens Hawaii’s cultural foundation and grounds us to an important part of our historical past.

Papahānaumokuākea is a name that will encourage abundance and energize the continued procreative forces of earth, sea, and sky. It reminds us that it is spiritual inspiration that supports the physical world. Papahānaumokuākea will help to continue life for everything that pro-creates, gives birth, a continuum, everything that is part and parcel of our world, the Hawaiian archipelago.

## **2.2 Historical Period**

By the time of Western European contact with the Hawaiian Islands, little was collectively known about the NWHI by the majority of the population, as relatively few individuals traveled to these remote islands and had seen them with their own eyes, except families from Kaua’i and Ni’ihau who voyaged to these islands to perpetuate subsistence fishing practices (Maly 2003). Within the next century, a number of expeditions were initiated by Hawaiian ali’i to visit these islands and bring them under Hawaiian political control and ownership. The accounts of these historical expeditions were published in great detail in the Hawaiian newspapers from 1857 through 1894, as they related to each visit.

Contact between the main Hawaiian islands and the NWHI seems to have slowed for a period until the 19th century, when Hawaiian monarchs exhibited a strong interest in reuniting the entire Hawaiian Archipelago by consolidating the NWHI into the Kingdom of Hawai’i. Title to the islands and waters of the NWHI was vested in the Kingdom Hawai’i throughout the 1800s (Mackenzie and Kaiama 2003). In 1822, Queen Ka’ahumanu organized and participated in an expedition to locate and claim Nihoa Island under the Kamehameha Monarchy. In 1856, Nihoa was reaffirmed as part of the existing territory of Hawai’i by authority of Alexander Liholiho, Kamehameha IV (March 16, 1856 Circular of the Kingdom of Hawai’i). The following year, King Kamehameha IV voyaged to Nihoa and then returned to Honolulu. He instructed Captain John Paty on the vessel Manuokawai to explore the rest of the northwestern region to annex any lands discovered during the expedition. Paty traveled to Nihoa, Mokumanamana, Gardner, Laysan, Lisianski, and Pearl and Hermes. Later in 1857, the islands of Laysan and Lisianski were declared new lands to be included into the domain of the Kingdom (Kingdom of Hawai’i 1857).

In 1885, the most famous visit by Hawaiian royalty was made by then princess Lydia Lili’uokalani and her 200-person party who visited Nihoa on the ship Iwalani. In 1886, King David Kalakaua, through Special Commissioner Colonel James Harbottel annexed Kure Atoll (Ocean Island) and announced formal possession of the island (Harbottel-Boyd 1886). In 1893, Queen Lydia Lili’uokalani was overthrown by the self-proclaimed provisional government, with the assistance of U.S. Minister John L. Stevens. In 1898, the archipelago, inclusive of the certain lands in the NWHI, was collectively ceded to the United States through a domestic resolution, called the “New Lands Resolution”.

The *ea*, (sovereignty, life), and *kuleana* (responsibility) for the entire Hawaiian Archipelago continues to exist in the hearts and minds of many Native Hawaiians. The “Apology Bill” (U.S. Public Law 103-150), a joint Resolution of Congress that was signed by the President in 1993, recognizes that “the health and well-being of the Native Hawaiian people is intrinsically tied to their deep feelings and attachment to the land.” The Apology Bill “apologizes to Native Hawaiians on behalf of the people of the United States for the overthrow of the Kingdom of Hawaii on January 17, 1893 with the participation of agents and citizens of the United States, and the deprivation of the rights of Native Hawaiians to self-determination.”

### **2.3 Contemporary Connections to the Northwestern Hawaiian Islands**

Today, Native Hawaiians remain deeply connected to the NWHI on genealogical, cultural, and spiritual levels. Kaua‘i and Ni‘ihau families voyaged to these islands indicating that they played a role in a larger network for subsistence practices into the 20th century (Tava and Keale 1989; Maly 2003). The NWHI as a region qualifies as an important traditional place of Native Hawaiian culture worthy of global recognition. The Monument includes a collection of *wahi pana* (places of great cultural significance and practice) (OHA, *wahi pana* list) that are linked together throughout the expanse of the ten main atolls and islands. *Wahi pana* benefit all Hawaiian people - past, present and future-born, as well as inspiring generations of all cultures. The *wahi pana* and geography of this remote area includes storied names that give connotative value and meaning. Much of the cultural information about the NWHI has been passed down in oral and written histories, genealogies, songs, dance, and via archaeological sites. Through these sources, Native Hawaiians are able to recount the travels of seafaring ancestors between the NWHI and the main Hawaiian Islands in centuries past. Hawaiian language archival resources have played an important role in providing this documentation, through a large body of information published more than a hundred years ago in local newspapers. More recent ethnological studies have highlighted the continuity of Native Hawaiian traditional practices and histories in the NWHI. Only a fraction of these have been recorded, and many more exist in the memories and life histories of *kūpuna* (elders).

In recent years, Native Hawaiian cultural practitioners voyaged to the NWHI to honor their ancestors and perpetuate traditional practices. As discussed above, in 1997, Hui Mālama I Nā Kāpuna o Hawai‘i Nei repatriated sets of human remains to Nihoa and Mokumanana that were collected by archaeologists in the 1924-25 Bishop Museum Tanager Expeditions (Ayau and Tengan 2002). In 2003, a cultural protocol group, Na Kupū‘eu Paemoku, traveled to Nihoa on the voyaging canoe Hōkūle‘a to conduct traditional ceremonies. In 2004, Hōkūle‘a sailed over 1,200 miles to the most distant end of the island chain to visit Kure Atoll as part of a statewide educational initiative called “Navigating Change.” In 2005, Na Kupū‘eu Paemoku sailed to Mokumanamana to conduct protocol ceremonies on the longest day of the year, June 21, the summer solstice. Cultural practitioners (Kamakakūokalani Center for Hawaiian Studies and the Edith Kanaka‘ole Foundation) continued this practice in 2006 and in 2007.

## 2.4 Cultural Access for Native Hawaiian Practices

Presidential Proclamation 8031 recognizes that the NWHI has great cultural significance to Native Hawaiians and provides a means to issue permits for Native Hawaiian practices. The Proclamation defines these practices as cultural activities conducted for the purposes of perpetuating traditional knowledge, caring for and protecting the environment, and strengthening cultural and spiritual connections to the Northwestern Hawaiian Islands that have demonstrable benefits to the Native Hawaiian community. This may include, but is not limited to, the non-commercial use of Monument resources for direct personal consumption while in the Monument. Monument goals and objectives reinforce this position and the MMP includes several activities that support access and use of the NWHI for Native Hawaiian practices.

## 3.0 MONUMENT MANAGEMENT PLAN

The Monument Management Plan (MMP) was developed cooperatively by the State of Hawai'i Department of Land and Natural Resources (DLNR), Office of Hawaiian Affairs (OHA), the U.S. Fish and Wildlife Service (FWS), and National Oceanic and Atmospheric Administration (NOAA), and was based on the earlier draft NOAA Sanctuary management plan. The MMP outlines current and future planning, administrative, and field activities to enhance the conservation and protection of the natural, cultural, and historic resources in the NWHI.

The draft MMP was available for public review and comment for 90 days from April-July, 2008. The MMP consists of 22 Action Plans that describe the wide-ranging and coordinated management process necessary to achieve the vision, mission, and guiding principles, and desired outcomes of the Monument. The mission of the Monument is to: "Carry out seamless integrated management to ensure ecological integrity and achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian culture, and heritage resources for current and future generations."

The vision, mission, guiding principles, and goals outlined in the MMP honor and protect the significance of the NWHI for Native Hawaiians. Monument Goal no. 6 specifically is written to: "support Native Hawaiian practices consistent with long-term conservation and protection."

The MMP includes a Native Hawaiian Cultural and History Action Plan, and a Native Hawaiian Community Involvement Action Plan, with the goal to increase the understanding and appreciation of Native Hawaiian cultural values related to Papahānaumokuākea Marine National Monument.

The desired outcome for the Native Hawaiian Cultural and History Action Plan is to:

**"Increase the understanding and appreciation of Native Hawaiian histories and cultural practices related to Papahānaumokuākea Marine National Monument and effectively manage resources for their cultural, educational and scientific value".**

Five strategies have been identified to achieve this outcome:

**1: Identify and prioritize scientific and Native Hawaiian cultural research needs.**

- 1.1: Identify and research needs that can be accomplished through anthropological, archaeological, historical, and Hawaiian cultural methods.
- 1.2: Develop cultural research priorities alongside associated management challenges and opportunities.

**2: Conduct, support, and facilitate Native Hawaiian cultural and historical research of the NWHI over the life of the plan.**

- 2.1: Continue to compile information and conduct new cultural and historical research about the NWHI.
- 2.2: Support Native Hawaiian cultural access to ensure cultural research needs are met.
- 2.3: Facilitate cultural field research and cultural education opportunities annually.
- 2.4: Convene a Native Hawaiian nomenclature working group.
- 2.5: Incorporate cultural resources information into the Monument Information System.
- 2.6: Continue to facilitate Native Hawaiian cultural access.
- 2.7: Establish agreements with local universities and museums to address possible curation, research, use, return, and repatriation of collections.

**3: Increase cultural resource management capacity across MMB agencies.**

- 3.1: Assess Monument cultural resource capacity.
- 3.2: Engage Native Hawaiian practitioners and cultural experts and the Native Hawaiian Cultural Working Group in the development and implementation of the Monument's management activities.
- 3.3: Increase knowledge base of Native Hawaiian values and cultural information through "in-reach" programs for resources managers.
- 3.4: Identify and integrate Native Hawaiian traditional knowledge and management concepts into Monument management.

**4: Plan, develop, and implement a Monument Cultural Resources Program.**

- 4.1: Prepare a Cultural Resources Program Plan.
- 4.2: Develop and implement specific preservation plans, as appropriate, to protect cultural sites and collections on Nihoa and Mokumanamana.
- 4.3: Initiate implementation of the Monument Cultural Resources Program.

**5: Provide cultural outreach and educational opportunities to serve the Native Hawaiian community.**

- 5.1: Integrate Native Hawaiian values and cultural information into general outreach and education programs.
- 5.2: Develop a culturally based strategy for education and outreach to the Native Hawaiian community.

5.3: Integrate Native Hawaiian values and cultural information into the Monument permittee education and outreach program.

The desired outcome of the Native Hawaiian Community Involvement Action Plan is to:

“Engage the Native Hawaiian community in active and meaningful involvement in Papahānaumokuākea Marine National Monument management.

Three strategies have been identified to achieve this outcome.

**1: Regularly involve the Native Hawaiian community.**

1.1: Formalize, expand, and convene the Native Hawaiian Cultural Working Group.

1.2: Engage the Native Hawaiian Cultural Working Group in the development of a Monument Cultural Resource Program.

1.3: Establish an annual cultural resources exchange.

**2: Develop and annually maintain partnerships with Native Hawaiian organizations and institutions.**

2.1: Continue to expand and explore opportunities to partner with institutions serving Native Hawaiians.

**3: Identify and integrate Native Hawaiian traditional knowledge and management concepts into Monument management annually.**

3.1: Engage the Native Hawaiian community to identify how traditional knowledge will be integrated into Monument activities.

3.2: Use and integrate Native Hawaiian traditional knowledge in Monument management activities.

The development of the MMP included extensive consultation with the Native Hawaiian community and Native Hawaiian cultural practitioners. Initial consultations with the Native Hawaiian community occurred at the inception of the designation of the NWHI as a Coral Reef Ecosystem Reserve in 2000 and continued during the process to designate this area as a sanctuary through the National Marine Sanctuary Program. During this process a Native Hawaiian Cultural Working Group (CWG) was formed as a part of the Reserve Advisory Council. Over 200 individuals in the Native Hawaiian community were consulted in the development of the draft sanctuary management plan. The formation of the CWG increased Native Hawaiian involvement in the planning process for the Monument. The CWG and additional Native Hawaiian practitioners were consulted by DLNR during the development of the State’s NWHI Marine Refuge. The consultation resulted in a recommendation that cultural importance should be weighed equally with biological importance during the review of proposed activities within the NWHI. This recommendation was subsequently incorporated into the MMP and the Co-Trustees joint permitting process.

In summary, the implementation of the MMP will expand the current Monument efforts to incorporate Native Hawaiian traditional and customary cultural and religious practices and research needs into the day-to-day management of the Monument. Native Hawaiian cultural research needs will continue to be identified and prioritized through consultation with OHA and other Native Hawaiian institutions and organizations. The MMB will continue to assess capacity needs to support cultural resource management activities. Native Hawaiian traditional ecological knowledge and management concepts will continue to inform management decisions in the Monument.

#### **4.0 ARCHAEOLOGICAL BACKGROUND**

Physical remnants of wahi kūpuna (ancestral places), Hawaiian language archival and oral resources, and historical accounts provide evidence of the various past uses of the NWHI and the surrounding ocean by Native Hawaiians (Kaunamano 1862 in Hoku a ka Pakipika; Manu 1899 in Ka Loea Kalaiaina; Wise 1923 in Nupepa Kuokoa). Evidence indicates that the area served as a home and a place of worship for centuries. It is posited that the first Native Hawaiians to inhabit the archipelago and their descendants frequented Nihoa and Mokumanamana for at least a 500- to 700-year period (Emory 1928; Cleghorn 1988; Irwin 1992). They brought many of the skills necessary to survive with them from their voyaging journeys throughout Polynesia.

The impressions left by Hawaiian ancestors can be seen through the distinctive archaeology of Nihoa and Mokumanamana. The heiau (place of worship) and platform foundations with upright stones found on both Nihoa and Mokumanamana resemble other Hawaiian wahi pana on the islands of Maui at Haleakalā, Hawai‘i Island on top of Mauna Kea and the island of Kaua‘i Kea Ali‘i heiau in Waimea (Cleghorn 1988; Meech and Warther 1993). These sites all correspond to the important journey of the sun especially Mokumanamana. Mokumanamana is often referred to as the Tropic of Cancer Island because of its once unique location on the Tropic of Cancer (Meech & Warther 1993). Mokumanamana may reflect the hypothesis of the role of geography in the development of Polynesian Tropic astronomy (Meech and Warther 1993). These sites are not only amazing examples of unique traditional Hawaiian architectural forms of stone masonry work, but they also show similarities to samples from the inlands of Tahiti (Emory 1928). The structures are some of the best preserved early temple designs in Hawai‘i, and have played a critical role in understanding Hawai‘i’s strong cultural affiliation with the rest of Polynesia, and the significant role of Native Hawaiians in the migratory history and human colonization of the Pacific (Cleghorn 1988).

Archaeological surveys on Nihoa and Mokumanamana have documented numerous archaeological sites and cultural material (Emory 1928; Cleghorn 1988; Ziegler 1990; Graves and Kikiloi, 2006.). Nihoa Island (Site # 92-01-89) and Mokumanamana (Necker Island) (Site # 91-01-53) are both listed on the National Register of Historic Places, with over 140 archaeological sites documented thus far on these two islands (see Fig. 3 & 4). Though quite barren and seemingly inhospitable to humans, the number of cultural sites they support is testimony to their religious importance, occupation and use prior to European understanding.

Nihoa is unlike any of the other Northwestern Hawaiian Islands (NWHI) with its 900 foot cliffs, basalt rocky surface, and tiny beach. This small island is about 1 square km (171 acres) and is at the southeastern end of the NWHI chain. More than 90 cultural sites have been recorded, (66 by the Tanager Expedition (Emory 1928) and 22 in 1984 (Cleghorn 1984) and Graves and Kikiloi, 2006 in progress. The sites included; habitation sites such as massive platforms; rockshelters, terraces and enclosures; heiau that are small terraces with single linear arrangement of upright dike stones and numerous pieces of branch coral laying on surface; extensive agricultural terraces that cover over 10% of the island's land surface; and burial sites (Cleghorn 1984).

Various artifacts have been collected, including fishhooks, sinkers, cowry shell lures, hammerstones, grindstones, adzes, and coral rubbing stone (Emory 1928;38-50). Many of the mea makamae (cultural objects) and structures associated with these wahi pana (sacred places) are similar to many found throughout the Main Hawaiian Islands. This island also has sufficient soil development for extensive agriculture, along with stone terraces that suggest expenditure and investment in agricultural food production. Sweet potato would have been the predominant crop cultivated given its hardy nature with the ability to produce 64 tons annually (Cleghorn 1988). It is believed that the abundance of natural resources fish, shell fish, birds, and bird eggs and at least three freshwater seeps may have supported as many as 100 people between A.D. 1000 and A.D. 1700 on semipermanent or brief visits (Cleghorn 1988).

Mokumanamana is also known for its numerous wahi pana and mea makamae. Fifty-five cultural places are known, of which 33 are religious, 17 are shelter caves, and 2 sites are of unknown function, making it the highest concentration of such religious sites found anywhere in the Hawaiian Archipelago. All of these sites are strategically placed and act as physical reminders of the important spiritual role these sites play in Hawaiian culture.

Because the island is small, dry, and has little soil suitable for agriculture, Hawaiians probably traveled to Mokumanamana from Nihoa and other Hawaiian Islands primarily for religious purposes. It has also been theorized that the shrines, which line the spine of the island, may have been used for navigational purposes during the great trans-pacific voyages of the early Hawaiians and Polynesians. In addition to constructing shrines, Hawaiians made ki'i pohaku or stone human images while on Mokumanamana. More than 11 of these stone ki'i are known. Other activities that took place on the island are indicated by the production and use of stone adzes, grindstones, stone bowls, and fishing tools.

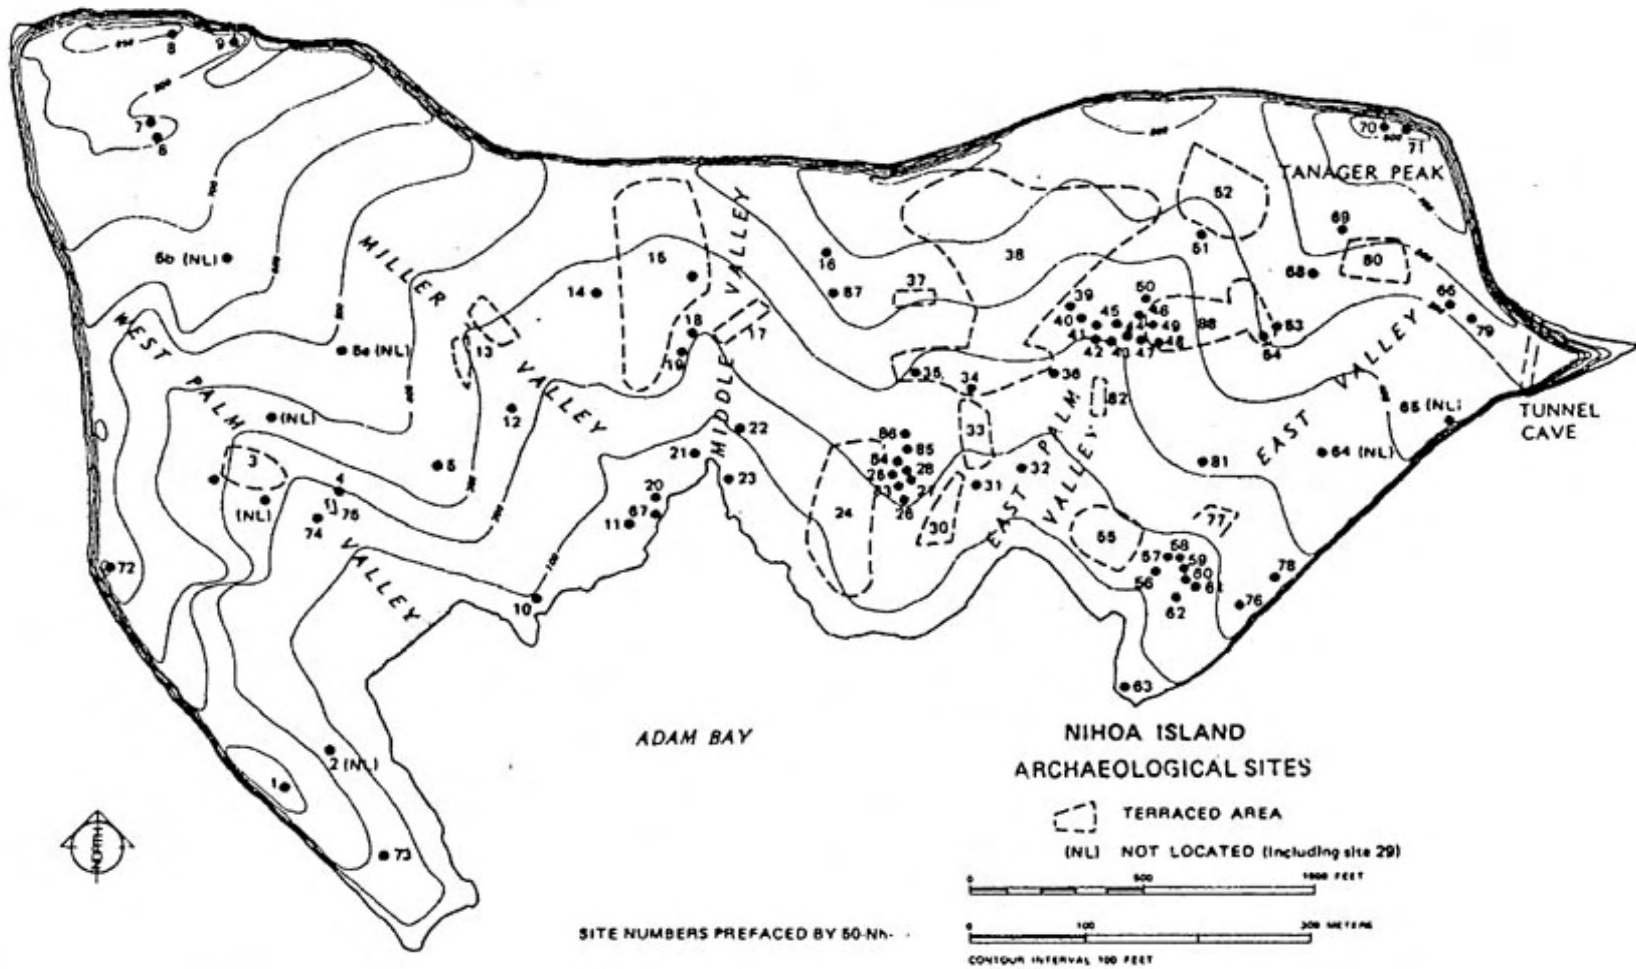

Figure 3. Map of Nihoa Island, showing archaeological sites (Emory 1928)

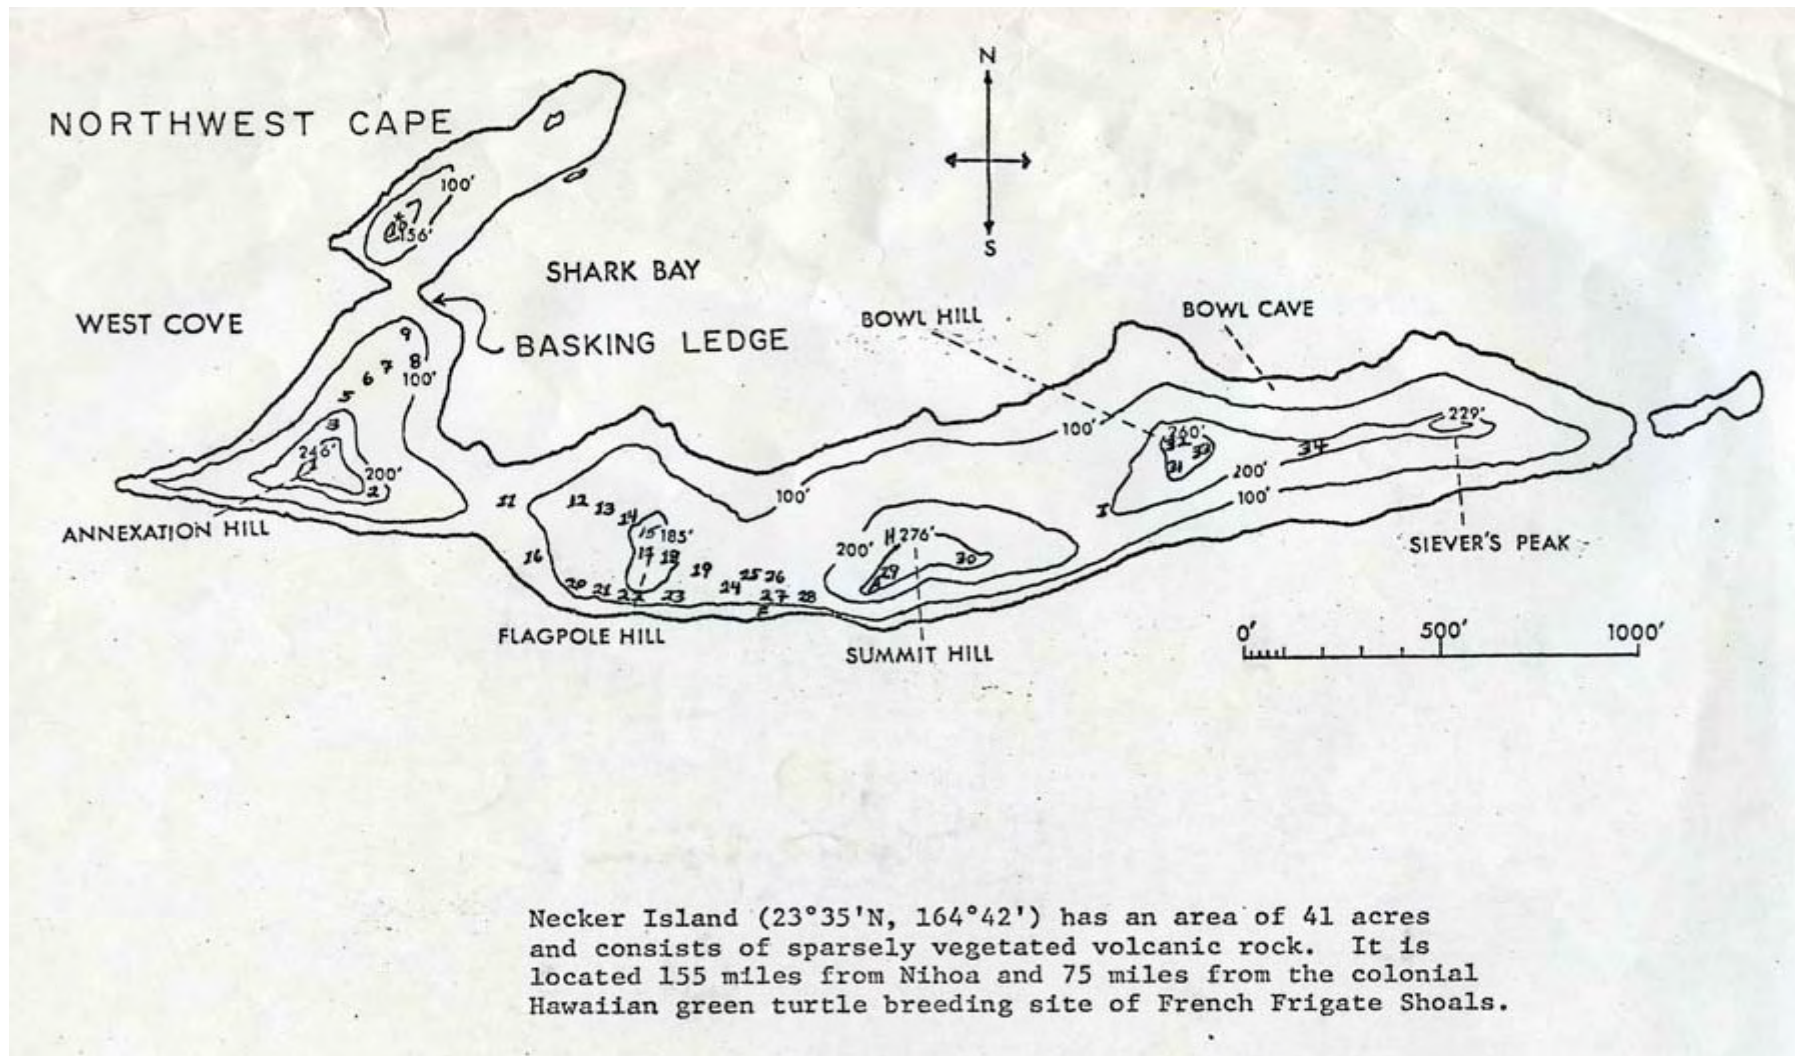

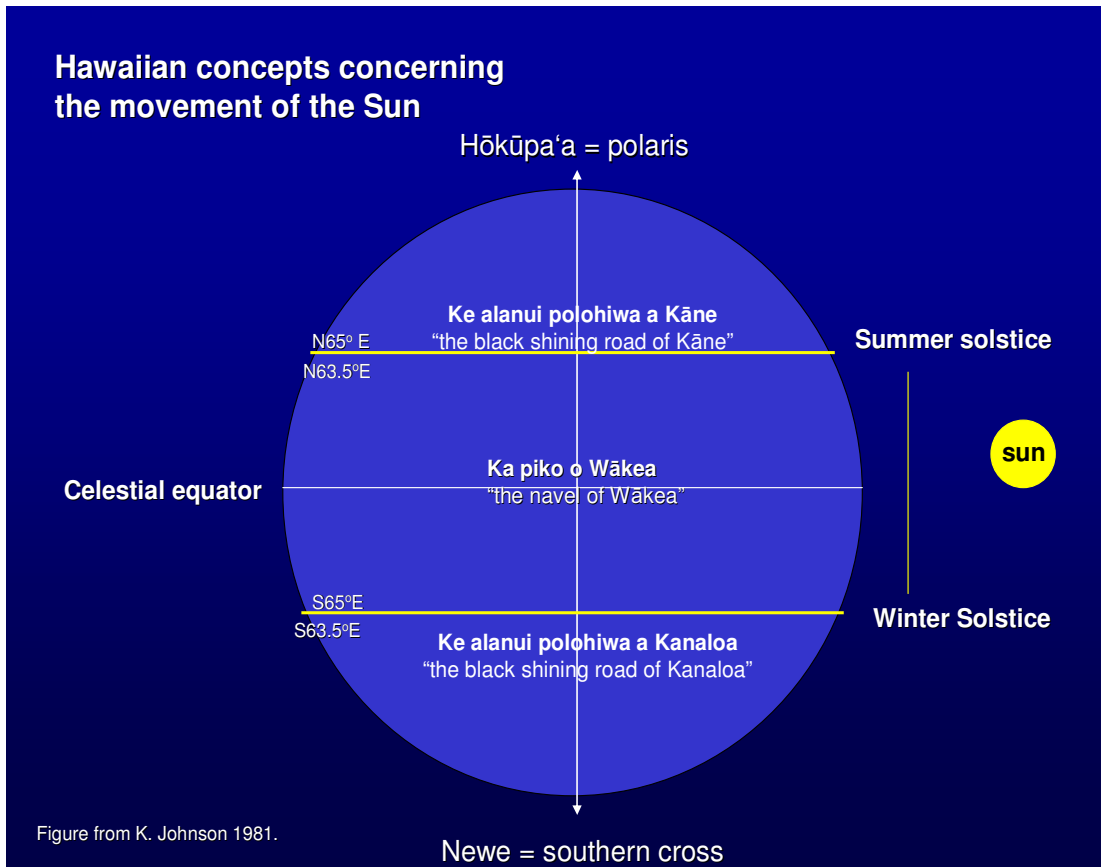

Figure 4. Map of Mokumanamana, Showing Archaeological sites (Emory 1928)

It is believed that Mokumanamana played a central role in Hawaiian ceremonial rites and practices a thousand years ago because it was directly in line ( $23^{\circ} 34.5'$  N latitude) with the rising and setting of the equinoctial sun along the Tropic of Cancer (Liller 2000). Research shows that the Tropic of Cancer is slowly decreasing by about  $1'$  every 128 years. In Hawaiian, this path is called *Ke alanui polohiwa a Kāne* or the black shining road of Kāne. Because Mokumanamana sits on the northernmost limit of the path the sun makes throughout the year, it sits centrally on an axis between two spatial and cultural dimensions: *pō* (darkness, creation, and afterlife) and *ao* (light, existence) (Fig.5).

**Figure 5. Hawaiian concepts concerning the movement of the sun (K. Johnson 1981)**

During the summer solstice (the longest day of the year), the sun travels slowest across the sky on this northern passage, “standing still” directly over Mokumanamana. Liller also notes it is no accident that nine out of 34 heiau are aligned with the rising winter solstice and the setting summer solstice (Liller 2000). The early Hawaiians knew that the sun would make its way up north and pause directly overhead for only one day out of the year on the summer solstice June 21st. There is mythological and ritualistic reason for this important moment on Mokumanamana it is called “Kau ka lā i ka lolo, the sun rests on the brain [it is noon; ... but formerly believed a time with great mana as a man’s aka (shadow, image) was no longer visible and was thought to have entered his sacred head]” (Pukui 1986). In Hawaiian culture when there is no visible shadow cast from a human,

that person is in direct connection with his creator, source or God he is in the image of ke Akua. The strategic concentration of ceremonial sites on this island is a reminder of the important spiritual role it plays in Hawaiian culture in channeling the creation of new life and facilitating the return to source after death.

There are no other Polynesian islands that are situated on or close to the Tropic of Cancer but on the southern end there are similar cultural sites on or very near the Tropic of Capricorn. Verin in 1969 reported six marae, four of the marae were in alignment with the winter solstice sunset on the island of Tubua'i in the Austral Islands. On the Island of Ra'ivavae 92 marae were recorded and of the 79 that were mapped 11 were astronomically oriented (Liller 2000). There are other evidence of "sun temple" sites situated near the mystical Tropic Latitudes such as Mexico, Egypt, Africa, India, and China.

In 1786, *Compte de La Pérouse*, a French explorer, visited Mokumanamana and named it "Necker Island" after Jacques Necker, the finance minister under Louis XVI. In 1857, Kamehameha IV sent Captain John Paty to claim Mokumanamana for the Kingdom of Hawai'i. His claim was contested until 1894, when the island was annexed by Hawai'i's Provisional Government.

The Tanager Expedition visited Mokumanamana in 1923-24 to conduct biological and cultural research, collecting cultural artifacts and ancestral human bones for further study. Members of the Native Hawaiian organization Hui Mālama I Nā Kūpuna O Hawai'i Nei visited Mokumanamana in 1997 to rebury ancestral human bones that were removed from the island in the 1920s.

The sites and structures on these islands are believed to be channels for the creation of new life, and facilitate Native Hawaiians' return to their spiritual source after death (Liller 2000). Several archaeological surveys have collected cultural artifacts from both of these islands which are now stored in the Bernice Pauahi Bishop Museum and the University of Hawai'i Archaeological Laboratory. The range in types of cultural artifacts stored in these collections is testimony to the various uses these islands and the surrounding oceans served for Native Hawaiians. These ancient sites on Nihoa and Mokumanamana provide important examples of how over time, they developed complex resource management systems and specialized skill sets to survive on these remote islands with limited resources (Cleghorn 1988). Given the number of religious structures definitely indicates the sacredness of these islands Emory noted, "there must have been strong religious reasons for making the dangerous journey to this isolated island" (Cleghorn 1984). As one can see that, a more comprehensive archaeological study is needed for both Nihoa and Mokumanamana. Liller suggest "I should think that since it has been 76 years since Emory visited Necker, a new more exhaustive archaeological study should be made of this fascinating little island that was once perched on the Tropic of Cancer (Liller 2000)

## 5.0 NATIVE HAWAIIAN COMMUNITY CONSULTATION

As indicated above, the development of the draft sanctuary management plan for the NWHI included extensive consultation with the Native Hawaiian community and Native Hawaiian cultural practitioners. The CWG was maintained after Presidential Proclamation 8031 established the Monument, and is now hosted by OHA. OHA worked with MMB members to convene four workshops on proposed Native Hawaiian practices in the NWHI as a part of the process to revise the draft sanctuary management plan. The outcome of these workshops provided the basis for the action plan strategies and activities outlined in the Native Hawaiian Cultural and History Action Plan of the MMP.

Several additional Native Hawaiian organizations and individuals were contacted in 2008 by DLNR to provide supplementary information regarding Native Hawaiian cultural practices and resources in the Papahānaumokuākea Marine National Monument in relation to the implementation of the MMP. Individuals and organizations that received scoping letters were identified in consultation with OHA and using the Native Hawaiian Cultural Working Group (CWG) member lists. The following organizations and individuals were contacted via consultation request letters, and/or phone calls, as well as interviews as part of the consultation process (Table 1). The individuals interviewed for this project were William Aila, Buzzy Agard, Wilma Holi, and Nolan Holi. Many other kūpuna that held the knowledge of this sacred area have past on, thanks to Kepa Maly's interviews they have left their mana'o which are also incorporated into this report. Transcripts are also incorporated from a cultural video produced by OHA in regards to the Monument.

The consultation letters sent by DLNR requested *kōkua* and guidance regarding the following aspects of the assessment:

- General history, and current and past uses of the land and marine resources in the NWHI.
- Knowledge of cultural sites that may be impacted by activities taking place in the Monument, including natural resource research activities and cultural practices and research activities.
- Knowledge of traditional gathering practices and rights in the NWHI.
- Legends and traditional uses of the NWHI.
- Referrals of kūpuna and *kama'āina* who might be willing to share their cultural knowledge of the NWHI.
- Any other cultural concerns the community might have related to Hawaiian cultural practices within or in the vicinity of the NWHI.

The responses received as a result of DLNR's solicitation of the above members of the Native Hawaiian Community in regard to the implementation of the MMP were favorable. Responses received acknowledged that the MMB were actively striving to incorporate Native Hawaiian histories and cultural practices into Monument management strategies.

Additionally, the activities and programs (undertakings) implemented by the MMP will be subject to review under the National Historic Preservation Act of 1966 (NHPA).

Specifically, Section 106 of the NHPA requires the Monument Co-Trustees agencies to take into account potential effects of MMP undertakings on historic and cultural properties. The NHPA requires consultation with Native Hawaiian organizations regarding historic properties with religious or cultural significance to the Native Hawaiian community during the Section 106 review process.

**Table 1. Community Contact Table**

Name	Affiliation
Marilyn Leimomi Khan	Association of Hawaiian Civic Clubs
Buzzy Agard	CWG/Kahea
Professor Carlos Andrade	University of Hawai‘i at Mānoa/CWG
Kēhaulani Souza	CWG/ Nāki‘i Ke Aho
Edward Halealoha Ayau	Hui Mālama I Nā Kūpuna O Hawai‘i Nei
Vicky Takamine & Wayne Kaho’onei Panoke	‘Ilio‘ulaokalani Coalition

Kalei Tsuha	Na Kupu'eu Paemoku
Mehana Hind	Na Kupu'eu Paemoku
Keone Nunes	Cultural Practitioner

## **6.0 COMMUNITY CONSULTATION OF TRADITIONAL CULTURAL PRACTICES AND BELIEFS OF PAPA HĀNAUMOKUĀKEA A WAHI PANA (Sacred Place)**

Hawaiian culture has embraced the very essence of man living in balance with nature with their holistic view of the world and all that it encompasses. Therefore, it is difficult to dissect and separate Hawaiian culture into western terms. Many topics overlap when trying to discuss them individually. However, the best effort was put forth during this process. Discussions of traditional Hawaiian culture during the community consultation process as well as prior community consultations with Kepa Maly and OHA are incorporated throughout this section as they relate to The Papahānaumokuākea Marine National Monument. Below Kepa Maly eloquently transforms the art of Hawaiian culture into words:

In a traditional Hawaiian context, nature and culture are one and the same; there is no division between the two. The wealth and limitations of the land and ocean resources gave birth to, and shaped the Hawaiian world view. The 'āina (land), wai (water), kai (ocean), and lewa (sky) were the foundation of life and the source of the spiritual relationship between people and their environs. Every aspect of life, whether in the sky, on land, or of the waters was believed to have been the physical body-forms assumed by the creative forces of nature, and the greater and lesser gods and goddesses of the Hawaiian people. Respect and care for nature, in turn meant that nature would care for the people. Thus, Hawaiian culture, for the most part, evolved in a healthy relationship with the nature around it, and until the arrival of foreigners on Hawaiian shores, the

health and well-being of the people was reflected in the health of nature around them (Maly 2005).

### **6.1 Wahi Pana (Storied/Sacred Place)**

Papahānaumokuākea is a sacred place, the ancestral homelands of the Hawaiian people. The naming process in Hawaiian culture is a very intimate spiritual process. It is a deep connection to the past and, therefore, the ancestors. The name of a specific place reveals intimate details about the people and akua who live/lived there, the environment, cultural practices, and historical events that took place. Hawaiians believe that mana (spiritual power) is attached to a place, which increases its importance. This section will bring to life the stories of Papahānaumokuākea, in specific Nihoa and Mokumanamana. On the subject of wahi pana Edward Kanahale writes:

*As a native Hawaiian, a place tells me who I am and who my extended family is. A place gives me my history, the history of my clan, and the history of my people. I am able to look at a place and tie in human events that affect me and my loved ones. A place gives me a feeling of stability and of belonging to my family, those living and dead. A place gives me a sense of well-being and of acceptance of all who have experienced that place. The concept of wahi pana merges the importance of place with that of the spiritual. My culture accepts the spiritual as a dominant factor in life; this value links me to my past and to my future, and is physically located at my wahi pana.*

*Where once the entire Native Hawaiian society paid homage to numerous wahi pana, now we may give wahi pana hardly a cursory glance. Only when a Native Hawaiian gains spiritual wisdom is the ancestral and spiritual sense of place reactivated. Spiritual knowledge and the wahi pana are ancestrally related, thus spiritual strength connects to the ancestral guardians, or ‘aumakua. My ‘aumakua knew that the great gods created the land and generated life. The gods infused the earth with their spiritual force or mana. The gravity of this concept was keenly grasped by my ancestors: they knew that the earth’s spiritual essence was focused through the wahi pana. (Kanahale in James 1995:6)*

William Aila was asked during a video interview to describe his imagery that relates to the name Papahānaumokuākea:

*Uh, I think the imagery that you’re referring to is the—the imagery that someone on a—on a canoe or boat gets; uh, this sort of—this mating of uh, Wakea and Papahanaumoku. As you’re—as you’re traveling, and you see the island emerge from ... uh, and the emergence can be two ways. It can be an emergence from the sea, or it actually could be an emergence from the sky, yeah? But what you visualize, and the symbolism is the—the mating of the sky and the Earth, and then the ... the demonstration of life; as you get closer, you see the seabirds. Um, then as you get closer, you see the fish, the emergence of life ... the—the emergence of life from this mating, which is so clearly visible as you approach from the ocean. So it’s the most appropriate name, um ... with the correct symbolism that comes out. And anybody that sees it, immediately knows it.*

Aila elaborates on wahi pana, the sanctity of Papahānaumokuākea often referred to as the Kūpuna Islands, a place where Hawaiian ancestors emerged and then make their westward journey back. These islands are the physical manifestation of the mythical world of the Hawaiian Ancestral Godly Realm:

*... the area ... is important, because it is our ancestral—it is ... it is the physical manifestation of our ancestral connection to all of those islands, yeah, the various um ... migrations that came through. For example, in some of the Pele ... Pele oli, um ... and moolelos, you have Pele coming down from the north ... traveling through these—you know, it's all one island chain, yeah? We—we break it up, but it's all one island chain. That's one of the thi—uh, one—one of the things that's wrong with this Western thinking about, oh, we have to say northwest, and then main Hawaiian Islands. It's all one island chain. Um ... but we have these connections to this place uh, genealogical connections, as well as sort of a geological connection in that these truly are the kupuna islands. They—they are the—the first ones to have risen from the hot spot uh, moving on their journey to the west northwest, um ... being born, and then slowly dying.*

*...So these island are important for us, because number one ... this is our ancestral connections. Number two, um, we're also connected to all of the birds, all of the fish, all the marine mammals, that inhabit those waters. Uh, who are our brothers, sisters, uncles, aunties, cousins, our aumakua.*

*Um, it's a place where kupuna had been left um, and interred. So it's our responsibility to make sure that they're protected, as well as the inhabitants on the land and in the water that's over there. It's our kuleana to make sure that they're protected. Um, that's why it's important for Hawaiians to be at the table, and ... we're very fortunate that the Office of Hawaiian Affairs asserted itself, and then was given a place—a place at the daily management um ... in the daily management on the management board, the monument management board. So Hawaiians have a place. It's important to understand that Hawaiians drove this process, and now have a place at the decision making table uh, and continue to—continue to review other things. Every permit that uh, that is applied for to—to go into Papahānaumokuākea is um, reviewed by native Hawaiians for its applicability, its impacts on uh, Hawaiian cultural and traditional—traditional practices, customary practices. Um, so it's—it's a Hawaiian-driven place and a Hawaiian-monitored place, as it should be...*

*...The area is sacred uh, and there's a s—there's a sanctity about it, because as ... as the—the soul departs the body, and then travels to the various uh ... uh ... leaping grounds, uh, on each island, um, from the traditional and customary religion, these souls then ... depart on a westward journey. And along that westward journey, are these—these kupuna islands which they travel on their journey. So while visitors are there, they have to be very respectful of—of the fact that Hawaiians believe, and rightfully so, that there are these uhane that are—that are there journeying along with them. And—and the need to—to recognize and respect that, just as I would respect anybody else's religion, uh, and their thoughts on angels, or their thoughts on um, their uhane, you know, uh, by giving them that respect. Um ... it's also sacred from the standpoint of ... um, the name.*

*We talk about Papahānaumokuākea; uh, the—the mating of Papahanaumoku and Wakea. Um ... and these islands being present at the time where life was born, uh, honoring ... that sort of ancestral ... history. Um, they're pointed from—and they're—they're sacred from a modern ... standpoint in that if ... we as native Hawaiians, and as people of Hawaii ... cannot manage this place that's remote that has minimal amount of impact on it already, um, what does that say about us? What does it say about our commitment? What does it say about our kuleana, um, our values as—as a people? Yeah. How ... how our ancestors gonna ... judge us when it becomes our turn to join them? So for all of those reasons, that's why these ... these islands and this n—National Marine Monument that has the name Papahānaumokuākea uh, should be afforded the utmost respect. Um ... and we should work the hardest for the continued protection.*

Nihoa and Mokumanamana are the first two islands encountered as you enter from the south to Papahānaumokuākea. These two islands are the only two out of the 10 islands that have retained their Hawaiian names. They are also the only two islands with any evidence of physical human contact. This reason may be rooted in the Hawaiian belief that after one travels pass Mokumanamana, one enters Pō or darkness, the spirit world. Mokumanamana lies on Ke Alanui Polohiwa a Kāne or Tropic of Cancer, which is especially significant because the sun never travels past that point (see figure 5). A dualistic yet complimentary position exists within the archipelago; the islands to the north of Mokumanamana, the portal, the realm of the spirits, the divine, the afterlife, and to the south is the realm of the living, the kanaka (human), called Ao or light. Kekuewa Kikiloa expresses his insight in regards to the significance of Nihoa and Mokumanamana:

*...the name Mokumanamana means, island of—of spiritual power. ...mana—mana being spiritual power, and—and—and manamana being like the—the exponential power, really. ...the next island, Nihoa, the first island, really; Nihoa has a variety of types of sites there which is testimony to the fact that I think people were trying to live there at one time in the past.*

*... to me, I mean, just looking at place names, yeah, like, Mokumanamana; that name itself shows that it was uh, one of the most important places to Hawaiian people in the past. ... the fact that there's so many heiau on one small area of land ... shows that it was valued by our kupuna. The island before, Nihoa in some of the chants, it's referred to Nihoa Kuhikuhipuone. Nihoa, the seer of sacred sites, Kuhikuhipuone, being a type of kahuna that would point out and mark the placement of where heiau should be. So that place name in itself kinda demonstrates that Nihoa was that directional marker to show where Mokumanana was. And I think a lot of the archaeology is even pointing to that too. You know, we've gotten some dates back, in the past year or so from Nihoa from coral dating, coral that was left as ritual offerings on the heiau over there, and all the—all the dates came back in the 1500s, which show that there was one big push of colonization of that island, really as a steppingstone to the construction of Mokumanamana, which might have been the ... arguably, the greatest engineering feat in native Hawaiian history, I would say. I know other scholars have pointed out that Piilani Hale in Maui has—is the largest heiau in the archipelago, but I would argue that*

*Mokumanamana is really the largest heiau. Even though it's made up of thirty-three somewhat features um, the island itself really functions as a heiau, yeah, in itself.*

*Mokumanamana lies on—on the Tropic of Cancer, or what is termed in Hawaiian Ke alanui polohiwa Kane, the dark shining path of Kane. ...its significance, I guess, to our people in the past was that, it really is the northern limit of—of where the sun goes throughout the year. ...on June 21st, which is the longest day of the year, the summer solstice, the sun will rise in the east and set in the west on the trajectory that mono—Mokumanamana is at, um, and it won't go any higher throughout the year, and it'll make its way back down um, throughout the year. ... but that's important because ... one, the sun is usually ... symbolic of the god Kane and life, yeah; the beginning of life and ending of life, the cycle of the sun. And Mokumanamana being on that western end of the archipelago really is the pathway that souls take in the afterlife. So a lot of times, you'll hear references to kealanui polohiwa kane in chants that have to do with death and the journey that the soul takes into the afterlife.*

*... I think, you know, things like, the Tropic of Cancer, kealanui polohiwa kane, give us clues as to how our kupuna saw the archipelago and the geography, and the Hawaiian cultural landscape. ... you know, really, anything past or north of Mokumanamana is places where the sun doesn't really shine overhead. And ... I think our kupuna conceptualized this as Po, or what is referred to as in like the kumu lipo or cosmogonic chants as—as places where we originated from, where creation began in the Hawaiian universe.*

There are references of travel along with traditional names brought to life in many mele (songs), mo'olelo (stories) that have been passed down for generations. Many of the original names of these Islands of Papahānaumokuākea have been replaced by foreign explorers with no research conducted. The names were always there waiting to be uncovered and restored, Kekuwa Kikilo'i has taken on that kuleana. Kikilo'i translated interviews conducted by Lahainaluna students in 1835. These interviews reveal specific names for cultural sites such as a heiau, a kahu, and the guardian of Nihoa:

### ***Beginning with Nihoa***

Ninioa was the heiau at Nihoa located on the western side on a precipice near the sea. The guardian of this heiau was Kahiupewa, a shark and younger sibling of Kamohoalii and Kuhaimoana. When men settled on Kaua'i during the reign of Kapulaukī, he sent Kapu to be its officiating priest for that heiau. He was the first human priest of that heiau (Keo 1835).

Other names associated with Nihoa are Waialoha, a name of a wind, and Waiakanohoaka, a name of a spring (Teva & Keale 1989). There are three known springs found on Nihoa. Another place name is Mauloku "continuous falling" a Leina a ke akua or Leina a ka 'uhane, which is a place where spirits leap back into Pō lit., Leap of the soul (Pukui 1974 & 1986).

Traditionally, Nīhoa is often mentioned with two other smaller islands known as Ka‘ula and Ni‘ihau in many mele. They are often viewed as the triplet islands that were birthed last by Hanaloa in the origin chant, Mele a Paku‘i. Both Hanaloa and her husband, Wanalia, were from Polapola. Other mele mention Nīhoa with Kaulanakalā or the West:

*E ui aku ana au iā ‘oe, aia i hea ka wai a Kāne?  
Aia i Kaulanakalā, i ka pae ‘ōpua i ke kai,  
Ea mai ana ma Nīhoa, ma ka mole mai o Lehua (traditional).*

Nīhoa is often mentioned in Kanikau to refer to the place where one’s Kino Wailua (spirit) will travel towards to return back to the Pō (Tsuha 2007).

Kikiloi continues his quest for ‘ike from his kūpuna as he travels to their ancestral homelands. Below is an insert from a journal entry from NWHI Education Project (NOWRAMP 2002) as he brings to light Holaniku a name mentioned in a chant to be the first Island:

*Recorded in our oral histories is ka mele a Kamahu‘alele, or the chant of Kamahu‘alele, the famous priest of the navigating chief Mo‘ikeha, who recited “Eia Hawai‘i” in the year 1215 A. D. on their return voyage to Hawai‘i. Within the lines of this old chant lie subtle clues to ancient place names and locations of traditional regions across Oceania. In verse twelve and thirteen of this mele, Kamahu‘alele recites this, “Pae like ka moku i lalani, hui aku hui mai me Holani...,” which means “The (Hawaiian) islands lay in sequence, adjoined to Holani...” (Ka mele a Kamahu‘alele in Fornander, APR 2:10-11). Holani is a region that lies due west of the Hawaiian archipelago, and its boundaries are traditionally marked by Holaniku (Holaniku in the East) and Holanimoe (Holaniku in the West) (Ka Mo‘olelo o Aukelenuiaiku in Fornander, Vol. 4: 32-111). These names are so ancient that many of them have been forgotten about, residing in obscurity for many years. Holaniku however, is an ancestral island name we should never forget. It is the island name for the oldest geological island in our homeland, known today as Kure Atoll (Bishop Museum Archives #HI. H.107, folder 2), and she is a reminder of how long our history spans back in time.  
([www.hawaiianatolls.org/research/NOWRAMP2002/journals/kuaihelani.php](http://www.hawaiianatolls.org/research/NOWRAMP2002/journals/kuaihelani.php))*

Below is another excerpt from Kikiloi’s journal as his path takes him to yet another kūpuna island. This island is poetically referenced in genealogical chants as a mythical place he feels that Kuaiheilani is the traditional name for Midway:

*Hidden under layers of deteriorated concrete buildings, broken runways, and abandoned vehicles on Midway Atoll, as a traditional Hawaiian place, is an entity many believe as mythical. Its name is Kuaiheilani and it is real. The history of its name and location is a complicated one, as it stretches back to the beginning of Hawai‘i’s traditions and lore. Described in the legend of Aukelenuiaiku, the origin of this name can be traced to an ancient homeland of the Hawaiian people, located somewhere in central Polynesia (Ka Mo‘olelo o Aukelenuiaiku in Fornander Vol IV: 33-111; Ke Aloha Aina 1893-1894). This name has also been recorded in ko‘ihonua, or genealogical chant as an island name in*

*the Northwestern Hawaiian Islands (Bishop Museum Archives #HI. H.107, folder 2). It is not uncommon for ancestral place names to be appropriated affectionately to newly discovered lands, and this may be the case here. The Legend of Aukelenuiaiku may be an indirect link to how this place name was given to an island in our chain, as Aukelenuiaiku represents a voyaging tradition that makes its way through the Northwest region of our archipelago.*

*In more modern times, the name Kuaihelani has become labeled as mythical to many people who read Hawaiian literature. The immediate problem here is that traditional knowledge of a place like this often gets lost, as primary Hawaiian language sources and history become fabricated into secondary English literature and fables. This island however is not a myth. According to historical sources, this island was used by Native Hawaiians even in the late 1800's as a sailing point for seasonal trips to this area of the archipelago. Noted authority and ethnologist Theodore Kelsey writes, "Back in 1879 and 1880 these old men used navigation gourds for trips to Kuaihelani, which they told me included Nihoa, Necker, and the islets beyond...the old men might be gone on their trips for six months at a time through May to August was the special sailing season." (Johnson and Mahelona 1975).*

*...The story of Kuaihelani is no longer mythical... it is real, and it is one of hope for our people. ([www.hawaiianatolls.org/research/NOWRAMP2002/journals/kuaihelani.php](http://www.hawaiianatolls.org/research/NOWRAMP2002/journals/kuaihelani.php))*

## **6.2 The Continuation of Religious Practices**

In the past many Hawaiians would travel the distance to the kūpuna Islands for religious purposes. One account was shared by Wilma Holi, whose tūtū was the Kahu of Nihoa. Holi stated that her tutu would journey to Nihoa to conduct religious ceremonies. The cultural protocol group Na Kupu'eū Paemoku is perpetuating this practice of reconnecting with their ancestors. They sailed to Papahānaumokuākea and conducted cultural protocol ceremonies on the Summer Solstice, the longest day of the year, June 21st. They conducted cultural research initiatives to better understand the relationship between the wahi kūpuna (ancestral places) and the northern pathway-of-the-sun. A member of the Na Kupu'eū Paemoku chanted this mele as they came upon Nihoa:

*... 'O Nīhoa ka 'āina a mākou i pae mua aku ai  
Lele a'e nei mākou kau i uka o Nīhoa  
'O ka hana nō a ko'u pōki'i o Kāneapua  
'O ka ho'oli ka ihu o ka wa' a nou i ke kai  
Waiho anei 'o Kamohoali'i iā Kāneapua i uka o Nihoa*

### **Translation:**

Nīhoa is the first land that we disembark upon  
We land on the shore of Nīhoa  
Then the charge that was given to my brother Kāneapua  
Was to keep the stern of the canoe positioned towards the sea  
Then Kamohoali'i left Kāneapua in the uplands of Nīhoa (Tsuha 2007).

It is recommended by the group that a proper name be given to the site known as “Needle Rock”. It is thought that the name of the rock should be Kāneapua named after Pele’s brother “*Perhaps the NW Hawaiian Island offices may consider renaming it after Pele’s brother Kāneapua who in the migration chant was left i uka o Nihoa, or in the upland of Nihoa*” (Tsuha 2007). Inspired by the very essence of Nihoa a mele ho’ohanohano was composed by Kalei Tsuha on their 2007 voyage:

### **He Paha no Nihoa Kuhikuhipu‘uone**

#### **Na Kalei Tsuha 6/22/07**

*E Nihoa ē, aloha kāua  
Aloha wale i ko pi‘ina kahakaha  
Kikaha nā manu i nā welelau pali  
E ō mai e Lono Kahakuakea  
E hō mai ka ‘ike o nei moku  
E Nihoa ē, aloha kāua*

*He hea aku kēia i nā kūpuna  
E Kahi‘upewa ka manō kia‘i o Honouli  
E kuhikuhi mai i nā pu‘u one  
O ka heiau kapu o Ninioa.  
E Nihoa ē, aloha kāua*

*E hō‘ike aku iā mākou nā kānaka o Ha‘ae Wale nei  
I nā ala ‘ula o nā Hā‘ena mai ‘ō a ‘ō ē  
E Nihoa ē, aloha kāua*

### **6.3 Mo‘oleo Associated with Fishing**

Papahānaumokuākea National Marine Monument was commonly referred by local fishermen as The Northwestern Hawaiian Islands. This area was frequently visited by many Hawaiian fishermen either for subsistence fishing or commercial use. Over the years many fishermen were interviewed and many attest to the depletion of ocean resources. In this section, additional interviews will be incorporated that were previously recorded in regards to the NWHI over the years, by Kepa Maly (KM) in “Ka Hana Lawai‘a a me Nā Ko‘a o Nā Kai ‘Ewalu Volume II: A History of Fishing Practices and Marine Fisheries of the Hawaiian Islands Compiled From Native Hawaiian Traditions (Maly & Maly 2003). The Kūpuna that are quoted include; the late Elia Ku‘ualoha Kawika Kapahulehua (KK), Eddie Namakani Ka‘anā‘anā (EK) and Louis “Buzzy” Agard (LA). The full transcripts are incorporated in the Appendix of this report.

Kupuna Kapahulehua was raised on the Island of Ni‘ihau. He was blessed to spend time with his kupuna who passed on the traditional seafaring ways of his ancestors. Below he

recalls stories that were traditionally passed on to him by his Kūpuna who sailed from Ni‘ihau to Nihoa:

*KK: If you need something, you go get. If you don't get it, you go without. So that is how they did their fishing and harvesting taro on Kaua‘i. So you have two different groups and they waited till the last week of the month, that's when the south wind is going to change, come from the north, so they can go home. Following the rising stars, and they are back at Kawaihoa. But the people on Moku Manamana, they stay there for six months out of the year. This time of the year, they turn around and get ready, waiting for the wind shift from the north, and they go home.*

*And the fish they catch, there is an overhang reef. All the crabs underneath. What the fellas do is get wana, crack the wana and leave it out. All the crabs can smell the wana, they come out to eat. But they know that the birds are looking for them. But they failed to look in the ocean. The ‘ulua is also waiting for them. But the ‘ulua failed to see this post standing above, it's not a post, it's a man with a spear. He's posed, not making any move, So when the ‘ulua comes out of the water and spits at the crab, to get ‘um loose from the rocks. They fall off and the ‘ulua comes to get the crab. But the man hits it right behind the eye, where the brain is. He puts the spear there, and the ‘ulua stops moving. So all the other ‘ulua kept swimming around. Nut the partner of that spears man, has a stick with a hook [gestures], and he hooks it under the chin and pulls it clear out of the water. The two guys pulling it out. They cut the head off, and then cut, just like your finger [gesturing width of cuts], and fill it up with salt. Put is aside with that coconut panel they made, cover it.*

*Early the next morning they swish it in the water. Their food, the ‘ulua head, coconut, and they drink the water. That's how they lived over there for the whole week. And ‘a‘ā rocks. After eight o'clock, it gets warm. So that is how they dried the ‘ulua meat, on the ‘a‘ā. Two guys catch two ‘ulua, that's about 500 pounds total, just the meat (Maly 1210:2003).*

In the 1940's Kupuna Agard began his journey to the NWHI as a commercial fisherman. He was the captain and owner of a few large fishing boats that supplied the local markets. Below he shares one of his many fishing stories as he surrounds an akule schools at Nihoa (Adam's Bay):

*LA: There is an account in Captain Cook's log book that he was at Kure Island, I think his second trip, 1779. When he encountered a Hawaiian canoe way up there at Kure, and asking the natives... There were ten natives on the double-hulled canoe. What they were doing there? And they said they had come to "collect turtles and bird eggs." It's in his log book. So they had sailed all the way up there. Coconuts for water and so forth. So there is an account in the log book of a double-hulled canoe with ten men in it, catching turtles. And turtles of course, you don't have to do anything with, they survive on their own in the canoe, until you get them back home to Ni‘ihau and Kaua‘i. In fact the fishing ground close to Kalalau and Nu‘alolo. Nu‘alolo, when you sail by there, you can see what you think are round rocks, but they are actually all turtles. It's*

*kind of a place where they go to rest. I don't think there is much sand, so they can't lay their eggs. And in some of the bays over there...I can describe Nihoa, Adam's Bay. It is anywhere from three fathoms and a half to about four fathoms, and these huge schools of akule come inside there. And we'd pass by there on our way, we would leave Kewalo at midnight, thirty three hours later, we would wake up in the morning, and there was Nihoa standing majestically in the distance, and the sun behind our heads.*

*We would go by the bay first and look in. And if we'd see that there was a lot of discoloration, a reddish-blackish kind of color, and you see undulating and moving, we knew that was a school of fish. And generally what happens is, because there are these huge 'ulua in that vicinity, when they charge into this mass of fish, the fish will part and you can see the discoloration in the color of the water. And they go through and the fish come back. And as these big fish go through, they hit several fish, chopping, and they usually injure a few. These fish kind of flutter down to the bottom. It's mostly sand, but there are rocks there too. But there's a lot of sand from over centuries of wave action creating this sand there.*

*The first time we went there (flying), some fisherman had mentioned to me, "You know, I saw fish there." I said, "You sure?" So I went, and "yes, that's a school of fish." So we came back home, got some nets and went back out. [chuckles] So I swam off first by myself, and I swam in and looked, looked at the bottom and set the purse net. You don't want to catch rocks because the net won't hold. Swimming in there, I looked about two or three times, [smiling] and the hair on my head stood up. I said, "Oh my God, what is this?" There is this huge school of fish, flat on the top, like a hanging bee-hive. Thousands of fish in this school, ball, mixing, this is the spawning process. The females casting out roe, and the males casting out the milk. This is how they propagate. And that is the way customarily, when they gather together, that's when you can net them, and that technique is still going on today.*

*But, underneath that [chuckling], was this pack of sharks and giant 'ulua, all intermixing, underneath this ball. When a big kāhala crashed in or a big 'ulua crashed in, the injured fish would fall down, swim down and land on the sand, and these large fish would just swim around and pick them up. And this goes on, this activity, days and days, even weeks. Because there is nobody there to disturb them. They just spawn all the time. Except for guys like me who went over there and disturbed them.*

*So I jumped in the water and signaled to the men, come. I watched and watched, and these top predators are on the bottom of the ocean, in a circle, like a pack of wolves, and the mass of fish over them. They are picking up the injured fish. It took about five minutes, and they would slowly come up from the bottom, and they would circle you and the fish. But, they include you in there, eyeball you. [smiling] It's kind of a harrowing experience. So I look in the back of the boat, and there is one of my fishermen. I picked him up from Kona, a pure Hawaiian boy. He went in the water, I looked in the back, I saw him lower himself, and all the sudden, I saw him leap out and come right inside the boat [chuckling], when he saw what was down there. It is frightening.*

*Then of course, we set the net and then all hell broke loose. The fish got frightened, and they explode to the surface, and they explode down. And they hit the net, and at the corner of their mouth is a little structure that sticks out. It allows them to open their mouth [gestures, wide]. When that catches the net, they struggle on the net. But there is a sound they make—trrrrrr, trrrrrr—as soon as that sound is made in the water, either you jump in the boat, or you jump inside the net. Because that is when the predators start going puni. Bite the net, with the fish and the webbing in their mouth as they swim away. They swallow the fish and the webbing. They go into a feeding frenzy when you surround. In those places, anyway. In town here, you don't have the top predators that circle the schools. But out there you have. And Shark Bay is like that, a huge school of sharks. We would have to stay inside the net, they thought that that was a fish and they bite. Your fin touches the net, they bite. You cannot touch the net. So we learned the hard way and got the nets all torn up, and we ended up with all those big 'ulua. But that was the reason that it was spooky, but it is also destructive, that kind of fishing out there.*

*And I think we still do it here, when you can. We have so many boats that cruise up and down the shoreline, they interrupt the tranquility of the spawning system. So you don't see that too much, at least around this island, you're not going to find that. But you go to the outside islands, where you don't have that many people or that many boats, they can still come in and spawn. But you go out there, the school stay there like perennially, it's always there. When I go by, I fly over, I look and I can see it in the bay, Adam's Bay. I've never gone by there without ever seeing it in there. It's just there permanent, spawning all the time. Same thing in Shark Bay at Necker Island. That's what you're calling Moku Manamana isn't it? Or are you calling French Frigate, Moku Manamana? (Maly & Maly 1211-1212:2003).*

All of the fishermen interviewed saw the depletion, the devastation of this fragile environment. They describe the decline in abundance of the marine life in just a 10 to 20 year span. Below Kupuna Agard shares his revelation as he realizes that he fished himself out of a job:

*I am an original member of the Western Pacific Fishery Management Council, appointed by the Secretary of Commerce, and we had some studies done, when I was working on the Council, 1976, we started. Which was the year after the lobsters were discovered up there. So we had a collapse of the sea-mount fishery, that we had a stop, don't open up the precious coral fishery. We had the black lipped pearl oyster fishery down the tubes. We had the lobster fishery actually collapse three times up there. This is all happening up there. So there is a reason why they cannot replace themselves. Of course the habitat is small, they are little atolls. They are not like these main island that you can go around 100 miles. They are tiny, they might be 100 feet across, and 150 feet long. Something like that. Very tiny, small habitat. That study made when I worked on the Western Pacific Fishery Management Council, showed the nutrients up there were very little. And they came to me, the biologist with DLNR, they said, "You know Buzzy, up there, not too much nutrients." I didn't want to believe them [chuckles]. But now I know. I was wrong plenty times up there in a pristine area. I don't say, "You ought to just shut this whole thing down, nobody can fish." But it has a value for us. There is very little fresh water up there.*

*We don't have what you find here, mountains that cause moisture to fall, that feeds the streams, that makes the estuaries where little nurseries can exist. There is nothing up there like that. There is no water. On many, many islands there is none. On Nihoa, you can go on an overhang ledge, there is a little drip. But you get a few drops in your mouth, you don't want to swallow because it is full of bird droppings. It's in there and it's bitter. We tried [gestures catching drip in mouth], we held our mouth and let it drop in, and wow! What a taste! I would say it doesn't have fresh water, except for the droppings. But those experiences that I'm just trying to hit quickly with you, are very important to learning something about that place.*

*When you first land, as I saw those fish rolling in the sand and surf. Shining bodies, I said, "Oh my God, I know what that is. Let's surround it" So we surrounded it, sent it to Honolulu. I went back the next week, I figured, if it's like here, the next week they'll move from the outside and move into the vacant area to take the food. There is always more scattered around. But you go down there, you take it, the next week you go... Like over here, you say, "next week, I'll go check the ko'a, if has the fish." But we went look, no more. We went the next month, no more. I went back on my boat to Shark Island, go look, no more. Ten years I worked there, I never caught one more fish in that ko'a. Nothing! So I looked to Honolulu, sailed about 90 degrees, didn't look back, and don't go back. And I never went back. If it were worth it, I would probably still be working there. But it is not worth it. So it is a lesson that I learned, and I just want to explain what happened out there. It looks great, but it is not sustainable. The fish are tame, you walk in the water on the reef, up to your hip, and you look behind you, all the fish are following you. They are all tame. But thank goodness for you having this meeting so that we can share. And I can congratulate my buddy over there, Isaac, for going with me and talking to President Clinton. And he said "Yes, if that is what happens in Hawai'i, we should protect it." We put the Executive Order [No. 13178 & 13196], and now we are struggling to keep it in there. I was looking at the map here, 1919. It says there, and it circles it, it's a "Bird Reserve." And that would be great, just keep it that way [chuckling] (Maly & Maly 1206-1207:2003).*

#### **6.4 Voyaging**

Oral traditions of Hawaiian people sailing to the NWHI or Na Moku'Aha, such as Nihoa and Mokumanamana, have been passed down from generation to generation. Many speak of Nihoa being a training area for new navigators. Below Kawika Kapahulehua and Eddie Ka'anā'anā, express oral traditions passed down by their Kūpuna who journeyed by way of the stars and current.

*KK: Growing up on the island of Ni'ihau, at about four years old, I heard two uncle telling stories. One said, "Mōla'ela'e kēia ahiahi. Hiki au ke 'ike i nā hōkū a pau. Nui nā hōkū o kēia ahiahi." This evening is so bright. I am seeing a lot more stars than I am used to. I could see much, much more stars. The other one said, "You see that group of stars overthere?" "Yes, I see that, a group of big stars." "That is called Nāhiku (the Big Dipper), and the Big Dipper is going home towards the west." There was a story about an uncle saying that six months out of the year, during the summer months, they get their*

canoe ready, put a lot of coconut leaves on it. A double canoe. And they wait for that star to come out in the month of April. The third week of April, they have the south wind to take them north to Moku Manamana. That's where they will spend six months out of the year, live on the land. They sleep in and around the canoe, and they use the coconut leaves to keep them from sunburn, because there are no trees on Moku Manamana. They fish, they bring potatoes with them. Or sometimes they stop on Kaua'i, Kalalau. They go pick up taro, a couple of bags of taro and they take that with them. They cook it. They have the water, they take a lot of coconuts. Water untouched by human hands in the coconuts. They catch fish on the way. They substitute the fish and coconut milk. So that's what they live on until they get on the island and then do a lot of fishing. It is cooler on Moku Manamana, being further north, than Ni'ihau. Ni'ihau is so hot. Hardly any rain, hardly any trees at the time, in those days. So they used to live there on Moku Manamana and do a lot of fishing.

Then the other story, the same two uncles saying that another group. That first group, they lived close, right across from the island of Lehua, a cove which is called Nanina. That's where they lived. But another group, started from Kawaihoa on the Kamalino side of the island, the west end of the island. But they picked the month of April also. The first two weeks of the month, the wind is blowing from the northeast. So they have their double hull canoe ready, from the first of the month. They crack the coconuts, let it dry out on the coral. Mainly because they want the coconut meat to turn into oil. Then you know the coconut leaves as they grow, they have the coconut webbing like a net? They gather all those and save it. And when the time comes, and they have enough oil in the coconuts, they wrap it into this coconut webbing. What they do with it is, they used the webbing as a sand paper to rub on the side of the canoe to knock off all the whatever.

...And they put the oil into the wood. So the barnacle and sea worms will not get into the wood. That's how they would prolong the life of the canoe. So that's how they would get the canoe ready. Then they would make coconut baskets to put coconuts into the basket. Then they would weave panels for the trip. They make it because on the island of Nihoa, There is no grass, no trees, no shrubs. But a lot of 'ōpihi, wana, hā'uke'uke, crabs. The 'a'ama crabs, and of course, Mr. Agard forgot to put the bigger 'ulua on that picture there [pointing to poster on wall]. And that's what those guys do, catch 'ulua.

There's eight guys on the canoe. On the way to Nihoa, the steersman keeps the North Star at two o'clock. [gesturing with hand] What they do, twelve o'clock, straight ahead, one o'clock, two o'clock, three o'clock, on the right hand side. But he followed the tail of the Big Dipper. As the Big Dipper is going, he follows that. That's how they navigate, to stay higher than Nihoa. Because the wind and the current is taking them towards Nihoa, so they steer higher. In the mean time, the other guy sitting across from him, looking across his head, to know what star is rising from the east. Because the following week, they are going to go home. So they can follow that rising star to go home. They only have one week to do the 'ulua fishing on Nihoa.

So every hour, the steersman is not only watching Nāhiku, but he also watches for another one, and he measures from the thumb on the horizon, and the index finger

straight up. That's one hour. So he is supposed to be steering only for one hour. Then the two exchange. Then the other guy is doing the same thing. When that second hour is almost up then they trade, the two guys watch, all night long until day break, and they see Nihoa right ahead. They never passed it. So that is how they go fishing. (Maly & Maly 1208-1209:03).

*Kupuna Ka'anā'anā expressed that his ancestors traveled up north not just for fishing but to gain 'ike about navigating, as well as connecting to his ancestor by visiting and showing respect.*

*EK: Then here again, the story comes back. Ho'i mai la ka no'ono'o i ka ha'i mai nā kūpuna o kākou i kēia 'āina. Mana, manamana [holding up his hand], manamana lima, a 'aha, Moku 'aha. So you put that two in place, when you say manamana lima, we have our main islands over here, and these are their finger [indicating the NWHI]. And then we hear today, "we are going to the Line Islands." We forget the word 'aha [line, cordage or rope]. Today we seem to forget what the 'aha means. And there are a lot of stories behind the 'aha. 'Ahahui, kēia, 'ahahui kēlā. Today we forget the 'aha, we just hui this, hui that. That's our pilikia with what's going on today, we want to shorten things, we want to get there quick, and we forget about things in the back. That's why I think about that, we are here to talk about our Line Islands, and then we hear today, mana. And then, when we hear again, people of Ni'ihau, they went up there, they went to Nihoa, they went to Ka'ula. And then here again, the story, lohe au i nā mo'olelo mai ku'u kupuna mai, mai ku'u anakala. Hele lākou i kēia 'āina Manamana, hele lākou i Nihoa. And we figure, from the place I come from, Hawai'i, what, why do they have to go over there? For get this fish or whatever they do over there, when we have all the fish over here. But we don't ask questions. We were not supposed to ask questions. But you hear stories, the did go over there.*

*Well, mai Kapalilua, hele lākou a hui lākou me nā 'ohana o Ni'ihau. A noho lākou i ka 'āina o Ni'ihau, a ma laila hele aku la lākou i laila. Ka po'e holo moana. So the story that you hear of our people, they are seafaring people, our navigators. The sun, the stars, and they go over there, it's just like a training area for them. They join with the families. We have 'ohana all over the mokus. ...Here we figure, fish was so plentiful, when I was growing up, they were so plentiful. Then you wonder, why are they going to go over there to those islands? Training, holo moana. ...Passing on the knowledge, the navigation knowledge. So they go over there. ...You have to eat, holo lawai'a. So that kind of thing, when I listen. Like I say, I am a young kupuna, I need to hear from somebody first, then this connection comes back, and that's why we say Nā Moku 'Aha.*

*...When we talk about pu'uhonua, we get into 'aha. 'Ahahui, what kind of organization are we forming when we are bringing this 'aha together? Why are we pulling them in? To form an 'aha... The 'aha is a big thing when you hear the stories of our kūpuna.*

*...So much, and that's why I see the connection here. It comes back when I hear this story. And why are we hearing this story, they say they are going over there to get fish, when fish is so plentiful in our place?*

*...Part of your traveling, part of your life. It's just like when you want to train warriors, 'oia ka mo'olelo o nā kūpuna o kākou. Mākou 'āina, hele 'oe i Molokai they can train you*

*in certain things over there. That's part of your training to become a warrior, protect your 'āina, protect your ali'i like that. Kēlā ka 'ano. That's what they said. A'ole na'u ke ninau, "No ke 'aha kākou e hele aku i kēlā 'āina ma laila, ki'i aku ka i'a?" ... (Maly & Maly 1218-1219:2003).*

The Polynesian Voyaging Society continues the path of their ancestors of using Nihoa as a training ground for new navigators. Ka'iulani Murphy was trained on this very path as a new navigator "Nihoa is a—a challenging navigational ... learning experience". Murphy stresses the importance of keeping this tradition alive for future generations:

*And it is a living, you know, we have a living culture evolving, ..and ... to continue those and make our own traditions, maybe,...of continuing that connection with that place. ... so I would love to see the canoes going up there for uh, training purpose, for um, spiritual connections. ... and I think it's important to keep that connection. ... So Nihoa is an—an incredible place to sail to, because it's far enough away from the main islands that it's that long voyage condensed into, you know, a one, two-day period, and um, it's so tiny that you have to be totally accurate. You can't be—I mean, thirty miles is half a degree. ...one degree is sixty miles. If you're, you know, ten miles off, you could miss your island. ... and then you know, I'm sure that nervousness would set in. You know, you don't see the island when you think you're going to, did we pass it, you know, are we east or west of it. ...so that the beauty of that kind of a training trip is you have to be, like, dead-on accurate. (Video Interview Na'alehu & Sterling 2008)*

## **6.5 Cultural “Subsistence”: A Way of Life**

There is no word in the Hawaiian language for subsistence because it is a way of life; it is a kuleana (responsibility). The value of lōkahi to live in harmony and total balance with the surrounding environment is practiced in everyday life. It is the deep understanding of stewardship the responsibility of mālama 'āina (take care of the land) the relationship Hawaiians have with the environment, the way they view, managed and balance the natural elements around them. This knowledge of oneness between kanaka and nature, the kuleana to care for it physically and spiritually, was perpetuated generation after generation by their kūpuna.

During the 2003 interviews conducted by Kepa Maly there were two important sections titled “Allow subsistence practices to continue as necessary in the NWHI” and “Cultural “subsistence” related not only to taking what is needed as food, when up in the NWHI, but also, perpetuation of the practices and knowledge associated with travel and visitation to Nā Moku 'Aha”. What prompted this discussion was when William Aila asked all the kupuna what advice would they give their mo'opuna in regard to the Kūpuna Islands. Some of these kūpuna are no longer physically here, but their ka leo and mana'o are still here with us. The Kūpuna and Kama'āina included in this insert are as follows William Aila (WA), Val Ako (VA), Kawika Kapahulehua (KK), Eddie Ka'anā'anā (EK), Isaac Harp (IH):

WA: But it is important to get your mana'ō down. As we are going around the table, what would you tell your mo'opuna, what to do, and what not to do?

VA: Okay, I have two mo'opuna who are fishermen. And the way I taught them, one is a deep sea fisherman. If they were to go to the Northwestern Hawaiian Islands, it is for resources, don't take more than what you can handle, and to respect the ocean. You can catch a hell of a lot of fish, but if you don't know how to preserve it and you don't know how to navigate in that particular area, it would be hazardous for them. And being a former seaman, and I respected the ocean. That's reason that uncle Walter, Eddie and I, came through a lot of large storms, and there were times that we thought we wouldn't return home. But luckily everybody held together...

And when I was in the Merchant Marines, there were times the ocean was so rough, and we were on an LST, you would think the LST would break in half. But we were able to survive. So my experience, and sharing with my mo'opuna, I always tell them that they must respect the ocean, and don't take more than what they can handle. So first of all, get the market. But fishing in the Northwestern Hawaiian Islands, I always told them "It would be better to stay in Hawai'i.

WA: Not go up there?

VA: No. Go up there to visit, but not to fish for commercial purposes. That's my mana'ō.

KM: Mahalo. Uncle Leo Ohai said the exact same thing yesterday. He said he "wants it to benefit Hawaiian people." He wants "Our Hawaiian youth to be... Don't worry about up there, take care down here, work for that."

WA: What about your mana'ō for your mo'opuna, if they should go traveling up north?

KK: Well, Ni'ihau, they stopped doing all that. But I think that all the families now should teach. Like he [Kupuna Ako] said, his mo'opuna going up there to do their fishing. Fine, it's our own people. And teach them not to rape the island, not to bring any kind of chemical that will destroy. Mālama ka 'āina, take care. Because their children of the future will need all of the supplies that we have to preserve it now, not wait until later until they say, "Oh I am sorry, I forgot."

KM: 'Ae.

WA: Uncle Eddie, what advise would you give your mo'opuna?

EK: First of all when we think of what our plan is to do with that 'āina up there, make it a sanctuary, make it a pu'uhonua. We know how people have been going over there and fishing that place out. We heard where they drag that net out. We heard that. We have to try and keep what we have over there now. Some way, we have to do it. Now, we have to find out how we are going to do that. Without having all this pilikia of what people are doing, wanting this and wanting that. Until we know what it's about, and that's where I need to educate my mo'opuna, what that 'āina is going to be for. If it is made for that purpose, you have to learn and understand that. And if you are going to make it the way like we've done it—there's time to go get this fish, and this time it's kapu, and there's that time to go get that one. Then that's where I'm going to have to teach them, you have to prepare yourself. You have to go over there, you have to know the seasons, and you have to prepare your fishing equipment to get that particular fish. What season and what season to go over there, and when this fish is open. Not just have just one type of fishing over there, and it's not season for, but "I'm going there anyway and I can catch it." They have to get that kind of understanding. So that's the conservation of the pu'uhonua, or what ever we plan to do. And then again, when you mentioned about that and what they

are trying to do, and what they will have to do to go get the akule and the 'ōpelu to begin to feed that 'ahi, we are just defeating the purpose. When we let them do that, get them started, let alone what ever it is polluting on the ocean side. Are going to solve that problem by going over to Miloli'i or some place to get the 'ōpelu and start feeding the fish over here? Then when it goes to the market, we can't get it because it's so expensive. Unless like how they do in Kahuku, we can get the shrimps. Is that the same thing that is going to happen? And then we go back to this same thing here, there are many things that our tūtū tell us. They came and they took our stories and everything. Then sometimes the stories are not right, hū hewa ka mo'olelo i ha'i 'ia! Then we find that they tell us they read this story, and they wanted to make the story more exciting, and it came to the competition and wanting more money. Hū a hewa ka hua'ōlelo i kēia mo'olelo! So these are the things I see...this is all we have left. But there is something, there is hope. That's why sometimes our tūtū told us "Ka mea o lo'a ai ka 'ō mokumoku palaoa!" (What's left for us is the crumbs of the bread!) But what little we have, it's there.

KM: That's why your voices, your recollections we still have the opportunity to take care. So it's not just a memory.

EK: To me they are there. It's just like when I sat here this morning, the first thing I heard about, ka manamana.

KM: 'Ae, ka Moku Manamana.

EK: Moku Manamana, Nā Moku 'Aha. I heard that from my tūtū. But today, we hear LineIslands. Poina a'ela ka inoa o kākou.

KM: 'Ae.

Allow subsistence practices to continue as necessary in the NWHI:

EK: But when I sat here, my memory comes back, I heard of that from our tūtūs. I feel that sitting here. Yet, we have to way this balance. That's why, when we speak of 'aumakua, like the honu, we respect them. Because I know it is 'aumakua. Not our 'aumakua, but that doesn't mean that I didn't go and help somebody, and catch that one and give them. If it's not theirs, that's what they are going to feed on. Well, maika'i! If it is to sustain life, ho'ōla kino, ikaika i ke kino, fine! A'ole i pāpā 'ia kēlā.

KM: 'Ae.

KK: Pololei.

EK: Even if you know that is their 'aumakua. But don't disrespect that 'aumakua. Don't disrespect that 'ohana. That's why I say, when we went that first time, and that was what I saw, that kua, that honu back like that. My memory thought of, "whoever the 'ohana of that, the least they could have done..." But they were ignorant.

KM: So respect.

EK: Yes

KM: ...A critical thing in that, is making sure that the people are taken care of, it's the resource first. Healthy resources, healthy land, healthy ocean, and healthy people.

PA: Yes.

KM: And I believe, that if the Hawaiians are healthy, everyone else will be healthy as well. Uncle Leo Ohai brought up this point about the lobster fishery. I think it was back in the mid 1980s. The first year they went out and laid out 100, 200 traps, there were 40, 50, 60 lobster in one trap, in one night. He said that within a year of fishing like that, it dropped down to lucky if they would get four or five lobsters in the trap. And now I understand from Randy and others, that it may be even less. Uncle said, the year after

that, he went to the state Division of Aquatics and told them, “You’ve got to put a cap on this, something is wrong, it’s not coming back up.” That state’s research biologist—which would be in part the reason we are where we are today in the lobster fishery up there—said, “No, no, don’t worry, it will balance off, it’ll level off, and everything will be fine.” Well, what it did, to quote a friend here, “It balances off at just about zero, or point-five lobsters per trap.” It’s unacceptable. So the need to ensure the health and well-being of the resources is critical, and that way, the people can be healthy too.

IH: I just want to share what I believe is the greatest benefit, not only to Hawaiians, but to everybody else here in the Main Hawaiian Islands. The stories and everything I hear from people is that there are a lot of mature, and highly productive fish stocks and species up there. I provided the scientific report to Randy, the science person in the reserve. It’s a surface current report done in 2001. It shows that Hawai‘i has a unique counter-current that flows from that direction to the Main Hawaiian Islands. A lot of the marine fish biologists understand that many of the species let go their larva into the ocean and it floats up into the surface current and drifts along. Some for a few days, and some for a few weeks, others for a few months. If that’s the case, and the current is coming this way, and they release the eggs into the water up there, that stuff may be coming to the main islands and settling out here. So that would be the only real benefit that I see the majority of the Hawaiians getting.

PA: That’s what uncle Buzzy was saying.

KM: Yes.

IH: Yes. Probably less than one percent of the Hawaiians will ever get up there. So I think the great benefit is protecting the area, not letting any exploitation go on up there.

EK: Uh-hmm.

IH: And like uncle Buzzy shared, the recovery is terrible. In ten years, the fish he took never came back...

WA: ...I just wanted to ask uncle to share... For me, one thing that I will take away from this discussion is, uncle Eddie Ka‘anā‘anā and several other of the kūpuna made it a point, and reinforced it, that there is this kuleana to go up there, and to have each succeeding generation up there. To have them experience that very special place, and at the same time, to protect it.

KM: Yes.

WA: So, while being there, to only take what you need to survive, and to use what is there. Uncle, you had mentioned how your kūpuna had stories of how they would leave Miloli‘I and go to Ni‘ihau, and then join up with the Ni‘ihau fishermen...

EK: That’s right.

WA: ...going up there. Could you share that again?

EK: Well, after hearing what was said about the Ni‘ihau people going up there to Moku Mananama, and the way you [Kupuna Kapahulehua] put it in the beginning.

KK: ‘Ae.

Cultural “subsistence” relates not only to taking what is needed as food, when up in the NWHI, but also, perpetuation of the practices and knowledge associated with travel and visitation to Nā Moku ‘Aha:

EK: Seeing that clear night with the stars all out. Then the thought came within, that this is the time to go up. The way has been prepared. Not only just look at it, but understand it. And that’s when they got on their canoes and went up there. Then when I hear that,

and that's why the story connects to me and our tūtūs, and I asked, "Why are we going up there and get all these kālai wa'a?" "We better go get it now, because the time will come when we won't be able to go get this lā'au, the koa." And yet at the same time my thoughts were, "We have all these large canoes in the back over here, and we weren't using them." They said, "We aren't using those wa'a now." But there again was that connection, all those big wa'a, when they wanted to go over to Punalu'u, past South Point, they would pick the time when it was right, and go over there to visit the 'ohana. And the people from the other side would come and visit their 'ohana. The same this, they went all the way back up to Niuli'i. But that was the mana'o, you don't ask questions. But we wonder why would they go way up there (the Northwestern Hawaiian Islands) to get fish, when we have a lot of fish over here? At one point tūtū them sat down, and they realized this was the thought on my mind. It was the question, but I dare not ask the question. But they told me, they knew this was the questions on my mind — "Ai no ka i'a imua o kākou, hele aku la, no ke 'aha?"

KM: 'Ae.

EK: Why are we going over there? Then they began to tell me the reason why.

KM: Holo moana.

EK: Holo moana. And from there, who was chosen to get on that wa'a, you prepare yourself. You prepare the moena and what ever, the moena to sail. You sail, and get to Ni'ihau. And it's from there that you go and take your training from them to go over there. And that was part of the story. And then again, maybe it was the same thing with Ni'ihau.

KK: Could be.

EK: The fish is plentiful, but yet, they had to go. They had to touch these islands. Because, o ka 'aha kēlā. These are the cords that connect. These manamana lima, they are all connected. And if we don't do anything about them, just leave them alone. Then nothing.

KM: Lilo ka mana'o, you lose the knowledge.

EK: Lilo. Kēlā ka 'ano o ka no'ono'o. With that kind of prospect that I have.

KM: So the idea is, you perpetuate the knowledge and the practice. Not just on paper, "Oh they used to."

EK: Yes, they used to.

KM: You are going to perpetuate it and keep it alive by practice.

KK: 'Ae, 'ae.

EK: That's why I am so intrigued with Hōkūle'a. That's what they are doing now.

KK: Yes.

EK: The students, they say, when they ride the Hōkūle'a, they feel the touch of that. And when they first started to build the Hōkūle'a, I heard among our people, "I don't know why they are spending this money for building this canoe, for what? We need the money for something else." But then I felt, we have other people building straw rafts and what, and others sailing from here to there, saying they were the ones who did this. But yet, we heard from our kūpuna that we were the ones who sailed the sea from here to here. So now we are going to build something and prove that we did it. And in my own mind, with my blessings, I hoped they would do it. And uncle Walter and I sailed, we did our part with that wa'a. So that is part of that thing.

*And now, if we are going to send our people up there to touch the islands, how are they going to get up there? Are we going to ask OHA where we get a good yacht, where we can take our mo'opuna up there and see the islands, and put them ashore? To look and understand what it's about, tell the stories on the 'āina. Or do we have to make double hulled canoes and sail them. Like now, Hōkūle'a which is taking them...*

*KM: So you follow the path of the kūpuna.*

*EK: Follow the path of the kūpuna.*

*KM: And all these places, from Kuhaimoana, the traditions of Ke Ala i Kahiki, not just the Kaho'olawe one, but your mo'olelo are rich with stories of the kūpuna traveling to those islands up there, and then down to Kahiki. So we know that there is tradition, so you can follow that path. Ho'omau!*

*KK: Ho'omau!*

*EK: Then again, we will be dealing with people, "What is that all about? Ua hala, forget it!" Never! You don't say those things. Like when you say, "Ua moe a hala." Our kūpuna, a'ole i make.*

*KK: Ua hala lākou.*

*EK: Ua hala lohe ala kākou!*

*KM: 'Ae, a koe no nā pua!*

*EK: Koe no nā pua!*

*(Maly & Maly 1240-1245:2003).*

Many Kūpuna mentioned as they traveled up north that the Island of Nihoa was so abundant in marine life there was no need to bring food. Below Kupuna Kapahulehua talks about gathering on the Island of Nihoa:

*KK: Like Nihoa, has hā'uke'uke, wana, 'ōpihi. They have all of that. So that is why, when the crew goes to Nihoa fishing, they never took anything other than the coconut, because they had all the food there. So why load up the canoe with so many other things that you don't need. They had the panel of coconut leaves that they had slit in half, and wove into a panel. Because the only clothing they had was the malo. And they used the coconut husk to burn it, to get fire, to keep themselves warm. They put the panel of coconut leaves to block the wind away, so they can spend the night comfortably. There are a couple of high plateaus or mountains. One is just slightly over 900 feet and the other one is slightly over 800 feet, and they are on the mauka side of the island so the wind goes over. The guys built a small, little wall on once side so they would be protected. It was from the family that I heard, that they do travel to Nihoa a lot, because it was famous for 'ulua fishing. No other fish. But of course they do a lot of 'a'ama, pāpa'i 'a'ama fishing. So the 'a'ama comes out, when the wana is broken, they can smell it like [thinking – smiling] tuber roses (Maly & Maly 1229:2003).*

Cultural practitioners such as Keone Nunes, a traditional Hawaiian tattoo artist stress their concern for gathering rights in order to perpetuating the path of his Hawaiian ancestors, and Keone feels it is vital to his art. William Aila expresses the importance of perpetuating the traditions of his ancestors in showing respect by conducting ceremonies as they once did. He elaborates on the kuleana to use everything that you gather from nature, and to give back what is not used:

*WA: If I could mention, I like the mana‘o that is coming, because we in effect have been doing some of that already. Since 2001, when the first Makahiki was conducted in Mākuā in about 180 years. In preparation for the Makahiki, we went and got from Fish and Wildlife Service, a ka‘upu, which is the albatross. Because it was new ground that we were breaking, we went to the Bishop Museum. Fish and Wildlife gave the bird to the museum, and the museum loaned it to us. It was prepared in a traditional Hawaiian manner where the na‘au and everything was hemo, and salted, and everything that wasn’t used went to the ocean. Kanu in the ocean. So that bird has been used three times now, two time a year. One time to open, one time to close. But as a consequence of that, the wing bones from that bird have been taken out and have been given to Keone Nunes, who is a traditional Hawaiian tattoo practitioner. Who is tattooing right now with those bones (Maly & Maly 1234:2003).*

Aila continues to elaborate in a video interview on the importance of the process of gathering to honor his ancestors and show respect. To honor the journey from the beginning of the process, the exchange of energy and mana that is involved:

*Well, this idea of separating ... natural resources from cultural resources is—is, again, something that’s ... Western imposed. ...you know, Hawaiians—Hawaiians made use of ... many ... many kino lau of different creatures, yeah? So for example, the koaeula feathers, tail feathers; because there’s not a lot of koaeula in the main Hawaiian Islands right now, and there probably ... weren’t large numbers, otherwise the—the evidence would have indicated that, that these birds, you know ... called home ... the Northwestern Hawaiian Islands more. So it’s this ... this relationship of traveling to places to obtain certain kinds of we’ll call it resources, yeah, but certain time—certain types—filling certain types of needs um, of gathering the koaeula feathers for uh, the creation of thing like kahili. Well, why did you create the kahili? It’s to honor somebody, yeah? So normally, you just don’t make a kahili and say, Oh, I made a kahili. Normally, there’s somebody that’s in mind, and somebody of such stature that you would go out of your way, expend all that energy, to create this object of finery, of—a demonstration of knowledge, a demonstration of workmanship, a demonstration of love for that person that you’re creating this kahili for; and it’s all of those things that add up to the creation of, you know, the collection of the feathers, the idea that you’re honoring somebody, the workmanship, the amount of mana that you put into this project, that ... in the Western world, creates a cultural resource, but in the Hawaiian world, just—you’re creating ... you’re capturing the love that you have for this important person, and symbolizing it in this ... in this form. (Video Interview Na‘alehu & Sterling 2008)*

## **6.6 Advice and Recommendations for Access to the Islands of Papahānaumokuākea**

Many Hawaiians who have traveled to the sacred Kūpuna Islands of Papahānaumokuākea feel it is vital to the sanctity of the area that anyone who transverse this area needs to understand the cultural significance and have the utmost respect. They have voiced there heartfelt concerns and advice as one journey’s to their ancestral homeland:

*The islands and islets after Ni‘ihau are all considered the edges of the Hawaiian universe, but Mokumanamana especially is situated on the edge of Kāne’s realm. In the Hawaiian epistemology, only death grants one entrance onto those lands. Therefore, anyone who is allowed to traverse there and back needed to embark on the voyage through intense ceremony throughout the duration of the expedition.*

*It is also the writer’s recommendation that all individuals who plan to access this portal, its land or the sea surrounding; must participate in some kind of exclusive cultural/spiritual training that prepares them for the Mokumanamana experience. Ua holo a hele a lele wale ka pule. \_ Āmama. Ua noa (Tsuha 2007).*

William Aila was asked the question “How can visitors be respectful to the Monument for the sanctity and spirituality? And what kind of mindset should they have as they enter the Monument?”

*I think the visitors from the very beginning—what is—what is the intent of the trip, yeah? You always judge ... something by what is its intent. So if someone is ... desires to go to the—a place in Papahānaumokuākea National Marine Monument, I always question what is their intent. Is their intent to do research that ... the research will lead to better management, better understanding of ... the area up there, uh, including the spirits that still walk there, including um, the relationship between uh, aumakua which still reside there. ... what is the intent? So if the intent is good, and you go with good intent, then you must have the respect that goes along with that intent. So for example, you’re not gonna conduct any activities in the monument that is gonna be destructive, that is going to be disrespectful. For example, you’re not ... you’re not gonna go and do cultural resource—research at Nihoa or Mokumanamana, and destroy some of the cultural sites that are there. Or, go shishi on some of the cultural sites that are there. I mean, that’s ... that’s just—you know, if you go with good intent, that’s not possible. But if you go with hidden intent or bad intent, then certainly not only is that possible, but it’s also probable; but you better—you make sure if you go up there with intent that is not pono, that you brace yourself for the consequences, yeah? Because there are—there are going to be physical consequences and spiritual consequences for somebody that does that. Oftentimes, Haole researchers can show respect simply by asking to learn about the relationship that Hawaiians have with these islands, relationships that Hawaiians have with uh, the inhabitants. And when I talk about inhabitants, I’m talking about the sharks, I’m talking about the birds, I’m talking about the turtles, uh ... you know, talking about the—the individual coral polyp; what is the relationship um, that they have in this desire to have an understanding, rather than come from a standpoint of, Eh, I get my PhD, I know everything about everything, and uh, you guys cannot tell me nothing, I know what’s best for you guys, I know what’s best for the area. Um, that’s a ... that’s a demonstration of disrespect. It’s actually a demonstration of ignorance. And so somebody with PhD might be very ignorant, because ... you know, they don’t have this concept of respect. They don’t have this concept of ... honoring how someone else thinks about the place. So when I talk about, you know, honoring the birds, honoring the sharks, we have people that are trained in—in Western thinking that go, What the hell is he talking about? You know. They cannot relate to that. But if they take the time to try to understand the relationship, that shows that they are—they’re pono in their intent.*

*So um, a classic—classic example which I still get heat for is, being one of the first guys to um ... one of the first native Hawaiians to express objections to another native Hawaiian who wanted to ... paddle the length of the Northwestern Hawaiian Islands in a—in a six-man canoe. Yeah? So I looked at the application, ... my brain told me that this was an extreme sport, my naau told me that this wasn't cultural. So because Hawaiians are stepping up to take a uh, a more active role in the management of this place, and the integrity that comes along with that, yeah, ... you have to honor that integrity, and even though it was another native Hawaiian that was asking to do something that ... you know, paddling six-man canoe, yeah, is ... sort of Hawaiian, it's sort of cultural, but the application in this instance was more of an extreme sport than ... something that was ... akin to a tradition or custom and practice in that area. So you know ... I still get heat for that decision today, but tough; that's ... that's the level of integrity that Hawaiians, because we're stepping forward and we're saying we ... we are ready to manage, we are ready to be part of this team, we have to maintain that level of integrity...*

*...In the briefings that I've done for groups of scientists that have gone to the Northwestern Hawaiian Islands, I've suggested, yeah—because you know, they can take it, they can leave it; it's up to them. I've suggested that they not only use their consciousness, ... and their intellect to try to gain information, but also use their naau, use that um, that portal to um ... the spiritual resources that are—that are there. I mean, you can see it; you can see it—you can see the hoailona in the clouds, you can see it in the rain, you can see it in the bird flying by and looking at you eye-to-eye, and that connection is there, or underwater when you're snorkeling and a big ulua comes up and goes, Oh, who you think you are, brah, over here? I mean, you can see it if you open yourself up, if you open your naau o—open enough, and you allow that—what they call this ike papalua, this additional deeper ike to come in, um ... you can take away knowledge ... from the Northwestern Hawaiian Islands that you wouldn't ... have been privy to simply by going up there with your—the intellect that's associated with your brain. You know. And you can go one step further; you can honor the spirits that still reside there, or the spirits that are transitioning along their path to po, uh, if you give them the respect. Um, again, there's an additional deeper level of ike that can become available to you. And ... believe it or not, most ... most scientists with PhDs can grasp that. There's only a few that can't; but the majority that I've spoken to, when they've come back from the Northwestern Hawaiian Islands, ... expressed that they've had those experiences. That they've had these connections with the animals either on land, or in the ocean, or been given, you know, some of the hoailona. And it's made their research that much more successful....*

*...It—it turns it from uh, an experience where you're an outside observer, to an experience where you're a participant. And that's the difference between a Western way of looking at resources, where you're an outside observer, you're an outside observer, manipulating the resources, versus an indigenous view where you're a participant, and your participation is based upon what's best for the entire system. (Video Interview Na'alehu & Sterling 2008)*

## **7.0 ASSESSMENT OF CULTURAL IMPACTS**

There are many similarities between the MMP ecosystem-based management approach for the NWHI and the traditional ecological knowledge and practices implemented by Native Hawaiians to manage their natural resources. Both approaches share the view of nature as a holistic and dynamic system of interrelated parts and emphasize the need for long-term sustainability and health of our natural resources.

The Native Hawaiian traditional ecological knowledge and worldview is valued for its rich base of empirical knowledge and practical methods of resource management, developed over hundreds of years of living and interacting with the lands and ocean waters of Hawai'i (Titcomb and Pukui 1952; Kikuchi 1976; Titcomb et. al. 1978; Poepoe et. al 2003; Kikilo'i 2003). Traditional management practices take advantage of understanding seasonal patterns in weather, patterns of biological species, and the designation of ecological zones (Handy et al. 1972; Kelly 1989; Gon 2003).

The significance of the NWHI natural, cultural, and historical resources led to the establishment of the Papahānaumokuākea Marine National Monument to protect these resources. In developing a management framework for the Monument, consultation with the Native Hawaiian community was sought to address how to best conserve cultural sites and practices. Ongoing consultation and engagement with the Native Hawaiian community is an important aspect for the success of the Monument's management through the implementation of the MMP. Protection of cultural resources and access to the NWHI is of high importance to the Native Hawaiian community to maintain traditional practices. Proclamation 8031 recognizes the cultural significance of the NWHI and outlines specific procedures to grant access to the Monument to engage in Native Hawaiian practices. In addition, when prioritizing management objectives for the Monument Management Plan, the MMB developed two action plans within the MMP to specifically address Native Hawaiian cultural practices and involvement in the Monument.

The MMP action plan strategies and activities strengthen the relationship between the Monument Co-Trustees and the Native Hawaiian community, and increase Native Hawaiian participation in the management process. Potential impacts to cultural and historic resources are carefully considered with science and management when assessing the applicability of a project or action. Additionally, cultural assessments by members of the Native Hawaiian community are part of the permit application review process for allowing access to the Monument. All activities proposed in permit applications for cultural access are assessed to determine if the purpose and intent of the activity are appropriate and deemed necessary by traditional standards in the Native Hawaiian culture (pono) and demonstrate an understanding of, and background in, the traditional practice, and its associated values and protocols. All persons entering the Monument pursuant to a Monument permit are required to attend a cultural briefing on the significance of the NWHI resources to Native Hawaiians.

Monument goals as implemented through the MMP reinforce the area's great cultural significance to Native Hawaiians. The implementation of the MMP will have a beneficial cultural impact and will provide increased opportunities for Native Hawaiians to play a significant role in the management of the NWHI, an area of great natural, cultural, and historic importance.

## **8.0 OBSERVATIONS AND CONCERNS YIELDED FROM COMMUNITY CONSULTATION PROCESS AND RESPONSES TO ADDRESS THESE CONCERNS**

**Comment:** The community commends the Office of Hawaiian Affairs (OHA) for facilitating the cultural working group meetings. The community feels it is vital that OHA has an equal seat within the managing board to represent the Hawaiian community in this joint venture. The idea of having mandatory cultural monitors to accompany the scientific expeditions was also expressed by a number of individuals including Auntie Wilma Holi who stated, "...the Office of Hawaiian Affairs needs to empower a body of people that will monitor and not leave it up to other entities..." (Kupuna Holi 2008)

**Response:** The MMB is committed to regular consultation and engagement with the Native Hawaiian community, including the Native Hawaiian Cultural Working Group. The Office of Hawaiian Affairs is a member of the Monument Management Board. Since July 2008, cultural monitors have been on accompanied each of the trips to Nihoa and Mokumanamana. These cultural monitors have been provide by the Office of Hawaiian Affairs, however, in order to provide these experts with adequate compensation for their activities, each agency should provide the funds to support the cultural monitor in the future.

**Comment:** When speaking about Papahānaumokuākea, individuals have referred to the islands as a Pu'uhonua, a Wahi Pana, the Kūpuna Islands, the ancestral Godly realm, and the Stargate or Portal. Papahānaumokuākea is viewed with great respect by all participants, and the understanding that it is very sacred and unique to Kānaka Maoli (Native Hawaiians) was continually expressed throughout the interview process.

According to many of the participants, the islands within Papahāhaumokuākea are the physical manifestations of the Hawaiian ancestral Godly realm. "The islands and islets after Ni'ihau are all considered the edges of the Hawaiian universe..." (Tsuha 2007). This is the place where the Hawaiian ancestors make their westward journey as their soul leaves the physical temple of the human body. "These Islands and waters are the pathway that the spirits of our ancestors take in their afterlife. After the spirit separates from the body after death, they travel in the ocean in a north-west direction past the islet of Lehua on rout to Pō (creation). These Islands, which are remembered as ancestral homelands.." (Kikilo'i 2004) see appendices for full testimony to WESPAC.

**Response:** An acknowledgement of the importance of Papahāhaumokuākea to Native Hawaiians is found throughout the Monument Management Plan (MMP). In addition, a mandatory cultural briefing is required for all who access this special place. The MMP

includes a Native Hawaiian Cultural and History Action Plan, and a Native Hawaiian Community Involvement Action Plan, with the goal to increase the understanding and appreciation of Native Hawaiian cultural values related to Papahānaumokuākea Marine National Monument.

**Comment:** Many of the participants consider Pahānaumokuākea as the “sacred ancestral homeland” which needs to be respected and revered. It is strongly suggested that anyone who ventures into this “sacred ancestral homeland” should intimately understand that “In the Hawaiian epistemology, only death grants one entrance onto those lands. Therefore, anyone who is allowed to traverse there and back needed to embark on the voyage through intense ceremony throughout the duration of the expedition” (Tsuha 2007).

**Response:** An acknowledgement of the importance of Papahānaumokuākea to Native Hawaiians is found throughout the Monument Management Plan (MMP). In addition, a mandatory cultural briefing is required for all who access this special place. The MMP includes a Native Hawaiian Cultural and History Action Plan, and a Native Hawaiian Community Involvement Action Plan, with the goal to increase the understanding and appreciation of Native Hawaiian cultural values related to Papahānaumokuākea Marine National Monument. A key component of the cultural briefing is to stress the how Papahānaumokuākea is considered a sacred place.

**Comment:** All the participants have a great desire to continually perpetuate their culture and reconnect with their seafaring ancestors by respecting this wahi pana. All of these individuals maintain strong cultural ties to the land and sea through hui such as the Polynesian Voyaging Society and Na Kupu‘eu Paemoku. The participants are concerned that people may be ignorant, forgetting that the Hawaiian culture is still alive. Therefore, access is imperative to the continuation of Native Hawaiian cultural practices. Kikiloi confirms this belief by stating, “.in our customs and traditions...There’s the saying, maka hana ka ike, knowledge is in doing...having Native Hawaiians continue to experience and reconnect, with the Northwestern Hawaiian Islands is vital” (Kikiloi 2008).

Research is another avenue some Native Hawaiians have utilized to reconnect and relearn about Panahānaumokuākea. Native Hawaiians, such as Kalie Tsuha, feel it is imperative to conduct their own research “....so that further rediscovery and revelation can transpire to assist with clearing the obscurity and provide understanding...” (Tsuha 2007).

**Response:** An acknowledgement of the importance of Papahānaumokuākea to Native Hawaiians is found throughout the Monument Management Plan (MMP). The MMP includes a Native Hawaiian Cultural and History Action Plan, and a Native Hawaiian Community Involvement Action Plan, with the goal to increase the understanding and appreciation of Native Hawaiian cultural values related to Papahānaumokuākea Marine National Monument. The plan has an entire strategy devoted to conducting, supporting, and facilitating Native Hawaiian practitioners access to the NWHI. During this past summer, six cultural practioners where provided access on research cruises to Papahānaumokuākea.

**Comment:** Many participants feel it's vital to restore original names and when necessary, give appropriate Hawaiian names to the islands that don't currently have one. "There are cultural reasons for that one is when you give a place a name, that adds to the mana of the place and adds to the understanding of the place as it reflex the whole. So every effort should be made to refer to the earliest known name possible to place the mana back" (Alia 2008). Many names are found in mo'olelo and oli so it is recommended that "a committee with various interested parties can be created for this purpose" (Tsuha 2007). Na Kupu'eu Paemoku has recently conducted their own research and implemented the work of Kikiloi in this naming process.

**Response:** The MMB will work with Native Hawaiian groups such as the OHA sponsored Cultural Working Group or Na Kupu'eu Paemoku seek the appropriate place names and to facilitate the process to restore the integrity of places with their Hawaiian names and/or to work towards development of appropriate names for those places without a Hawaiian name. If a traditional Hawaiian name cannot be revealed through research then the group may suggest a new name in relation to the wahi pana. In the MMP, there is a activity devoted to developing a process for Hawaiian naming of places, organisms and the like.

**Comment:** Nihoa and Mokumanamana are both listed on the National Register of Historic Places for their cultural and historical significance. There is great concern for these Hawaiian sites, they should be constantly monitored and cared for. Therefore, it is vital that the recommendations listed in the MMP for a preservation plan be implemented and carried out in a timely manner.

**Response:** As noted, there is a strategy in the Monument Management Plan devoted to this activity.

**Comment:** Several participants are concerned about the military presence in the monument. These participants oppose any further impacts such as war games, bombing and missiles tactics especially near or over Nihoa and Mokumanamana.

**Response:** The military is exempt from the provisions of the Proclamation. Under the Proclamation the military is required to respond if any Monument resources are harmed, lost, are destroyed. The military must operate in a manner that avoids impacts on the Monument resources and qualities, if possible. This is actually a much stronger obligation than is required of the military for its activities in other areas. Furthermore, the military is not exempted from all other applicable laws and regulations including the Endangered Species Act, the Marine Mammal Protection Act, the Wildlife Refuges Act, cultural consultation under the Native American Graves Protection and Repatriation Act, and the Migratory Bird Treaty, to name a few. The Monument Management Board (MMB) is working with representatives of the military to develop a consultation process for military activities in the Monument, which will ensure that resources and qualities of the Monument are not harmed.

**Comment:** Cultural practitioners Keone Nunes and William Aila stress the importance and concern in regards to gathering rights for cultural practices, such as but not limited to, Koa'e 'ula bird feathers for making of kähili and Ka'upu bird bones for the art of Kākau (tattoo).

**Response:** The Proclamation and State law allows for non-commercial subsistence gathering for perpetuation of cultural practices under the Native Hawaiian permit issued by the Monument Management Board.

**Comment:** Several participants—including representatives of Kāheha—voiced concerns about commercial fishing in the waters off the monument. “Opening this area up to the general public and commercial fishing will disrupt the sanctity of this area” (Kikiloi 2004). Interviews conducted prior to this report also voiced similar concerns regarding fishing in Papahānaumokuākea. The following recommendations come from Kepa Maly’s 2004 testimony to WESPAC see appendices for full testimony:

a) Subsistence fishing should be allowed, and will continue. Kūpuna felt strongly that the use of ocean resources in the Nā Moku 'Aha is not only a part of their cultural identity, but it is also their responsibility—their kuleana. In their view subsistence use includes the idea that you take only what you need, and that you also give back. In Nā Moku 'Aha, kuleana obliges you to use, but to also care for and protect the area. This is expressed in the Hawaiian concept “Ho'ohana aku, a hō'ola aku!” (Use it and let it live!) (Kupuna Ka'anā'anā, October 27, 2003).

b) Future commercial use of the waters and resources of Nā Moku 'Aha should not be allowed. It is not culturally appropriate, nor economically or ecologically. Kūpuna saw first-hand that fishing in Nā Moku 'Aha forces the fisher to overexploit resources in order to get some return for their investment. They have seen the over harvesting and exploitation of many species including the armorhead, giant 'ama'ama, black 'ulu, black lipped pearl oyster, weke pueo, small mullet, and the collapse of the lobster fishery three times. The over fishing and collapse have occurred irregardless of the “best science” and determinations of “maximum sustainable yields.”

**Response:** Under the Proclamation, commercial fishing for bottomfishing will be phased out by Dec. 2011. All other types of commercial fishing are no longer allowed.

## APPENDICES

### Appendix A: Transcripts of Interviews

Transcripts for Wilma Holi and Nolan Holi will be provided at request only.

William Aila (WA), July 16th 2008

Wai`anae Small Boat Harbor

Interviewed by Kēhaulani Souza (KS) for the Department of Land and Natural Resources

---

KS: Do you agree that I can use the interview that you did with Na`alehu and Sterling (OHA) and this is a supplement to that interview?

WA: Yes I do.

KS: So basically what I wanted to add to that interview is do you feel that the NWHI can replenish itself? Do you feel it is okay to fish up there?

WA: Let me answer the first question from a biological commercial fishing standpoint my recollection begins with the kupuna Kapahulehua, uncle Walter Paulo, uncle Buzzy Agard, Ka`anā`anā all those folks that have been there that have fished, tried to commercial fish there. All entertain it's not sustainable there. My feeling is that upon the knowledge of this kupuna that the commercial fishing is something that should not be allowed there. Another, the Western Pacific Fishers Management Council has made overtures and suggestions that commercial fishing is a culturally appropriate activity in the North Western Hawaiian Islands, because Hawaiian's commercial fish. To that I say, I agree Hawaiian's commercial fish in the main Hawaiian Islands and that commercial fishing is out growth of barter in the system and that began post connection with the outside world, by European explorers. Prior to that, our original barter system, the families up mauka, didn't say okay tomorrow were going makai and the going rate for kalo lehua, is five akule, they just never did that. They sat around and talked about okay, today we going makai and aunty so and so this is her favorite, uncle so and so this is his favorite. So we are going to gather those resources and were going makai and were going to pick them and at the same time the folks makai know they were coming. So they would know that aunty up mauka her favorite limu is this, and her favorite crab is this, her favorite fish is this, and they would go and gather so it wasn't a haole perspective of bartering. A Hawaiian perspective of ho`i, ho`i and taking care of the family. This bartering system that sort of the economy was switch on Hawaiians which in the main Hawaiian islands because of our ahupua`a system allowed for that sort of changing from a bartering system to a one on one cash payment. Yes I would say that Hawaiians that live in the main Hawaiian Islands certainly considered commercial fishing an extension of traditional practices because through no fault of their own those families that were fishing families had the economy to change all that. In Northwestern Hawaiian Island especially Nihoa and Mokumanamana there was no ahupua`a system. The distance from shore to mauka is so short that there were no families living up mauka and makai. So the

Western Pacific Fisheries Management theory of fishing commercial fishing should not be allowed in the NWHI it does not fit. The same people who live for several hundred years on Nihoa and Mokumanamana did so by utilizing the resource mostly makai and a little bit mauka. So no commercial fishing in the NWHI! Because the kupuna have said so and because tradition and history says according to traditional practices that there has been no commercial fishing out there prior to captain cook. I am not in favor of commercial fishing!

KS: So basically your main concern is?

WA: Well that was from a biological standpoint! Spiritually I still think that Hawaiians can have already resurrected that relationship with the `āina the kai. The more that we pay attention and pray to and pray with those the stronger the connections come. And for folks who seek `ike the stronger that connection becomes the deeper the `ike will be.

KS: Can you talk about the significance of the repatriation of `iwi kupuna.

WA: the one with Halealoha, Maka them. The idea was as part of the larger re-burial of kupuna reconnected their `uhane on their journey, there was `iwi found in the bishop museum that was from both Mokumanamana and Nihoa. So it is part of the larger process of taking hold of this type of burial and making sure they were re-interred. There maybe other `iwi that were taken from that area that are sitting in other museums outside of the united states so in that case it would be the kuleana of some Hawaiian. Some Hawaiian who would cherish that kuleana to certainly go back there you know given the fact that you have to worry about the birds and the plants freezing this and that. I think that are good protocols because we have a kuleana to both... those that have to take of the eco system the `āina that they area. So that's why we as Hawaiians agree to abide by the protocol. It is in the act of protecting of what is there now to keep it sustainable for future grandchildren.

KS: Are you concerned about the increased human impact on the environment?

WA: Well certainly be responsible for your access to the NWHI Papahānaumokuākea is always is introduced pest. So access has to be one that is good intent and is not going up there to maha`oi and trying to accomplish something that is positive to add to the body of knowledge to honor the `uhane that area there the kupuna that are there the stories that have been passed down honoring those kinds of things would be good reasons to go up there research that could help invasive species that can help the species that are in trouble that can help explain why thing are the way they are up there. To make things better in the main Hawaiian Islands all of that and any research that adds to the body of knowledge that helps. Cannot have too much research the research has to be spread out over a period of time over a large area so that it is not that detrimental to Papahānaumokuākea. Besides research if we had two thousands Hawaiians on the island going every where that would not be good too! First what would there intent be? In the future we are going to work with Fish and Wildlife Fisheries because there are cultural

sites on the island that are being impacted by the birds and that needs to be mitigated so how do we mitigate the action of the endangered species on a cultural site and where is the balance. That is something that native Hawaiians and Fish and Wildlife will have to work out and I am sure it can work out. In a way that it is not harmful to the birds but at the same time prevents the cultural sites. It is not just protecting the pile of rocks it's about honoring the pile of rocks it's about those who put their blood and their sweat who put their tiers into the pile of rocks. So it is going to be a rocky road but certainly one that needs to be traveled. I think Fish and Wildlife has a duty to consult under section 106 of the National Historic Preservations Act. The consultation cannot be like that of the army, they send you a letter to get you opinion and they employ. It has to be one of, we got you opinion and now how can we work things out with the physical, the biological, and the spiritual of Papahānaumokuākea. If we all work together we certainly can accomplish all of these three goals because it the sum of the whole of all of these goals its not ....you cannot have one without the other one.

There is one concern of mine of access by the folks of the pacific missile demar. Currently it looks like from the environmental impact statement that they are proposing-- that there is a possibility of them proposing shooting missiles and missiles coming in that intercepts over both Mokumanamana and Nihoa. Which will then have the potential for either broken pieces of rockets or whole rockets or miss fired rockets landing on not only the cultural sites but the biological sites. Because the rocket fuel is there and it has been known to be hazardous and if it rains down it could have an impact. If broken pieces rained out it could have catastrophic impacts on the cultural sites as well as the biological so the recommendation that the RAC is going or that I will personally make is that the military take a look at changing what the fan of the surfaces dangers are, away from the two islands. So at least when they fire the chances of any impact on the two islands or the water surrounding, are further away. So mitigate the maximum extent possible to the point of not firing. I am not sure of the underground warfare because we didn't get a chance to talk about it a lot in the EIS. But then again if they run a ground if they spill oil that would be an huge impact.

KS: What about the marine archaeology?

WA: Yeah! Many of those ships area predated pre annexation subsequent territory of Hawaii and state of Hawaii from a Hawaiian perspective many of those ships belong to the Kingdom of Hawaii and the nationals of Hawaii. The monument managers and the national managers of the monument need to understand this claim and this affiliation towards those ships and there is should be certain consultation should be a type of recovery or curator ship of "artifacts" of these shipwrecks before they take action. There should be real consultation weather or not the artifact would be removed and if they are removed where are they going to be. So that needs to be done.

I think in the cultural working group- the Hawaiians that I have spoken to is that the desire to go back and recognize the earliest things for parts of, parts of the islands and atolls that comprise of Papahānaumokuākea. So if research determines that through oli or through chant or documentation of annexation place things within this moku the moku of

Nihoa the moku of Manamana that there be a conscious effort to utilize the earliest land claim.

There are cultural reasons for that one is when you give a place a name, that adds to the mana of the place and adds to the understanding of the place as it reflex the whole. So it leads to the deeper understanding of that particular `āina and the whole moku and the events that have accrued at the time of the naming. So it's not a matter of wanting to get rid of the haole names, it's a matter of returning the mana and the respect the first folks that were there who gave its original name and understanding why the original name was there. Often times the original name is there for a reason it is pointing to a resource, its pointing to a reference point in navigation, its pointing to a very special person who did something there or an ancestor from where they come from to honoring that ancestor when they land, thanking that ancestor for guiding them and protection. So every effort should be made to refer to the earliest known name possible to place the mana back.

KS: World Heritage Status?

WA: I am in support of World Heritage Status! For one it brings additional recognition to the special ness to this place not only biological we all know how special it is biologically how-40% of the species there are indigenous that's nice and it is important. But there is another layer to that and the other layer is its special for native Hawaiian history, native Hawaiian genealogy. World Heritage application should treat both sides of that application equally as a significant as a significant biological as well as a significant cultural place. To me there no down side because some people say oh well that would bring extra tourist, the average person cant get there. The only place that the tourism is going to be continued to be aloud is with an increase with a proposed increase from 30 people overnight to 50 people overnight is at Midway. That tourism at Midway helps to supplement the operating cost for the important field station up there as well as the run way open incase there is a mid-pacific flight that needs to land. The down side to World Heritage Status is so minimal compared to the up side. The recognition by other Polynesian as well as international societies of how special this place is for both its biological and cultural. So I am fully in support for the life of me I can't understand why any Hawaiian is not in support of this.

KS: Mahalo for your time!

Louis “Buzzy” Agard (BA)

July 10th 2008

On the Island of O`ahu

Interviewed by Kēhaulani Souza (KS) for Department of Land and Natural Resources

---

KS: Ok so do I have your permission to tape record and use this interview.

BA: Yes.

KS: and your name is?

BA: My name is Louis Buzzy Agard.

KS: I have this interview that Kepa did and I don't want to ask the same questions again. But can you talk a little bit about yourself where you were born and your parents names so that we can acknowledge them and bring them here too?

BA: Ok I was born 1924 February 25, here in Honolulu at Kapi`olani Women Children Hospital. I am actually from the island of Kaua`i. I left there when I was 12 years old-a country boy to go to Kamehameha Schools. My mother's name was Aloie Mariah and Hawaiian name Kahaulo`iahiahiahi. When I ask my mother what that meant she said red hot lovers at sunset in the taro patch.

KS: Wow!

BA: And uh so I was curious! Hawaiians were named after something or in the event of the occurrence of the time of birth so. What does your name mean so that I can understand like kaha and bowl of poi and kaha make and lo`i taro patch meaning an event of some kind in the taro patch. Ahiahi meaning very hot so she explained that was my uncle and aunt making love in the taro patch and they gave me that name. I said but “that is your name it's not your aunty and uncle name, so what does that mean” So she did not explain very well so I had to interpret it. So yeah my mother was Aloie Mariah Kahaulo`iahiahi Prestidge. Her father was an English man.

KS: How many years did you fish up north and when did you realize that the area was fragile?

BA: 10 years because I kept going deeper and deeper. I started with in shore then off shore went into depths then into pelagic and I was catching then I ran out of reef fish first.

KS: What type of reef fish?

BA: Moi, mullet, `āholehole. You have to stop, they don't come back, You have to switch. It became apparent if there was a break down in one of the five things about fishing you have; sick men, bad weather you can't go fishing, broken down boat, wrong season that you fish. You have to have five conditions to make a successful trip. If any one of those five conditions- you cannot go with the limited resources at your disposal to fish your out. So this still happens today if you have a boat and no crew your out! If you are fishing in the wrong season your out!

KS: So 10 years later you realized that you needed to stop fishing?

BA: Yeah! I had to stop. I gave up! I told you I looked ninety degrees to Honolulu, set the compass and never looked back, never turned back. That was the end. After ten years I struggled, tried to make it unique most of the guys fished with me died out there. They lost there lives. It was an unsustainable fragile, you cannot manufacture the fish, I was not in the business of breeding fish.

KS: In another interview, you mentioned a biologist that said that there were no nutrients up north?

BA: Yeah his name was Okumoto. He worked for the DLNR he said "you know Buzzy you know the fish you catch down there we went down there for check the nutrient and you know not enough for sustain the size operation you run". I said, "what you mean there is plenty fish here." He said "no the nutrient to feed that supply which is not there what you are catching is the cream of the standing stock. When you fish you going have nothing" which is true! What he meant was you had to go out deeper and deeper hoping and praying checking every so often and that's what I told the university. I go back the next week and fish, no fish go back the next month no fish, go back the next year no more ball, go back the next ten years, no never saw it again.

KS: Did you see any cultural practices during the time you were up there?

BA: No. After all of this became open I suggested to Nainoa you have been sailing all over to Tahiti and all over why don't you guys sail up to the island.

KS: How important do you think it was for Hawaiians to do that?

BA: Well it gave us a strong cultural impetus too, it was a opportunity of what you know about our culture and to practice it and what you don't know you can implement and put something together that you know about. And say well you can do this type of voyage where it is risky. And you know that some Hawaiian some place, some time have seen those same things you are looking at and what was the wonderment and their idea at that time. You can make a composite of knowledge when you have all of that and you can make it fit.

KS: So do you think it is still important for native Hawaiians to go up there?

BA: I think that they would gather some connection out of it. They can identify to it if they know their history then they look at what other Polynesians have looked at. I think that the ora about that is self sustain you can look and you can see and not all of them ended up here. ...

KS: So earlier, you mentioned you were concerned about the human impact on the monument?

BA: Yup Yup! Yes and Kāhea have adopted it and that means no human footprint! Never mind all the books that says do no harm meaning you are there already but they are telling you do no harm. I don't think that is right if you are letting too many people in. We don't need any body up there what we need is for the place to recover naturally! And then they migrate and get carried down here by the currents like they always have been. Because they area the same DNA because the fish they have tagged up there have been found tagged down here. There is this interchange and if there is only 100 miles across, the fish can swim 100 miles guarantee. But the current itself now we find the counter currents and everybody always thought that the trade winds always went in the direction and that the currents went in that direction but they find that the currents move in all kinds of directions. The Hawaiian 1500 mile chain is like a big strainer, straining everyday. Everyday the sunrises and the current follows the sun -its the closest and it pulls up this mass of water and causes the tide and the tide starts at sunrise close to the eastern region and follows the sun all day till it sets in the western region. But if the sun and the moon are aligned together then you have the double pull then you have the double tide. When the sun and moon are together or getting close together you have this going on every day and this is a massive of water for it to raise for one to two feet. For how many miles this massive thing moving every day with the sun.

KS: Do you feel it is important for Hawaiians to be involved in the management of the monument?

BA: Yeah in the old days that was the primary thing for existence. Everything they did was in tuned with nature to make it possible planting doing all this work they were used to hard work. That's all they ate so they had to know this and Hawaiian society it all revolved around the environment

KS: What is your main concern for Papahānaumokuākea?

BA: Well Kāhea adopted the idea. Mine is no human foot print. If we leave that natural place alone it can continue to reproduce and continue to feed us. Because food is important and I say no human footprint which means no carbon footprint if humans are up there's carbon up there. They are going to be burning oil and put carbon in the atmosphere. They do all kinds of things that you don't need up there you can bring your oil gear and let the fish propagate up there...so I say no human footprint.

KS: Are you talking on a large scale?

BA: Yeah?

KS: Can you define that?

BA: Well when I say no human footprint I mean like guys who want to go up there like tourist guys that want to go up there, who want to go fishing, like charter boats fishing, which they have been doing.

KS: Just to clarify, so you're saying no human footprint means no tourist, no fishing what about cultural practices?

BA: Yes, cultural practices are allowed because they are not going to do anything that is harmful. But when you start talking about new things everything they do is harmful that's why we have problems like warming. You name it that's a big problem burning phosphor fuel. Everything, if you leave it alone up there it can recover but at the same time if you spread that living organism you can enjoy. Cause you know already it travels down here cause it has been tagged. We know that the DNA is the same cause it has been tested. There is always people who are going to want to do research to get their Ph.D. That's the other side and they can always get money out of the government because the government is always looking as if this is a break through then we got more economic impetus. That's what this world is about. One cultural is natural is saying I just want to exist and the other one is I want to make more money. The two psychology is different. When you have enough there is no need for getting more. But the Americans if they got plenty they want more. They have a propensity to make more money. The whole idea is to make money everything they look at is to make money.

KS: Are you confident in the management plan?

BA: So far we have had some problems and the last thing here is wide open. When they dropped out all these revisions and excluded all the things that Kāhea was asking about. I asked that girl Susan White why did you guys drop all the insights into managing the place. I asked why was it all avoided. Her explanation was the proclamation is the strongest implied thing that we have to do that is in the document. Well, that means that we have to go get all the books and go read the proclamation so that we know. What I am saying is why don't you just put it into the permitting process already so nobody has to go find the book and go read it. They have all the money to do this and they want to continue to use this place for defense. It is a great big place out there. I mean God they shoot their missiles back and forth dropping in the water. They shoot their missiles on to Ka`ula Rock the whole thing is collapsing into the ocean. Now you look at it steep like that and you can not even climb up it to go look at the artifacts because that's where they practice. They lost Kaho`olawe now they go out there and they tell the pilot and say you find this target with so and so coordinates and when you get there you are going to fire a rack of rockets and you hit it and you know where you are supposed to be and you do it. That is what they do and no one is out there but I am out there and I see it! So I talk about it. I tell um eh they are out there and they are practicing now, they are practicing shooting

down the missiles. Some place shooting it down over Nihoa letting it fall on the island and killing all the birds. The birds are protected by federal law and here is the federal guys killing them. I have seen the sky filled with bird wing and bird feathers blown to bits, blown to bits! The island straight down like a cliff.

Based on what I know and what I have seen, don't do it. Don't go up there and go fishing! Leave it alone! There is nothing to be gained.

KS: Ok let's hit all of your cultural concerns again

BA: No fishing! No Bombing! No more war games up there anymore! Those islands 1200 miles 1500 miles long is farther apart-or the island that I am worried about is closer to us then that and that is Johnson Island. It is only 700 miles southwest. And they burn all of the poison gas there. You know, they brought it all back from Germany all the World War II stations. And they burned it there and they said that they weren't going to do it and they did.....

World Heritage Yes if you weigh the two sides the practicality of getting up there almost is zero! How can you get up there? You can charter a boat but it is going to cost you an arm and a leg! So you need a permit.

KS: West Pac still wants to fish up there NWHI?

BA: .....If you open the door sure they want the lobsters they are tied in to the big lobsters, the king crab in Alaska. When that season runs out ..in the past they been coming down here. They get thousands of traps and they rape the area. They take all the babies all the female's they don't care! So when you got that attitude the American attitude making money off of resources there is a big difference between indigenous people who take to stay alive and eat. Americans take all to sell and when they do that they take that standing stock that is waiting continually and put in the freezer. That works for the consumer because you can buy it later when that fish is in the freezer that fish does not reproduce, if you leave it there it is reproducing. So lets hope that we can educate them but not that system we have the capitalist system make all the money you can make take um all! Take um all! If you let them go they take everything the hell with the next guy.

KS: Do you remember any old timers talking about any traditional place names for any of the islands?

BA: You know in the last meeting they were asking what should we name these seamounts? Because out here there are more seamounts, the emperor seamounts that the Japanese named because they were fishing them. Because a seamount is `āina it is a place of food. Because at the base of the seamount it slopes that's where all the food gathers. So I suggested that we could name it according to age. I have not run across any Hawaiian that knew or even knew that they were there because an old Hawaiian did not have an dept recorder. It would have been very difficult for him to have found it. You

can do hand sound, I have done that before because I went fishing without an electronic device. I went with a hand sound. You throw the weight over and span it. When you bring it up at so many fathoms you set your hook ...other wise you would be too high in the air and the fish would be too far below to bite the hook so you have to do it that way. So I suggested to name by the old age by the number and the age.

Transcripts from Video Interview Conducted by Sterling Wong and Na‘alehu Anthony  
for the Office of Hawaiian Affairs

**Interview**  
**WILLIAM AILA**

QUESTION: So basically, first, say your name and spell it out.

AILA: Oh, sure. Uh, name is William Johnson Aila, Jr. William, W-I-L-L-I-A-M; Johnson, J-O-H-N-S-O-N; Aila, A-I-L-A; and Junior.

QUESTION: And you’re from ...

AILA: From Waianae.

QUESTION: Born and raised?

AILA: Born and raised.

QUESTION: What do you do for a living?

AILA: To pay the bills, I manage the Waianae Boat Harbor for the State of Hawaii. Uh, this will be my twenty-third year working for the State at the Waianae Boat Harbor. Um ... that’s how—what I pay the bills from. My passion is uh ... making things better for my community. So that’s what I do for the psyche part. [CHUCKLE]

QUESTION: And how do you do that? What kind of things do you do?

AILA: Well, belong to many groups that um ... sort of push the envelope, trying to—trying to ... trying to bring justice to uh, certain groups of people. Um ... Hui Malama O Makua, fighting for the return of Makua Valley. Um ... um, board of directors of Mao Farms, um, bringing organic agriculture, as well as leadership programs within that—that uh, program that ... produces, you know, off of the land. I mean, th—there’s no better way to ... to honor the land than by producing food for people. Um ... belong to Hui Malama I Na Kupuna O Hawaii Nei; you can’t find a more controversial group than that. Um ... just trying to bring peace and ... help our kupuna on their long journey um, after being ripped out of the ground, taken to many parts of the world, studied, abused ... uh ... treated disrespectfully. Um, so bringing them home, uh, showing them respect. I—as I said, putting them on their journey to po, so they can sleep the long sleep. That’s just a few. [CHUCKLE]

QUESTION: Plenty. What cultural practices do you engage in?

AILA: Um ... well ... fishing is the one that comes to mind first. Uh, fishing was a very traditional and customary practice. Of course, today, we used modern materials, um, but the psychology of catching fish, the intent um, uh, by which uh, you wake up in the morning and decide you're gonna go jump into the—the ocean um, to—to obtain resources i—is really the same, yeah? I mean, for sustenance, you know, you're gonna catch fish for food, you're gonna catch for your family. Um, sometimes you catch fish for religious reasons, yeah? If you're going to um ... for example, another practice—uh, this is gonna be our eighth year in Makua doing makahiki. Um, my job, of course, because I'm the fisherman in the group, is to go procure, um, the aweoweo. So ... fishing can be done for many reasons; you know, sustenance. Um, today, fishermen are commercial fishermen because the economy was turned on them. Um, it can be for religious reasons, can be for recreation. You know, there are many reasons to go fishing. My favorite reason is to make my aunties happy, 'cause they like certain kind fish, yeah? Cannot go wrong by making your aunties happy. So that's uh—all you fishermen out there, remember that. Find out what their favorite fish is, and once in a while on the special occasions, their birthdays and stuff ... show up with some of their favorite fish.

QUESTION: How'd you learn how to fish?

AILA: Interesting. Um, I learned how to fish from a few uncles, um, the basics. And then uh ... a lot of it, just ... on my own, being in the ocean ... doing what kupuna would have done. Being very observant about how fish behave, how they react to certain things, uh, what they do when the seasons change, when the water becomes colder. You know, those kinds of things. And then I was fortunate; as I ... as I grew into my teens and uh, my adult years ... I was able to talk to many people who I feel are great fishermen, who took the time to share with me um, techniques, took the time to share with me their philosophies, yeah? Um ... Carl Jellings, uh, not too much older than me, but a very astute, akamai fisherman, born and raised on the Waianae Coast ... um, fishes commercially, but fishes with ethics. And it's hard to find a fisherman who fishes commercially ... in combination with those ethics. Um ... Leslie [INDISTINCT] a good offshore fish—one of the best offshore fishermen that I know of um, took the time to teach me how to catch uku, um, how to catch papio, um ... and many others. I mean, talking to—talking to kupuna, asking them when they were young, what were some of the things that uh, they remember their kupuna doing. Uh, asking them about things like uh, giving hookupu, uh, things like um ... if they ever saw their tutus keep kuul—uh, kuula stones. And you'd be surprised; many of these fishermen that are in their seventies and eighties now, they recall. When you—when you ask

them those questions, and they think backwards, and they go, Oh, yeah, my tutu used to do that. You know. Talking to some of the—the Leslie family on Hawaii Island going, Okay, sometimes the akule schools and the opelu schools, they no come in, they stay outside. What would you guys do? We would take ... you know, Henry Leslie thinks back, and he goes ... Uh, my tutu, they would go get on black pig, and they would kill the black pig, put ‘em in the imu, and then take—as soon as they took it out of the imu, feed everybody down at the beach, whoever was there, everybody would eat. Whatever is left, take ‘em out on the canoe, offer that as hookupu, and then within a matter of a day or two, the schools would come in. So ... triggering those memories in those kupuna, uh, making them ... sort of making them uh, go backward, looking at the lessons or the values that sort of were shared with them from a cultures—cultural perspective, but not something that is in their conscious today because of the need to—to live in a Western world, um ... shows that ... innately, they still have those—they still have the connection to their kupuna and those cultural practices uh, that those kupuna used to do. It’s—it’s still there; you just gotta trigger those memories, and then they will—they will share the things that they saw, that they continue to do today.

**QUESTION:** What do you think is the importance of the culture to you, and to the wellbeing of Hawaiians in general?

**AILA:** I think Hawaiians today, a lot of the problems that Hawaiians face today is because we’re forced to live in a world that’s schizophrenic. And what I mean schizophrenic is that we have to ... we have basic Hawaiian values that are ... based on what is best for ... our families, then our ... extended ohana, then our villages, uh, then our moku. And today’s society, it’s superimposed over that um, has the emphasis on the individual. So what is best for the individual. And it’s—it’s these two culture clashes that cause a lot of the problems, because many Hawaiians can’t figure how to live with their feet in both worlds. And therefore, they get toppled over on one way or the other, often leading to, you know, um, drug abuse, leading to uh, domestic violence, leading to uh, some of the social ills that we have. It’s because their foundation uh, in the Hawaiian world, which is based upon what’s best for—what’s best for me and you, not necessarily what’s best for me, um ... is not solid. If we could teach more of our kids that basic foundation, that it’s really about—not about you the individual, but how ... how you interact with the rest of your family, and how the health—health of the family is the most important thing, um, then the health of the community, and build upon that outward; uh, if they had that solid foundation, they could survive anywhere in the world. And that’s what our kupuna had a hundred years ago. I mean, you ... you think back um ... I always go back to the aunties, yeah? You look at aunties; they’re always making sure everybody get something to eat, they always making sure everybody get enough sleep. They always make sure that um ... uh,

you have enough time for play. You know, always make sure the work is done too, but it's that balance that uh, that the aunties bring um, that really is the core of—of Hawaiian values, yeah? What's ... what's best for everybody around the table, as opposed today what's—I'm the most important thing, yeah? I mean, I see too many Hawaiian kids running around, thinking they Popolo. And it bugs the hell out of me, because they're not Popolo. Popolo is someplace on the mainland in the ghettos. And we don't have ghettos, especially in Waianae. You know, so when you walking around with the hat sideways and your okole sticking out ... it's a void, yeah? We—we're not doing enough as parents, we're not doing enough as makua, we're not doing enough as kupuna to instill those—the—those cultural values on the next generation. And as long as that void is there, it's gonna be filled by the media. And so we gotta make sure that uh, we offer these—this ability for our children to look at the media today, separate what is ... what is fact, what is fiction, what is good. And if they had a good foundation, they'd be able to do that.

[GENERAL CONVERSATION]

QUESTION: [INDISTINCT] your background with the area. What's your experience with the region and ...

AILA: Okay.

QUESTION: [INDISTINCT]

AILA: Well, I—I'm—I've been to Midway once. Um ... and uh, it was a ... it was a very uh ... personal experience for me, because I had heard fishermen talk about three-pound akule, you know. And I, as a young, skeptical fisherman, having not seen any, I thought that they were—you know, the older folks were just pulling my leg, like oftentimes older folks will, yeah? They just like see how much uh ... how much you really know. They'll—they'll feed you a little bit, and just check. So you know, they would talk about akule that were three pounds. So, okay, I—I listened. But I never saw anything bigger than about uh, a pound over here, as I grew up. So when I got to Midway, I jumped in the water and snorkeled. Like I wanted to see the place, I wanted to taste the waters; something that I do, yeah, every place I go. Jump in the water, taste the water. 'Cause the water is—you can actually taste the difference in salinity as you go around the islands, yeah? Um ... was—was snorkeling, looking at the fish; lots of big fish. Um ... but not a lot of ... variety in terms of uh, species. But I was swimming, and I came across this big shadow, and I thought, Oh, no, here comes a big shark. I backed up; and as I backed up, the fish came closer to me, and I saw that it was a school of fish. And as it got closer and I could make out the individual fish, um, I saw akule that were indeed at least three pounds, and maybe even bigger.

And it got me to—into thinking about what they call a sliding um, a sliding base, yeah, a scale, uh, that w—the sizes of fish that we grew up with and we see, and we think is big today, um, really isn't as big as our grandfathers and great-grandfathers saw. So ... kinda like that M&M—M&M commercial; you see the guys go, Hi, then—you know, he's look at Santa, and Santa's looking at them, and he's going, Aha, they do exist. Well, for—it was one of those moments for me, where, yeah, those three-pound akule do exist, and ... why the heck aren't we having three-pound akule in the main Hawaiian Islands, and what can we do to make it happen again. So that's—that's my—my—you know, my ... my take-home message from jumping in the water at Midway. That we have a long way to go in terms of matching the responsibility or the kuleana that our tutus had um, in returning those size fish, yeah? Um, if you read some of the old um ... stories from uh, some of the old fishermen around the turn of the century, eight—1800, they would talk about mullet that were three feet long. You know, they would talk about fish of that kind of size. Uh ... people would talk about lobsters that were twenty pounds. I mean, to—today, if somebody told you, Yeah, I saw a lobster twenty pounds, you would think, Well, what were you on? But the reality is, they do exist. Um ... right now, they exist here, but they exist kinda far off shore, around at three hundred feet. People see 'em, they're there; but they're not up here, and that's the problem, yeah? They used to be up here. And so we need to ... we need to search inward um, get away from the I, me, my, I going take everything that I see before somebody else takes, what am I gonna give up to make sure that my kids get to see something, or my grandkids get to see something better or closer to what ... my tutu saw. Um, that's the lesson that I took back from the ... my first visit to Midway. Um ...

QUESTION: When was that?

AILA: M-m ... was probably about five, six years ago. Yeah. Um ... my experience with the Northwestern Hawaiian Islands began with uh ... even prior to the creation of the ... the nat—what's it called, the—the National Marine uh, the National Coral—Coral Reef Ecosystem Reserve Council. Um, about two years prior to that, I went uh, with a group of folks to the State of Hawaii to try to get them, the Land Board, to create uh, its own reserve in State waters. And while we were undergoing that process, um ... met with other Hawaiians and non-Hawaiians who then began the process on the federal side too. So you had folks like um ... the Harps, Isaac and Tammy, Uncle Buzzy Agard, um ... Auntie Vicky Holt Takamine, you know, who—who went to Washington, DC to sort of promote this idea of creating, at time, in the year 2000, a monument. Um, unfortunately, President Clinton at that time was told by his legal staff that uh, a monument wasn't the best way to go about doing the protection. He also didn't have a favorable Congress at that time, um, to back him up. So

the next best thing that he ... could do was a reserve. And then uh, the deal that he made with Congress was, it was a reserve supposed to transition into a marine sanctuary, yeah? Fast forward to two thousand and um, six, and ... uh ... the Bush administration begin thinking about uh ... added protections for the Northwestern Hawaiian Islands. And it's not all, you know ... it's not all ... beneficial, yeah? It's because um ... there are no mining interests there, there are no logging interests there, so it's kind of a ... kind of a—a no-brainer decision to make; but then um, early in the year creating the Papahānaumokuākea National Marine Monument. This was the—the ultimate um ... uh, evolution of—of this process that had been going on now for more than—for me, more than ten years, for the reserve process more than eight years. I've uh ... was an initial member of the Reserve Advisory Council, continue uh, to sit uh, one uh—as one of three native Hawaiians on that reserve council. You know, advising more on ... on—on management issues for the reserve.

QUESTION: Have you been on any other trips up there?

AILA: No; I missed out on uh ... I missed out on the ... on a trip of a lifetime, which Kekuewa took my place, uh ... to—with Auntie Pua folks to do um, this cultural reconnection. Um ... because I had other commitments, yeah? But I'm glad Kekuewa went, because he came back ... enamored, connected, uh ... you know, forever touched by ... what he saw and what he felt, and what he breathed. So it was a good thing. It wasn't—wasn't my time to go, and it was his time to go. So maikai for him.

QUESTION: Can you talk a little bit about that, like the importance of being able to have Hawaiians to go up there, to make that sort of connection, and what they can bring back [INDISTINCT]?

AILA: Well, the—the area is ... the area ... is important, because it is our ancestral—it is ... it is the physical manifestation of our ancestral connection to all of those islands, yeah, the various um ... migrations that came through. For example, in some of the Pele ... Pele oli, um ... and moolelos, you have Pele coming down from the north ... traveling through these—you know, it's all one island chain, yeah? We—we break it up, but it's all one island chain. That's one of the thi—uh, one—one of the things that's wrong with this Western thinking about, oh, we have to say northwest, and then main Hawaiian Islands. It's all one island chain. Um ... but we have these connections to this place uh, genealogical connections, as well as sort of a geological connection in that these truly are the kupuna islands. They—they are the—the first ones to have risen from the hot spot uh, moving on their journey to the west northwest, um ... being born, and then slowly dying. I mean, it's—it's this symbolism of—of who we are, and what we do, yeah? 'Cause when we—when we make, we go on this journey that is to the west northwest, very similar to

the path that these kupuna islands were taking, yeah, eventually um, ending up as sea mounts under the sea once again. Eventually, ending up as part of the crust that goes in—underneath the—the next shelf which returns to the—the—the mantle uh, of the Earth, yeah? Similar to what Hawaiians believe um, happens to—to them spiritually. So these island are important for us, because number one ... this is our ancestral connections. Number two, um, we're also connected to all of the birds, all of the fish, all the marine mammals, that inhabit those waters. Uh, who are our brothers, sisters, uncles, aunties, cousins, our aumakua. Um, it's a place where kupuna had been left um, and interred. So it's our responsibility to make sure that they're protected, as well as the inhabitants on the land and in the water that's over there. It's our kuleana to make sure that they're protected. Um, that's why it's important for Hawaiians to be at the table, and ... we're very fortunate that the Office of Hawaiian Affairs asserted itself, and then was given a place—a place at the daily management um ... in the daily management on the management board, the monument management board. So Hawaiians have a place. It's important to understand that Hawaiians drove this process, and now have a place at the decision making table uh, and continue to—continue to review other things. Every permit that uh, that is applied for to—to go into Papahānaumokuākea is um, reviewed by native Hawaiians for its applicability, its impacts on uh, Hawaiian cultural and traditional—traditional practices, customary practices. Um, so it's—it's a Hawaiian-driven place and a Hawaiian-monitored place, as it should be.

QUESTION: I just want to talk to you a little bit about the differences between cultural resources and natural resources. What's the difference from a Hawaiian perspective? [INDISTINCT] when we talk to scientists, we see the area under—

[INTERRUPTION]

QUESTION: So back to natural resources and cultural resources, and the differences between them from a Hawaiian perspective, scientific perspective.

AILA: Let's—let's start with the Western view of nat—of—of those categories, the natural resources and cultural resources. Um, I don't understand the need to—to—

[INTERRUPTION/GENERAL CONVERSATION]

QUESTION: So Western perspective uh—

AILA: Oh.

QUESTION: [INDISTINCT]

AILA: I'll—I'll talk about the—the Western perspective first. Um ... and I don't understand the need to categorize everything, because when you categorize it, what you do is you lose the connections, uh, you lose the bonds that are—that are—that exist between the different categories. I mean ... but they do. So cultural, they—they separate the rocks, yeah? The rocks are cultural. Piles of rocks are—are cultural resources, and um ... I think it has to do with Western thinking and archaeology. So piles of rocks are—are uh, archaeology, how people ... interact uh, the societies and those things are sort of anthropology. And to me, it makes no make—it makes no sense, because in the archaeology, if they just look at the rocks ... they don't know how the cupboard was set up. Yeah, so they assume that because one person set up a cupboard in this way, that therefore, all indigenous people set up the cupboard that way. Well, people ... you know, you—your—your wife and my wife may set up the cupboards very differently. And so they lose out on stuff like that. Um ... separating the—the—the fish and the birds, and those kinds of uh, resources from the ... the pile of rocks is—is also something that you lose the connection on, yeah? The fish; well, maybe that pile of rocks was set up to worship a bird, or worship a fish in terms of shark. Um ... and the connection wi—with families. So from an indigenous perspective, or from a Hawaiian perspective, it's all related. There's no such thing as cultural resources and natural resources. There just are ... and you don't even call 'em resources. There are ... there are ... things that we interact with, some of 'em on a level of uh, providing food for us, some of 'em on a level of providing worship for us, some of 'em on a level of um ... forcing us to have respect, and uh, this—this—this reciprocal relationship, yeah? What are we doing for—what are we doing to ensure that our food source remains there for the next generation, what are we doing to make sure—how are we behaving, how are we demonstrating our kuleana to make sure that our kupuna are proud of us, and approve of our behavior. You know, that's—that's the difference with—with breaking things up and classifying everything to the—to the umph degree without looking at the relationships between the two, and then how it all fits together, and how those bonds sort of add this extra energy uh, to make ... to make society work in harmony with the rest of the environment. Yeah, as well as the spirits that still reside here, uh, our—our ancestral relationship to the people that came before us, and to the people who come after us, yeah? 'Cause if you—if you base your decision on the impacts on the future generations, yeah, how is my decision gonna impact them, and then how is it gonna impact me when I have to answer to those guys that came before us. If you make decisions like that, you're not gonna make bad decisions. We gotta teach the Legislature and Congress how to make decisions like that. That'll help make better decisions.

QUESTION: [INDISTINCT]

AILA: Yeah.

QUESTION: Could you talk a little bit about ... still on the same subject, the natural resources ...

[GENERAL CONVERSATION]

QUESTION: Okay; so natural resources, cultural resources. Can you talk a little bit about the kumulipo and how Hawaiians see like ... sort of the natural world as siblings, and you know, all from the same [INDISTINCT].

[GENERAL CONVERSATION]

QUESTION: So start with genealogy that connects, you know ... Hawaiians to the world around them, the natural environment.

AILA: Well, you know, y—you begin the genealogy, really, with yourself and then your relationship to, again, those—those people that are gonna spring from you, and the responsibility that you have to them, as well as the responsibility and the connection that you have to the people that came before you. And in the Hawaiian sort of cosmology, um ... there's this recognition that there were things, there were animals, there were plants, there were um ... there were things that came before us; that you know, we're not ... we're not so—we're not so humancentric that the rest of the world revolves around us. That you know, we have a natural place in the order of things, and a relationship with things, uh, that the first thing to—to come out of um ... the sort of primor—primordial uh, chaos was, of course, light, yeah? Light came out of the darkness first. And then you had um ... the various creatures including coral, which then were birth from this process, and then you know—I mean, uh, the kumulipo talks about wana, and it talks about the uh, the loli, the—the sea cucumbers, and it talks about uh, gradually more sophisticated organisms um, being borne out of—out of this chaos, out of this darkness, po. Um, and then later on, of course, people came along. Um, so i—it—the nice thing about the Hawaiian cosmology is it doesn't place the emphasis on us. In—in the Western world, because of ma—this manifest destiny, yeah, that the Earth was put here for humans, right, ak—God made it for humans to take advantage of. Versus the cosmology, we're part of it, and because we're part of it, um, we're not the most important thing. The harmony of all of—all of the elements, the harmony of putting kupuna back into the ground so they can continue their journey, the harmony of making good land use decisions, the harmony of making sure that the family is balanced, that uh, you know, we uh, evolved hooponopono to make sure to re-instill that balance ... it's—it's this harmony that's the most important thing, and that's what's best for the humans. That's—that's what

separates Hawaiian culture, indigenous culture, from Western culture. Where uh, resources are put there as things that uh—today's world; you know, the fish are put there for you to go out and catch, turn them into cash, and this capital now is then used to create other capital. But ... that capital comes at the expense of somebody else. It comes at the expense of taking advantage of either somebody else's working at a lower ... wage scale, or taking their natural resources, and using it for your benefit, without ... having the—the conscience to think about the impact of what you're having on those people uh, on those—those other creatures. Um, that's the big difference. And again, we go back to how we started the interview. The—the s—the schizophrenic nature of ... where we are today and what's causing us all these problems.

QUESTION: I still want to stay on that a little bit more. Just ... you talked about the fishing and you know, how [INDISTINCT] ahu for fishes and stuff like that, for gods. The Hawaiians see like natural resources as cultural resources too in the sense that we ... like pick flowers for lei. I know you always talk—or I've heard you talk about [INDISTINCT] Northwestern Hawaiian Islands and using the [INDISTINCT]?

AILA: Koaoula [PHONETIC] feathers; yeah.

QUESTION: So can you talk a little bit about how ... that different aspect of the natural resources and cultural resources. We see natural resources and use them in cultural practices.

AILA: Well, uh, this idea of separating ... natural resources from cultural resources is—is, again, something that's ... Western imposed. Um ... you know, Hawaiians—Hawaiians made use of ... many uh ... many kino lau of different creatures, yeah? So for example, the—the—the koaoula feathers, tail feathers; because there's not a lot of koaoula in the main Hawaiian Islands right now, and there probably ... weren't large numbers, otherwise the—the evidence would have indicated that, that these birds, you know ... called home ... the Northwestern Hawaiian Islands more. So it's this ... this relationship of traveling to places to ... to obtain certain kinds of uh ... we'll call it resources, yeah, but certain time—certain types—filling certain types of needs um, of gathering the koaoula feathers for uh, the creation of thing like kahili. Well, why did you create the kahili? It's to honor somebody, yeah? So normally, you just don't make a kahili and say, Oh, I made a kahili. Normally, there's somebody that's in mind, and somebody of such stature that you would go out of your way, expend all that energy, to create this ... this object of um ... of finery, of—a demonstration of knowledge, a demonstration of workmanship, a demonstration of love for that person that you're creating this kahili for; and it's all of those things that um ... that add up to the creation of, you know, the collection of the feathers, the idea that you're honoring

somebody, the worksmanship, the amount of mana that you put into this project, that ... in the Western world, creates a cultural resource, but in the uh ... Hawaiian world, just—you're creating um ... you're capturing the love that you have for this im—important person, and symbolizing it in this ... in this form. Yeah? So oftentimes, we go, Oh, well, that's a—those—that artsmanship is really, really nice; but it's more than art. I mean, it's about the relationship with that person, the love for that person, the ... uh ... the idea that you're gonna create something that's gonna ... last beyond that person's lifetime. Uh, and ... the importance and the—the demonstration of the relationship, yeah, to go to that extreme in order to create this—this implement, this demonstration of ... of love, really, for that person. Yeah? So in the archaeological world, you don't hear them talk about love, you don't hear them talk about um ... honoring, you don't—you never hear—it—it's a pile of rocks. And they only talk about the pile of rocks, without ... the ... without all of the other intrinsic things that make the pile of rocks part of a process of honoring, of loving, that's important, yeah?

QUESTION: How can visitors be respectful to the monument for the sanctity and spirituality of [INDISTINCT]?

AILA: I—I—I think the visitors from the very beginning—what is—what is the intent of the trip, yeah? You always judge ... something by what is its intent. So if someone is ... desires to go to the—a place in Papahānaumokuākea National Marine Monument, I always question what is their intent. Is their intent to do research that ... the research will lead to better management, better understanding of—of ... the area up there, uh, including the—the—the spirits that still walk there, including um, the relationship between uh, aumakua which still reside there. Um ... what is the intent? So if the intent is good, and you go with good intent, then you must have the respect that goes along with that intent. So exa—for example, you're not gonna conduct any activities in the monument that is gonna be destructive, that is going to be disrespectful. For example, you're not ... you're not gonna go and do cultural resource—research at Nihoa or Mokumanamana, and destroy some of the cultural sites that are there. Or, go shishi on some of the cultural sites that are there. I mean, that's ... that's just—you know, if you go with good intent, that's not possible. But if you go with hidden intent or bad intent, then certainly not only is that possible, but it's also probable; but you better—you make sure if you go up there with intent that is not pono, that you brace yourself for the consequences, yeah? Because there are—there are going to be physical consequences and spiritual consequences for somebody that does that. Um, oftentimes, Haole researchers can show respect simply by asking to learn about the relationship that Hawaiians have with these islands, relationships that Hawaiians have with uh, the inhabitants. And when I talk about inhabitants, I'm talking about the sharks, I'm talking

about the birds, I'm talking about the turtles, uh ... you know, talking about the—the individual coral polyp; what is the relationship um, that they have in this desire to have an understanding, rather than come from a standpoint of, Eh, I get my PhD, I know everything about everything, and uh, you guys cannot tell me nothing, I know what's best for you guys, I know what's best for the area. Um, that's a ... that's a demonstration of disrespect. It's actually a demonstration of ignorance. And so somebody with PhD might be very ignorant, because ... you know, they don't have this concept of uh, respect. Uh, they don't have this concept of ... honoring how someone else thinks about the place. So when I talk about, you know, honoring the birds, honoring the sharks, we have people that are trained in—in Western thinking that go, What the hell is he talking about? You know. They cannot relate to that. But if they take the time to try to understand the relationship, that shows that they are—they're pono in their intent. So um, a classic—classic example which I still get heat for is, being one of the first guys to um ... one of the first native Hawaiians to express objections to another native Hawaiian who wanted to ... paddle the length of the Northwestern Hawaiian Islands in a—in a six-man canoe. Yeah? So I looked at the application, um ... my brain told me that this was an extreme sport, my naau told me that this wasn't cultural. So because Hawaiians are stepping up to take a uh, a more active role in the management of this place, and the integrity that comes along with that, yeah, um ... you have to honor that integrity, and even though it was another native Hawaiian that was asking to do something that ... you know, paddling six-man canoe, yeah, is ... sort of Hawaiian, it's sort of cultural, but the application in this instance was more of an extreme sport than ... something that was ... akin to a tradition or custom and practice in that area. So you know ... I still get heat for that decision today, but tough; that's ... that's the level of integrity that Hawaiians, because we're stepping forward and we're saying we ... we are ready to manage, we are ready to be part of this team, we have to maintain that level of integrity.

QUESTION: What sort of mindset should visitors take when they go there? I know [INDISTINCT] talk about how ... scientists tend to think with their brain, and you know—but you were saying how when you looked at this application, your naau—

AILA: Yeah.

QUESTION: --was telling you something too. And—

AILA: Well—

QUESTION: [INDISTINCT]

AILA: In—

QUESTION: [INDISTINCT]

AILA: In the briefings that I've done for groups of scientists that have gone to the Northwestern Hawaiian Islands, I've suggested, yeah—because you know, they can take it, they can leave it; it's up to them. I've suggested that they not only use their consciousness, um ... and their intellect to—to try to gain information, but also use their naau, use that um, that portal to um ... the spiritual resources that are—that are there. I mean, you can see it; you can see it—you can see the hoailona in the—in the clouds, you can see it in the rain, you can see it in the bird flying by and looking at you eye-to-eye, and that connection is there, or underwater when you're—when you're snorkeling and a big ulua comes up and goes, Oh, who you—who you think you are, brah, over here? I mean, you can see it if you open yourself up, if you open your naau o—open enough, and you allow that—what they call this ike papalua, this additional deeper ike to come in, um ... you can take away knowledge ... from the Northwestern Hawaiian Islands that you wouldn't ... have been privy to simply by going up there with your—the intellect that's associated with your brain. You know. And you can go one step further; you can honor the spirits that still reside there, or the spirits that are transitioning along their—their path to po, uh, if you give them the respect. Um, again, there's an additional deeper level of ike that can become available to you. And ... believe it or not, most ... most scientists with PhDs can grasp that. There's—there's only a few that can't; but the majority that I've spoken to, when they've come back from the Northwestern Hawaiian Islands, um ... expressed that they've had those experiences. That they've had these connections with—with the animals either on land, or—or in the ocean, or—or been given, you know, some of the—the hoailona. And it's made their research that much more um ... successful.

QUESTION: It adds additional meaning to the trips too. I mean, it's not just—

AILA: Uh, it—

QUESTION: [INDISTINCT] the scientific trip to a cultural trip too.

AILA: It—it turns it from uh, an experience where you're an outside observer, to an experience where you're a participant. And that's the difference between a Western way of—of looking at resources, where you're an outside observer, you don—you're an outside observer, manipulating the resources, versus an indigenous view where you're a participant, and your participation is—is uh ... based upon what's best for the entire uh ... system.

QUESTION: I guess [INDISTINCT] on the same idea, but you know, there's this Western sort of view that you talked about, about how people go there just to take. You know, people should start thinking about ways to give back. Could you talk about that a little bit?

AILA: Question that uh, often ask—

[INTERRUPTION]

AILA: It—it's question that I often um, ask people. You know, I—I question their intent; Why are you going? Yeah? And if I—if I get an answer that—that makes sense, then I say, Well, what are you ... the next question, the follow up question is, Well, what are you offering ... in terms of a reciprocal relationship with this place that you're asking this information of? And it's not a bartering. It's not like I'm gonna—I'm gonna take one ...uh, corm of kalo up there and expect to get, you know, um ... my PhD thesis answered. It's not that. It's—it's very basic, yeah? It's an idea of being a participant, rather than observer. And a participant in this system is one that gives to the system, the energy that goes along in that system. Versus one that only takes. So you'd be surprised. I mean, I get some very good questions from Haole researchers that go, Well, what is the appropriate hookupu? And it's—it's a hard one to answer, because it depends on where you're going. And if you're going on—on the island, then you've gotta deal with the Fish and Wildlife Service, um, restrictions, and—and they're good restrictions, because they're trying to prevent the introduction of alien species, alien microbes, you know, which would wreak havoc with the ... so it gets them to open up their mind beyond the structural thinking that they're used to. And so you have things that enter, like ... Well, write a poem. You know. Do an oli; uh, sing a song, dance, um, recite your genealogy. Um ... bring water from where you come from, from an important place, you know. 'Cause water—why is water important? Water is important because ... I like see you go three days without drinking water. By the third day, I guarantee you praying for it. That's how you know how sacred it is. And so water from ... where—where you live, water from where you come from is a very symbolic gift and a very universal gift um ... to offer as hookupu. Then it puts the researcher in the mindset of ... not being an observer, outside observer, but actually being a participant in the system. And when they do that, when they plug into the system, and it opens up, and the amount of knowledge that becomes available is much greater than had they been an observer. And believe it or not, most people take to this idea very, very easily, because we all have it. Innately, we all come from ... an indigenous culture. You know. We ca—you—you go back in their history; they all come from indigenous cultures. So it's a matter of accessing um ... their naau, and the genealogical connections that they

have to those ancestors which are often clouded by this thing that we have up here called the brain.

QUESTION: I just ... okay; so it's more of a question sort of ... geared towards the Hawaiians that go up there. I know you were [INDISTINCT] speaking for them too. What's the importance of like Hawaiians, importance of the area, the region to Hawaiians today?

AILA: Uh—

QUESTION: [INDISTINCT]

AILA: Well, I would answer that—that question in sort of the reciprocal way. What is the importance of ... of ... what is the importance of Hawaiians ... visiting that place up there is really this connection that has been ... severed for many, many years uh, being ... reconnected. And our responsibility to malama those uhane, those spirits, to malama those cultural sites, to malama the—the birds, to malama the sharks, to malama the—the—I don't want to call it resources, 'cause that's uh—the system, yeah? The system, the system that's there. Um, this reconnection and this taking of responsibility by native Hawaiians to do it in a pono way. We have native Hawaiians out there that want to use this cultural access as a way to ... put that uh, wedge in the door, so that ... ooh, we can puka behind and do commercial fishing. Well ... go back two hundred years, and commercial fishing was not a traditional and customary practice. Fishing for sustenance, fishing for those uh, religious purposes, fishing for your kupuna and your ohana that lived up mauka ... was—was a way of life. Yeah? Um, uh, I—I ... you know, it was never ... fishermen never sat at Pokai Bay and go, Today, well, the going price for—for the kalo from uh, Pueo is uh, uh, five akule for one corm. They never sat around talking like that. They sat around going, Eh, tomorrow, our tutus and um, uncle them coming down from Pueo, and uh, what we going get for them take home? And if you're in tune with your family, then you know that auntie and that uncle, their special—their favorite fish is this, this, and this. So as a fisherman, your responsibility, your kuleana to the family is to go get, prepare, and having waiting for them when they come down. And the ... the uncles that were up mauka, I'm sure they didn't sit around going, Well, you know, man, this is choice kalo; we gotta get at least five akule for this. It was never like that. It was like, Oh, the guys down there, I know they ono for this; I—I know they need some aho, so we go make some rope for them, because you know, they always using 'em down with their nets and stuff. So it was never uh ... this term bartering that was brought in by Westerners, when they observed this practice going on. It was never bartering; it was more of a uh, what they call a hoihoi or a give-give, yeah? It wasn't like ... we're gonna equate this much to that much. It was, I knew what they needed, we knew what their favorite was; that's

our family, we going provide for them. Yeah? Now, in the main Hawaiian Islands, we have fishermen who had the economy huli'd on them, yeah? So when that ... when that traditional or customary practice of hoihoi sort of ... evolved into uh, uh, a society or an economy where you had to pay money for stuff ... then those fishermen along the shore, as well as the farmers up mauka, had no choice but to uh, survived, and then uh ... evolve into commercial fishermen, commercial farmers. So in the main Hawaiian Islands, you could make the argument that commercial—Hawaiian commercial fishermen, who fished pono by the way, 'cause I wouldn't ... I wouldn't attribute this to fishermen, Hawaiian or non-Hawaiian, who don't fish in a pono way ... are doing a traditional and customary practice. 'Cause they had no choice. The economy was flipped on them, so they took the skills that they had and they continued to provide for their families. In the Northwestern Hawaiian Islands, there was no ahupuaa system. And that's the argument that I use for not allowing commercial fishing under traditional and customary practices. Because the guys that were living on Nihoa and Mokumanamana ... didn't have a mauka-makai relationship with their ohana. The island is so small that there was mauka and makai ... so therefore, commercial fishing was something that ... the economy up there didn't huli them, force them to do. Therefore, it—it was—it's not a traditional and customary practice up there.

QUESTION: What do you think Hawaiians can learn about their culture from [INDISTINCT]?

AILA: I think they can learn how ... how difficult it is to not go to uh, 7-Eleven late at night when you're hungry. That you gotta grow your food or you gotta catch your food. Uh, first of all, you gotta sail up there, um, and sail back successfully, otherwise you die. Um, it teaches ... it teaches—it'll—can teach Hawaiians about uh ... the—the—the mettle of their ancestors, and the pride that comes from um, being able to ... not only survive, but actually to thrive in those kinds of ... under those kinds of circumstances. I mean ... no nails ... no—no steel tools; but they created waa that could sail, you know, to ... Rapa Nui, to Aotearoa, you know. Today, we have kids running around; they no more pride because they think they Popolo; the hat sideways, yeah? They get one culture, they know where they come from; it's a matter of reconnecting to that culture, understanding the—the strengths, the—the ... the can-do attitude of kupuna, yeah? Then ... when I was growing up, I never heard one kupuna say, Oh, we cannot do that. It was always, How we going do that? What do we need to do that? Whereas, you look at the youth today; Oh, no, I no can. Why? Uh, that's too hard work. Yeah? Or um ... It's not worth it. So those—those lessons, those values ... can be symbolized in ... what it takes to survive there, what it takes to honor the resources that are there, what it takes to honor ourselves, yeah? And dem—then demonstrating. People talk about

kuleana, yeah? But what is kuleana? Oh, it's responsibility, it's privilege. But how did you get it? You got kuleana from people who held it; they held the privilege, the kupuna. They gave it to you when you demonstrated to them that you understood the responsibility, and then demonstrated the skills necessary to honor that responsibility. They said, Eh, fine, welcome to the club; here you go, here's the privilege. And then when they gave you that privilege, then it hit you; the level of responsibility that came along with that privilege. Yeah? The weight of now being the next person to sort of keep everything going, to sort of keep this uh, historical knowledge, to keep this um ... to be this watchful eye over whatever area, whether it be hula, whether it be fishing, whether it be farming, to hold the secrets that separated uh ... a fisherman from a master fisherman. It was only after you demonstrated that you understood the responsibility, and that you mastered the techniques, were you given the kuleana, the privilege. And then at the time that you were given this privilege, you sat there and you went, My god ... what an honor it is, and how much work it is to maintain it. Because now you gotta go find someone to train, to replace you. Yeah? So today, we throw kuleana around so much without understanding the full implications of what it really stands for. Yeah? And ... by visiting the Northwestern Hawaiian Islands on a very minimum scale, for a certain amount of ... limited amount of people, is to understand that kuleana, both the responsibility and then the privilege. Yeah? 'Cause we want to bring the place to the people, and not necessarily the people to the place. Because it is such a fragile place, and such a special place. And we get plenty work to do in the main Hawaiian Islands, so before we think we can have—we all should have that privilege to going up there, we better go fix our own back yards. Yeah. We better ... manage the akule fisher, so one day get three-pound akule.

QUESTION: You mentioned [INDISTINCT]. Could you talk a little bit about that, and then [INDISTINCT] the importance of—

AILA: Okay; okay. Well, the Bishop Museum um ... had held some ... native Hawaiian human remains um, that were removed from earlier expeditions. And many of the—the members of Hui Malama I Na Kupuna O Hawaii Nei believe that we, as modern Hawaiians, cannot ... cannot come to agreement on things like sovereignty, on things like um, what's best for management, until all of our kupuna, our iwi kupuna, are placed back into ... uh, back into the ground, uh, and—and put back on their journey. Because so many of them have been ... ripped from that journey um, for whatever reason; um ... development, um, scientists finding the need that they have to study bones, um ... erosion, um, those kinds of things. So the—the inventory that was held at the Bishop Museum, Hui Malama instigated the repatriation um, went through that process, and then you know, found funding, members got on a—on a boat, Hale Aloha, I think

was Kunani. Um ... uh, they brought in um, Uncle um ... Les Kulololio from Maui, and they sailed back up there. And they sailed at the wrong time; they really—they sailed in November, which—and anybody that wants to go ... to—to Nihoa and Mokumanamana, that's the worst time of the year that you can pick. But there was this—there was this need, there was this nagging, there was this urging—this sense of urgency on behalf uh, uh, on behalf of the kupuna that it needed to be done then. And so they sailed, and it was rough going up there, and when they got um, to the islands and actually got on the island and found secure places to—to do the reburials, um ... they were ... rewarded, if you will. You know, they were rewarded for the demonstration of their responsibility by having unseasonably calm weather all the way home. So much so that the captain couldn't believe that uh ... the captain actually told them, Okay, get ready, we going turn the boat around ho—we going head home, and you know, if you guys get seasick, no worry, we understand, everybody gets seasick, this is some of the roughest water you going have, and ... Hale Aloha just told him, No, it's gonna be fine. And when the boat turned around, brah, there was nothing but calm water from Mokumanamana all the way back to Kauai. And that was affirmation, yeah? That was kupuna affirming that what you did was pono, and a big mahalo to you folks. So there are ... or there may be other ... human remains out there in other collections ... possibly in other countries that the—the need may arise to go back on one of these reburial, re-interment trips to some of these islands up there. And that's our kuleana. You know. They've been—maybe somebody else wants to step up besides Hui Malama, but that's the kuleana of every native Hawaiian, whether it be at Mokumanamana or Nihoa, or Nanakuli, or ... at Ward, or any one of those other places, yeah? So we have responsibility to those folks who have been ripped from their journey, um, and are sitting in limbo right now. Yeah. And again, why? Because of this manifest destiny attitude, yeah? In the ... mid-1500s, early 1600s, you had people who believed that skull size determined intelligence. So all of the—the European folks thought they had, you know ... the reason that they had bigger skulls was because God gave them that ... physical ability. But when they came into the Pacific and ... met Polynesians, um, that theory sort of went out the door. And it created this whole demand from universities, uh, from museums all around the world for Polynesian skulls. And ... the hewa that was created by people who went out and cut people's heads off to be sold to museums and universities, and the kaumaha that uh, resulted and still resides today in us, will remain until we bring those last kupuna home and ... put them back on their journey. And most of the museums—about 99.9 percent of the museums in the United States have come to grips with their responsibility, and returned kupuna. But we have kupuna in Germany, in England, in many other places in the world that um ... those museums don't want to give them up, because they're possessions, we paid for 'em. Never mind that that's somebody's uncle, grand-auntie, or somebody's family; we paid for that. So it's this—

this culture clash that's still going on today, trying to bring home these kupuna, finish off them on their journey, and uh ... it's a long road, but it's—it's gotta be done. It has applications to the Papahānaumokuākea, it has applications to your back door, your back yard. But we as native Hawaiians, we have no choice.

QUESTION: Just sort of—I know you touched on this earlier. Just want to make sure we get [INDISTINCT]. Can you talk a little bit more about the sanctity of the area, what makes it so sacred in the Hawaiian culture?

AILA: Well, there are me—there are many reasons why um ... various places along Papahānaumokuākea National Marine Monument are—are sacred to Hawaiians. They could be sacred for ... people who are related to Pele, and all of the—the moololo of Pele uh, as she travels down. The area is sacred uh, and there's a s—there's a sanctity about it, because as ... as the—the soul departs the body, and then travels to the various uh ... uh ... leaping grounds, uh, on each island, um, from the traditional and customary religion, these souls then ... depart on a westward journey. And along that westward journey, are these—these kupuna islands which they travel on their journey. So while visitors are there, they have to be very respectful of—of the fact that Hawaiians believe, and rightfully so, that there are these uhane that are—that are there journeying along with them. And—and the need to—to recognize and respect that, just as I would respect anybody else's religion, uh, and their thoughts on angels, or their thoughts on um, their uhane, you know, uh, by giving them that respect. Um ... it's also sacred from the standpoint of ... um, the name. We talk about Papahānaumokuākea; uh, the—the mating of Papahānaumoku and Wakea. Um ... and these islands being present at the time where life was born, uh, honoring ... that sort of ancestral ... history. Um, they're pointed from—and they're—they're sacred from a modern ... standpoint in that if ... we as native Hawaiians, and as people of Hawaii ... cannot manage this place that's remote that has minimal amount of impact on it already, um, what does that say about us? What does it say about our commitment? What does it say about our kuleana, um, our values as—as a people? Yeah. How ... how our ancestors gonna ... judge us when it becomes our turn to join them? So for all of those reasons, that's why these ... these islands and this n—National Marine Monument that has the name Papahānaumokuākea uh, should be afforded the utmost respect. Um ... and we should work the hardest for the continued protection.

QUESTION: They're gonna ask Auntie Pua about the naming. But there is one aspect to the naming that I've heard you describe [INDISTINCT] the imagery that's in the Hawaiian Islands, Northwest Hawaiians, between Wakea, Papa, and the islands.

AILA: Okay. Uh, I think the imagery that you're referring to is the—the imagery that someone on a—on a canoe or boat gets; uh, this sort of—this mating of uh, Wakea and Papahanaumoku. As you're—as you're traveling, and you see the island emerge from ... uh, and the emergence can be two ways. It can be an emergence from the sea, or it actually could be an emergence from the sky, yeah? But what you visualize, and the symbolism is the—the mating of the sky and the Earth, and then the ... the demonstration of life; as you get closer, you see the seabirds. Um, then as you get closer, you see the fish, the emergence of life ... the—the emergence of life from this mating, which is so clearly visible as you approach from the ocean. So it's the most appropriate name, um ... with the correct symbolism that comes out. And anybody that sees it, immediately knows it.

QUESTION: Okay; so last question. If you could talk to all the visitors, and I guess you do on the briefings, but the visitors that go up there, what's the one thing that you want to know about the culture when they go [INDISTINCT]?

AILA: I want them to know that the culture is alive. That Hawaiians ... it's not just Hawaiians used to do this, or Hawaiians used to do that; that Hawaiians continue to do it today. Um, we don't necessarily go up on canoes every time; sometimes it's big steel ships. But we still go up. Uh, we still go up for the same reasons; to demonstrate the knowledge on how to get there, to demonstrate uh, the reconnection between uh, our ancestors, and really, to demonstrate responsibility for the protection and management of the area. That Hawaiians ... have a role, a major role to play in the management of this very special area.

[GENERAL CONVERSATION]

[END]

**Interview**  
**KEKUEWA KIKILOI**

[GENERAL CONVERSATION]

- KIKILOI: Um ... my name is Kekuewa Kikiloi; K-E-K-U-E-W-A, K-I-K-I-L-O-I. Um, I work at the Kamehameha Schools Land Assets Division uh, as the cultural assets manager. Um, I'm also a student at UH Manoa uh, in the Department of uh, Anthropology; um, PhD student.
- QUESTION: So I guess I want to start off with something about the archaeology of the area, Nihoa and Mokumanamana, or if you could explain where most of the archaeology sites, cultural sites are—
- KIKILOI: M-hm.
- QUESTION: --in the Northwest Hawaiian Islands and what's there.
- KIKILOI: Okay. Um, archaeology uh, as it relates to the study of the material past or the tangible things left on the landscape, uh ... most of the archaeology in the Northwest Hawaiian Islands uh, exists on the first two islands, uh, Nihoa and Mokumanamana. Uh, Nihoa uh, the first island, is a relatively small island uh, one hundred uh, seventy-one acres in size. Uh, there's about eighty-nine cultural sites on the island uh, that span kind of the variation of things that would be found in a place where people tried to reside for at least some period of time. Uh, you have um, residential sites, uh, temporary habitation sites, ceremonial features, uh, agricultural terraces, uh, and even burials are found on—on Nihoa. Uh, Mokumanamana, the—the next island, uh, is even smaller, uh, forty-six acres uh, in size, uh, fifty-two archaeological sites on the island, uh, thirty-three of which are ceremonial sites or heiau. Um ... and um, there's no other types of features other than temporary habitation and ceremonial features on the island.
- QUESTION: So what does the archaeology on those two islands suggest life was, like what were they used for, those two islands, by Hawaiians? And uh ... yeah; what were those islands used for?
- KIKILOI: Um ... well ... I guess the first, uh ... Mokumanamana, um, because there's only really two types of—of—of functions seen in—in the types of sites found there, uh ... other scholars have hypothesized that people didn't live there for any um, extended period of time, that it was just temporary, and that the main function of that—that um, island was uh, ceremonial. Um, the name Mokumanamana means um, island of—of spiritual power. Uh,

mana—mana being spiritual power, and—and—and manamana being like the—the exponential power, really. Uh, the next island, Nihoa—uh, the first island, really; um, Nihoa [CLEARS THROAT] has a variety of types of sites there um, which is testimony to the fact that uh, I think people were trying to live there at one time in the past.

QUESTION: How was--so they were live—

[GENERAL CONVERSATION]

QUESTION: So people lived on Nihoa for ... it was sort of a permanent site, at least for a period. How was life on that island different from what life was on the main Hawaiian Islands at around the same time?

KIKILOI: Um ... I think you know, for—for islands in—like the Northwest Hawaiian Islands, it really pushed uh ... native Hawaiians to their limits uh, where they could colonize an—and settle. Um, these islands being very remote um, and very small and isolated, uh, they had very uh, limited uh ... capacity to carry human life over an extended period of time. So it's difficult to have any large population on these islands for any extended period of time. Um ... this ... in comparison to the main Hawaiian Islands, there's a lot uh, less productivity in the soil, uh, a lot less arable land. Um, but in the case of Nihoa, at least, there's evidence of agricultural terraces being there, and uh, at least some demonstration of an effort to try and um, colonize that island for—for a period of time, at least.

QUESTION: What was the relationship between Nihoa and Mokumanamana? I mean, you've said--I heard you say in the past that Mokumanamana has one of the highest concentrations of ceremonial sites.

KIKILOI: Yeah. Um ... to me, uh, I mean, just looking at place names, yeah, like, Mokumanamana; that name itself shows that it was uh, one of the most important places to Hawaiian people in the past. Um ... the fact that there's so many heiau on one small area of—of land um ... shows that it was valued by our kupuna. Um, the—the island before, Nihoa um, in some of the chants, it's referred to Nihoa Kuhikuhipuone. Uh, Nihoa, the seer of sacred sites, uh, Kuhikuhipuone, being a type of kahuna that would um ... point out and mark the—the—the placement of where heiau should be. So that place name in itself kinda demonstrates that Nihoa was that uh, directional marker to uh, show where Mokumanana was. And I think a lot of the archaeology is even pointing to that too. You know, we've gotten some dates back uh, in the past year or so from Nihoa from uh, coral dating, uh, coral that was left as ritual offerings on the heiau over there, and all the—all the dates came back in the 1500s, uh, which show that there was one big push of colonization of that island, really as a steppingstone to the construction of Mokumanamana, which might have

been the ... arguably, the—the ... the greatest engineering feat in native Hawaiian history, I would say. Um, I know other scholars have pointed out that Piilani Hale in Maui has—is the largest heiau in the archipelago, but I would argue that Mokumanamana is really the largest heiau. Even though it's made up of thirty-three somewhat features um, the island itself really functions as a heiau, yeah, in itself.

QUESTION: Can you talk about—you were talking a little bit about ... how Nihoa and Mokumanamana present sort of the limits of what Hawaiians could do as far as them being so isolated [INDISTINCT]. Could you compare ... I mean, what it took to build these sites, and to live there, compared to building sites on the main Hawaiian Islands, and what—I mean, how that plays into the importance of Mokumanamana?

Um ... sure. I mean, for me, uh, it—it ... that issue is even more real, because when we're trying to do archaeological field work up there, uh ... it really makes an impression on you how much energy it takes to prepare for a voyage, then to go on that voyage, and then to stage from someplace on an island, you know, to get any kinda work done. Uh, for Nihoa and Mokumanamana, it's—it's—uh, it must have been really difficult in the past to—to—to voyage there, to try—attempt to live there for any um, period of time. Um ... in the main Hawaiian Islands, you have uh, a lot of land, a lot of uh, potential for productivity, of resources, water, uh, food; things you take for granted. The basic necessities of life that can be found readily available over here, uh is not so readily available in the Northwest Hawaiian Islands. So when you're out there, it really is about uh, mitigating risk and maximizing survival.

QUESTION: Talk a little bit about ... Mokumanamana's ... significance in that it's located on the Tropic of Cancer, and what you think its role was in ceremonial [INDISTINCT].

KIKILOI: Um ... Mokumanamana lies on—on the Tropic of Cancer, or what is uh, termed in Hawaiian uh, kealanuipolohiwa kane, the dark shining path of Kane. Um ... its significance, I guess, to our people in the past was that, um ... it really is the northern limit of—of where the sun goes throughout the year. Uh, on June 21st, which is the longest day of the year, the summer solstice, the sun will uh, rise in the east and set in the west on the trajectory that mono—Mokumanamana is at, um, and it won't go any higher throughout the year, and it'll make its way back down um, throughout the year. Um ... but that's important because ... um, one, the sun is als—uh, usually ... uh, symbolic of the god Kane and life, yeah; the beginning of life and ending of life, the cycle of the sun. And um ... uh, Mokumanamana being on that western end of the archipelago uh, really is the pathway that souls take in the afterlife. So a lot of times, you'll s—

you'll hear uh, references to kealanuipohiwa kane in chants that have to do with death and the journey that the soul takes into the afterlife.

QUESTION: So in that sense, what does the Northwestern Hawaiian Islands represent, if it's everything above Mokumanamana [INDISTINCT].

KIKILOI: Yeah. Um ... I think, you know, things like, um ... the—the Tropic of Cancer uh, kealanuipohiwa kane, give us clues as to how our—our kupuna saw the—the archipelago and the geography, and the Hawaiian cultural landscape. Um ... you know, really, anything past or north of Mokumanamana is places where the sun doesn't really shine overhead. And ... I think our kupuna conceptualized this as—as Po, or what is referred to as in like the kumu lipo or uh, cosmogonic chants as—as places where we originated from, where creation began in the Hawaiian universe. Um ... yeah. [CHUCKLE]

[GENERAL CONVERSATION]

QUESTION: So the settlements on Nihoa and Mokumanamana—well, [INDISTINCT] have been abandoned. Can you talk a little bit about when they were abandoned, and your theories or what the theories are out there on why they were abandoned?

KIKILOI: Um ... sure. Um ... I guess, you know, the—the anthropological theories of—of—of how the Northwest Hawaiian Islands, or Nihoa and Mokumanamana came to be settled uh, has evolved over the years. Uh, early on, um, you had researchers like Kenneth Emory who thought, um ... the people that colonized uh, Nihoa and Mokumanamana were really, um ... uh, this is—this is kinda hard. [CHUCKLE] I gotta think about this. [CHUCKLE] Um ...

[GENERAL CONVERSATION]

QUESTION: Talk a little bit about Pele and some of—

KIKILOI: Okay.

QUESTION: --the uh, the ... moolelo about the area that we have preserved in chants and ...

KIKILOI: Okay.

QUESTION: --mele.

KIKILOI: Okay. Um ... I guess for a long time, I think a lot of scholars have thought that uh, you know, there's references in—in some of the more

well known Hawaiian uh, sources, like Malo, Kamakau, Fornander, of a place called Kahiki, yeah, um, or the cognate would be Tahiti. And uh, this place wa—was thought to be somewhere in the South Pacific, because Tahiti is in the South Pacific. But from a lot of the—the chants an—and the things that I’ve found in the research concerning the Northwest Hawaiian Islands, Kahiki is really uh, a place uh, conceptualized as the Northwest Hawaiian Islands, a place where—where—where we ... our kupuna perceived it as uh, ancestral homelands, yeah? And ... um, in a lot of our stories, these are places where gods such as Pele uh, migrated from on their way to—the main Hawaiian Islands. So if you look at a lot of the stories, it’s always coming down the chain, and the first island mentioned, really, is uh, Mokumanamana, usually. Sometimes Nihoa, uh, another island called uh, Mokupapapa, which is a small uh, coral atoll right next to Kaula Island, uh, Niihau, and going down the chain. Um, in a lot of the stories from the main Hawaiian Islands, um, mythical heroes often make their way back up the chain, yeah; so there’s this uh, pattern in a lot of the stories of going up and down the chain uh, into the Northwest Hawaiian Islands, and back down uh, into the main Hawaiian Islands.

QUESTION: And what does that sort of—I mean, what message does that send to you, the stories about people going up and down the ... and as far as [INDISTINCT]?

KIKILOI: Um, I think a lot of these stories point to the fact that the Northwest Hawaiian Islands were perceived as ancestral islands, or ... uh, place—places where gods dwelled, yeah? And ... Mokumanamana really being that—that kind of portal between two realms of—of Au and Po, or uh, the divine an—and the—the real—you know, the real day life of—of the main Hawaiian Islands. Um ... you know, in—in a lot of our traditions, there really isn’t uh, uh, a division between natural and supernatural. And um, our kupuna saw—saw the cultural landscape as natural and supernatural, being real rooted in what we see today, and—and uh, also having a supernatural element of um ... being a place of deified gods as well.

QUESTION: And I guess the ... [INDISTINCT] on the islands how people died [INDISTINCT].

KIKILOI: Yeah. I think, you know, in—in a real fundamental way, the Northwest Hawaiian Islands is one-half of—of the life cycle of—of—of what we knew in the past of how the sun rises and the sun sets, an—and people in the main Hawaiian Islands as—uh, when you pass away, uh, your spirit departs from the body and they go to these places where uh, you have leina, um ... which are leaping-off points for the soul uh, to go into the water, to be received by their aumakua or ancestral uh, family gods, and to be taken into the journey into the afterlife up into the northwest.

[GENERAL CONVERSATION]

QUESTION: So the research that's going on now, cultural research ... and a lot more into like [INDISTINCT].

KIKILOI: Into what?

QUESTION: Like your opinions. We're trying to get more—

KIKILOI: Oh. Uh ...

QUESTION: [INDISTINCT]

KIKILOI: Cultural research?

QUESTION: Yeah. Can you talk a little about ... were you the one that worked on the OHA study for that [INDISTINCT] that was contracted [INDISTINCT]?

KIKILOI: Um, behind the scenes, I did, but I wasn't one of the authors in the report. Yeah.

QUESTION: Can you talk a little about the sort of research that's going on right now in the area ... about modern day Hawaiians and our trying to find out what those areas about?

KIKILOI: Sure.

QUESTION: What they were used for.

KIKILOI: Um ... I think there's a lot of different aspects of research. Um ... they can, you know, run the gamut from uh, sitting in the archives and doing uh ... microfilm work, you know, one slide at a time, and looking at old documents, to uh, being on the—the decks of the Hokulea and uh, actually being out and experiencing an—and actually doing the practice. Uh, research covers uh, all those aspects. Yeah. So I think, you know, for researchers like me, uh ... a lot of my work is in the archives, an—and I enjoy that work. Uh, but being able to uh, see that information then be taken and be put in—into action uh, seeing the Hokulea go up there, and the Hoku Alakai an—and uh, Hawaiians being given the opportunity to go up there and to experience these places for themselves is—is—is a real important aspect of research uh, as well. Um, you know, we have that saying, uh, in our—in our customs and traditions; uh, *maka hana ka ike*, yeah; uh, knowledge is in doing. And um ...

[GENERAL CONVERSATION]

QUESTION: Maybe you could also ... compare cultural resources to natural resources. [INDISTINCT] Or maybe you can talk about the research too, about ... the differences between cultural resources and natural resources, and how scientists research—well, talk about first the differences between cultural resources and natural resources.

KIKILOI: Okay. Um ... um, cultural resources is a term that's uh, broadly applied to—to uh ... resources that ... um ... impact the wellbeing of living communities. Uh, in this case, it would be the native Hawaiian community. Um, cultural resources encompasses a number of things, uh, including archaeology, which is uh, the study of the material past or the tangible things left on the landscape by our ancestors. Uh, it also encompasses uh, natural resources, because ... natural resources are resources that ... have—uh, native Hawaiians have a relationship to that uh, impact their wellbeing, their identity. Um ... so ... uh, that wasn't a very good explanation. [CHUCKLE]

QUESTION: Do it again.

KIKILOI: Yeah.

QUESTION: Yeah.

KIKILOI: Okay. Um ... cultural resources uh, is a broad term that applies to uh, a number of different things, uh, including archaeology, for one, which is the study of the material past um ... the tangible things left on the landscape. Ev—everything from um, sites uh, artifacts, um, things of that sort. Uh, it also encompasses what is uh, called natural resources, which is the natural environment. Because the—the natural environment um, gives services to—to living communities, the native Hawaiian community uh, um, for sustenance, uh, for identity, for wellbeing. Um, so it's a broad term that applies to a number of different things. Um ... I think uh, for a lot of researchers uh, that go up to the Northwest Hawaiian Islands, they have to remember that uh, natural resource—natural resources are cultural resources uh, because the—the species that they're studying, the biological species, uh ... do have a connection to native Hawaiian people. Um ... you know, in our—in our ... creation stories, our cosmogonic chants uh, we have uh, like the kumulipo, for instance, which is uh, a v—one of the oldest, longest creation chants in our traditions, um ... in that chant, it highlights the relationship we—we have uh, to—to the natural resources as older siblings, as things that were born before us, and things that are entrusted us—entrusted to us to care for uh, into the future. Um ... yeah.

QUESTION: So talk about like ... like an albatross, for instance.

KIKILOI: Uh-huh.

QUESTION: And researchers doing research, scientists is doing research on an albatross, like ... or any bird in the area or something like that. Compare what they're doing to what like the albatross means for Hawaiians when these birds—not just something to use, right?

KIKILOI: [CLEARS THROAT] Sure. Um ... the albatross, uh ... you know, for—I think for a lot of researchers, is—is a bird or a biological species that they're trying to know more about; um ... their life cycle, their patterns and behaviors, uh, the things they eat, uh, how they live. Um ... for native Hawaiians, I think we're interested in the same types of information, but we don't just see it as—as a—as a biological species, but one that is intimately tied to uh, our cul—our culture and our customs. Um, for us, like the albatross is the body form of the god Lono. Um ... it's a—it's a symbol of uh, reproductivity, uh, because the bird comes uh, and mates during the makahiki season, which is an uh, important time of year for us for uh, for peace, for festivities, for um ... for regrowth and productivity. So the—the bird is really a symbol of all those things for us. And um ... it's tied to an important part of our culture, really.

QUESTION: Can you compare the research that a scientist would do, and someone like yourself that would go up into the Northwest Hawaiian Islands?

KIKILOI: Um, I think I'm a little bit different, because uh ... you know, there's ... different dimensions to my research, yeah? So uh, on one hand, you have like ... um, the things that I learned in anthropology and archaeology, and that being rooted in like a social study—uh, social sciences and humanities. Uh, and then you know, there's—I also have um ... educational background in um, Hawaiian studies, which is a very different approach, um ... one that is somewhat historical, but at the same time, based in um, experience. Um ... so ... for—I think for biological uh, researchers, uh, researchers of the natural environment, they're researching the same thing. They're researching, you know, all the different species and—and—and the environment, and the landscape. Um ... I think for me, though, I'm always trying to look uh, to understand uh, how it ties to Hawaiian culture, how it relates to me as a—as a—as a Hawaiian, and our traditions and customs. Um ... how can I renew those connections and commitments to the environment. And I think those are uh, really fundamental differences between um ... scientists who try to objectify the natural environment and see it as something that they can study or gain knowledge from; where uh, Hawaiians are trying to gain knowledge too, but they're also trying to establish a relationship with that thing, and a commitment to that thing. Um, so those are some ... fundamental differences.

QUESTION: I wondering if you could touch a little bit on ... you know, the settlements, how they ended about the 18<sup>th</sup> century, or I guess before that. But there's always been a connection between the Hawaiians on the main Hawaiian Islands—

[GENERAL CONVERSATION]

QUESTION: Okay; so that link that was never really broken between the main Hawaiian Islands—

KIKILOI: Yeah.

QUESTION: Talk a little bit about that.

KIKILOI: Um ... yeah; I think, you know ... definitely, there was uh ... uh ... uh, what archeolo—what—what archeologists are studying, you know, is like the—the population of people that tried to colonize uh, Nihoa and Mokumanamana in the past—uh, in the remote past, yeah? We're talking about um ... what they believed at one point was uh, 1200, you know, AD up until 700 AD. [CLEARS THROAT] Now some of the dates are pointing to maybe a later period of time, uh, in the 1500s. Um, that population uh, that tried to do that, that—that push, that voyaging push and settlement of those remote islands uh, [CLEARS THROAT] ... has been the focus of what archeologists have been trying to uh, understand an—and—and research, yeah, about the past. But um ... besides that one main push that shows up in the record itself—you know, the evidence that we see today, the sites, the artifacts, and so forth, um, there were native Hawaiians that were still going up there uh, throughout history. Uh, so in the 1800s, there's an account actually from um ... David Kupihea Malo from Sand Island. Uh, and in that account, he talks about how fishermen from that area still go up into the Northwest Hawaiian Islands to fish. And this was in the 1880s. And um, more recently, you know, in the past uh ... couple years or so, um ... we went to interview um, the late uh, Kawika Kapahulehua, uh ... Anakala Kawika Kapahulehua, who uh, talked about some of his family traditions of going up there in—in the 1900s, yeah? So um ... native Hawaiians continued to go up there um, throughout history. Uh, whether it showed up in the archaeological record is a—is a que—is a different uh, question, yeah? Um ... [CLEARS THROAT] but definitely, there was a ongoing uh ... connection with that place uh, with the Niihau people.

QUESTION: A lot of the Marks and [INDISTINCT] from the 19<sup>th</sup> century began going up there and ... trying to reestablish their connections there. Can you talk a little about that, and maybe why they did that?

KIKILOI: Yeah. Um ... yeah; throughout the—the 1800s um ... from the time of Kamehameha, with uh, starting with Kaahumanu, uh, up until uh, eighteen-ninety ... four and five, uh, with the-the Provisional Government and the Republic of Hawaii, um, native Hawaiians w—uh, were interested in going up into the Northwest Hawaiian Islands, and so were uh, the native—the—the government itself, yeah, the Kingdom of Hawaii, and um, their predecessors, the uh, people that uh ... took part in the illegal overthrow. [CLEARS THROAT] And I think people went up there for varying reasons. I think for the uh, the alii, they were interested, just like us today, to—to renew connections with another half of the archipelago that they weren't uh, familiar with uh, growing up. Uh ... Kaahumanu being the first uh, to—alii to go up there, uh, contracted William Sumner, uh, who was a Western ship captain, to take three ships up there. And sh—I—I believe she went with Ka—Kaumualii, according to the um ... Kamakau's text in uh, 1869. Uh, and she claimed uh, Nihoa, the first island, for um ... as territory of—of ... of the Hawaiian Nation, as—as uh, unified by the Kamehameha I. Um ... other monarch uh, went up uh, including uh, Alexander Liholiho, uh, in 1857. On the ship, um ... he contracted a ship called Manuokawai with um ... uh, Captain John Paty. And uh, they went up there and they rendezvoused uh, at Nihoa. Uh, Paty went on to try and uh, relocate all the islands up into the Northwest, uh, but Kamehameha IV, uh, Alexander Liholiho, um, only went to Nihoa, and he came back. Um ... other royalty that went up were uh, Queen Liliuokalani in 1885, uh, on a ship called the Iwalani. It's a steamer that uh, took a—a large party of uh, government officials up to Nihoa. And um ... the purpose was scientific research, to try and map the island, to try and um, take notes on its uh ... its natural resources, its uh, biological species, and so forth. Um, so she was able to uh, go up there and see those islands for herself. Um ... and the last uh, expedition uh, related to, at least to Hawaiian royalty, was um ... uh, the steamer called the Waialeale, who went up in 1886, one year later, uh, to rescue some uh, people that were stranded on Kiri Atoll. And at the time, uh, King Kalakaua contracted uh, the steamer to go up and uh, sent onboard um ... uh, one of the special commissioners, um ... Commissioner uh, Harbottle Boyd, to go up there and to claim uh, Kiri under the—the Kingdom of Hawaii. Um ... so there were some really important historical events that took place in the 1800s that are—are tied to uh ... not just our cultural relationship to the place, but our—our uh, political relationship to the Northwest Hawaiian Islands, as they were trying to incorporate these—these islands into the territory of the Kingdom.

QUESTION: What did the alii know about the islands in the 19<sup>th</sup> century? Did they know a lot?

KIKILOI: Um, I think they were trying to—the alii were trying to rediscover these places for themselves too, you know. I mean, uh, in Kamakau's text in

1869, he writes about how Kaahumanu was um ... interested in—in finding this place, kind of like a storied place of her ancestors that was only mentioned in chants at the time. And um ... Moke Manu in 1899 relates back to that story of Kaahumanu, and talks about how, you know, she was so moved by the experience, she came back and she named the—the waterfront area by Aloha Tower uh, Nihoa. So it still has that name ‘til this day, in commemoration of her voyage up there. Um ... other types of information that I found was um ... some reference to Kalakaua and his board of genealogists trying to understand how those islands were related uh, in terms of island name and genealogy, much like how we’re doing today, uh, to the Hawaiian people at that time. Uh, they were trying to, you know, relocate the old names and trying to figure out which island name corresponded to which group. Um ... I think ... you know, in—in that timefra—in that time period in the 1800s, though, there—there’s somewhat of a limitation. Even though they’re closer to um, our kupuna, you know, that lived in a traditional manner and that there was um, generational uh, ties and—and ... and passing of knowledge uh, from one person to another, um ... I still think, you know, today we have a greater opportunity to research and to implement some of these things. Because we have technology now that can uh, digitalize all the oral traditions, all the newspapers, you know, and we can search and query them in a manner that um ... people back then didn’t have the opportunity to do so. So you know, they were trying to uh, use written documents and go one at a time, you know, to try and find these types of information; where today, we’re having information come at a much higher rate um, and um ... we’re able to try and gather and synthesize those things a lot better than um ... what they were uh—the opportunities they were provided with at that time.

QUESTION: I want to try to get ... your opinion on broader things. What about [INDISTINCT] captured your attention? And ... what made you want to get so involved with the area?

KIKILOI: Um ... well, my relationship with that place actually started in the archives, you know. I had heard about the project, then I got hired as an intern at the Bishop Museum in um ... I think it was 2001. And I did a lot of the legwork for that initial report that they did on the relationship um, native Hawaiians have uh, with the Northwest Hawaiian Islands. Um, so from that, like, my interest really uh, was stirred. And uh, in 2002, um ... uh, Dr. Lilikala Kame—Kameeleihiwa gave me the opportunity to go up there. Um ... uh, then working with uh, Center for Hawaiian Studies to go on the [INDISTINCT] 2002 expedition. And um ... you know, that was actually—for me, it was a uh, eye-opening experience. I mean, I’ve been to a lot of places and a lot of cultural sites in the main Hawaiian Islands, but um ... one, I really had to conquer my fear of water, you know. Like I—I thought—uh, you know, being on a ship for thirty days; I’ve never been on a ship even for one day. [CHUCKLE] So I was trying to go up

there, uh, a boat uh, on a large research vessel, um ... was a little nerve wracking for me. And um ... but once I conquered that fear, uh, and realized what an opportunity it was, uh, going up there was—was uh ... was an incredible experience. I mean ... um, I don't think, you know, even as a researcher, like we always look at the documents an—and y—you try to understand things from—from a paper perspective; you're reading about it, trying to envision it. But it's not until you really go up there that it really starts to make sense, yeah, that um ... it gets really paa in your naau. Um, because the experience uh ... kinda locks you to a memory of that place. So for me, um ... it was really spiritual. I mean, it changed my life. It did. Because uh ... I guess prior to—really, prior to going up there, I didn't have a lot of focus. You know, I was kind of all over the place in terms of school, uh, my personal life; and—and going up there really locked me in, and um ... the element of spirituality, reconnecting with uh, a landscape that is uh, still in its most pristine condition, seeing things that our ancestors saw, and being in a place where it all began for us, uh, was really moving. Um ... for me, I really think it's—it's important for native Hawaiians to have that experience too, yeah? Because um, it's something about that place that'll—that'll change you, forever, pretty much. And when you go up there, um ... it re-centers you on what's important, makes you more grounded, uh, brings you closer to our ancestors. So um ... it was one of the most important experiences, if not the most important experience of my life so far.

QUESTION: [INDISTINCT] Hawaiians ... you know, some people may question why Hawaiians should be allowed to access the area for their practices or whatever. You kinda touched on it a little bit, but [INDISTINCT].

KIKILOI: Sure. Um ... I think for, you know, our people, like ... there's a uh, a high value put on experience, you know. There's the saying, uh, *maka hana ka ike*, knowledge is in doing. So it's only in doing something, actually doing it yourself uh ... experiencing it yourself, uh, does true knowledge stem—stem from, you know. So ... I think on a more uh ... uh ... important, you know, level ... native Hawaiians need to be connected to the environment. Because there's a reciprocal—reciprocal relationship that goes on uh, between people and place, yeah? And um ... it's tied to uh, identity, it's tied to wellbeing. And uh, to sever that connection impacts the people. So ... the continuation of practices up in the Northwest Hawaiian Islands uh, having access for traditional cultural practices, and uh, having native Hawaiians continue to experience and reconnect uh, with the Northwest Hawaiian Islands is—is—is vital. Not just for the—the wellbeing of the people, but for the wellbeing of the place.

QUESTION: So the place benefits too?

KIKILOI: The place does benefit.

QUESTION: Why?

KIKILOI: Um ... it goes back to that idea of, you know, natural resources or cultural resources, yeah? Like uh, what people see as biological species, we see as our ancestors. And ... it's about a family history and a family connection, and ... when you go up there, you're visiting family, and you're trying to reestablish ties which—with your family. And um ... I think if you um ... simplify it in those terms, uh ... all people can understand that, yeah?

QUESTION: I was gonna ask a broad question; you kinda answered it. What do you think the Northwestern Hawaiian Islands mean to Hawaiians today? What's the significance of them?

KIKILOI: M-m—

QUESTION: Why should like, you know ... [INDISTINCT].

KIKILOI: Um ... I think for most Hawaiians, uh ... you know, places like the Northwest Hawaiian Islands are really important to uh ... to preserve and keep protected, because there isn't a lot of places in our homeland left that are in a pristine condition, yeah? So—as you know, cultural practitioners, people that are trying to um ... connect with the environment, um ... the integrity of the environment is really important. Uh, there's not too many places that you can go that uh ... you have unobstructed views of—of the mountains and the ocean, uh, that it's not somehow impacted by buildings, noise, uh, and other types of visual effects. Uh, when you go up there, it ... that landscape really is uh, how it was hundreds of years ago, if not thousands of years ago. So how you see it, is how your ancestors saw it. And ... it's really about the quality of experience when you go up there. Um ...

QUESTION: Talk a little bit about how people today see, you know ... it's starting to change now, but the general perception is that, you know, there's the main Hawaiian Islands, the Northwestern Hawaiian Islands; they're kind of separate [INDISTINCT]. But if you could talk a little bit about how our ancestors maybe didn't see it that way, and that's not how it should be.

KIKILOI: Um ... yeah; I think, you know, today, because of the way um ... our lands are—and territories are divided up under different jurisdiction or agencies, and—and—and owners uh, we see these place as disconnected, yeah; the Northwest Hawaiian Islands being a separate place, and the main Hawaiian Islands being a separate place. And I mean, we even call it by that, right; Northwest Hawaiian Islands and main Hawaiian Islands. But in the past, uh, these were just islands, and they were all part of Hawaii.

And I think we need to kind of return to those uh, ideas of uh, interconnections and relationships. Um, I really like the—the idea of the canoe as the metaphor or the thing that links it all together, you know. Uh

...

[GENERAL CONVERSATION]

KIKILOI: Um ... yeah. I guess in the past, we were talking about um ... how the main Hawaiian Islands and the Northwest Hawaiian Islands today are conceived as two very separate areas. Um ... I think—wait. [CHUCKLE] I'm not in a flow, so it's kinda hard to just like jump into it, yeah? [CHUCKLE]

[GENERAL CONVERSATION]

QUESTION: So you don't think they should be separate; they should be connected?

KIKILOI: Right. I mean, they aren't separate. You know. [CHUCKLE] It's just uh, imaginary boundaries that we—we place upon uh ... areas, geographic areas, you know. Uh, much like how the—the Pacific is—is broken up into all these different areas; Polynesia, Melanesia, Micronesia. In the past, uh, I don't think anyone in the Pacific conceived these as—as separates areas, but all interconnected through ocean and um ... and canoes. Uh, the Hokulea really is uh, a powerful metaphor of uh, linking these islands up again. You know, some of the voyages up there uh ... was about reconnection, about going uh, up the chain to uh ... rediscovery these places, and trying to understand them from a perspective of—of ocean voyages. And I think that's really important, you know; like seeing it from ... from that perspective. Because like for me, uh, it was a very different experience being in a research vessel, than being on Hokulea, yeah? Uh, being on the canoe is uh ... you're totally immersed in—in the natural environment; the waves, the wind, the sun. Um ... and you get a better idea of what ... what—what it takes for uh, people to uh, have the perseverance of going up there, and trying to survive. Um ... if you think about it, it's a pretty amazing feat that people can—can go all the way up to the Northwest Hawaiian Islands. I mean, these islands are little specks of land in the middle of a vast ocean. And um ... you know, on the Nihoa trip, uh, Nainoa was saying that if you're off one degree, that you would miss the island. And um, there's no room for error in—in that kind of uh ... that kinda calculations. So it took really uh ... keen uh, observers and—and a whole system of knowledge that was developed over generations to uh, utilize the stars, the wind, the sun, the waves, to try and find uh ... little specks of land in the middle of the ocean.

QUESTION: Do you want to talk about ... abandonment questions?

KIKILOI: Um, what's the question again?

QUESTION: What are some of the theories about why native Hawaiians abandoned the settlement [INDISTINCT]. What's your theory?

KIKILOI: Okay. Um ... I think early on, um ... you know, a lot of uh, of the theories uh, on colonization and settlement of Nihoa and Mokumanamana was influenced by general anthropological theory about how the Pacific was uh, settled. Um ... you know, early on in—in the history of—of the discipline, um ... oftentimes Pacific Islanders and—and Hawaiians were discredited as not being uh, capable voyagers, yeah, uh, to find these—these remote island, and to navigate them purposefully. Um ... but over the years, um, those ideas have evolved, yeah, with um, Ben Finney being a proponent uh, of um ... Polynesians and other Pacific Islanders being very capable and very skilled in navigation, and very seaworthy people. Um, the creation of the Hokulea proved a lot of these—these theories, because uh, how can you discredit people actually going on the canoe and doing it in—in modern times, and—and actually uh, sailing two thousand miles and finding dots of land in the middle—middle of the ocean. Um, so for Nihoa and Mokumanamana, a lot of the early theories uh, were based on um ... those preconceived notions that Pacific Islanders weren't capable navigators. Uh, oftentimes, uh ... relegating ... you know, the ... the answer of, you know, who—who were the people that—that actually settled and discovered Nihoa and Mokumanamana, saying that it was either Tahitians or—or Marquesans, you know, drifting on a log or—or—and then shipwrecking on the island, and then kind of like living out their last days in kind of like a uh, castaway scenario. Um ... I think today, we know—we know better. Um ... we know that ... uh ... the—the likelihood of people voyaging from Marquesas an—and Tahiti in kind of a random kind of way, an—and landing on Nihoa and Mokumanamana and getting stuck there, and then dying their last days is—is probably not what happened. Um ... a more uh, likely uh ... answer to that question probably lies in—in the history of the Hawaiian Islands, because of its proximity um, because it—it—those islands are in a linear trajectory, you know, going in the same direction of—of how people could have voyaged from one island to the next. Um ... other uh, scholars later on, like uh, Paul Cleghorn in the eighty—uh, 1980s; uh, he did some uh, fieldwork on Nihoa and Mokumanamana, and got it on the uh, National and State Register for Historic Places. Uh, he had a lot of ... I think, better um ... hypotheses and conclusions that, you know, it's likely that there was um ... ongoing interaction with that area from the main Hawaiian Islands uh, for some period of time. Um, a lot of the research I'm doing is trying to really fine tune those ideas, and a lot of is linked to uh ... our ability to get dates from the areas. So for archaeology, we—we use exact dating methods, like um ... radio carbon dates, and more recently, the development of um, thorium 230 dating, which is coral dating. Um, those

are two ways that we're—we're hoping to kind of fine tune the ... the chronology of settlement for those two islands. And also using um, other relative chronology methods, like uh, seriation, which is the stylistic comparison of um ... different architectural features on ceremonial sites and residential sites, with the main Hawaiian Islands and other places in the Pacific.

QUESTION: So why were the islands abandoned?

KIKILOI: Um ... well, the um, Northwest Hawaiian Islands um ... are in a category of islands um ... with other Pacific Isl—a score of other Pacific islands um, that have been labeled uh, in anthropological discussions as mystery islands. Because uh, in the past um, there's evidence of settlement of those areas, but at the time of European contact, um, nobody was found living on those islands. So the Northwest Hawaiian Islands are considered mystery islands, and it was mystery as to why those places were abandoned in the past. I think it's um ... somewhat common sense, though, that ... you know, as—as you move up into the north uh, northwest direction of the main Hawaiian Islands uh, into the Northwest Hawaiian Islands, the islands get smaller, um, there's less uh, land for uh, agriculture, there's less biodiversity found on the islands; so um, human survival is really pushed to its uh, to its limit. And um ... you know, oftentimes ... people say that uh, islands is a microcosm—microcosm of the—the world, yeah, that we have to learn how to live sustainably within our island environment, and the lessons uh, taught here uh, are lessons for the planet. Well, if the lessons taught here are lessons for the planet, then the lessons on an atoll is lessons for uh, the universe. [CHUCKLE] You know, really. Because uh, the ... atolls really are a microcosm of the microcosm, which is the island, and—and um ... these atolls and—and low-lying islands are really susceptible to weather patterns, um, any diff—uh ... any little [INDISTINCT] from—from the natural environment, species introductions, uh, little things that we take for granted that can be buffered by uh, geographical space here and in larger continents um ... are magnified on a small, tiny, little island. So uh, resources are limited, and ... um ... the ability to support populations over time is—is severely limited uh, as you get smaller land area.

QUESTION: So I remember one time you were telling me that ... there's a sort of theory that ... as voyaging throughout the Pacific decreased or declined—

KIKILOI: Yeah.

QUESTION: --that [INDISTINCT] small islands [INDISTINCT].

KIKILOI: Yeah.

QUESTION: What's the correlation, or is there a correlation?

KIKILOI: Yeah; there was um ... ideas like that put forth by a ... a guy name Jeff Irwin, who wrote a book um ... on—well, a—a chapter section on the Mystery Islands. And he ... he showed how um ... he thought that there was a correlation between the abandonment of islands and the decline in voyaging throughout the Pacific. And I think that makes sense, you know. I mean ... um, definitely, there's a period in time when uh ... voyaging declines because ... a lot of the uh ... islands throughout the Pacific are settled and colonized. And people are gonna go to the best islands first, yeah, so the larger, more productive islands with good soil, high mountains, a lot of water; those are places that people want to live. And as they become domesticated and invest more in agriculture and uh, domesticated activities, um, exploration uh ... marginal islands uh ... become less of importance to um, native people throughout the Pacific. And um ... especially when you have, like, small islands like Nihoa and Mokumanamana; I mean, they're so susceptible to any little kind of effect from, you know, the changes in—in—in rainfall, wind, uh, and so forth, that um ... there's so much risk in living in those places, that people probably didn't want to live there after a period of time. Or, they might have even died out.

QUESTION: [INDISTINCT]

KIKILOI: It's a possibility. Yeah. [CHUCKLE]

[GENERAL CONVERSATION]

KIKILOI: Um, I think that ties into the question of abandonment too, you know. [CHUCKLE] Like uh, talking about places of risk. Um ... you know, I—I stayed on—well, let's see. I—I've been to Nihoa a number of times. Um ... but in 2005 and 2006 was two of the—the field ses—seasons that we actually um ... actually lived on the island for about two to three weeks at a time. And um ... I think living there, and again, you know, relating back to maka hana ka ike, yeah, uh, knowledge is in—in actual—in the experience of doing things; uh, living on the island ... and um, forming a more intimate relationship, and seeing every nook and cranny of the island, uh, really gave me a different perspective on what it took for our ancestors to try and colonize places like that. Um ... it's—it's a very difficult place to live for an extended period of time. Um ... so you kind of get an idea of some of the—the problems and constraints I think people had to deal with. Um, Nihoa Island is one hundred seventy-one acres in size; it's—it's somewhat small, but the real problem is that the entire island is on a—a slope from—anywhere from thirty to seventy degrees at any given point, you know. Uh, if not ninety degrees, uh, you know, the back—the back cliff. [CHUCKLE] So ... um ... trying to live on that

island um, there really is a premium on ... uh, level, flat space.

[CHUCKLE] 'Cause you know, half the time, your ankles are twisted in one way, trying to either climb up or climb down the thing. And um ... it's very crumbly, the soil; so uh ... you know, a lot of the archaeology kinda reflects their adaptation to the environment, yeah? So uh, one of the things I noticed is that uh—well, obviously, for one, um, everything has a uh, a front face, a retaining wall, you know, that's trying to, you know, hold uh ... hold back the—the—the—the slope, and to uh, level out the—the surface, yeah? So you have um ... retaining walls for terraces, for platform—living platforms, uh, enclosures, and so forth. Um, another thing they tried to do was, they—they—they strategically built sites on certain areas. So um, one of the things you'll notice is that when you go to the island, you can see these dike stones that run through the island, yeah? They're—um, I don't know what, exactly, they are in—in geologic terms, but they're—they're harder rock than the—the regular soil. So you have these, like, veins of uh, of um ... dike stones that run uh, vertically through the island. And they'll try and build the retaining wall on top of that face, because that's one area that won't collapse, you know. Uh, if you try to build it on any other kind of surface or—or ground, there's—it's so rubbly and so crumbly that um, there's a good chance that the retaining face will collapse, yeah, over time. So they were very strategic in the way they um, they built things and—and how they—they planned out the—the settlement of that area. Um ... being there for two to three weeks, uh, it's—it's just murder on your ankles and your feet. By the end, I felt like my—my feet has—had bruised all the way through, because they're constantly pounding on rocks and—and hard—hard pavement, you know, of—of uh, of rock, you know, over an extended period of time. Um ... and—and it just requires a lot of energy. I think, you know, when you're on a vessel and you see that place, it looks—it looks kinda small, actually, you know, even on a map an—and when y—you're on the vessel looking—looking onto shore. But uh, when you're on the island, you know, it takes about two hours to get from one side to the other. And um ... you're pretty exhausted by then, and you have no water, you know.

[CHUCKLE] So you only take the water that you bring onto shore, an—and you realize that um, beside ... you know, if—if you didn't have the water that we brought, uh, the only water available were those seeps that come out at the bottom, and um ... it's rough. It's rough to live there. It's about survival. I mean, those kinds of things go into your mind. I mean, when I'm at home, I never think about, you know, like, do I have enough water to make it through the day. When I'm over there, I'm thinking about trying to live and trying to survive, and everything becomes more real to me. And um ... it's really going back to the basics of—of—of living when you're—when you're on that island.

QUESTION: And I guess it speaks to like the commitment that it took to live on that island, and ... you gotta want to live there for a reason; there has to be a reason.

KIKILOI: Yeah. I think it's uh ... the commitment isn't just on living on the island; it's also ... the recognition that there's so limited resources um ... on the island, that ... uh, no one island in the Northwest Hawaiian Islands might have enough resources for you to actually have all the things you need to survive. So again, that's where the canoe comes in, you know. Having um ... canoe as the vehicle that interlocks the islands and creates um ... systems or uh ... uh ... what do you call ... shoot; my mind's going blank. Um ... just having inter—interrelated networks, yeah, in between islands uh, in order to um, survive, yeah, to buffer the—the effects of—of uh, limited size and resources. Um, linking them up together gives you uh, a more variety of resources to live and subsist over a longer period of time.

[GENERAL CONVERSATION/AMBIENT]

[END]

**Interview**  
**KAIULANI MURPHY**

QUESTION: Can you say your name, and spell it?

MURPHY: Kaiulani, K-A, okina, I-U-L-A-N-I, Murphy, M-U-R-P-H-Y.

QUESTION: And where do you work, and what do you do?

MURPHY: My position? Okay; I work with uh, Honolulu Community College, and I'm an instructor. Um, we're trying to develop a ocean studies voyaging program. Yeah. [CHUCKLE]

QUESTION: Um—

MURPHY: I never know what to call it.

QUESTION: Okay. So first question; just some general background about yourself. Well, talk a little about why or how you got into voyaging, and what pulled you in.

MURPHY: M-m—

QUESTION: [INDISTINCT]

MURPHY: Uh, the first ... actually, the first time I got on the canoe, on Hokulea, was when I was in elementary school. And I was just in total awe of this beautiful canoe; it seemed so big. Um, but I hadn't really seen or touched her again si—until I got into um, UH Manoa. And [CLEARS THROAT] ... I listened to Nainoa Thompson give a presentation at the Center for Hawaiian Studies, and I was just so inspired by his—by his talk, and—and what he was saying about how the canoes um ... you know, symbolizes hope and—and—and pride, in—in our people. And so I enrolled in a voyaging course, thinking he was gonna teach it. Um ... of course, he didn't teach the course, but I did get involved with the canoe by um ... being part of that class. So since that time—that was about eleven years ago, um ... I've been ... fortunate enough to have been able to go on um ... on some voyages with the canoe, and—and share what I've been able to learn um, through that.

QUESTION: So eleven years; what's kept you in it? What's kept your drive going [INDISTINCT]?

MURPHY: Um ... I can't—I don't know; I can't see myself not sailing. It's just um ... I think it's a lifestyle. It's something that um, those of us that have been sailing—you know, there's many people that have been sailing longer than I have, but you just—there's this draw from the canoe, and—and we just love the ... connections, I think, with the canoe, with the ocean, uh, with nature, and especially with each other, with other people. Um, and those of us that um, have that love for—for voyaging, um ... I think ... can't really see the canoes not being in our lives. At least that's—that's kinda how I feel.

QUESTION: What role did like reconnecting with your culture play, or [INDISTINCT] or ...

MURPHY: M-m ... um, I definitely feel like I've been learning plenty. Um, and I've ... you know, learned that I've a lot more to learn. But um, it's—[CLEARS THROAT]—I think I never really learned about, like, more depth of—of our culture, Hawaiian culture, um, until I was at UH. Which is um ... kinda was old already. [CHUCKLE] But um, not to say I didn't have a good foundation when I was growing up, but I learned a lot more um, by taking classes about Hawaiian culture, Hawaiian history. And so realizing that there's kind of a ... um ... there's a disconnect in our education system of our—with our culture, uh, at least when I was, you know, like in elementary school and stuff. And I think the voyaging canoes are such an important um ... an impors—an important aspect of our culture and uh, they're a great way to uh, reconnect with that um, educating of young people. Um, I think the canoes [CLEARS THROAT] have—have ... inspired me to want to learn more about us, our place, um, the relationship that our kupuna had with nature, and the relationship that I'd like to develop, and I'm learning to develop. Um, and just, you know, being ... being close with our surroundings, um, learning about, you know, the ocean, the—the land, and um, how the ocean connects all of us, you know, our larger ohana outside of Hawaii. Um ... and how much more similar we are than we are different. But um, that ... the more I learn about our culture and our kupuna, the more proud I am to be from here and—and—and from them, and the more I'd like to share that um ...the values, I guess, or those experiences that I've had with young people, so they have—uh, for me, it's given me a good um, sense of direction too in life. You know, I mean, I don't know what I'd be doing if I wasn't voyaging. Um, fortunate that our um, university system is you know, embracing the fact that voyaging is such an important part of ... of us and of this place that um, there's actually um, support for education programs, you know, to uh, use the canoes as classrooms. [CLEARS THROAT] So I know that wasn't really your question; I forget what your original question was. [CHUCKLE]

QUESTION: Um—

MURPHY: Sorry. [CHUCKLE]

QUESTION: No; that was great. So talk about your history with voyaging, like what kind of places have you been on—

MURPHY: M-m—

QUESTION: --or to with the canoe.

MURPHY: M-hm.

QUESTION: [INDISTINCT]

MURPHY: Yeah. Uh, I've mostly been—uh, been able to sail with Hokulea. Um, Hawaii Loa, a little bit, just coastal sails while she was um ... uh, while she was still in the water. Now she's being um, repaired. But um ... so from the time I started um ... with Hokulea, you know, trained um, around Oahu and throughout the main Hawaiian Islands. And um, the first voyage I—I got to be a part of was um, coming home from Tahiti, back here. Uh, that was back in 2000, part of the Rapa Nui voyage. Um, and then [CLEARS THROAT] the next longer voyage I'd um, been a part of was to the Kupuna Islands, and that was back in 2004. Um, I was able to go up to Kiri and—and come back with the canoe. And then um, just last year, going through um—from—from here, from Hawaii through Micronesia, and Ja—and Japan.

QUESTION: Can you talk a little bit about that trip you guys made to the Northwest—well, to Nihoa, the one you navigated on?

MURPHY: M-m. Okay; that was actually part of that um ... that full voyage to Kure. And um, I got that leg from Kauai to Nihoa. Uh, my kuleana was to um ... to navigate the canoe there. Um, but I was very fortunate to have two great mentors and navigators onboard, Nainoa Thompson and Bruce Blankenfeld. Um ... it's ... it's kinda nerve wracking and—and uh ... it's a big kuleana. [CHUCKLE] And you never—like I never really felt, even leading up to departing from Hanalei, I never thought that I was ready. You know, and it's—you know, it's—it's only an—like an overnight sail, really, but it really made me realize um ... how much I didn't know, how much I wanted to learn, um ... how lucky I was that two navigators were onboard. Um, but it's a—I guess a ... a short [CLEARS THROAT] version of what a long voyage would be. I mean, you learn everything that um, you would need to learn for a long voyage, but it's condensed into, you know, a twenty-four-hour period or so. Um, but yeah; I was really ... really nervous, um ... just trying to study, study, study up until the day we left. And uh ... once we saw Nihoa, um ... I went to sleep.

[CHUCKLE] I was so exhausted. [CHUCKLE] Just from trying to study, and then trying to stay awake, and—I mean, I was really lucky, ‘cause along the way, Nainoa would ask me questions and—and get me to look at things in, you know, the ocean and the—and the sky that I should be paying attention to. And so it was uh, a great learning process for me. And um ... yeah; still learning. [CHUCKLE]

QUESTION: What kind of—how do you prepare for it? What goes into ...

MURPHY: The preparations?

QUESTION: This was your first trip you navigated.

MURPHY: Yeah. The—the very first voyage I was part of, um, I was like learning the navigation, so we were kind of on a team an—and there were two of us that were supporting or assistants to the main navigator. Um, so this was the first time that, yeah, you know, I was supposed—that was kind of my kuleana. Um ... and ... to prep for that, um, it’s [CLEARS THROAT]—there’s the academic stuff, which is kinda the easier stuff. You know, just the memor—memorizing stars, um ... looking at, I guess [CLEARS THROAT]—to me, the hard part is—is the—the—the changing things. You know, just having to um, have that experience of being out on the ocean for longer periods of time, an—and you know, learning how to um ... how to read the surface of the ocean, the swells that are coming, read the wind, you know, how the clou—how you can read wind in the clouds. Um ... you know, real—realizing ... or reading signs, I guess, when ... you know, just the colors in the sky when the sun rises or sets. Um, to me, that’s ... that’s a bigger part of the preparation, is actually um, having that experience to um ... to fall back on when you’re—when you’re actually out there an—and doing it. Um, the academic stuff, like I said, the memorizing stars and things like that, rising and setting points, that’s a little easier, because the stars are ... the stars are more constant. You know where you should see them. Uh, whereas the weather and—and the ocean is always changing. Um ... so those are kind of the—some of the physical, maybe, um, learning preparations. And then there’s just like, you know [CLEARS THROAT] ... um, mentally and—and spiritually um, preparing yourself for a trip like that.

QUESTION: So you’re studying the environment; things that you said were shifting a lot [INDISTINCT].

MURPHY: M-m.

QUESTION: How do you do that? Do you stay on land, or just kind of ...

MURPHY: Um, ideally—ideally, um, you would be uh, get out there on the ocean. And ideally, on the canoe that you're gonna be sailing for the voyage, so on Hokulea. Um, but even if it's just, you know, on ... uh ...  
[CHUCKLE] good one, Naalehu.

[GENERAL CONVERSATION]

QUESTION: So you ideally want to be on the canoe.

MURPHY: You'd want to be on the canoe training out there in the elements. Um, but if you can't do that, because Hokulea does take a lot of resources to get out there, um, you know, whether you go on a one-man canoe or kayak, or six-man canoe; just being out there on the ocean, and just you know, feeling the wind and feeling the swells, um ... even on a boat if you can get out, you know, ou—outside of the island, more in the channel, or away from um, away from land for a little bit, and just kind of develop that relationship with the ocean and ... and the weather.

QUESTION: Did you spend a lot of time on Kauai, or in that area before?

MURPHY: Um, actually, leading up to that voyage, we ... I think we were delayed for two or three weeks, yeah; so we got to spend a lot of time on Kauai. But um ... [CLEARS THROAT] before then, um, I had—yeah; we had um, sailed Hokulea around throughout the main islands, and we spent some time over there. Um ... but mostly the ... the purpose, I guess, of getting the canoe there was for um, for education and sharing with—with—with people of—of that island. Um, so I never really went beyond Kauai, or just got out off—offshore to go sailing out there. So um, actually, when we did leave for Nihoa from Hanalei, um ... we were a little—well, I was a little surprised that the—the ... um, the weather conditions, I guess, the fact that we kind of ran out of wind when we were on the north side of—of Kauai. So we had to kinda change course. I mean, that--[CHUCKLE]-  
-I was like, Oh, my god, I want to go there. [CHUCKLE] I have to get there before we turn. You know, it was like [GASP] kinda nerve wracking. Just gotta adjust again. [CHUCKLE]

QUESTION: So that was during the trip?

MURPHY: Yeah; during the trip.

QUESTION: To Nihoa?

MURPHY: Yeah. Yeah.

QUESTION: So what's it like trying to—I mean, trying to ... I guess for me, it's kinda odd that you go to an area, you're supposed to get to an island that you've never been to and—

MURPHY: M-m.

QUESTION: --go on a route that you've never been on.

MURPHY: M-hm.

QUESTION: And then having to just sort of get the [INDISTINCT]. What—

MURPHY: Yeah.

QUESTION: What's that like? And then what's it like when you actually accomplish it?

MURPHY: Um [CLEARS THROAT], you know, another part of the preparations, I guess, is the—the actual sail planning, the physical sail plan. So you use uh, nautical charts. So you see the—this little speck of land on the chart, um ... and you draw ... you draw a course line. And so [CLEARS THROAT] ... even though you'd never gone there before, you have this um, imaginary path over the ocean that you're trying to stay on, um, and constantly keeping track of ... where you are relative to that—that course line. Um, and that's—that goes for, you know, from Kauai to Nihoa, or from Hawaii to Tahiti, all the voyages that—that we've done. Um [CLEARS THROAT] ... so to ... to actually see the island come up from the ocean is um ... I don't really have words for it. But it's—it's—it's pretty awesome; it's—it's amazing. You ... um ... I didn't really know what to expect. I mean, you—you see pictures and everything, but uh, when you actually see it, you know, far off on the horizon and you have it grow and grow as you get up close to it, um ... it's something that y—you gotta do to—to know that feeling, I guess. But I would hope that ... everybody can do that, to get that feeling.

QUESTION: Can you talk a little bit about doing something that your ancestors did?

MURPHY: M-m.

QUESTION: That they probably felt that exact, same—had that exact, same experience when they went to Nihoa [INDISTINCT].

MURPHY: M-m.

QUESTION: I know I've talked to you before about this. You mentioned that, you know, [INDISTINCT] footsteps of your ancestors.

MURPHY: M-hm. Yeah.

QUESTION: [INDISTINCT]

MURPHY: Yeah. Um, definitely, I think we hear that a lot, sailing in the wake of our ancestors, and um ... knowing that, you know, we come from incredible explorers. And um ... and to know that they were there, I mean, lived in Nihoa, you know, for so many years, um, voyaged back and forth uh, between the main islands and there. Um ... it seems—it's—it's like we're—we're crossing uh, a familiar path, but um, it hadn't been traveled, you know, for so many years. Um ... so it was—it was al—it was like ... kind of like going back in time, or reconnecting with that time. Um ... you just really feel that—you feel the mana of—of those places. And when you're out on the ocean, just this um ... can imagine, maybe, what ... um ... what it was like to sail back then, or how it was to sail. Uh, I mean, I have incredible admiration and respect for them. You know, we have a lot of modern amenities, I guess, even—even on the canoe now, that—that we have, that [CLEARS THROAT] you know, they wouldn't have. I mean, just for example um, the clothes that we have, you know. And it gets—it can get really cold at night, and to—to think that, you know, if they only had, you know, natural fiber kind clothing, and ... and to um ... to have that physical stamina of—of um, enduring harsh weather or—or what not, and uh ... that they just—I mean, even beyond Nihoa, you know, traveling probably around the world, um ... it just ... makes—again, just kinda makes me feel more proud of—of who we come from. Yeah.

QUESTION: Do you have—I know you were just talking about how, you know, [INDISTINCT] how they sailed a lot between those—

MURPHY: M-m.

QUESTION: --islands. Do you have any idea of what ... the role Nihoa played in voyaging—or the role Nihoa played in [INDISTINCT] voyaging traditions, whether—I know—and I'll talk about this [INDISTINCT]. But there's been talk about using the area as a training ground [INDISTINCT].

MURPHY: M-m.

QUESTION: Was that traditional, you think, from your experience or ...

MURPHY: Um, I think ... I—I'm not sh—uh, I'm not for sure, but I think it would serve a great um, uh, training ground for young navigators, or even um, testing navigators, maybe. Um ... we did try uh, to sail to Nihoa again with some high school students. Um, that was two years ago in 2006.

Um, the weather ... the weather didn't allow for us to—to get all the way there, but what we were trying to do is—was teach this group of young people um ... again, you know, the basics, what you need to learn to be able to voyage far, to navigate far. And um, after all the learning and training that they had done, that was kind of like the—the test for them, you know, can they find Nihoa. Um ... and uh ... although we didn't get to Nihoa, we did sail uh, to—we had them find Kaula. And um ... and they did really good. I mean, they were—we kept track of their estimates and the escort boat we had kept track of um, our actual positions. And the—the match ups were amazing, and it's um ... I guess it just—it shows ... that, you know, the—the training that we're doing, you know, is—is of value to young people, and um, it is teachable and learnable, I guess, an—and I would think that, you know, that's probably a—that would—would—would have been a good place too for ... you know, our kupuna to have done their training. Because you can't see the—the island, so you're ... you know, you have to sail overnight and um ... yeah; I think that'd be a—that would be a great training ground. Yeah.

QUESTION: What are some of the other advantages to using Nihoa as a training ground? Is it just the distance or ...

MURPHY: Um, the distance, the fact that it's tiny—tiny, little island. I mean, compared to these—these large ones that we live on. Um ... and ... I mean, for me, once we sailed up close to the island, you—you know, it's just—it's a beautiful island. You see um ... at least for us in—in our times, you know, nobody um ... no people living there, but just you know, the amount of birds, and—and animals, and the plant life that just, you know ... dominate that—that place. It's just a—a place of beauty and mana, and um ... awesome to pull it out and watch it grow from the sea.

QUESTION: So can you talk a little bit about ... what your ... hopes are for voyaging in the future to the Northwestern Hawaiian Islands?

MURPHY: Uh, I do hope that we can continue on um ... you know, regular voyages out there, um, so that it's something that's happening either at least once a year or every other year. Um ... because this whole idea of—especially now, I mean, we have—last year um, Mau Pialug recognized five navigators from Hawaii. This—earlier this year, he recognized another uh, group of men from the South Pacific. And um ... you know, to think in thirty-something years, we have nine pwo navigators now, or at least recognized by the um ... by their um ... first teacher from Micronesia. And the idea that, you know, in the next thirty years how many more navigators uh, will we have. And their kuleana, part of their kuleana is to—to teach and um, keep that knowledge alive. And—and it is a living—uh, you know, we have a living culture evolving, an—and um ... to continue those and make our own traditions, maybe, um, of—of

continuing that connection with that place. Um ... so I would—I—I would love to see the canoes going up there for uh, training purpose, for um, spir—spiritual connections. Um ... and I think it's important to keep that connection.

QUESTION: Is there discussions going on with any of the other—

[INTERRUPTION]

QUESTION: Okay; so same question. So have the other canoes been talking about going up there? Has there been discussions about regular trips up there?

MURPHY: Um, yeah; I think as uh, ohana waa throughout, you know, all the—the main islands, all the—the waa organizations that have been born since the time of Hokulea, um, I think everybody [CLEARS THROAT] you know, realizes the importance of—of teaching and um ... and at least one canoe has—um, besides Hokulea, you know, Hokualakai, um, had gone up there in 2005. And um ... I'm sure, you know, we're more and more trying to do things together with—with all the waa, as much as we can. Uh, so I—I mean, I'd love to see that as a trip, you know, just uh, a fleet of waa sailing up to our kupuna islands and—and honoring that place and uh, you know, so much can happen on—on ... on those kinds of huakai. So I think that would be awesome.

QUESTION: So there's Hokulea and Hokualakai; those are the only two Hawaiian voyaging canoes that have been in the area [INDISTINCT]?

MURPHY: Uh, as far as I know, yeah. M-hm.

QUESTION: What was Hokualakai's—what was the reason for them going up there?

MURPHY: Um, in 2005, Hokulea and Hokuala—Hokualakai together sailed um, with the um ... with that group—uh, what is it now, Kupueo Kaimoku, I think is their name. Um, and ... they went up there—I think it was—was it around the solstice? Around now? They went up there to—to both Nihoa and Mokumanamana um, observed the solstice, um [CLEARS THROAT], so it was—I didn't um, I wasn't able to go on that particular trip. But um, it was part of—we did a—Hokulea was doing an island wide educational sail, voyaging program, and um ... Hokualakai joined part of that. And in Kauai—from Kauai, they left together to go up to Nihoa. So I think it was not only—it was a continuation of that island wide, you know, connecting all the—all the mokupunis um, including Nihoa and Mokumanamana. And um ... going up there to do some—some ceremonies and observing the uh, the longest day of the year.

[GENERAL CONVERSATION]

QUESTION: It's often said that canoes are sustainable floating islands. And the Northwest Islands are some of the most desolate and remote islands—

MURPHY: M-hm.

QUESTION: --around. What can conservationists and research scientists going to the Northwest Hawaiian Islands learn from canoe culture and from your ancestors who sailed there and lived up there?

MURPHY: Uh, I think [CLEARS THROAT] the waa have so much um ... so much lessons can come from—from the waa. And uh, one thing we say is, He waa he moku, he moku he waa. So the canoe is an island, an island is a canoe. And um, when we go on these voyages where we're out of the sight of land for, you know, more than a day, um, you really ... you really realize the—the importance of taking care of that waa that you're on. Um, you know, the—the food and water we bring on the waa will last us for the duration of that trip. Um, the people that we're on the waa with, you know, that's ... that's ohana. You know, you—you have to get along; you don't really have a choice, there's no—uh, not a lot of privacy, you know, it's small. It can be small spaces if you um ... think of it that way, uh, or it can be totally comfortable and—and just [CLEARS THROAT] needing to work together as that ohana, as that team to get to your destination. Um ... listening—you know, having the leadership onboard, the—Mau says that the—the navigator is your father, and the canoe is your mother. And so again, that kinda reaffirms or um ... has you look at it in terms of a family. You know, your—the crew members are the—the children, you listen to your parents and you'll get to where you need to go. Um, take care of the waa; before you go on these voyages, you know, making sure that—that she is seaworthy and safe. [CLEARS THROAT] And so when you're out on the ocean, you can, you know, you can um, rest easy, maybe, knowing that the canoe is in good shape. Um, and so all of those—an—and just the values of—especially of malama to me is the—the main one. They all translate back to the bigger waa that we live on. Um, and ... you know, we do have um, limited resources. It's not as—um, you don't realize it as quickly, maybe, as you do on a waa, because you know, that's like survival. You know, if you run out of water ... um ... can't survive without water. But you know, having ... having those kinds of lessons brought back to the—the bigger islands, and how do you take care of those uh, resources, the food and water, taking care of each other, um, of yourselves too, and um, and the islands so that you know that it will be healthy and it will um, take care of you throughout not just your life, um, but ... for um, until forever, you know. And so ... I think the—the waa is a really awesome ... um ... island uh, for us to learn from how to live better on the main islands, I guess. And I think that's something that maybe um ... uh ... maybe—I don't know about easier, but it's—it's

a good way to—to—to teach people, young people, older people. I mean, I learned plenty from being on the waa, you know, just—just realizing that. You know, how um ... how sensitive our environment is, and—and especially you know, having that relationship with nature. Again, you know, being able to um, understand weather and the ocean, and how everything works, and the---cycle of life and how we're all connected. And um ... um ... yeah. I forget where I was going with that, but ... [CHUCKLE].

QUESTION: Great.

MURPHY: It's just a good classroom.

[GENERAL CONVERSATION]

QUESTION: Scientists and visitors who go up to the Northwest Islands might not know too much about the culture, but they know—I mean, [INDISTINCT] reasons why they're going to the Northwest Islands is the environment.

MURPHY: M-m.

QUESTION: What would you want them to know about the Northwestern Hawaiian Islands and what it means to the Hawaiians and [INDISTINCT]. What would you want to tell them?

MURPHY: Um ... h-m ... I guess I would—I would hope that, you know, people going up there, anybody would um ... would know that, you know, um ... our kupuna had this awesome relationship with um, with their honua, with the ocean, with the land, um ... and had an understanding of how everything ... was connected, how everything worked. Um, and us living as people, living with you know, with the land, with the ocean, um ... and as—as caretakers of—of this place. And I think um ... you know, that ... idea that, you know, everything in nature has—you know, has a spirit, has an essence, and um ... you know, because it—everything has life, um, our kupuna and us, I think, have that respect for, you know, these places, an—and that um ... I guess uh ... part of us is to ... or part of our kuleana being here is to take care of—of those islands. And um ... although we who live on the main islands cannot always go up there—I mean, it's ... awesome [INDISTINCT] protect the place, but it's still our kuleana to take care of. Um, so I think looking at the ways that our kupuna knew how to manage their resources um, is something that we should all look at uh, when we think about, you know, how should we malama the—those places. Uh, so just—I guess mostly that, just um ... maybe learning from or knowing that—that point of view that our kupuna had when they—you know, when they go to these places or um ... even on our main islands, you know, just that value of malama. And um, going to these places with

respect and aloha, and um ... knowing that we do have plenty to learn about—about all of these places, the—those islands up there, um, the ocean surrounding them. Uh ... yeah; and just I think we can learn a lot from ... from the ike of our—of our kupuna.

QUESTION: What [INDISTINCT]. You know, you were talking [INDISTINCT]. Let's go to—you know, having voyaged a lot and you know, actually—

MURPHY: M-m.

QUESTION: --navigated to an island, and having those experiences and understanding [INDISTINCT] do that. After experiencing all that, how does that make you appreciate more, or what does that make you think about what your ancestors did when they first, you know—

MURPHY: M-m.

QUESTION: --launched off from the Eastern Pacific and Western Pacific and made their way across [INDISTINCT] the Pacific.

MURPHY: M-m.

QUESTION: Sometimes just kinda exploring, sometimes ...

MURPHY: Yeah. It just—I guess um ... I'm more and more, I guess um, realize how, you know, how brave they were, how courageous um, they were, um, to—to leave—especially leaving an island, maybe not knowing if you're gonna get to wherever you're trying to go, or not knowing what you're gonna find. Um ... I think ... it just, you know, reaffirms to me that they were the—the greatest explorers of—of their time, of that time. And um ... again, just appreciating that relationship, I guess, they had with nature. And um, you know, I don't know exactly why they—you know. How did they know they would get to land? You know, a lot of people ask, you know, how—how did they know. Um, and I'm not sure, but I mean, again, because they had this relationship with nature, you know, they realized migratory patterns of birds or you know, certain um ... sea life. So I think um ... for me, it—it ... it uh ... it does make me very proud of—of coming from that kind of that legacy, having that seafaring heritage, and really wanting to um ... keep that alive and—and growing, and—and I think for—for us as people to—to know how akamai our kupuna are, where um ... and how akamai we are and can be in—in learning from them. Um ... I think it's uh ... it helps—it helps all of us, you know, our self esteem, health, um ... it's ... I guess um ... gives hope, I think, not just to young people, but older people like me. [CHUCKLE] Um ... but I don't know; it just—it just makes me really proud to be, you know, who I am and from here. And I think if—if every ... everyone here

lives in Hawaii has—you know, has that um, ancestry um, could be proud of—of the people we come from and where we come from. Um, by knowing that, that they set off, you know, on these ... uh, expeditions and um ... had that ... that relationship um, with the world, um, the understanding, I think um, it's something for all of us to be—to be proud of and that we can all learn from.

QUESTION: So now kinda looking forward. You're the first time, fulltime, the first fulltime voyaging instructor at a university?

MURPHY: Um ... I guess; I don't know. I didn't think of it that way. Um ... we're trying to ... at—at Honolulu Community College, um, and then—and there have been other voyaging courses offered, um, still happening at UH Manoa and at Windward. Um, and just [CLEARS THROAT] uh, at HCC, what we're trying to do, at Honolulu Community College, is expand on that. So ... already in place—I mean, I took that voyaging course at Manoa ten, eleven years ago, you know. And so um ... now ... at HCC, uh, I think the ... the university system is uh, is realizing the importance of—of that kind of learning, of experiential learning, um, and the ... the value of the—the waa as a classroom. Um, and it's not just learning voyaging, but through voyaging you learn about your world and—and everything. I mean, so this—this kind of Hawaii ocean studies uh, kind of a program is something that, you know, um ... we're hoping uh, young kids—I mean, most people that live here love the ocean. Um, so why wouldn't you want to learn on the ocean. Uh, if school every day could be going on a waa and—or you know, just being on the water, um, I think more keiki would go to school [CHUCKLE] every day. But um, so I think anyway, the university sees that—that importance of—of—of um ... an ocean ... related program an—and the waa being a perfect uh, kind of a classroom. So we're just trying to expand on that now at—at the community college, and hoping that you know, it's something that can be um ... translated to other you know, system wide um ... programs and—and just build on the—the voyaging knowledge that has been learned and what we're continuing to learn.

[GENERAL CONVERSATION]

QUESTION: Explain just maybe a little bit about the usefulness of Nihoa. You kinda touched on it, but you kinda slid by it. The idea that you can get—because Nihoa is so small, that your accuracy has to be good enough. Even though it's only twenty-four hours—

MURPHY: M-m.

QUESTION: --you still have to be dead-on, and how that multiplier works for like a month-long voyage—

MURPHY: Ah.

QUESTION: --versus the twenty-four-hour voyage, because of the expanded land target being so much smaller.

MURPHY: Yeah.

QUESTION: You can answer to him.

MURPHY: [CHUCKLE]

QUESTION: Like how you would utilize Nihoa as a training base.

MURPHY: Okay.

QUESTION: Based on the expanded land target.

MURPHY: Okay. Okay. [CHUCKLE]

QUESTION: Okay.

MURPHY: Okay. Okay; so how do I start a question with that. Um, so mostly ... I'm answering why Nihoa is so important for the training—

QUESTION: As a training—

MURPHY: Expand on that training.

QUESTION: Yeah.

MURPHY: Okay. Uh, how big is Nihoa, again?

QUESTION: [INDISTINCT]

MURPHY: Hundred seventy-one acres.

[GENERAL CONVERSATION]

MURPHY: Okay; so [CLEARS THROAT] ... I guess the importance of Nihoa as an—an island to train navigators to—to navigate to, um, it is a tiny island. Um ... it's only ... it's only an—an overnight, twenty-four to thirty-hour voyage, maybe, from Kauai. Um, but ... you see—when we saw Nihoa, we saw it from maybe thirty miles away. Um, the cliffs are about, I think, nine hundred feet tall. Um ... so ... in the preparation for, you know, navigating a trip like that, you—okay, you study the island, how big is it,

how tall is the island, how far away might you see it from. Um ... and you take in all the—uh, you account for current drift, things like that uh, when you're making that course line. So for that thirty hours or you know, between twenty-four, thirty hours, um, you're trying to ... maintain the canoe on that course. Um, if you ... get off that course and you're maybe forty miles away from the island, you could sail right by it and not even know. Um, so it's ... again, a really good testing grounds. Um ... it kinda reminds me of uh, a story one of the aunties from—or kupuna from the Big Island told about um ... when they train navigators, if the navigator didn't ... you know, accomplish um, what he or she had set out to do, they would come home and be farmers. [CHUCKLE] So if you miss that island [CHUCKLE], it's um ... back then, at least, I'm sure it was, you know, Okay, well, y—you're not gonna be a navigator, you know. Um, so that's uh ... now—nowadays, I think we have a little bit more—you know, we're trying to expand that knowledge, we're trying to teach it. So Nihoa is an—an incredible place to sail to, because it's far enough away from the main islands that it's that long voyage condensed into, you know, a one, two-day period, and um, it's so tiny that you have to be totally accurate. You can't be—I mean, thirty miles is half a degree. Uh, one degree is sixty miles. If you're, you know, ten miles off, you could miss your island. Um, and then you know, I'm sure that nervousness would set in. You know, you don't see the island when you think you're going to, did we pass it, you know, are we east or west of it. Um, so that ... um, the beauty of that kind of a training trip is you have to be, like, dead-on accurate. Um, versus if you were gonna sail a voyage to someplace like Tahiti from here, um, it may be thirty days away, but um, you have like a screen of islands. So you're not just aiming for a tiny rock in the middle of the ocean, but you're—you're—you're sailing south heading towards a screen of—you got Tuamotu Islands, and you've got the Society Islands. So you're bound to see something. [CHUCKLE] I mean, not to say that a navigator can't—doesn't have to be on it, but you're not just sailing for one pinpoint rock in the middle of the ocean, you're sailing for an expanded target or expanded landfall. Um, so you ... as a navigator, you would sail um—you know, keep track of, again, like on the way to Tahiti, um, keep track of the—the waa on the course of that reference line, um, but you're—you're aiming for a big um—again, like a big back—big screen of islands. Um ... so Nihoa is ... uh, you have to be totally accurate in that short amount of time. And ... um ... that's a good training for being that accurate on the long voyages, but then you have to—you have that thirty days or so of—of kind of cushioning or buffering. If you're ten miles off, you know, you—you won't be—it won't be tragic. You know, it's um ... it's a little more ... uh ... I don't know what's the word, but yeah. Nihoa is a—a challenging navigational ... learning experience. [CHUCKLE]

[GENERAL CONVERSATION]

QUESTION: There's this idea that when we sail there, there's this reconnection—

MURPHY: M-m.

QUESTION: --because of the fact that Hawaiians lived there in hundreds of years, and canoes haven't gone there traditionally in a long time, except for maybe some of the oral traditions.

MURPHY: M-m.

QUESTION: Niihau; but what were your feelings seeing not only Nihoa, but the whole archipelago and how pristine it was, versus what's here, and what—

MURPHY: M-hm.

QUESTION: --is degraded here, and what—can you compare it and contrast it a little bit and talk about what your reaction was to the place [INDISTINCT]?

MURPHY: M-m.

QUESTION: As opposed to—

MURPHY: Okay.

QUESTION: --other vessels.

[GENERAL CONVERSATION]

MURPHY: But um, I guess—okay; so part of that—that um, voyage when Hokulea sailed throughout the kupuna islands all the up to Kure, um, it was to kind of um, allow ... Hawaii and whoever else wanted to follow um, the voyage, but to see those islands, and to be able to learn from that kind of voyage and going up there. And um ... and to see the ... how healthy or unhealthy it is there, and comparing them to places um, that we have back here um [CLEARS THROAT], on the main islands that we live on. Um, comparing maybe the abundance of whether it's reef fish or the predators, you know, the ulua and the—and the mano, the sharks, um, to the abundance that we have in our main islands, and why is there that difference. So [CLEARS THROAT] the—the kinda theme of that—that particular voyage was navigating change, and changing people's maybe um ... perspectives or um, attitudes and—and—and behaviors towards what we do in our main islands. Um, so you know, why is there—why are there so many more ulua an—and sharks there, maybe, than you know, some people go diving here and you don't see much. Uh, maybe one or two sharks or something, but [CLEARS THROAT] you know, is—is that

because the food chain there is—is a lot healthier than it is here, you know. Um, being protected, um, people can't just go and—and fish out everything until it's gone. You know, it's um ... places here ... um, how—how do people um, manage what they take, you know. Uh, I hear—I'm not—I'm not a lawaia myself, but I do hear some um ... stories from friends who say, Oh, you know ... you know, guys just—they'll take fish, even if they don't need it, because there's that mindset that, Oh, if I don't take it, somebody else will, the next guy will. Um, but again, going back to that—that ike of our kupuna that, um, you know, take what you need to feed yourself, your family, or you know, what you're gonna share uh, with the—with the community or what not, um ... and ... how can we ... kind of um, look at those kinda management values um, and apply them here, even if they're not you know, maybe law or regulated, but just within the lawaia community, you know. Um [CLEARS THROAT] ... you know what; I think I'm going off from what the original question was. But um, I think going to those places, I was—it really opened my eyes and I was happy to see um, the amount of honu or—or um ... birds that lived on those islands, and um ... although they did go through—those islands did go through a lot of change with um, people being on those islands, there was uh, some devastating human impact. But seeing how um, things can come back. Um, for example, at Laysan, we were able to go on land um, on the island and help with some things. So you see one, um [CLEARS THROAT]--I mean, one thing is, it's—it's awesome that you see this abundance of life and um, you see the—the turtles at French Frigate Shoals, um, that we know continue to—to come to the main islands and go back there. But [CLEARS THROAT] you also see the—the devastation of—of plastics and nets, and you know, this marine debris that pile up on those islands, because they are a screen across the Pacific. Um, so even though we can't go up there [CLEARS THROAT]--you know, people can't go up there all the time now, we still affect it by um, what we do in our oceans and coastlines, and um ... so it was ... uh ... see, my question's going longer than your—your—I mean, my answer's going longer than your question. [CHUCKLE] Um ...

QUESTION: I guess for you, like, what did you see? Describe to us what it felt like to be there in the context of the pristineness [INDISTINCT].

MURPHY: M-m. [CLEARS THROAT] The pristineness on the canoe?

QUESTION: Well, from the platform of [INDISTINCT].

MURPHY: Uh, yeah, yeah; okay, okay. Um [CLEARS THROAT] ...

[GENERAL CONVERSATION]

MURPHY: Okay; so that reconnection. Being um, being up there in the kupuna islands and voyaging there from the uh ... from a waa, um, and feeling that, you know, this is the way that our kupuna traveled, this is um, probably the way they saw the islands for the first time was from the platform of a—of a voyaging canoe, of a waa, um ... it's just ... I don't know. There's—it just invokes so much feeling than just um ... you know, something that in your naau, you just feel connected again, maybe. Uh ... um ... I don't know how to describe it. But ... um ... it's—maybe it's that feeling in the naau that makes me keep wanting to voyage; you know, to keep feeling that, to um, feel that reconnection with our kupuna, um ... and that desire to see through their eyes, maybe, um ... and understanding the world, and—and ... and the importance of taking care of it. Um ... I guess that's .... [CHUCKLE] I don't know. [CHUCKLE]

QUESTION: I have one more question.

MURPHY: Yeah.

QUESTION: Sorry; it's one that I skipped over. It's sort of a broad look at, you know ... voyaging was a big part of the peopling and the entire culture of Polynesia and the Pacific for a long time, but there was a demise—

MURPHY: M-m.

QUESTION: Now there's a resurgence. I was wondering if you could talk a little bit about like what's the state of voyaging today in your mind, across the Pacific—

MURPHY: M-m.

QUESTION: --and what can the other—I mean, you said there's Mau, just ...

MURPHY: Oh, rec—recognize the other—

QUESTION: --five navigators in Hawaii and—

MURPHY: Yeah.

QUESTION: --five ...

MURPHY: I think—was it four of them?

[GENERAL CONVERSATION]

MURPHY: Yeah; well, they're um ... see, back in—I wasn't around yet, but in ninety ... before the ninety—before ... the 1995 voyage, when Hokulea, Makalii,

Hawaii Loa, sailed from here to Tahiti, um ... they trained a bunch of um ... Polynesians. So there was a big training here in Hawaii. Um, since the time the Hokulea had, for example, gone to Aotearoa, they built a voyaging canoe there, Te Aurere. And so they had this big training here in Hawaii with Mau an—and ... his students, um, so that ... these—these um, extensions or—our ohana in the South Pacific could learn how to navigate their canoes. So before that '95 trip, there was a big um, navigation training. And so canoes from Tahiti, from Rarotonga, from Aotearoa, joined the canoes from Hawaii in Raiatea at Taputapuata. So that um ... that was ki—I think there hasn't been one big one like that since then, but so there was that um ... need to train navigators from the South Pacific. And the—the reason, really, they got pwo this past year was so that, you know, they're all ... were all equal, so the Hawaii and the—the polyne—the rest of the Polynesians, you know, that ohana stays um ... you know, keeps that kuleana of needing to continue to teach and recognizing the—the accomplishments of everybody.

QUESTION: Keeping that in mind, like—

MURPHY: M-m.

QUESTION: What do these [INDISTINCT] cultures that are now experiencing a resurgence; what can they or what are they offering each other, and how is their relationship with each other helping voyaging tradition to stay alive—

MURPHY: M-m.

QUESTION: --and prosper?

MURPHY: Uh, I think more and more um ... all the ohana waa are realizing the importance of—of um, doing things together and supporting each other, because um, you know, thirty-three years ago, there was one voyaging canoe. Um, over that ... thirty years um ... canoes have come up in other islands in Polynesian, um, other of our main Hawaiian Islands; so ... you know, that nee—that—that realization that these waa are um ... are great tools to—to relearn an—and kind of reawaken that—that ike, that knowledge that may have been sleeping for a while, um, but there's ... [CLEARS THROAT] um ... there's a big—I guess one of the big things is—is funding with all the canoes. I mean, once you build a canoe, the hard part is maintaining it, and—and having the leadership to sail them. So there's that need to um, continue to train leadership, but also to continue to support each other so that the canoes can continue to voyage. And that's, you know, having the support—financial support and—and community and people support to keep them sailing. So rather than um ... uh ... you know, going after the same ... um, or—I should say, rather than

competing for those kinds of resources, the ohana waa you know, not just Hawaii but you know, the—the Pacific ohana waa um ... realizes that need to stick together to um ... help each other get those kinds of resources, so that the waa can continue.

[GENERAL CONVERSATION]

QUESTION: How are they working together [INDISTINCT]. I mean ...

MURPHY: M-m.

QUESTION: Is it like ... I guess ...

MURPHY: Well, I mean, like with this—the next voyages coming up, there's uh ... talk about—like Aotearoa is building another canoe. And so their waa—their waka will be launched in August. And um, with Hokulea's upcoming voyaging plans, whether it's to Aotearoa, to Pacific wide, or um, to wherever, um—I don't know if I can say that. [CHUCKLE] Uh, the canoe from Aotearoa, for example, wants to join Hokulea at, say, Rapa Nui. So this idea of the voyaging canoes, you know, coming together at another ... at an island um, somewhere in Polynesia, just to reconnect um ... uh ... yeah; just—yeah, realize the good work that everybody's been doing. I think that's ... there's an importance for the canoes to—to maintain the connections with each other, and um ... and continue to voyage throughout Polynesia.

[END]

**APPENDIX B**  
**CATEGORICAL EXCLUSIONS**

**Summary of Co-Trustee Agency Categorical Exclusions Related to the Monument Management Plan**

The Monument Management Plan contains numerous strategies and activities that are routine program administrative functions with no potential for causing environmental impacts. Such proposed actions within the Monument Management Plan individually and cumulatively will have no significant effect on the environment and are therefore categorically excluded from further analysis under a categorical exclusion by one or more of the Co-Trustee agencies. Categorical exclusions are defined as a group of actions that would have no significant individual or cumulative effect on the quality of the human environment and for which, in the absence of extraordinary circumstances, require neither an environmental assessment nor an environmental impact statement.

Summary of Co-Trustee Agency Categorical Exclusions Related to the Monument Management Plan
<b>National Oceanic and Atmospheric Administration<sup>1</sup></b>
<p><b>Research Programs.</b> Programs or projects of limited size and magnitude or with only short-term effects on the environment and for which any cumulative effects are negligible.. Examples include natural resource inventories and environmental monitoring programs conducted with a variety of gear (for example, satellite and ground-based sensors and fish nets) in water, air, or land environs. Such projects may be conducted in a wide geographic area without need for an environmental document, provided related environmental consequences are limited or short term.</p> <p><b>Financial and Planning Grants.</b> Financial support services, such as a Saltonstall-Kennedy grant, a fishery loan or grant disbursement under the Fishermen's Contingency Fund or Fisheries Obligation Guarantee Program, or a grant under the CZMA where the environmental effects are minor or negligible. New financial support services and programs should undergo an EA or EIS at the time of conception to determine if a CE could apply to subsequent actions.</p> <p><b>Minor Project Activities.</b> Projects where the proposal is for a minor amelioration action such as planting dune grass or for minor project changes or minor improvements to an existing site (e.g., fences, roads, or picnic facilities), unless such projects in conjunction with other related actions may result in a cumulative impact (40 CFR 1508.7).</p> <p><b>Administrative or Routine Program Functions.</b> The following NOAA programmatic functions that hold no potential for significant environmental impacts qualify for a categorical exclusion: program planning and budgeting, including strategic planning and operational planning; mapping, charting, and surveying services; ship support; ship and aircraft operations; fishery financial support services; grants for fishery data collection; basic and applied research and research grants, except as provided in Section 6.03b. of this order; enforcement operations; basic environmental services and monitoring, such as weather observations, communications, analyses, and predictions; environmental satellite services; environmental data and information services; air quality observations and analyses; support of national and international atmospheric and Great Lakes research programs; executive direction; administrative services; and administrative support advisory bodies.</p> <p><b>Real Estate Actions.</b> The following NOAA real estate actions with no potential for significant environmental impacts are categorically excluded from preparation of an EA or EIS: repair, or replacement in kind, of equipment and components of NOAA-owned facilities; weatherization of NOAA facilities; environmental monitoring; procurement contracts for NEPA documents; architectural and engineering studies and supplies; routine facility maintenance and repair and groundskeeping activities; acquisitions of space within a previously occupied structure, either by purchase or lease, where no change in the general type of use and minimal change from previous occupancy level is proposed; acquisition of less than 5,000 square feet of occupiable space by means of federal construction, lease construction, or a new lease for a structure substantially completed before solicitation for offers and not previously occupied; lease extensions, renewals, or succeeding leases; relocation of employees into existing federally owned or commercially leased office space within the same metropolitan area not involving a substantial number of employees or a substantial increase in the number of motor vehicles at a facility; out-lease or license of government-controlled space or sublease of government-leased space to a nonfederal tenant when the use will remain substantially the same; various easement</p>

**Summary of Co-Trustee Agency Categorical Exclusions Related to the Monument Management Plan**

acquisitions; acquisition of land which is not in a floodplain or other environmentally sensitive area and does not result in condemnation; and installment of antennas as part of site plan of the property.

**Construction Activities.** Minor construction conducted in accordance with approved facility master plans and construction projects on the interiors of nonhistoric NOAA-owned and leased buildings, including safety and fire deficiencies, air quality, interior renovation, expansion or improvement of a facility where the gross square footage is not increased by more than 10 percent and the site size is not increased substantially, and minor repair/replacement of piers or floats not exceeding 80 feet in length.

**Facility Improvement or Addition.** Minor facility improvement or addition where ground disturbance is limited to previously disturbed areas (i.e., previously paved or cleared areas).

**Restoration Action.** Restoration actions that do not individually or cumulatively have significant impacts on the human environment (e.g., actions with limited degree, geographic extent, and duration) may be eligible for categorical exclusion (40 CFR 1508.4), provided such actions meet all of the following criteria: a) are intended to restore an ecosystem, habitat, biotic community, or population of living resources to a determinable pre-impact condition; b) use for transplant only organisms currently or formerly present at the site or in its immediate vicinity; c) do not require substantial dredging, excavation, or placement of fill; and d) do not involve a significant added risk of human or environmental exposure to toxic or hazardous substances.

Restoration actions likely to meet all of the above criteria and therefore be eligible for Categorical Exclusions include on-site, in-kind restoration actions (actions in response to a specific injury) such as: 1) revegetation of habitats or topographical features, e.g., planting or restoration of seagrass meadows, mangrove swamps, salt marshes, coastal dunes, streambanks, or other wetland, coastal, or riparian areas; 2) restoration of submerged, riparian, intertidal, or wetland substrates; 3) replacement or restoration of shellfish beds through transplant or restocking; and 4) structural or biological repair or restoration of coral reefs.

**Other Categories of Actions Not Having Significant Environmental Impacts.** These actions include routine operations and maintenance, preparation of regulations, orders, manuals, or other guidance that implement, but do not substantially change these documents, or other guidance; policy directives, regulations and guidelines of an administrative, financial, legal, technical or procedural nature, or whose environmental effects are too broad, speculative, or conjectural to lend themselves to meaningful analysis and will be subject later to the NEPA process, either collectively or case-by-case; activities that are educational, informational, advisory, or consultative to other agencies, public and private entities, visitors, individuals, or the general public; actions with short-term effects or actions of limited size or magnitude.

**Fish and Wildlife Service<sup>2</sup>**

**General.** Changes or amendments to an approved action, when such changes have no or minor potential environmental impact.

- Personnel training, environmental interpretation, public safety efforts, and other educational activities, which do not involve new construction or major additions to existing facilities.
- The issuance and modification of procedures, including manuals, orders, guidelines, and field instructions, when the impacts are limited to administrative effects.
- The acquisition of real property obtained either through discretionary acts or when acquired by law, whether by way of condemnation, donation, escheat, right-of-entry, escrow, exchange, lapse, purchase, or transfer and that will be under the jurisdiction or control of the United States. Such acquisition of real property will be in accordance with 602 DM 2 and the Service's procedures, when the acquisition is from a willing seller, continuance of or minor modification to the existing land use is planned, and the acquisition planning process has been performed in coordination with the affected public.

**Resource Management.** Before carrying out these actions, the Service should coordinate with affected federal agencies and state, tribal, and local governments.

- Researching, inventorying, and collecting information directly related to the conservation of fish and wildlife resources and that involve negligible animal mortality or habitat

### Summary of Co-Trustee Agency Categorical Exclusions Related to the Monument Management Plan

destruction, no introduction of contaminants, and no introduction of organisms not indigenous to the affected ecosystem.

- The operation, maintenance, and management of facilities and routine recurring management activities and improvements, including renovations and replacements that result in no or only minor changes in the use and have no or negligible environmental effects on the site or in the vicinity of the site.
- The construction or the addition of small structures or improvements, including structures and improvements to restore wetland, riparian, instream, or native habitats, which result in no or only minor changes in the use of the affected local area.
- The development of limited access for routine maintenance and management.
- The use of prescribed burning for habitat improvement, when conducted in accordance with local and state ordinances and laws.
- Fire management, including prevention and restoration measures, when conducted in accordance with Departmental and Service procedures.
- Reintroducing or stocking native, formerly native, or established species into suitable habitat within their historic or established range, where no or negligible environmental disturbances are anticipated.
- Minor changes in the amounts or types of public use on Service- or state-managed lands, in accordance with regulations, management plans, and procedures.
- Consultation and technical assistance activities directly related to the conservation of fish and wildlife resources.
- Minor changes in master plans, comprehensive conservation plans, or operations, when no or minor effects are anticipated. Examples include minor changes in the type and location of compatible public use activities and land management practices.
- The issuance of new or revised site-, unit-, or activity-specific management plans for public use, land use, or other management activities when only minor changes are planned. Examples include an amended public use or fire management plan.
- Natural resource damage assessment restoration plans, prepared under Sections 107, 111, and 122(j) of the Comprehensive Environmental Response Compensation and Liability Act (CERCLA); Section 311(f)(4) of the Clean Water Act; and the Oil Pollution Act; when only minor or negligible change in the use of the affected areas is planned.

**Permit and Regulatory Functions.** The issuance, denial, suspension, and revocation of permits for activities involving fish, wildlife, or plants regulated under 50 CFR Chapter 1, Subsection B, when such permits cause no or negligible environmental disturbance. These permits involve endangered and threatened species, species listed under the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), marine mammals, exotic birds, migratory birds, eagles, and injurious wildlife.

- The issuance of ESA Section 10(a)(1)(B) “low effect” incidental take permits that, individually or cumulatively, have a minor or negligible effect on the species covered in the habitat conservation plan.
- The issuance of special regulations for public use of Service-managed land, which maintain essentially the permitted level of use and do not continue a level of use that has resulted in adverse environmental effects.
- The issuance or reissuance of permits for limited additional use of an existing right-of-way for underground or aboveground power, telephone, or pipelines, where no new facilities or major improvements to those facilities are required; and for permitting a new right-of-way, where no or negligible environmental disturbances are anticipated.
- The issuance or reissuance of special use permits for the administration of specialized uses, including agricultural uses, or other economic uses for management purposes, when such uses are compatible, contribute to the purposes of the refuge system unit, and result in no or negligible environmental effects.
- The denial of special use permit applications, either initially or when permits are reviewed for renewal, when the proposed action is determined not compatible with the purposes of the refuge system unit.
- Activities directly related to the enforcement of fish and wildlife laws, not included in 516 DM 2, Appendix 1.4. These activities include assessment of civil penalties, forfeiture of property seized or subject to forfeiture, issuance or reissuance of rules, procedures, standards, and permits for the designation of ports, inspection, clearance, marking, and license requirements pertaining to wildlife and wildlife products, and for the humane and healthful transportation of wildlife.
- Actions where the Service has concurrence or coapproval with another agency and the action is a categorical exclusion for that agency. This would normally involve one

## Summary of Co-Trustee Agency Categorical Exclusions Related to the Monument Management Plan

federal action or connected actions where the Service is a cooperating agency.

**Recovery Plans.** Issuance of recovery plans under section 4(f) of the ESA.

**Financial Assistance.** State, local, or private financial assistance (grants or cooperative agreements), including State planning grants and private land restorations, where the environmental effects are minor or negligible. Grants for categorically excluded actions in paragraphs A, B, and C, above; and categorically excluded actions in Appendix 1 of 516 DM 2.

### Appendix 1. Department of Interior Categorical Exclusions.

- Personnel actions and investigations and personnel services contracts.
- Internal organizational changes and facility and office reductions and closings.
- Routine financial transactions, such as salaries and expenses, procurement contracts (in accordance with applicable procedures and Executive Orders for sustainable or green procurement), guarantees, financial assistance, income transfers, audits, fees, bonds, and royalties.
- Departmental legal activities, such as arrests, investigations, patents, claims, and legal opinions. This does not include bringing judicial or administrative civil or criminal enforcement actions that are outside the scope of NEPA, in accordance with 40 CFR 1508.18(a).
- Nondestructive data collection, inventory (including field, aerial, and satellite surveying and mapping), study, research, and monitoring.
- Routine and continuing government business, such as supervision, administration, operations, maintenance, renovations, and replacement activities having limited context and intensity (e.g., limited size and magnitude or short-term effects).
- Management, formulation, allocation, transfer, and reprogramming of the Department's budget at all levels. (This does not exclude the preparation of environmental documents for proposals included in the budget when otherwise required.)
- Legislative proposals of an administrative or technical nature (such as changes in authorizations for appropriations and minor boundary changes and land title transactions) or having primarily economic, social, individual, or institutional effects; and comments and reports on referrals of legislative proposals.
- Policies, directives, regulations, and guidelines that are administrative, financial, legal, technical, or procedural and whose environmental effects are too broad, speculative, or conjectural to lend themselves to meaningful analysis and will later be subject to the NEPA process, either collectively or case-by-case.
- Activities that are educational, informational, advisory, or consultative to other agencies, public and private entities, visitors, individuals, or the general public.
- Hazardous fuels reduction activities, using prescribed fire not to exceed 4,500 acres, and mechanical methods for crushing, piling, thinning, pruning, cutting, chipping, mulching, and mowing, not to exceed 1,000 acres. Such activities: Shall be limited to areas in wildland-urban interface and Condition Classes 2 or 3 in Fire Regime Groups I, II, or III, outside the wildland-urban interface; Shall be identified through a collaborative framework as described in "A Collaborative Approach for Reducing Wildland Fire Risks to Communities and the Environment 10-Year Comprehensive Strategy Implementation Plan"; Shall be conducted consistent with agency and Departmental procedures and applicable land and resource management plans; Shall not be conducted in wilderness areas or impair the suitability of wilderness study areas for preservation as wilderness; Shall not include the use of herbicides or pesticides or the construction of new permanent roads or other new permanent infrastructure; and may include the sale of vegetative material, if the primary purpose of the activity is hazardous fuels reduction. (Refer to the Environmental Statement Memoranda Series for additional required guidance.)
- Post-fire rehabilitation activities not to exceed 4,200 acres (such as tree planting, fence replacement, habitat restoration, heritage site restoration, repair of roads and trails repair, and minor facilities damage repair, such as campgrounds) to repair or improve lands unlikely to recover to a management-approved condition from wildland fire damage, or to repair or replace minor facilities damaged by fire. Such activities: Shall be conducted consistent with agency and Departmental procedures and applicable land and resource management plans; Shall not include the use of herbicides or pesticides or the construction of permanent roads or other permanent infrastructure, and Shall be completed within three years following a wildland fire.

Summary of Co-Trustee Agency Categorical Exclusions Related to the Monument Management Plan

**Appendix 2. Categorical Exclusions—Extraordinary Circumstances.**

- Have significant impacts on public health or safety.
- Have significant impacts on such natural resources and unique geographic characteristics as historic or cultural resources; park, recreation, or refuge lands; wilderness areas; wild or scenic rivers; national natural landmarks; sole or principal drinking water aquifers; prime farmlands; wetlands (Executive Order 11990); floodplains (Executive Order 11988); national monuments; migratory birds; and other ecologically significant or critical areas.
- Have highly controversial environmental effects or unresolved conflicts concerning alternative uses of available resources (NEPA Section 102[2][E]).
- Have highly uncertain and potentially significant environmental effects or involve unique or unknown environmental risks.
- Establish a precedent for future action or represent a decision in principle about future actions with potentially significant environmental effects.
- Have a direct relationship to other actions with individually insignificant but cumulatively significant environmental effects.
- Have significant impacts on properties listed, or eligible for listing on, the National Register of Historic Places, as determined by either the bureau or office.
- Have significant impacts on species listed, or proposed to be listed, on the List of Endangered or Threatened Species, or have significant impacts on designated critical habitat for these species.
- Violate a federal law, or a state, local, or tribal law or requirement imposed for the protection of the environment.
- Have a disproportionately high and adverse effect on low-income or minority populations (Executive Order 12898).
- Limit access to and ceremonial use of Indian sacred sites on federal lands by Indian religious practitioners or significantly adversely affect the physical integrity of such sacred sites (Executive Order 13007).
- Contribute to the introduction, continued existence, or spread of noxious weeds or nonnative invasive species known to occur in the area or actions that may promote the introduction, growth, or expansion of the range of such species (Federal Noxious Weed Control Act and Executive Order 13112).

**State of Hawai‘i<sup>3</sup>**

- Class 1:** Operations, repairs, or maintenance of structures, facilities, equipment or topographical features involving negligible or no expansion or change of use beyond that previously existing.
- Trail maintenance on DOFAW Program areas<sup>1</sup>, using hand tools and small motorized equipment, such as chainsaws and motorized weeders; involves clearing spaces 4 feet wide and 10 feet high from grade on trails.
  - Repair and maintenance paved, unpaved, dirt, cinder, and gravel roads, concrete fords, cattle guards, gates and wash-out ditches in DOFAW program areas; involves grading, patching, and resurfacing roads, removing encroaching vegetation, and manually cleaning or repairing ditches, fords, and culverts.
  - Repair and maintenance of DOFAW program area fences; includes boundary, enclosure, and exclosure fences, wildlife water units, checking stations, water pumps, nesting areas, aviaries, and yards.
  - Repair and maintenance of signs in DOFAW program areas; includes fire prevention, instructional, regulatory, enforcement, safety, boundary, location, and toxicant or plant and animal control signs.
  - Repair and maintenance of cabins, resident workers’ quarters, warehouse workshops, mobile camping structures, weather stations, checking stations (single room structures with porches or small boxes on legs) for hunters, hikers, and campers; meat safes, viewing kiosks, and platforms, wildlife observation towers, sanitary facilities, trail shelters, equipment shelters, fire equipment caches, plant nurseries, captive propagation facility buildings, established arboretum areas, baseyards, and biological survey transect lines.
  - Repair and maintenance of covered and open fence areas for endangered species (waterfowl, waterbirds, forest birds), game birds (pheasants, quail, partridges) and mammals (pigs, sheep, goats, deer); auxiliary buildings for food and equipment storage, incubators, and brooders; open-top breeding and release pens, field aviaries, and hacking boxes. Repair and maintenance of water tanks, pipelines, water catchment basins (capacity of 300 to 10,000 gallons), wildlife water units, pumps and controls, pipes and channels; fences, dikes, and moats in waterbird sanctuaries for the purposes of maintaining water levels, providing water, and precluding predators.

### Summary of Co-Trustee Agency Categorical Exclusions Related to the Monument Management Plan

- Weed, brush, and noxious tree control using hand tools, small motorized equipment (chainsaws and motorized weeders), and approved herbicides on DOFAW program areas, campsites, picnic grounds, viewpoints, baseyards, wildlife water units, trails, captive propagation facilities, arboreta, plant nurseries, checking stations, and public use facilities.
- Routine pruning, trimming, and thinning of trees, excluding commercial logging.
- Gathering minor forest products for noncommercial purposes.
- Gathering plant seed for commercial and noncommercial propagation.
- Cultivating, fertilizing, mowing, and harvesting wildlife food plots.
- Routine operation, repair, and maintenance of DOFAW program facilities, arboreta, baseyards, and captive propagation facilities.
- Maintenance of previously established game habitat improvement sites and lawn areas with mechanized equipment.
- The award of grants under H.R.S., Chapter 173A, for the acquisition of interests in land, provided that the acquisition does not cause any material change of use of land or resources beyond that previously existing.
- The acquisition of land or interests in land for conservation, provided that the acquisition does not cause any material change of land use or resources beyond that previously existing.

**Class 2:** Replacement or reconstruction of structures and facilities where the new structure will be located generally on the same site and will have substantially the same purpose, capacity, density, height, and dimensions as the structure replaced.

- Replacement of signs in DOFAW program areas; includes signs for fire prevention, instruction, regulatory, enforcement, safety, boundary, location, and toxicant or plant and animal control.
- Repair and maintenance of cabins, resident workers' quarters, warehouse workshops, mobile camping structures, weather stations, checking stations (single-room structures with porches or small boxes on legs) for hunters, hikers, and campers; meat safes, viewing kiosks and platforms, wildlife observation towers, sanitary facilities, trail shelters, equipment shelters, fire equipment caches, established arboretum areas, plant nursery operations, and captive propagation facility buildings.
- Replacement of covered or open fenced areas for endangered species (waterfowl, waterbirds, forest birds), game birds (pheasants, quail, partridges), and mammals (pigs, sheep, goats, and deer); auxiliary buildings for food storage, equipment storage, incubators and brooders; open-top breeding and release pens, field aviaries, and hacking boxes.
- Replacement of water tanks, pipelines, water catchment basins (capacity 300 to 10,000 gallons), wildlife water units, pumps and controls, pipes and channels; fences, dikes, and moats in waterbird sanctuaries for purposes of maintaining water levels, providing water, and precluding predators.
- Replacement of paved, unpaved, dirt, cinder, and gravel roads, concrete fords, cattle guards, gates, wash-out ditches and biological survey transect lines in DOFAW program areas.
- Revegetating burned areas to encourage the succession of selected plant species to prevent soil erosion and promote the goals of the Division.

**Class 3:** Construction and location of single, new, small facilities or structures and the alteration and modification of same and installation of new small equipment and facilities and the alteration and modification of same single-family residences less than 3,500 square feet not in conjunction with the building of two or more such units; multi-unit structures designed for not more than four dwelling units if not in conjunction with the building of two or more structures; stores, offices, and restaurants designed for total occupant load of twenty persons or fewer, if not in conjunction with the building of two or more such structures; and water, sewage, electrical, gas, telephone, and other essential public utility services extensions to serve such structures or facilities; and accessory or appurtenant structures, including garages, carports, patios, swimming pools, and fences; and acquisition of utility easements.

- Fences to include areas no greater than 10 acres around individual or small colonies of rare, threatened, or endangered plants, covered and open areas for endangered species

### Summary of Co-Trustee Agency Categorical Exclusions Related to the Monument Management Plan

(waterfowl, waterbirds, forest birds), game birds (pheasants, quail, partridges), and mammals (pigs, sheep, goats, deer); auxiliary buildings for food storage, equipment storage, incubators and brooders; open-top breeding and release pens, field aviaries, and hacking boxes.

- Cabins, resident workers' quarters, warehouse workshops, mobile camping structures, weather stations, checking stations (single-room structures with porches or small boxes on legs) for hunters, hikers, and campers; meat safes, viewing kiosks, and platforms, wildlife viewing towers, sanitary facilities, trail shelters, equipment shelters, fire equipment caches, arboreta, and plant nurseries.
- Fencing to include areas no greater than one acre for ecosystem management research.

**Class 4:** Minor alteration in the conditions of land, water, or vegetation.

- Establishment of helispots for fire control and rescue.
- Clearing of fuel breaks on grass and brush on DOFAW program areas necessary to protect enclosures, exclosures, facilities, and colonies of rare threatened and endangered plants or animals, where a thorough biological survey has determined that the species will not be adversely impacted by such clearing. The definition of a fuel break is the reduction of ground fuel without significant modification of the soil.
- Minor alterations to wildlife or plant sanctuaries, including construction of pumps and controls, pipes and channels, and dikes and moats for the purposes of maintaining water levels, providing constant water supplies, and precluding predators. Also includes minor alterations to biological transects, campsites, fertilizing and mowing, maintaining new pastures, weed control, outplanting native plants, transplanting, clearing mist net lines, and trap sites.
- Construction of reservoirs of 0.1 acre or less to collect runoff for wildlife or to redistribute water for water units or plantings if done at sites where nonnative vegetative cover constitutes greater than 75 percent of the area.
- Controlled burning of vegetation less than five acres in size to improve wildlife habitat where nonnative vegetative cover constitutes greater than 75 percent of the area.
- Mowing nonnative vegetation where dense mature stands form impenetrable cover.
- Establish temporary or permanent vegetative cover, including trees, shrubs, and grasses for landscaping, reforestation, soil stabilization, and wildlife habitat, provided, however, that this exemption should not apply to tree plantings for which harvesting is planned or reasonably foreseeable.

**Class 5:** Basic data collection, research, experimental management, and resource evaluation activities that do not result in a serious or major disturbance to an environmental resource.

- Implanting transponders and affixing transmitters or markers (bands, collars, ear tags) to birds and mammals to record movement, longevity; taking disease and blood samples; placing remote monitoring devices to determine animal movement, cameras, equipment, and feeders; removal of nonnative avian competitors, predator control (including placement of approved toxic baits, kill traps, live traps, snares), and using approved herbicides.
- Game and nongame wildlife surveys, inventory studies, new transect lines, photographing, recording, sampling, collection, and captive propagation (involves walking, driving, and flying in the field in helicopters or light aircraft), use of nets and firearms, temporary traps, including snares, mist nets, corral traps, drop-door traps, or leg hold traps.
- Releases and recoveries of wildlife. On approved releases of game and nongame wildlife (after EA or EIS preparation and acceptance), actual release of animals and follow-up surveys, translocation within the range, or rearing in captivity and releasing to the wild.
- Captive propagation of birds or mammals. Housing, care, feeding, veterinarian examination, breeding (pairing, hatching, brooding, fledgling, rearing), cross fostering, double clutching nests, experimental studies of native species (including those that are rare, threatened, or endangered), game birds and game mammals; may involve hybridization of game birds or mammals.
- Wildlife management actions, including predator control, insect control, snail control, nonnative bird control, controlled grazing or burning as a management tool, and use of toxicants or herbicides. All use of chemicals follows label instructions or restrictions.

**Class 6:** Construction or placement of minor structures accessory to facilities.

Summary of Co-Trustee Agency Categorical Exclusions Related to the Monument Management Plan

- Fencing around minor facilities, such as game water units, checking stations, animal pens, water pumps, aviaries, fire caches, and plant enclosures.
- Driveways.
- Exterior lights in already developed areas for security.
- Water tanks with less than 10,000-gallon capacity.
- Water catchments, lines, and faucets next to hunter checking stations for domestic or public use or game water units.

<sup>1</sup>Summary of NOAA’s Categorical Exclusions based on Administrative Management and Executive Secretariat, NAO 216-6, Environmental Review Procedures for Implementing the National Environmental Policy Act, Issued 06/03/99; Effective 05/20/99 [http://www.corporateservices.noaa.gov/~ames/NAOs/Chap\\_216/naos\\_216\\_6.html#section\\_8](http://www.corporateservices.noaa.gov/~ames/NAOs/Chap_216/naos_216_6.html#section_8). Note: The list of NOAA’s Categorical Exclusions presented in the table is not all-inclusive, but are listed because they are most likely to be used for Monument Management actions.

**APPENDIX C**  
**STATE AND FEDERAL**  
**FINDING OF NO SIGNIFICANT IMPACT**

## Finding of No Significant Impact

### Papahānaumokuākea Marine National Monument Management Plan Midway Atoll and Hawaiian Islands National Wildlife Refuges

The U.S. Fish and Wildlife Service (Service) has completed the Monument Management Plan (MMP) and Environmental Assessment (EA) for Papahānaumokuākea Marine National Monument which includes Midway Atoll and Hawaiian Islands National Wildlife Refuges (Refuges). The MMP will guide management of the Refuges for the next 15 years. The MMP, EA, and supporting documents describe the Service's proposals for managing the Refuges and their effects on the human environment under 2 alternatives, including the no action alternative.

#### Decision

Following comprehensive review and analysis, the Service selected Alternative B for implementation because it is the alternative that best meets the following criteria:

- Achieves the mission of the National Wildlife Refuge System.
- Achieves the purposes of the Refuges.
- Will be able to achieve the vision and goals for the Refuges.
- Maintains and restores the ecological integrity of the habitats and populations on the Refuges.
- Addresses the important issues identified during the scoping process.
- Addresses the legal mandates of the Service and the Refuges.
- Is consistent with the scientific principles of sound wildlife management and endangered species recovery.
- Facilitates priority public uses compatible with the Refuges' purposes and the Refuge System mission.

As described in detail in the MMP, EA, and supporting documents, implementing the selected alternative will have no significant impacts on any of the environmental resources identified with the Papahānaumokuākea Marine National Monument.

#### Public Review

The planning process incorporated a variety of public involvement techniques in developing and reviewing the MMP. This included 10 public workshops, planning updates, numerous meetings with partners, elected officials, and neighbors, and public review and comment on the planning documents. The details of the Service's public involvement program are described in the MMP.

#### Conclusions

Based on review and evaluation of the information contained in the supporting references, I have determined that implementing Alternative B as the MMP for management of Midway Atoll and Hawaiian Islands National Wildlife Refuges is not a major Federal action that would significantly affect the quality of the human environment within the meaning of section 102(2) (C) of the National Environmental Policy Act of 1969. Accordingly, the Service is not required to prepare an environmental impact statement.

This Finding of No Significant Impact and supporting references are on file at the Papahānaumokuākea Marine National Monument - USFWS, 300 Ala Moana Blvd. Room 5-231, Honolulu, HI, 96850 and U.S. Fish and Wildlife Service, Division of Planning and Visitor Services, 911 NE 11<sup>th</sup> Avenue, Portland, Oregon, 97232. ## **FINDING OF NO SIGNIFICANT IMPACT**

### **Environmental Assessment on the Papahānaumokuākea Marine National Monument Proposed Final Monument Management Plan**

The National Oceanic and Atmospheric Administration, National Ocean Service, Office of National Marine Sanctuaries, Papahānaumokuākea Marine National Monument (PMNM) have completed a joint environmental assessment (EA) dated December 2008 with the U.S. Fish and Wildlife Service and the State of Hawaii Department of Land and Natural Resources to evaluate the potential environmental effects associated with implementing the proposed final Monument Management Plan (MMP). The EA is the basis for NOAA's Office of National Marine Sanctuaries finding of no significant impact for implementing the proposed MMP.

NOAA Administrative Order (NAO) 216-6 (revised May 20, 1999) provides eleven criteria for determining the significance of the impacts of a proposed action. These criteria are discussed below with respect to the proposed action. Based on the analysis in the environmental assessment, the ONMS finds that:

*1. Are there both beneficial and adverse impacts of the proposed action that when combined result in a net benefit?*

The purpose of the proposed action, the implementation of the MMP, is to protect and manage the PMNM in a manner that satisfies legal mandates set forth in the Presidential Proclamation 8031 and priority management needs identified by the Co-Trustee agencies. The Proposed Action to implement the MMP would result in net beneficial effects to the Monument resources as compared to the No Action alternative. These beneficial impacts would not be significant. Implementation of the MMP would result in no significant negative effects, while only a few activities had short-term minor effects on resource areas.

The MMP will improve coordinated agency management and overall protection for the natural, historical and cultural resources of the Northwestern Hawaiian Islands. Beneficial effects of the Proposed Action on the ecosystem would result from improved planning and coordination of research, education, monitoring, and management actions by the Co-Trustees, compared to the No Action alternative. Although it is expected that plan implementation will result in overall beneficial effects to the human environment, these beneficial effects do not represent a significant impact. This is because the magnitude of benefits expected to result from plan implementation will be incrementally modest within the context of the essentially uninhabited pristine lands and waters of the Monument.

Short-term negative effects could occur when conducting activities that involve the restoration, enhancement or protection of organisms and ecosystems, or the rehabilitation of structures. These effects are inherently of short duration and are limited to the site where the activities occur. Affected resources are expected to return to predisturbance conditions shortly after activity ceases, so this does not constitute a significant effect. In addition, these negative

effects are minimized through the use of the best management practices and strict permit conditions placed on conducting limited human activities in the Monument. Therefore, while there may be short-term negative effects as a result of some activities, the long-term beneficial effects almost always offset the negative effects, and cumulatively the net effect of implementing the management plan is beneficial.

The Proposed Action's environmental effects are summarized in the EA in the following tables: natural resources, (Table 3.2.1), cultural and historic resources (Table 3.3.1), socioeconomic resources (Table 3.4.1) and other resources (water quality, transportation and communications, infrastructure and utilities (Table 3.5.1).

*2. What is the degree to which public health or safety is affected by the proposed action?*

The proposed action contains several action plans (Central Operations, Coordinated Field Operations) and documents (Midway Atoll Conceptual Site Plan, Midway Atoll Visitor Services Plan, Operational Protocols and Best Management Practices) that help provide consistent guidance and protocols for the conduct of human activities in a safe manner and that protects both humans and wildlife in the Monument. The proposed action would therefore have modest beneficial effects on public health and safety.

*3. Are there unique characteristics of the geographic area in which the proposed action is to take place?*

As one of the world's largest marine protected areas, the Papahānaumokuākea Marine National Monument encompasses a vast area of the Pacific. Extending for a distance of roughly 1,200 statute miles by 115 statute miles, the Monument covers an area of approximately 140,000 square miles and includes a rich, varied, and unique natural, cultural, and historic legacy. The Monument includes the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, State of Hawai'i Northwestern Hawaiian Islands Marine Refuge, State Seabird Sanctuary at Kure Atoll, the Midway National Wildlife Refuge (NWR), the Hawaiian Islands NWR, and the Battle of Midway National Memorial.

The Monument supports a diverse and unique array of both marine and terrestrial flora and fauna. With a spectrum of bathymetry and topography ranging from abyssal basins at depths greater than 15,000 feet below sea level to rugged hillslopes and clifftops on Nihoa and Mokumanamana (Necker) islands at up to 903 feet above sea level, the Monument represents a complete cross section of a Pacific archipelagic ecosystem. Habitats contained within the Monument include deep pelagic basins, abyssal plains, submarine escarpments, deep and shallow coral reefs, shallow lagoons, littoral shores, dunes, and dry coastal grasslands and shrublands. Relatively high percentages of most taxonomic groups in the NWHI are found nowhere else on earth. The Monument supports over 14 million seabirds and contains habitat for 23 species listed as threatened or endangered under the Endangered Species Act, including the Hawaiian monk seal, leatherback and hawksbill sea turtles, and the Laysan duck. In addition, this area has great cultural significance to Native Hawaiians and a connection to Polynesian culture worthy of protection and understanding, as noted in Presidential Proclamation 8031.

*4. What is the degree to which effects on the human environment are likely to be highly controversial?*

Presidential Proclamation 8031 designated the PMNM and established limits on access and regulated specific human activities. FWS and NOAA promulgated joint implementing regulations on August 29, 2006 (71 FR 51134, 50 CFR Part 404). The MMP protects and manages the PMNM in a manner that satisfies legal mandates set forth in the designation of the Monument and priority management needs identified by the Co-Trustee agencies. No additional regulations or restrictions beyond status quo were added by the management plan.

None of the effects of implementation of the MMP on the quality of the human environment are particularly controversial. However, several descriptions in the MMP and EA were improved and clarified in response to public comment. The MMP represents a collection of activities that when implemented will allow the Co-Trustees to coordinate their actions and provide a safe and environmentally friendly environment for the agencies and their partners to conduct resource protection, research, monitoring, education, enforcement and visitor service programs. Over 6,000 comments were received on the draft management plan; many of these comments were actually geared towards the protections listed in the Proclamation and the final rule, versus the activities proposed by the management plan or EA.

*5. What is the degree to which effects are highly uncertain or involve unique or unknown risks?*

The proposed action involves implementing a management plan designed to protect sanctuary natural, historic and cultural resources. The proposed action is not highly uncertain and does not involve unique or unknown risks. However, the plan does identify the need to initiate several step-down planning efforts and envision eventual implementation of the Midway Atoll Conceptual Site Plan. If these activities are developed beyond the conceptual stage, they may require additional assessment under NEPA (such as a supplemental EA or an environmental impact statement), as well as HRS Chapter 343 compliance.

Furthermore, although all human activities and actions may not be known as this time, any and all future human activities in the Monument may only be allowed if granted a joint permit by the Monument Management Board. These permits are subject to further NEPA review, which would detail any unknown or specific risks of the project.

*6. What is the degree to which the action establishes a precedent for future actions with significant effects or represents a decision in principle about a future consideration?*

The proposed MMP establishes a framework to allow resource managers to plan and execute current and future management activities in a manner that satisfies legal mandates set forth in the designation of the Monument and priority management needs identified by the Co-Trustee agencies. Any future management activities beyond the scope of this management plan or that could result in significant effects would undergo further NEPA and HRS Chapter 343 analysis on a case-by-case basis. The proposed action will help inform Monument managers about the conduct of human activities in the Monument, which will help contribute toward the understanding of existing impacts and the prevention of future impacts.

*7. Does the proposed action have individually insignificant but cumulatively significant impacts?*

Implementation of all the activities in the MMP will result in overall beneficial impacts to the Monument. While there are some activities that may individually result in minor impacts, there are no cumulatively significant adverse or beneficial impacts to natural, cultural, or historical impacts are anticipated as a result of the proposed action.

The Proposed Action's environmental effects are summarized in the EA in the following tables: natural resources, (Table 3.2.1), cultural and historic resources (Table 3.3.1), socioeconomic resources (Table 3.4.1) and other resources (water quality, transportation and communications, infrastructure and utilities (Table 3.5.1). The cumulative effects are summarized in Table 4-2 (Summary of Potential Contribution of the No Action and Proposed Action Alternatives to Cumulative Effects).

*8. What is the degree to which the action adversely affects entities listed in or eligible for listing in the National Register of Historic Places, or may cause loss or destruction of significant scientific, cultural, or historic resources?*

The proposed action would not adversely affect areas listed in or eligible for listing in the National Register of Historic Places, or cause loss or destruction of significant scientific, cultural or historic places. Implementation of the proposed action would have beneficial impacts on archaeological, social, or cultural resources, as there are specific action plans to locate, identify and protect such resources and minimize human activities that could impact them.

*9. What is the degree to which endangered or threatened species, or their critical habitat as defined under the Endangered Species Act of 1973, are adversely affected?*

The proposed action would beneficially affect endangered or threatened species, or their critical habitat as defined under the Endangered Species Act of 1973. The "Threatened and Endangered Species Action Plan" (Section 3.2.1) provides specific activities aimed at helping coordinate the implementation of the recovery plans for threatened and endangered species such as the Hawaiian monk seal, green sea turtles, short-tailed albatross, Laysan duck, Laysan finch, Nihoa finch, Nihoa millerbird and other plants and invertebrates. Other action plans help to protect and, when appropriate, restore marine, coastal and terrestrial habitats.

*10. Is a violation of Federal, state, or local law for environmental protection threatened?*

The proposed action does not threaten a violation of federal, state, or local law requirements imposed for the protection of the environment. In fact, implementation of the MMP will help strengthen existing environmental protection laws in the Monument.

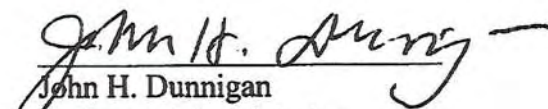

*11. Will the proposed action result in the introduction or spread of a nonindigenous species?*

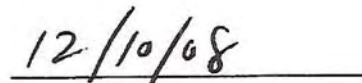

The proposed action would not result in the introduction or spread of a nonindigenous species. The MMP contains an "Alien Species" Action Plan (Section 3.3.2) that will help identify, contain, remove and prevent alien or nonindigenous species from being established in the

Monument. Further, the Monument permit conditions require permittees to adhere to a “Disease and Introduced Species Prevention Protocol” and “Special Conditions and Rules for Moving Between Islands and Atolls” to reduce and prevent the spread of nonindigenous species.

**FONSI Statement**

In view of the analysis presented in this document, the Environmental Assessment on the Proposed Final Monument Management Plan for the Papahānaumokuākea Marine National Monument (dated December 2008), the proposed action will not significantly affect the quality of the human environment with specific reference to the criteria contained in Section 6.01 of NAO 216-6, Environmental Review Procedures for Implementing the National Environmental Policy Act (NEPA). Accordingly, the preparation of an environmental impact statement for the proposed action of implementing the proposed final Monument Management Plan is not necessary.

  
John H. Dunnigan  
Assistant Administrator

  
Date

## **State Evaluation and Notice of Expected Determination of No Significant Impact Under Hawai'i Administrative Rules, Section 11-200-12 for Papahānaumokuākea Marine National Monument Management Plan and Environmental Assessment.**

The Department of Land and Natural Resources (DLNR) is the proposing agency and accepting authority for the above project for the State of Hawai'i. DLNR has reviewed the comments received during the 30 day state public comment period which began on June 8, 2008. The corresponding 90 day federal public comment period began May 22, 2008 and ran through July 23, 2008. As a policy call, the State was willing to respond to and consider all public comment received during the 90-day period. The State of Hawai'i Environmental Council gives 13 criteria (in italics below) for defining significant project impacts (Hawai'i Administrative Rules, Section 11-200-12). These criteria are summarized in the Hawai'i Health Department's Office of Environmental Quality Control (OEQC) guidebook. As discussed below, this project does not trigger any of the criteria for significance and thus, under State law, does not require preparation of an environmental impact statement (EIS). Accordingly, the agency expects that a finding of no significant impact will be issued and published in the Office of Environmental Quality Control (OEQC) Environmental Notice.

### Description of Proposed Action

The proposed Monument Management Plan is the Monument Co-Trustee agencies' overall guiding framework for their mission to carry out seamless integrated management to ensure ecological integrity and achieve strong, long-term protection and perpetuation of Northwestern Hawaiian Islands (NWHI) ecosystems, Native Hawaiian culture, and heritage resources for current and future generations. Management of the Monument is the responsibility of three Co-Trustees: the State of Hawai'i, through the Department of Land and Natural Resources (DLNR); the U.S. Department of the Interior, through the Fish and Wildlife Service (FWS), and the Department of Commerce, through the National Oceanic and Atmospheric Administration (NOAA). The Monument Management Plan was developed in part to carry out Presidential Proclamation 8031 (Establishment of the Northwestern Hawaiian Islands Marine National Monument, June 15, 2006) to develop a joint management plan for the Monument, an effort that the State of Hawai'i joined through a Memorandum of Agreement (MOA) signed by the Governor and the Secretary of Commerce and the Secretary of the Interior in December 2006. The EA was developed in accordance with the National Environmental Policy Act (NEPA) of 1969 and Hawai'i Revised Statutes (HRS) Chapter 343 Environmental Impact Statement Law. The purpose of the EA is to inform the relevant State and Federal agencies and the public of the likely environmental consequences of the activities contained in the Monument Management Plan. It focuses on site specific issues within the boundaries of the Monument and the socioeconomic effects on the State of Hawai'i.

## Findings

The National Oceanic and Atmospheric Administration, National Ocean Service, Office of National Marine Sanctuaries, Papahānaumokuākea Marine National Monument (PMNM) drafted a joint environmental assessment (dated December 2008) with the U.S. Fish and Wildlife Service and the State of Hawaii Department of Land and Natural Resources (Co-Trustee Agencies) to evaluate the potential environmental effects associated with implementing the final Monument Management Plan.

The environmental assessment is the basis for Department of Land and Natural Resources finding of no significant impact for implementing the final Monument Management Plan (MMP). Findings of No Significant Impact (FONSI) documents prepared by NOAA and USFWS provide the rationale, from the perspective of Federal guidelines and regulations, for justifying the decision not to prepare an EIS. Federal and State criteria for significance are similar but not identical.

Based on the analysis in the environmental assessment, the DLNR finds that:

1. *The proposed actions do not involve an irrevocable commitment to loss or destruction of any natural or cultural resource.*

The MMMP will improve coordinated agency management and overall protection for the natural, historical and cultural resources of the Northwestern Hawaiian Islands. The beneficial effects of the proposed action on the PMNM will result from improved planning and coordination of research, education, monitoring, and management actions by the Co-Trustee agencies. The proposed action would not adversely affect or cause loss or destruction of significant cultural or historic places. The PMNM has great cultural significance to Native Hawaiians and a connection to Polynesian culture worthy of protection as is noted in Presidential Proclamation 8031 and in the Cultural Impact Assessment (CIA) attached to this EA. Implementation of the proposed action would have beneficial impacts on archaeological, social, or cultural resources, as there are specific action plans to locate, identify and protect such resources and minimize human activities that could impact them. The proposed actions effects on natural resources are summarized in the EA in Table 3.2.1 (natural resources) and Table 3.3.1 (cultural and historic resources).

2. *The proposed actions will not curtail the range of beneficial uses of the environment.*

The proposed action, which is the implementation of the MMP, is to protect and manage the PMNM in a manner that satisfies both the legal mandates set forth in the Presidential Proclamation 8031 which established the Monument, all other legal authorities under State and federal law, and the priority management needs identified by the Co-Trustee agencies. Implementation of the management plan would result in an overall beneficial impact to the

PMNM and its resources and will not curtail the range of beneficial uses of the PMNM environment.

Short-term negative effects could occur when conducting activities that involve the restoration, enhancement or protection of organisms and ecosystems, or the rehabilitation of structures. These effects are inherently of short duration and are limited to the site where the activities occur. Affected resources are expected to return to pre-disturbance conditions after activities are completed. In addition, these negative effects are minimized through the use of the best management practices and strict permit conditions placed on conducting limited human activities in the Monument.

3. *The proposed actions will not conflict with the State's long-term environmental policies.*

The proposed actions will not conflict with the environmental policies set forth in Chapter 344, HRS, and other statutes and regulations, since the implementation of the MMP will not damage sensitive natural resources nor emit excessive noise or contaminants. Instead, it will improve and provide additional protection for the PMNM environment.

Within the Monument, the DLNR has stewardship responsibility for managing, administering, and exercising control over the coastal and submerged lands, ocean waters, and marine resources, around each of the Northwestern Hawaiian Islands, except at Midway Atoll under Title 12, Section 171.-3 Hawaii Revised Statutes. In 2005, Hawai'i Governor Linda Lingle established the Northwestern Hawaiian Islands Marine Refuge (0 to 3 nautical miles) around all emergent lands, except Midway Atoll) under Sections 187A-5 and 188-53(a), Hawaii revised Statutes (implemented as ch. 60.5, Hawaii Administrative Rules). The State is the lead agency for management of the emergent lands at Kure Atoll, a State Wildlife Sanctuary. DLNR's Division of Conservation and Resources Enforcement (DOCARE) maintains full police powers, including the power of arrest, within all lands and waters within the State's jurisdiction. Unless otherwise authorized by law, it is unlawful for any person to enter the refuge without a permit except for freedom of navigation, innocent passage, interstate commerce, and activities related to national defense, enforcement, or foreign affairs and in response to emergencies.

4. *The proposed actions will not substantially adversely affect the economic and social welfare of the community.*

The Proposed Action would provide an integrated framework for Monument management among the Co-Trustees. While this coordination should save money, it is anticipated that activities needed to address priority management needs will never be fully funded. A few additional jobs would be generated as a result of the Proposed Action, such as facilities repair and construction at Midway. An integrated approach presented in the Monument Management Plan could result in increased funding for research and management.

The overall, the total level of funding would still be subject to annual budgetary process and would likely experience increases or decreases, depending on overall federal spending. The cost of implementing the Proposed Action is estimated to average \$23 million a year over 15 years, but because funding is subject to federal and State budget and appropriations and private donations, it is not possible to determine in advance what level of funding may be available in any given year, or over the life of the plan. Overall, the proposed alternative is not expected to have a significant effect on population, employment, industry, income or the broader Hawai'i economy. The proposed actions effects on socioeconomic resources are summarized in the EA in Table 3.4.1. (natural resources) and Table 3.3.1 (cultural and historic resources).

5. *The proposed actions will not substantially adversely affect the public health of the community.*

The MMP contains several action plans (Central Operations, Coordinated Field Operations) and documents (Midway Atoll Conceptual Site Plan, Midway Atoll Visitor Services Plan, Operational Protocols and Best Management Practices) that help provide consistent guidance and protocols for the conduct of human activities in a safe manner and that protects both humans and wildlife in the Monument. The proposed action will have beneficial effect on public health and safety.

6. *The proposed actions will not involve substantial secondary impacts, such as population changes or effects on public facilities.*

Table 3.5-1 in the EA summarizes the proposed actions effects on water quality, transportation and communications, infrastructure and utilities in the PMNM, including water quality, transportation, communications infrastructure and utilities. Minor negative effects are expected from increased demands on utilities but this would be offset by rehabilitation and replacement of existing infrastructure with more sustainable and efficient systems, having beneficial effects overall. Implementation of the proposed action will not induce permanent population growth beyond that which is necessary for effective Monument operations.

7. *The proposed actions will not involve a substantial degradation of environmental quality.*

The Proposed Action to implement the Monument Management Plan would result, overall, in beneficial effects or no effects on the environmental quality of the PMNM. Short-term negative effects could occur when animals or vegetation are being restored, protected, or enhanced. These effects are inherently of short duration and are limited to the site where the activities occur. Affected resources are expected to return to pre-disturbance conditions shortly after activity ceases, so this does not constitute a significant effect. In addition,

negative effects are minimized through the use of the best management practices described in Volume III, Appendix G of the MMP.

8. *The proposed actions will not have cumulative impacts or involve a commitment for larger actions.*

Implementation of all the activities in the MMP will result in overall beneficial impacts to the Monument. While there are some activities that may individually result in minor impacts, there are no cumulative significant adverse impacts to natural, cultural, or historical impacts are anticipated as a result of the proposed action. The cumulative effects are summarized in Table 4-2 (Summary of Potential Contribution of the No Action and Proposed Action Alternatives to Cumulative Effects).

The MMP allows resource managers to plan and execute current and future management activities in a manner that satisfies legal mandates set forth in the designation of the Monument and priority management needs identified by the Co-Trustee agencies. Any future management activities beyond the scope of this management plan or that could result in significant effects would undergo a NEPA and HRS Chapter 343 analysis on a case-by-case basis. The proposed action will help inform Monument managers about the conduct of human activities in the Monument, which will help contribute toward the understanding of existing impacts and the prevention of future impacts.

9. *The proposed actions will not affect a rare, threatened, or endangered species or its habitat.*

The proposed action would beneficially affect endangered or threatened species, or their critical habitat as defined under the federal Endangered Species Act of 1973 and HRS §195D-4. The “Threatened and Endangered Species Action Plan” (Section 3.2.1) provides specific activities aimed at helping coordinate the implementation of the recovery plans for threatened and endangered species such as the Hawaiian monk seal, green sea turtles, short-tailed albatross, Laysan duck, Laysan finch, Nihoa finch, Nihoa millerbird and other plans and invertebrates. Other action plans are also considered and approaches integrated to help to protect and when appropriate restore marine, coastal and terrestrial habitats.

10. *The proposed actions will not substantially affect air or water quality or ambient noise levels.*

There will be no significant effect on air or water quality, or on ambient noise levels given the limited scale of the project and use of good management practices. Table 3.5-1 summarizes the effects of MMP implementation on other resources including water quality. The EA examined the impacts to water quality conditions that could be associated with marine, terrestrial and potable water resources; sources of marine pollution; vessel and aircraft activity; potable water supply protection; wastewater management; storm water

management; solid waste management; and management of fueling facilities in the PMNM. Implementation of the proposed action will could have a primarily beneficial water impact on water quality. Any negative impact on water quality or impact associated with change in ambient noise levels will be minimized through the use of the best management practices described in the EA and in Volume III, Appendix G of the MMP. There will be no impact on air quality.

11. *The proposed action will not have a substantial negative effect on those portions of the PMNM that may be located within an environmentally sensitive area.*

As is discussed in greater detail above the purpose of the proposed action is to protect and manage the PMNM in a manner that results in an overall beneficial impact to the PMNM and its resources. While short-term negative effects could occur when conducting activities that involve the restoration, enhancement or protection of organisms and ecosystems, or the rehabilitation of structures could occur, these effects are inherently of short duration and are limited to the site where the activities occur. Affected resources are expected to return to pre-disturbance conditions after activities are completed and the final overall effect of the activity will be an environmentally beneficial one. In addition, negative effects will be minimized through the use of the best management practices and strict permit conditions placed on conducting limited human activities in the Monument.

12. *The proposed actions will not substantially affect scenic vistas and view planes identified or State plans or studies.*

Any Monument related activity that may involve the construction of a permanent structure or the alteration of landscapes will not occur on state of Hawaii lands or on state lands covered by view plans or studies.

13. *The proposed project will not require substantial energy consumption.*

Activities occurring within the PMNM will not require consumption of substantial amounts of energy, and any energy that is expended will be directly related to monument operations. The affected area is not on a local power grid. Additionally, Co-Trustees will work together to develop alternative energy systems and waste reduction strategies including evaluating biodiesel fuel capacity or sustainable fuel types to meet future fuel requirements of aircraft, vessel, facilities and equipment that will be operating within the Monument.

---

---

**APPENDIX D**

**SCOPING AND CONSULTATION SUMMARY**

## **Summary of Seven Year Agency, Citizen Group and Individual Consultation and Public Comment and Response Processes Leading To the Development of the Papahānaumokuākea Marine National Monument Management Plan and Environmental Assessment**

On May 26, 2000 President Clinton announced his intention to provide “strong and lasting protection for the coral reef ecosystem of the Northwestern Hawaiian Islands.” He directed the Secretaries of the Departments of Commerce and the Interior, working cooperatively with the State of Hawaii and in consultation with the Western Pacific Regional Fishery Management Council to develop recommendations within 90 days for a new, coordinate management regime to increase protection of the ecosystem for sustainable use. The Departments were directed to conduct ‘visioning’ sessions, which would provide opportunities for the public to comment and help to shape the final recommendations.

Over 1,400 public comments were received in writing and at seven public meetings. The public visioning sessions accomplished three main objectives: 1) They communicated the intent of the President’s directive regarding the coral reef ecosystems of the Northwestern Hawaiian Islands; 2) They provided excellent opportunities for public participation, dialog, discussion, and interactions; and 3) they produced a substantial amount of information for the Secretaries of the Interior and Commerce to use in making their recommendations to the President.

In December 2000, President Bill Clinton issued an inter-agency memo to the Secretaries of Commerce and the Interior directing them to hold public meetings to assess the Executive Order 13178 (as amended by Executive Order 13196), establishing the NWHI Coral Reef Ecosystem Reserve (Reserve), with the purpose “to ensure the comprehensive, strong, and lasting protection of the coral reef ecosystem and related marine resources and species of the Northwestern Hawaiian Islands.” Executive Order 13178 also directed NOAA, in consultation with federal and State partners, to initiate a process to designate the Reserve as a National Marine Sanctuary pursuant to sections 303 and 304 of the National Marine Sanctuaries Act of 2000. A Reserve Advisory Council (RAC) was established to provide advice and recommendations on the designation and management of any Sanctuary and to develop a Reserve Operations Plan for managing the Reserve. With these actions began the initial general consultation and public outreach process that would; some seven years later; culminate in the identification of the issues that would be addressed in the development of Papahānaumokuākea Marine National Monument Management Plan and Environmental Assessment.

Interested State and federal agencies, the public, citizens groups and other stakeholders were engaged to seek input and gather information toward developing a unified plan for Reserve operations and the proposed sanctuary. Between 2000 and 2005, NOAA conducted an extensive

information gathering process, including over 100 meetings with jurisdictional agency partners, the RAC and associated RAC subcommittee meetings, the Western Pacific Fishery Management Council, non-governmental organizations, fishing and other stakeholder groups, and the public.

The aim of these information gathering efforts was to identify concerns related to Sanctuary designation and development of the range of alternatives considered. A series of ten public scoping meetings were hosted in Hawai‘i and Washington, D C., with more than 13,000 comments received during the initial scoping period. Throughout the designation process, additional input was collected from the public, stakeholder groups, and interagency and RAC and associated subcommittees meetings. In total, close to 52,000 public comments were received that guided the direction and development of a draft sanctuary management plan to direct management of the anticipated sanctuary upon its designation.

Simultaneously, a Reserve Operations Plan (ROP) was drafted and finalized with extensive consultation with partner agencies and the RAC. The ROP guided the management of the Reserve and was the foundational document from which the draft sanctuary management plan was developed. The draft Sanctuary Management Plan had several companion documents packaged into the draft designation proposal, including a draft environmental impact statement and draft implementing regulations. When the Monument was designated in June 15, 2006 by Presidential Proclamation 8031, the processing of these documents was halted. However, the Proclamation recognized the extensive public input and the relevancy of the NMSP public processes and resulting draft Sanctuary documents, and directed the Co-Trustees to modify, as appropriate, the draft Sanctuary Management Plan as the basis for the creation of the management plan for the newly designated Monument.

The Proclamation marked the point where the State of Hawai‘i, through the Department of Land and Natural Resources joined with the U.S. Department of the Interior, through the Fish and Wildlife Service and the U.S. Department of Commerce, through the National Oceanic and Atmospheric Administration to become one of the three Co-Trustees responsible for management of the monument. A Memorandum of Agreement to establish roles and responsibilities of the three Co-Trustees was signed on December 8, 2006. The Co-Trustees then began to develop the new Monument’s management plan.

Public information meetings were again held on all main Hawaiian Islands to inform the public of the establishment of the Monument and its implementing regulations. Overall, establishment of the Monument and joint Co-Trustee management program were well received by the public, most of whom supported strong protection of the ecosystem of the Monument. On April 4, 2007, formal notice was given of the preparation of the MMP and associated EA for the Monument. Given the extensive six-year informational gathering process that lead up to the development of the draft Sanctuary Plan; the Co-Trustees asked for specific input on changed circumstances or new environmental issues that were not identified in the draft Sanctuary planning effort or in previously held public meetings.

Instead of summarizing specific public comments obtained at these meetings, the management agencies developed a table to consolidate and summarize issues and initial responses to all public and agency comments received during outreach efforts leading up to the development of the MMP and associated EA. This summary table, which is reproduced below, was posted on the Monument web site, and notices were sent via a list-serve to the over 780 interested parties on this list, all RAC members, and relevant local agencies requesting input on any additional issues that needed to be resolved. Issues are organized by topic and location (Monument-wide and Midway-specific).

**Table 1. Summary of Monument-wide Issues Identified and Addressed in MMP and EA**

Topic	Monument-wide Issues
Monument Management Plan Development	<ul style="list-style-type: none"> <li>• The primary purpose is conservation and protection of the natural and cultural resources of the Monument. These original goals need to be reincorporated, and further development of the plan should occur through an open process that includes a Citizen Advisory Council based on the RAC model.</li> <li>• The MMP should provide specific mechanisms for partnerships among government agencies and between government and the public.</li> </ul>
Permitting	<ul style="list-style-type: none"> <li>▪ The permitting process should provide for the maximum transparency; include a 90-day public review; employ independent expert panel reviews; and in unifying the permit system, adopt conditions, terms, and instructions based on the State's permitting system. The system should be structured to allow for cumulative impact analyses.</li> <li>▪ The MMP should facilitate multiple public and private uses.</li> <li>▪ As per State NWHI rules, permit violators should not be granted additional permits and, in the case of a permit violation, a long-term permit should be revoked.</li> </ul>
Extractive Activities	<ul style="list-style-type: none"> <li>▪ The impacts on this ecosystem from sustenance fishing, bioprospecting, and bottomfishing are poorly understood and inconsistent with the primary purpose of the Monument; these should be prohibited in all forms immediately.</li> <li>▪ Commercial bottomfishing and sustenance fishing should be overseen by rigorous monitoring programs.</li> </ul>
Research	<ul style="list-style-type: none"> <li>▪ Research activities in the NWHI have dramatically increased, primarily in sensitive nearshore and land habitats as a result of increased funding. Research activities should require a risk assessment analysis, followed by implementation of an ongoing risk monitoring protocol.</li> <li>▪ Monitoring and research of the ecosystem and cultural resources are needed.</li> </ul>
Military Activities	<ul style="list-style-type: none"> <li>▪ Military activities and their impacts were not discussed in the draft SMP and should be addressed in MMP and associated EA.</li> <li>▪ Interagency coordination should include, as appropriate, the interests and activities of the Navy and MDA.</li> </ul>
Education and Outreach	<ul style="list-style-type: none"> <li>▪ Increased emphasis should be placed on building public understanding and appreciation of the NWHI through education and outreach.</li> </ul>
Habitat and Ecosystem Impacts	<ul style="list-style-type: none"> <li>▪ Impacts of marine debris, vessel groundings, pollution, alien species introduction, and general human presence in the Monument, collectively, are an ongoing concern because of effects on species and habitats in the NWHI.</li> <li>▪ The MMP should focus on the restoration and enhancement of natural habitats, populations, and ecological processes.</li> <li>▪ The economic cost of these threats should be calculated and planned for.</li> </ul>
Funding Allocation	<ul style="list-style-type: none"> <li>▪ Allocation of funds should reflect the primary purpose of the Monument, with substantial percentages of the overall budget going to enforcement, ecosystem protection, and Native Hawaiian activities.</li> <li>▪ Overhead and research should not dominate the budget allocation.</li> </ul>
Enforcement	<ul style="list-style-type: none"> <li>▪ A greater enforcement presence is needed to ensure compliance with regulations and permit conditions. Resources need to be protected through enforcement, education, policy, and management.</li> </ul>
Native Hawaiian Management Concepts and Access	<ul style="list-style-type: none"> <li>▪ Native Hawaiian management concepts should be employed in managing resources of the Monument.</li> <li>▪ Access to Native Hawaiians must be ensured.</li> </ul>

**Table 2. Summary of Midway-specific Issues Identified and Addressed in the MMP and EA**

<b>Topic</b>	<b>Issues</b>
Enforcement of Rules	Specific enforcement protocols need to be developed.
Visitor Carrying Capacity	The established cap should be critically analyzed and realistically based on staffing levels and potential impacts to resources.
Visitor Impacts on Wildlife	Monitoring measures need to be implemented to detect and evaluate possible visitor impacts on monk seals and other wildlife; these measures should derive from NMFS and FWS consultations, and perhaps should enact recommendations from the Gilmartin and Antonelis study (1998).  The impact of lead paint on the Midway's wildlife is disturbing, and the recently appropriated money should be spent removing or cleaning all structures at Midway covered with lead paint, as well as the soil around them, before hiring new staff or developing outreach materials.
Interpretation	Historic artifacts and records of Midway veterans should be prominent in interpretive materials and overall preservation of Midway's resources.  Consider and reference Kilauea Point NWR as a logical offsite exhibit and program site.
Means of Transportation	The use of larger aircraft to Midway could reduce cost to visitors.
Lead Contamination	FWS should fund and complete the removal of lead-based paint from buildings and the soil before funding the visitor services program.

**Table 3. Issues Statements and Responses Identified for the Monument Management Plan and Environmental Assessment**

Topic	Issue	Response
Access and Permitted Activities	<i>What decisions will be made in the MMP regarding Monument access and permitting of activities?</i>	The types of activities allowed and requirements for access are regulated through a permitting process detailed in 50 CFR 404. The MMP's Permitting Action Plan will identify strategies to develop a streamlined and effective permit approval and issuance process and describe how data obtained from permits will be used to assess cumulative impacts and improve long-term monitoring and protection of Monument resources. Other action plans will identify strategies and activities related to human access, types of activities allowed, limits and controls.
	<i>Will commercial fishing be permitted?</i>	Commercial Bottomfishing will be permitted by NOAA Fisheries for the eight active vessels grandfathered until June 15, 2011 through Presidential Proclamation 8031. The Proclamation also includes regulations that restrict fishing in Ecological Reserves and Special Preservation Areas, set an annual catch limit and require the fishing vessels to comply with the same rules as other Monument permit holders.
Management Capacity and Operations	<i>What facilities, vessels and levels of staffing and funding are needed to effectively operate and protect the resources of the Monument?</i>	Each action plan will identify the specific needs required to accomplish the goals and objectives of that plan. The MMP will also identify areas where needs overlap and resources can be shared while still accomplishing the goals of each action plan. In these cases, references will be made to other action plans, providing a more accurate overall need assessment.
	<i>What decisions will be made in the MMP regarding how the Co-Trustee agencies will operate as a management body and how they will coordinate with other agencies and the public?</i>	The coordinated management regime creating the MMB was outlined in a Memorandum of Agreement and signed by the Co-Trustees in December 2006. It will be the basis for further defining roles and responsibilities in carrying-out the operational and management activities of the MMP. Several mechanisms for future coordination with other agencies, community organizations, and the public will also be identified in the plan.
	<i>How will law enforcement needs for Monument management be addressed?</i>	The Enforcement Action Plan will outline the shared and coordinated responsibilities among the MMB enforcement agencies and the U.S. Coast Guard, and identify barriers to and opportunities for effective law enforcement. It will also address improving compliance through effective outreach and education.
	<i>How will military activities be managed in the MMP?</i>	Activities of the Armed Forces that could occur within the Monument are beyond the scope of MMB management activities.
Research and Monitoring	<i>What type of research programs will be established and how will they be coordinated and directed to ensure we gather information that will help to protect and manage Monument resources while minimizing damage to the ecosystem?</i>	The MMP will have action plans as well as a separate Monument Science Plan that requires research to be management-driven – by furthering an ecosystem-level understanding of the Monument or improving detection of and response to human-created threats and restoration of damaged ecosystems. Scientists must comply with the findings outlined in the Proclamation in designing their projects, while the MMP will establish a process to identify criteria and assess impacts for evaluating all proposed research and monitoring activities in the Monument.

**Table 3. Issues Statements for the Monument Management Plan and Environmental Assessment (continued)**

<b>Topic</b>	<b>Issue</b>	<b>Response</b>
Outreach, Education, and Visitation	<i>How will the MMP address public use, interpretation, and environmental education opportunities for the Monument?</i>	Midway Atoll, with its existing infrastructure and history of human activity, will serve as the on-site “window to the Monument,” and visitation opportunities will be described in the Midway Interim Visitor Services Plan of the MMP. The Mokuāpāpapa: Discovery Center in Hilo, the National Marine Sanctuaries office in Honolulu, and lectures and other types of outreach from Monument staff and trained volunteers will provide opportunities to “bring the place to the people rather than the people to the place” and will be discussed in the Ecosystem Literacy Action Plan.
Public Involvement	<i>How can the public be involved in managing and conserving the Monument?</i>	The Constituency Building and Outreach Action Plan will explore strategies for involving the public in promoting protection and awareness of Monument resources, which could include public meetings, workshops, establishing citizen advisory groups, volunteering opportunities, and other possibilities.
Habitat and Ecosystem Impacts	<i>How will terrestrial and marine habitats, fish and wildlife be managed in the Monument?</i>	The MMP will identify a range of proposed strategies and activities to address local threats (e.g., spread of alien species, contaminant spills) as well as global threats (e.g., sea level, temperature and chemistry changes) to understand and protect Monument resources. Management actions will be aimed at maintaining biological integrity, diversity, and ecosystem health and will be performed in a manner that does not cause any significant impacts to Monument natural and cultural resources.
	<i>What type of information and direction will be provided in the MMP regarding global climate change and sea level rise?</i>	The MMP and Monument Science Plan will present activities specific to the threat of global climate change, including new research models to help predict sea level rise and the possible impacts to Monument species and habitats, and will consider options for monitoring climate change and sea level rise as a part of a global network of information.
	<i>How will the MMP address threats to the Monument’s ecosystem?</i>	The MMP will identify known threats to the ecosystems of the Monument, such as marine debris, environmental contaminants, and invasive species, and propose actions and activities that can reduce or potentially eliminate damage to marine and terrestrial resources.
	<i>How will the MMB prevent the discharge of contaminants into the Monument and respond to unforeseen incidents?</i>	The Presidential Proclamation established strict standards to prevent pollution from vessels while operating in the Monument. The MMP will establish procedures for coordinated emergency response in event of an accidental or negligent pollution event and will identify a process to assess natural resource damages and implement compensatory restoration projects.
	<i>What will the MMB do to cleanup contamination caused by past human activities in the Monument?</i>	Contamination hazards exist across the NWHI, with particular issues at Midway that are known to impact the health of the Laysan Albatross. The Restoration Action Plan will identify and assess known hazards, and provide cleanup strategies, funding requirements and detail other relevant factors to remediate hazards at the most critical of these sites.
Native Hawaiian Culture	<i>How will the MMB take care of Native Hawaiian cultural resources?</i>	The MMP will outline a range of strategies and activities for cultural resource protection, identification, documentation, preservation, traditional use, interpretation, and education that will implement Native Hawaiian cultural and historic resource preservation, protection and perpetuation methods. Through the Office of Hawaiian Affairs, Native Hawaiian Working Group, and Action Plans specific to Native Hawaiian interests, the MMB will incorporate Native Hawaiian resource management skills and knowledge across all programs.

<b>Table 3. Issues Statements for the Monument Management Plan and Environmental Assessment (continued)</b>		
<b>Topic</b>	<b>Issue</b>	<b>Response</b>
Historic Preservation Issues	<i>How will the Monument manage post-contact (historic period) cultural resources?</i>	The MMP will outline a range of strategies and activities to identify, document, preserve, reuse, and interpret post-contact historic resources 1) from Midway Atoll, 2) submerged under the ocean, and 3) from exploration, commerce, war, and conservation throughout the Monument. Many of these activities, particularly for structures and buildings at Midway and sunken ships, are currently ongoing.
Midway Atoll NWR – Access and Permitting	<i>What is the appropriate total number of people (to visit, work and volunteer) that Midway Atoll can support?</i>	Midway’s Interim Visitor Services Plan has identified up to 40 overnight visitors at one time and at least 300 visitors per year as appropriate given the current staffing and infrastructure. NOAA has identified Midway as a potential operational hub and location for new programs and staff, which would cause more waste generated, more electricity required, additional infrastructure built, more water and food consumed, and potentially more disturbance to wildlife. The MMP will propose a maximum number of people on Midway, a site plan for the allocation of land uses, and facilities needed to balance people and wildlife.
Midway Atoll NWR – Management Capacity and Operations	<i>How will the Management needs of Co-Trustees be incorporated into Midway operations without negative consequences to the natural and historic resources?</i>	The MMP will present strategies and activities in a Site and Operations Action Plan that address facility and operational needs throughout the Monument, including at Midway. Conserving natural resources, preserving historic resources, and incorporating cultural considerations are all components of the action plan.
Midway Atoll NWR – Interpretation	<i>How will visitors be provided information to introduce and sensitize them to the fragile Midway Atoll ecosystem and history? To what extent should new interpretive and educational exhibits be placed at Midway?</i>	The Midway Interim Visitor Service Plan will offer several opportunities to interpret the natural and cultural features of the Monument, including guided tours, self-guided interpretive walks, guided boat trips, interpretive exhibits and signs, and programs and presentations, focusing on wildlife, historic structures, artifacts, memorials, and key sites. The MMP will address expanding the current visitor program at Midway to represent the entire Monument.
	<i>To what extent should historic structures be preserved and restored for interpretation on Midway?</i>	Decisions to preserve, restore, reuse or demolish buildings will be determined on a case-by-case basis, as the state of each building, its relative historic importance, interpretive opportunities, and the cost to restore and maintain vary widely. An appropriate balance of on-island and off-island interpretation is needed and will be further addressed in the MMP.

## **APPENDIX A:** **Permitting Process**

---

**Papahānaumokuākea Marine National Monument  
Monument Permit Application Unified Public Notification Policy**

Effective 02/01/08

**Background**

A permit is required for most activities allowed in the Papahānaumokuākea Marine National Monument (Monument), including Hawaiian Islands National Wildlife Refuge, the Midway Atoll National Wildlife Refuge, Battle of Midway National Memorial, Northwestern Hawaiian Islands State Marine Refuge, Kure Atoll Hawaii State Seabird Sanctuary, and the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve. Permit applications are accepted:

- February 1: For activities occurring between June 1 and August 31
- May 1: For activities occurring between September 1 and December 31
- September 1: For activities occurring between January 1 and May 31

Permit applications received after the deadline dates are not guaranteed to be processed before the associated activity period commences.

The following unified public notification policy will engage and inform the public of activities proposed to occur within the Monument. Posting of a permit application does not equate to permit approval. After posting, each application is thoroughly reviewed. Final permitted activities may differ from the proposed activities.

**Policy**

- Within 10 calendar days of receipt of application, a summary of the applicant's proposed activities will be posted on an agency web site for public viewing.
- Within 40 calendar days of receipt of application, full permit applications will be posted on an agency website for public viewing. A full application is one from which reviewers are able to evaluate the merits of the proposed activity.
- The permit application will be posted for a minimum of 30 calendar days prior to agency determination.
- Proposed activities that respond to urgencies, meet a high management priority, and are exigent in either opportunity or need for execution shall be considered separately. Examples of such occasions from the 2007 field season include providing twin monk seal captive care, as well as an unanticipated opportunity to gather critical mapping data.

It is noted that there are additional opportunities for public notification and input:

- Monument Regulations (50 CFR Part 404.11) require Monument permit applications for Special Ocean Use be posted for public notice and comment 30 days prior to the issuance of a Monument permit.
- Appropriate regulatory and environmental reviews (e.g. Environmental Impact Statements, Environmental Assessments, and Compatibility Determinations) related to Monument permit applications are posted for public comment.
- Monument permit applications that include proposed activities within the Northwestern Hawaiian Islands State Marine Refuge are posted to the Board of Land and Natural Resources (BLNR)

website for 7 days prior to the scheduled BLNR meeting as part of the overall Land Board submittal.

This policy provides guidance to the Co-Trustee representatives for public notification of permit applications for proposed activities in the Monument.

It is also important to note that the permit application that is posted may not include some of the detailed logistical and compliance information being considered prior to permit issuance. An activity may be provisionally approved based on the posted full application, but a permit will only be issued after the receipt of all required information (e.g. final crew/team roster, hull inspection certification, etc.).

Note to Readers:

In accordance with Presidential Proclamation 8031, which established Papahānaumokuākea Marine National Monument, applicants may seek one of six different Monument permits depending upon the type of activity they wish to pursue. Each permit type has a separate application and instructions. To reduce the size of this document, only one application and instructions—the one for research permits—is included in this Appendix. Applications and instructions for the other permit types are available at:

[http://www.hawaiireef.noaa.gov/resource/permit\\_apply.html](http://www.hawaiireef.noaa.gov/resource/permit_apply.html)

**Papahānaumokuākea Marine National Monument**  
**Research Permit Application Instructions**  
**January 2008**

**Introduction**

On June 15, 2006, President Bush established the Papahānaumokuākea Marine National Monument (Presidential Proclamation 8031, 71 FR36443, June 26, 2006) under the authority of the Antiquities Act (Act) (16 U.S.C. 431). The Proclamation reserves all lands and interests in lands owned or controlled by the Government of the United States in the Northwestern Hawaiian Islands (NWHI), including emergent lands and submerged lands and waters, out to a distance of approximately 50 nautical miles (nmi) from the islands. The outer boundary of the Monument is approximately 950nmi long by 100nmi wide, extending around coral islands, seamounts, banks, and shoals. The area includes the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, the Midway Atoll National Wildlife Refuge/Battle of Midway National Memorial, and the Hawaiian Islands National Wildlife Refuge and the Northwestern Hawaiian Islands State Marine Refuge.

The three principals with responsibility for managing lands and waters of the Monument, the Department of Commerce, Department of the Interior, and the State of Hawaii (collectively the Co-Trustees), work cooperatively to administer the Monument. This relationship is further described in the Memorandum of Agreement among the Co-Trustees signed on December 8, 2006.

**Permit Application Deadlines**

Permit applications must be received by:

- February 1: For activities occurring between June 1 and Aug 31
- May 1: For activities occurring between September 1 and December 31
- September 1: For activities occurring between January 1 and May 31

NOTE: Issuance of a Monument permit is dependent upon the completion and review of the application and Compliance Information Sheet.

**Confidential Information**

The Co-Trustees intend to post completed permit applications on the Internet for public review. Applicants are requested to indicate any information that is considered proprietary business information. Such information is typically exempt from disclosure to anyone requesting information pursuant to the Freedom of Information Act (FOIA) and all applicable State law. NOAA, the U.S. Fish and Wildlife Service and the State of Hawaii attempt to protect such proprietary information, consistent with all applicable FOIA exemptions in 5 U.S.C. 552(b) and applicable State law. Typically exempt information includes trade secrets, commercial and financial information (5U.S.C. 552(b) (4)). Personal information affecting an individual's privacy, such as personal telephone numbers and addresses will also be kept confidential

consistent with 5 U.S.C. 552(b) (6) and applicable State law. Unless such information is so identified, the application may be made available to the public in its entirety.

### **Intellectual Property**

The permittee retains ownership of any data, derivative analyses or other work product, or any photographic or video material, or other copyrightable works, but the Federal Government and the State of Hawaii retain a lifetime, non-exclusive, worldwide, royalty-free license to use the same for government purposes, including copying and redissemination, and making derivative works.

### **Indemnification**

The permittee and any person participating in any activity authorized by this permit shall release, indemnify, and hold harmless National Oceanic and Atmospheric Administration, the Department of Commerce, the U.S. Fish and Wildlife Service, the Department of the Interior, the United States Government, the State of Hawaii, and their respective employees acting within the scope of their duties from and against any claims, demands, actions, liens, rights, subrogated or contribution interests, debts, liabilities, judgments, costs, and attorney's fees, arising out of, claimed on account of, or in any manner predicated upon the issuance of this permit or the entry into or habitation upon the Papahānaumokuākea Marine National Monument or as the result of any action of the permittee or persons participating in the activity authorized by this permit.

### **Reporting Burden**

Submittal of the information requested in these guidelines is required to obtain a permit pursuant to Monument regulations (50 CFR Part 404). This data is to evaluate the potential benefits of the activity, determine whether the proposed methods will achieve the proposed results, evaluate any possible detrimental environmental impacts, and determine if issuance of a permit is appropriate. It is through this evaluation that the Co-trustees are able to use permitting as one of the management tools to protect Monument resources and qualities.

Public reporting burden for this collection of information, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information is estimated as:

- A. Twenty-four (24) hours per response for Special Ocean Use permits;
- B. Five (5) hours per response for General (Research, Conservation and Management, and Education), Native Hawaiian Practices, and Recreation permits;
- C. Four (4) hours per response for VMS installation and maintenance;
- D. Five (5) minutes per response for entry and exit notices and VMS certification;
- E. Five (5) seconds per response for hourly VMS reports.

Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Papahānaumokuākea Marine National Monument Permit Coordinator, 6600 Kalaniana'ole Hwy. # 300, Honolulu, HI 96825.

Notwithstanding any other provision of the law, no person is required to respond to, nor shall any person be subject to a penalty for failure to comply with, a collection of information subject to the requirements of the Paperwork Reduction Act, unless that collection of information displays a currently valid OMB Control Number.

**Directions for filling out the Monument Permit Application**

1. Download the Research permit application. If you are unsure of the category for your proposed project, contact the Monument Permit Coordinator (contact information below).
2. Click on the document to open.
3. You will now be able to type in all the gray text field boxes and check boxes.
4. You will not be able to alter, copy, delete or modify the permit application questions and cover page in any way.

If you have difficulty filling out the application, contact the PMNM Permit Coordinator at (808) 397-2660 OR [nwhipermit@noaa.gov](mailto:nwhipermit@noaa.gov).

**Send Permit Applications to:**

Papahānaumokuākea Marine National Monument Permit Coordinator  
6600 Kalaniana'ole Hwy. # 300  
Honolulu, HI 96825  
[nwhipermit@noaa.gov](mailto:nwhipermit@noaa.gov)  
PHONE: (808) 397-2660      FAX: (808) 397-2662

**NOTE: SUBMITTAL VIA ELECTRONIC MAIL IS PREFERRED BUT NOT REQUIRED. YOU ARE ALSO REQUIRED TO SEND ONE SIGNED ORIGINAL APPLICATION VIA MAIL TO THE MONUMENT OFFICE ABOVE:**

## Papahānaumokuākea Marine National Monument RESEARCH Permit Application Instructions

**NOTE:** *This Permit Application (and associated Instructions) are to propose activities to be conducted in the Papahānaumokuākea Marine National Monument. The Co-Trustees are required to determine that issuing the requested permit is compatible with the findings of Presidential Proclamation 8031. Within this Application, provide all information that you believe will assist the Co-Trustees in determining how your proposed activities are compatible with the conservation and management of the natural, historic and cultural resources of the Papahānaumokuākea Marine National Monument (Monument).*

### **Permit Application Cover Sheet Summary Information**

NOTE: The permit application cover sheet is intended to provide summary information on permit applications for activities proposed to occur in the Papahānaumokuākea Marine National Monument. Information submitted in this section will be posted on the Monument website to inform the public regarding projects proposed to occur in the Monument.

**Applicant Name:** Enter the name of the person who is in charge of the proposed activity and who will be responsible for all the personnel and actions under the authority of the requested Monument permit.

**Affiliation:** Specify the Applicant’s affiliation, if any, in relation to the proposed project.

**Proposed Activity Dates:** Specify the dates of your activities.

**Proposed Method of Entry:** Specify whether you will enter the Monument via vessel or aircraft.

**Proposed Locations:** Provide a brief summary of the location(s) for proposed activities (e.g. French Frigate Shoals, or 300-1500 meters depth east of Twin Banks, etc.). NOTE: Specific GPS and other location information are requested in the Monument Compliance Information Sheet.

**Estimated number of individuals to be covered under this permit:** Provide an ESTIMATE of the number of individuals (including Applicant) to be covered under this permit.

**Estimated number of days in the Monument:** Provide the ESTIMATED number of days in the Monument.

**Description of proposed activities:** Include a brief description of the proposed activities, including the following:

- Define the objective of the proposed activity (*The proposed activity will. . .*)
- Identify what the action will entail (*To accomplish this activity we would. . .*)
- Explain the benefit of the activity to the Monument (*This activity would help the Monument by. . .*)

**Other information or Background:** Include any other information relevant to your proposed activity summary.

### **Section A: Applicant Information**

1. State the name and title of the Applicant. The Applicant is the individual who is in charge of the proposed activity and, therefore, responsible for all the personnel and actions undertaken under the authority of the any Monument Permit issued pursuant to this application. Attach the Applicant's CV, resume or biography if applicable.

1a. If you will not be present in the Monument for the proposed activities in your application, provide the full name(s), affiliation(s) and contact information of the person or persons responsible for ensuring the permit conditions are followed in the Monument. Attach their respective CV, resume, or biography if applicable.

2. State the Applicant's mailing address, phone number, fax number, and email address. If the Applicant is a student, state the Major Professor's contact information in addition to his/her own.

3. Specify the Applicant's affiliation, if any, in relation to the proposed project.

4. List all personnel roles and/or names. Include first and last name, position (Research Diver, Field Technician, Medical Assistant, etc.), affiliation, telephone number, and email address for each individual. If specific names of all participants are not known at the time this form is submitted, then specific roles must be provided as placeholders for numbers of persons requested to enter the Monument. The Application Review Committee may request resumes, biographies, or CVs for any personnel listed, at a later date. Attach additional information if necessary.

It is the Applicant's responsibility to keep Monument staff apprised of any proposed personnel changes. Full names of personnel and roles will be required in the Monument Compliance Information Sheet prior to issuance of a permit.

### **Section B: Project Information**

5a. Project Location: Check the boxes of all applicable locations where the proposed activities will occur. Indicate whether your project will occur on land, in the ocean, or both. Also indicate whether your project will occur in deep water or shallow water, or both. Shallow water is defined by water less than 100 meters in depth. NOTE: Include alternate locations if appropriate.

\* Location Description: Provide a description of the location of the proposed activity that includes sufficient detail. Refer to the Monument Compliance Information Sheet for information on including specific site and collection location(s).

5b. Check all applicable regulated activities proposed to be conducted in the Monument by the Applicant at any of the locations mentioned in 5a.

\*Removing, moving, taking, harvesting, possessing, injuring, disturbing, or damaging, or attempting to remove, move, take, harvest, possess, injure, disturb, or damage any living or nonliving Monument resource.

\*Drilling into, dredging, or otherwise altering the submerged lands other than by anchoring a vessel; or constructing, placing, or abandoning any structure, material, or other matter on the submerged lands.

\*Anchoring means dropping anything on to the ocean bottom with the intention of holding something fast to the bottom. Generally an anchor secures a vessel, but it may also be used for a mooring or any other item.

\*Deserting a vessel aground, at anchor, or adrift.

\*Discharging or depositing any material into Special Preservation Areas or the Midway Atoll Special Management Area except vessel engine cooling water, weather deck runoff, and vessel engine exhaust.

OR

\*Discharging or depositing any material or other matter into the Monument, or discharging or depositing any material or other matter outside of the Monument that subsequently enters the Monument and injures any resources of the Monument, except fish parts (i.e. chumming material or bait) used in and during authorized fishing operations, or discharges incidental to vessel use such as deck wash, approved marine sanitation device effluent, cooling water, and engine exhaust.

\*Touching any coral, living or dead.

\*Possessing fishing gear except when stowed and not available for immediate use during passage without interruption through the Monument.

\*Attracting any living Monument resources.

\*Sustenance Fishing means fishing for bottomfish or pelagic species within Federal waters, but outside of Special Preservation Areas, Ecological Reserves and the Midway Atoll Special Management Area, in which all catch is consumed within the Monument, and that is incidental to another activity permitted under Presidential Proclamation 8031.

\*Subsistence Fishing means fishing for bottomfish or pelagic species in State waters in which all catch is for direct personal consumption within the Monument, and that is incidental to another activity permitted under Presidential Proclamation 8031.

\*Swimming means entering the water and propelling oneself by movements of the limbs, without special equipment of any kind.

\*Snorkeling means entering the water and swimming with the aid of a mask, snorkel, and fins, or any combination of the aforementioned equipment.

\*SCUBA Diving means entering the water and submerging oneself with the aid of self-contained underwater breathing apparatus.

6. State the purpose of the proposed activities, including the goals and objectives of the activities.

7. The Secretaries of Commerce and Interior are required to determine that issuing the requested permit is compatible with the Findings of Presidential Proclamation 8031. Answer the Monument findings below and provide information that you believe will assist the Co-Trustees in determining your proposed activities are compatible with the conservation and management of the natural, historic and cultural resources of the Monument:

The Findings are as follows:

a. How can the activity be conducted with adequate safeguards for the cultural, natural and historic resources and ecological integrity of the Monument?

b. How will the activity be conducted in a manner compatible with the management direction of the proclamation, considering the extent to which the conduct of the activity may diminish or enhance Monument cultural, natural and historic resources, qualities, and ecological integrity, any indirect, secondary, or cumulative effects of the activity, and the duration of such effects?

c. Is there a practicable alternative to conducting the activity within the Monument? If not, explain why your activities must be conducted in the Monument.

d. How does the end value of the activity outweigh its adverse impacts on Monument cultural, natural and historic resources, qualities, and ecological integrity?

e. Explain how the duration of the activity is no longer than necessary to achieve its stated purpose.

f. Provide information demonstrating that you are qualified to conduct and complete the activity and mitigate any potential impacts resulting from its conduct.

g. Provide information demonstrating that you have adequate financial resources available to conduct and complete the activity and mitigate any potential impacts resulting from its conduct.

h. Explain how the methods and procedures proposed by the applicant are appropriate to achieve the proposed activity's goals in relation to their impacts to Monument cultural, natural and historic resources, qualities, and ecological integrity.

i. Has your vessel has been outfitted with a mobile transceiver unit approved by OLE and complies with the requirements of Presidential Proclamation 8031?

j. Demonstrate that there are no other factors that would make the issuance of a permit for the activity inappropriate.

8. Describe the procedures and methods you will use in performing the proposed activity while within the Monument.

Describe in detail how you will get to your work locations and specific sites (walking, climbing, wading, swimming, snorkeling, diving, boating, etc.). Will you need to enter a seabird colony? Will you need access to beaches? Will you work at night?

Will you request assistance from Monument staff to maintain the equipment or collect data or samples in association with the proposed activity in your absence or presence? If so, describe procedures for doing so including how often it is to occur and how long it will take per maintenance/data/sample collection event. Describe how you plan to compensate volunteers for the maintenance or data/sample collection work.

**NOTE:** If you will not collect specimens, you may enter “N/A” for questions 9-11 and skip to question 12a.

9a. List all specimens (organisms or objects) you plan to collect. If applicable, list each species common name, scientific name, number to be collected, maximum size of specimens to be collected, amount taken and the size of the organism from which you will take any sample(s), and general collection location requested in #5a. Also indicate whether you will take the whole organism or a subsample thereof.

9b. List the post project disposition of specimens. What will be done with the parts of samples that are not used in your initial analysis?

9c. Check the appropriate box to indicate if the organisms will be kept alive after collection. If the organisms are to be kept alive, state where will they be housed. (Provide the general site and/or location.) Also check the appropriate box to indicate if there is an open or closed-system for maintaining living organisms and if there is an outfall or discharge. If applicable, note whether the organisms will be kept with other species and if so, the species names of the other organisms. Will any organisms be released? If so, where?

10. How will the collected samples be transported out of the Monument? Will samples be transported by vessel or aircraft? Will samples be transported frozen, in formalin, in alcohol, or other media?

11. Describe whether you are collaborating with others to reduce duplicative activities in the Monument or elsewhere in the State of Hawaii or other Pacific Remote Island National Wildlife Refuges. If you are collecting samples for someone else, stipulate to whom the samples will be

provided and give their Monument permit number. Also, list State of Hawaii and United States Fish and Wildlife Service permit numbers for any relevant collaborations or research related to this project, including projects in the main Hawaiian Islands and Pacific Remote Island National Wildlife Refuges. Provide information on permit applications for related research that are under review at any of the above agencies.

12a. Provide a complete itemized list of work related gear/equipment/supplies, including collecting equipment, radio isotopes, dive equipment, etc. that will be taken into and removed from the Monument. If you wish to store any items on any island between field seasons, request so here. Indicate how and where you propose the stored items be kept. If you propose to take any work or personal items ashore that will require use of resources (electrical, power, water, or other resources) also describe that in this section.

12b. For any Hazardous Materials also include the following information:

\*List all hazardous materials by common name, proper shipping name, hazard class, and amount to be taken into the Monument. Provide a Material Safety Data Sheet for each hazardous material.

\*Describe how each hazardous material will be contained and stored while in the Monument.

\*Describe how each hazardous material will be used for the proposed activity. Describe how and when each hazardous material will be removed from the Monument.

NOTE: The Principal Investigator (Applicant) is responsible for disposal of, storage or unauthorized use of any left-over hazardous materials from any permitted activity.

13. If applicable, indicate the types of permanent or semi-permanent installments you would like to install in the Monument, and answer the following questions:

\*What is it made of?

\*What will be installed?

\*How will it be installed?

\*Where will it be installed?

\*How long will it be installed?

\*Will the installation require maintenance? If so, who will conduct the maintenance and how often?

\*How and when will the installation be removed?

14. Provide information regarding the projected completion dates of the following: sample analysis, write-up and publication of information gathered within the Monument.

15. List all publications directly related to the proposed project:

**Papahānaumokuākea Marine National Monument**  
RESEARCH Permit Application

**NOTE: *This Permit Application (and associated Instructions) are to propose activities to be conducted in the Papahānaumokuākea Marine National Monument. The Co-Trustees are required to determine that issuing the requested permit is compatible with the findings of Presidential Proclamation 8031. Within this Application, provide all information that you believe will assist the Co-Trustees in determining how your proposed activities are compatible with the conservation and management of the natural, historic, and cultural resources of the Papahānaumokuākea Marine National Monument (Monument).***

**ADDITIONAL IMPORTANT INFORMATION:**

- Any or all of the information within this application may be posted to the Monument website informing the public on projects proposed to occur in the Monument.
- In addition to the permit application, the Applicant must either download the Monument Compliance Information Sheet from the Monument website OR request a hard copy from the Monument Permit Coordinator (contact information below). The Monument Compliance Information Sheet must be submitted to the Monument Permit Coordinator after initial application consultation.
- Issuance of a Monument permit is dependent upon the completion and review of the application and Compliance Information Sheet.

**INCOMPLETE APPLICATIONS WILL NOT BE CONSIDERED**

Send Permit Applications to:

## **Papahānaumokuākea Marine National Monument Permit Application Cover Sheet**

This Permit Application Cover Sheet is intended to provide summary information and status to the public on permit applications for activities proposed to be conducted in the Papahānaumokuākea Marine National Monument. While a permit application has been received, it has not been fully reviewed nor approved by the Monument Management Board to date. The Monument permit process also ensures that all environmental reviews are conducted prior to the issuance of a Monument permit.

### **Summary Information**

**Applicant Name:**

**Affiliation:**

**Permit Category:** Research

**Proposed Activity Dates:**

**Proposed Method of Entry (Vessel/Plane):**

**Proposed Locations:**

**Estimated number of individuals (including Applicant) to be covered under this permit:**

**Estimated number of days in the Monument:**

**Description of proposed activities:** (complete these sentences):

- a.) The proposed activity would...
  
  
  
  
  
  
  
  
  
  
- b.) To accomplish this activity we would ....
  
  
  
  
  
  
  
  
  
  
- c.) This activity would help the Monument by ...

**Other information or background:**

## **Section A - Applicant Information**

### **1. Applicant**

Name (last, first, middle initial):

Title:

#### **1a. Intended field Principal Investigator (See instructions for more information):**

**Ocean Based**

NOTE: There is a fee schedule for people visiting Midway Atoll National Wildlife Refuge via vessel and aircraft.

Location Description:

**5b. Check all applicable regulated activities proposed to be conducted in the Monument:**

- Removing, moving, taking, harvesting, possessing, injuring, disturbing, or damaging any living or nonliving Monument resource
- Drilling into, dredging, or otherwise altering the submerged lands other than by anchoring a vessel; or constructing, placing, or abandoning any structure, material, or other matter on the submerged lands
- Anchoring a vessel
- Deserting a vessel aground, at anchor, or adrift
- Discharging or depositing any material or matter into the Monument
- Touching coral, living or dead
- Possessing fishing gear except when stowed and not available for immediate use during passage without interruption through the Monument
- Attracting any living Monument resource
- Sustenance fishing (Federal waters only, outside of Special Preservation Areas, Ecological Reserves and Special Management Areas)
- Subsistence fishing (State waters only)
- Swimming, snorkeling, or closed or open circuit SCUBA diving within any Special Preservation Area or Midway Atoll Special Management Area

**6 Purpose/Need/Scope *State purpose of proposed activities:***

**7. Answer the Findings below by providing information that you believe will assist the Co-Trustees in determining how your proposed activities are compatible with the conservation and management of the natural, historic, and cultural resources of the Monument:**

The Findings are as follows:

a. How can the activity be conducted with adequate safeguards for the cultural, natural and historic resources and ecological integrity of the Monument?

b. How will the activity be conducted in a manner compatible with the management direction of this proclamation, considering the extent to which the conduct of the activity may diminish or enhance Monument cultural, natural and historic resources, qualities, and ecological integrity, any indirect, secondary, or cumulative effects of the activity, and the duration of such effects?

c. Is there a practicable alternative to conducting the activity within the Monument? If not, explain why your activities must be conducted in the Monument.

d. How does the end value of the activity outweigh its adverse impacts on Monument cultural, natural and historic resources, qualities, and ecological integrity?

e. Explain how the duration of the activity is no longer than necessary to achieve its stated purpose.

f. Provide information demonstrating that you are qualified to conduct and complete the activity and mitigate any potential impacts resulting from its conduct.

g. Provide information demonstrating that you have adequate financial resources available to conduct and complete the activity and mitigate any potential impacts resulting from its conduct.

h. Explain how your methods and procedures are appropriate to achieve the proposed activity's goals in relation to their impacts to Monument cultural, natural and historic resources, qualities, and ecological integrity.

i. Has your vessel has been outfitted with a mobile transceiver unit approved by OLE and complies with the requirements of Presidential Proclamation 8031?

j. Demonstrate that there are no other factors that would make the issuance of a permit for the activity inappropriate.

### **8. Procedures/Methods:**

**NOTE: If land or marine archeological activities are involved, contact the Monument Permit Coordinator at the address on the general application form before proceeding, as a customized application will be needed. For more information, contact the Monument office on the first page of this application.**

#### **9a. Collection of specimens - collecting activities (would apply to any activity): organisms or objects (List of species, if applicable, attach additional sheets if necessary):**

Common name:

Scientific name:

# & size of specimens:

Collection location:

Whole Organism     Partial Organism

**9b. What will be done with the specimens after the project has ended?**

**9c. Will the organisms be kept alive after collection?**  Yes  No

• General site/location for collections:

• Is it an open or closed system?  Open  Closed

• Is there an outfall?  Yes  No

• Will these organisms be housed with other organisms? If so, what are the other organisms?

• Will organisms be released?

**10. If applicable, how will the collected samples or specimens be transported out of the Monument?**

**11. Describe collaborative activities to share samples, reduce duplicative sampling, or duplicative research:**

**12a. List all specialized gear and materials to be used in this activity:**

**12b. List all Hazardous Materials you propose to take to and use within the Monument:**

**13. Describe any fixed installations and instrumentation proposed to be set in the Monument:**

**14. Provide a time line for sample analysis, data analysis, write-up and publication of information:**

**15. List all Applicants' publications directly related to the proposed project:**

With knowledge of the penalties for false or incomplete statements, as provided by 18 U.S.C. 1001, and for perjury, as provided by 18 U.S.C. 1621, I hereby certify to the best of my abilities under penalty of perjury of that the information I have provided on this application form is true and correct. I agree that the Co-Trustees may post this application in its entirety on the Internet. I understand that the Co-Trustees will consider deleting all information that I have identified as "confidential" prior to posting the application.

**SEND ONE SIGNED APPLICATION VIA MAIL TO THE MONUMENT OFFICE BELOW:**

Papahānaumokuākea Marine National Monument Permit Coordinator  
6600 Kalaniana'ole Hwy. # 300  
Honolulu, HI 96825  
FAX: (808) 397-2662

**DID YOU INCLUDE THESE?**

- Applicant CV/Resume/Biography
- Intended field Principal Investigator CV/Resume/Biography
- Electronic and Hard Copy of Application with Signature
- Statement of information you wish to be kept confidential
- Material Safety Data Sheets for Hazardous Materials

**Papahānaumokuākea Marine National Monument  
Compliance Information Sheet  
Instructions**

*NOTE: Issuance of a Monument permit is dependent upon the completion and review of the application and Compliance Information Sheet.*

1. Updated list of participating personnel. List all personnel participating in the proposed activity. Include first and last name, position (John Doe, Diver; Jane Doe, Field Technician; Jerry Doe, Medical Assistant, etc.), affiliation, telephone number, and email address for each individual. If specific names of all participants are not known at the time this form is submitted, then specific positions must be provided as placeholders for numbers of persons requested to enter the Monument. The Application Review Committee may request resumes, biographies, or CVs for any personnel listed, at a later date. Attach additional information if necessary.

It is the Applicant's responsibility to keep Monument staff apprised of any proposed personnel changes. Full names of personnel and roles will be required in the Monument Compliance Information Sheet prior to issuance of a permit.

2. Provide additional detail on site locations here. Additional detail may include, but is not limited to: specific lat/long coordinates, habitat type, water depth, substrate type, etc. If appropriate, attach an Excel spreadsheet or Shape file to this sheet. Contact the Monument Permit Coordinator for additional instructions.

3. List permit numbers for all other related Federal or State Permits for which you have applied or received. These may include, but are not limited to, a Bird Banding Lab Migratory Bird Banding Permit, State of Hawaii Department of Land and Natural Resources Division of Forestry and Wildlife Permit, State Conservation District Use Permit, Endangered Species Act consultations, Marine Mammal Protection Act Permit, International Animal Care and Use Committee, or any University permits. Attach copies of permits already received. You will be required to provide copies of all required permits to the Monument permit coordination personnel prior to departure for the Monument.

List all permits you have received for the same or similar activities from any State or Federal entity.

3a. For each of the permits listed, identify any permit violations or any permit that was suspended, amended, modified, or revoked. Explain the circumstances surrounding the violation or permit suspension, amendment, modification or revocation.

4. Include a budget and funding sources specific to the proposed activities. **Salary information and detailed program budgets are not necessary.** List any in-kind contributions awarded for the proposed activities.

5. The “Activity start” and “Activity completion” must include the entire span of the proposed activity. In other words, these dates must specify if the proposed activity is a multi-year activity and if so, the duration the proposed activity is expected to be conducted in the Monument.

NOTE: Multi-year projects do NOT guarantee the issuance of additional permits in subsequent years.

If specific dates cannot be determined at the time of application, explain the reasons dates are pending (e.g., ship schedules, flight schedules). At minimum, describe the intervals of time you propose to visit the Monument, e.g. during a specific nesting season or quarterly, and the proposed duration of the proposal.

For Personnel Schedule, list those who will be in the Monument (specific locations) and for what periods of time. Attach additional documentation if necessary.

6. All persons covered under the permit are responsible for the cost of removing themselves from the Monument at the conclusion of the term of the permit, revocation, or other enforcement matters. Additionally, persons covered under the permit are responsible for the cost of removing themselves from the Monument in the event of a necessary medical evacuation, emergency evacuation, including weather, or for the cost of any necessary search and rescue operation. Demonstrate that all persons covered under the permit have either insurance coverage, adequate bond, or have other financial resources to pay Monument Co-Trustees for the cost of their necessary search and rescue and/or removal from the Monument.

NOTE: The State of Hawaii requires permittees to carry general liability insurance.

7. Check the appropriate box to indicate how personnel will enter the Monument. Note which vessel(s) or aircraft(s) will be used to transport personnel. If entering by a vessel which is not already permitted to enter the Monument in support of your proposed activity, you must include that respective vessel and its crew on this permit application. If entering by a vessel which is already permitted to enter the Monument in support of your proposed activity, state the vessel’s Monument Permit number here.

8. Check the relevant inspections that you will conduct prior to departure for the Monument. Include the dates of scheduled inspections. Upon completion of the inspections and any required cleaning operations, you will be required to provide proof of approved inspections and cleaning to Monument Permit coordination personnel.

All vessels must have at a minimum a Rodent Free Inspection, Hull Inspection, and Ballast Water Record Inspection no more than 14 days prior to departure for the Monument. If any small boat operations are proposed to occur within the Monument, then a Tender Vessel Fouling Inspection must occur in this time frame as well. If any gear will be placed or used in the water or on land, you must schedule an inspection of these items before departing for the Monument. For more information on arranging these inspections contact the Monument Permit Coordinator at (808) 397-2660, or [nwhipermit@noaa.gov](mailto:nwhipermit@noaa.gov).

NOTE: Results of inspections may require cleaning operations such as rodent eradication, hull cleaning, or ballast water maintenance at your own cost before departing for the Monument. If proposed gear or materials are found to be contaminated with alien species you may be required to conduct specific cleaning measures or complete replacement of contaminated items at your own cost before departing for the Monument. Re-inspection may be required.

9. List all vessel information: Vessel name, owner, captain's name, vessel type, length, gross tonnage and vessel identification number. List vessel International Maritime Organization Number (if applicable), flag of origin, call sign, port of embarkation, total ballast water capacity volume (m<sup>3</sup>), total number of fuel tanks on ship, total number of ballast water tanks on ship, total fuel capacity and last port.

Indicate whether the vessel has a Marine Sanitation Device (MSD) and its type. Explain in detail how you will comply with the regulations regarding discharge in the Monument. If applicable, attach schematics of the vessel's discharge and treatment systems.

List all types and amounts of hazardous materials to be carried on board for vessel or tender vessel use.

Indicate that the vessel has a NOAA Office of Law Enforcement (OLE)-approved Vessel Monitoring System (VMS). Provide the name and contact information of the contractor responsible for installing the VMS system. For more information on NOAA OLE-approved VMS systems, refer to 50 CFR 407.11 (e) (f). This information can be located at: <http://hawaiiireef.noaa.gov/PDFs/VMSfdreg.pdf>

List the make and model of the VMS to be used while conducting activities in the Monument.

NOTE: All vessels entering the Monument MUST have an NOAA OLE-approved VMS System installed PRIOR to entering the Monument, "An owner or operator of a vessel that has been issued a permit for accessing the Monument must ensure that such a vessel has an operating vessel monitoring system (VMS) on board, approved by the OLE in the National Oceanic and Atmospheric Administration in the Department of Commerce when voyaging within the Monument" (50 CFR 404.5).

\* NOTE: This question is not required if you are traveling aboard a NOAA vessel.\*

10. List all workboats (tenders) which will be use to transport personnel, gear and materials within the Monument. Include information on the number of tenders/skiffs aboard the vessel and the specific types of motors on each tender/skiff.

## **Additional Information for Land Based Operations**

ANSWER QUESTIONS IN THIS SECTION IF YOU WISH TO CONDUCT ACTIVITIES ON LAND

11. Answer the following questions:

\*If personnel, gear and materials are to be transported to the Monument by vessel, how will personnel, gear and materials be transported between ship and shore?

\*If applicable, how will personnel be transported between islands within any one atoll?

\*Provide a time line of all significant transportation events for arrivals and departures.

12. Describe where personnel will sleep/eat/bathe while on the island(s). Note how many personnel will be using U.S. Fish and Wildlife Service and/or State of Hawaii supplied accommodations and for how long.

13. Describe office/desk/workbench/workshop/lab space you expect to use during the proposed activity on the island(s). Describe all electrical and water needs you expect to use during the proposed activity on the island(s). Describe what disposal route all of the water and hazardous materials will take (e.g., laboratory sink, drains, flow-through aquaria) and where these materials will ultimately end up.

NOTE: charging batteries, rinsing gear, cleaning tools, painting and maintaining equipment, etc., all take space and resources. Requesting use of these resources should be done in this section.

## **Papahānaumokuākea Marine National Monument Compliance Information Sheet**

**1. Updated list of personnel to be covered by permit. List all personnel names and their roles here (e.g. John Doe, Diver; Jane Doe, Field Technician, Jerry Doe, Medical Assistant):**

**2. Specific Site Location(s): (Attach copies of specific collection locations):**

**3. Other permits (list and attach documentation of all other related Federal or State permits):**

**3a. For each of the permits listed, identify any permit violations or any permit that was suspended, amended, modified or revoked for cause. Explain the circumstances surrounding the violation or permit suspension, amendment, modification or revocation.**

**4. Funding sources (Attach copies of your budget, specific to proposed activities under this permit and include funding sources. See instructions for more information):**

**5. Time frame:**

Activity start:

Activity completion:

Dates actively inside the Monument:

From:

To:

Describe any limiting factors in declaring specific dates of the proposed activity at the time of application:

Personnel schedule in the Monument:

**6. Indicate (with attached documentation) what insurance policies, bonding coverage, and/or financial resources are in place to pay for or reimburse the Monument trustees for**

**the necessary search and rescue, evacuation, and/or removal of any or all persons covered by the permit from the Monument:**

**7. Check the appropriate box to indicate how personnel will enter the Monument:**

- Vessel  
 Aircraft

Provide Vessel and Aircraft information:

**8. The certifications/inspections (below) must be completed prior to departure for vessels (and associated tenders) entering the Monument. Fill in scheduled date (attach documentation):**

- Rodent free, Date:  
 Tender vessel, Date:  
 Ballast water, Date:  
 Gear/equipment, Date:  
 Hull inspection, Date:

**9. Vessel information (NOTE: if you are traveling aboard a National Oceanic and Atmospheric Administration vessel, skip this question):**

Vessel name:

Vessel owner:

Captain's name:

IMO#:

Vessel ID#:

Flag:

Vessel type:

Call sign:

Embarkation port:

Last port vessel will have been at prior to this embarkation:

Length:

Gross tonnage:

Total ballast water capacity volume (m3):

Total number of ballast water tanks on ship:

Total fuel capacity:

Total number of fuel tanks on ship:

Marine Sanitation Device:

Type:

Explain in detail how you will comply with the regulations regarding discharge in the Monument. Describe in detail. If applicable, attach schematics of the vessel's discharge and treatment systems:

Other fuel/hazardous materials to be carried on board and amounts:

Provide proof of a National Oceanic and Atmospheric Administration (NOAA) Office of Law Enforcement-approved Vessel Monitoring System (VMS). Provide the name and contact information of the contractor responsible for installing the VMS system. Also describe VMS unit name and type:

VMS Email:  
Inmarsat ID#:

### **10. Tender information:**

On what workboats (tenders) will personnel, gear and materials be transported within the Monument? List the number of tenders/skiffs aboard and specific types of motors:

## **Additional Information for Land Based Operations**

**11. Proposed movement of personnel, gear, materials, and, if applicable, samples:**

**12. Room and board requirements on island:**

**13. Work space needs:**

DID YOU INCLUDE THESE?

- Map(s) or GPS point(s) of Project Location(s), if applicable
- Funding Proposal(s)
- Funding and Award Documentation, if already received
- Documentation of Insurance, if already received
- Documentation of Inspections
- Documentation of all required Federal and State Permits or applications for permits

**PAPAHĀNAUMOKUĀKEA  
MARINE NATIONAL MONUMENT  
PERMIT TEMPLATE**

**Permittee:** \_\_\_\_\_

**Permit Number:** PMNM-200x-xxx

**Effective Date:** \_\_\_\_\_

**Expiration Date:** \_\_\_\_\_

**Project Title:** \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

This permit is issued for activities in accordance with Proclamation 8031 (“Proclamation”) establishing the Papahānaumokuākea Marine National Monument (“Monument”) under the Antiquities Act of 1906, 16 USC §§ 431-433 (“Antiquities Act”) and implementing regulations (50 CFR Part 404). All activities must be conducted in accordance with the Proclamation and the regulations (attached). No activity prohibited by the Proclamation or 50 CFR Part 404 is allowed except as specified below. Chapter 13-60.5, Hawaii Administrative Rules remains in effect for proposed activities in State waters.

Subject to the terms and conditions of this permit, the National Oceanic and Atmospheric Administration (NOAA), the State of Hawai‘i, and the U.S. Fish and Wildlife Service (collectively, the Co-Trustees) hereby authorize the permittee listed above to conduct \_\_\_\_\_ activities within the Monument. All activities are to be conducted in accordance with this permit. The permit application is incorporated into this permit and made a part hereof; provided, however, that if there are any conflicts between the permit application and the terms and conditions of this permit, the terms and conditions of this permit shall be controlling.

**PERMITTED ACTIVITY DESCRIPTION:**

The following activities are authorized by this permit:

- 1.

No further disturbance of the cultural or natural resources of the Monument is allowed.

**Papahānaumokuākea  
Marine National Monument**  
6600 Kalaniana‘ole Hwy  
Suite 300  
Honolulu, HI 96825

**PERMITTED ACTIVITY LOCATION:**

Other than entrance into the Monument, the permitted activities listed above are allowed at the following locations:

- 1.

**GENERAL TERMS AND CONDITIONS:**

In accordance with the Proclamation and applicable regulations, the permitted activities listed above are subject to the following general terms and conditions:

1. The permittee must sign and date this permit on the appropriate line below. Once signed and dated, the permittee must provide a signed original copy to the Monument official identified below. The permit becomes valid on the date the last Monument official signs the permit and shall remain valid for not more than one (1) year from that date.

Permit Coordinator  
Papahānaumokuākea  
Marine National Monument  
6600 Kalanianaʻole Hwy. Suite 300  
Honolulu, HI 96825

2. This permit is neither transferable nor assignable and must be carried by the permittee while engaging in any activity authorized by this permit. All other persons entering the Monument under the authority of this permit must provide the name of the permittee or the permit number to any authorized enforcement or management personnel upon request.
3. This permit may only be modified by written amendment approved by the Co-Trustees. Modifications to this permit must be requested in the same manner as the original request was made. Any modifications requested by the permittee, such as adding or changing personnel to be covered by the permit or to change the activities that are allowed, must be made in writing.
4. This permit is subject to suspension, modification, non-renewal, or revocation for violation of the Proclamation, implementing regulations, or any term or condition of the permit. Any verbal notification of a violation from an authorized Monument representative may require immediate cessation of activities within the Monument. The issuance of a permit shall not constitute a vested or property right to receive additional or future permits. This permit may, in the sole discretion of the Co-Trustees, be renewed or reissued. However, there is no right to a renewal or re-issuance of a permit. Failure to fulfill permit requirements may affect consideration of future permit applications.

5. Permit terms and conditions shall be treated as severable from all other terms and conditions contained in this or any other ancillary permit. In the event that any provision of this permit is found or declared to be invalid or unenforceable, such invalidity or unenforceability shall not affect the validity or enforceability of the remaining terms or conditions of this permit.
6. This permit does not relieve the permittee of responsibility to comply with all federal, state and local laws and regulations. Activities under this permit may be conducted only after any other permits or authorizations necessary to conduct the activities have been obtained.
7. The permittee may be held liable for the actions of all persons entering the Monument under the authority of this permit.
8. All persons entering the Monument under the authority of this permit are considered under the supervision of the permittee and may be liable in addition to the permittee for any violation of this permit, the Proclamation and implementing regulations in conjunction with this permit. The permittee must ensure that all such persons have been fully informed of the permit terms and conditions prior to entry into the Monument. Each such person must provide written acknowledgment to the permittee, prior to entry into the Monument, that he/she has received a copy of the permit, agrees to abide by all applicable terms and conditions, and may be liable for violations of the permit. The permittee shall maintain all signed acknowledgments and submit them with the summary report described in General Condition #22.b.
9. Notification of entry into the Monument must be provided at least 72 hours, but no longer than one month, prior to the entry date. Any updates to the list of personnel must also be provided at least 72 hours before entering the Monument. Notification of departure from the Monument must be provided within 12 hours of leaving the Monument. Notification may be made via e-mail, or telephone by contacting: E-mail: [nwhi.notifications@noaa.gov](mailto:nwhi.notifications@noaa.gov); Telephone: 1-866-478-6944; or 1-808-395-6944. No other methods of notification will be considered valid.
10. The permittee and any person entering the Monument under the authority of this permit shall, before entering the Monument, attend a cultural briefing or view designated cultural informational materials on Papahānaumokuākea regarding the region's cultural significance and Native Hawaiians' spiritual and genealogical connection to the natural and cultural resources. Persons entering the Monument at Midway Atoll may satisfy this requirement upon arrival.
11. All vessels (including tenders and dive boats), engines and anchor lines shall be free of introduced species prior to entry into the Monument. To ensure this, all vessels, engines and anchor lines shall be inspected for potential introduced species prior to departing the last port before entering the Monument. No later than 24 hours prior to entry, the permittee shall provide the Monument Permit Coordinator with a report prepared by the individual conducting the inspection that: a) sets forth when and where the inspection

occurred; b) identifies any introduced species observed, including where found; c) summarizes efforts to remove any species observed; and d) certifies the vessel as free of all introduced species. The Monument Permit Coordinator shall review the report and, based on the review, may delay the entry into the Monument until all concerns identified by the Monument Permit Coordinator have been addressed.

12. All hazardous materials, biohazards and sharps, must be pre-approved by the Co-Trustees. For purposes of this permit, “hazardous material” has the same meaning as the definition found at 49 CFR §105.5 (U.S. Department of Transportation). All hazardous materials, biohazards and sharps must be stored, used, and disposed of according to applicable laws and Monument-approved protocols. The permittee, or a designated individual entering the Monument under the authority of this permit must be properly trained in the use and disposal of all such materials proposed. Proof of appropriate training may be required by the Co-Trustees. No such material may be left in the Monument after the departure of the permittee unless it has been previously approved by Monument staff. Immediately after the project is complete the permittee must remove all such materials from the Monument. The permittee will be responsible for all costs associated with use, storage, transport, training, disposal, or HazMat response for these materials.
13. All equipment or supplies brought into the Monument, or structures of any kind built in the Monument by the permittee are the responsibility of the permittee. All materials that are brought to the Monument by the permittee must be removed by the permittee except as otherwise permitted. Any permanent structures, equipment, or supplies that require maintenance, are determined to be unserviceable, or are a safety hazard, must be immediately repaired or removed from the Monument by the permittee. No structures, equipment, or supplies may be left in the Monument following the completion of the project except as listed in the permit.
14. If Monument staff are present at the field site, the permittee must meet with them before beginning permitted activities. Even with a valid permit, authorized Monument staff may prohibit entry into any location(s) within the Monument as they may deem appropriate to conserve or manage resources, particularly in areas where cumulative impacts of permitted activities are concentrated.
15. In order to facilitate monitoring and compliance, any person entering the Monument under the authority of this permit, including assistants and ship’s crew shall, upon request by authorized Monument enforcement personnel, promptly: a) allow access to and inspection of any vessel or facility used to carry out permit activities; b) produce for inspection any sample, record, or document related to permit activities, including data, logs, photos, and other documentation obtained under, or required by, this permit; and c) allow inspection on board the vessel or at the permittee’s premises of all organisms, parts of organisms, and other samples collected under this permit.
16. It is prohibited to possess or consume alcohol in the Hawaiian Islands National Wildlife Refuge in accordance with refuge regulations. Any violations will result in immediate

removal of the offender from the Monument at the individual's own cost. Offenders may not be readmitted to the Monument.

17. All persons entering the Monument under the authority of this permit are responsible for the cost of removing themselves from the Monument at the conclusion of the term of the permit or upon revocation or suspension of the permit. All such persons are also responsible for the cost of removing themselves from the Monument in the event of a necessary medical evacuation, emergency evacuation, including weather, or for the cost of any necessary search and rescue operation.
18. Except as expressly required by applicable law, the Co-Trustees are not liable for any damages to equipment or injuries to the permittee and persons entering the Monument under the authority of this permit. The permittee and any person entering the Monument under the authority of this permit shall release, indemnify, and hold harmless the National Oceanic and Atmospheric Administration, the Department of Commerce, the U.S. Fish and Wildlife Service, the Department of the Interior, the United States Government, the State of Hawai'i, and their respective employees and agents acting within the scope of their duties from and against any claims, demands, actions, liens, rights, subrogated or contribution interests, debts, liabilities, judgments, costs, and attorney's fees, arising out of, claimed on account of, or in any manner predicated upon the issuance of this permit or the entry into or habitation upon the Monument or as the result of any action of the permittee or persons participating in the activity authorized by this permit. In the event that a government employee, acting in his official capacity, is the permittee, or is entering the Monument under the authority of this permit, then he shall be subject to all applicable federal and State laws that pertain to claims by or against him predicated upon the issuance of this permit or entry into or habitation upon the Monument.
19. Monument managers or their designees may verbally require the permittee to modify or cease activities not identified in this permit if, in the opinion of the managers or designees, such action is necessary to limit disturbance to or protect Monument resources, to protect government equipment, or to ensure the safety of personnel. After providing such verbal instructions, the managers or designees will provide the permittee with a written modification, suspension or revocation to this permit at the earliest practicable opportunity. The failure to follow verbal instructions or modified permit terms, or to cease activities upon suspension or revocation of this permit, may constitute a violation of this permit, the Proclamation, the regulations, or other applicable law.
20. Disturbance of any cultural or historic property, including but not limited to Native Hawaiian cultural sites, burials, archaeological deposits, and WWII structures and features, such as stone walls and mounds, stone uprights, bunkers, batteries, camp sites, hospitals, housing areas, and radio towers; or the disturbance or collection of any historic or cultural materials and artifacts, including but not limited to bottles, dishes, cartridges, hospital materials, carvings, human remains, or Native Hawaiian bone or stone implements, found within the Monument, including the sale or trade in such items, is prohibited.

21. All Monument resources within the jurisdiction of the State of Hawai‘i are held in trust under the Hawai‘i State Constitution, Article XI, Sec. 1. The State of Hawai‘i and the Government of the United States reserve ownership or control, as the case may be, of Monument resources, both living and nonliving, that may be taken or derived from those found in the Monument.
22. The permittee must satisfy the following reporting requirements:
- a. For activities on State lands or within State waters, the permittee must submit a monthly report on the specified form.
  - b. The permittee must maintain a cruise log including, but not limited to: anchoring locations and small boat dive locations. The log must contain a description of cruise activities and the geographic locations of those activities. Within thirty (30) days after the end of the cruise or the expiration date of this permit, the permittee must submit the cruise log and a summary report of activities conducted under this permit. The permittee having authority over the vessel must maintain a vessel discharge log, which must be submitted with the cruise log.
  - c. Annual Report. The comprehensive annual report is a summary of all activities undertaken, including but not limited to: dates of all arrivals and departures from islands and atolls within the Monument, names of all persons involved in permitted activities, details of all specimens collected, handled, etc., any other pertinent information, GPS locations of all samples collected, transects, etc., results of work to date, copy of all data collected, and a proposed schedule of publication or production of final work. The report shall include a concise summary or abstract for use in Monument reports. Two hard copies and one electronic copy (Microsoft Word preferred, but not required), must be submitted to the Co-Trustees. The annual report is due by the end of the second week of January of the calendar year that follows the year that the permit was in effect or before a new permit is issued, whichever comes first. Subsequent annual reports are required each year until all data collected under research permits are fully analyzed.
  - d. The permittee must debrief the Co-Trustees following the completion of all activities in the Monument covered under this permit. The permittee must schedule the debriefing upon submitting the annual report.
  - e. The permittee must submit two copies of any article, publication, or other product created as a result of the information gained or work completed under this permit, including materials generated at any time in the future following expiration of this permit.
  - f. Any publications and/or reports resulting from activities conducted under the authority of this permit must include the notation that the activity was conducted

under permit number PMNM-200x-xxx. This requirement does not apply to publications or reports produced by the news media.

- g. All required submissions (including plans, logs, reports, and publications) shall be provided to the Monument official at the address indicated in General Condition #1.
  
- 23. All data acquired or created in conjunction with this permit will be submitted with the summary report, and annual report. Photographic and video material is considered data. The permittee retains ownership of any data, (including but not limited to any photographic or video material), derivative analyses, or other work product, or other copyrightable works, but the Federal Government and the State of Hawai'i retain a lifetime, non-exclusive, worldwide, royalty-free license to use the same for government purposes, including copying and dissemination, and making derivative works. The permittee will receive acknowledgment as to its ownership of the data in all future use. This requirement does not apply to data acquired or created by the news media.
  
- 24. Because photographic or video material that is created for personal use (i.e., not specifically acquired or created in conjunction with this permit) could unintentionally collect data that is also valuable for management purposes, the Co-Trustees reserve the right to request copies of any such material and the permittee agrees to provide a copy of such material within a reasonable time. The Co-Trustees may use such material for management purposes.
  
- 25. Any question of interpretation of any term or condition of this permit will be resolved by the Co-Trustees.

Your signature below, as permittee, indicates that you accept and agree to comply with all terms and conditions of this permit. This permit authorized only those activities listed above. This permit becomes valid on the date when signed by the last Monument Official. Please note that the expiration date on this permit will not be extended by a delay in your signing below.

U.S. Fish and Wildlife Service, Pacific Region

In accordance with the National Wildlife Refuge System Administration Act of 1966, as amended, (16 U.S.C. 668dd-668ee) and Fish and Wildlife Service Manual Section 605, this visitor services plan has been prepared for Midway Atoll National Wildlife Refuge and the Battle of Midway National Memorial. In addition, it is incorporated into the Papahānaumokuākea Marine National Monument Management Plan to guide visitor activities within the Midway Atoll Special Management Area. This visitor services plan is compliant with Presidential Proclamation 8031 and was prepared in consultation with the Secretary of Commerce by Honolulu-based National Oceanic and Atmospheric Administration staff, the State of Hawai'i's Department of Land and Natural Resources, and the Office of Hawaiian Affairs. This visitor services plan is submitted for approval by the Regional Chief of the National Wildlife Refuge System for the Pacific Region.

## **Executive Summary**

In 1996, the Fish and Wildlife Service (FWS) prepared a public use plan to guide visitor services on Midway Atoll National Wildlife Refuge. Since then, new laws and policies regarding wildlife-dependent recreation in the National Wildlife Refuge System have been promulgated, and a new visitor services plan is required to ensure recreational uses at Midway Atoll are compatible with the Refuge System mission and the purposes of the refuge and the Battle of Midway National Memorial. In addition, all recreational and special ocean use activities must be compliant with the requirements of Papahānaumokuākea Marine National Monument (Monument), designated in 2006.

This document was based on an interim plan to guide visitor activities on Midway Atoll until such time as the broader Monument Management Plan that meets the applicable requirements of a refuge comprehensive conservation plan and visitor services plan was completed. Although substantially the same as the Interim Visitor Services Plan for Midway Atoll, this plan is now a step-down plan to the overall Monument Management Plan. It was developed during initial implementation of the interim plan, and, therefore, evaluation and adaptive management of the visitor program is a key element of the Monument Management Plan's Midway Atoll Visitor Services Action Plan. FWS will continue to work closely with its Co-Trustees in the Monument, the National Oceanic and Atmospheric Administration (NOAA) and State of Hawai'i, as this visitor services plan is implemented.

This plan documents approved recreational activities at Midway Atoll and identifies the structure of the visitor services program. Special ocean uses that support recreational activities within the Midway Atoll Special Management Area are also addressed. The plan also outlines activities that honor and interpret the World War II history at Midway Atoll in recognition of its status as the Battle of Midway National Memorial, as well as opportunities to share the cultural significance of Papahānaumokuākea Marine National Monument to Native Hawaiians. It discusses operational limitations, biological constraints, and partnership opportunities beyond Midway Atoll.

Since 1995, FWS has been strongly committed to welcoming visitors to Midway Atoll. This is the first and only remote island national wildlife refuge in the Pacific – and the only place within Papahānaumokuākea Marine National Monument – to provide the general public with an opportunity to learn about and experience these unique ecosystems. A regularly scheduled visitor program operated on Midway Atoll until early in 2002 but ended when our cooperator left the atoll. Since then, visitors have arrived almost exclusively by the occasional cruise ship or sailboat, or for a Battle of Midway commemorative event. Through this visitor services plan, we will begin to offer limited opportunities to expand the visitor program to allow more people to experience Midway's wildlife and historic treasury.

The following wildlife-dependent recreational uses have been determined to be compatible at Midway Atoll Special Management Area and National Wildlife Refuge: wildlife observation and photography, environmental education and interpretation, and participatory research. Hunting and fishing, two recreational uses normally given priority on national wildlife refuges when compatible, will not take place at Midway Atoll. All animal species are protected by law or occur in numbers too low for harvest to allow hunting opportunities. Recreational fishing is precluded under Presidential Proclamation 8031, which designated the Monument.

Additional compatibility determinations allow for beach use activities such as swimming and volleyball, nonadministrative airport operations, limited outdoor sports such as bicycling and jogging, and amateur radio use. Each compatibility determination includes stipulations necessary to ensure protection of Midway's natural and historic resources. Any additional activities that may be proposed within Midway

Atoll National Wildlife Refuge would need to be evaluated through the compatibility determination process with formal public review. Activities that are determined to be compatible are authorized through the issuance of Monument permits, which fall within six permit types: conservation and management, research, education, Native Hawaiian practices, special ocean uses, and recreation.

Goals, objectives, and strategies for the visitor program are discussed in Chapter 4 of this plan. FWS will encourage individual visitors as well as organized groups to come to Midway. Opportunities for educator workshops in environmental education, formal classes, and distance learning will be implemented as funding permits. Improvements to trails and installation of blinds will benefit wildlife observation and photography opportunities, as will snorkeling and guided kayaking tours. Although not expected to be available in the early years of the visitor program, a dive program will be instituted as soon as practicable. Onsite and offsite interpretation of Midway Atoll's historic and wildlife resources will be enhanced.

In order to ensure a high quality visitor experience using the limited infrastructure currently available, the total number of overnight visitors that would be allowed on Midway Atoll at any one time will be limited to 50 people as long as this visitor services plan is effective. This number of visitors may be exceeded for short duration (less than a day) prearranged visits by ocean vessels or aircraft. In these cases, visitor activities are closely supervised and primarily consist of guided tours or participation in commemorative events.

For the next 4 years (2008-2011), visitor programs will operate from November through July, which coincides with the albatross season on Midway. The months of August through October are reserved primarily for planned construction and major maintenance activities.

With no additional FWS funding available to support a visitor program, visitation at Midway Atoll must be financially self-sustaining. Fees reflecting current actual costs for transportation, lodging, food services, and visitor services staffing are included in this plan. Additional permitting requirements also are discussed.

For the initial stage of the visitor program, FWS intends to operate primarily with its own staffing and with help from Monument Co-Trustees and volunteers. Outside entities may be needed to provide assistance with marketing the program and to establish a dive program at Midway; these options will be evaluated over the coming 2 years. In the longer term, and based on the results of the evaluation required in the Monument Management Plan's Midway Atoll Visitor Services Action Plan, other operational designs may be instituted.

## **Chapter 1 Introduction and Background**

### **1.1 Introduction**

On June 15, 2006, President George W. Bush established the Papahānaumokuākea Marine National Monument (Monument) by Proclamation 8031. The Monument incorporates the Hawaiian Islands National Wildlife Refuge, the Midway Atoll National Wildlife Refuge/Battle of Midway National Memorial, the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, and State of Hawai‘i Northwestern Hawaiian Islands Marine Refuge and Seabird Sanctuary at Kure Atoll.

The Monument was established to protect the historic and scientific features of the Northwestern Hawaiian Islands and to enhance visitation in a special area around Midway Atoll (through the establishment of the Midway Atoll Special Management Area), provide for carefully regulated educational and scientific activities, preserve access for Native Hawaiian cultural activities, prohibit unauthorized access to the Monument, phase out commercial fishing over a 5-year period, and ban other types of resource extraction and dumping of waste.

Midway Atoll is located about 1,250 miles (2,012 km) northwest of Honolulu. It includes three small islands (Sand Island, 1,117 acres (452 ha); Eastern Island, 336 acres (136 ha); and Spit Island, 15 acres (6 ha)), an encircling protective coral reef, and submerged lands and waters out to the 12-nautical mile territorial seas (581,864 acres; 235,473 ha).

Midway Atoll is an unincorporated territory of the United States and is the only atoll/island in the Hawaiian archipelago not part of the State of Hawai‘i. Midway Atoll National Wildlife Refuge is owned and administered by the U.S. Fish and Wildlife Service (FWS) on behalf of the American people and has international significance for both its historic and natural resources.

### **1.2 Human History**

Like on many of the low islands and atolls in the Northwestern Hawaiian Islands, the first visitors to what is now called Midway Atoll may have been Polynesians/Hawaiians exploring the Pacific in voyaging canoes. Unfortunately, no physical evidence of their visits remains, but oral histories and chants refer to distant low-lying islands with abundant birds and turtles. Native Hawaiians named the atoll “Pihemanu,” which means “the loud din of birds.”

Midway Atoll’s central location in the midst of the Pacific Ocean has made it a vital link in modern-day communication, transportation, and military history. The first recorded landing at Midway Atoll was made in 1859 by Captain N. C. Brooks. In 1867, the Secretary of the Navy sent Captain Reynolds to take possession of the islands for the United States. Efforts in the 1870s to open a channel in the reef were unsuccessful, and for the next 30 years visits to the atoll were limited to shipwreck survivors and bird feather collectors, who sought to satisfy the significant demand for feathers in the millinery trade. In January 1903, President Theodore Roosevelt placed the Midway Islands and environs “under the jurisdiction and control of the Navy Department” by Executive Order 199–A to stop the “wanton destruction of birds that breed on Midway.”

Midway’s role as an important communications link was established in 1903, when the Commercial Pacific Cable Company chose Sand Island for one of its relay stations. The cable link between Honolulu and Guam was completed on July 4, 1903, in time for President Roosevelt to send the first round-the-

world message wishing Americans a happy Independence Day. In 1905, the U.S. Lighthouse Service established a lighthouse on Sand Island.

In 1935, Pan American Airways established a seaplane base in the harbor and a small (but relatively luxurious) hotel on Sand Island. Midway became a regular fuel stop on a transpacific route that also included Honolulu, Wake Island, Guam, and Manila. The short-lived era of the “Clipper” seaplanes was an important chapter in aviation history.

Midway’s most significant historic role was as a military base. Military interest in Midway accelerated as World War II started in Europe. In 1941, the Naval Air Station was commissioned, altering the civilian character of Midway. On December 7, 1941, not only Pearl Harbor but Midway was attacked by the Japanese, who landed a direct hit on the power plant. First Lieutenant George Cannon was fatally wounded in the attack and became the first Medal of Honor recipient for the U.S. Marine Corps in World War II. On June 4, 1942, the atoll was again attacked, but the men stationed on the atoll played a significant role in the ensuing Battle of Midway, credited with turning the tide of the war in the Pacific. In July 1942, the Midway Submarine Advanced Base was formally established and operated until the end of World War II.

Though relatively quiet as a military base for several years after World War II, Midway’s importance returned in 1953 with the Cold War and the construction of the Distant Early Warning (DEW) Line. By 1958, Midway was an important part of the “Pacific Barrier,” which extended North America’s early warning system from Alaska to the mid-Pacific, and a significant construction program to support operations was underway. “Willy Victor” radar planes flew night and day as part of the DEW Line, and antenna fields covered the islands, part of an intricate chain of radar defenses. During the Vietnam War, Midway was one of the main aircraft and ship refueling stations, and it also hosted classified missile and submarine monitoring missions.

By the early 1990s, military activities significantly declined, replaced by new technologies and centralized operations. On October 1, 1993, Naval Air Facility Midway was operationally closed under the Base Realignment and Closure Act of 1990. Prior to the Navy’s departure in 1997, a massive cleanup effort removed all buildings and structures from Eastern Island, and many of the Cold War era buildings from Sand Island. A significant effort was made to remove the environmental contaminants left by more than 90 years of military operations. In transferring Midway to the FWS, the Secretary of the Navy remarked that Americans are “trading guns for goonies,” and a new era began.

### **1.3 Monument and Refuge History**

#### **1.3.1 Establishment of the Refuge, Memorial, and Monument**

FWS staff have been conducting research and/or assisting the Navy with wildlife management issues on Midway Atoll for almost 50 years. Cooperative projects increased in the 1970s, addressing issues such as rodent control and lead poisoning in seabirds. A cooperative management plan developed by the Navy and FWS in the early 1980s further defined responsibilities and eventually led to establishment of an “overlay” national wildlife refuge on Midway in 1988. As on other military bases with similar arrangements, the Navy retained primary jurisdiction, while FWS staff provided wildlife management assistance.

When Naval Air Facility Midway was identified for closure in 1993, the Navy began planning to transfer the atoll to the FWS. On October 31, 1996, President William Clinton signed Executive Order 13022, directing the Secretary of the Interior, through the FWS, to administer Midway Atoll National Wildlife Refuge. The purposes of the refuge, as defined in the Executive order, are to maintain natural biological

diversity; conserve fish and wildlife and their habitats; fulfill international wildlife treaty obligations; provide opportunities for research, education, and compatible wildlife-dependent recreation; and recognize and maintain the atoll's historic significance.

On September 13, 2000, in accordance with language in the Fiscal Year 2000 Interior Appropriations Act, Secretary of the Interior Bruce Babbitt signed Secretary's Order 3217 designating the lands and waters of Midway Atoll National Wildlife Refuge as the Battle of Midway National Memorial "so that the heroic courage and sacrifice of those who fought against overwhelming odds to win an incredible victory will never be forgotten."

On June 15, 2006, President George W. Bush established the Papahānaumokuākea Marine National Monument (Monument) by signing Proclamation 8031. The Monument provides immediate and permanent protection for the lands and waters associated with the Northwestern Hawaiian Islands (NWHI), including Midway Atoll National Wildlife Refuge. According to the Proclamation:

The Secretary of Commerce, through the National Oceanic and Atmospheric Administration (NOAA), will have the primary responsibility regarding management of the marine areas, in consultation with the Secretary of the Interior. The Secretary of the Interior, through the Fish and Wildlife Service (FWS), will have sole responsibility for management of the areas of the Monument that overlay the Midway Atoll National Wildlife Refuge, the Battle of Midway National Memorial, and the Hawaiian Islands National Wildlife Refuge, in consultation with the Secretary of Commerce.

As the only atoll currently open to public visitation in the Monument, Midway Atoll provides a window to the Monument.

### **1.3.2 Monument Vision, Mission, Guiding Principles, and Management Goals**

#### ***Vision:***

To forever protect and perpetuate ecosystem health and diversity and the Native Hawaiian cultural significance of Papahānaumokuākea.

#### ***Mission:***

To carry out seamless integrated management to ensure ecological integrity and achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian culture, and heritage resources for current and future generations.

#### ***Guiding Principles:***

The Monument shall be managed in a manner that:

- is consistent with the Vision and Mission;
- recognizes that the resources of the Northwestern Hawaiian Islands are administered by the Co-Trustees for the benefit of present and future generations;
- affirms that the NWHI and its wildlife are important, unique, and irreplaceable;
- honors the significance of the region for Native Hawaiians;
- honors the historic importance of the region;
- incorporates best practices, scientific principles, traditional knowledge, and an adaptive management approach;
- errs on the side of resource protection when there is uncertainty in available information on the impacts of an activity;
- enhances public appreciation of the unique character and environment of the NWHI;
- authorizes only uses consistent with Presidential Proclamation 8031 and applicable laws;

- coordinates with federal, state, and local governments, Native Hawaiians, relevant organizations, and the public; and
- carries out effective outreach, monitoring, and enforcement to promote compliance.

**Goals:**

- Goal 1. Protect, preserve, maintain, and where appropriate restore the physical environment and the natural biological communities and their associated biodiversity, habitats, populations, native species, and ecological integrity.
- Goal 2. Support, promote, and coordinate research, ecosystem characterization, and monitoring that increases understanding of the NWHI, improves management decisionmaking, and is consistent with conservation and protection.
- Goal 3. Manage and only allow human activities consistent with Proclamation 8031 to maintain ecological integrity and prevent or minimize negative impacts for long-term protection.
- Goal 4. Provide for cooperative conservation, including community involvement, that achieves effective Monument operations and ecosystem-based management.
- Goal 5. Enhance public understanding, appreciation, and support for protection of the Monument’s natural, cultural and historic resources.
- Goal 6. Support Native Hawaiian practices consistent with long-term conservation and protection.
- Goal 7. Identify, interpret, and protect Monument historic and cultural resources.
- Goal 8. Offer visitor opportunities at Midway Atoll to discover and appreciate the wildlife and beauty of the NWHI, enhance conservation, and honor its unique human history.

**1.4 Purpose and Need for the Visitor Services Plan**

This Visitor Services Plan is incorporated as Appendix C of the Papahānaumokuākea Marine National Monument Management Plan to provide additional detail to implement the Midway Atoll Visitor Services Action Plan. It is based primarily on the Interim Visitor Services Plan approved on May 23, 2007, and incorporates the same compatibility determinations that were approved on that date (see Appendix D of the Monument Management Plan).

In 1996, FWS prepared a public use plan to guide visitor services on Midway Atoll National Wildlife Refuge. Since then, the National Wildlife Refuge System Improvement Act of 1997 (an amendment to the National Wildlife Refuge System Administration Act of 1966) set new standards for visitor programs on refuges, and in 2006, new guidance was issued in the form of FWS Manual chapters regarding wildlife-dependent recreation. In accordance with the National Wildlife Refuge System Administration Act of 1966, as amended, and FWS guidance, this visitor services plan is required to ensure recreational uses are compatible with the Refuge System mission and the purposes, goals, and objectives of the refuge and national memorial. In addition, all recreational activities must be in compliance with Proclamation 8031 and its codifying regulations at 50 CFR Part 404.

This plan documents approved recreational activities at Midway Atoll and identifies the structure of the visitor services program. Special ocean uses that support recreational activities within the Midway Atoll Special Management Area are also addressed. The plan also outlines activities that honor and interpret the World War II history at Midway Atoll in recognition of its status as the Battle of Midway National Memorial, as well as opportunities to share the significance of Papahānaumokuākea Marine National Monument to Native Hawaiian culture. It discusses operational limitations, biological constraints, and partnership opportunities beyond Midway Atoll.

This plan is partially based on experiences with Midway visitors since 1996, but also reflects new information and new requirements. In 2005, a *Midway Atoll National Wildlife Refuge Visitor Program Market Analysis and Feasibility Study* was completed by Pandion Systems, Inc., of Gainesville, Florida, under contract to FWS. The complete study is available on the FWS Website at <http://www.fws.gov/midway>. This visitor services plan also reflects insights gained from their study.

Furthermore, Proclamation 8031 reinforced the importance of Midway as a vital link to the Northwestern Hawaiian Islands ecosystem, especially as an opportunity for visitors to experience, learn about, and appreciate the area. This visitor services plan not only addresses various FWS policy requirements, but goes beyond those requirements and looks at Midway Atoll as a “window to the Monument.” Here visitors may learn about the broader Monument, and the interrelationships among the islands and the wildlife moving on, between, and among them, and the significance of the area to Native Hawaiian culture.

Since 1995, the FWS has been strongly committed to welcoming visitors to Midway Atoll. This is the first and only remote island national wildlife refuge in the Pacific to provide the general public with an opportunity to learn about and experience these unique ecosystems. With this visitor services plan, we rededicate our efforts to share the atoll’s wildlife and historic resources with the world.

### **1.5 Internal/External Issues**

In August 2007, as part of the Monument management planning process, the following issues were identified related to visitor use at Midway Atoll. These issues will all be addressed in the appropriate sections below and within pertinent sections of the Monument Management Plan.

<b>Midway Atoll NWR – Access and Permitting</b>	<i>What is the appropriate total number of people to visit, work, and volunteer on Midway?</i>	The Interim Visitor Services Plan identified up to 40 overnight visitors at one time and at least 300 visitors per year as appropriate given the current staffing and infrastructure. The proposed Co-Trustee operational hub at Midway Atoll, including new programs and staff, would further strain the island’s operational infrastructure and potentially increase wildlife disturbance. The MMP will propose establishing a carrying capacity and maximum number of people on Midway, a site plan for the allocation of land uses, and facilities needed to balance people and wildlife.
<b>Midway Atoll NWR – Interpretation</b>	<i>How will visitors be provided information to introduce and sensitize them to the fragile Midway atoll ecosystem and history? To what extent should new interpretive and educational exhibits be placed at Midway?</i>	The Midway Interim Visitor Service Plan offers several opportunities to interpret the natural and cultural features of the Monument, including guided tours, self-guided interpretive walks, guided boat trips, interpretive exhibits and signs, and programs and presentations focusing on wildlife, historic structures, artifacts, memorials, and key sites. The MMP will address expanding the current visitor program to represent the entire Monument.

	<i>To what extent should historic structures be preserved and restored for interpretation on Midway?</i>	The determination to preserve, restore, reuse, or demolish a given building has to be done case by case, as the state of each building, its relative historic importance, interpretive opportunities, and the cost to restore and maintain varies widely. Decisions will likely be controversial, as Midway means different things to different people. An appropriate balance of on-island and off-island interpretation is needed and will be further addressed in the MMP.
--	--	---

During development of the Interim Visitor Services Plan, issues raised included the fee structure, natural resource protection, historical recognition, authorized uses, cruise ship impacts, visitor capacity, length of visits offered, and type of facilities offered, infrastructure capacity, and transportation. These issues and comments included within 6,282 letters, e-mails, or telephone calls were addressed in the final Interim Visitor Services Plan.

In April 2008, the Draft Visitor Services Plan was released for public review and comment as part of the Draft Papahānaumokuākea Marine National Monument Management Plan. Some of the concerns raised in the 6,458 public comments on the draft plan focused on the visitor program, including potential human impacts and the biological carrying capacity of Midway Atoll, cumulative impacts over time, visitor program costs, incorporating education regarding the Monument’s significance to Native Hawaiians, preventing the introduction of alien species, expanding recreational activities, monitoring visitor impacts, and closing Midway to all tourism activities. These concerns are addressed within this final Visitor Services Plan and in Volume IV of the Monument Management Plan.

## **1.6 Local Setting**

### **1.6.1 Community Description**

Midway Atoll is so remote (about 1,250 miles from Honolulu, its nearest major city) that it must operate independently as its own small town. It provides its own power system, water treatment and distribution, facilities maintenance, sewage treatment, waste management systems, communications systems, and all the other operational necessities found in a small municipality.

The refuge is currently staffed by nine full-time FWS employees, one of whom is stationed in Honolulu. A few volunteers (normally one to four) assist the refuge staff in biological and habitat management activities. The atoll also hosts transient<sup>1</sup> researchers, other FWS employees, or U.S. Coast Guard personnel on an occasional basis. During “construction season,” from August through October, as many as 30 additional workers may be on the island. NOAA and the State of Hawai‘i will also base a small number of staff (8-10 people) on Midway, as outlined in the Monument Management Plan, 3.6.3, Coordinated Field Operations Action Plan and the Midway Conceptual Site Plan (Volume IV). The refuge has contracted with a private entity to operate the infrastructure of the atoll. The contractor currently has approximately 50 employees on Midway.

Island residents live in renovated Navy housing, including single family homes, duplexes, and Bachelor Officers Quarters (BOQ). One BOQ (known as Charlie Barracks), which contains 36 rooms, has been set aside for transient and visitor use. Almost all of the residents and transients eat at the “Clipper House,”

---

<sup>1</sup> Transients include those coming to Midway Atoll for official duties, e.g., refuge employees, Co-Trustee staff, Coast Guard or other law enforcement entities, contractors, researchers, other federal or state employees, or other permitted personnel.

where three meals a day are served buffet style. Most supplies, particularly foodstuffs, are flown to the island on chartered aircraft. Approximately once a year, a barge brings in equipment, food, and supplies too large or heavy for the aircraft. Fuel to operate the generators and small vehicles and to refill chartered aircraft is brought by fuel barge about once a year. All fuel deliveries operate in compliance with FWS regulations and the Midway Atoll Spill Prevention Control and Countermeasure Plan.

Current funding to operate Midway Atoll comes from FWS, supplemented by Federal Aviation Administration funding that fully covers airport operations costs and a share of infrastructure operations costs. A small amount of funding is generated by other users of the atoll, such as other federal agencies conducting activities on Midway.

### **1.6.2 Travel Links**

The only means of accessing Midway Atoll are by air or vessel. Midway has a fully certified airport known as Henderson Airfield, maintained to standards specified in Federal Aviation Administration Title 14 Code of Federal Regulations, Part 139. Midway is used as a required emergency landing site for extended twin-engine operations (ETOPS) flights across the Pacific Ocean. Under current regulations, twin-engine aircraft must be within a maximum of 180 minutes from a Part 139 certified airfield in case of an emergency. Midway's 7,900-foot runway is capable of handling almost any type of aircraft.

As a Navy base, numerous facilities were built to support a variety of vessel types. Small boats can enter the inner harbor and moor dockside or in the harbor. Larger vessels resupplying the island and research vessels generally come into the cargo pier, inside Midway's lagoon but outside the inner harbor. Large passenger vessels are required to remain outside the reef and shuttle their passengers in via tenders due to port security requirements.

### **1.6.3 Visitor Services Opportunities (Beyond Midway)**

When Midway Atoll was opened to the public in 1995, it became the first and only remote refuge in the Pacific open to public visitation. The other islands in the Northwestern Hawaiian Islands are protected within the Hawaiian Islands National Wildlife Refuge (from Nihoa to Pearl and Hermes Atoll) or in the State of Hawai'i's Seabird Sanctuary at Kure Atoll. Because of their fragility and sensitive wildlife, these other islands and atolls are all closed to public use.

The Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve was established adjacent to and seaward of the seaward boundaries of the State of Hawai'i and Midway Atoll National Wildlife Refuge in 2001, and is administered by NOAA. The area was under consideration for designation as a national marine sanctuary until the entire region was set aside as a Marine National Monument. As required in the Presidential proclamation establishing the Monument, special ocean uses such as ecotourism may be permitted outside the Midway Atoll Special Management Area if:

- the activity will directly benefit the conservation and management of the Monument;
- the activity is for research or education related to the resources or qualities of the Monument;
- the public is provided an opportunity to review the application for a special ocean use permit at least 30 days before the permit is issued; and
- the activity does not involve the use of a commercial passenger vessel.

The State of Hawai'i also administers submerged lands and waters out to 3 nautical miles from the islands and atolls except at Midway. In 2005, the State created a marine refuge in those waters with regulations prohibiting commercial and recreational fishing. Other uses (such as research, education, and Native Hawaiian cultural practices and subsistence fishing) are regulated by Monument permit.

Although numerous visitor opportunities exist in the main Hawaiian Islands or at other islands in the Pacific, none offer the unique combination of natural and historic resources found at Midway Atoll.

## **Chapter 2 Significant Features**

### **2.1 Terrestrial Resources**

Humans have greatly changed Midway Atoll from its original form. Only Spit Island has the general terrestrial habitat characteristics of an undisturbed atoll island, though it probably formed as an unintended result of channel dredging. Although the combined effects of dredging and filling, seawall construction, and importation of soil and many nonnative plant species has greatly expanded and altered the original acreage of Midway, it is still a wildlife habitat of worldwide importance.

The earliest botanical descriptions of Midway were made in 1902. Since then, 222 different plant species have been identified. Twenty-eight species are native and 2 are questionably indigenous to Hawai'i. One plant species, *Cenchrus agriminoides* var. *laysanensis*, is listed as endangered, but it has not been observed on Midway since the early 1900s. More than 190 exotic species are found on Midway, including some that are invasive and affect wildlife habitat. Ecological restoration efforts are underway to eradicate the worst invasive plants, control others, and revegetate with native species.

Since the first insect (a moth) was described from Midway in 1894, more than 300 species of arthropods and land snails have been found on Midway, most introduced aliens.

Almost 2 million breeding seabirds of 19 species make Midway one of the most important breeding areas of seabird conservation in the Pacific. Midway hosts the world's largest populations of both the Laysan albatross (452,609 nesting pairs in 2007) and black-footed albatross (25,320 nesting pairs). Midway's breeding populations of white terns, black noddies, and red-tailed tropicbirds constitute the largest colonies in the Hawaiian archipelago. After eradication of rats in the mid-1990s, the Bonin petrel colony at Midway has rebounded to more than 32,000 pairs. One or two endangered short-tailed albatrosses generally visit Midway each year, although none have nested since the 1960s.

In 2004, 20 endangered Laysan ducks were transported to Midway from their home at Laysan Island in the Hawaiian Islands National Wildlife Refuge. Biologists hope to establish a second "insurance" population of this endemic duck. The birds adapted well to the seeps created on Sand Island and surprised biologists by breeding during their first year, with 12 ducklings successfully fledging. An additional 22 ducks were transported to Midway in 2005, most of which were introduced to Eastern Island. By the end of 2007, almost 200 Laysan ducks were living on Midway Atoll.

Midway also serves as an overwintering area for several arctic migrant shorebirds, including the rare bristle-thighed curlew. The availability of predator-free islands on which this large shorebird can spend its nonbreeding season is essential, because they become flightless during their molt. Many other migratory birds also visit Midway, some regularly and some rarely.

### **2.2 Marine Resources**

Midway Atoll is one of the northernmost coral atolls in the world, presenting a unique opportunity to study the effect of colder waters on the growth, development, and ecology of coral reefs. Its neighbor, Kure Atoll, is the northernmost atoll in the world. Midway Atoll drops off steeply outside the barrier reefs, making it possible to observe in a relatively small area the different organisms and communities associated with pelagic, reef crest, ocean facing reef slope, deep reef, and lagoon habitats.

The lagoon is filled with dense networks of linear reticulated and circular reefs that trap sand washed over the northeastern reef rim. As in many atoll lagoons, sediments limit coral growth at Midway except in the

deeper central lagoon where a modest amount of finger coral gardens still exists. Meadows of seagrass are common in the lagoon, as are rock-boring urchins, calcareous green algae, and brown turban algae. The deep southern ship channel between the ocean and lagoon was dredged during the World War II era and has substantially modified circulation and lowered lagoon water levels. Together with lagoon reefs, these changes reduced or blocked water circulation in much of the lagoon and created higher levels of turbidity. Coral bleaching episodes were reported in 2000 and 2004 at Midway and the neighboring atolls of Kure and Pearl and Hermes. Lagoon lobe and finger corals have declined during the past decade, although blue encrusting coral continues to thrive.

Massive spurs and grooves consisting mostly of coralline algae face the open ocean along the northwest to southwest perimeter reefs and protect the atoll from heavy wave action common during the winter months. These massive reefs offer evidence of the importance of coralline algae as a major reef builder in the far end of the Northwestern Hawaiian Islands. Corals on ocean facing reef habitats are generally not as abundant compared to neighboring atolls to the southeast, but are common in a few sheltered reefs and especially on shallow back-reefs and lagoon pinnacles. High concentrations of the rock-boring urchin *Echinometra* are presently eroding much of the shallow perimeter reef crests dominated by coralline algae. Although not grazing corals directly, the sea urchins are hollowing out the dead interior skeletons of living lobe corals and undermining other attached corals.

A total of 32 species of stony coral have been recorded at Midway, mostly *Pocillopora*, *Porites*, and *Montipora*, plus one zoanthid soft coral, *Palythoa*. Blue encrusting coral tentatively identified as *Montipora* cf. *turgecens* occurs in spectacular formations in the lagoon and back reef habitats and may be endemic to the Northwestern Hawaiian Islands.

The first systematic marine invertebrate survey was conducted at Midway in 1997. It documented 316 invertebrate species, 250 of which had not been previously recorded at Midway. Crustaceans were the dominant macroinvertebrates, composing 46 percent of the total species.

More than 100 species of algae are known from Midway, including 35 previously unrecorded species at Midway and 1 seaweed species new to science, *Dudresnaya babbittiana*. One alien algae, one alien fish (blueline snapper), and four alien marine invertebrate species are established at Midway as found in 2000-2003 surveys. Incidental observations of two other introduced species, blacktail snapper and bluespotted grouper, have occurred at Midway in the last decade.

A total of 266 species of fish, including 7 pelagic species, have been recorded at Midway. Some of these species are either not found in the main Hawaiian Islands or are very rare. Despite its low species diversity, Midway's reef fish biomass is higher than in the main Hawaiian Islands, largely due to lower fishing pressures. Midway and its neighboring atolls have the highest rates of endemic reef fishes within the archipelago, with up to 52% of all fish observed being endemic species.

Many Midway species grow to larger than average size. All trophic levels are well represented, including jacks and four species of sharks. Several species of fish found elsewhere only in deep waters are found at shallow diving depths at Midway, including the endemic Hawaiian black grouper (hapu'upu'u).

Threatened Hawaiian green turtles are frequently seen inside the lagoon and basking on beaches. No turtle nesting had been documented until successfully hatched eggs were discovered on Spit Islet in July 2006. High surf uncovered the eggs, which probably hatched in 2005. In 2007, a successful sea turtle nest was documented on Sand Island. Endangered hawksbill sea turtles are infrequently seen in the lagoon. About 65 endangered Hawaiian monk seals are usually present at Midway at any one time, and pupping levels have increased significantly since 1996, with a record number of 17 in 2004. However, as

is common throughout the Hawaiian Islands, survivorship of juveniles is low and contributes to the endangered status of the species. In an effort to increase survivorship, NOAA-Fisheries established a captive care program on Sand Island in 2006. Six females were released in March 2007.

Approximately 200-300 Hawaiian spinner dolphins rest within Midway's lagoon and forage outside the atoll. Bottlenosed, striped, spotted, and rough-toothed dolphins may occasionally be seen in the open ocean, as well as beaked, pilot, and endangered humpback whales.

## **2.3 Historic Resources**

### **2.3.1 Early Cultural Resources Investigations**

Study of Midway's heritage resources was initiated in 1986 by the National Park Service when it conducted a survey of World War II-era properties eligible for designation as a National Historic Landmark. Nine structures, all defensive positions on the west side of Sand Island, were identified on Midway that convey a close association with the pivotal Battle of Midway, including ammunition magazines (ARMCO huts), a pillbox, and gun emplacements. Later that year, the nine defensive positions on Sand Island identified as eligible by the National Park Service and surrounding buffer areas were designated as a landmark.

Between 1992 and 1994, the Navy sponsored studies of the Naval Air Facility on Midway, including archival research, interviews, and field surveys. The initial field effort consisted of an architectural history survey of the structures, buildings, and objects located on Sand and Eastern Islands.

The study of Cold War Resources was conducted in 1993-94 by contractors hired by the Department of the Navy in order to identify the most important Cold War-era resources, even though they were less than 50 years old, as part of the Base Closure process. The historian hired to conduct the inventory, research, and make recommendations regarding the significance of the buildings on Midway was a specialist in the Cold War period. The Cold War-era buildings were constructed on Midway between 1957 and 1969. The recommendation accepted by the Navy was that the Cold War-era buildings and structures on Midway lacked architectural merit, were not directly associated with President Nixon's visit, and do not convey a direct link to the events that occurred during the Cold War. The Navy subsequently demolished many of the Cold War-era buildings and structures prior to the transfer to the FWS.

In addition to the landmark structures, 69 buildings, structures, and objects associated with the 1903-1945 historic period on Sand and Eastern Islands were determined to be eligible according to criteria established for the National Register. The properties evaluated as significant are associated with three major themes: colonization, initial years of base construction and the Battle of Midway, and 1942-1945 base construction.

Archaeological surveys of Sand and Eastern Islands were conducted in 1992 and 1994. Surface inspections, 68 subsurface core samples, and 5 shovel-test units revealed no evidence of Polynesian/Hawaiian or pre-1900 historic period cultural remains. A literature review of Hawaiian legends found numerous references to distant low-lying islands with abundant birds and turtles but no clear tie to Midway. However, like many low islands and atolls in the Northwestern Hawaiian Islands, Midway may have been visited by Polynesians/Hawaiians in their extended travels. Prior to extensive military-era construction, these islands were periodically scoured by storms and high winds that may have removed or buried evidence of use.

### **2.3.2 Programmatic Agreement and Treatment of Midway’s Historic Properties**

In 1996, the Navy’s Pacific Division, Naval Facilities Engineering Command; the Advisory Council on Historic Preservation; and FWS signed a programmatic agreement directing how Midway Atoll’s historic properties were to be treated during the closure of Naval Air Facility Midway. These properties were assigned to one of six categories of preservation treatment: reuse and maintain, secure and abandon in place, abandon in place and leave as is, fill or cover, relocate, or demolish. FWS was required to prepare a long-term Historic Preservation Plan, which it completed in 1999.

### **2.3.3 Historic Preservation Plan**

The June 1999 *Midway Atoll National Wildlife Refuge Historic Preservation Plan* defines a program to integrate historic preservation planning with the wildlife conservation mission of FWS at Midway Atoll. The plan focuses on the long-term management conditions and goals for preserving and stabilizing historic properties. It also recommends procedures for treating new discoveries, caring for museum collections, and implementing a visitor program that includes historic preservation work. The plan will be revised and updated over the coming year. In the future, the Co-Trustees will incorporate submerged cultural resource protection into such plans.

## **Chapter 3 Limitations on the Visitor Program**

### **3.1 Visitor Access**

The wildlife treasury that makes Midway Atoll so special for visitors also requires certain restrictions be placed on visitors for the protection of plants and animals. As on all national wildlife refuges, wildlife takes priority. Albatross nesting within the main housing areas of Sand Island continues successfully, even in the presence of human residents, but management measures are necessary to control human access to the nesting habitat of more sensitive bird species and the beach areas frequented by monk seals and sea turtles.

To maximize visitor safety and minimize wildlife disturbance and habitat degradation, land-based visitor activities (other than walking, bicycling, and refuge manager-approved interpretive programs) will be restricted to daylight hours (legal sunrise to legal sunset), and water-based to ½-hour after legal sunrise to ½-hour before legal sunset. Vessels involved in the visitor program must return to dock at least 1 hour before sunset to allow sufficient time for search and rescue operations if necessary.

To prevent disturbance of petrel and shearwater burrows, visitors and residents will be required during their initial orientation and through appropriate handout material to remain on paved or gravel roads and designated trails. The trails that are open for visitor use will be clearly marked on maps (see Figure 3.1.1). North Beach from Rusty Bucket to the old fuel farm is considered a ‘trail.’

All of the beaches on the western half of Sand Island are closed to public access to protect Hawaiian monk seals from disturbance, although there will be opportunities for beach viewing access from a primitive walking trail to designated viewing sites. “Turtle Beach,” located on the eastern side of Sand Island from the old seaplane ramp to Cross Point and several wetlands inhabited by endangered Laysan ducks are also closed to visitors. For visitor safety, the fuel farm and active airport runways are closed to the public, except for designated crossing points on the runways.

Spit Island is closed to all public access, and Eastern Island is open only to visitors with FWS or FWS-trained escorts on scheduled trips. Since 1988, all beach areas (including all beach crest vegetation to its deepest extent inland), lagoon waters, and ocean waters to a depth of 20 fathoms – except on Sand Island and its harbor – have been designated critical habitat for Hawaiian monk seals. Power boats engaged in recreational activities are not allowed within buffer areas of at least 500 feet around Eastern, Spit, and most of Sand Island (see Figure 3.1.2), although they may transit to the pier on Eastern Island for interpretive tours and volunteer work. No visitors will be allowed to come in contact with coral reefs. Water activities will avoid preferred monk seal and sea turtle resting habitat areas on these reefs.

To protect threatened and endangered species, visitors are required to remain at least 150 feet away from Hawaiian monk seals, short-tailed albatrosses, and sea turtles on land or in the water. This distance is recommended under Watchable Wildlife guidelines. Disturbance or harassment of these species is a violation of the Endangered Species Act. Collection of live or dead wildlife, including feathers, bones, eggs, shells, and coral, also is prohibited under 50 CFR 27.61. Objects of antiquity are similarly protected from removal under 50 CFR 27.62, and military shipwrecks and aircraft wrecks are also protected under the Sunken Military Craft Act of 2005 and other statutes.

All visitor activities allowed under this visitor services plan, as authorized by compatibility determinations, will occur within the Midway Atoll Special Management Area. No excursions beyond that boundary will occur.

Refuge staff and volunteers are working diligently to remove invasive species from Midway Atoll. Although the battle is far from won, we want to ensure no additional invasive species – particularly plants and insects – are inadvertently introduced to the atoll, or conversely, taken from Midway and introduced into Hawai‘i or elsewhere. To help prevent this, an inspection program will be implemented both before departure from Honolulu and before departure from Midway. In addition, visitors going to Eastern Island will be asked to check their gear for mice before departure to prevent accidental introductions. Prior to returning to Sand Island, they will be asked to clean their shoes, clothing, and gear to prevent spread of the invasive black mustard onto Sand Island.

Passengers arriving by vessel are required to clean their footwear before coming ashore. Sailboats are inspected by FWS staff upon arrival and before docking to ensure they are rat free.

In addition, all permitted vessels must have their hulls inspected and cleaned when required, including the visual inspection of anchors and tender vessels. Proclamation 8031 prohibits the release of ballast water within the Special Management Area. Protocols have also been developed and will be enforced for the treating of snorkel and dive gear to prevent the inadvertent introduction or transmission of alien species.

To minimize conflicts between aircraft and birds in flight, all visitor flights from November through July will be scheduled to arrive and depart Midway at night, unless specifically authorized by the refuge manager.

### **3.2 Visitor Capacity and Scheduling**

Many of Midway’s infrastructure systems (i.e., water, sewer, power generation) were originally designed to service a population of up to 5,000 individuals. However, Sand Island’s current population of FWS employees and volunteers, contractors, etc., is fewer than 100 people. FWS is concluding several millions of dollars of construction downsizing the primary infrastructure systems in order to create long-term efficiencies. These new, more economical and efficient systems are designed to support a population of no more than 200 individuals, including interagency personnel, volunteers, researchers, and visitors engaged in any activity. In addition, the infrastructure downsizing will be done in a manner that incorporates the latest in environmentally sustainable technologies.

In order to ensure a quality visitor experience using the limited infrastructure currently available, the total number of overnight visitors allowed on Midway Atoll at any one time will be limited to no more than 50 people. At the time of writing, a maximum of 24 rooms are available for visitors, which may be more restrictive than the 50 person limit depending on multiple occupancies of the same rooms. All visitors must stay in existing facilities; the policy to disallow camping continues due to potential impacts on wildlife habitat and the species themselves. Although visitors arriving by sailboat will not require rooms, they will still be counted toward the total number of overnight visitors since they may require other infrastructure support such as fresh water and food. In addition to lodging, other factors such as the number of visitors who can be accommodated on the aircraft and in our dining facility limit the total number of visitors.

Due to other infrastructure or visitor safety limitations, all visitors may not be able to engage in the same activity at one time (e.g., snorkel boat capacity, a limited number of approved guides, etc.). Children are welcome at Midway, though parents are cautioned that limited medical facilities are available in this remote location. Parents will be responsible for monitoring their children’s activities.

The 50-visitor limit may be exceeded for short duration (less than a day) prearranged visits by ocean vessels or aircraft. In these cases, visitor activities are closely supervised and primarily consist of guided tours or participation in commemorative events.

For the next 4 years (2008-2011), visitor programs will operate from November through July, which coincides with the albatross season on Midway. To ensure the safety of visitors and enhance their experience on Midway, visitor programs will be concentrated in this 9-month timeframe. The months of August through October are reserved for planned construction and major maintenance activities. Very few rooms will be available during these months due to the number of contractors on island, and aircraft capacity will be needed both for contractors and supplies.

### **3.3 Monitoring Visitor Impacts**

Midway Atoll Monument staff will monitor the impacts of visitors and other users on wildlife and historic resources to ensure continuing compatibility, as required by Monument and FWS policies. Monitoring methodology to assess impacts on seabirds, Hawaiian monk seals, sea turtles, corals, and fishes has been developed by the refuge biologist based on previous work on other refuges and protected areas, in consultation with the Co-Trustees. The visitor program supervisor, in consultation with the FWS and NOAA cultural resources program staffs, will monitor impacts on historic resources. Impact monitoring of marine resources will be conducted in partnership with NOAA using the multiagency monitoring protocols developed collaboratively since 2000.

Based on FWS experience from 1996-2002, when up to 100 overnight visitors were allowed on Midway at any one time, we anticipate few impacts as long as visitors comply with refuge and Monument rules and regulations. A refuge officer has been hired to enforce these rules and regulations, as well as to assist with coordinated law enforcement throughout the Monument. Additional refuge officers may be detailed to Midway for special events or activities. Under the National Wildlife Refuge System Administration Act, the refuge manager has the authority to close areas, halt activities, or restructure visitor programs if necessary to protect wildlife or historic resources or to ensure a quality visitor program.

### **3.4 Midway Atoll Law Enforcement Activities**

Lands within the National Wildlife Refuge System are generally considered strict liability lands, where the visitor is responsible for knowing the rules. Because of the “closed until open” concept of the National Wildlife Refuge System Administration Act of 1966, as amended, everything is initially prohibited. Because activities conducted in the Monument are prohibited without an appropriate permit, this same concept applies. A refuge may be opened to particular uses or a suite of uses through a finding of appropriateness, when required, and approved compatibility determinations. The public may then be notified of this opening through one of several mechanisms found in Title 50 of the Code of Federal Regulations 25.31: conspicuously posted signs, special regulations published in 50 CFR 26.33, maps, or other appropriate methods that give the public actual or constructive notice of the permitted activity.

At Midway, the public review and comment period associated with development of the interim visitor services plan, as well as issuance of this plan, serve as constructive notice to the visitor under the strict liability standard. Additionally, the mandatory visitor orientation presentation within 24 hours of arrival; visitor access maps provided at that orientation, posted throughout the island, and contained in information notebooks in each room; signs; and other information found within the information notebooks located in each hotel room provide the visitor with additional actual or constructive notice.

A visitor found in violation of these rules may be issued a Notice of Violation, or arrested in the most serious cases. A Notice of Violation usually includes an option for paying a fine under an established Forfeiture of Collateral Schedule or appearing in court before a Magistrate Judge. In addition, depending on the violation, other applicable laws and penalties will apply.

Monument permits will incorporate all applicable requirements, and the signed Monument permit also serves as actual notice of these requirements.

## Chapter 4 Visitor Services Standards

### 4.1 Welcome and Orient Visitors

“We will assure that refuges are welcoming, safe, and accessible. We will provide visitors with clear information so they can easily determine where they can go, what they can do, and how to safely and ethically engage in recreational and educational activities. Facilities will meet the quality criteria defined in [policy]. We will treat visitors with courtesy and in a professional manner.”  
*Fish and Wildlife Service Manual, 605 FW 1*

*Goal 8. Offer visitor opportunities at Midway Atoll to discover and appreciate the wildlife and beauty of the NWHI, enhance conservation, and honor its unique human history.*

**Objective 1 Provide visitor opportunities for at least 500 overnight visitors annually, with no more than 50 overnight visitors at any one time.**

*Strategy 1.1* By June 2009 and based on a completed Midway Conceptual Site Plan, seek funding to establish additional housing opportunities for individuals and groups.

*Strategy 1.2* By December 2010, seek larger capacity aircraft to service Midway Atoll on a regular basis.

*Strategy 1.3* Limit the total number of overnight visitors to no more than 50 at any one time to match the existing infrastructure, ensure a quality program, and limit impacts to wildlife.

*Strategy 1.4* Work with private and educational groups to arrange facilitated visits to Midway.

*Strategy 1.5* Offer a minimum of four 3- to 7-day visits annually for independent travelers to come to Midway on less structured visits.

*Discussion:* The limit of no more than 50 overnight visitors on Midway at any one time reflects the limited capacity of our means of transportation and island infrastructure. While Strategy 1.2 is to continue to seek a larger capacity aircraft to service Midway Atoll, our Fiscal Year 2008 aircraft charter company operates a Gulfstream G-1 aircraft with 19 seats and a weight capacity of 3,200 pounds. Therefore, it is likely that no more than 15 seats will be available on any flight. In general, visitor groups will be transported on separate charter flights from those that bring food; mail; supplies; repair parts; and FWS, contractor, and Co-Trustee staff to and from the atoll. Most visits will be for one week at a time, although occasionally a shorter-term visit may be offered.

Of the 36 rooms in our guest lodging facility (Charlie Barracks), 24 rooms generally will be available for overnight guests at any one time (except from August through October). The remaining rooms may occasionally be available, but often will be occupied by off-island staff, Co-Trustee staff, and contractors. The seating capacity at Midway’s dining facility is likewise limited. Although meal times can be staggered to accommodate larger numbers of people on island, aircraft seating and lodging still limit the size of the program.

FWS Monument staff, in coordination with NOAA, will evaluate other types of aircraft that could safely and more cost-effectively transport visitors to Midway Atoll. We will work with the Department of the Interior's Office of Aircraft Services and NOAA's Marine and Aviation Operations office to identify suitable potential bidders for an aircraft charter service. Our goal would be to be able to transport 25-30 visitors to and from Midway per flight. We also continue to evaluate the island infrastructure to identify additional needs for visitor housing, food services facilities, etc., for future planning and budget development purposes.

Since 2002, various private groups have inquired about the possibility of bringing structured groups of people to Midway for 2 to 7-day visits. FWS will encourage such visits, working with the organizers to arrange trips in the most cost-efficient manner possible. These groups will be led by a FWS-approved guide who has been thoroughly briefed in refuge and Monument rules and regulations, and all proposed activities on Midway Atoll will be approved in advance by the refuge manager in compliance with Monument regulations and necessary permit conditions.

Although most visits would be part of structured programs, we intend to offer at least four 3- to 7-day periods annually when individuals may come to Midway to enjoy the atoll's historic and wildlife resources in a less structured manner. Such visitors would participate in available guided activities but would not be with an organized group. All of the rules and restrictions that apply to other visitors would apply to independent travelers. These independent travelers would require more oversight by Monument employees than organized groups, but still deserve the opportunity to visit their public lands.

***Objective 2*** On an annual basis, provide up to three day-long visitor opportunities for larger groups of people to learn about and enjoy Midway Atoll's distinctive wildlife and historic resources.

*Strategy 2.1* Continue to allow up to three opportunities each year for groups of 50-800 visitors to participate in day-long special events and walking tours.

*Discussion:* For the past several years, Midway has hosted from one to four large groups of visitors to learn about the atoll's wildlife and historic resources. In addition, visitors have the opportunity to learn about the Monument's Native Hawaiian cultural significance. These groups have ranged in size from 250 to 1,800 people. These groups may arrive via aircraft or passenger vessels. All groups must meet all Monument findings and requirements as specified in Presidential Proclamation 8031 and 50 CFR 404.11, including obtaining the appropriate (usually Special Ocean Use) Monument permit. In order to protect Midway's natural and historic resources, while still providing limited opportunities for group visitation, the Monument Management Board will approve no more than three permits for large groups (ranging in size from 50 to 800), and as in the past, all visits will be related to the atoll's wildlife and historic resources. In addition, no more than 400 visitors will be allowed to come ashore at any one time, unless refuge management has approved a higher number (e.g., for very limited and special circumstances such as to participate in a ceremony commemorating the anniversary of the Battle of Midway).

These large-group visits are generally scheduled months in advance of the visit. In order to ensure these short-term visits do not conflict with overnight visitors, we will make every effort to avoid scheduling overnight visitor trips at times when large day-long groups will be present.

Because Midway does not have the infrastructure to support such large groups overnight, they typically arrive after sunrise and spend from 8 to 12 hours on Sand Island. Group sponsors provide water and food for their passengers and remove all trash generated by the visit from the atoll upon departure. Prior to arrival, passengers participate in an orientation session to ensure a safe visit for both humans and wildlife.

They also learn during these orientations about the natural and historic resources of Midway Atoll as well as of the broader Monument, and about the cultural significance of the NWHI to Native Hawaiians.

Passenger vessels bringing large groups of visitors to Midway remain outside of the southern reef at the channel entrance and offload their passengers in groups of up to 100 in the ships' tenders. These small boats come into the inner harbor, where the passengers disembark and are divided into groups for a 2-3 hour interpretive walking tour along existing roads and trails to specific sites where Monument staff, National Park Service, or volunteer interpreters provide informative talks. Tour guides from the ship accompany each group to ensure the passengers remain on the clearly marked guided tour route. Visitors return to the vessel at the end of their tours. No more than 400 passengers will be allowed ashore at any one time, unless refuge management has approved a larger number to participate in a special event (e.g., a special ceremony commemorating the Battle of Midway).

In addition to Monument permit conditions such as hull inspections, specific vessel monitoring systems, and discharge limitations, the refuge requires specific conditions be met by passenger vessels. These passenger vessel requirements are included in Appendix I (Operational Protocols) of the Monument Management Plan and include such conditions as arrival and departure times, port security requirements, and additional staff requirement costs at Midway Atoll that must be covered by the vessel company.

Monument staff who assist in providing interpretation for the visitors and monitor their activities while on Midway typically accompany passengers arriving by aircraft. Groups of approximately 25 people each are guided along existing roads and trails from one interpretive station to the next through maps and signage. During albatross season, aircraft are not permitted to depart until after sunset to reduce the potential risk to albatross and humans.

***Objective 3 Provide visitor opportunities for private sailboat crews.***

*Strategy 3.1* Continue to allow private sailboat crews with prior approval to stop at Midway Atoll and moor in the inner harbor. All sailboats must obtain a Monument permit and meet Monument requirements during their voyage.

*Discussion:* Although the number of sailboats visiting Midway Atoll varies from year to year, the average number seeking prior permission to land is about five per year. Midway Atoll is not en route to normal sailboat destinations in the Pacific, and due to prevailing winds and currents, it is difficult to sail from Midway back to Honolulu. Those that do come to Midway generally stay only a few days, remaining overnight on their vessels. Occasionally they eat some of their meals at the Clipper House dining facility.

***Objective 4 Ensure all visitors feel welcome, enjoy a safe experience, and understand refuge and Monument rules and regulations during their stay on Midway Atoll.***

*Strategy 4.1* Ensure visitors with disabilities feel welcome at Midway and enjoy a quality experience. Opportunities to improve existing facilities for the disabled will be evaluated within 1 year and funding for improvements will be sought thereafter.

*Strategy 4.2* Ensure all visitors arriving at Midway Atoll receive advance materials regarding the sensitivity of Midway's resources and participate in a mandatory orientation briefing within 12 hours after their arrival.

*Strategy 4.3* On an ongoing basis, maintain notebooks in each visitor room with maps and information on safety, wildlife viewing etiquette, regulations, and emergency contacts.

*Strategy 4.4* Staff the visitor center at least 4 regularly scheduled hours a day during workweeks so that visitors can ask questions and seek additional information.

*Strategy 4.5* By June 2015, complete installation of directional, regulatory, and interpretive signage as proposed in the Midway interpretive plan and sign plan.

*Strategy 4.6* Continue monitoring visitor satisfaction surveys on a weekly basis, adjusting the visitor program, visitor facilities, and maintenance schedules as appropriate.

*Strategy 4.7* By March 2009 and biennially thereafter, assess the results of monitoring visitor activities for impacts to wildlife and historic resources, level of visitor satisfaction, financial stability of the program, level of staffing, and program structure resulting in recommendations for improvement.

*Strategy 4.8* Based on the assessment above, seek funding, authority, or other needs to implement the recommendations.

*Discussion:* Opportunities to enhance accessibility for all visitors will be sought throughout implementation of the visitor program. Wheelchair-accessible lodging is currently available for visitors in Bravo Barracks on Sand Island. The boardwalk leading to the dining facility also is accessible. Due to Sand Island's mostly flat terrain, most of the roads are passable for all visitors. A review of Midway's facilities with particular attention to their accessibility was completed in 1997 and another will be conducted within the next year.

Advance materials will be provided to registered visitors with helpful hints about what to bring to Midway, how to avoid introducing new invasive species, how to avoid disturbing wildlife, and what to expect on the atoll. Since 1995, all visitors arriving at Midway Atoll have been required to attend a mandatory orientation session led by FWS personnel, even those who may have participated in a pre-trip briefing. During this time, visitors learn about some of the natural and historic resources of Midway Atoll, cultural resources of Papahānaumokuākea Marine National Monument, rules and regulations that protect wildlife, and personal safety information. They are provided maps and other information to make their visit more enjoyable and educational. The schedule of the briefing varies by the time the aircraft/vessel arrives on Midway, but it always occurs within 12 hours. As a helpful reference, each guest room will have a notebook containing this information. These notebooks will be updated on a regular basis. Information on natural, military, and other hazards will be included in both the orientation and the reference notebooks. Staffing the visitor center at least 4 hours per day will allow visitors the opportunity to seek answers to any questions.

For passenger vessels, briefings are either given on board the ship prior to arrival or, if no FWS-approved guides are on board, via written materials developed by the vessel company in coordination with FWS and Monument Co-Trustees. For larger groups arriving by aircraft, the orientation is conducted either at the airport prior to departure or during the flight. Since all large-group visitors are guided in small groups from one site to another along existing roads, these methods of orientation suffice.

We try to minimize the number of signs on Midway both to reduce impacts on wildlife and to allow visitors to have a more natural experience. Street signs have been lowered to minimize collisions by birds in flight. During 2009, refuge staff will analyze the need for additional signage and complete a sign plan in consultation with Co-Trustee staff.

Because of the age of Midway’s infrastructure, the atoll’s harsh climate, and the difficulty of getting materials and supplies to the atoll, maintenance of visitor facilities is a major and expensive endeavor. Efforts will be made to improve these facilities during 2008-2011. However, to ensure a minimal level of funding is available, visitor program fees will be structured to cover maintenance costs for lodging and dining facilities, on-island means of transportation (e.g., golf carts and bicycles), and at least some of the interpretive facilities. FWS will also work with its other partners on Midway to seek funding for island infrastructure maintenance and repair.

FWS’ contractor will seek feedback regarding visitor satisfaction. A previous questionnaire distributed by a private partner at Midway provided valuable insight into how we could improve our visitor program. FWS, contractor, and Co-Trustee staff will work together to make appropriate changes to enhance the visitor experience based on this feedback.

After 1 year of operation, FWS will evaluate the visitor program and work with the Co-Trustees to form recommendations for its improvement. As feasible, these recommendations will be implemented. Such assessments will continue on at least a biennial basis.

#### **4.3 Provide Quality Hunting Opportunities**

“Hunting is a wildlife-dependent recreational use and, when compatible, an appropriate use of resources in the Refuge System. Hunting programs will meet the quality criteria defined in [policy] and, to the extent practicable, be carried out consistent with State laws, regulations, and management plans.”

*Fish and Wildlife Service Manual, 605 FW 1*

Midway Atoll has no available hunting opportunities because all of its animal species are protected by law as either nongame species or threatened or endangered species, or they occur in numbers too low for harvest (e.g., migratory waterfowl).

#### **4.4 Provide Quality Fishing Opportunities**

“Fishing is a wildlife-dependent recreational use and, when compatible, an appropriate use of resources in the Refuge System. Fishing programs will meet the quality criteria defined in [policy] and, to the extent practicable, be carried out consistent with State laws, regulations, and management plans.”

*Fish and Wildlife Service Manual, 605 FW 1*

Consistent with relevant law, FWS grants wildlife-dependent public uses, including fishing, special consideration on national wildlife refuges. When determined compatible, wildlife-dependent public uses receive priority consideration over all other uses of a refuge. In this instance however, Midway Atoll is managed not just as a national wildlife refuge but as part of the Monument. In accordance with Proclamation 8031 “[r]emoving, moving, taking, harvesting, possessing, injuring, disturbing, or damaging; or attempting to remove, move, take, harvest, possess, injure, disturb, or damage any living or nonliving Monument resource” is prohibited without a permit, and recreational permits cannot be issued

for activities that result in the extraction of Monument resources. Therefore, sportfishing at Midway Atoll is not allowed.

#### **4.5 Provide Quality Wildlife Observation and Photographic Opportunities**

“Visitors of all ages and abilities will have an opportunity to observe and photograph key wildlife and habitat on the refuge when it is compatible with refuge purpose(s). Viewing and photographing wildlife in natural or managed environments should foster a connection between visitors and natural resources . . .

*Fish and Wildlife Service Manual, 605 FW 1*

*Goal 5. Enhance public understanding, appreciation, and support for protection of the Monument’s natural, cultural, and historic resources.*

*Goal 8. Offer visitor opportunities at Midway Atoll to discover and appreciate the wildlife and beauty of the NWHI, enhance conservation, and honor its unique human history.*

**Objective 5 Within 3 years, improve wildlife viewing and photography opportunities for all visitors to Midway Atoll.**

*Strategy 5.1* Maintain and monitor use of the West Beach trail to provide visitors an opportunity to view wildlife on West Beach without disturbance.

*Strategy 5.2* Construct a migratory bird/Laysan duck observation blind by March 2009.

*Strategy 5.3* Working with Monument Co-Trustees, re-establish an active dive program for visitors on Midway by May 2011.

*Strategy 5.4* In Fiscal Year 2010, seek funding for two new boats to support the visitor program, one capable of carrying at least 25 visitors to Eastern Island, the other to support the dive program.

*Strategy 5.5* By 2011, establish remote viewing cameras to transmit live video of terrestrial and marine species and their habitats to the visitor center and other locations beyond Midway Atoll.

*Discussion:* At few other places in the world can visitors be so totally surrounded by wildlife. Midway’s seabirds have little fear of humans, and visitors are offered opportunities to observe and photograph them from the time they arrive until they leave. To enhance their experience and ensure their expectations are met, a wildlife calendar has been developed showing what species are present at Midway during each month of the year. Existing bird and fish checklists have been reviewed and updated, then printed for distribution. A wildlife map of Midway Atoll shows visitors where they might have the best opportunity to see specific wildlife species. These documents will also be available on the Midway Atoll website and Monument’s web sites.

In 1997, West Beach – wrapping all the way from Rusty Bucket around Frigate Point – was closed to protect Hawaiian monk seals that use the beach for resting and pupping. To continue to allow visitors to reach historic resources in that area and to expand their opportunities to see the wildlife resources of Midway, FWS constructed a trail through the ironwood forest adjacent to West Beach, in consultation

with NOAA-Fisheries. At several locations along the trail, spur trails leading to overlooks were marked and native vegetation planted to create natural wildlife viewing blinds. That trail was renovated in 2008 to ensure visitor safety and to ensure the viewing blinds are effective in screening visitors from resting monk seals. Maintenance of the trail will be ongoing, and visitor use will be monitored to ensure wildlife resting on the beach are not disturbed.

Unlike the albatrosses and some other seabird species, Laysan ducks are frequently secretive and wary of humans. To increase opportunities for visitors to see this highly endangered species, an accessible observation/photography blind will be constructed at the water catchment basin in 2009. If needed, a spotting scope may be added to the blind to enhance viewing opportunities.

A limited water-based wildlife observation program began in 2008, using existing refuge boats. FWS and its partners will seek additional resources to expand the program. Because of the inherent safety concerns of any water-based activities, particularly in such a remote location, strict standards and rules will be established and enforced before any visitors are allowed to engage in these activities.

Snorkeling and guided kayaking opportunities are offered during daylight hours only (one-half hour after sunrise to one hour before sunset) to learn about and enjoy Midway's marine resources. Small groups of up to eight snorkelers per guide are taken by FWS-approved guides to specified locations within the lagoon to enjoy snorkeling within the lagoon and adjacent to the reef (except within the 500-foot buffer zone identified in Figure 3.1.2). Snorkeling sites are rotated to reduce marine impacts and avoid preferred monk seal and sea turtle haulout sites. Visitors are also allowed to snorkel near the cargo pier as long as no monk seals are in the vicinity. Use of the "buddy system" is required.

Guided kayaking tours of the lagoon will also be offered in groups of no more than six kayakers. All participants will be carefully instructed in kayak safety and wildlife/marine resource viewing etiquette before launching the boats. Kayakers will launch from Sand Island and may tour only from the cargo pier across the northern beach, around Rusty Bucket to Frigate Point. All kayak tours must remain at least 150 feet from shore to avoid disturbing resting monk seals on the beach. Kayaker tours will remain at least 500 feet from shore at West Beach if a monk seal mother and pup are present. FWS or FWS-approved kayak guides will be trained in kayak operation and in radio contact with employees on Sand Island. Individuals may not take kayakers out on their own. Kayaking tours will not be allowed to head toward Eastern Island or Spit Island, or to approach the reef. No snorkeling will be conducted from kayakers.

Visitors may also want to explore the coral reefs in waters inside and outside the lagoon through SCUBA diving. Monument staff will work toward re-establishing a dive program by May 2011, through the use of a concessionaire. As a preliminary step toward a dive program, the refuge manager has determined guided dive tours focused on wildlife observation and photography would be a compatible wildlife-dependent use. Divers would be accompanied by a certified master diver, with a maximum of six divers per one dive master. The dives would be specialized for divers interested in marine life and underwater photography, and all NOAA-Fisheries guidelines for viewing marine mammals and sea turtles would be met. No night diving would be allowed due to increased shark activity. Typically, this would be a seasonal activity, generally from May through September when the seas are calmer. Specific Monument protocols to ensure invasive species and disease are not transmitted through snorkel and dive gear will be implemented.

Although live-aboard dive cruises are offered on the Island of Hawai'i and many other areas of the Pacific, Midway's remote location would mean vessels would need to be in transit for many days before reaching the atoll to dive, and that they would need to transit the waters of the Monument. It is highly unlikely such a vessel could meet the environmental standards required of vessels within the Monument.

Any request for such use at Midway Atoll would require the approval of the Co-Trustees through the permitting process under a Special Ocean Uses permit. Large group day visitors are only onsite for sufficient time to allow terrestrial tours and occasionally the opportunity to swim off the North Beach. No other alternatives (e.g., snorkeling or diving) will be allowed. All requirements outlined in the compatibility determinations for wildlife observation and nonwildlife-dependent recreational activities would apply.

As technology improves and funding becomes available, we will work with our Co-Trustees to provide opportunities to broadcast live images of sensitive species such as the short-tailed albatross, Hawaiian monk seal, and Laysan duck and coral reef habitats to the visitor center on Sand Island and perhaps to the main Hawaiian Islands (such as at the Mokuapāpapa Discovery Center in Hilo) and beyond through the National Marine Sanctuary Program’s web portal (<http://www.oceanslive.org/portal/>).

**Objective 6 Work with and encourage qualified groups or individuals to develop specialized wildlife-dependent programs such as wildlife monitoring, photography, and art in 2009 and beyond.**

*Strategy 6.1* Continue to seek new vendors who would be interested in bringing groups to Midway.

*Discussion:* In the *Midway Atoll National Wildlife Refuge Visitor Program Market Analysis and Feasibility Study*, Pandion Systems, Inc., recommended several target audiences within the broad category of sustainable ecotourism, including specialized programs such as service learning activities, photography tours, writing and artist workshops, and educational tours. The FWS and Monument Co-Trustees agree and will continue to explore opportunities to reach such vendors. Since these programs generally bring a leader/guide/instructor with them, we need only ensure their understanding and compliance with rules and regulations and provide local expertise as needed. Proposed activities that would generate revenue or profits would require Monument Special Ocean Use permits.

**4.6 Develop and Implement Quality Environmental Education Programs**

<p>“Through curriculum-based environmental education packages based on national and State education standards, we will advance public awareness, understanding, appreciation, and knowledge of key fish, wildlife, plant, and resource issues. Each refuge will assess its potential to work with schools to provide an appropriate level of environmental education. We may support environmental education through the use of facilities, equipment, educational materials, teacher workshops, and study sites that are safe, accessible, and conducive to learning.”</p> <p style="text-align: right;"><i>Fish and Wildlife Service Manual, 605 FW 1</i></p>
---

*Goal 5. Enhance public understanding, appreciation, and support for protection of the Monument’s natural, cultural, and historic resources.*

**Objective 7 Beginning in 2008, develop and provide annual wildlife-dependent educator and conservation leader workshops at Midway Atoll targeting a mix of formal and informal educators and community and conservation leaders and building upon Navigating Change curricula and vision.**

*Strategy 7.1* Working with the Navigating Change Educational Partnership, conduct annual, week-long educator, conservation, and community leader workshops on Midway, based on the program developed by the educator focus group in 2008.

*Strategy 7.2* By 2012, hold one educator workshop on expanding Navigating Change curricula to meet the needs of intermediate and high school classrooms.

*Discussion:* One goal of these educator and conservation leader workshops is to inspire a new group of educators to use environmental education as a method of connecting students and lifelong learners to Hawai‘i’s wildlife and culture. Another goal is to have participants in these workshops actually propose and implement an environmental stewardship program in their community, utilizing their experience at Midway as inspiration. Over the past 5 years, the partners have joined together to create Navigating Change, a project conceived by the Polynesian Voyaging Society and focused on raising awareness and ultimately motivating people to change their attitudes and behaviors to better care for our islands and ocean resources. A standards-based educational curriculum for fourth and fifth graders was released by the partnership in 2005, and more than 15 workshops have been conducted on the main Hawaiian Islands to introduce the curriculum to local teachers. The major themes included within the curriculum could provide the stepping stones for future development of educational activities such as telepresence and distance learning projects.

The target date for the first workshop on Midway would be summer 2009. Agency planning began in 2007, and the members of an educator focus group held a planning workshop in January 2008. Co-Trustee education staff will be coordinating and conducting these workshops with input from previous classes of workshop attendees, collectively referred to as Alaka‘i. By 2012, a workshop will focus on designing upper grade level curriculum components as an extension of Navigating Change. Each workshop could take approximately 15 participants.

***Objective 8* Beginning in 2009, facilitate at least two opportunities per year for educational groups or private/nonprofit environmental or historical organizations to conduct wildlife dependent or history courses or administer informal educational camps.**

*Strategy 8.1* During 2009, seek partners who may be interested in offering educational programs on Midway Atoll and set schedules for trial courses or camps in 2010.

*Strategy 8.2* By March 2010, Monument staff will develop, design, and offer a mandatory 1-day orientation that all guides and instructors must attend before hosting a class on Midway for the first time.

*Strategy 8.3* Assist with classes/camps on Midway, providing guidance to avoid impacts on wildlife resources and monitoring group activities.

*Strategy 8.4* By 2010, collaborate with universities to offer semester internship opportunities for students interested in biological studies.

*Strategy 8.5* By 2012, develop dormitory-style or other lower-cost housing, classrooms, and laboratories in support of longer-term classes on Midway.

*Strategy 8.6* Investigate opportunities to bring select middle and high school students to Midway for courses in atoll ecosystems by 2015.

*Discussion:* Organizations have already shown their interest in using Midway for educational experiences, since it provides unparalleled wildlife dependent educational opportunities. Organizations will be held responsible for providing instructors and leading their participants. The Co-Trustees will provide guidance during the mandatory advance orientation. When possible, Monument staff can provide learning opportunities that engage participants in biological and historical projects such as habitat restoration or historic preservation. FWS staff will also monitor group activities to ensure Midway’s wildlife and historic resources are protected.

The Co-Trustees support expanding environmental education opportunities to the extent feasible on Midway Atoll. Developing lower-cost housing and increasing classroom and laboratory space will facilitate these programs. An opportunity to study Midway’s unique natural resources could be the catalyst to inspire lifelong devotion to the field of science.

**Objective 9 Develop and implement new tools to bring the place to the people rather than the people to the place (with an emphasis on students) by 2010.**

*Strategy 9.1* Install appropriate technologies to make distance learning possible from Midway Atoll by 2009.

*Strategy 9.2* Initiate a distance learning program from Midway Atoll to bring the Monument to classrooms across the Nation by 2010.

*Discussion:* FWS has long been interested in offering a distance learning program from Midway, but doing so from such a remote location is challenging. As technologies improve, the Co-Trustees will evaluate the possibility of establishing such a program that could bring the Northwestern Hawaiian Islands into Hawai’i classrooms in particular, but also to other educational venues. In order to provide support for staff, researchers, and distance learning, NOAA is exploring opportunities to install high-speed satellite uplinks on Midway Atoll.

**4.7 Provide Quality Interpretation of Key Resources**

<p>“We will communicate fish, wildlife, habitat, and other resource issues to visitors of all ages and abilities through effective interpretation. We will tailor core messages and delivery methods to provide interpretation to refuge visitors and present them in appropriate locations.” <i>Fish and Wildlife Service Manual, 605 FW 1</i></p>
---

The rich natural and human history of Midway Atoll provides a unique opportunity to promote visitor understanding of and appreciation for America’s natural and historic resources. Interpretation provides opportunities for visitors to make their own connections to the resource so that a sense of stewardship and respect for these resources develops. To ensure our interpretive products remain focused, we develop interpretive themes that guide development of all interpretive products on the refuge.

The primary interpretive themes for Midway Atoll are adapted from those of the Monument:

- Encircled by the earth’s largest ocean, the small islands and coral reefs of the Northwestern Hawaiian Islands provide a scarce and safe haven for diverse native wildlife species to raise their young; to rest, grow, and play; and to survive into the future.
- These remote atolls host a complex reef ecosystem dominated by apex predators and rich in species found nowhere else in the world.

- Just as human actions can destroy wildlife and their habitat, people can restore island and reef ecosystems to benefit both wildlife and mankind through research, sound science, and special care.
- Stories, ancient chants, and archaeological remnants connect ancient Polynesians to the Northwestern Hawaiian Islands not only geographically but also spiritually.
- Throughout history, Midway has served as a vital outpost for humans as they explored their world, expanded their horizons, protected their boundaries, and sought peace in the world.
- Brave young men – far from home and loved ones – risked their lives at Midway to defend America, and in doing so, turned the tide of war in the Pacific to ensure our freedom.

These themes are designed to encompass the tremendous wildlife and historical treasury found at Midway. Through a variety of interpretive methods, these themes will be conveyed to our visitors.

*Goal 5. Enhance public understanding, appreciation, and support for protection of the Monument's natural, cultural, and historic resources.*

*Goal 7. Identify, interpret, and protect Monument historic and cultural resources.*

*Goal 8. Offer visitor opportunities at Midway Atoll to discover and appreciate the wildlife and beauty of the NWHI, enhance conservation, and honor its unique human history.*

***Objective 10 By 2012, develop a Midway Atoll interpretive plan that will be incorporated into a Monumentwide interpretive plan addressing key interpretive sites and activities.***

*Strategy 10.1* Develop detailed and site-specific descriptions of interpretive facilities, exhibits, signs, programs, trails, etc., that will meet the goals of the Monument, the interests and needs of Midway's visitors, and the unique and meaningful features of the Monument's natural and cultural resources.

*Discussion:* A Midway-specific interpretive plan will guide the development of additional interpretive facilities, exhibits, etc. It will be based on the Monument's interpretive themes and include information on project priorities, costs, staffing needs, and schedules.

***Objective 11 Continuously improve onsite interpretation and interpretive facilities to better educate visitors about the natural resources of Midway Atoll and the Northwestern Hawaiian Islands.***

*Strategy 11.1* Offer wildlife-oriented guided tours to all visitors on at least a weekly basis.

*Strategy 11.2* Transition the wildlife-related visitor center into a Papahānaumokuākea Marine National Monument visitor center by September 2009, to provide an educational window to the Monument. Annually review the exhibits and update them as needed and as described in the Midway Atoll interpretive plan.

*Strategy 11.3* Provide additional opportunities for visitors to learn about ongoing management and research projects through field talks and evening programs.

*Strategy 11.4* Offer evening programs in the Midway theater, including slide talks, videos, and other presentations on the Monument's natural and human history.

*Strategy 11.5* Support and monitor an expanded Friends of Midway Atoll National Wildlife Refuge gift store, ensuring merchandise offers accurate and educational messages.

*Discussion:* The refuge interpreters will offer guided walks and bicycle/golf cart tours focused on natural history themes on at least a weekly basis. To ensure a quality experience, tour groups will be no larger than 25 people (except during large group visits). Tour routes will vary depending on the physical ability of the participants, the weather, and wildlife use patterns. All visitors should have the opportunity to tour Sand Island. Dependent upon the weather and availability of transportation, visitors may also have the opportunity to have a guided tour of Eastern Island, which will combine both natural and historic resource features. Tours on Eastern Island generally walk from the boat pier to and along the historic World War II runways and Battle of Midway memorials. All beaches on Eastern Island are closed to visitors to protect Hawaiian monk seals and sea turtles, and tour routes will vary to accommodate wildlife needs.

Self-discovery and exploration is a key component of the Midway experience. To enhance their experience, interpretive panels regarding Midway's natural resources will be placed at a limited number of remote locations along existing trails on Sand Island, as identified in the Midway Atoll interpretive plan. These panels may include reminders of wildlife viewing etiquette, as appropriate. If a significant number of non-English-speaking visitors come to Midway, translated versions of these panels will be made available as handouts.

The natural resource interpretive exhibits in the Midway visitor center will be reviewed for currency and updated as necessary, working in cooperation with the Co-Trustees. As the "window to the Monument," the focus of the exhibits will be broadened to include the natural resources of the entire Monument.

Researchers and biologists will be encouraged to offer field talks to describe their work and/or provide insights into the world of individual wildlife species. NOAA-Fisheries has expressed an interest in providing guided tours to view monk seals in an unobtrusive manner, and frequently researchers provide presentations or demonstrations to broaden knowledge of their activities. By better understanding the needs of each species for its survival, visitors will gain knowledge of how they can help protect these animals.

Over the years, numerous films and documentaries about the Battle of Midway and other aspects of the atoll's history and its wildlife have been produced. Sharing these with visitors in the historic Midway theater enhances their learning experience and enjoyment.

Through the Friends of Midway Atoll National Wildlife Refuge, a gift store on Midway offers visitors the opportunity to purchase Midway Atoll-related items such as books, posters, postcards, coffee mugs, tee shirts, and note cards. Refuge staff will monitor sales items to ensure they accurately interpret refuge and Monument natural and historic resources. These items will also be available on the Friends website, broadening the distribution of these interpretive materials.

***Objective 12*** By 2010, improve onsite interpretation and interpretive facilities to better educate visitors about the Battle of Midway National Memorial, Midway's human history, and Native Hawaiian culture.

*Strategy 12.1* Offer a history-oriented guided tour to all visitors on at least a weekly basis.

*Strategy 12.2* Working with the Office of Hawaiian Affairs and the Native Hawaiian Cultural Working Group, add a Native Hawaiian cultural component to Midway's orientation session, visitor center exhibits, and outreach materials.

*Strategy 12.3* Partner with NOAA to develop interpretive materials and displays for the temporary museum about the submerged historic sites (shipwrecks and aircraft) located within the Monument to enhance existing historic interpretation.

*Strategy 12.4* By December 2010, seek funding to restore a historic building to house a permanent museum/library to recognize and honor Midway’s – and the Northwestern Hawaiian Islands’ – distinguished history.

*Strategy 12.5* By December 2012, complete restoration of a historic building to house the museum and develop and install the interpretive exhibits as identified in the Midway Atoll interpretive plan.

*Strategy 12.6* Annually review, update, and/or replace exhibits within the museum to ensure they appropriately represent the Monument.

*Discussion:* Much like the natural history tours, historic resource guided tours will be offered by refuge staff on at least a weekly basis. To ensure a quality experience, tour groups will be no larger than 25 people (except during large group visits). Depending upon the physical ability of the participants, the weather, the length of the tour route, and the potential impacts on wildlife, these tours may be on foot, by bicycle, or by golf cart. On Sand Island, the history tour will be separate from the wildlife-oriented tour; on Eastern Island, both topics will be covered in one visit.

Sand Island’s historic structures are found in all corners of the island. A self-guided historic resource tour map with descriptive information was developed in 1996 and was updated in 2008 for current visitor use. Interpretive panels regarding several of Midway’s historic resources were produced in 2002. Because the regularly scheduled visitor program was no longer active, the panels were temporarily placed on portable stands for use only during large group visits. Now that visitors are returning on a more regular basis to Midway, these panels have been mounted as originally planned at their designated sites to bring history to life along the self-guided tour.

As the “window to the Monument,” interpretation at Midway will be broadened to include information about the Northwestern Hawaiian Islands’ importance in Native Hawaiian culture. All interpretive materials and presentations will be reviewed to ensure the islands’ cultural resources are appropriately represented.

History-related exhibits are currently housed on the first floor in the airport hangar. Because that location is rarely visited by visitors and because the building is deteriorating, the exhibits are being moved to a new temporary location in the visitor center in 2009. The new site will be more readily accessible to visitors.

In the longer term, one of the historic buildings – probably within the “Midway Mall” – will be restored to house a permanent museum/library. Detailed plans for this facility will be included in the Midway Atoll interpretive plan. In accordance with the *Midway Atoll National Wildlife Refuge Historic Preservation Plan*, FWS does not plan to acquire materials currently preserved in museums, archival institutions, and private collections to bring them to Midway’s harsh environmental conditions. It is more appropriate to acquire copies of such materials for Midway, allowing the originals to remain secured at existing facilities or in a repository in Hawai‘i. Interpretive exhibits will be developed to reflect all of Midway’s “eras,” from prerecorded history to discovery, to shipwrecks and the Commercial Pacific Cable Company days, the Pan American Flying Clipper period, the Battle of Midway, and on through the Cold War and Vietnam conflicts. Broader based exhibits about cultural and historic sites throughout the

Northwestern Hawaiian Islands will also be developed in partnership with NOAA’s cultural resources program and the State of Hawai‘i.

**Objective 13 By 2010, develop at least two offsite exhibits and programs to educate the general public about the Northwestern Hawaiian Islands and Midway Atoll in particular.**

*Strategy 13.1* In 2009, develop and install a visitor access exhibit in NOAA’s Mokuapāpapa Discovery Center in Hilo, Hawai‘i, as part of the updating of the facility.

*Strategy 13.2* Working with the National Park Service and other key entities, develop offsite exhibits within the World War II in the Pacific Interpretive Concept that feature the historic Battle of Midway and Battle of Midway National Memorial.

*Strategy 13.3* Work with the other venues to incorporate information about Midway Atoll and the Northwestern Hawaiian Islands in their exhibits.

*Discussion:* Since the number of visitors to Midway Atoll will always be relatively small, FWS will work with partner entities to provide information about the Northwestern Hawaiian Islands and Midway Atoll to a broader audience. The Mokuapāpapa Discovery Center in Hilo, Hawai‘i, informs an average of 60,000 visitors per year about the new Monument. As funding is available, FWS will work with NOAA to incorporate an exhibit about Midway Atoll and visitor opportunities. Additional opportunities, such as within the Northwestern Hawaiian Islands exhibit at the Waikiki Aquarium, will be sought in 2008 and beyond.

While some exhibits will focus on natural history, FWS will also ensure appropriate attention is placed on the Battle of Midway in offsite interpretive efforts. In establishing the Battle of Midway National Memorial, FWS was charged with helping others keep knowledge of this important battle alive for future generations. In the near term, our first efforts will be at Pearl Harbor with its many World War II in the Pacific themed attractions. We will also seek partners to help place an exhibit in Washington, D.C.

**Objective 14 Work with and encourage qualified groups or individuals to develop specialized historical programs that honor the Battle of Midway.**

*Strategy 14.1* Continue to seek new vendors who would be interested in bringing history-related groups to Midway.

*Discussion:* FWS will explore opportunities to bring historical tours, either through commercial tour groups or veterans organizations, to Midway Atoll in recognition of its status as the Battle of Midway National Memorial. All such tours will be reviewed and approved through the Monument permitting process.

**4.8 Manage for Other Recreational Use Opportunities**

“We may allow other recreational uses that support or enhance one of the wildlife-dependent recreational uses or minimally conflict with any of the wildlife-dependent recreational uses when we determine they are both appropriate and compatible. We will allow uses that are either legally mandated or occur due to special circumstances.”

*Fish and Wildlife Service Manual, 605 FW 1*

**Objective 15 Allow residents and visitors to engage in other recreational uses on Midway in regulated areas that have been determined to be compatible.**

*Strategy 15.1* Allow residents and visitors to ride bicycles and jog for exercise on existing roads.

*Strategy 15.2* Allow residents and visitors to play tennis and volleyball at designated facilities.

*Strategy 15.3* Allow beach uses such as swimming and sunbathing for visitors and residents.

*Strategy 15.4* Allow amateur radio use from Midway Atoll in accordance with stipulations that make the use compatible.

*Discussion:* The refuge manager has determined that several forms of nonwildlife-dependent recreation are compatible with the Refuge System mission and the refuge purposes, and therefore Monument permits may include special conditions to allow them. These activities will take place only on Sand Island, and most are within developed areas. Bicycling and jogging will be restricted to hard surface roads, including along the edges of the runway, or along the cart path of the West Beach trail. Volleyball will only be allowed in the designated court area adjacent to the Captain Brooks facility. The tennis court is located outside the airport hangar building.

Swimming and sunbathing may only occur on the open public beach along the northern shore of Sand Island during daylight hours (from one-half hour after sunrise to one-half hour before sunset) for visitor safety. Use of the “buddy system” will be required. During the mandatory orientation session, visitors will be advised of appropriate behavior if a monk seal or sea turtle approaches them in the water.

Because of potential bird strikes on amateur radio antennae, limitations will be placed on this use. FWS will work with amateur radio enthusiasts to implement a compatible program, as long as it does not displace wildlife-dependent visitors wanting to visit Midway Atoll. Placement of the outdoor antennae must be approved by the refuge manager.

#### **4.9 Communicate Key Issues with Off-Site Audiences**

“Effective outreach depends on open and continuing communication and collaboration between the refuge and its many publics. Effective outreach involves determining and understanding the issues, identifying audiences, listening to stakeholders, crafting messages, selecting the most effective delivery techniques, and evaluating effectiveness. If conducted successfully, the results we achieve will further refuge purpose(s) and the Refuge System mission.”

*Fish and Wildlife Service Manual, 605 FW 1*

*Goal 5. Enhance public understanding, appreciation, and support for protection of the Monument’s natural, cultural, and historic resources.*

*Goal 7. Identify, interpret, and protect Monument historic and cultural resources.*

**Objective 16 On a continuing basis, maintain outreach efforts to Midway’s diverse audiences to update them on the visitor program and wildlife-oriented news stories.**

*Strategy 16.1* On a continuing basis, update the Monument and refuge websites with current information about the visitor program and wildlife viewing opportunities.

*Strategy 16.2* On an as-needed basis, issue news releases and write articles for publication in newsletters, magazines, or other periodicals to keep key publics informed about the visitor program on Midway Atoll and wildlife issues throughout the Monument.

*Strategy 16.3* Continue to support reporters and documentary filmmakers in developing appropriate articles and films/television productions about the wildlife and history of Midway Atoll.

*Discussion:* Midway Atoll, the Battle of Midway National Memorial, and the Monument have been highly visible in the public eye for some time. The atoll has a broad following by government officials, Members of Congress, veterans' organizations, environmental organizations, media, former residents, past and potential visitors, World War II historians, and others who can be defined as "key publics." Rather than being "local community" members, Midway's supporters are spread across the Nation and around the world.

As individual issues arise regarding Midway, refuge staff on Midway and in Honolulu will work together with their counterparts in the Monument to reach out to our publics with timely and accurate information. The Midway Atoll website (<http://www.fws.gov/midway>) and Monument website will be continuously updated with news of Midway's wildlife, ongoing visitor activities, Battle of Midway-related events, and other Monument-related topics. News releases will be issued to the media as appropriate, and information or articles for periodicals will be provided as requested.

Documentary filmmakers and videographers will be accommodated to the extent possible under Monument permits so that we can reach the broadest audiences. Staffing levels may limit the number of filmmakers that can be accommodated.

***Objective 17* By March 2009, evaluate the effectiveness of the visitor program marketing effort.**

*Strategy 17.1* Assess the need to contract with a marketing firm to promote the visitor program.

*Discussion:* Although FWS will promote the visitor program at Midway to the best of its ability, the specialized skills of a marketing company may be needed to develop sufficient demand to make the program financially self-sustaining. If the evaluation indicates additional work is needed, FWS would work closely with the marketing firm to ensure appropriate and accurate information is distributed to target audiences.

***Objective 18* Working with partners, offer special events and programs on Midway and at other offsite locations that honor its history and natural resources.**

*Strategy 18.1* Annually commemorate the anniversary of the Battle of Midway from June 4-6.

*Strategy 18.2* Celebrate other Monument-focused special events such as Maritime Heritage Week, International Migratory Bird Day, and the International Year of the Reef.

*Strategy 18.3* Work with outside entities to sponsor history-related programs and events on Midway.

*Strategy 18.4* Seek other venues and opportunities to participate in special events that connect to Midway’s history.

*Discussion:* Occasionally, special events will be offered at Midway, particularly in relation to its status as the Battle of Midway National Memorial. As staffing allows, we will also participate in other offsite events to bring the history of Midway to larger numbers of people.

FWS continues to believe the historic aspects of Midway Atoll are an important draw for visitors. In addition to organizations such as the International Midway Memorial Foundation, which is dedicated to honoring and preserving the memory and values of the Battle of Midway, many individuals who were stationed on Midway during the Cold War era have expressed an interest in returning to the atoll with their families.

Other internationally recognized designations such as the International Year of the Reef should also be celebrated on Midway Atoll.

#### **4.10 Build Volunteer Programs and Partnerships with Midway Atoll Support Groups**

“Volunteer and Friends organizations fortify refuge staffs with their gifts of time, skills, and energy. They are integral to the future of the Refuge System. Where appropriate, refuge staff will initiate and nurture relationships with volunteers and Friends organizations and will continually support, monitor, and evaluate these groups with the goal of fortifying important refuge activities. The National Wildlife Refuge System Volunteer and Community Partnership Enhancement Act of 1998 strengthens the Refuge System’s role in developing effective partnerships with various community groups. Whether through volunteers, Friends organizations, or other important partnerships in the community, refuge personnel will seek to make the refuge an active community member, giving rise to a stronger Refuge System.”

*Fish and Wildlife Service Manual, 605 FW 1*

*Goal 1. Protect, preserve, maintain, and where appropriate restore the physical environment and the natural biological communities and their associated biodiversity, habitats, populations, native species, and ecological integrity.*

*Goal 4. Provide for cooperative conservation, including community involvement, that achieves effective Monument operations and ecosystem-based management.*

*Goal 5. Enhance public understanding, appreciation, and support for protection of the Monument’s natural, cultural, and historic resources.*

*Goal 7. Identify, interpret, and protect Monument historic and cultural resources.*

*Goal 8. Offer visitor opportunities at Midway Atoll to discover and appreciate the wildlife and beauty of the NWHI, enhance conservation, and honor its unique human history.*

**Objective 19 Incorporate at least 75 percent of visitors staying 3 days or longer into the volunteer program for habitat restoration.**

*Strategy 19.1* Plan weekly invasive plant pulling parties to involve visitors in invasive weed control.

*Strategy 19.2* Provide trash bags for visitors to take with them as they walk along the open beach so they can collect marine debris as they find it.

*Strategy 19.3* Schedule monthly beach cleanups to pick up marine debris on closed beaches where Monument staff have determined no monk seals or sea turtles are resting.

*Discussion:* Hand pulling of weeds is labor intensive, but it is also an effective tool in the continuing battle against invasive plant species. On most areas of Midway Atoll, the sandy substrate makes weed pulling relatively easy. Many visitors want to “give something back” to the wildlife during their time on the atoll, and this activity will help restore acres of habitat for nesting seabirds.

Beach cleanups are also a valuable tool, not only to protect wildlife species but also to educate visitors about the marine debris problem. By involving them in cleanup efforts, they are more likely to seek solutions and educate others about the problem. Refuge or other designated biologists would first ensure no resting monk seals or sea turtles are present in the stretch of beach to be cleaned. Areas to be cleaned would be rotated around the islands from one month to the next so that all beaches would be cleaned twice a year, if possible.

**Objective 20 Provide 25 percent of visitors staying 3 days or longer opportunities to assist with wildlife population monitoring as volunteers.**

*Strategy 20.1* As refuge staff or long-term biological volunteers are available, offer interested visitors the opportunity to assist with seabird monitoring and banding activities.

*Strategy 20.2* As refuge staff, U.S. Geological Survey-Biological Resources Discipline staff, or long-term biological volunteers are available, allow interested visitors the opportunity to assist with Laysan duck monitoring activities.

*Discussion:* Much like the habitat restoration work above, visitors gain a better appreciation for wildlife and their needs with direct involvement in a monitoring program. All such work would be under the direct supervision of a trained biologist to prevent impacts on the animals. This program will be limited in size and nature, and will be continually monitored by the refuge biologist and refuge manager to ensure it is useful to both the wildlife populations and the visitor.

**Objective 21 Seek long-term well qualified volunteers to assist Monument staff with the operation of the visitor services program.**

*Discussion:* As a complement to Midway Atoll’s ongoing biological volunteer program, we will offer opportunities for qualified volunteers to assist with interpretive programs on Midway. Monument staff will explore the possibility of offering an intern program for college students or other similarly trained volunteers.

**Objective 22 Seek grant funds to bring at least two groups of volunteers to Midway each year to work on historic restoration projects under the guidance of FWS’ cultural resources staff and/or historic preservation specialists.**

*Strategy 22.1* Beginning in 2008, apply for a *Save America's Treasures* (SAT) grant for historic rehabilitation work on Midway Atoll.

*Discussion:* The SAT grant requires a 50/50 match, which FWS can accrue through volunteer service, direct contributions, or material donations. FWS received a SAT grant in 1999 that included termite control work, theater building window restoration, a condition assessment report for the interior of the theater and the Commercial Pacific Cable Company Station, reroofing of one cable building, restoration of an ARMCO hut, and collection of oral histories and memorabilia. A similar program could be reinitiated in the future.

***Objective 23* Provide at least 15 percent of visitors staying 3 days or longer opportunities to assist with historic preservation tasks and activities.**

*Strategy 23.1* Much like the habitat restoration projects, volunteers will be offered opportunities to help accomplish historic preservation tasks that require few technical skills.

*Discussion:* FWS' Cultural Resources Team or Historic Preservation Specialist will update the list yearly or as needed to meet the refuge staff recommendations. Volunteers could greatly facilitate the maintenance of historic resources and give the public a greater appreciation and involvement with historic preservation.

#### **4.11 Refuge Law Enforcement**

A refuge law enforcement officer is present on Midway Atoll, and a law enforcement zone officer in Honolulu and other refuge officers in Hawai'i provide support on an as-needed basis. For large events, the zone officer assembles a group of officers from refuges throughout the Pacific Region to provide law enforcement. Midway's refuge officer will also assist with law enforcement issues for the Monument.

#### **4.12 Concession Operations**

Because this is a small-scale program that is just reopening, the Midway Atoll visitor program will be operated by existing Monument staff in its early years. The program evaluation required in 2009 and biennially thereafter will allow further assessment of whether the program should be operated by a concessionaire. Developing a solicitation for a concessionaire, seeking proposals, and evaluating them can take up to a year to complete.

The one exception to this could be a snorkeling/SCUBA diving concession, which was briefly discussed above in the wildlife observation standard. If interest is expressed in such a program, FWS and its Co-Trustees will evaluate the feasibility of a diving concession at Midway in 2011 or beyond.

#### **4.13 Fee Programs**

Midway Atoll National Wildlife Refuge has charged access fees for its visitor program since 1997, when it received approval under the Recreation Fee Demonstration Program. That program has now been renamed the Recreation Fee Program, established through the Federal Lands Recreation Enhancement Act of 2004 (Public Law 108-447). Almost all of the original fee program sites transitioned into the new program. The entrance fee for Midway Atoll National Wildlife Refuge is \$5.00 per person per day.

With limited FWS funding available to support a visitor program, the refuge has been charged by FWS with developing a visitor program that is financially self-sustaining. To help us meet this goal, Congress has also given the refuge receipts authority, which allows the refuge to keep reasonable fees collected for

services provided at Midway Atoll. These fees will be used to offset costs of implementing the visitor services program.

The following fee schedule reflects actual costs for visiting Midway. The entrance fee is collected under the authority of the Federal Lands Recreation Enhancement Act. Lodging and meal fees cover additional hotel and food services staffing, hotel supplies, and food costs. The visitor fee is collected under Midway’s receipt authority and contributes toward the cost of additional refuge staffing or extended on-island volunteers needed to work with visitors, as well as enhancing visitor facilities. The on-island transportation rental fees will enable repair and replacement of these items as necessary. Boating fees cover vessel maintenance and fuel costs. Round-trip airfare is based on the actual cost of the current flight, divided by the number of passengers that can be accommodated on the aircraft. If that cost can be reduced in the future, the airfare will be reduced accordingly.

**Table 4.13.1 Visitor Program Fee Schedule (as of 2008)**

Description	Fee
Entrance fee	\$5 per day
Round trip airfare	\$2,000 per person
Lodging	\$125 per night
Meals	\$45 per day
Visitor fee	\$55 per day
Bicycle rental (optional)	\$5 per day
Golf cart rental (optional)	\$25 per day
Snorkel rental (optional)	\$25 per week
Boat fees (for Eastern Island or snorkeling trips)	\$20 per half day

In the *Midway Atoll National Wildlife Refuge Visitor Program Market Analysis and Feasibility Study*, Pandion Systems surveyed similar tourism providers to ascertain a typical cost range. Excluding transportation costs, typical costs ranged from \$200 to \$400 per day. Thus the Midway fees above are considered reasonable for the experience offered.

FWS recognizes the extremely high airfare costs associated with our current charter aircraft. We will continue to seek a more cost-efficient means of transportation for our visitors.

#### **4.14 Permitting**

##### **General Permit Requirements**

As part of the newly established Monument, activities within the Midway Atoll Special Management Area will be managed differently than at other national wildlife refuges. Typically, and with few exceptions, lands and waters within the Refuge System, including Midway Atoll National Wildlife Refuge, are closed to all public access and use unless FWS has specifically opened the use or use program on that refuge. The process of opening a refuge includes planning, appropriateness review and compatibility determinations, public review and comment, and NEPA compliance. Some uses, such as sport fishing or hunting, may also require the adoption of refuge-specific regulations under the Administrative Procedure Act involving public comment and publication in the Federal Register. Throughout the Refuge System, this process is used to open a refuge for general access, a particular use, or suite of uses. The refuge manager may also require a special use permit for specialized uses.

However, Proclamation 8031 alters the regulatory regime under which the Midway Atoll National Wildlife Refuge is operated as part of the Monument. The Proclamation established new requirements and methods of management throughout the Northwestern Hawaiian Islands. By overlaying the Midway Atoll and Hawaiian Islands National Wildlife Refuges, the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, and State of Hawai‘i’s Seabird Sanctuary at Kure Atoll and marine refuge with the Monument, the Proclamation created a mechanism to ensure the Co-Trustees provide consistent, unified management while meeting their respective obligations under other applicable statutes and regulations. Specifically, Midway Atoll National Wildlife Refuge is a location where the FWS conducts compatibility determinations in consultation with the Co-Trustees to aid the Secretaries of the Interior and Commerce, in their discretion, to issue a co-signed Monument permit in one of six permit categories described in the Proclamation, provided the Secretaries find the activity:

*(i) is research designed to further understanding of Monument resources and qualities; (ii) will further the educational value of the Monument; (iii) will assist in the conservation and management of the Monument; (iv) will allow Native Hawaiian practices; (v) will allow a special ocean use; or (vi) will allow recreational activities.*

Furthermore, the Secretaries may not issue any permit unless they find:

- the activity can be conducted with adequate safeguards for the resources and ecological integrity of the Monument;
- the activity will be conducted in a manner compatible<sup>2</sup> with the management direction of this proclamation, considering the extent to which the conduct of the activity may diminish or enhance Monument resources, qualities, and ecological integrity, and indirect, secondary, or cumulative effects of the activity, and the duration of such effects;
- there is no practicable alternative to conducting the activity within the Monument;
- the end value of the activity outweighs its adverse impacts on Monument resources, qualities, and ecological integrity;
- the duration of the activity is no longer than necessary to achieve its stated purpose;
- the applicant is qualified to conduct and complete the activity and mitigate any potential impacts resulting from its conduct;
- the applicant has adequate financial resources available to conduct and complete the activity and mitigate any potential impacts resulting from its conduct;
- the methods and procedures proposed by the applicant are appropriate to achieve the proposed activity’s goals in relation to their impacts to Monument resources, qualities, and ecological integrity;
- the applicant’s vessel has been outfitted with a mobile transceiver unit approved by NOAA Office of Law Enforcement and complies with the requirements of this proclamation; and
- there are no other factors that would make the issuance of a permit for the activity inappropriate<sup>3</sup>.

The six categories of Monument permits are:

1. Conservation and Management;
2. Native Hawaiian Practices;
3. Research;
4. Education;

---

<sup>2</sup> Note the use of this word is not necessarily consistent with the same terminology from the Administration Act and FWS policy and regulations promulgated thereunder.

<sup>3</sup> Note the use of this word is not necessarily consistent with the same terminology from the Administration Act and FWS policy and regulations promulgated thereunder.

5. Recreation; and
6. Special Ocean Use.

### **Permits for Visitor Services at Midway Atoll**

Permit applications for visitor services at Midway Atoll will be considered using the findings required by Proclamation 8031 as described above. As discussed in sections 4.5-4.10, 4.12, and 4.13, the plan anticipates recreational, ecotourism, volunteer, and educational activities, which would require Monument permits in the recreation, special ocean use, conservation and management, or education categories.

### **Additional Requirements for Individual Recreational Uses**

Recreational uses conducted by individuals at Midway Atoll, such as snorkeling from the cargo pier, must also comply with additional requirements. For the purposes of this chapter, the Monument recreation permit requirement applies to recreational visitors and transients within the Midway Atoll Special Management Area. The Secretaries may not issue a recreation permit unless they find:

- the activity is for the purpose of recreation when defined as “an activity conducted for personal enjoyment that does not result in the extraction of Monument resources and that does not involve a fee-for-service transaction”
- the activity is not associated with any for-hire operation; and
- the activity does not involve any extractive use.

### **Additional Requirements for Special Ocean Uses**

Enterprises offering recreational use opportunities at Midway Atoll that generate revenue or profits for one or more of the persons associated with the activity or use (e.g., ecotourism, passenger vessels, filmmakers, and potentially some education and research activities) must comply with not only the special ocean use permit requirements from the Proclamation, but also two additional requirements:

- the Secretaries find the activity furthers the conservation and management of the Monument; and
- the refuge manager has found the use compatible with the purposes for which Midway Atoll National Wildlife Refuge was designated.

For the purposes of this chapter, a FWS special use permit as described in the Administration Act or regulation or associated policy at the Midway Atoll National Wildlife Refuge would instead be issued as a Monument special ocean use permit.

### **Permits for Recreational<sup>4</sup> Uses within Midway Atoll Special Management Area**

The permitting regime for the visitor services program for compatible wildlife-dependent recreational uses within the Midway Atoll Special Management Area will be as follows. This plan makes a distinction between visitors (those who visit Midway Atoll specifically to participate in some form of recreational, historical, or memorial-related activity covered under this plan) and transients (those who visit Midway Atoll to conduct work or other permitted activities but wish to recreate in their off-duty hours) and island residents. Island residents include FWS staff (employees and volunteers), NOAA staff, and various resident contractors living on Midway Atoll. Island residents’ participation in recreational activities is part of the FWS morale, welfare, and recreation program. As such, it is covered under the

---

<sup>4</sup> “Recreational” is used here as defined in the National Wildlife Refuge System Administration Act of 1966, as amended.

FWS conservation and management Monument permit and is not discussed further in this plan. However, all morale, welfare, and recreation activities must adhere to all other requirements and stipulations; it is only in the form of permitting that these activities may differ.

This visitor services plan and its associated findings of appropriateness, compatibility determinations, and environmental assessment<sup>5</sup> evaluate broad categories of recreational uses that will generally be allowed or prohibited. Visitors and transients who desire to participate in any one of the uses approved within this plan may apply for a Monument permit. However, in order to be user-friendly and minimize paperwork, these individuals will be provided a Monument permit application as part of their registration forms instead of using the unified application process in advance. This paper form will fulfill the needs of the unified Monument permit application without placing an undue burden on the individuals or the Monument staff who must review them. Monument recreation permits are free under this visitor services plan, and valid for the remainder of the existing Federal fiscal year (October 1 – September 30 of the following calendar year).

The Midway Atoll National Wildlife Refuge manager is responsible for summarizing all individual Monument permits issued as described above during a fiscal year for the FWS annual public use report and the Monument permit tracking system.

The minimum information to be collected includes the full name and signature of applicant, home address and telephone number, types of approved uses in which permission is sought to engage, date(s) of participation, approximate time spent in each activity, etc.

Enterprises who wish to offer fee-for-service visitor opportunities in accordance with this plan must apply for a Monument special ocean use permit using the unified Monument permit application. These Monument special ocean use permits include permission “to transit the Monument as necessary to enter the Midway Atoll Special Management Area” and will be issued in accordance with all Proclamation special ocean use findings, criteria, and requirements, such as being valid for no more than 5 years, requiring the provider to carry insurance or a bond, etc. These permits will carry a variable fee based on recovering the government’s cost in reviewing, issuing, and monitoring the permit under this visitor services plan. These permits may also include a per passenger fee, profit-sharing agreements, or use of government facilities.

Nothing in this plan is intended to limit the ability of the Co-Trustees to actively seek for-profit enterprises to enter into concession agreements or other legal relationships to provide specific for-fee services that help achieve refuge and Monument purposes or goals and this plan.

### **Emergency Provisions**

In addition to Proclamation 8031’s exemption to prohibitions for emergencies and law enforcement activities (“The prohibitions required by this proclamation shall not apply to activities necessary to respond to emergencies threatening life, property, or the environment, or to activities necessary for law enforcement purposes”), the Administration Act contains similar provisions which apply only to the national wildlife refuge portions of the Monument. These provisions are:

- Notwithstanding any other provision of this Act, the Secretary [of the Interior] may temporarily suspend, allow, or initiate any activity in a refuge in the [National Wildlife Refuge] System if the

---

<sup>5</sup> The FONSI signed on May 23, 2007, for the Interim Visitor Services Plan addressed most of these activities. Increased visitation is addressed in the Monument Management Plan Environmental Assessment, found in Volume II of the Plan.

Secretary [of the Interior] determines it is necessary to protect the health and safety of the public or any fish or wildlife population.

- These provisions include, but are not limited to, compatibility and permitting requirements. Recreational uses previously found to be appropriate and compatible may be suspended for the protection of human health, life, or safety; property; general environment; or fish or wildlife population.

The refuge manager's execution of these provisions should be conducted in consultation with the Monument Co-Trustees in advance when practicable, or as quickly as practicable once the immediate emergency or threat has passed.

#### **4.15 Cooperating Association/Friends Groups**

Midway Atoll National Wildlife Refuge is fortunate to have a dedicated support group in the form of the Friends of Midway Atoll National Wildlife Refuge. This nonprofit group was formed in 1999 and currently has more than 200 members from across the Nation. The Friends group was formed to:

- support Midway Atoll National Wildlife Refuge in its efforts to preserve, protect, and restore the biological diversity and historical resources of Midway Atoll, while providing opportunity for wildlife-dependent recreation, education, and scientific research.
- make available interpretive and educational books and pamphlets primarily through retail book sales outlets and free distribution to add to the visitor's understanding of the refuge's management problems and programs, the natural and historic resources of the area, the Refuge System, and FWS.
- contribute funds, goods, and services for FWS interpretation, recreation, and educational programs. Interpretive, recreational, and educational facilities may also be constructed, rehabilitated, or maintained with the use of Friends donations.

The Friends of Midway Atoll operate a gift store on Midway, making such refuge or Monument-related items as books, posters, postcards, coffee mugs, tee shirts, and note cards available to visitors and residents. Donations from the Friends group are used to improve, maintain, and update Midway Atoll's interpretive, educational, recreational, or biological programs or facilities. In the past, the Friends have purchased bicycles for the refuge and financially supported the annual albatross count by volunteers. They sought grants to fund invasive species control work by volunteers that began in December 2006.

## Chapter 5 Implementing the Plan

### 5.1 Proposed Staffing

Current FWS staffing at Midway Atoll includes a refuge manager, deputy refuge manager, wildlife biologist, biological science technician, park ranger (law enforcement), supervisory visitor services manager, park ranger (interpretive), equipment operator, and administrative officer (stationed in Honolulu). The supervisory visitor services manager has the primary responsibility for Midway’s visitor program, including program development, program implementation, program evaluation, coordination with Monument partners, and supervision of the interpretive staff. This employee is responsible for implementing the visitor services plan for Midway in collaboration with Monument Co-Trustee staff. FWS staff in Honolulu will continue to provide support for the Midway visitor program. With the very limited visitor program currently operating at Midway Atoll, this staff has been able to provide visitor services outlined in this plan. When large groups are scheduled to stop at Midway, the sponsor covers the cost of bringing additional visitor services staff to the atoll from the main Hawaiian Islands.

This plan includes activities that can be implemented with funded staff, but longer term development of the visitor program will require additional staff, including additional refuge interpretive rangers. Long-term qualified volunteers may also assist with staffing. In addition, our operations contractor will need to hire additional staff to support the visitor program. These positions will be phased in over the next 5 years as the program is implemented. Staffing may also be augmented by other Monument staff from NOAA or the State of Hawai‘i should those resources become available.

### 5.2 Table of Projects

The table below summarizes the various strategies and projects outlined in this visitor services plan. Implementation of these projects is dependent upon the availability of funding.

**Table 5.2.1 Summary of Strategies/Projects**

Strategy	Project	Target Date
4.7	Complete evaluation of visitor program and make recommendations for improvements	03/31/2009
5.2	Construct a migratory bird/Laysan duck observation blind	03/31/2009
17.1	Assess need to contract with a marketing firm to promote the visitor program	03/31/2009
7.1	Conduct annual educator/conservation leader workshops based on Navigating Change	06/30/2009
11.2	Transition wildlife-related visitor center into a Monument visitor center	09/30/2009
13.1	Develop and install exhibit at Mokuapāpapa Discovery Center	12/31/2009
8.3	Facilitate wildlife-dependent educational classes or educational camps	12/31/2009
5.4	Acquire new vessels to support visitor services program	10/31/2010
1.2	Seek larger capacity aircraft to service Midway Atoll on a regular basis	12/31/2010
13.2	Develop Battle of Midway National Memorial interpretive exhibit in Pearl Harbor Historic District	12/31/2010
5.3	Work with NOAA Co-Trustees to reestablish a dive program for visitors	05/31/2011
10.1	Complete Midway Atoll interpretive plan	12/31/2012
4.5	Develop and install interpretive exhibits and signs in accordance with interpretive plan	05/31/2015

Strategy	Project	Target Date
1.1 and 8.5	Establish additional housing opportunities for individuals and groups	Dependent upon the availability of funding
9.2	Initiate a distance learning program from Midway Atoll	Dependent upon availability of funding
12.5	Restore historic building to house Midway Atoll museum	Dependent upon availability of funding
5.5	Establish remote viewing cameras on sensitive species	Dependent upon availability of funding

### **5.3 Partnership Funding and Resources**

Midway Atoll has several partnering opportunities with other government entities. Henderson Field, Sand Island’s airport, is operated in partnership with the Department of Transportation’s Federal Aviation Administration (FAA). Significant funding has been provided by FAA to not only operate the facility but to upgrade its facilities to meet their Part 139 standards. In addition to serving the needs of Midway Atoll, the airfield is operated as an emergency landing site for twin-engine aircraft flying across the Pacific Ocean.

As part of the Monument, the refuge also partners with NOAA’s National Marine Sanctuary Program, which shares jurisdiction for the Monument with FWS. We are also committed to working with the State of Hawai‘i on Monument programs and issues. Opportunities to share resources and projects with these entities will bring enhanced efficiencies and effectiveness to all of our work in the Northwestern Hawaiian Islands.

NOAA’s National Marine Fisheries Service also monitors Hawaiian monk seals on Midway. It also established a monk seal “captive care and release” program on Midway to enhance survivability rates for female monk seal pups as a cooperative conservation effort between NOAA, FWS, and nongovernmental organizations.

NOAA’s Office of Law Enforcement provides significant support by enforcing Monument regulations, including at Midway Atoll.

Another Department of the Interior agency, the U.S. Geological Survey, worked with refuge staff to bring the endangered Laysan duck to Midway, establishing only the second wild population of the species in the world. The National Park Service has provided funding for historic preservation on Midway through the “Save America’s Treasures” program and has also provided interpreters to assist with guided tours when large groups visit Midway.

Together, FWS and its Co-Trustees coordinate with the U.S. Coast Guard as they exercise their law enforcement, search and rescue, and medical evacuation responsibilities in the central Pacific. The Coast Guard is working with FWS to store aircraft fuel on Midway for mission-related use, and occasionally crews will stay on Midway during extended operations.

The Monument Co-Trustees also partner with universities to conduct research on Midway that will lead to better management of its resources and with documentary filmmakers and photographers who broaden public knowledge of Midway’s wildlife and historic resources.

Other valued partners include our dedicated refuge volunteers, who generally give 3 months or more of their time working on Midway, and the Friends of Midway Atoll, our refuge support group.

**Proclamation 8031—Establishment of the  
Northwestern Hawaiian Islands Marine  
National Monument**

---

**Presidential Documents**

---

Title 3—

**Proclamation 8031 of June 15, 2006****The President****Establishment of the Northwestern Hawaiian Islands Marine National Monument****By the President of the United States of America****A Proclamation**

In the Pacific Ocean northwest of the principal islands of Hawaii lies an approximately 1,200 nautical mile stretch of coral islands, seamounts, banks, and shoals. The area, including the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, the Midway National Wildlife Refuge, the Hawaiian Islands National Wildlife Refuge, and the Battle of Midway National Memorial, supports a dynamic reef ecosystem with more than 7,000 marine species, of which approximately half are unique to the Hawaiian Island chain. This diverse ecosystem is home to many species of coral, fish, birds, marine mammals, and other flora and fauna including the endangered Hawaiian monk seal, the threatened green sea turtle, and the endangered leatherback and hawksbill sea turtles. In addition, this area has great cultural significance to Native Hawaiians and a connection to early Polynesian culture worthy of protection and understanding.

WHEREAS Executive Order 13089 of June 11, 1998, Executive Order 13178 of December 4, 2000, and Executive Order 13196 of January 18, 2001, as well as the process for designation of a National Marine Sanctuary undertaken by the Secretary of Commerce, have identified objects of historic or scientific interest that are situated upon the lands owned or controlled by the Government of the United States in the area of the Northwestern Hawaiian Islands;

WHEREAS section 2 of the Act of June 8, 1906 (34 Stat. 225, 16 U.S.C. 431) (the “Antiquities Act”) authorizes the President, in his discretion, to declare by public proclamation historic landmarks, historic and prehistoric structures, and other objects of historic or scientific interest that are situated upon lands owned or controlled by the Government of the United States to be national monuments, and to reserve as a part thereof parcels of land, the limits of which in all cases shall be confined to the smallest area compatible with the proper care and management of the objects to be protected;

WHEREAS it would be in the public interest to preserve the marine area of the Northwestern Hawaiian Islands and certain lands as necessary for the care and management of the historic and scientific objects therein,

NOW, THEREFORE, I, GEORGE W. BUSH, President of the United States of America, by the authority vested in me by section 2 of the Act of June 8, 1906 (34 Stat. 225, 16 U.S.C. 431), do proclaim that there are hereby set apart and reserved as the Northwestern Hawaiian Islands Marine National Monument (the “monument” or “national monument”) for the purpose of protecting the objects described above, all lands and interests in lands owned or controlled by the Government of the United States within the boundaries described on the accompanying map entitled “Northwestern Hawaiian Islands Marine National Monument” attached to and forming a part of this proclamation. The Federal land and interests in land reserved includes approximately 139,793 square miles of emergent and submerged lands and waters of the Northwestern Hawaiian Islands, which is the smallest

area compatible with the proper care and management of the objects to be protected.

All Federal lands and interests in lands within the boundaries of this monument are hereby appropriated and withdrawn from all forms of entry, location, selection, sale, or leasing or other disposition under the public land laws, including, but not limited to, withdrawal from location, entry, and patent under mining laws, and from disposition under all laws relating to mineral and geothermal leasing.

The Secretary of Commerce, through the National Oceanic and Atmospheric Administration (NOAA), will have primary responsibility regarding management of the marine areas, in consultation with the Secretary of the Interior. The Secretary of the Interior, through the Fish and Wildlife Service (FWS), will have sole responsibility for management of the areas of the monument that overlay the Midway Atoll National Wildlife Refuge, the Battle of Midway National Memorial, and the Hawaiian Islands National Wildlife Refuge, in consultation with the Secretary of Commerce.

The Secretary of Commerce and the Secretary of the Interior (collectively, the "Secretaries") shall review and, as appropriate, modify the interagency agreement developed for coordinated management of the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, signed on May 19, 2006. To manage the monument, the Secretary of Commerce, in consultation with the Secretary of the Interior and the State of Hawaii, shall modify, as appropriate, the plan developed by NOAA's National Marine Sanctuary Program through the public sanctuary designation process, and will provide for public review of that plan. To the extent authorized by law, the Secretaries, acting through the FWS and NOAA, shall promulgate any additional regulations needed for the proper care and management of the objects identified above.

The Secretary of State, in consultation with the Secretaries, shall take appropriate action to enter into negotiations with other governments to make necessary arrangements for the protection of the monument and to promote the purposes for which the monument is established. The Secretary of State, in consultation with the Secretaries, shall seek the cooperation of other governments and international organizations in furtherance of the purposes of this proclamation and consistent with applicable regional and multilateral arrangements for the protection and management of special marine areas. Furthermore, this proclamation shall be applied in accordance with international law. No restrictions shall apply to or be enforced against a person who is not a citizen, national, or resident alien of the United States (including foreign flag vessels) unless in accordance with international law.

Nothing in this proclamation shall be deemed to diminish or enlarge the jurisdiction of the State of Hawaii.

The establishment of this monument is subject to valid existing rights and use of the monument shall be administered as follows:

#### **Access to the Monument**

The Secretaries shall prohibit entering the monument except pursuant to permission granted by the Secretaries or their designees. Any person passing through the monument without interruption must notify an official designated by the Secretaries at least 72 hours, but no longer than 1 month, prior to the entry date. Notification of departure from the monument must be provided within 12 hours of leaving. A person providing notice must provide the following information, as applicable: (i) position when making report; (ii) vessel name and International Maritime Organization identification number; (iii) name, address, and telephone number of owner and operator; (iv) United States Coast Guard (USCG) documentation, State license, or registration number; (v) home port; (vi) intended and actual route through the monument; (vii) general categories of any hazardous cargo on board; and (viii) length of vessel and propulsion type (e.g., motor or sail).

#### **Vessel Monitoring Systems**

1. As soon as possible but not later than 30 days following the issuance of this proclamation, NOAA shall publish in the **Federal Register** a list of approved transmitting units and associated communications service providers for purposes of this proclamation. An owner or operator of a vessel that has been issued a permit for accessing the monument must ensure that such a vessel has an operating vessel monitoring system (VMS) on board, approved by the Office of Legal Enforcement in the National Oceanic and Atmospheric Administration in the Department of Commerce (OLE) when voyaging within the monument. An operating VMS includes an operating mobile transmitting unit on the vessel and a functioning communication link between the unit and OLE as provided by an OLE-approved communication service provider.
2. Only a VMS that has been approved by OLE may be used. When installing and activating the OLE-approved VMS, or when reinstalling and reactivating such VMS, the vessel owner or operator must:
  - a. Follow procedures indicated on an installation and activation checklist, which is available from OLE; and
  - b. Submit to OLE a statement certifying compliance with the checklist, as prescribed on the checklist.
3. No person may interfere with, tamper with, alter, damage, disable, or impede the operation of the VMS, or attempt any of the same.
4. When a vessel's VMS is not operating properly, the owner or operator must immediately contact OLE, and follow instructions from that office. If notified by OLE that a vessel's VMS is not operating properly, the owner and operator must follow instructions from that office. In either event, such instructions may include, but are not limited to, manually communicating to a location designated by OLE the vessel's positions or returning to port until the VMS is operable.
5. As a condition of authorized access to the monument, a vessel owner or operator subject to the requirements for a VMS in this section must allow OLE, the USCG, and their authorized officers and designees access to the vessels position data obtained from the VMS. Consistent with applicable law, including the limitations on access to, and use, of VMS data collected under the Magnuson-Stevens Fishery Conservation and Management Act (16 U.S.C. 1801 *et seq.*), the Secretaries may have access to, and use of, collected data for scientific, statistical, and management purposes.
6. OLE has authority over the installation and operation of the VMS unit. OLE may authorize the connection or order the disconnection of additional equipment, including a computer, to any VMS unit, when deemed appropriate by OLE.
7. The Secretaries shall prohibit any person from conducting or causing to be conducted:
  - a. Operating any vessel without an approved transmitting device within the monument area 45 days after the publication of the list of approved transmitting devices described in paragraph (1) above;
  - b. Failing to install, activate, repair, or replace a mobile transceiver unit prior to leaving port;
  - c. Failing to operate and maintain a mobile transceiver unit on board the vessel at all times;
  - d. Tampering with, damaging, destroying, altering, or in any way distorting, rendering useless, inoperative, ineffective, or inaccurate the VMS, mobile transceiver unit, or VMS signal required to be installed on or transmitted by a vessel;
  - e. Failing to contact OLE or follow OLE instructions when automatic position reporting has been interrupted;
  - f. Registering a VMS or mobile transceiver unit registered to more than one vessel at the same time;

g. Connecting or leaving connected additional equipment to a VMS unit or mobile transceiver unit without the prior approval of OLE;

h. Making a false statement, oral or written, to an authorized officer regarding the installation, use, operation, or maintenance of a VMS unit or mobile transceiver unit or communication service provider.

### **Restrictions**

#### *Prohibited Activities*

The Secretaries shall prohibit persons from conducting or causing to be conducted the following activities:

1. Exploring for, developing, or producing oil, gas, or minerals within the monument;
2. Using or attempting to use poisons, electrical charges, or explosives in the collection or harvest of a monument resource;
3. Introducing or otherwise releasing an introduced species from within or into the monument; and
4. Anchoring on or having a vessel anchored on any living or dead coral with an anchor, anchor chain, or anchor rope.

#### *Regulated Activities*

Except as otherwise provided in this proclamation, the Secretaries shall prohibit any person from conducting or causing to be conducted within the monument the following activities:

1. Removing, moving, taking, harvesting, possessing, injuring, disturbing, or damaging; or attempting to remove, move, take, harvest, possess, injure, disturb, or damage any living or nonliving monument resource;
2. Drilling into, dredging, or otherwise altering the submerged lands other than by anchoring a vessel; or constructing, placing, or abandoning any structure, material, or other matter on the submerged lands;
3. Anchoring a vessel;
4. Deserting a vessel aground, at anchor, or adrift;
5. Discharging or depositing any material or other matter into Special Preservation Areas or the Midway Atoll Special Management Area except vessel engine cooling water, weather deck runoff, and vessel engine exhaust;
6. Discharging or depositing any material or other matter into the monument, or discharging or depositing any material or other matter outside of the monument that subsequently enters the monument and injures any resources of the monument, except fish parts (i.e., chumming material or bait) used in and during authorized fishing operations, or discharges incidental to vessel use such as deck wash, approved marine sanitation device effluent, cooling water, and engine exhaust;
7. Touching coral, living or dead;
8. Possessing fishing gear except when stowed and not available for immediate use during passage without interruption through the monument;
9. Swimming, snorkeling, or closed or open circuit SCUBA diving within any Special Preservation Area or the Midway Atoll Special Management Area; and
10. Attracting any living monument resources.

### **Emergencies and Law Enforcement Activities**

The prohibitions required by this proclamation shall not apply to activities necessary to respond to emergencies threatening life, property, or the environment, or to activities necessary for law enforcement purposes.

### **Armed Forces Actions**

1. The prohibitions required by this proclamation shall not apply to activities and exercises of the Armed Forces (including those carried out by the United States Coast Guard) that are consistent with applicable laws.
2. Nothing in this proclamation shall limit agency actions to respond to emergencies posing an unacceptable threat to human health or safety or to the marine environment and admitting of no other feasible solution.
3. All activities and exercises of the Armed Forces shall be carried out in a manner that avoids, to the extent practicable and consistent with operational requirements, adverse impacts on monument resources and qualities.
4. In the event of threatened or actual destruction of, loss of, or injury to a monument resource or quality resulting from an incident, including but not limited to spills and groundings, caused by a component of the Department of Defense or the USCG, the cognizant component shall promptly coordinate with the Secretaries for the purpose of taking appropriate actions to respond to and mitigate the harm and, if possible, restore or replace the monument resource or quality.

#### **Commercial Fishing**

1. The Secretaries shall ensure that any commercial lobster fishing permit shall be subject to a zero annual harvest limit.
2. Fishing for bottomfish and pelagic species. The Secretaries shall ensure that:
  - a. Commercial fishing for bottomfish and associated pelagic species may continue within the monument for not longer than 5 years from the date of this proclamation provided that:
    - (i) The fishing is conducted in accordance with a valid commercial bottomfish permit issued by NOAA; and
    - (ii) Such permit is in effect on the date of this proclamation and is subsequently renewed pursuant to NOAA regulations at 50 CFR part 660 subpart E as necessary.
  - b. Total landings for each fishing year may not exceed the following amounts:
    - (i) 350,000 pounds for bottomfish species; and
    - (ii) 180,000 pounds for pelagic species.
  - c. Commercial fishing for bottomfish and associated pelagic species is prohibited in the monument after 5 years from the date of this proclamation.

#### **General Requirements**

The Secretaries shall ensure that any commercial fishing within the monument is conducted in accordance with the following restrictions and conditions:

1. A valid permit or facsimile of a valid permit is on board the fishing vessel and is available for inspection by an authorized officer;
2. No attempt is made to falsify or fail to make, keep, maintain, or submit any logbook or logbook form or other required record or report;
3. Only gear specifically authorized by the relevant permit issued under the Magnuson-Stevens Fishery Conservation and Management Act is allowed to be in the possession of a person conducting commercial fishing under this section;
4. Any person conducting commercial fishing notifies the Secretaries by telephone, facsimile, or electronic mail at least 72 hours before entering the monument and within 12 hours after leaving the monument;
5. All fishing vessels must carry an activated and functioning VMS unit on board at all times whenever the vessel is in the monument;
6. All fishing vessels must carry an observer when requested to do so by the Secretaries; and

7. The activity does not take place within any Ecological Reserve, any Special Preservation Area, or the Midway Atoll Special Management Area.

#### **Permitting Procedures and Criteria**

Subject to such terms and conditions as the Secretaries deem appropriate, a person may conduct an activity regulated by this proclamation if such activity is specifically authorized by a permit. The Secretaries, in their discretion, may issue a permit under this proclamation if the Secretaries find that the activity: (i) is research designed to further understanding of monument resources and qualities; (ii) will further the educational value of the monument; (iii) will assist in the conservation and management of the monument; (iv) will allow Native Hawaiian practices; (v) will allow a special ocean use; or (vi) will allow recreational activities.

#### **Findings**

1. The Secretaries may not issue any permit unless the Secretaries find:
  - a. The activity can be conducted with adequate safeguards for the resources and ecological integrity of the monument;
  - b. The activity will be conducted in a manner compatible with the management direction of this proclamation, considering the extent to which the conduct of the activity may diminish or enhance monument resources, qualities, and ecological integrity, any indirect, secondary, or cumulative effects of the activity, and the duration of such effects;
  - c. There is no practicable alternative to conducting the activity within the monument;
  - d. The end value of the activity outweighs its adverse impacts on monument resources, qualities, and ecological integrity;
  - e. The duration of the activity is no longer than necessary to achieve its stated purpose;
  - f. The applicant is qualified to conduct and complete the activity and mitigate any potential impacts resulting from its conduct;
  - g. The applicant has adequate financial resources available to conduct and complete the activity and mitigate any potential impacts resulting from its conduct;
  - h. The methods and procedures proposed by the applicant are appropriate to achieve the proposed activity's goals in relation to their impacts to monument resources, qualities, and ecological integrity;
  - i. The applicant's vessel has been outfitted with a mobile transceiver unit approved by OLE and complies with the requirements of this proclamation; and
  - j. There are no other factors that would make the issuance of a permit for the activity inappropriate.
2. *Additional Findings for Native Hawaiian Practice Permits.* In addition to the findings listed above, the Secretaries shall not issue a permit to allow Native Hawaiian practices unless the Secretaries find:
  - a. The activity is non-commercial and will not involve the sale of any organism or material collected;
  - b. The purpose and intent of the activity are appropriate and deemed necessary by traditional standards in the Native Hawaiian culture (pono), and demonstrate an understanding of, and background in, the traditional practice, and its associated values and protocols;
  - c. The activity benefits the resources of the Northwestern Hawaiian Islands and the Native Hawaiian community;
  - d. The activity supports or advances the perpetuation of traditional knowledge and ancestral connections of Native Hawaiians to the Northwestern Hawaiian Islands; and

- e. Any monument resource harvested from the monument will be consumed in the monument.
3. *Additional Findings, Criteria, and Requirements for Special Ocean Use Permits*
- a. In addition to the findings listed above, the following requirements apply to the issuance of a permit for a special ocean use:
- (i) Any permit for a special ocean use issued under this section:
- (A) Shall authorize the conduct of an activity only if that activity is compatible with the purposes for which the monument is designated and with protection of monument resources;
- (B) Shall not authorize the conduct of any activity for a period of more than 5 years unless renewed by the Secretaries;
- (C) Shall require that activities carried out under the permit be conducted in a manner that does not destroy, cause the loss of, or injure monument resources; and
- (D) Shall require the permittee to purchase and maintain comprehensive general liability insurance, or post an equivalent bond, against claims arising out of activities conducted under the permit and to agree to hold the United States harmless against such claims; and
- (ii) Each person issued a permit for a special ocean use under this section shall submit an annual report to the Secretaries not later than December 31 of each year that describes activities conducted under that permit and revenues derived from such activities during the year.
- b. The Secretaries may not issue a permit for a special ocean use unless they determine that the proposed activity will be consistent with the findings listed above for the issuance of any permit.
- c. Categories of special ocean use being permitted for the first time under this section will be restricted in duration and permitted as a special ocean use pilot project. Subsequent permits for any category of special ocean use may be issued only if a special ocean use pilot project for that category has been determined by the Secretaries to meet the criteria in this proclamation and any terms and conditions placed on the permit for the pilot project.
- d. The Secretaries shall provide public notice prior to requiring a special ocean use permit for any category of activity not previously identified as a special ocean use.
- e. The following requirements apply to permits for a special ocean use for an activity within the Midway Atoll Special Management Area.
- (i) The Secretaries may issue a permit for a special ocean use for activities within the Midway Atoll Special Management Area provided:
- (A) The Secretaries find the activity furthers the conservation and management of the monument; and
- (B) The Director of the United States Fish and Wildlife Service or his or her designee has determined that the activity is compatible with the purposes for which the Midway Atoll National Wildlife Refuge was designated.
- (ii) As part of a permit, the Secretaries may allow vessels to transit the monument as necessary to enter the Midway Atoll Special Management Area.
- f. The Secretaries may issue a permit for a special ocean use for activities outside the Midway Atoll Special Management Area provided:
- (i) The Secretaries find the activity will directly benefit the conservation and management of the monument;
- (ii) The Secretaries determine the purpose of the activity is for research or education related to the resources or qualities of the monument;
- (iii) The Secretaries provide public notice of the application and an opportunity to provide comments at least 30 days prior to issuing the permit; and

(iv) The activity does not involve the use of a commercial passenger vessel.

4. *Additional Findings for Recreation Permits.* The Secretaries may issue a permit only for recreational activities to be conducted within the Midway Atoll Special Management Area. In addition to the general findings listed above for any permit, the Secretaries may not issue such permit unless the Secretaries find:

- a. The activity is for the purpose of recreation as defined in regulation;
- b. The activity is not associated with any for-hire operation; and
- c. The activity does not involve any extractive use.

#### **Sustenance Fishing**

Sustenance fishing means fishing for bottomfish or pelagic species that are consumed within the monument, and is incidental to an activity permitted under this proclamation. The Secretaries may permit sustenance fishing outside of any Special Preservation Area as a term or condition of any permit issued under this proclamation. The Secretaries may not permit sustenance fishing in the Midway Atoll Special Management Area unless the activity has been determined by the Director of the United States Fish and Wildlife Service or his or her designee to be compatible with the purposes for which the Midway Atoll National Wildlife Refuge was established. Sustenance fishing must be conducted in a manner compatible with this proclamation, including considering the extent to which the conduct of the activity may diminish monument resources, qualities, and ecological integrity, as well as any indirect, secondary, or cumulative effects of the activity and the duration of such effects. The Secretaries will develop procedures for systematic reporting of sustenance fishing.

**Definitions** For purposes of this proclamation:

*Attract or Attracting* means luring or attempting to lure a living resource by any means, except the mere presence of human beings (e.g., swimmers, divers, boaters).

*Bottomfish Species* means bottomfish management unit species as defined at 50 CFR 660.12.

*Commercial Bottomfishing* means commercial fishing for bottomfish species.

*Commercial Passenger Vessel* means a vessel that carries individuals who have paid for such carriage.

*Commercial Pelagic Trolling* means commercial fishing for pelagic species.

*Deserting* a vessel means:

1. Leaving a vessel aground or adrift:
  - (i) Without notifying the Secretaries of the vessel going aground or adrift within 12 hours of its discovery and developing and presenting to the Secretaries a preliminary salvage plan within 24 hours of such notification;
  - (ii) After expressing or manifesting intention to not undertake or to cease salvage efforts; or
  - (iii) When the Secretaries are unable, after reasonable efforts, to reach the owner/operator within 12 hours of the vessels condition being reported to authorities.
2. Leaving a vessel at anchor when its condition creates potential for a grounding, discharge, or deposit and the owner/operator fails to secure the vessel in a timely manner.

*Ecological Reserve* means an area of the monument consisting of contiguous, diverse habitats that provide natural spawning, nursery, and permanent residence areas for the replenishment and genetic protection of marine life, and also to protect and preserve natural assemblages of habitats and species within areas representing a broad diversity of resources and habitats found within the monument.

*Ecological Integrity* means a condition determined to be characteristic of an ecosystem that has the ability to maintain the function, structure, and abundance of natural biological communities, including rates of change in response to natural environmental variation.

*Fishing Year* means the year beginning at 0001 local time on January 1 and ending at 2400 local time on December 31.

*Introduced Species* means:

1. A species (including, but not limited to, any of its biological matter capable of propagation) that is non-native to the ecosystem(s) protected by the monument; or
2. Any organism into which genetic matter from another species has been transferred in order that the host organism acquires the genetic traits of the transferred genes.

*Landing* means offloading fish from a fishing vessel or causing fish to be offloaded from a fishing vessel.

*Midway Atoll Special Management Area* means the area of the monument surrounding Midway Atoll out to a distance of 12 nautical miles, established for the enhanced management, protection, and preservation of monument wildlife and historical resources.

*Mobile Transceiver Unit* means a vessel monitoring system or VMS device installed on board a vessel that is used for vessel monitoring and transmitting the vessel's position as required by this proclamation.

*Native Hawaiian Practices* means cultural activities conducted for the purposes of perpetuating traditional knowledge, caring for and protecting the environment, and strengthening cultural and spiritual connections to the Northwestern Hawaiian Islands that have demonstrable benefits to the Native Hawaiian community. This may include, but is not limited to, the non-commercial use of monument resources for direct personal consumption while in the monument.

*Ocean-Based Ecotourism* means a class of fee-for-service activities that involves visiting the monument for study, enjoyment, or volunteer assistance for purposes of conservation and management.

*Pelagic Species* means Pacific Pelagic Management Unit Species as defined at 50 CFR 660.12.

*Pono* means appropriate, correct, and deemed necessary by traditional standards in the Hawaiian culture.

*Recreational Activity* means an activity conducted for personal enjoyment that does not result in the extraction of monument resources and that does not involve a fee-for-service transaction. This includes, but is not limited to, wildlife viewing, SCUBA diving, snorkeling, and boating.

*Special Preservation Area (SPA)* means discrete, biologically important areas of the monument within which uses are subject to conditions, restrictions, and prohibitions, including but not limited to access restrictions. SPAs are used to avoid concentrations of uses that could result in declines in species populations or habitat, to reduce conflicts between uses, to protect areas that are critical for sustaining important marine species or habitats, or to provide opportunities for scientific research.

*Special Ocean Use* means an activity or use of the monument that is engaged in to generate revenue or profits for one or more of the persons associated with the activity or use, and does not destroy, cause the loss of, or injure monument resources. This includes ocean-based ecotourism and other activities such as educational and research activities that are engaged in to generate revenue, but does not include commercial fishing for bottomfish or pelagic species conducted pursuant to a valid permit issued by NOAA.

*Stowed and Not Available for Immediate Use* means not readily accessible for immediate use, e.g., by being securely covered and lashed to a deck

or bulkhead, tied down, unbaited, unloaded, or partially disassembled (such as spear shafts being kept separate from spear guns).

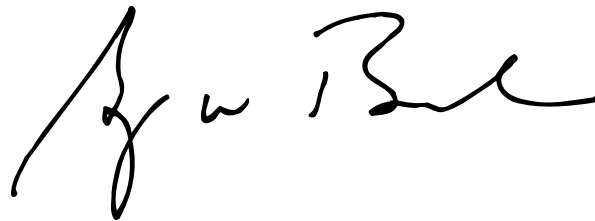

*Sustenance Fishing* means fishing for bottomfish or pelagic species in which all catch is consumed within the monument, and that is incidental to an activity permitted under this proclamation.

*Vessel Monitoring System or VMS* means a vessel monitoring system or mobile transceiver unit approved by the Office for Law Enforcement for use on vessels permitted to access the monument, as required by this subpart.

Nothing in this proclamation shall be deemed to revoke any existing withdrawal, reservation, or appropriation; however, the national monument shall be the dominant reservation.

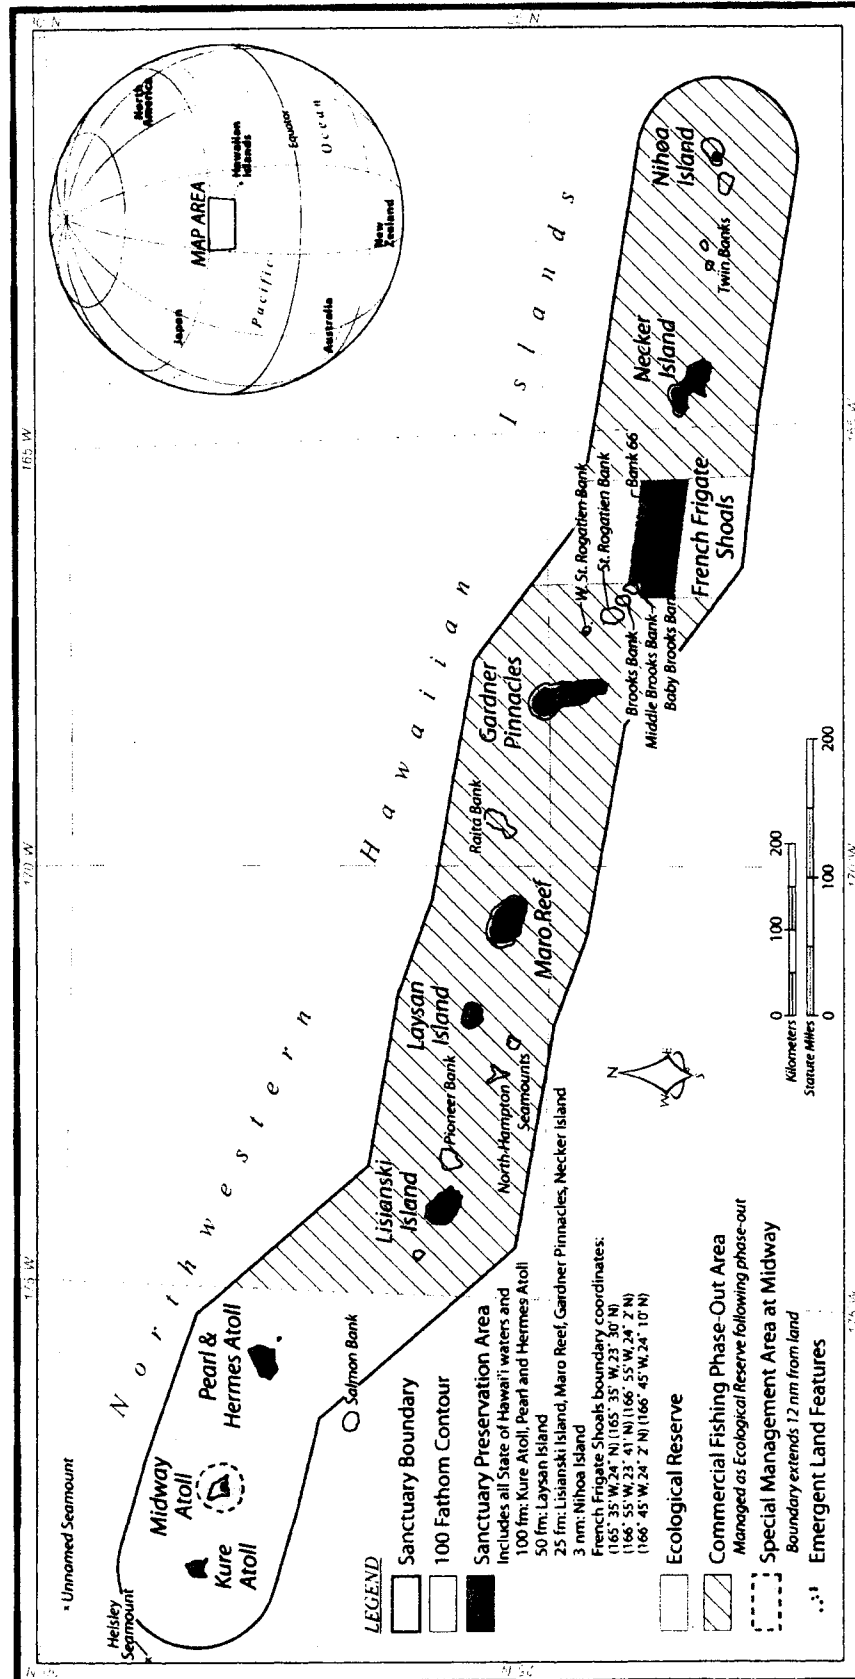

Warning is hereby given to all unauthorized persons not to appropriate, injure, destroy, or remove any feature of this monument and not to locate or settle upon any lands thereof.

IN WITNESS WHEREOF, I have hereunto set my hand this fifteenth day of June, in the year of our Lord two thousand six, and of the Independence of the United States of America the two hundred and thirtieth.

Billing code 3195-01-P

Proclamation 8112 of February 28, 2007

## The President

**Amending Proclamation 8031 of June 15, 2006, To Read, “Establishment of the Papahānaumokuākea Marine National Monument”**

By the President of the United States of America

**A Proclamation**

WHEREAS Proclamation 8031 of June 15, 2006, established the Northwestern Hawaiian Islands Marine National Monument;

NOW, THEREFORE, I, GEORGE W. BUSH, President of the United States of America, by the authority vested in me by the Constitution and the laws of the United States, including section 2 of the Act of June 8, 1906 (34 Stat. 225, 16 U.S.C. 431), do amend Proclamation 8031 for the purpose of giving the monument a Native Hawaiian name and making the following conforming changes and corrections;

**Section 1.** The title of Proclamation 8031 is amended to read, “Establishment of the Papahānaumokuākea Marine National Monument”.

**Sec. 2.** The phrase Northwestern Hawaiian Islands Marine National Monument is amended to read Papahānaumokuākea Marine National Monument, wherever it appears in Proclamation 8031.

**Sec. 3.** Under *Findings, Additional Findings for Native Hawaiian Practice Permits*, 2(e) is amended to read: *Any living monument resource harvested from the monument will be consumed or utilized in the monument.*

**Sec. 4.** The title of the map of the Monument accompanying Proclamation 8031 is amended to read, “Papahānaumokuākea Marine National Monument” and the word “Sanctuary” in the map is deleted wherever it appears and the word “Monument” is inserted in lieu thereof.

### Northwestern Hawaiian Islands Marine National Monument

**AGENCIES:** National Oceanic and Atmospheric Administration (NOAA), Department of Commerce (DOC); United States Fish and Wildlife Service (USFWS), Department of the Interior (DOI).

**ACTION:** Final rule.

**SUMMARY:** NOAA and the USFWS are issuing final regulations for the Northwestern Hawaiian Islands Marine National Monument. This action codifies the prohibitions and management measures set forth in Presidential Proclamation 8031 establishing the Monument. The rule is effective immediately.

**DATES:** *Effective date:* These regulations are effective August 25, 2006. Written comments on the information collection requirement must be received by October 30, 2006.

**ADDRESSES:** Submit written comments regarding the burden-hour estimates or other aspects of the information collection requirements contained in this proposed rule by e-mail to Diana Hynek at [dHynek@noaa.gov](mailto:dHynek@noaa.gov).

Coordinates for the outer boundary of the Monument, the Special Preservation Areas, the Ecological Reserves, and the Midway Atoll Special Management Area can be found at: <http://hawaiireef.noaa.gov/management/>.

**FOR FURTHER INFORMATION CONTACT:** NOAA contact: T. Aulani Wilhelm, Monument Superintendent (NOAA); 6600 Kalaniana'ole Highway, #300, Honolulu, HI 96825; (808) 397-2657.

FWS contact: Barry Stieglitz, Monument Project Leader (USFWS); Hawaiian and Pacific Islands NWR Complex, 300 Ala Moana Boulevard, Box 50167, Honolulu, HI 96850-5000; 808-792-9540.

*State of Hawaii contact:* Athline Clark, Special Projects Manager, Department of Land and Natural Resources, Division of Aquatic Resources; 1151 Punchbowl Street, Room 330, Honolulu, HI 96813; (808) 587-0099.

**SUPPLEMENTARY INFORMATION:** On June 15, 2006, President Bush established the Northwestern Hawaiian Islands Marine National Monument by issuing Presidential Proclamation 8031 (71 FR 36443, June 26, 2006) under the authority of the Antiquities Act (Act) (16 U.S.C. 431). The Proclamation reserves all lands and interests in lands owned or controlled by the Government of the United States in the Northwestern Hawaiian Islands (NWHI), including emergent and submerged lands and waters, out to a distance of approximately 50 nautical miles (nmi) from the islands. The outer boundary of the Monument is approximately 100 nmi wide and extends approximately 1200 nmi around coral islands, seamounts, banks, and shoals. The area includes the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, the Midway Atoll National Wildlife Refuge/Battle of Midway National Memorial, and the Hawaiian Islands National Wildlife Refuge.

The Proclamation appropriated and withdrew the area from all forms of entry, location, selection, sale, or leasing or other disposition under the public land laws, including, but not limited to, withdrawal from location, entry, and patent under mining laws, and from disposition under all laws relating to mineral and geothermal leasing.

The Proclamation provides that the Secretary of Commerce, through NOAA, has primary responsibility regarding the management of the marine areas of the Monument, in consultation with the Secretary of the Interior. The Secretary of the Interior, through the USFWS, has sole responsibility for management of the areas of the Monument that overlay the Midway Atoll National Wildlife Refuge, the Battle of Midway National Memorial, and the Hawaiian Islands National Wildlife Refuge, in consultation with the Secretary of Commerce. Further, the Proclamation

provides that nothing in the Proclamation diminishes or enlarges the jurisdiction of the State of Hawaii. The Monument includes state waters, including the Northwestern Hawaiian Islands State Marine Refuge and Kure Atoll Wildlife Sanctuary. The State currently holds the submerged and ceded lands of the NWHI in trust. This public trust is overseen by the Office of Hawaiian Affairs through an amendment to the Constitution of the State of Hawaii. The State of Hawaii has primary responsibility for managing the State waters of the Monument.

The three principal entities with responsibility for managing lands and waters of the Monument—NOAA, USFWS, and the State of Hawaii (collectively, the Co-Trustees)—are working cooperatively and will consult to administer the Monument. The Co-Trustees have established a goal to provide unified management in the spirit of cooperative conservation. This relationship will be further described in a Memorandum of Agreement among the Co-Trustees.

The Proclamation requires restrictions and prohibitions regarding activities in the Monument consistent with the authority provided by the Act. The Proclamation shall be applied in accordance with international law. No restrictions shall apply to or be enforced against a person who is not a citizen, national, or resident alien of the United States (including foreign flag vessels) unless in accordance with international law. NOAA and USFWS are promulgating as final regulations the management measures and prohibitions set forth in the Proclamation to codify them in the Code of Federal Regulations. This action will provide additional notice to the public and other interested parties of the terms of the Proclamation and activities that are prohibited or regulated and thereby facilitate improved compliance. Interested parties may view Hawaii Administrative Rules also applicable within the Monument at [http://www.hawaii.gov/dlnr/dar/fish\\_regs/nwhi.htm](http://www.hawaii.gov/dlnr/dar/fish_regs/nwhi.htm).

These regulations address the requirement in the Proclamation that the Secretaries shall ensure, in addition to other things, that commercial fishing for bottomfish and other associated pelagic species may continue in the Monument for no more than 5 years. Section 404.10 sets out the conditions under which such fishing may continue to be conducted. However, commercial fishing remains prohibited in areas of the Monument not open to such fishing prior to issuance of the Proclamation.

**Classification**

*Administrative Procedure Act*

The Secretaries find good cause to waive notice and comment on these regulations, pursuant to 5 U.S.C. 533(b)(B), and the 30-day delay in effective date pursuant to 5 U.S.C. 553(d). Notice and comment are unnecessary and contrary to the public interest because these regulations do not expand on the action already taken by the President in the Proclamation. The Proclamation became effective upon issuance on June 15, 2006. These regulations codify the prohibitions and management measures set forth in the Proclamation. Therefore, these regulations are being published as final

regulations and are effective August 25, 2006.

*E.O. 12866*

This rule has been determined to be significant for purposes of E.O. 12866.

*Paperwork Reduction Act*

This rule contains a collection-of-information requirement that was submitted to OMB for emergency approval under the Paperwork Reduction Act (PRA). The collection-of-information requirement was approved by OMB and granted OMB control number 0648-0548 which expires on February 28, 2007. We are now requesting comment on this information collection requirement for OMB's

subsequent review and approval on a non-emergency basis.

The public reporting burden for this information collection is described in the table below. The public reporting burden for permit applications and associated reporting requirements is estimated to average 1 hour per response. The public reporting burden for entry and exit notification is expected to average 15 minutes per response. The public reporting burden for VMS checklist certification is estimated to average 5 minutes per response. Each of these public reporting burdens includes the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

**APPLICANT BURDEN**

Permit type	Permits and other reporting per year	Responses per requirement	Total responses	Hours/response	Total hours	Annual record-keeping/reporting cost per response (dollar)	Total annual cost (dollar)

■ Accordingly, NOAA and USFWS add part 404, title 50 of the Code of Federal Regulations as follows:

**PART 404—NORTHWESTERN HAWAIIAN ISLANDS MARINE NATIONAL MONUMENT**

- Sec.
- 404.1 Scope and purpose.
- 404.2 Boundary.
- 404.3 Definitions.
- 404.4 Access to the Monument.
- 404.5 Requirements for a vessel monitoring system.
- 404.6 Prohibited activities.
- 404.7 Regulated activities.
- 404.8 Emergencies and law enforcement activities.
- 404.9 Armed Forces actions.
- 404.10 Commercial fishing.
- 404.11 Permitting procedures and criteria.
- 404.12 International law.
- Appendix A to Part 404—Map of the Monument Outer Boundary and Ecological Reserves, Special Preservation Areas, and Midway Atoll Special Management Area
- Appendix B to Part 404—Approved Vessel Monitoring Systems

**Authority:** 16 U.S.C. 431 *et seq.*; 16 U.S.C. 460k-3; 16 U.S.C. 1801 *et seq.*; 16 U.S.C. 742f, 16 U.S.C. 742l, and 16 U.S.C. 668dd-

ee; 16 U.S.C. 1361 *et seq.*; 16 U.S.C. 1531 *et seq.*, Pub. L. No. 106–513, § 6(g) (2000).

#### § 404.1 Scope and purpose.

The regulations in this part codify the provisions of Presidential Proclamation 8031, and govern the administration of the Northwestern Hawaiian Islands Marine National Monument. These regulations are jointly implemented by the Secretaries of the Interior, through the U.S. Fish and Wildlife Service (USFWS), and Commerce, through the National Oceanic and Atmospheric Administration (NOAA). Nothing in these regulations shall be deemed to diminish or enlarge the jurisdiction of the State of Hawaii.

#### § 404.2 Boundary.

The Northwestern Hawaiian Islands Marine National Monument consists of all lands and interest in lands owned or controlled by the Government of the United States within the boundaries of the Monument, including emergent and submerged lands and waters of the Northwestern Hawaiian Islands. The map in Appendix A to this part 404 depicts the outer boundary of the Monument, which consists of the geodetic lines connecting the coordinates specified in the Proclamation.

#### § 404.3 Definitions.

The following definitions are applicable only to this Part.

*Attract or Attracting* means luring or attempting to lure a living resource by any means, except the mere presence of human beings (e.g., swimmers, divers, boaters).

*Bottomfish Species* means Bottomfish management unit species as defined at 50 CFR 665.12.

*Commercial Bottomfishing* means commercial fishing for bottomfish species.

*Commercial passenger vessel* means a vessel that carries individuals who have paid for such carriage.

*Commercial pelagic trolling* means commercial fishing for pelagic species.

*Deserting a vessel* means:

(1) Leaving a vessel aground or adrift:  
(i) Without notifying the Secretaries of the vessel going aground or adrift within 12 hours of its discovery and developing and presenting to the Secretaries a preliminary salvage plan within 24 hours of such notification;

(ii) After expressing or manifesting intention to not undertake or to cease salvage efforts; or

(iii) When the Secretaries are unable, after reasonable efforts, to reach the owner/operator within 12 hours of the vessel's condition being reported to authorities.

(2) Leaving a vessel at anchor when its condition creates potential for a grounding, discharge, or deposit and the owner/operator fails to secure the vessel in a timely manner.

*Ecological Reserve* means the areas of the Monument, identified in the Proclamation, consisting of contiguous, diverse habitats that provide natural spawning, nursery, and permanent residence areas for the replenishment and genetic protection of marine life, and also to protect and preserve natural assemblages of habitats and species within areas representing a broad diversity of resources and habitats found within the Monument. Specific coordinates for Ecological Reserves within the Monument are found in the Proclamation, and the Ecological Reserves consist of the areas within the geodetic lines connecting these coordinates. The Ecological Reserves are depicted on the map in Appendix A to part 404.

*Ecological integrity* means a condition determined to be characteristic of an ecosystem that has the ability to maintain the function, structure, and abundance of natural biological communities, including rates of change in response to natural environmental variation.

*Fishing year* means the year beginning at 0001 local time on January 1 and ending at 2400 local time on December 31.

*Introduced Species* means:

(1) A species (including, but not limited to, any of its biological matter capable of propagation) that is non-native to the ecosystem(s) protected by the Monument; or

(2) Any organism into which genetic matter from another species has been transferred in order that the host organism acquires the genetic traits of the transferred genes.

*Landing* means offloading fish from a fishing vessel or causing fish to be offloaded from a fishing vessel.

*Midway Atoll Special Management Area* means the area of the Monument surrounding Midway Atoll out to a distance of 12 nautical miles, established for the enhanced management, protection, and preservation of Monument wildlife and historical resources. The geographic coordinates of this area, which consists of the area within the geodetic lines connecting these coordinates, are found in the Proclamation. The Midway Atoll Special Management Area is depicted on the map in Appendix A to part 404.

*Mobile transceiver unit* means a vessel monitoring system or VMS device, as described in Appendix E to this Part, installed on board a vessel that is used

for vessel monitoring and transmitting the vessel's position as required by this Part.

*Monument* means the Northwestern Hawaiian Islands Marine National Monument.

*Native Hawaiian Practices* means cultural activities conducted for the purposes of perpetuating traditional knowledge, caring for and protecting the environment and strengthening cultural and spiritual connections to the Northwestern Hawaiian Islands that have demonstrable benefits to the Native Hawaiian community. This may include, but is not limited to, the non-commercial use of Monument resources for direct personal consumption while in the Monument.

*Ocean-based ecotourism* means a class of fee-for-service activities that involves visiting the Monument for study, enjoyment, or volunteer assistance for purposes of conservation and management.

*Office for Law Enforcement (OLE)* refers to NOAA, National Marine Fisheries Service, Office for Law Enforcement.

*Pelagic Species* means Pacific Pelagic Management Unit Species as defined at 50 CFR 665.12.

*Pono* means appropriate, correct, and deemed necessary by traditional standards in the Hawaiian culture.

*Proclamation* means Presidential Proclamation 8031, dated June 15, 2006 (71 FR 36443).

*Recreational activity* means an activity conducted for personal enjoyment that does not result in the extraction of Monument resources and that does not involve a fee-for-service transaction. This includes, but is not limited to, wildlife viewing, SCUBA diving, snorkeling, and boating.

*Secretaries* means the Secretary of Commerce and the Secretary of the Interior or their designees.

*Special Preservation Area (SPA)* means discrete, biologically important areas of the Monument, identified in the Proclamation, within which uses are subject to conditions, restrictions, and prohibitions, including but not limited to access restrictions. SPAs are used to avoid concentrations of uses that could result in declines in species populations or habitat, to reduce conflicts between uses, to protect areas that are critical for sustaining important marine species or habitats, or to provide opportunities for scientific research. Specific coordinates for Special Preservation Areas within the Monument are found in the Proclamation, and the Special Preservation Areas consist of the areas within the geodetic lines connecting these coordinates. The Special

Preservation Areas are depicted on the map in Appendix A to part 404.

*Special ocean use* means an activity or use of the Monument that is engaged in to generate revenue or profits for one or more of the persons associated with the activity or use, and does not destroy, cause the loss of, or injure Monument resources. This includes ocean-based ecotourism and other activities such as educational and research activities that are engaged in to generate revenue, but does not include commercial fishing for bottomfish or pelagic species conducted pursuant to a valid permit issued by NOAA.

*Stowed and not available for immediate use* means not readily accessible for immediate use, e.g., by being securely covered and lashed to a deck or bulkhead, tied down, unbaited, unloaded, or partially disassembled (such as spear shafts being kept separate from spear guns).

*Sustenance fishing* means fishing for bottomfish or pelagic species in which all catch is consumed within the Monument, and that is incidental to an activity permitted under this part.

*Vessel monitoring system or VMS* means a vessel monitoring system or mobile transceiver unit as described in § 404.5 and approved by Office for Law Enforcement for use on vessels permitted to access the Monument, as required by this Part.

#### § 404.4 Access to the Monument.

(a) Entering the Monument is prohibited and thus unlawful except:

- (1) As provided in §§ 404.8 and 404.9;
- (2) Pursuant to a permit issued under §§ 404.10 or 404.11; or

(3) When conducting passage without interruption in accordance with paragraph (b) of this section.

(b) Any person passing through the Monument without interruption is subject to the prohibitions in §§ 404.5, 404.6, and 404.7 and must provide notification prior to entering and after leaving the Monument. Notification of entry must be provided at least 72 hours, but no longer than 1 month, prior to the entry date. Notification of departure from the Monument must be provided within 12 hours of leaving. Notification under this paragraph may be made via e-mail, telephone or fax by contacting:

(1) E-mail: [nwhi.notifications@commat.noaa.gov](mailto:nwhi.notifications@commat.noaa.gov);  
or

(2) Telephone: 1-866-478-NWHI (6944); or (808) 395-NWHI (6944).

(c) A person providing notice under this paragraph must provide the following information, as applicable:

(1) Position when making report.

(2) Vessel name and International Maritime Organization identification number.

(3) Name, address, and telephone number of owner and operator.

(4) USCG documentation, state license, or registration number.

(5) Home port.

(6) Intended and actual route through the Monument.

(7) General categories of any hazardous cargo on board.

(8) Length of vessel and propulsion type (e.g., motor or sail).

#### § 404.5 Requirements for a vessel monitoring system.

(a) *Requirement for use.* Effective August 28, 2006, an owner or operator of a vessel that has been issued a permit for accessing the Monument must ensure that such vessel has an OLE-approved, operating VMS on board when voyaging within the Monument. An operating VMS includes an operating mobile transmitting unit on the vessel and a functioning communication link between the unit and OLE as provided by an OLE-approved communication service provider. Appendix B to this part 404 provides information regarding OLE-approved transmitting units.

(b) *Installing and activating the VMS.* Only a VMS that has been approved by OLE may be used. When installing and activating the OLE-approved VMS, or when reinstalling and reactivating such VMS, the vessel owner or operator must:

(1) Follow procedures indicated on an installation and activation checklist, which is available from OLE; and

(2) Submit to OLE a statement certifying compliance with the checklist, as prescribed on the checklist.

(c) *Interference with the VMS.* No person may interfere with, tamper with, alter, damage, disable, or impede the operation of the VMS, or attempt any of the same.

(d) *Interruption of operation of the VMS.* When a vessel's VMS is not operating properly, the owner or operator must immediately contact OLE, and follow instructions from that office. If notified by OLE that a vessel's VMS is not operating properly, the owner and operator must follow instructions from that office. In either event, such instructions may include, but are not limited to, manually communicating to a location designated by OLE the vessel's positions or returning to port until the VMS is operable.

(e) *Access to position data.* As a condition of authorized access to the Monument, a vessel owner or operator subject to the requirements for a VMS in this section must allow OLE, the USCG,

and their authorized officers and designees access to the vessel's position data obtained from the VMS. Consistent with other applicable laws, including the limitations on access to, and use of, VMS data collected under the Magnuson-Stevens Fishery Conservation and Management Act, the Secretaries may have access to, and use of, collected data for scientific, statistical, and management purposes.

(f) *Authority for installation and operation.* OLE has authority over the installation and operation of the VMS unit. OLE may authorize the connection or order the disconnection of additional equipment, including a computer, to any VMS unit when deemed appropriate by OLE.

(g) *Activities Regarding Vessel Monitoring Systems.* Effective August 28, 2006, the following activities regarding vessel monitoring systems are prohibited and thus unlawful for any person to conduct or cause to be conducted:

(1) Operating any vessel within the Monument without an OLE type-approved mobile transceiver unit described in this section;

(2) Failing to install, activate, repair, or replace a mobile transceiver unit prior to leaving port;

(3) Failing to operate and maintain a mobile transceiver unit on board the vessel at all times as specified in this section;

(4) Tampering with, damaging, destroying, altering, or in any way distorting, rendering useless, inoperative, ineffective, or inaccurate the VMS, mobile transceiver unit, or VMS signal required to be installed on or transmitted by a vessel as specified in this section;

(5) Failing to contact OLE or follow OLE instructions when automatic position reporting has been interrupted as specified in this section;

(6) Registering a VMS or mobile transceiver unit to more than one vessel at the same time;

(7) Connecting or leaving connected additional equipment to a VMS unit or mobile transceiver unit without the prior approval of OLE; and

(8) Making a false statement, oral or written, to an authorized officer regarding the installation, use, operation, or maintenance of a VMS unit or mobile transceiver unit or communication service provider.

#### § 404.6 Prohibited activities.

The following activities are prohibited and thus unlawful for any person to conduct or cause to be conducted:

(a) Exploring for, developing, or producing oil, gas, or minerals within the Monument;

(b) Using or attempting to use poisons, electrical charges, or explosives in the collection or harvest of a Monument resource;

(c) Introducing or otherwise releasing an introduced species from within or into the Monument; and

(d) Anchoring on or having a vessel anchored on any living or dead coral with an anchor, anchor chain, or anchor rope.

#### § 404.7 Regulated activities.

Except as provided in §§ 404.8, 404.9 and 404.10, the following activities are prohibited and thus unlawful for any person to conduct or cause to be conducted within the Monument without a valid permit as provided for in § 404.11:

(a) Removing, moving, taking, harvesting, possessing, injuring, disturbing, or damaging; or attempting to remove, move, take, harvest, possess, injure, disturb, or damage any living or nonliving Monument resource;

(b) Drilling into, dredging, or otherwise altering the submerged lands other than by anchoring a vessel; or constructing, placing, or abandoning any structure, material, or other matter on the submerged lands;

(c) Anchoring a vessel;

(d) Deserting a vessel aground, at anchor, or adrift;

(e) Discharging or depositing any material or other matter into Special Preservation Areas or the Midway Atoll Special Management Area except vessel engine cooling water, weather deck runoff, and vessel engine exhaust;

(f) Discharging or depositing any material or other matter into the Monument, or discharging or depositing any material or other matter outside the Monument that subsequently enters the Monument and injures any resources of the Monument, except fish parts (i.e., chumming material or bait) used in and during authorized fishing operations, or discharges incidental to vessel use such as deck wash, approved marine sanitation device effluent, cooling water, and engine exhaust;

(g) Touching coral, living or dead;

(h) Possessing fishing gear except when stowed and not available for immediate use during passage without interruption through the Monument;

(i) Swimming, snorkeling, or closed or open circuit SCUBA diving within any Special Preservation Area or the Midway Atoll Special Management Area; and

(j) Attracting any living Monument resource.

#### § 404.8 Emergencies and law enforcement activities.

The prohibitions in this part do not apply to activities necessary to respond to emergencies threatening life, property, or the environment, or to activities necessary for law enforcement purposes.

#### § 404.9 Armed Forces actions.

(a) The prohibitions in this part do not apply to activities and exercises of the Armed Forces (including those carried out by the United States Coast Guard) that are consistent with applicable laws.

(b) These regulations shall not limit agency actions to respond to emergencies posing an unacceptable threat to human health or safety or to the marine environment and admitting of no other feasible solution.

(c) All activities and exercises of the Armed Forces shall be carried out in a manner that avoids, to the extent practicable and consistent with operational requirements, adverse impacts on Monument resources and qualities.

(d) In the event of threatened or actual destruction of, loss of, or injury to a Monument resource or quality resulting from an incident, including but not limited to spills and groundings, caused by a component of the Department of Defense or the United States Coast Guard, the cognizant component shall promptly coordinate with the Secretaries for the purpose of taking appropriate actions to respond to and mitigate the harm and, if possible, restore or replace the Monument resource or quality.

#### § 404.10 Commercial fishing.

(a) *Lobster fishing.* Any commercial lobster fishing permit is subject to a zero annual harvest limit condition.

(b) *Fishing and bottomfish and pelagic species.* (1) Notwithstanding the prohibitions in § 404.7(a) and (h), commercial fishing for bottomfish and associated pelagic species may continue within the Monument subject to paragraph (c) of this section, until June 15, 2011, provided that:

(i) The fishing is conducted in accordance with a valid commercial bottomfish permit issued by NOAA; and

(ii) Such permit was in effect on June 15, 2006, and is subsequently renewed pursuant to NOAA regulations at 50 CFR part 665, subpart E as necessary.

(2) Total landings for each fishing year from fishing allowed under paragraph (b)(1) of this section may not exceed the following amounts:

(i) 350,000 pounds for bottomfish species; and

(ii) 180,000 pounds for pelagic species.

(3) Commercial fishing for bottomfish and associated pelagic species is prohibited in the Monument after June 15, 2011.

(c) *General requirements.* Any commercial fishing within the Monument shall be conducted in accordance with the following restrictions and conditions:

(1) A valid permit or facsimile of a valid permit shall be on board the fishing vessel and available for inspection by an authorized officer;

(2) No attempt is made to falsify or fail to make, keep, maintain, or submit any logbook or logbook form or other required record or report.

(3) Only gear specifically authorized by the relevant permit issued under the Magnuson-Stevens Fishery Conservation and Management Act is allowed to be in the possession of a person conducting commercial fishing under this section;

(4) Any person conducting commercial fishing notifies the Secretaries by telephone, facsimile, or electronic mail at least 72 hours before entering the Monument and within 12 hours after leaving the Monument in accordance with § 404.4(b) and (c);

(5) All fishing vessels must carry an activated and functioning VMS unit on board at all times whenever the vessel is in the Monument;

(6) All fishing vessels must carry an observer when requested to do so by the Secretaries;

(7) The activity does not take place within any Ecological Reserve, any Special Preservation Area, or the Midway Atoll Special Management Area.

#### § 404.11 Permitting procedures and criteria.

(a) *Issuance.* Subject to such terms and conditions as the Secretaries deem appropriate, a person may conduct an activity prohibited by § 404.7 if such activity is specifically authorized by a permit issued under this section.

(b) *Application requirements.* Applicants for permits under this section shall submit applications to: Northwestern Hawaiian Islands Marine National Monument, 6600 Kalanianaʻole Highway, Suite 300, Honolulu, HI 96825.

(c) *Permit Types.* A permit under this subpart may be issued if the Secretaries find that the activity:

(1) Is research designed to further understanding of Monument resources and qualities;

(2) Will further the educational value of the Monument;

(3) Will assist in the conservation and management of the Monument;

(4) Will allow Native Hawaiian practices subject to paragraph (e) of this section;

(5) Will allow a special ocean use subject to paragraph (f) of this section; or

(6) Will allow recreational activities subject to paragraph (g) of this section.

(d) *Findings.* A permit may not be issued under this section unless the Secretaries find:

(1) The activity can be conducted with adequate safeguards for the resources and ecological integrity of the Monument;

(2) The activity will be conducted in a manner compatible with the purposes of the Proclamation, considering the extent to which the conduct of the activity may diminish or enhance Monument resources, qualities, and ecological integrity, any indirect, secondary or cumulative effects of the activity, and the duration of such effects;

(3) There is no practicable alternative to conducting the activity within the Monument;

(4) The end value of the activity outweighs its adverse impacts on Monument resources, qualities, and ecological integrity;

(5) The duration of the activity is no longer than necessary to achieve its stated purpose;

(6) The applicant is qualified to conduct and complete the activity and mitigate any potential impacts resulting from its conduct;

(7) The applicant has adequate financial resources available to conduct and complete the activity and mitigate any potential impacts resulting from its conduct;

(8) The methods and procedures proposed by the applicant are appropriate to achieve the proposed activity's goals in relation to their impacts to Monument resources, qualities, and ecological integrity;

(9) The applicant's vessel has been outfitted with a mobile transceiver unit approved by OLE and complies with the requirements of § 404.5; and

(10) There are no other factors that would make the issuance of a permit for the activity inappropriate.

(e) *Additional findings for Native Hawaiian practice permits.* In addition to the findings listed in paragraph (d) of this section, a permit to allow Native Hawaiian practices under paragraph (c)(4) of this section, may not be issued unless:

(1) The activity is non-commercial and will not involve the sale of any organism or material collected;

(2) The purpose and intent of the activity are appropriate and deemed necessary by traditional standards in the Native Hawaiian culture (*pono*), and demonstrate an understanding of, and background in, the traditional practice, and its associated values and protocols;

(3) The activity benefits the resources of the Northwestern Hawaiian Islands and the Native Hawaiian community;

(4) The activity supports or advances the perpetuation of traditional knowledge and ancestral connections of Native Hawaiians to the Northwestern Hawaiian Islands; and

(5) Any Monument resource harvested from the Monument will be consumed in the Monument.

(f) *Additional findings, criteria, and requirements for special ocean use permits.* (1) In addition to the findings listed in paragraph (d) of this section, the following requirements apply to the issuance of a permit for a special ocean use under paragraph (c)(5) of this section:

(i) Any permit for a special ocean use issued under this section:

(ii) Shall authorize the conduct of an activity only if that activity is compatible with the purposes for which the Monument is designated and with protection of Monument resources;

(A) Shall not authorize the conduct of any activity for a period of more than 5 years unless renewed;

(B) Shall require that activities carried out under the permit be conducted in a manner that does not destroy, cause the loss of, or injure Monument resources; and

(iii) Shall require the permittee to purchase and maintain comprehensive general liability insurance, or post an equivalent bond, against claims arising out of activities conducted under the permit and to agree to hold the United States harmless against such claims;

(iv) Each person issued a permit for a special ocean use under this section shall submit an annual report to the Secretaries not later than December 31 of each year which describes activities conducted under that permit and revenues derived from such activities during the year.

(2) In addition to the findings listed in paragraph (d) of this section, a permit may not be issued for a special ocean use unless the activity has been determined to be consistent with the findings made pursuant to paragraph (f) of this section.

(3) Categories of special ocean use being permitted for the first time under this section will be restricted in duration and permitted as a special ocean use pilot project. Subsequent permits for any category of special

ocean use may only be issued if a special ocean use pilot project for that category meets the requirements of this section, and any terms and conditions placed on the permit for the pilot project.

(4) Public notice shall be provided prior to requiring a special ocean use permit for any category of activity not previously identified as a special ocean use.

(5) The following requirements apply to permits for a special ocean use for an activity within the Midway Atoll Special Management Area.

(i) A permit for a special ocean use for activities within the Midway Atoll Special Management Area may be issued provided:

(A) The activity furthers the conservation and management of the Monument; and

(B) The Director of the United States Fish and Wildlife Service or his or her designee has determined that the activity is compatible with the purposes for which the Midway Atoll National Wildlife Refuge was designated.

(ii) As part of a permit issued pursuant to this paragraph (f)(5), vessels may be allowed to transit the Monument as necessary to enter the Midway Atoll Special Management Area.

(6) A permit for a special ocean use for activities outside the Midway Atoll Special Management Area may be issued provided:

(i) The activity will directly benefit the conservation and management of the Monument;

(ii) The purpose of the activity is for research or education related to the resources or qualities of the Monument;

(iii) Public notice of the application and an opportunity to provide comments is given at least 30 days prior to issuing the permit; and

(iv) The activity does not involve the use of a commercial passenger vessel.

(g) *Additional findings for recreation permits.* A permit for recreational activities under paragraph (c)(6) of this section may be issued for activities to be conducted within the Midway Atoll Special Management area if, in addition to the findings listed in paragraph (d) of this section:

(1) The activity is for the purpose of recreation as defined in section 404.3;

(2) The activity is not associated with any for-hire operation; and

(3) The activity does not involve any extractive use.

(h) *Sustenance fishing.* Sustenance fishing, as defined in 404.3, may be allowed outside of any Special Preservation Area as a term or condition of any permit issued under this part. Sustenance fishing in the Midway Atoll

Special Management Area shall not be allowed unless the activity has been determined by the Director of the U.S. Fish and Wildlife Service or his or her designee to be compatible with the purposes for which the Midway Atoll National Wildlife Refuge was established. Sustenance fishing must be conducted in a manner compatible with the Proclamation and this part, including considering the extent to which the conduct of the activity may

diminish Monument resources, qualities, and ecological integrity, as well as any indirect, secondary, or cumulative effects of the activity and the duration of such effects. Sustenance fishing is subject to systematic reporting requirements when developed by the Secretaries.

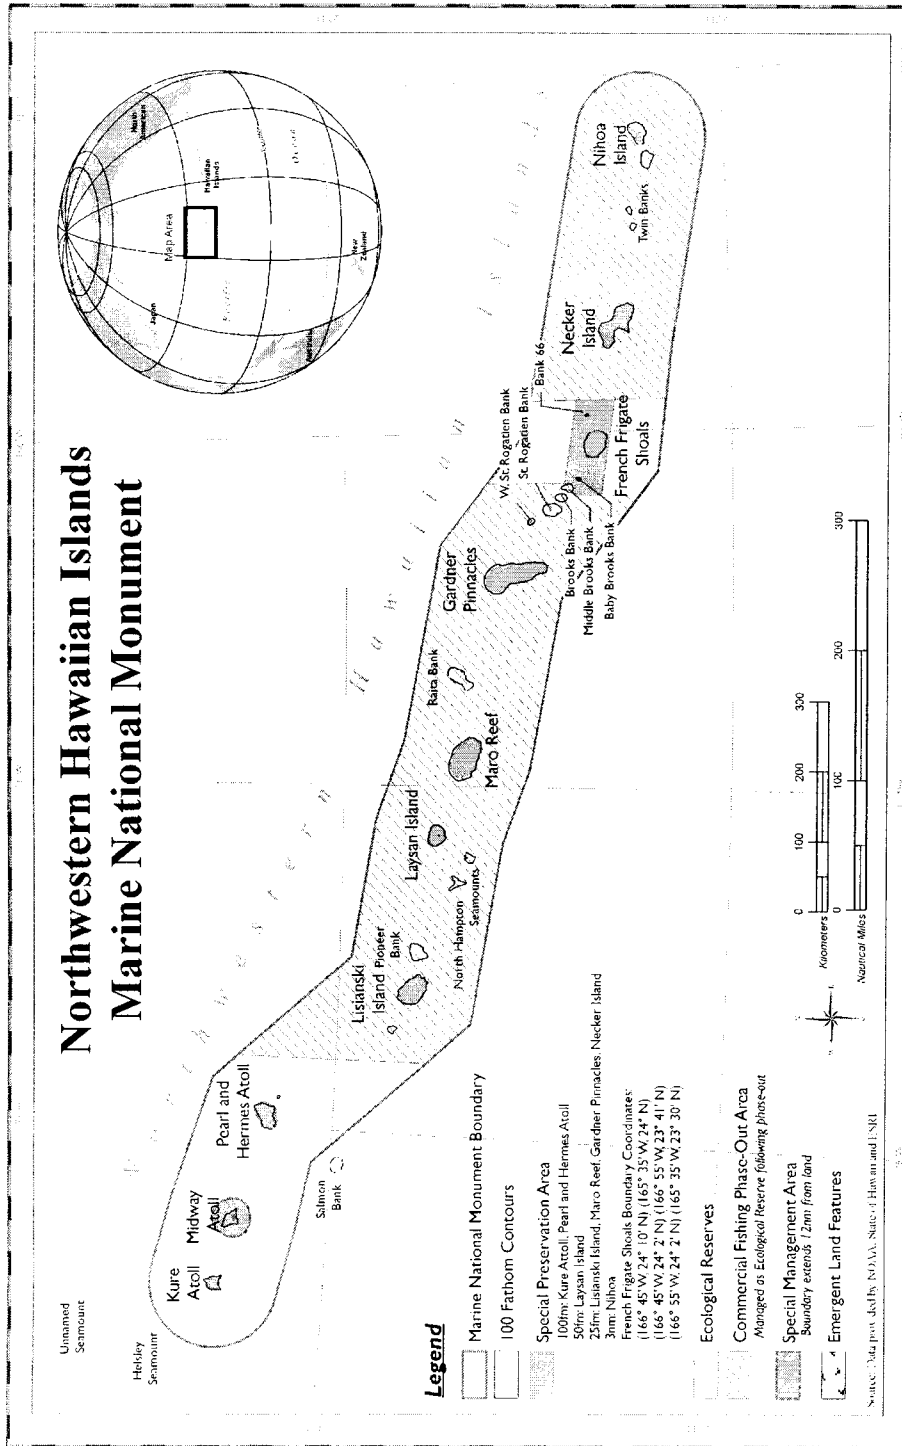

**§ 404.12 International law.**

These regulations shall be applied in accordance with international law. No restrictions shall apply to or be enforced

against a person who is not a citizen, national, or resident alien of the United States (including foreign flag vessels) unless in accordance with international law.

BILLING CODE 3510-NK-P

BILLING CODE 3510-NK-C

## Appendix B to Part 404—Approved VMS

### I. VMS Mobile Transceiver Unit

#### *Thrane & Thrane Sailor 3026D Gold VMS*

The Thrane & Thrane Sailor 3026D Gold VMS (TT-3026D) has been found to meet the minimum technical requirements for vessels issued permits to operate in the Northwestern Hawaiian Islands Marine National Monument. The address for the Thrane & Thrane distributor contact is provided in this notice under the heading VMS Provider Address.

The TT-3026D Gold VMS features an integrated GPS/Inmarsat-C unit and a marine grade monitor with keyboard and integrated mouse. The unit is factory pre-configured for NMFS VMS operations (non-Global Maritime Distress & Safety System (non-GMDSS)). Satellite commissioning services are provided by Thrane & Thrane personnel.

Automatic GPS position reporting starts after transceiver installation and power activation onboard the vessel. The unit is an integrated transceiver/antenna/GPS design using a floating 10 to 32 VDC power supply. The unit is configured for automatic reduced position transmissions when the vessel is stationary (i.e., in port). It allows for port stays without power drain or power shut down. The unit restarts normal position transmission automatically when the vessel goes to sea.

The TT-3026D provides operation down to +/- 15 degree angles. The unit has the capability of two-way communications to send formatted forms and to receive e-mail and other messages. A configuration option is available to automatically send position reports to a private address, such as a fleet management company.

A vessel owner may purchase this system by contacting the entity identified in this notice under the heading "VMS Provider Address". The owner should identify himself or herself as a vessel owner issued a permit to operate in the Northwestern Hawaiian Islands Marine National Monument, so the transceiver set can be properly configured. To use the TT-3026D the vessel owner will need to establish an Inmarsat-C system use contract with an approved Inmarsat-C communications service provider. The owner will be required to complete the Inmarsat-C "Registration for Service Activation for Maritime Mobile Earth Station." The owner should consult with Thrane & Thrane when completing this form.

Thrane & Thrane personnel will perform the following services before shipment: (1) Configure the transceiver according to OLE specifications for vessels issued permits to operate in the Northwestern Hawaiian Islands Marine National Monument; (2) download the predetermined NMFS position

reporting and broadcast command identification numbers into the unit; (3) test the unit to ensure operation when installation has been completed on the vessel; and (4) forward the Inmarsat service provider and the transceiver identifying information to OLE.

### II. Inmarsat-C Communications Providers

It is recommended, for vendor warranty and customer service purposes, that the vessel owner keep for his or her records and that Telenor and Xantic have on record the following identifying information: (1) Signed and dated receipts and contracts; (2) transceiver serial number; (3) Telenor or Xantic customer number, user name and password; (4) e-mail address of transceiver; (5) Inmarsat identification number; (6) owner name; (7) vessel name; (8) vessel documentation or registration number; and (9) mobile earth station license (FCC license).

The OLE will provide an installation and activation checklist that the vessel owner must follow. The vessel owner must sign a statement on the checklist certifying compliance with the installation procedures and return the checklist to OLE. Installation can be performed by an experienced crew or by an electronics specialist, and the installation cost is paid by the owner.

The owner may confirm the TT-3026D operation and communications service to ensure that position reports are automatically sent to and received by OLE before leaving on a trip under VMS. The OLE does not regard the vessel as meeting requirements until position reports are automatically received. For confirmation purposes, contact the NOAA Fisheries Office for Law Enforcement, 8484 Georgia Ave., Suite 415, Silver Spring, MD 20910, phone 888-219-9228, fax 301-427-0049.

#### *Telenor Satellite Services*

Inmarsat-C is a store-and-forward data messaging service. Inmarsat-C allows users to send and receive information virtually anywhere in the world, on land, at sea, and in the air. Inmarsat-C supports a wide variety of applications including Internet, e-mail, position and weather reporting, a free daily news service, and remote equipment monitoring and control. Mariners can use Inmarsat-C free of charge to send critical safety at sea messages as part of the U.S. Coast Guard's Automated Mutual-Assistance Vessel Rescue system and of the NOAA Shipboard Environmental Acquisition System programs. Telenor Vessel Monitoring System Services is being sold through Thrane & Thrane, Inc. For the Thrane & Thrane and Telenor addresses, look inside this notice under the heading "VMS Provider Address".

#### *Xantic*

Xantic is a provider of Vessel Monitoring Services to the maritime industry. By

installing an approved OLE Inmarsat-C transceiver on the vessel, vessels can send and receive e-mail, to and from land, while the transceiver automatically sends vessel position reports to OLE, and is fully compliant with the International Coast Guard Search and Rescue Centers. Xantic Vessel Monitoring System Services are being sold through Thrane & Thrane, Inc. For the Thrane & Thrane and Xantic addresses, look in this notice under the heading "VMS Provider Address".

For Telenor and Xantic, Thrane & Thrane customer service supports the security and privacy of vessel accounts and messages with the following: (a) Password authentication for vessel owners or agents and for OLE to prevent unauthorized changes or inquiries; and (b) separation of private messages from OLE messages. (OLE requires VMS-related position reports, only.)

Billing is separated between accounts for the vessel owner and the OLE. VMS position reports and vessel-initiated messaging are paid for by the vessel owner. Messaging initiated from OLE operations center is paid for by NOAA.

Thrane & Thrane provides customer service for Telenor and Xantic users to support and establish two-way transmission of transceiver unit configuration commands between the transceiver and land-based control centers. This supports OLE's message needs and, optionally, the crew's private message needs.

The vessel owner can configure automatic position reports to be sent to a private address, such as to a fleet management company.

Vessel owners wishing to use Telenor or Xantic services will need to purchase an Inmarsat-C transceiver approved for vessels issued permits to operate in the Northwestern Hawaiian Islands Marine National Monument. The owner will need to complete an Inmarsat-C system use contract with Telenor or Xantic, including a mobile earth station license (FCC requirement). The transceiver will need to be commissioned with Inmarsat according to Telenor or Xantic's instructions. The owner should refer to and follow the configuration, installation, and service activation procedures for the specific transceiver purchased.

### III. VMS Provider Address

For TT-3026D, Telenor, or Xantic information, contact Ronald Lockerby, Marine Products, Thrane & Thrane, Inc., 509 Viking Drive, Suite K, L & M, Virginia Beach, VA 23452; voice: 757-463-9557; fax: 757-463-9581, e-mail: [rdl@tt.dk.com](mailto:rdl@tt.dk.com); Web site: <http://www.landseasystems.com>.

# Corrections

Federal Register

Vol. 71, No. 173

Thursday, September 7, 2006

This section of the FEDERAL REGISTER contains editorial corrections of previously published Presidential, Rule, Proposed Rule, and Notice documents. These corrections are prepared by the Office of the Federal Register. Agency prepared corrections are issued as signed documents and appear in the appropriate document categories elsewhere in the issue.

## DEPARTMENT OF COMMERCE

### Northwestern Hawaiian Islands Marine National Monument

#### *Correction*

In rule document 06–7235 beginning on page 51134 in the issue of Tuesday,

August 29, 2006, make the following correction:

#### **§ 404.4 [Corrected]**

On page 51137, in the first column, in § 404.4(b)(1), in the second line, “*nwhi.notifications@commat;noaa.gov*” should read “*nwhi.notifications@noaa.gov*”.

[FR Doc. C6–7235 Filed 9–6–06; 8:45 am]

BILLING CODE 1505–01–D

(3) \* \* \*

(i) *Possession and use of required mitigation gear.* The equipment listed in paragraph (c)(5)(i) of this section must be carried on board and must be used to handle, release, and disentangle hooked or entangled sea turtles, prohibited sharks, or smalltooth sawfish in accordance with requirements specified in paragraph (d)(3)(ii) of this section.

(ii) *Handling and release requirements.* Sea turtle bycatch mitigation gear, as required by paragraph (d)(3)(i) of this section, must be used to disengage any hooked or entangled sea turtles as stated in paragraph (c)(5)(ii) of this section. This mitigation gear should also be employed to disengage any hooked or entangled species of prohibited sharks as listed in Category (D) of Table 1 of Appendix A of this part. If a smalltooth sawfish is caught, the fish should be kept in the water while maintaining water flow over the gills and examined for research tags and the line should be cut as close to the hook as possible. Dehooking devices should not be used to release smalltooth sawfish.

\* \* \* \* \*

■ 5. In § 635.71, paragraph (a)(33) is revised as follows:

**§ 635.71 Prohibitions.**

\* \* \* \* \*

(a) \* \* \*

(33) Deploy or fish with any fishing gear from a vessel with pelagic or bottom longline gear on board without carrying the required sea turtle bycatch mitigation gear, as specified at § 635.21(c)(5)(i) for pelagic longline gear and § 635.21(d)(3)(i) for bottom longline gear. This equipment must be utilized in accordance with § 635.21(c)(5)(ii) and (d)(3)(ii) for pelagic and bottom longline gear, respectively.

**DEPARTMENT OF COMMERCE****National Oceanic and Atmospheric Administration****DEPARTMENT OF THE INTERIOR****Fish and Wildlife Service****50 CFR Part 404**

[Docket No. 060824225-6031-02]

RIN 0648-AU82

**Northwestern Hawaiian Islands Marine National Monument; Correction**

**AGENCIES:** National Oceanic and Atmospheric Administration (NOAA), Department of Commerce (DOC); United States Fish and Wildlife Service (USFWS), Department of the Interior (DOI).

**ACTION:** Final rule; correcting amendment.

**SUMMARY:** NOAA and the USFWS published final regulations for the Northwestern Hawaiian Islands Marine National Monument (Monument) on August 29, 2006. The preamble and regulatory text of that notice contained errors pertaining to the electronic mail address for submitting comments on the information collection requirements of that rule, the reference to the dimensions of the outer boundary of the Monument, and the numbering sequence for one paragraph. This final rule corrects those errors. This rule makes no substantive change to the regulations.

**DATES:** This correction is effective February 7, 2007.

**SUPPLEMENTARY INFORMATION:** Regulations published by NOAA and the USFWS on August 29, 2006 to codify the prohibitions and management measures set forth in Presidential Proclamation 8031 (71 FR 36443, June 26, 2006) establishing the Monument, contained an error in the instructions for submitting comments on the information collection requirements of the final rule via electronic mail, the reference to the dimensions of the Monument's outer boundary, and the numbering sequence for one paragraph.

The first error appeared in the first sentence of the **ADDRESSES** section of the notice. Here the notice incorrectly refers to a "proposed rule" and provides the incorrect e-mail address. That sentence should read "Submit written comments regarding the burden-hour estimates or other aspects of the information collection requirements contained in this final rule by e-mail to Diana Hynek at *dHynek@doc.gov*." The incorrect e-

mail address also appeared in the **SUPPLEMENTARY INFORMATION** section of the notice in the first column on page 51135 below the table. The e-mail address should read *dHynek@doc.gov*.

The second error is in the third sentence of the first paragraph of the **SUPPLEMENTARY INFORMATION** section of the notice, where dimensions for the outer boundary of the Monument were given. The dimensions are for the Monument, not the outer boundary. Therefore, this sentence should read "The Monument is approximately 100 nmi wide and extends approximately 1200 nmi around coral islands, seamounts, banks, and shoals."

The regulatory text of that rule also contained an error in the numbering sequence for one paragraph. Paragraph 404.11(f)(1)(ii) should have been designated as paragraph 404.11(f)(1)(i)(A). Paragraphs 404.11(f)(1)(ii)(A) and (B) and paragraph 404.11(f)(1)(iii) should have been numbered paragraphs 404.11(f)(1)(i)(B) through (D), respectively. Paragraph 404.11(f)(1)(iv) should have been designated as paragraph 404.11(f)(1)(ii). This final rule makes these corrections. The substance of the regulations remains unchanged.

**Classification***Administrative Procedure Act*

The Secretaries find good cause to waive notice and comment on this correction, pursuant to 5 U.S.C. 533(b)(B), and the 30-day delay in effective date pursuant to 5 U.S.C. 553(d). Notice and comment are unnecessary because this correction is a minor, technical change in an e-mail address and the numbering of the regulations as well as elimination of erroneous references to the notice as a proposed rule and the dimensions of the Monument's outer boundary. The substance of the regulations remains unchanged. Therefore, this correction is being published as a final regulation and is effective February 7, 2007.

*E.O. 12866*

This rule has been determined to be not significant for purposes of E.O. 12866.

**List of Subjects in 50 CFR Part 404**

Administrative practice and procedure, Coastal zone, Fish, Fisheries, Historic preservation, Intergovernmental relations, Marine resources, Monuments and memorials, Natural resources, Reporting and recordkeeping requirements, Wildlife, Wildlife refuges.

Dated: November 16, 2006.

**Conrad C. Lautenbacher Jr.,**

*Undersecretary of Commerce for Oceans and Atmosphere.*

Dated: January 5, 2007.

**David M. Verhey,**

*Acting Assistant Secretary for Fish and Wildlife and Parks.*

■ Accordingly, NOAA and USFWS correct 50 CFR part 404 as follows:

#### **PART 404—NORTHWESTERN HAWAIIAN ISLANDS MARINE NATIONAL MONUMENT**

■ 1. The authority citation for 50 CFR part 404 continues to read as follows:

**Authority:** 16 U.S.C. 431 *et seq.*; 16 U.S.C. 460k-3; 16 U.S.C. 1801 *et seq.*; 16 U.S.C. 742f; 16 U.S.C. 742l; and 16 U.S.C. 668dd-ee; 16 U.S.C. 1361 *et seq.*; 16 U.S.C. 1531 *et seq.*; Pub. L. No. 106-513, § 6(g) (2000).

■ 2. In § 404.11, paragraph (f)(1) is revised to read as follows:

#### **§ 404.11 Permitting procedures and criteria.**

\* \* \* \* \*

(f) *Additional findings, criteria, and requirements for special ocean use permits.*

(1) In addition to the findings listed in paragraph (d) of this section, the following requirements apply to the issuance of a permit for a special ocean use under paragraph (c)(5) of this section:

(i) Any permit for a special ocean use issued under this section:

(A) Shall authorize the conduct of an activity only if that activity is compatible with the purposes for which the Monument is designated and with protection of Monument resources;

(B) Shall not authorize the conduct of any activity for a period of more than 5 years unless renewed;

(C) Shall require that activities carried out under the permit be conducted in a manner that does not destroy, cause the loss of, or injure Monument resources; and

(D) Shall require the permittee to purchase and maintain comprehensive general liability insurance, or post an equivalent bond, against claims arising out of activities conducted under the permit and to agree to hold the United States harmless against such claims;

(ii) Each person issued a permit for a special ocean use under this section shall submit an annual report to the Secretaries not later than December 31 of each year which describes activities conducted under that permit and revenues derived from such activities during the year.

#### **National Oceanic and Atmospheric Administration**

#### **50 CFR Part 648**

[Docket No. 061124307-7013-02; I.D. 112106A]

**RIN 0648-AT65**

#### **Fisheries of the Northeastern United States; Atlantic Mackerel, Squid, and Butterfish Fisheries; Specifications and Management Measures; Correction**

**AGENCY:** National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

**ACTION:** Final rule; correction.

**SUMMARY:** On January 30, 2007, NMFS published a final rule implementing 2007 specifications and management measures for Atlantic mackerel, squid, and butterfish (MSB) and modifying existing management measures. The preamble to the final rule contains Table 1 announcing the specifications for Atlantic mackerel, squid, and butterfish fisheries for the 2007 fishing year. Table 2 of the preamble to the final rule announces the trimester allocation of the *Loligo* squid quota in 2007. The headings to both tables inadvertently indicated that the specifications and allocation for 2007 were “proposed” rather than “final”. This document corrects those errors.

**DATES:** Effective March 1, 2007.

**FOR FURTHER INFORMATION CONTACT:** Carrie Nordeen, Fishery Policy Analyst, 978-281-9272, fax 978-281-9135.

**SUPPLEMENTARY INFORMATION:** Regulations implementing the Fishery

Management Plan for the Atlantic Mackerel, Squid, and Butterfish Fisheries (FMP) appear at 50 CFR part 648, subpart B, and regulations governing foreign fishing appear at 50 CFR part 600, subpart F. The final rule published on January 30, 2007 (72 FR 4211) fulfilled NMFS regulatory requirements at §§ 648.21 and 600.516(c) based on the maximum optimum yield (Max OY) of each fishery as established by the regulations, annually specify the amounts of the initial optimum yield (IOY), allowable biological catch (ABC), domestic annual harvest (DAH), and domestic annual processing (DAP), as well as, where applicable, the amounts for total allowable level of foreign fishing (TALFF) and joint venture processing (JVP) for the affected species managed under the FMP. The final specifications for 2007 were identified in Table 1 of the preamble to the final rule. However, the heading to Table 1 inadvertently indicated that the specifications were “proposed” rather than “final”. This document corrects the heading for Table 1 appearing on page 4212 (FR Doc. E7-1445) of the preamble contained in the January 30, 2007 **Federal Register** document. The remainder of Table 1 is republished in its entirety for the public’s convenience.

The final rule published January 30, 2007 (72 FR 4213) also identified the distribution of the trimester allocation of *Loligo* squid quota for the 2007 fishing year. However, the heading to Table 2 inadvertently indicated that the trimester allocation was “proposed” rather than “final”. This document corrects the heading for Table 2 appearing on page 4213 (FR Doc. E7-1445) of the preamble contained in the January 30, 2007 **Federal Register** final rule document. The remainder of Table 2 is republished in its entirety for the public’s convenience.

#### **Correction**

Accordingly, the final rule published on January 30, 2007, at 72 FR 4211 (FR Doc. E7-1445), to be effective March 1, 2007, is corrected as follows:

1. On page 4212, Table 1, title heading is corrected and the table text is republished to read as follows:

---

**APPENDIX E:**  
**Monument Memorandum of Agreement**

---

MEMORANDUM OF AGREEMENT

AMONG THE

STATE OF HAWAII  
DEPARTMENT OF LAND AND NATURAL RESOURCES

AND THE

U.S. DEPARTMENT OF THE INTERIOR  
U.S. FISH AND WILDLIFE SERVICE

AND THE

U.S. DEPARTMENT OF COMMERCE  
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

FOR

PROMOTING COORDINATED MANAGEMENT OF THE  
NORTHWESTERN HAWAIIAN ISLANDS MARINE NATIONAL MONUMENT

## I. BACKGROUND

- A. The President established the Northwestern Hawaiian Islands Marine National Monument (Monument) on June 15, 2006, to protect the scientific and historic resources of the Northwestern Hawaiian Islands (NWHI). The purposes and management regime for the Monument, as well as restrictions and prohibitions regarding activities in the Monument, are set forth in Presidential Proclamation 8031 (71 FR 36443, June 26, 2006).
- B. The Monument encompasses a vast and remote chain of islands that is a part of the Hawaiian Archipelago and provides habitat for numerous species found nowhere else on earth. These islands represent a nearly pristine ecosystem where habitats upon which marine species depend include both land and water. This area represents the majority of the coral reefs found within the United States' jurisdiction and supports more than 7,000 marine species, of which at least one quarter are unique to the Hawaiian Islands chain. This diverse ecosystem is home to many species of coral, fish, birds, marine mammals, and other flora and fauna, including the endangered Hawaiian monk seal, the threatened green sea turtle, and the endangered leatherback and hawksbill sea turtles. Like the coral reefs, the islets are home to many plant and animal species found nowhere else in the world, including four endangered land birds, an endangered seabird, and 12 endangered plants. In addition, millions of central Pacific seabirds congregate on these islands to breed. The area is rich in history and represents a place of great cultural significance to Native Hawaiians. It is an area that must be carefully managed to ensure that the resources are not diminished for future generations. The Hawaiian Islands are also the most remote archipelago in the world. This isolation has resulted in the opportunity and need for integrated resource management of this vast and exceptional environment.
- C. The Secretary of Commerce, through the National Oceanic and Atmospheric Administration (NOAA), has primary responsibility regarding the management of the marine areas of the Monument, in consultation with the Secretary of the Interior. The Secretary of the Interior, through the United States Fish and Wildlife Service (USFWS), has sole responsibility for the areas of the Monument that overlay the Midway Atoll National Wildlife Refuge, the Battle of Midway National Memorial, and the Hawaiian Islands National Wildlife Refuge, in consultation with the Secretary of Commerce. Nothing in the Proclamation diminishes or enlarges the jurisdiction of the State of Hawai'i. The State of Hawai'i has primary responsibility for managing the State waters of the Monument. The State of Hawai'i through the Department of Land and Natural Resources has primary responsibility for the Kure Atoll portion of the Hawai'i State Seabird Sanctuary. The State of Hawai'i holds the State submerged and ceded lands of the NWHI in trust. The Department of Land and Natural Resources (DLNR) will collaborate with the Office of Hawaiian Affairs (OHA) in the perpetuation of Hawaiian cultural resources in the Monument, including the customary and traditional rights and practices of Native Hawaiians exercised for subsistence, cultural, and religious purposes under the Constitution of the State of Hawai'i, Article XII, Section 7.

- D. The areas subject to this Agreement are the lands and waters within the Monument. The Monument includes all lands and interest in lands owned or controlled by the Government of the United States in the NWHI, including emergent and submerged lands, and waters out to a distance of approximately 50 nautical miles from the islands. The Monument extends approximately 1200 nautical miles across coral islands, seamounts, banks, and shoals. The Monument includes a portion of State of Hawai'i waters, including the Northwestern Hawaiian Islands State Marine Refuge and the Kure Atoll portion of the Hawai'i State Seabird Sanctuary. The Monument also includes Midway Atoll National Wildlife Refuge/Battle of Midway National Memorial, Hawaiian Islands National Wildlife Refuge, and the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve.
- E. The United States and the State of Hawai'i recognize the importance of the Monument's healthy coral reef, marine, and terrestrial ecosystems to the cultural, economic, and biological future of the State of Hawai'i and the Nation as a whole. Both recognize that a well managed terrestrial and marine environment in the NWHI is necessary to maintain the health and vigor of rare and protected species such as Hawaiian monk seals, sea turtles, seabirds, land birds, and plants, as well as to protect the other vital components of the ecosystem. The parties are collectively charged with protecting, conserving, and enhancing fish, plant, and wildlife habitats, including coral reefs and other marine and terrestrial resources in the NWHI. In order to protect the unique resources of these remote islands, the parties will manage the Monument in a manner that is free from exploitation and degradation due to human activities.

## II. PARTIES, PURPOSE AND SCOPE

- A. The Parties to this agreement are the State of Hawai'i, the U.S. Department of the Interior (DOI), and the U.S. Department of Commerce (DOC) (hereinafter collectively referred to as the Co-Trustees). This Memorandum of Agreement (Agreement) constitutes an agreement among the Co-Trustees to carry out coordinated resource management for the long-term comprehensive conservation and protection of the Monument.
- B. This Agreement establishes functional relationships to effectively coordinate management actions in this area among the Co-Trustees. This Agreement also provides the general terms and conditions under which the Co-Trustees will cooperate and manage the resources of the Monument.
- C. This Agreement also establishes objectives and responsibilities necessary for coordinated management activities in the Monument and is intended to provide the framework for long-term comprehensive protection of the Monument. The Co-Trustees will focus on coordinating planning efforts, management priorities, and field operations in the Monument.

- D. The Co-Trustees will undertake coordinated, integrated management and protection that will result in comprehensive conservation of the ecosystems of the Monument in perpetuity. The Co-Trustees recognize that the Monument is also a place of special cultural significance for Native Hawaiians, which provides a unique opportunity to manage marine resources in a manner that honors the rich heritage of the Native Hawaiian culture. The Monument also is a place of more recent historical significance, including the Battle of Midway.
- E. Monument Vision, Mission, and Guiding Principles:
1. The Monument vision is that the health, diversity, and resources of the vast NWHI ecosystems and the wildlife they support – unique in the world – be protected forever.
  2. The Monument mission is to carry out seamless integrated management to achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian traditional and customary cultural and religious practices, and heritage resources for current and future generations.
  3. The Monument guiding principles are to manage the Monument in a manner that, consistent with applicable law:
    - is consistent with the vision and mission;
    - recognizes that the resources of the NWHI are administered by the Co-Trustees for the benefit of present and future generations;
    - affirms that the NWHI and its wildlife are important, unique, and irreplaceable;
    - honors the significance of the region for Native Hawaiians;
    - honors the historic importance of the region;
    - incorporates best practices, scientific principles, traditional knowledge, and an adaptive management approach;
    - errs on the side of resource protection when there is uncertainty regarding impacts of an activity;
    - enhances public appreciation of the unique character and environment of the NWHI;
    - authorizes only uses consistent with Presidential Proclamation 8031 and other applicable laws;
    - coordinates with federal, state, and local governments; Native Hawaiians; relevant organizations; and the public; and
    - carries out effective outreach, monitoring, and enforcement to promote compliance.

### III. REFERENCES AND AUTHORITIES

The Co-Trustees are authorized to enter into this Agreement under various authorities most relevant to coordinated management, including:

- A. Antiquities Act, 16 U.S.C. § 431, *et seq.*;

#### **IV. MONUMENT MANAGEMENT OFFICIALS AND RESPONSIBILITIES**

- A. Senior Executive Board (SEB): The Co-Trustees hereby establish the SEB.
1. The SEB shall provide policy guidance to their respective agency staff assigned to carry-out Monument management activities.
  2. Responsible Officials: SEB Membership will consist of an appropriate senior level designee from each of the following (Co-Trustees will notify each other of appointed designee and upon change of designee):
    - a. State of Hawai'i Department of Land and Natural Resources
    - b. U.S. Department of the Interior
    - c. U.S. Department of Commerce
  3. The SEB shall be responsible for the following activities through the Monument Management Board (MMB):
    - a. Develop a management plan for ensuring the coordinated management of the coral reef ecosystems and related marine resources, terrestrial resources, and cultural and historic resources of the Monument, consistent with Proclamation 8031 and other applicable laws and regulations. To develop the management plan, the SEB shall modify, as appropriate, the plan developed by NOAA's National Marine Sanctuary Program through the public sanctuary designation process and provide for public review of that plan. The management plan should also maximize the efficient use of financial and human capital. Further, the SEB shall regularly review the implementation of the management plan and adjust the management framework as appropriate, consistent with applicable laws and policies.
    - b. Provide access and support for enforcement purposes, share enforcement resources and data, as appropriate, and develop joint enforcement capabilities as needed to ensure compliance with applicable State and Federal laws. Enforcement support may involve assistance from additional agencies such as the U.S. Coast Guard.
    - c. Coordinate research and monitoring efforts to better understand and address major threats to Monument resources. Initiate joint resource assessment, monitoring, and research activities including, but not limited to, population studies, species inventories and assessments, impacts from derelict fishing gear, and documentation of historic and cultural resources. Provide opportunities to participate in research activities initiated by each Co-Trustee, as appropriate. Coordinate research, including permits required for management activities that further the recovery of threatened or endangered species and protect and/or restore biodiversity within the Monument.

- d. Develop a mechanism to access scientific and resource data, as needed, and, consistent with applicable law, a protocol to ensure the necessary confidentiality of certain information, such as fisheries data and the location of heritage resources.
  - e. Provide support to identify locations of cultural and religious significance and for noncommercial Native Hawaiian practices, which may benefit the resources of the Monument and the Native Hawaiian community. Develop a protocol to protect sensitive, culturally significant, and religious locations while allowing permitted access.
  - f. Manage recreational, educational, and commercial activities that may take place within the Monument consistent with Proclamation 8031.
  - g. Identify and facilitate, as appropriate, coordination, consultation, and partnership opportunities regarding Monument management activities among Federal, State, and local governments, Native Hawaiians, the private sector, foreign governments, international organizations, and any other public or private persons or entities.
  - h. Facilitate opportunities to participate in and collaborate on educational activities and projects between and among the Co-Trustees.
  - i. Develop interagency agreements, grants, memoranda of understanding, or other appropriate instruments that allow for ease in sharing resources, including funds as appropriate, and a sharing of in-kind assistance and support such as the sharing of vessel time, aircraft missions, or other logistical support as a means of facilitating cooperative project opportunities. These more detailed agreements on specific issues will be signed at an appropriate level.
  - j. Ensure appropriate monitoring of activities within the Monument. Develop a coordinated response program to assess and address human induced or natural threats to Monument resources.
  - k. Enhance coordination by jointly issuing permits required for activities allowed under Presidential Proclamation 8031.
- B. Monument Management Board (MMB): The Co-Trustees hereby establish the MMB.
- 1. The MMB will promote coordinated management of the Monument at the field level.

2. Responsible Officials: MMB membership will consist of appropriate designees from the following entities (Co-Trustees will notify each other of appointed designee and upon change of designee):
    - a. State of Hawai'i, Department of Land and Natural Resources, Division of Aquatic Resources, Honolulu, HI
    - b. State of Hawai'i, Department of Land and Natural Resources, Division of Forestry and Wildlife, Honolulu, HI
    - c. U.S. Fish and Wildlife Service, National Wildlife Refuge System, Honolulu, HI
    - d. U.S. Fish and Wildlife Service, Pacific Islands Fish and Wildlife Office, Honolulu, HI
    - e. National Oceanic and Atmospheric Administration, National Marine Sanctuary Program, Honolulu, HI
    - f. National Oceanic and Atmospheric Administration, National Marine Fisheries Service, Honolulu, HI
    - g. State of Hawai'i, Office of Hawaiian Affairs, Honolulu, HI
  3. The Monument Management Board shall implement the activities set forth in Section IV.A.3.
  4. Whenever appropriate and practicable, the MMB will coordinate and consult with representatives of the U.S. Coast Guard, which provides enforcement support pertaining to laws and regulations regarding marine resources in the area.
- C. Interagency Coordinating Committee (ICC): The Co-Trustees hereby authorize the MMB to establish an Interagency Coordinating Committee (ICC) to assist in the implementation of Monument management activities set forth in Section IV.A.3. The MMB will request the participation of other Federal and State agencies to establish the ICC as it determines to be appropriate and necessary to seek additional input, or as subject to needs that may arise.

## V. PERIOD OF AGREEMENT, MODIFICATION, OR TERMINATION

- A. This Agreement becomes effective when all Co-Trustees sign it. The Co-Trustees shall review this Agreement at least every year to determine whether it should be modified or terminated.
- B. The Co-Trustees may modify this Agreement by written amendment only and with the concurrence of all Co-Trustees.
- C. The Co-Trustees may terminate this Agreement by mutual written consent. Any Co-Trustee may terminate its participation in this Agreement by giving the other Co-Trustees six months advance written notice.

## **VI. DISPUTE RESOLUTION**

If the members of the MMB disagree on an issue of Monument resource management, they shall present their differences to each other in writing, and they shall discuss them. The MMB should be the first body to attempt resolution of any disagreement. If the MMB fails to resolve their differences within 30 days after identification of the disagreement, or immediately upon determination that the MMB has reached an impasse, the matter shall be elevated to the SEB for resolution.

## **VII. OTHER PROVISIONS**

- A. Nothing in this Agreement shall be construed to conflict with applicable laws, or otherwise diminish authorities otherwise vested in the Secretaries of Commerce and Interior under federal law or the State of Hawai'i under state law. Any such conflicting term shall be invalid, but the remainder of the Agreement shall remain in effect. If a term is invalid, the Co-Trustees shall immediately review the Agreement to decide what should be done in light of the invalid term, e.g., amend or terminate the Agreement.
- B. This Agreement serves as the foundation for the entering into other agreements among the Co-Trustees and with agencies and other entities, as appropriate, and at a level appropriate to such agreement. Such agreements may be for the purpose of, among other things, the pursuit of research or training, supplementation of enforcement support or enter into cooperative enforcement agreements, data sharing, or increasing management capacity in the Monument. All such agreements shall be coordinated with the other Co-Trustees and may become annexes to this Agreement.
- C. The Co-Trustees intend to enter into an appropriate enforcement agreement to enhance enforcement of the Proclamation and implementing regulations. In the interim, pursuant to the authority of 16 U.S.C. 742l (b) and Title 12, Chapter 199, Section 199-3, Hawai'i Revised Statutes, NOAA and FWS and the State of Hawai'i each hereby authorize the other to use without reimbursement their respective personnel, services and facilities to enforce the provisions of all applicable Federal and State laws within the boundaries of the Monument.
- D. This Agreement defines in general terms the basis on which the Co-Trustees will cooperate, and as such, does not constitute a financial obligation or an authorization for particular expenditures. Expenditures of funds, human resources, equipment, supplies, facilities, training, public information, and technical expertise are generally intended to be provided by each signatory Co-Trustee to the extent that their participation is required and resources are available.
- E. Nothing in this agreement is intended to require the expenditure of funds in excess or advance of applicable appropriations. This Agreement is not a fiscal or funds obligation document. Any activities involving reimbursement or contribution of funds between Co-Trustees to this Agreement will be handled in accordance with

applicable laws, regulations, and procedures. Such activities will be documented in separate agreements, which will identify the specific projects between the Co-Trustees in appropriate detail. Such separate agreements should also reference this Agreement.

**APPENDIX F:**  
**Operational Protocols and**  
**Best Management Practices**

---

## **Disease and Introduced Species Prevention Protocol for Permitted Activities in the Marine Environment Papahānaumokuākea Marine National Monument<sup>1</sup>**

### **I. Equipment and Dive Gear Disinfection**

Equipment and gear is treated according to three levels that correspond to the potential for the spread of disease and/or introduced species.

General points applicable to all the levels and acceptable disinfection solutions are listed in D.

#### **A. Level One: Equipment in direct contact with diseased coral tissue or other diseased organisms**

- Equipment: includes, but is not limited to, gloves, chisels, forceps, drill bits, shears, clippers, and spear tips.
- Multiple sets of equipment: Use a disinfected set of equipment for diseased coral colonies and another disinfected set of equipment for non-diseased coral colonies at each dive site.
- Disinfect between sites: Use a disinfected set of equipment at each dive site. Disinfect equipment by soaking for a minimum of ten minutes in an acceptable disinfection solution (see acceptable disinfection solutions listed below).

*Non-porous equipment* (e.g. forceps, chisels): Use wipes in which the active ingredient is quaternary ammonium chloride compounds (QACs) (e.g., Clorox or Lysol® wipes) to remove organic matter. Follow wiping by soaking for a minimum of ten minutes in a disinfectant solution.

*Porous equipment and dive gear* (e.g. gloves, nylon mesh bags): Manually remove any organic matter, and soak for a minimum of 10 minutes in an acceptable disinfectant solution.

- Secure all samples: Seal all samples in bags or jars under water and place sample bags and jars in secure holding container.

#### **B. Level Two: Benthic equipment not used to sample diseased coral tissue or other diseased organisms**

- Benthic equipment: includes equipment that may contact the benthos such as reels, tape measures, goodie bags, transect lines, etc.
- Disinfect between sites: Use a disinfected set of equipment at each dive site.

---

<sup>1</sup> This protocol and a companion document, “Disease and Introduced Species Prevention Protocol for Permitted Activities in the Marine Environment Papahānaumokuākea Marine National Monument,” were accepted at the April 9, 2007 Monument Management Board Meeting.

- Disinfect equipment: achieved by soaking for a minimum of ten minutes in a disinfection solution (see acceptable disinfection solutions listed below).

*Non-porous equipment* must be wiped and/or soaked. If wiping, use wipes in which the active ingredient is QACs. An accepted wipe is Clorox or Lysol® wipes. If soaking, soak for a minimum of ten minutes in an acceptable disinfectant solution.

*Porous equipment* must be soaked for a minimum of ten minutes in an acceptable disinfectant solution.

### **C. Third Level: All dive gear used in the Monument**

- Dive gear includes any wetsuit, mask, fin, snorkel, BC, regulator, weight belt, booties, etc.
- Disinfect dive gear daily (if used). Inspect all dive gear and remove any organic matter. Disinfect by submerging for a minimum of ten minutes in an acceptable disinfection solution, followed by a thorough fresh water rinse, and hanging to dry.

### **D. General points applicable to all three levels**

- Disinfect any equipment and gear at least daily if used. Also, only disinfected equipment and gear may be transported either direction between Papahānaumokuākea and the main Hawaiian islands.
- Dispose of organic matter and used solution according to the ship's solid waste disposal or other approved secure holding system.
- Acceptable Disinfection Solutions:
  1. 3% dilution of commercial bleach (e.g. Clorox or other 5-6% sodium hypochlorite product) in fresh water;
  2. the manufacturer's recommended disinfection strength dilution of quaternary ammonium compounds in "soft" (low concentration of calcium or magnesium ions) fresh water. An example of an acceptable QAC solution is Lysol® All Purpose Cleaner in a 6.6% Lysol in water dilution.

## **II. Cleaning Tender Vessels**

- At least daily (if tender vessel if used), inspect for and remove any algal fragments or other organisms (dispose of organic matter and used solution according to the ship's solid waste disposal or other approved secure holding system).
- Rinse tender vessel internal and external surfaces with fresh water between islands, including during transits in either direction between Papahānaumokuākea and the main Hawaiian islands.
- Allow tender vessel to dry before redeployment.

## **III. Disinfection of Shipboard Wet Laboratory**

- At least daily (if lab is used), disinfect entire laboratory, including sinks, countertops, walls, doors, and floors.
- Acceptable Disinfection Solutions and Wipes:

1. 3% dilution of commercial bleach (e.g. Clorox or other 5-6% sodium hypochlorite product) in fresh water;
  2. the manufacturer's recommended disinfection strength dilution of quaternary ammonium compounds in "soft" (low concentration of calcium or magnesium ions) fresh water. An example of an acceptable QAC solution is Lysol® All Purpose Cleaner in a 6.6% Lysol in water dilution. Also, commercially available wipes containing QACs (e.g. Clorox®, Lysol®) are acceptable; and
  3. 70-80% ethanol.
- Dispose of all materials generated during cleaning according to the ship's solid disposal or other secure holding system.
  - The laboratory must be clean between islands, including during transits in either direction between Papahānaumokuākea and the main Hawaiian islands.

**Papahānaumokuākea Marine National Monument  
Special Conditions & Rules  
For  
Moving Between Islands & Atolls  
And  
Packing For Field Camps**

**June 2007**

The islands and atolls of the Papahānaumokuākea Marine National Monument (Monument) and the Hawaiian Islands National Wildlife Refuge are special places providing habitat for many rare, endemic plants and animals. Many of these species are formally listed as Endangered under the Endangered Species Act. Endemic plants and insects, and the predators they support, are especially vulnerable to the introduction of competing or consuming species. Such introductions may cause the extinction of island and reef endemics, or even the destruction of entire island or reef ecological communities. Notable local examples include: the introduction of rabbits to Laysan Island in 1902 which caused the extinction of numerous plant and insect species, and 3 endemic landbird species; the introduction of rats to many Pacific Islands causing the elimination of many burrowing seabird colonies; the introduction of the annual grass, sandbur, to Laysan Island where it has crowded out native bunch grass thus, eliminating nesting habitat for the Endangered Laysan finch; and, the introduction and proliferation of numerous ant species throughout the Pacific Islands to the widespread detriment of endemic plant and insect species.

Several of the islands within the Monument are especially pristine, and as a result are rich in rare and special plants and animals. Nihoa Island has at least 17 endemic and rare insect species, 5 Endangered plants and 2 Endangered birds. Necker Island has Endangered plants and 11 endemic insects. Laysan Island has Endangered plants, 9 endemic arthropods and the Endangered Laysan finch and Laysan duck. Other islands in the Monument such as Lisianski, and islets in Atolls such as Pearl and Hermes Reef and French Frigate Shoals provide homes for a variety of endemic and/or endangered species and require special protection from alien species.

Other Pacific Island such as Kure and the “high islands” (Oahu, Hawaii, Maui, Kauai, etc.) as well as, certain islands within Midway Atoll, Pearl and Hermes Reef and French Frigate Shoals have plants and/or animals that are of high risk for introduction to the relatively pristine islands discussed above. Of special concerns are snakes, rats, cats, dogs, ants and a variety of other insect and plant species. Harmful plant species of highest concern that we know of are *Verbesina encelioides*, *Cenchrus echinatus*, and *Setaria verticillata*.

The Co-trustees are responsible for the management and protection of the islands, reefs and wildlife of the Monument. No one is permitted to set foot within the Monument without the express permission of the Co-trustees through the permitting process. Because of the above concerns, the following restrictions on the movement of personnel and materials throughout the Monument exist.

**The Following Conditions and Rules apply to the all islands within the Monument with the exception of those at French Frigate Shoals and Midway Atoll:**

**Definitions:**

“new” means off the shelf and never used anywhere but the island in question.

“clothing” is all apparel , shoes, socks, over and under garments.

"soft gear" is all gear such as daypacks, fannypacks, packing foam or similar material, camera bags, camera/binocular straps, microphone covers, nets, holding or weighing bags, bedding, tents, luggage, or any fabric, fiber, paper or material capable of harboring seeds or insects.

1. Any personnel who will be landing boats, and staying within the boats, at any island should have clean clothes and shoes.
2. Any personnel going ashore at any island and moving inshore from the immediate area in which waves are breaking, or beyond the intertidal area, at the time of landing must have new footwear, new or island specific clothes and new or island specific soft gear. All must be frozen for at least 48 hours prior to landing.
3. Any personnel entering any vegetated area, regardless of how sparse the vegetation, must have new footwear, new clothes and new soft gear all frozen for at least 48 hours prior to landing.
4. To avoid transport of seeds from within small boats the following protocol should be followed. For islands with safe or sandy landing conditions, one should keep quarantine shoes/socks inside quarantine containers until the island is reached. One should go ashore bare foot, and then don the quarantine shoes. Non quarantine shoes should be removed in the small boat, put into a bucket or some kind of sealed container, and left enclosed in that container until the person departs the island. The sealed container, if clean on the outside, may go ashore, but should not be opened ashore. For landings which are rocky, rough, and relatively unsafe (such as Necker and Nihoa) for safety reasons, quarantine shoes should be donned when inside the small boats, but care should be taken to look for seeds and insects which may be in the small boat.
5. Soft gear may not be moved between islands. Hard gear must be thoroughly cleaned and frozen for at least 48 hours between islands.
6. During transit, clothing and gear coming off Kure, Midway, or any islet of French Frigate Shoals must be carefully sequestered to avoid contamination of gear bound for cleaner islands. Special care must be taken to avoid contaminating gear storage areas and quarters aboard transporting vessels with seeds or insects from these islands.
7. Regardless of origin or destination, inspect and clean all equipment, supplies, etc., just prior to any trip to the Monument. Carefully clean all clothing, footwear and softgear following use to minimize risk of cross contamination of materials between islands.
8. Pack supplies in plastic buckets with fitted lids or other sealable metal or plastic containers since they can be thoroughly cleaned inside and out. **Cardboard is not permitted on islands.** Cardboard boxes disintegrate in a short time and harbor seeds, animals, etc., which cannot be easily found or removed. **Wood is not permitted unless sealed (painted or varnished) on all surfaces and frozen for 48 hours.**

Wooden boxes can also harbor insects and seeds and therefore are only allowed if well constructed (tight fitting seams are required). All wood must be treated, and inside and outside surfaces must be painted or varnished to provide a smooth, cleanable finish that seals all holes.
9. Freeze or tarp and fumigate then seal all equipment (clothes, books, tents, everything) just prior to departure. Food and cooking items need not be fumigated but should be cleaned and frozen, if freezable. Cameras, binoculars, radios, and other electronic equipment must be thoroughly cleaned, including internal inspection whenever possible, but do not need to be frozen or

fumigated. Such equipment can only be packed in wooden crates if treated as in #2 above. Any containers must contain new, clean packing materials and be frozen or fumigated.

10. At present, Tern Island is the singular exception to the above rule, having less stringent rules due to the large number of previously established alien species. Careful inspection of all materials and containers is still required. However, it is acceptable to use wooden and cardboard containers for transporting supplies to Tern Island. Also, there is no requirement for freezing or fumigating items disembarked at Tern. Although requirements for Tern Island are more lax, the Refuge is still concerned about the possibilities of new introductions. Do not wear clothing to Tern Island that has been worn at Pearl and Hermes, Midway Atoll or Kure Atoll.

**Additional Special Conditions for Travel to Nihoa and Necker (Mokumanamana) Islands:**

Nihoa and Necker are the most pristine locations in the Monument. Nihoa is home to the highest number of federally listed endangered species in the Monument. Many areas of these small rugged islands are inaccessible. Introduction of any alien species could have disastrous results in a very short time. It would be almost impossible to mount any kind of control or eradication program on these islands should an alien species become established. Because of these reasons, access to Nihoa and Necker are strictly limited, and rules governing entry are more stringent.

1. Access to Nihoa and Necker by permittees will only be allowed under the accompaniment and supervision of a U.S. Fish and Wildlife Service (USFWS) Representative. The representative, who shall be appointed by the U.S. Fish and Wildlife Service Monument Manager will work with permittees to assure careful compliance with all rules for inspection, handling and preparation of equipment. The USFWS Representative will have the authority to control and limit access to various parts of the island to protect animals, plants and archaeological sites, especially endangered species. The USFWS Representative will have the authority to disallow access to the island, or order an immediate departure from the island if conditions for working on the island are not met or are violated in some way.
2. All field equipment made out of fabric material or wood must be new, and never previously used in the Northwestern or main Hawaiian Islands. Equipment previously purchased or made for use on Nihoa and Necker that has been carefully sealed and stored while away from Nihoa and Necker, and not used elsewhere, may also be brought onto the island. Rules for freezing and/or fumigating are as described for other sites in the Monument (see above).
3. Clothing, footwear (shoes, slippers, socks, etc.), daypacks (soft gear) must be new, unused, or previously only used on Nihoa (or Necker) and carefully sealed and stored while off of the island. Hard gear such as camera, and equipment must be thoroughly cleaned and inspected.

**Additional Special Conditions for Travel Within Pearl and Hermes Atoll:**

In recent years *Verbesina encelioides* has been introduced to Southeast Island within Pearl and Hermes Atoll. This noxious weed has taken over a large portion of the island. To prevent the further spread of this weed to the other islets within this atoll the following precaution must be taken:

1. Every person should have one set of quarantine gear and clothing for Southeast Island and one set of quarantine gear and clothing for all other islets in the atoll. For instance the same clothing, and if needed camping gear, may be used at north and seal kittery, but anything used at southeast needs to stay off all other islets in the atoll. Do not use the outer islet clothing and gear on Southeast Island.

2. Carefully inspect small boats and their associated equipment when traveling between islets at Pearl and Hermes Atoll. Since folks likely take one anchor ashore and put one anchor in the water there is potential for seed dispersal on anchor lines as well as from within the small boats. This needs to be watched very carefully.

**Additional Special Conditions for Food:**

Fresh foods such as fruits, vegetables, leafy vegetables and tubers are not permitted on quarantine enforced islands (Necker, Nihoa, Laysan, Garner Pinnacles, Lisianski and Pearl and Hermes Reef). Concern is not only that certain species such as tomatoes could easily become established but that decomposing organic waste can also harbor microbes and insects and can act as an introduction vector. Soil can contain many seeds, eggs, larvae, etc., and cannot be transported to or between islands.

All other food that can be safely frozen (this does not apply to food in cans or glass jars) must be packaged in air tight containers just as all other gear and frozen for 48 hours.

DEPARTMENT OF LAND AND NATURAL RESOURCES

Adoption of Chapter 13-76  
Hawaii Administrative Rules

August 10, 2007

SUMMARY

Chapter 13-76, Hawaii Administrative Rules,  
entitled "Non-Indigenous Aquatic Species", is adopted.

217.81

HAWAII ADMINISTRATIVE RULES

TITLE 13

DEPARTMENT OF LAND AND NATURAL RESOURCES

SUBTITLE 4

FISHERIES

PART IV FISHERIES RESOURCE MANAGEMENT

CHAPTER 76

NON-INDIGENOUS AQUATIC SPECIES

Subchapter 1 General Provisions

§13-76-1	Purpose
§13-76-2	Definitions
§13-76-3	General permit conditions
§13-76-4	Penalties
§13-76-5	Severability
§§13-76-6 to 13-76-10	(Reserved)

Subchapter 2 Ballast Water Management

§13-76-11	Purpose
§13-76-12	Definitions
§13-76-13	Prohibited activities
§13-76-14	Applicability
§13-76-15	Permits
§13-76-16	Ballast water management plan requirements
§13-76-17	Ballast water exchange requirements
§13-76-18	Ballast water discharge requirements
§13-76-19	Ballast water reporting requirements
§13-76-20	Evaluation and compliance

SUBCHAPTER 1

GENERAL PROVISIONS

§13-76-1 Purpose. This chapter governs rules aimed at preventing, to the extent practical, the introduction and spread of non-indigenous aquatic species into State waters. Such non-indigenous aquatic species are potentially harmful to the environment and economy of Hawaii because they may replace or destroy native species and alter their habitats. [Eff OCT 12 2007 ] (Auth: HRS §187A-32) (Imp: HRS §187A-32)

§13-76-2 Definitions. As used in this chapter unless otherwise provided:

"Board" means the board of land and natural resources.

"Department" means the department of land and natural resources.

"Master" means the person authorized by the vessel operator to be the captain of the vessel.

"Non-indigenous aquatic species" means any marine, brackish water, or freshwater species or other viable biological material, including, but not limited to, eggs, spores, or seeds, that enters or exists in an ecosystem where it was not known to have existed before, is outside its natural or historic range, or may have come to Hawaii by human introduction.

"Person" means any individual, corporation, partnership, trust, association, or other private entity, or any officer, employee, agent, department, or instrumentality of the federal government, of any state or political subdivision thereof, or of any foreign government.

"State" means the State of Hawaii.

"State marine waters" means all waters of the State, including the water column and the water surface, extending from the upper reaches of the wash of the waves on shore seaward to the limit of the

State's police power and management authority, including the United States territorial sea, notwithstanding any law to the contrary.

"USCG" means the United States Coast Guard.

"Vessel operator" means a company that owns, operates or has chartered a vessel. [Eff OCT 12 2007 ]  
(Auth: HRS §187A-32) (Imp: HRS §187A-32)

§13-76-3 General permit conditions. (a) The general permit provisions of this section shall be in addition to the more specific provisions of section 13-76-15, and as otherwise provided in this chapter.

(b) The department may require persons to submit an application for a permit issued pursuant to this chapter.

(c) The submission of an application to the department shall not obligate the department to issue a permit or constitute a right or interest on the part of the applicant to have a permit issued.

(d) A permit shall have a limited duration subject to the provisions of this chapter, but such duration shall not exceed one year from the date of issuance. The issuance of a permit shall not constitute a vested right or property interest to receive future or additional permits.

(e) Permits are non-transferable, so that whenever a permittee parts with possession or transfers, in whole or in part, the title to or interest in the vessel identified in the permit to another person by any arrangement, the permit shall immediately expire. The permittee must notify the department prior to and immediately after such transfer has occurred.

(f) The department may impose terms and conditions it deems necessary to carry out the purposes of this chapter, including requiring a report or reports of any activity conducted that may potentially introduce a non-indigenous species to state marine waters by the applicant or permit holder within the state.

(g) It is unlawful for any person to violate any provision of any permit issued pursuant to this chapter. Failure to comply with any provision of this chapter, or any provision of any permit issued hereunder, shall be cause for termination of said permit.

(h) If the department determines that the protection and conservation of aquatic life in the area requires the cessation of all or certain activities allowed under the permits, upon notification to the permit holders of this determination by any reasonable means, the permits shall automatically expire on a date provided in the notification.

(i) There is no right to a renewal or re-issuance of a permit. When reviewing an application for a permit, the department shall consider whether the applicant has previously violated or not complied with any term or condition of a permit and may deny the application on this basis.

(j) The permittee shall have the permit on board the vessel and be able to show the permit upon the demand of any employee, agent, or officer authorized to enforce this chapter. Failure or refusal to show the permit shall be a violation of this chapter and sufficient cause to immediately but temporarily suspend the permit until such time that the board may take action to revoke the permit.

(k) The board may revoke any permit for any violation of the terms and conditions of the permit and a person whose permit was revoked shall not be eligible to apply for another permit until one year from the date of revocation. [Eff **OCT 12 2007** ]  
(Auth: HRS §§187A-5, 187A-32) (Imp: HRS §§187A-5, 187A-32)

§13-76-4 Penalties. A person violating the provisions of this chapter shall be guilty of a petty misdemeanour, as provided under section 187A-13, HRS, subject to administrative penalties as provided under

section 187A-12.5, HRS, and punished as provided by law. [Eff OCT 12 2007 ] (Auth: HRS §§187A-12.5, 187A-13, 187A-32) (Imp: HRS §§187A-12.5, 187A-13)

§13-76-5 Severability. The provisions of these rules are declared to be severable, and if any portion or the application thereof to any person or property is held invalid for any reason, the validity or application of the remainder of these rules to other persons or property shall not be affected. [Eff OCT 12 2007 ] (Auth: HRS §§187A-12.5, 187A-13, 187A-32) (Imp: HRS §§187A-12.5, 187A-13)

## SUBCHAPTER 2

### BALLAST WATER MANAGEMENT

§13-76-11 Purpose. (a) This subchapter addresses the management and disposition of vessel ballast water as a medium or means for the introduction of aquatic invasive species into state marine waters, such as but not limited to any ocean, estuary, bay, harbor, beach, or coastal area. These rules are intended to act in coordination with federal regulations on ballast water management by 1) establishing state laws that will correspond to and complement federal regulations on ballast water to ensure consistency, 2) providing best practices guidelines to improve vessel ballast water management prior to entering state marine waters, 3) adopting a ballast water management program, including a ballast water exchange reporting system, and 4) monitoring compliance with program requirements.

(b) This subchapter identifies: 1) prohibited activities; 2) vessels exempted from ballast water management plan requirements, ballast water reporting requirements, ballast water exchange requirements, and ballast water discharge requirements; 3) which permits are available to qualifying vessels; 4) requirements

that incoming vessels are subject to regarding ballast water; and 5) State verification of compliance with this subchapter. [Eff **OCT 12 2007** ] (Auth: HRS §§187A-5, 187A-32) (Imp: HRS §§187A-5, 187A-32)

§13-76-12 Definitions. As used in this subchapter, unless otherwise provided:

"Aquatic invasive species" means a non-indigenous aquatic species, which, if introduced into an ecosystem, may cause harm to Hawaii's economy, environment, human health, or public safety and welfare.

"Ballast operations" means the transfer, uptake, and/or discharge of ballast water.

"Ballast tank" means any tank, hold, or part of a vessel used to carry ballast water, whether or not the tank or hold was designed for that purpose.

"Ballast water" means any water, associated sediments, and suspended matter taken on board a vessel to manipulate, control, or maintain trim, draft, stability, or stresses of the vessel, without regard to the manner in which it is carried.

"BWM" means ballast water management as required by federal law 33 CFR Part 151 Subpart D, Mandatory Ballast Water Management Program for U.S. Waters, dated July 28, 2004.

"Coastwise trade" includes the transportation of passengers or merchandise between points embraced within the coastwise laws of the United States.

"Discharge" means to drain or remove part or all of the ballast water off the vessel.

"EEZ" means the United States exclusive economic zone established by Presidential Proclamation No. 5030, dated March 10, 1983, which extends from the baseline of the territorial sea of the United States seaward 200 nautical miles, substantially as defined in federal law 33 CFR 151.2025, dated July 1, 2005.

"Empty/refill exchange" means to pump the ballast tank or tanks out, until empty or as close to empty as the master determines is safe to do so, then refilling

the tank with mid-ocean waters.

"Exchange" means to replace water in ballast tanks by using flow through exchange, empty/refill exchange, or other exchange methodology recommended or required by the United States Coast Guard.

"Flow through exchange" means to flush out ballast tanks by pumping in mid-ocean water at the bottom of the tank and continuously overflowing the tank from the top until three full volumes of the ballast water tank capacity have been changed.

"MHI EEZ" means the main Hawaiian islands exclusive economic zone identified as those waters of the EEZ surrounding the main Hawaiian islands east of 161° West longitude.

"Mid-ocean waters" means waters at least 200 nautical miles from any coast.

"Permanent ballast" means a weight or heavy material added to a vessel to enhance the vessel's stability that is always left on the vessel and not normally removed either between or during voyages.

"Transfer" means the on-board movement of ballast water from one part of the vessel to another.

"Qualifying vessels" means all vessels, United States or foreign flagged, carrying ballast water into state marine waters after operating outside the EEZ.

"Sediments" means any material that settles out of ballast water within a vessel.

"Uptake" means to fill part or all of the vessel's ballast tanks with water from outside the vessel.

"Vessel in innocent passage" means a ship engaged in continuous and expeditious surface passage through the territorial sea and archipelagic waters of foreign coastal states in a manner not prejudicial to its peace, good order, or security. Passage includes stopping and anchoring, but only if incidental to ordinary navigation or necessary by rough weather or distress, or for the purpose of rendering assistance to persons, ships, or aircraft in danger or distress.

"Voyage" means any transit by a vessel that originates from a port or place outside of the EEZ

surrounding the State of Hawaii and destined for a port or place in Hawaii. [Eff **OCT 12 2007** ] (Auth: HRS §187A-32) (Imp: HRS §187A-32)

§13-76-13 Prohibited activities. (a) Unless exempted under the provisions of section 13-76-14, by permit issued pursuant to section 13-76-15, or as may be otherwise provided by law, it is unlawful for the master of a qualifying vessel:

- (1) To fail to have or fail to follow a ballast water management plan, as required under section 13-76-16;
- (2) To exchange ballast water contrary to the provisions of section 13-76-17;
- (3) To discharge, or allow the discharge of, ballast water in state marine waters in violation of section 13-76-18;
- (4) To fail to submit a ballast water report form, as required in section 13-76-19; and
- (5) To violate any provision in this subchapter.

(b) It is unlawful for the master to prevent, hinder, or otherwise interfere with the department's or USCG's evaluation of the vessel's compliance with the provisions of this subchapter. The evaluation may be conducted in accordance with section 13-76-20 and as may be otherwise provided in this subchapter. [Eff **OCT 12 2007** ] (Auth: HRS §§187A-5, 187A-32) (Imp: HRS §§187A-5, 187A-32)

§13-76-14 Applicability. (a) The ballast water management plan requirements of section 13-76-16 shall apply to qualifying vessels.

(b) The ballast water reporting requirements of section 13-76-19 shall apply to qualifying vessels, except for the following:

- (1) Crude oil tankers engaged in coastwise trade. This exemption applies only to vessels carrying unrefined crude oil product from one U.S. place to another, including

Hawaii;

- (2) Any vessel of the United States Department of Defense or USCG, subject to the requirements of Section 1103 of the National Invasive Species Act of 1996, or any vessel of the armed forces, as defined in Section 1322(a)(14) of Title 33 of the United States Code that is subject to the "Uniform National Discharge Standards for Vessels of the Armed Forces" pursuant to Section 1322(n) of Title 33 of the United States Code;
- (3) Any vessel that operates exclusively within the MHI EEZ;
- (4) Any vessel that operates outside of the EEZ, but conducts all ballast operations exclusively in the MHI EEZ, regardless of the number of voyages the vessel makes; and
- (5) Any vessel in innocent passage or having entered state marine waters due to circumstances beyond its control; provided that the vessel does not discharge ballast water into state marine waters, or into waters that may impact state marine waters, unless the vessel meets the requirements of section 13-76-18;

(c) The ballast water exchange requirements of section 13-76-17 shall apply to qualifying vessels that conduct ballast water exchanges; except for vessels exempted under subsection 13-76-14(b) (1), (2), (3), (5) and the following:

- (1) Any vessel equipped with a functioning treatment system designed to kill all living aquatic organisms in the ballast water; provided that USCG or other approving authority has determined that the system is designed to be at least as effective as ballast water exchange at reducing the risk of transfer of aquatic invasive species in ballast water and the treatment system is properly functioning as designed; and

(2) Any vessel, to the extent that it is equipped with permanent, freshwater, or treated ballast, as specified in section 13-76-14 (c) (1) above or will not discharge ballast water in state marine waters.

(d) The ballast water discharge requirements of section 13-76-18 shall apply to qualifying vessels that either will discharge or have discharged ballast water into state marine waters; except for vessels exempted under subsections 13-76-14(b) (2) and (3), and 13-76-14(c) (1) and (2).

(e) The master, or vessel operator when there is no master, shall be responsible for complying with the provisions of this subchapter, unless otherwise provided. Nothing in this subchapter shall relieve the master of the responsibility to ensure the safety and stability of the vessel or the safety of the crew and passengers, or any other responsibility. [Eff

OCT 12 2007 ] (Auth: HRS §187A-32) (Imp: HRS §187A-32)

§13-76-15 Permits. (a) The department may issue permits to vessel operators, exempting qualifying vessels from the provisions of this subchapter, subject to the provisions of section 13-76-3 and the following conditions:

- (1) Receipt of a completed application, on a form provided by the department, and any other information the department may require; and
- (2) Approval by the department, after an assessment of the appropriateness of the application based on:
  - (A) Safety of the crew or its passengers, USCG approved ballast water treatment system, protection of property, vessel integrity or other factors the department considers relevant to the intent and purpose of this subchapter; and

(B) All applicable state and federal law.

(b) The permit exemptions are limited to the provisions of this subchapter and do not exempt the master from other state laws or any federal laws.

[Eff **OCT 12 2007** ] (Auth: HRS §§187A-5, 187A-32)  
(Imp: HRS §§187A-5, 187A-32)

§13-76-16 Ballast water management plan requirements. Vessels in compliance with BWM requirements for a ballast water management plan, shall be deemed to also be in compliance with this section. It is unlawful for any master to violate BWM requirements for a ballast water management plan.  
[Eff **OCT 12 2007** ] (Auth: HRS §187A-32) (Imp: HRS §187A-32)

§13-76-17 Ballast water exchange requirements.

(a) Qualifying vessels that require ballast water exchanges shall conduct such exchanges in mid-ocean waters. Unless exempted by section 13-76-14(c), or as may be otherwise provided by law, it is unlawful for a master to conduct a ballast water exchange within state marine waters while holding ballast water obtained from an area less than 200 nautical miles from any coast.

(b) All such exchanges shall be by flow through exchange, empty/refill exchange, or other exchange methodology recommended or required by the USCG or other approving authority.

(c) The master is responsible for the safety of the vessel, its crew, and its passengers and is not required to conduct a ballast water management practice, including exchange, if the master determines that the practice would threaten the safety of the vessel, its crew, or its passengers because of adverse weather, vessel design limitations, equipment failure, or any other extraordinary conditions. Should the master make such a determination, the master shall

take all feasible measures, based on the best available technologies economically achievable, that do not compromise the safety of the vessel, its crew, and its passengers, to minimize the discharge of ballast water containing non-indigenous aquatic species into state marine waters or waters that may impact state marine waters. Such discharge shall be subject to the provisions of section 13-76-18.

(d) Nothing in this subchapter relieves the master of the responsibility for ensuring the safety and stability of the vessel or the safety of the crew and passengers, or any other responsibility. [Eff  
OCT 12 2007 ] (Auth: HRS §187A-32) (Imp: HRS §187A-32)

§13-76-18 Ballast water discharge requirements.

(a) To the extent practical, the master of any qualifying vessel that has not conducted a mid-ocean waters ballast water exchange, and is subject to the provisions of subsection 13-76-14(d), shall not discharge ballast water into state marine waters.

(b) The master shall report to the department, pursuant to section 13-76-19, when a mid-ocean waters ballast water exchange was not done and a ballast water discharge into state marine waters is necessary.

(c) Unless exempted by subsections 13-76-14(c) or 13-76-14(e) of this section, prior to any ballast water discharge into the EEZ or state marine waters, the master shall obtain approval from the department to discharge ballast water. Upon approval, the master shall then implement all feasible measures to minimize the discharge of ballast water.

(d) This subchapter does not authorize the discharge of oil, noxious liquid substances, or any other pollutant in a manner prohibited by state, federal or international laws or regulations. Ballast water carried in any tank containing a residue of oil, noxious liquid substances, or any other pollutant shall be discharged in accordance with the applicable requirements.

(e) The master shall be exempted from the provisions of subsections 13-76-18(a) and 13-76-18(c), if the master determines that such ballast water discharge is necessary to ensure the safety and stability of the vessel or the safety of the crew and passengers, because of adverse weather, vessel design limitations, equipment failure, or any other extraordinary conditions. [Eff **OCT 12 2007** ]  
(Auth: HRS §187A-32) (Imp: HRS §187A-32)

§13-76-19 Ballast water reporting requirements.

(a) Unless exempted in subsection 13-76-14(b), for all qualifying vessels, the master shall:

- (1) Fully and accurately fill out the USCG ballast water report form;
- (2) Submit the form by fax, electronic mail, or as otherwise provided to the department no later than twenty-four (24) hours prior to vessel arrival into state marine waters;
- (3) Submit an amended form to the department before the vessel departs state marine waters, should there be a change in any of the information submitted in accordance with this section; and
- (4) Maintain on board the vessel records that include all of the information provided on the form for at least two years.

(b) Submission of this form or an amended form to the department does not relieve the master of the responsibility to report to the USCG, if the USCG requires such report or amended form. [Eff **OCT 12 2007** ] (Auth: HRS §187A-32) (Imp: HRS §187A-32)

§13-76-20 Evaluation and compliance. (a) In order to evaluate the compliance rate of qualifying vessels with the provisions of this subchapter, the department, in coordination with the USCG, may:

- (1) Take samples of ballast water and sediment, examine documents, and make other appropriate inquiries;
  - (2) Compile the information obtained from submitted reports and use the information in conjunction with existing information relating to the number of vessel arrivals; and
  - (3) Take other actions necessary for the purposes of this subchapter.
- (b) The master shall make available to the department, upon the department's request, the records required by section 13-76-19 and other relevant information. [Eff OCT 12 2007 ] (Auth: HRS §187A-32) (Imp: HRS §187A-32)

DEPARTMENT OF LAND AND NATURAL RESOURCES

Chapter 13-76, Hawaii Administrative Rules, on the Summary Page dated August 10, 2007, was adopted on August 10, 2007, following a public hearing held on June 28, 2007, after public notice was given in the Honolulu Star-Bulletin on May 20, 2007.

The adoption of chapter 13-76 shall take effect ten days after filing with the Office of the Lieutenant Governor.

## **Precautions for Minimizing Human Impacts on Endangered Land Birds in Papahānaumokuākea Marine National Monument**

The Nihoa finch (*Telespiza ultima*), Nihoa millerbird (*Acrocephalus remota*), and Laysan finch (*Telespiza cantans*) are inquisitive birds that constantly inspect and probe their environment while foraging. While this probably benefits them in their natural environment, it can be problematic when humans bring in equipment or set up encampments. Things that we normally would not think of as hazards to wildlife become sources of finch or millerbird mortality (usually by drowning, entanglement, and entrapment). In order to avoid the unintentional killing of these endangered species, it is imperative that visitors to Nihoa, Laysan, and Pearl and Hermes Atoll be aware of the different hazards that humans pose to passerine birds. The guidelines below derive from documented mortalities and will help you “bird-proof” your operation, but additional hazards exist, so use common sense at all times.

1. The burn barrel must be attended **at all times** when burning trash; be vigilant. When not burning, any vents or rust-eaten holes in the barrel or lid must be covered (e.g., with rocks).
2. Buckets must always be overturned so that they won’t collect rainwater.
3. Laundry buckets must have lids on them while laundry is soaking.
4. Water-filled buckets for dishwashing (or any other chore) must always be attended.
5. Desalinator garbage cans should have netting placed between the can and the lid. Make sure the lids close properly; faulty positioning of hoses can interfere with proper closure.
6. Tarps (e.g., those covering propane, etc.) must be tucked in tightly so that they don’t collect rainwater.
7. Fabric with loose threads should be burned; little feet can become entangled when fabric is hung out to dry. Cut loose threads off tents and tarps.
8. Anything with small mesh (e.g., bird nets or insect nets) should be put away to avoid foot entanglement.
9. Water jugs should be aligned with ample space between rows so that finches won’t get trapped. Always keep jugs capped.
10. For stability reasons, buckets should not be stacked more than two high. Keep an eye out for leaning buckets or water jugs, and level the sand beneath them if necessary.
11. Tents should be zipped at all times (day and night) so that finches and millerbirds cannot enter.
12. Finches and millerbirds should be discouraged from eating people-food so as not to augment the camp population any more than it is already. Dependency by the finches on the camp will result in suffering when temporary and more-permanent field camps dissolve.

## **Human Hazards to Seabirds in Papahānaumokuākea Marine National Monument**

Most seabirds exhibit insular tameness, which is behavior characterized by a lack of the wariness you might observe in birds living in areas with terrestrial predators. Because of this, it sometimes appears by their actions as if humans pose no problems for them. In fact there are a number of potentially serious consequences every time a seabird colony is entered, even by experienced researchers. Hazards to seabirds also result from the movement of vessels through the waters of the Monument.

**Mechanical** - At most seabird colonies in the Monument, you will see birds nesting on three different levels, under the ground, on the surface, and in the shrubs and trees. At many times of the year it is difficult to walk in some parts of the colony without stepping on eggs or caving in the burrows of the petrels and shearwaters. Chicks of several of the tern species hide in vegetation so you should be careful about setting your foot where you cannot see the surface of the ground. Ground-nesting gray-backed terns and brown noddies are often most affected by your activities because they are very timid and nest in open areas that may be travel pathways. If you have occasion to have to walk in burrow areas, you must be prepared to rescue a shearwater or petrel by digging if you accidentally cave in its home. Putting out temporary tents or stacks of equipment may provide a site that burrowing or crevice nesting birds will use. Subsequently removing these materials may cause the nest to fail. Special care should be taken never to leave string or line anywhere in the colony. Seabirds have an uncanny ability to find it and get tangled in any material of this kind. Lights in camps or on vessels at sea cause a collision hazard for petrels and shearwaters in particular because they are confused by the light and collide with the vessel or lighted structure. All ship lights except for running lights or anchor lights should be extinguished or shielded, especially when operating in proximity to seabird colonies.

**Thermal** - The climate of the tropical and subtropical islands seems mild but the eggs and small chicks of all the species live a precarious life on the edge of thermal disaster. The attendance patterns of adults reflect this with eggs and tiny chicks virtually never left unattended. Great care and attention must be given to never keeping a bird off its egg or chick for more than a few minutes. Keep this in mind if you must spend more than 3 or 4 minutes in any area. This is an issue when it is hot as well as when it is cool and wet. When first approaching a site look for any nests or adults flushed from an inconspicuous nest and plan your work to minimize keeping birds from attending their eggs or chicks for more than 3 minutes.

**Biological** - In some colonies, one species may learn to take advantage of human disturbance to prey upon others. Frigatebirds will take chicks and steal nest material from booby nests and other frigatebird nests when the owners of the nest are frightened off by human disturbance. In colonies inhabited by finches of various species, the minute an egg is exposed the finch will rush in and peck a hole and consume the contents. Unattended eggs of ground-nesting species are often eaten by shorebirds such as ruddy turnstones. All small seabirds are at great risk in colonies where there are introduced rats. It is possible that going up to isolated or cryptic nests and handling the eggs will provide a trail that might lead rats to the nest.

**Behavioral considerations** – Young ground-nesting terns such as sooty terns, gray-backed terns and brown noddies are particularly vulnerable to disturbance at age 2 through 7 days from hatching because they are large enough to run in panic if a person walks through the nesting area but not old enough to find their way back to their own nest-site where their parent will recognize and feed them. A colony with chicks at this young age (before scapular feathers have erupted) must not be disturbed. All three species

of boobies (brown, red-footed, and masked) are vulnerable to injury and death when they dive on towed lures used during trolling operations. Younger birds seem particularly susceptible to this. Sustainance fishing operations in the Monument should be stopped immediately if birds are flying in the area and express interest in the lures.

## **Papahānaumokuākea Marine National Monument**

### **National Marine Fisheries Service Best Management Practices**

- If there is any Hawaiian monk seal or any other protected species in the area when performing any permitted activity, the activity shall cease until the animal(s) depart the area unless the activity is covered under a separate permit that allows that activity (e.g., ESA and/or MMPA permits);
- The applicant and those working under any permit issued for this activity shall be familiar with the “Marine Wildlife Viewing Guidelines,” accessible at NOAA’s National Marine Fisheries Service website: [http://www.fpir.noaa.gov/PRD/prd\\_laws\\_policies\\_guidelines1.html](http://www.fpir.noaa.gov/PRD/prd_laws_policies_guidelines1.html);
- Implement the “Disease and Introduced Species Prevention Protocol for Permitted Activities in the Marine Environment Papahānaumokuākea Marine National Monument” for in-water activities; and
- Implement the “Bests Practices for Minimizing the Impact of Artificial Light on Sea Turtles” Pacific Islands regional Office, NOAA National Marine Fisheries service, Rev. Nov. 9, 2007, as applicable.

February 28, 2008 Pacific Islands Regional Office.

This page intentionally left blank.

## **Best Practices for Minimizing the Impact of Artificial Light on Sea Turtles**

NOAA's National Marine Fisheries Service (NOAA Fisheries) and the U.S. Fish and Wildlife Service are jointly responsible for the protection of threatened and endangered sea turtles. In Hawai'i, the agencies are especially concerned about the impact of shoreline activities on the successful nesting and basking of green and hawksbill sea turtles.

Over 90 percent of nesting activity for the Hawaiian population of the threatened green sea turtle (*Chelonia mydas*) occurs at French Frigate Shoals in the Northwestern Hawaiian Islands (NWHI). Green turtles nest from May through September, peaking in June and July. Hatchlings continue to emerge from nests through November. Large numbers of green turtles are also known to bask throughout the NWHI. The endangered hawksbill sea turtle (*Eretmochelys imbricata*) also nests in Hawai'i, with over 90 percent of documented nests occurring on the Island of Hawai'i. Regular nesting also occurs on Maui and Moloka'i. Hawksbills appear to nest and forage primarily within the main Hawaiian Islands, though they have been sighted in the Northwestern Hawaiian Islands.

Many factors affect the potential survival of these turtles, including the loss or destruction of nesting and basking beaches, and other human shoreline activities such as the use of artificial lights. The following set of measures should be adopted as appropriate, to minimize the impacts of lighting on sea turtles:

**A. Avoid the use of artificial lighting near beaches, where possible, particularly during nesting and hatching seasons.**

Artificial light sources on a nesting beach may deter adult females from exiting the water to lay eggs on the beach, cause abandonment of nesting attempts, or disorient adult females and disrupt their natural behavior of returning to the sea after nesting. Artificial light will disorient hatchlings that use light cues to find their way to the sea, making them more vulnerable to predation, exhaustion, and desiccation. Artificial light may also disturb basking turtles.

**B. Do not use excessive or unnecessary amounts of light, or leave lights on or allow campfires to burn longer than necessary.**

Basking behavior may help turtles avoid marine predators. If artificial lighting causes a basking turtle to return to the sea, it may be more vulnerable to predation.

**C. Shield or redirect lights to reduce as much as possible the amount of light that can be seen from the nesting or basking beach.**

Effective light shields should be completely opaque, sufficiently large, and positioned so that light from the shielded source does not reach the beach.

**D. Where possible, use low-intensity light sources that emit long wavelength light (yellow, red) and avoid sources that emit short wavelengths (ultraviolet, blue, green, white).**

Long wavelengths are the least disturbing to sea turtles. Red light-emitting diodes (LEDs) are the best option and one of the light sources least disruptive to sea turtles. Amber or yellow filters placed on light sources are less desirable than red lighting, as they vary in effectiveness and will fade over time.

**E. Aboard vessels at sea, use the minimum lighting necessary to comply with navigation rules and best safety practices.**

Sea turtles of all life stages may be attracted to lights from vessels at sea. These turtles may be vulnerable to vessel activities, as well as being vulnerable to predators that may also be attracted to the same lights.

## **Special Conditions & Rules for Small Boat Operations at Tern Island**

### **Trip Authorization**

All boat trips, including the use of non-FWS vessels, must be authorized by the resident refuge manager before leaving Tern Island or entering French Frigate Shoals. Information must be provided on the trip objectives, the destination(s), and approximate time of return. The resident refuge manager may withhold permission for a boat to leave Tern Island or operate within the refuge boundary if in his/her opinion, the seas are too rough, the weather is inclement, the equipment is in questionable condition, or the operator lacks the experience to cope with prevailing conditions.

### **Boat Operators and Passengers**

All boat operators are required to have completed a Boat Safety Course for use of boats at French Frigate Shoals. FWS Employees must have official DOI boat training certification. Operators must be experienced in handling small craft around coral heads and choppy seas and be familiar with outboard engine operation and repair. If the resident refuge manager is not familiar with their abilities, he/she may request a demonstration ride or other means for skills verification. All persons involved in boating operations must be able to swim. The operator is responsible for seeing that all boat use policy requirements are met. Any kind of unsafe boat operation (violation of boating policy, reckless driving, excessive speed, etc.) will be cause for the resident refuge manager to revoke that person's right to operate boats at French Frigate Shoals. Everyone in the boat must have his/her life jacket on at all times! Each person that is to operate boats at French Frigate Shoals will be required to read and sign the Tern Island copy of the Boat Use Policy to verify that he/she has read and understood it.

### **Boats and Equipment**

All boats going on solo trips are required to have two motors in working condition. Both motors must be tested before leaving the dock area and must be attached to the boat by a safety chain or rope unless bolted to the hull. Boats must have standard safety equipment on board including a life preserver for each person (diving buoyancy compensators and wet suits are not adequate), a bow anchor with at least 120 feet of line (and a similarly equipped stern anchor, if landing on another islet), paddles or oars, an emergency tool kit, a first-aid kit, an emergency locating transmitter (EPIRB), an emergency strobe light, and handheld radios.

A second boat with two motors in good working condition will either travel with the other boat(s) or be ready for immediate use at Tern Island should an emergency arise and rescue be required.

### **Radio Procedure**

All boats launched from Tern Island must be equipped with two operational radios. An exception to this rule is when several boats are being used to offload vessels. Since all boats will be in visual contact with other boats, Tern Island, or the offloading vessel, only one radio is required. Check with the resident refuge manager for the radio frequencies being used. Radios must be tested before leaving the dock area. It is the responsibility of the boat operator to make sure that radios are properly charged prior to any trip (check with the resident refuge manager for proper charging procedures).

Boats must contact Tern Island when they leave a location and when they reach their destination. Arrangements must be made prior to a boat trip to have someone monitoring the radios at Tern Island within 15 minutes after arrival at a destination, or of the time of a prearranged radio call. If contact is not made the boat must immediately return to Tern Island. If radio contact is made while returning to Tern Island the trip can be resumed. If Tern Island does not hear from a boat 1 hour past the expected arrival or prearranged radio call, the backup boat will be launched and a search will commence.

Previous FFS Boating Policy required a rescue boat to be launched 1 hour after any boat is overdue for radio check in. This remains unchanged except that in the late afternoon all boat operators must check in prior to the Departure Guidelines listed below. If a boat has not checked in by the listed guideline, a rescue boat will be launched immediately and sent to the last known location of the missing boat.

### **Departure Guidelines**

All boating activities must be limited to a period between half an hour after sunrise and 1 1/2 hours before sunset. If you change your original route for any reason during the day, contact the resident refuge manager by radio on Channel 16. To allow reasonable amount of time to perform search and rescue, boats must depart the following areas before sunset as stated: Disappearing Island 5 hours, the Gins 2 hr 15 min; East Island 2 hours; Shark, Trig, and Round Islands 1 hr 50 min.

### **General Rules**

No boats may be launched if the wind speed exceeds 20 knots or if seas are deemed exceedingly rough by the resident refuge manager. Approach to within one-half mile of any islet not specifically mentioned on Monument Permits is prohibited, except in emergency situations or unless permission is otherwise obtained in advance from the resident refuge manager. At least two people must be aboard a boat at all times unless pre-approved by the resident refuge manager.

- ANNEX 17 ITEMS TO BE INCLUDED IN THE AGENDAS FOR MEPC 58, MEPC 59 AND MEPC 60
- ANNEX 18 AMENDMENTS TO THE GUIDELINES ON THE ORGANIZATION AND METHOD OF WORK OF THE MARITIME SAFETY COMMITTEE AND THE MARINE ENVIRONMENT PROTECTION COMMITTEE AND THEIR SUBSIDIARY BODIES (MSC-MEPC.1/CIRC.1)

**ANNEX 12****RESOLUTION MEPC.171(57)****Adopted on 4 April 2008****DESIGNATION OF THE  
PAPAHĀNAUMOKUĀKEA MARINE NATIONAL MONUMENT  
AS A PARTICULARLY SENSITIVE SEA AREA**

THE MARINE ENVIRONMENT PROTECTION COMMITTEE,

BEING AWARE of the ecological, socio-economic and scientific attributes of the Papahānaumokuākea Marine National Monument, as well as its vulnerability to damage by international shipping activities and the steps taken by the United States to address that vulnerability,

NOTING the Revised Guidelines for the Identification and Designation of Particularly Sensitive Sea Areas adopted by resolution A.982(24) (PSSA Guidelines) and the Revised Guidance Document for Submission of PSSA Proposals to IMO set forth in MEPC/Circ.510,

HAVING CONSIDERED the proposal made by the Government of the United States that the Papahānaumokuākea Marine National Monument be designated as a Particularly Sensitive Sea Area,

HAVING AGREED that the criteria for the identification and designation of a Particularly Sensitive Area provided in resolution A.982(24) are fulfilled for the Papahānaumokuākea Marine National Monument,

HAVING NOTED that the Maritime Safety Committee, at its eighty-third session, in considering the necessary associated protective measures, adopted new and amended, routing measures, as well as a new ship reporting system applicable to the proposed Particularly Sensitive Sea Area,

1. DESIGNATES the Papahānaumokuākea Marine National Monument described in annex 1 as a Particularly Sensitive Sea Area;
2. INVITES Member Governments to recognize the ecological, socio-economic, and scientific attributes of the area, set forth in annex 2, as well as its vulnerability to damage by international shipping activities, as described in annex 3; and
3. FURTHER INVITES Member Governments to note the associated protective measures established to address the area's vulnerability, the details of which are contained in annex 4, and request ships flying their flag that they act in accordance with such measures.

ANNEX 1

**DESCRIPTION OF THE PAPAĀNAUMOKUĀKEA MARINE  
NATIONAL MONUMENT PSSA\***

(Reference chart: United States 19016, 2007 edition; 19019, 2007 edition; 19022, 2007 edition. These charts are based on World Geodetic Survey 1984 and astronomic datum.)

**Description of the Particularly Sensitive Sea Area for the Papahānaumokuākea Marine National Monument**

To avoid the risk of damage from ship groundings and pollution damage by international shipping activities and the destruction and degradation of this unique, fragile, and pristine coral reef ecosystem, as well as of significant cultural and archaeological resources, mariners should exercise extreme care when navigating in the area bounded by a line connecting the following geographical positions which is designated as a Particularly Sensitive Sea Area:

<b>Point</b>	<b>LATITUDE</b>	<b>LONGITUDE</b>

CHARTLET

## ANNEX 2

### **ECOLOGICAL, SOCIO-ECONOMIC, AND SCIENTIFIC ATTRIBUTES OF THE PAPA HĀNAUMOKUĀKEA MARINE NATIONAL MONUMENT PSSA\***

#### **1 *Ecological Criteria***

##### **1.1 Uniqueness or rarity**

1.1.1 The Papahānaumokuākea Marine National Monument (North-western Hawaiian Islands or NWHI) supports a unique, dynamic coral reef ecosystem, which, thanks to its relative isolation, is among the healthiest in the world (Citizen's Guide 2006). It is one of the last remaining large-scale wilderness coral reef ecosystems on the planet and the largest coral reef ecosystem in the marginal tropical seas (Cousteau 2003). Approximately one-quarter of the species found in the NWHI are endemic to the Hawaiian Island chain, which is one of the highest rates of marine endemism in the world (Friedlander *et al.* 2005; Citizen's Guide 2006). The proportion of scientifically non-described coral reef species (e.g., sponges, corals, algae, and other invertebrates) in this area is one of the highest in the world (Cousteau 2003). The NWHI also contain important breeding and nesting grounds for a number of species, many of which are at risk, including the critically endangered Hawaiian monk seal, the threatened green sea turtle, and 19 species of seabirds (Henderson 2001; NOAA 2004b; Citizen's Guide 2006).

1.1.2 The uniqueness of this area was expressed in 2003 by ocean explorer Jean-Michel Cousteau in his **Voyage to Kure** expedition log: "These islands are a celebration of the uniqueness brought on by isolation. Along this ribbon of life, we found teeming populations of spinner dolphins and large apex predators such as reef sharks, jacks, and groupers. We encountered many of the Hawaiian endemic species of reef fish, including the rare masked angelfish and Hawaiian grouper; all perfect reminders of an intact coral reef ecosystem" (Cousteau 2003).

##### **1.2 Critical Habitat**

1.2.1 Parts of the proposed area provide critical habitat for a variety of endangered or threatened species that are protected under various United States domestic laws. These species include the critically endangered Hawaiian monk seal; the endangered sperm whale; the endangered hawksbill, leatherback, and green sea turtles; the endangered short-tailed albatross; six endangered plant species; and four endangered land birds: the Nihoa finch, Nihoa millerbird, Laysan finch, and Laysan Duck, the world's rarest duck. Of these species, seven are listed in Appendix I of the Convention on Trade in Endangered Species of Wild Flora and Fauna (CITES) and nine are listed on the World Conservation Union (IUCN) Red List of Threatened Species (including three with "critically endangered" status).

##### **1.3 Dependency**

1.3.1 The ecological processes of the NWHI ecosystem are dependent on the health of its vast, diverse coral reef tracts. Often called the "rainforests" of the sea, coral reefs are vital to

---

\* The text in this annex is taken from the United States submission contained in document MEPC 56/8.

maintaining the biological diversity of the oceans (Citizen's Guide 2006). The pristine coral reefs of the NWHI are the foundation of a symbiotic community composed of countless millions of plants and animals dependent upon one another for survival (Citizen's Guide 2006). These reefs perform important ecosystem services including filtering water, protecting islands from sediment deposition and storms, and providing nourishment for marine organisms.

1.3.2 Thousands of species depend on the coral reefs of the NWHI. Hawaiian monk seals, a majority of which make their home in the NWHI, are the only surviving marine mammal that is dependent on coral reef ecosystems (Citizen's Guide 2006; Cousteau 2003). The high incidence of apex predators such as sharks, jacks, and groupers also depends on the high productivity of this ecosystem. In turn, the prevalence of apex predators has a significant effect on the structuring of the fish assemblage of the area, impacting the diversity and relative abundance of species lower on the food chain. Thus, adverse impacts on these apex predators could cause populations of smaller fish to quickly become unbalanced, changing the trophic structure and order of dominance within the ecosystem (Maragos and Gulko 2002; Friedlander and DeMartini 2002; Suthers 2004).

1.3.3 Approximately 14 million seabirds, with 5.5 million nesting annually in the NWHI, rely on the coral reef ecosystem for food and other habitat needs (Naughton and Flint 2004). In turn, the ecosystem is dependent on these birds' role in the high relative productivity and diversity of the NWHI. Nutrient-rich defecation (guano) deposited by the birds on the islands and nearshore waters – which subsequently is dissolved and provides significant levels of nitrogen to the ecosystem – is thought to stimulate the prolific growths of algae found around the islands. When high levels of algal growth are combined with significant wave action, such as at La Perouse Pinnacle at French Frigate Shoals, this creates favourable conditions for the growth of other species (Maragos and Gulko 2002).

1.3.4 The ecological processes of the NWHI depend on more than just its coral reefs. Beyond the banks and steep slopes, between 1,640 and 14,000 feet, the ocean floor levels out at sea bottom which contains distinct, rich habitat (Press and Siever 1986; Benoit-Bird *et al.* 2001). This habitat is linked to the coral reef ecosystem by a dense assemblage of small fish, shrimp, and squid that migrate from the ocean depths to near the surface in regular patterns and serve as an important food resource for many animals, including spinner dolphins, bottom fish, tunas, and billfish (Benoit-Bird *et al.* 2001). The importance of offshore and deepwater habitat is also evidenced by the movements and diets of Hawaiian monk seals. Although part of the seals' diet comes from shallow-water coral reef fish, the seals are known to travel over one hundred miles between islands and dive to depths of greater than 900 feet when foraging for deepwater prey, mainly bottom fish, which make up the primary part of their diet (Henderson 2001; TenBruggencate 2006). Each of these habitats is essential to the other, and the loss of one affects the operation of all the others throughout the system. Accordingly, an impact on one part of the system can threaten the entire ecosystem as well as the diversity of species that depend on the area.

## 1.4 Diversity

1.4.1 The NWHI supports more than 7,000 species of fishes, mammals, plants, coral, and other invertebrates (Bush 2006). Discoveries of species in the NWHI are continuing to be made, as demonstrated by a 2006 research expedition in French Frigate Shoals which yielded over 100 species not previously known to exist in the area and many of which may be previously unknown to science (Associated Press 2006). The rich diversity of the NWHI is in part due to

the relative isolation of the area and minimal impact from humans, which is underscored by the starkly contrasting lower levels of diversity found in the marine areas of the main Hawaiian Islands (DeMartini and Friedlander 2004; Friedlander *et al.* 2005a; NOAA 2004g). Coral reefs are among the most highly diverse of all ecosystems on the planet; the coral reef ecosystem of the NWHI exemplifies this point.

1.4.2 Further contributing to diversity, the ecosystem of the NWHI contains a wide variety of habitats, extending from the shoreline to depths of approximately 14,000 feet. For example, within the pristine coral reefs of the NWHI, the percentage of coral cover varies widely, creating a series of interconnected but distinct types of coral reef habitats, or zones (e.g., shelf, fore reef, reef crest, back reef, and lagoon). Wave exposure is the primary factor causing zonation in the NWHI, but gradients in sediment, salinity, and temperature are also important (Friedlander *et al.* 2005a). As a result of this zonation, the coral reefs of the NWHI contain a variety of environmental niches and resources that support a diverse array of species.

## **1.5 Productivity**

1.5.1 Coral reef ecosystems have the highest gross primary productivity of all ocean areas, and the proposed area contains several thousand square miles of coral reefs, indicating a highly productive ecosystem. Also indicative of the area's productivity is the high incidence of apex predators such as sharks, jacks, and groupers, which make up more than half of the total fish biomass in the NWHI. A very high replacement rate of small and mid-size fish is necessary to support an apex predator-dominated ecosystem.

1.5.2 The productivity of the proposed area can readily be seen by comparing it to the productivity in the main Hawaiian Islands. A comparison of both biomass and trophic structure between reef fish communities in the NWHI and the main Hawaiian Islands showed that across similar habitats, biomass was 260 per cent higher in the NWHI (Friedlander and DeMartini 2002). Productivity is especially high in the area's inshore waters, shallow lagoons, and coral reefs. For example, the lagoon in French Frigate Shoals produces nearly ten times the amount of phytoplankton as produced in the same volume of water in the open seas. The area also has extensive submerged banks, which have high levels of primary productivity due to the existence of expansive algal meadows. Furthermore, while apex predators represent only three per cent of the fish biomass in the main Hawaiian Islands, they make up 54 per cent of the biomass in the NWHI (Suthers 2004).

## **1.6 Spawning or Breeding Grounds**

1.6.1 The NWHI provide critical breeding and nesting grounds for a wide variety of species. The area contains the breeding grounds for almost the entire remaining population of the Hawaiian monk seal, and serves as the seals' primary haul-out, pupping, and weaning habitat. The area also provides the breeding grounds and primary nesting sites for approximately 90 per cent of the threatened Hawaiian Islands green sea turtle population. Millions of Central Pacific seabirds also congregate on these islands to breed, including all but three of Hawaii's 22 species of seabirds, such as the grey-backed tern, short-tailed albatross, and the red-tailed tropicbird. More than 99 per cent of the world's Laysan albatrosses and 98 per cent of the world's black-footed albatrosses return to the NWHI each year to reproduce. For some bird species, the NWHI provide their only breeding site.

## **1.7 Naturalness**

1.7.1 Because of their geographical isolation and long history of protection, the reefs of the NWHI are among the healthiest and most undisturbed coral reefs on the planet. Their naturalness is perhaps best evidenced by the relatively high diversity and productivity in the NWHI as compared with the reefs of the main Hawaiian Islands, which have experienced much greater impacts from humans, and by the fact that the NWHI is one of the worlds last remaining large-scale apex predator-dominated reef ecosystems.

## **1.8 Integrity**

1.8.1 The area of the NWHI is a prime example of a self-sustaining ecological entity. The volcanic islands, coral atolls, shallow reefs, banks, slopes, shoals, seamounts, deep reefs, and open water form the basis for this interlocking and complex ecosystem. Its integrated nature is evidenced by the vast number of interdependent processes that connect the varied NWHI habitats, as discussed in particular in section 3.4 (Dependency) of this proposal. Examples of this include: (1) the critical link between the shallow coral reef and the deep ocean floor habitats manifested by species that migrate regularly from great depths and are consumed by many shallower water animals; (2) the foraging, feeding, breeding, and pupping areas of the Hawaiian monk seal range from the offshore, deepwater habitats to the land areas; and (3) the deposits of bird guano stimulate algal growth which, when combined with wave action, contributes to the growth of other species and the high productivity of the ecosystem.

1.8.2 While the NWHI are a part of the greater chain of Hawaiian Islands, there is clear evidence that the NWHI function as a distinct, biological unit. The NWHI ecosystem is highly productive, diverse, and apex predator-dominated while the ecosystem around the main Hawaiian Islands has substantially lower productivity, less species diversity, and is not apex predator-dominated. These differences demonstrate that the NWHI function as an integral unit.

## **1.9 Fragility**

1.9.1 The area contains several thousand square miles of coral reefs made up of at least 57 species of hard coral and 12 species of soft coral. Coral communities are fragile ecosystems. They require a delicate balance across a range of environmental conditions in order to be healthy and grow. The health of a coral ecosystem may be threatened by changes to even one of those environmental conditions. Corals derive a substantial portion of their nutrition from symbiotic algae (called zooxanthellae) within their tissues. Because algae require light for photosynthesis, clear and clean water conditions are necessary for growth and well-being. The introduction of pollutants can be toxic to the coral.

1.9.2 The physical structure of the reef is provided by calcium carbonate, which forms the rock framework or reef “skeleton”. This calcium carbonate is deposited at a rate of about one-centimetre per year by the living coral animal (polyp). These polyps exist in a thin layer at the surface of the reef rock. The coral reef system of the NWHI has taken thousands of years to build and, if damaged, regeneration of the reef may never occur. If optimal conditions for regeneration exist, it would still take hundreds, and perhaps thousands of years, for a damaged area of the reef to return to its previous condition.

1.9.3 In the NWHI, transiting ships are a primary anthropogenic threat to this fragile ecosystem because of ship groundings and pollution from operational and accidental discharges. Secondary and cumulative damage may occur when dislocated coral fragments caused by groundings are tossed against healthy coral by wave action, currents, and storms.

1.9.4 The isolation of the NWHI affords both protection from and vulnerability to invasive species, which can be transferred by ships. The islands' ecosystems have evolved without the influence of outside forces, demonstrated by the high level of native and endemic species. To date, 11 non-native species have been identified in the waters of the NWHI. Non-native species can displace native species and seriously disrupt and imbalance the natural ecosystem.

## **1.10 Bio-geographic importance**

1.10.1 The NWHI represent one of the last remaining examples of an intact apex predator-dominated coral reef ecosystem with large top predator fish such as sharks in abundance. Because it is isolated, many aspects of the area represent what a completely pristine and undisturbed bio-geographic system would look like at this latitude if one still existed.

1.10.2 The area is geologically unique. The islands were created from a single plume of magma rising from a hot spot in the earth's mantle. Built up over millions of years of eruption, high volcanic islands were formed, then carried north-westerly by the movement of the Pacific Plate beneath. Twenty-eight million years ago the last emergent feature of the chain, Kure, was located where the present Big Island of Hawaii is now located.

## **2 Social, cultural and economic criteria**

### **2.1 Human Dependency**

2.1.1 The NWHI are of particular importance because of their significance in Native Hawaiian history and culture. The NWHI have long been considered a sacred place in Native Hawaiian traditions, and two of the islands in particular contain important archaeological sites (Kikiloi 2006). Early Polynesian voyagers, in their trans-Pacific voyages aboard large double-hulled sailing canoes, were the first humans to arrive in the NWHI, as early as 1000 A.D. Early Hawaiians lived on Nihoa for an estimated 700 years, but this occupation mysteriously ceased before Captain Cook's first landing in Hawaii in 1778 (Citizen's Guide 2006). Their early presence is evidenced by numerous sites on Nihoa and Mokumanamana (Necker), which are listed on both United States and State of Hawaii Registers of Historic Places for their cultural and historical significance. Together, the two islands have 140 recorded cultural sites, including ceremonial, residential, and agricultural sites, some which resemble historically important Polynesian sites in Tahiti and the Marqueses (Emory 1928; Cleghorn 1988; Liller 2000; Kawaharada 2001; Kikiloi 2006). These sites are being studied to increase the understanding of the connection between Native Hawaiian culture and the early Polynesians.

2.1.2 Oral traditions also confirm the relationship of the islands to ancestral Native Hawaiians, and recent ethnological studies have highlighted the continuity of traditional practices in the NWHI. Native Hawaiian cultural practitioners continue to voyage to the NWHI to honour their ancestors and perpetuate these practices. In 1997, Hui Mälama i Nä Kūpuna o Hawaii's Nei, a group dedicated to the repatriation of ancestral remains, returned sets of iwi (bones) to Nihoa and Mokumanamana (Necker). In 2003, the voyaging canoe *Hōkūle`a* travelled to Nihoa so that a group could conduct traditional ceremonies. In 2004, the *Hōkūle`a* sailed to Kure Atoll, and

in 2005 it took a group to Mokumanamana (Necker) for ceremonies on the summer solstice (Citizen's Guide 2006). Finally, underscoring the importance of the NWHI marine ecosystem in Native Hawaiian culture, oral traditions identify the coral polyp as the first living creature to emerge on Earth and the foundation and the building block of all other life in the sea (Friedlander *et al.* 2005b). It follows that ensuring a healthy, intact ecosystem in the NWHI plays an important role in perpetuating Native Hawaiian cultural traditions.

## **2.2 Cultural heritage**

2.2.1 The NWHI are rich in underwater cultural heritage. The numerous wrecks found in the area are time capsules which capture specific elements of our seagoing past. Documents indicate that over 120 vessels and aircraft have been lost in the waters of the proposed area. These remains are representative of distinct phases of Pacific history and include Japanese junks, Hawaiian sampans, 19th century whalers, United States Navy side wheel steamers, French sailing ships, and fighter aircraft lost during the World War II Battle of Midway. Only a handful of these sites have been located and assessed so far, but these surveys reveal resources unique to the North-western Hawaiian Islands. The wrecks of the whaling ships **Pearl** and **Hermes**, both of which ran aground in 1822, are the only archaeological remains of the South Seas whaling industry, and the oldest shipwrecks found thus far in Hawaii. The scattered remains of the **USS Saginaw**, lost in 1870, capture the United States Civil War-era technology of the "old steam navy." The wreck site of the **Dunnottar Castle**, an iron hulled sailing ship lost in 1886, offers a rare glimpse of the days of the Tall Ships. These and many other sites are rare, representative of broad themes of maritime history, and a testimony to the uniqueness of Pacific seafaring history. Unwarranted damage or removal of submerged archaeological sites is prohibited by state and federal preservation laws, and United States Monument management agencies seek to protect these heritage resources as windows into the past.

## **3 Scientific and educational criteria**

### **3.1 Research**

3.1.1 This area is of high scientific interest and offers unparalleled opportunity for research. Given the fact that the NWHI are remote and rich with marine and terrestrial life, they provide one of the few areas in the world where researchers can conduct large-scale comparisons between human-impacted marine ecosystems and un-impacted marine ecosystems (Citizen's Guide; Friedlander and DeMartini 2002). Such comparisons may serve as a living model to guide restoration efforts elsewhere.

3.1.2 As further evidence of the importance of this area for research, in October 2006 an international team of biologists made discoveries in French Frigate Shoals of several new species of coral, sea stars, snails, and clams. The researchers also discovered over one hundred species never before seen in French Frigate Shoals and many of which may have been previously unknown to science (Associated Press 2006). These scientific discoveries suggest that much research remains to be done to fully understand and appreciate this complex ecosystem.

3.1.3 Research and monitoring conducted by United States federal and state agencies, academic institutions, and other organizations over the last 30 years have contributed substantially to the understanding of natural and anthropogenic factors influencing the NWHI and the interconnectedness of the physical and biological processes along the entire Hawaiian Island chain. Ongoing research and monitoring of the marine ecosystems in the NWHI will continue to

provide significant insights that will benefit management not only for the NWHI but in the entire Hawaiian Island chain and marine ecosystems around the world.

### **3.2 Baseline for monitoring studies**

3.2.1 The NWHI are one of the few marine regions on earth where monitoring and research activities can be conducted in the virtual absence of local human habitation and activities. It thus provides ideal baseline conditions with regard to biota and environmental characteristics because it has not had substantial perturbations and is thus in a natural or near-natural condition. Remote, uninhabited, and relatively pristine in comparison to the main Hawaiian Islands and other marine ecosystems around the world, the NWHI serve as one of the few modern sentinels for monitoring and deciphering short-term and long-term responses to local, regional, and global environmental and anthropogenic stressors.

### **3.3 Education**

3.3.1 The NWHI provide a model and rare benchmark of a healthy, intact integrated ecosystem preserved in its natural or near-natural state that may inspire Hawaiian residents as well as others to take part in ocean restoration efforts in their communities. This guiding premise led to “Navigating Change”, a multi-year, interagency project which focuses on raising awareness and motivating people to change their attitudes and behaviours to better care for Hawaii’s land and ocean resources. A five-part video and educational curriculum featuring the traditional Polynesian voyaging canoe *Hōkūle`a* during its 2004 expedition to the NWHI was completed in partnership with several agencies and organizations. Teacher workshops on the “Navigating Change” program have been held since 2003 across Hawaii and an outreach co-ordinator leads an associated curriculum in schools state-wide. As people learn more about the NWHI, many will want to go there and experience it. Therefore, the educational message that is being sent to preserve the fragile balance of the NWHI is that people must admire it from afar. Educational activities, therefore, will focus on bringing the place to the people, not the people to the place.

## ANNEX 3

### **VULNERABILITY TO DAMAGE BY INTERNATIONAL SHIPPING ACTIVITIES\***

#### **1 *Vessel Traffic Characteristics***

##### **1.1 Operational factors**

1.1.1 There are limited maritime activities conducted in the waters of the NWHI, undoubtedly due to the islands' remote location and harsh environmental conditions for human activities. Pursuant to the Presidential Proclamation of June 15, 2006, most domestic activities within NWHI waters are prohibited or strictly regulated. Public access to the land portions of the NWHI has for many years been allowed by permit only, except for Midway Atoll, and permits are issued only for research and Native Hawaiian cultural activities. The maritime activities in this area are primarily research and management, fishing, cultural practices, and recreation. Research activities include assessment, long-term monitoring of resources, impacts and threats from human activities, and protection and conservation of NWHI resources. An estimated four million dollars are spent annually on research and management of the area. There are eight remaining commercial fishing permits in the NWHI, although the Presidential Proclamation and codifying regulations require closure of the fishery five years from the date of the Proclamation. Native Hawaiian cultural practitioners voyage to the NWHI to honour their ancestors and perpetuate traditional practices. Current tourism and recreational activities are limited to Midway Atoll and, under the Proclamation, a permit is now required. The extent to which ocean tourism and recreation occurs in the NWHI is unknown, but it appears to be extremely low. These activities may include wildlife watching, diving and snorkelling, charter fishing, and tour boats. Additionally, a management plan for tourism to the historic World War II location and military heritage sites on Midway Atoll is currently being developed and up to three cruise ships may visit the island each year.

##### **1.2 Vessel Types**

1.2.1 Container ships, bulk carriers, tankers, freighters, and fishing vessels regularly transit the waters surrounding the NWHI. With the exception of a few small boats at Midway Atoll and Tern Island (French Frigate Shoals), no vessels home port in the NWHI. Research and management vessels, eight fishing vessels, vessels used by Native Hawaiians, some recreational vessels, and a few cruise ships, conduct strictly regulated activities in NWHI waters (Franklin 2006; Mohri 2006).

##### **1.3 Traffic Characteristics**

1.3.1 Although due to its remoteness, the exact route of vessels through this area is unknown, it appears that most traffic passes to the north of the island chain, following the great circle routes to and from ports on the west coast of North America and East Asia. Other trans-Pacific ships travelling from ports in Hawaii transit at least 100 miles south of the NWHI. Occasionally, vessels transiting from the south pass within the boundaries of the proposed PSSA (Franklin 2006; Tosatto 2005; Horizon Lines 2006; Devany 2006).

---

\* The text in this annex is taken from the United States submission contained in document MEPC 56/8.

1.3.2 A preliminary analysis of vessel traffic patterns within the NWHI was conducted based on data collected by the World Meteorological Organization's Voluntary Observing Ships scheme. This scheme collects geo-referenced data from select non-research vessels that make frequent and regular crossings of all major ocean basins. While the scheme does not capture the total traffic in the area, during a 21-month study period in 2004 and 2005, approximately 132 vessels reported from within the area of the proposed PSSA: 104 of these vessels were freighters, 8 were tankers, 4 were research vessels, 2 were passenger vessels, 2 were vessels used for educational purposes, 1 was a recreational vessel, 1 was a towing vessel with a 666-foot vessel in tow, and 10 were unidentified vessels. The 132 vessels were flagged in 23 different countries (Franklin 2006).

## 1.4 Substances Carried

1.4.1 While precise data is not available for the types of harmful substances carried on board the vessels that transit the waters of the NWHI, it is possible to identify examples of such substances from incidents that have occurred in the area. Three vessels, the **Paradise Queen II** (1998), the **Swordman I** (2000), and the **Casitas** (2005), all grounded in the NWHI and had significant quantities of bunker fuel or were carrying other types of fuel onboard (Cascadia Times 2006; Shallenberger 2004). These substances are harmful to the marine ecosystem and to the terrestrial environment when washed ashore. In another incident, a container of the pesticide, carbofuran, washed ashore at Laysan Island (Friedlander *et al.* 2005).

1.4.2 Three other ship accidents occurred involving cargoes that may not be classified as "hazardous substances," but that would be harmful if released into this area of the sea. The first incident involved the **Anangel Liberty** in 1980 where 2,200 tons of kaolin clay was dumped overboard to lighten the ship enough to pull it off one of the reefs on French Frigate Shoals. Fortunately, the currents on that day carried most of the clay out to sea rather than onto the reef. Had it not, the clay could have smothered coral thus adversely affecting the ecosystem. The other two incidents involved the grounding on Laysan of fishing vessels that had evidence of rats on board. Again, fortunately, the rats did not take up residence on the nearby island; however, if they had, it would have been extremely harmful to the ecology of the area because such introduced species can become "ecosystem busters" and cripple the ecosystem within that area (Shallenberger 2004).

## 2 Natural Factors

### 2.1 Hydrographical

2.1.1 The hydrography of the NWHI underscores the need for mariners to navigate with extreme caution. The chain of small islands, atolls, banks, seamounts, pinnacles, shoals, and other emergent features are remnants of volcanic islands which are eroding and subsiding beneath the ocean surface. While only the peaks of the original islands remain above the water's surface, coral growth on submerged slopes has matched the rate of subsidence (Evans *et al.* 2004). Due to these features, navigation in this area is dangerous and must be done with extreme caution. Water depths in this area range from the water's surface to slightly submerged banks, reefs, and other emergent features to the ocean floor at more than 14,000 feet.

2.1.2 The area of the proposed PSSA is currently covered by mostly small scale charts, with the most recent surveys taking place since 2000 near known islands, reefs and atolls. Although modern hydrographic surveys by the University of Hawaii and satellite imagery of the area have

allowed NOAA's Office of Coast Survey to correct the position of several of these features, many of the submerged banks and isolated features have yet to be updated or discovered.

2.1.3 In 2003, a mapping expedition was undertaken by NOAA and the University of Hawaii Undersea Research Laboratory. The primary objective of this project was to provide for more complete and accurate charts and survey data to support the management of the NWHI Coral Reef Ecosystem Reserve and protection of its resources. This expedition included hydrographic experts to ensure that appropriate International Hydrographic Organization quality standards were met. The hydrographic data will be applied to all affected charts by the end of 2007. Notwithstanding, large areas of the NWHI remain to be surveyed and nautical charts updated.

## **2.2 Meteorological**

2.2.1 The northeast trade winds prevail throughout the year, but westerly blows can be expected during the winter. The average velocity of the winds is 12 knots, with monthly averages of 16 knots in December and 9.5 knots in August. Gales have been experienced in July and September. Occasional heavy showers of short duration also occur, cutting visibility to about 2 miles (Coast Pilot 7, 38<sup>th</sup> ed., 2006).

2.2.2 Tropical storms and hurricanes are a potential, but infrequent, threat to the shallow coral reef community structure of the NWHI. They can generate extreme wave energy events that can damage the coral and are the primary natural force in altering and shaping coral reef community structures (Dollar 1982; Dollar and Grigg 2004). Since 1979, two hurricanes (category 2) have passed near the NWHI. The most recent significant tropical storm was Hurricane Nele which passed near Gardner Pinnacles in 1985 (Friedlander *et al.* 2005).

2.2.3 Pacific Decadal Oscillation (PDO) events and the El Nino/La Nina phenomenon (ENSO) are two other meteorological factors that occur in the area of the NWHI. PDO events have been described as long-lived El Nino-like patterns of Pacific climate variability. They appear to persist for 20 to 30 years, compared to the 6 to 18 months for an El Niño event. The effects of the PDO are strongest in the North Pacific, while secondary signatures exist in the tropics. PDO sea level pressure anomalies vary with low pressures over the North Pacific and high pressure over the subtropical Pacific. These pressure patterns cause enhanced counter-clockwise wind stress over the North Pacific. With regard to the ENSO, while scientists do not fully understand how one is triggered, the initial detection occurs by a rise in atmospheric pressure in the western Pacific and a drop in pressure in the eastern Pacific (Garrison 1999). This causes trade winds to shift direction, which subsequently causes warm water in the western Pacific to flow across the Pacific basin. This mass of warm water has a number of effects on climate and ocean conditions. For example, it can cause trade wind speeds to drop, which can cause an increase in sea surface temperature (Hoeke *et al.* 2004). Light winds are likely the cause of recent coral bleaching in the NWHI. Increased water temperatures stress the coral, which causes it to expel the symbiotic zooxanthellae. If water temperature does not decrease and zooxanthellae do not return to the coral tissue, the coral will die.

## **2.3 Oceanographic**

2.3.1 The NWHI are influenced by a wide range of oceanographic conditions that vary on spatial and temporal scales. Ocean currents, waves, temperatures, nutrients, and other oceanographic parameters and conditions influence ecosystem composition, structure, and function in the NWHI. Ocean currents play an important role in the dispersal and recruitment of

marine life in the NWHI. Surface currents are highly variable in both speed and direction (Firing *et al.* 2004), with long-term average surface flow from east to west in response to the prevailing northeast trade wind conditions. The highly variable nature of the surface currents is due in large part to eddies created by local island effects on large-scale circulation. Marine debris accumulation in shallow water areas of the NWHI also is influenced by large and small-scale ocean circulation patterns. These eddies might also result in pollution from vessels accumulating in the coral thus damaging resources.

2.3.2 Ocean waves also play an important role in the NWHI. The distribution of corals and other shallow water organisms is influenced by the exposure to waves. The size and strength of ocean wave events have annual, inter-annual, and decadal time scales. Annual extra-tropical storms (storms that originate outside the tropical latitudes) create high energy large wave events from five to over ten meters which approach largely from the northwest during the winter. During this time, the average wave power increases substantially and extreme wave events of over ten meters pound the shallow water coral communities, thus posing a hazard to the coral reef communities and to navigation. Decadal variability in wave power is possibly related to PDO events (Manutau *et al.* 1997). The number of extreme wave events has been recorded during the periods from 1985 to 1989 and from 1998 to 2002, and anomalously low numbers of extreme wave events occurred during the early 1980s and during the period from 1990 to 1996 (Friedlander *et al.* 2005).

## 2.4 Other helpful information

2.4.1 There is substantial evidence that international shipping activities are causing or may cause damage to the recognized attributes of the proposed PSSA. The hazards to navigation in the NWHI are demonstrated by the large number of shipwrecks throughout the NWHI chain. Over 60 shipwrecks have occurred in the area and some of these wrecks serve as the origin of a number of the islands' names.<sup>1</sup> While some of these wrecks are truly historic and therefore serve as time capsules of seafaring history, there have been a number of significant maritime casualties in more recent years. In 1998, the 80-foot **Paradise Queen II** ran aground on Kure Atoll. It spilled approximately 4,000 gallons of diesel fuel and other petroleum hydrocarbons. The remaining 7,000 gallons on board the vessel were recovered during salvage operations. The 85-foot **Swordman I** ran aground on Pearl and Hermes Atoll in 2000. It was carrying over 10,000 gallons of diesel fuel and hydraulic oil and approximately \$1.5 million was spent for response and removal of the vessel. In 2005, the 145-foot **Casitas** also ran aground on Pearl and Hermes Atoll, carrying over 33,000 gallons of diesel fuel on board. The vast majority of diesel fuel was salvaged and the vessel was removed from the Atoll and scuttled in an estimated \$5 million clean up and removal operation (Cascadia Times 2006; Shallenberger 2004; Biennial Coastal Zone Conference 2003).

2.4.2 The grounding of the **Anangel Liberty** on French Frigate Shoals in 1980 plowed a channel 2-3 metres deep, 100 metres long, and 30 meters wide in the coral reef. Coral communities were damaged within 50 meters on both sides of the channel ploughed by the freighter as a result of cargo (kaolin clay) that was dumped. In 1977, the burning and sinking of the **Hawaiian Patriot** to the south of French Frigate Shoals resulted in more than five million gallons of fuel oil entering the ocean (United States Fish & Wildlife Serv. 2005; United States Coral Reef Task Force 1999). Also in 1977, **Irene's Challenge** spilled

---

<sup>1</sup> This figure does not include aircraft or vessels that were sunk in the Battle of Midway.

approximately 10.4 million gallons of crude oil approximately 50 miles to the north of Lisianski Island. MEPC 56/INF.2, annex 1, provides a table summarizing select incidents that have occurred between 1970 and 2006 (United States Coral Reef Task Force 1999; NOAA 2006).

2.4.3 In addition to the damage that may be caused to the NWHI by spills or releases of ships' cargos or bunker fuel, damage may be caused by the grounding of ships on fragile coral and other sensitive habitats in the area. In the case of vessel grounding, destruction in the area of contact may be widespread and result in the scouring and destruction of coral by dislodgement and pulverization, as well as the crushing, fracturing, and removal of reef structure. Impacts may also include the scarring and abrading of nearby resources as wave action, currents, and wind move rubble produced at the initial site of the grounding. Additionally, there may be increased sedimentation with the fracturing and erosion of the reef structure, which can smother coral and other sensitive habitats (Coral Reef Restoration Handbook 2006). Damage may also be caused by subsequent vessel removal efforts which can further crush and bury sensitive resources. A vessel that has grounded and then is abandoned can continue to damage resources as debris becomes dislodged from the vessel and from its movement at the grounding location by wind and wave action.

2.4.4 Fortunately, although damage to coral and other resources has occurred from the ships that have grounded or sunk in the NWHI, recovery and removal efforts as well as favourable weather patterns and the currents occurring at the time of these maritime casualties have so far spared the fragile NWHI ecosystem from being seriously adversely impacted (Shallenberger 2004). Without taking the necessary action to increase maritime safety, protect the fragile marine environment, and facilitate the ability to respond to developing maritime emergencies, it is reasonably foreseeable that ships will continue to run aground in the NWHI and cause physical damage to the fragile coral reef ecosystem, as well as pose a threat of severe damage to this pristine area from the release of cargo and bunker fuel. Given the remoteness of the NWHI, the low level of development on the islands, and the minimum amount of domestic maritime activity that takes place within the surrounding waters, vessels that transit the area are one of the most persistent and significant anthropogenic threats to the recognized attributes of the area.

2.4.5 Another element that increases the vulnerability of the NWHI to international shipping activities is that, although the islands span 1,200 miles, most emergency response equipment is stationed in the main Hawaiian Islands, including Kauai, which is to the east of the NWHI. Search, rescue, and response operations have been staged from Midway Atoll, which is at the far north-western end of the island chain; however, without assistance from resources based in the main Hawaiian Islands, search, rescue, and response from Midway can generally reach only 10 miles offshore due to the limited equipment located permanently on the island. The sparse land area and fragile environment of the other islands makes it virtually impossible for them to act as staging areas for emergency response efforts. This fact, coupled with the hazardous nature of navigation throughout this area, results in the NWHI being highly vulnerable to damage by international shipping.

2.4.6 Another potential source of damage to this pristine area by international shipping activities is from the introduction of alien species. While only approximately 11 alien species have been detected in the waters of the NWHI, once established these species are extremely difficult – if not impossible – to control and eradicate from the reefs. Therefore, it is critical to keep ships that may be carrying ballast water or species on their hulls from foundering or

grounding on the reefs and providing the opportunity for the introduction of alien species (Citizen's Guide 2006).

2.4.7 In addition to the threat posed by transiting ships, another stress to the environment of the NWHI is marine debris, a severe and chronic threat to the area. Ocean currents carry a wide array of marine debris to the NWHI, including derelict fishing nets and other gear, household plastics, hazardous materials, and shore-based debris, and deposit it on the reef and beaches of the island chain. The debris frequently entangles and kills coral and leads to the death of animals such as seabirds and the Hawaiian monk seal through the ingestion of material or entanglement in nets. Derelict fishing gear also poses a navigation hazard because, for example, it can get wrapped around the propeller of a vessel. In the past 10 years, United States agencies have removed over 560 tons of debris from NWHI reefs at a cost of approximately US\$13.5 million (Citizen's Guide 2006; Brainard 2006).

2.4.8 The IMO measure of six existing ATBAs is already in effect. While there has been no incident in the areas of the existing ATBAs subsequent to their adoption that involves the vessels to which the ATBAs apply (e.g., vessels of 1,000 gross tons and above), there have been incidents in the NWHI outside of the existing ATBAs and incidents within the ATBAs by vessels to which the ATBAs do not now apply. For instance, the **Paradise Queen II** grounded on Kure Atoll, an area which is not now included within the ATBAs. Within the ATBA surrounding Pearl and Hermes Atoll, the **Swordman I** and **Casitas** ran aground; however, these vessels were smaller than the 1,000 gross ton applicability threshold of the existing ATBAs.

ANNEX 4

**ASSOCIATED PROTECTIVE MEASURES FOR THE PAPAĀNAUMOKUĀKEA  
MARINE NATIONAL MONUMENT PSSA\***

*Expansion and amendment of the areas to be avoided “In the region of the Papahānaumokuākea Marine National Monument Particularly Sensitive Sea Areas (PSSA)”*

(Reference chart: United States 19016 (2007 edition; 19019, 2007 edition; 19022, 2007 edition.)  
**Note:** These charts are based on World Geodetic System 1984 Datum (WGS-84) and astronomic datum<sup>2</sup>.)

**Description of the Areas to be Avoided**

Given the magnitude of obstacles that make navigation in these areas hazardous, and in order to increase maritime safety, protection of the environment, preservation of cultural resources and areas of cultural importance significant to Native Hawaiians, and facilitate the ability to respond to developing maritime emergencies in the Papahānaumokuākea Marine National Monument, all ships solely in transit should avoid the following areas:

1 Those areas contained within a circle of radius of 50 nautical miles centred upon the following geographical positions:

- |      |              |  |
|------|--------------|--|
| (1)  | 28° 25'.18 N | 178° 19'.75 W (Kure Atoll)                       |
| (2)  | 28° 14'.20 N | 177° 22'.10 W (Midway Atoll)                     |
| (3)  | 27° 50'.62 N | 175° 50'.53 W (Pearl and Hermes Atoll)           |
| (4)  | 26° 03'.82 N | 173° 58'.00 W (Lisianski Island)                 |
| (5)  | 25° 46'.18 N | 171° 43'.95 W (Laysan Island)                    |
| (6)  | 25° 25'.45 N | 170° 35'.32 W (Maro Reef)                        |
| (7)  | 25° 19'.50 N | 170° 00'.88 W (Between Maro Reef and Raita Bank) |
| (8)  | 25° 00'.00 N | 167° 59'.92 W (Gardner Pinnacles)                |
| (9)  | 23° 45'.52 N | 166° 14'.62 W (French Frigate Shoals)            |
| (10) | 23° 34'.60 N | 164° 42'.02 W (Necker Island)                    |
| (11) | 23° 03'.38 N | 161° 55'.32 W (Nihoa Island)                     |

2 The areas contained between the following geographical positions:

		Begin Co-ordinates		End Co-ordinates	
		Latitude	Longitude	Latitude	Longitude
<b>Area 1</b>	Lisianski Island (N) ---> Laysan Island	26° 53'.22 N	173° 49'.64 W	26° 35'.58 N	171° 35'.60 W
	Lisianski Island (S) ---> Laysan Island	25° 14'.42 N	174° 06'.36 W	24° 57'.63 N	171° 57'.07 W
<b>Area 2</b>	Gardner Pinnacles (N) ---> French Frigate Shoals	25° 38'.90 N	167° 25'.31 W	24° 24'.80 N	165° 40'.89 W
	Gardner Pinnacles (S) ---> French Frigate Shoals	24° 14'.27 N	168° 22'.13 W	23° 05'.84 N	166° 47'.81 W

\* The text in this annex is directly taken from document MSC 83/28, annexes 25 and 26.

<sup>2</sup> The charts are available in paper, raster, or ENC form and may be found at <http://chartmaker.ncd.noaa.gov/NSD/coastpilot.htm>. Mariners are also urged to consult the latest edition, of the United States Coast Pilot No.7, available at <http://chartmaker.ncd.noaa.gov/nsd/coastpilot7.htm> and in particular, Chapter 14, which pertains to Hawaii, available at [http://chartmaker.ncd.noaa.gov/nsd/Cp7/CP7-39ed-Ch14\\_7.pdf](http://chartmaker.ncd.noaa.gov/nsd/Cp7/CP7-39ed-Ch14_7.pdf).

*A ship reporting system (CORAL SHIPREP) is established in “The Papahānaumokuākea Marine National Monument” Particularly Sensitive Sea Area (PSSA)*

## **1 Categories of ships**

### **1.1 Ships required to participate in the system**

1.1.1 As a condition of entry to a United States port or place, all ships 300 gross tonnage or greater, and all ships in the event of a developing emergency, and that are in transit through the reporting area are required to participate in CORAL SHIPREP, except for sovereign immune vessels which are exempt under SOLAS regulation V/1.

### **1.2 Ships recommended to participate in the system**

1.2.1 All ships 300 gross tonnage or greater, fishing vessels, and all ships in the event of a developing emergency, and that are in transit through the reporting area are recommended to participate in CORAL SHIPREP.

## **2 Geographical coverage of the system and the number and edition of the reference chart used for the delineation of the system**

2.1 The geographical coverage of CORAL SHIPREP is depicted by the geographical positions in the appendix.

2.2 The reference charts that include the ship reporting area are United States 19016, 2007 edition, 19019, 2007 edition, and 19022, 2007 edition. These charts are based on World Geodetic System 1984 Datum (WGS-84) and astronomic datum.

## **3 Format, content of reports, times and geographical positions for submitting reports, authorities to whom reports should<sup>3</sup> be sent, available services**

### *3.1 Format*

3.1.1 The ship report should be drafted in accordance with the format shown in paragraph 2 of the appendix to resolution A.851(20).

### *3.2 Content*

3.2.1 The report for a ship entering the system should contain the following information:

System identifier: CORAL SHIPREP

A	Name of the ship, call sign, or IMO identification number
B	Date and Time (UTC)
C or D	Position
E or F	Course and speed of ship
I	Destination
L	Intended route through the reporting area
O	Vessel draft

---

<sup>3</sup> For those ships that are required to report the use of the word “should” in this annex is to be read as “shall”.

P	General categories of hazardous cargo on board
Q or R	Defects or deficiencies, if relevant
T	Contact information of ship's agent or owner
U	Ship size and type (e.g., length, tonnage, and type)
W	Total number of persons on board

3.2.2 The report for a ship leaving the system should contain the following information:

System identifier: CORAL SHIPREP

A	Name of the ship, call sign, or IMO identification number
B	Date and Time (UTC)
C or D	Position

3.2.3 A ship may elect, for reasons of commercial confidentiality, to communicate that section of the report which provides information on general categories of hazardous cargo by non-verbal means prior to entering the reporting area.

### 3.3 *Geographical positions for submitting reports*

3.3.1 Each ship should submit a full report in accordance with paragraph 3.2.1 as soon as it crosses the boundary to enter the ship reporting system.

3.3.2 Each ship should submit a report in accordance with paragraph 3.2.2 as soon as it crosses the boundary to leave the ship reporting system.

3.3.3 Further reports should be made whenever there is a change in navigation status or circumstances, particularly in relation to item Q of the reporting format.

### 3.4 *Authority to whom reports should be sent*

3.4.1 The shore-based Authority is the United States Coast Guard's Communication Area Master Station Pacific (CAMSPAC). For ships 300 gross tonnage and greater, an e-mail address to be used for reporting through INMARSAT-C will be provided in advance of implementation of this system through Notices to Mariners. In the event of a developing emergency, ships are urged to call the United States Coast Guard 14th District. Vessels unable to report in through INMARSAT-C should report to [nwhi.notification@noaa.gov](mailto:nwhi.notification@noaa.gov).

## 4 **Information to be provided to ship and procedures to be followed**

4.1 The CORAL SHIPREP shore-based Authority will provide critical alerts and information to shipping about specific and urgent situations and other information that may affect safety of navigation within the IMO-adopted Areas To Be Avoided and "The Papahānaumokuākea Marine National Monument" Particularly Sensitive Sea Area, as well as remind ships about the existence of the IMO-adopted Areas To Be Avoided and necessity of navigating with extreme caution through the Particularly Sensitive Sea Area.<sup>4</sup>

---

<sup>4</sup> Pending the final decision of MEPC 57 on the designation of this PSSA.

4.2 Navigational warnings and emergency broadcasts will be issued as NAVTEX messages or specifically directed at GMDSS equipped vessels using INMARSAT-C.

## **5 Radio Communication required for the system and frequencies on which reports should be transmitted**

5.1 This system will be based on INMARSAT-C and an e-mail and ships equipped with such capabilities should report through INMARSAT-C.

5.2 In the event of a developing emergency, a ship is urged to call the United States Coast Guard 14th District at 001-808-541-2500 to request a response and assistance.

5.3 For vessels unable to communicate through INMARSAT-C, reports should be made prior to, during, or after transiting through the reporting area to [nwhi.notification@noaa.gov](mailto:nwhi.notification@noaa.gov).

5.4 Commercially sensitive information will be kept confidential and should be transmitted prior to entry into the reporting system. Such information may be sent to [nwhi.notification@noaa.gov](mailto:nwhi.notification@noaa.gov).

5.5 The language used for reports to the system should be English, employing the IMO *Standard Marine Communications Phrases*, where necessary.

5.6 Communications associated with CORAL SHIPREP are, in accordance with SOLAS regulation V/11, free of charge to affected vessels.

## **6 Relevant rules and regulations in force in the area of the system**

### *6.1 International actions*

6.1.1 The United States has taken appropriate action to implement the international conventions to which it is party.

6.1.2 In recognition of the fragile environment in this area and potential hazards to navigation, the IMO has adopted several Areas To Be Avoided to protect the Northwestern Hawaiian Islands and has designated the area as a Particularly Sensitive Sea Areas where mariners should navigate with extreme caution.

6.1.3 The United States applies its laws in accordance with international law, which includes navigational rights under customary international law as reflected in the United Nations Convention on the Law of the Sea. No restrictions shall apply to or be enforced against foreign flagged vessels unless in accordance with such law.

### *6.2 Domestic Actions*

6.2.1 The United States has taken considerable action to ensure maritime safety and to protect the fragile environment and cultural resources and areas of cultural importance significant to Native Hawaiians in the NWHI. This area has been the subject of a variety of protective measures, including designation of this area as the North-western Hawaiian Islands Marine National Monument (subsequently renamed the Papahānaumokuākea Marine National Monument) in recognition of its fragility and to protect the many species of coral, fish, birds, marine mammals, and other flora and fauna, as well as to protect historical and archaeological

heritage resources, including cultural resources and areas of significant importance to Native Hawaiians.

6.2.2 Regulations in this area, *inter alia*, prohibit taking, possessing, injuring, or disturbing any resource; altering the seabed; anchoring or deserting a vessel; and possessing fishing gear unless stowed. All of these activities may be allowed by permit; however, permits cannot be issued for such things as releasing an introduced species. Activities such as discharging or depositing any material into the Monument, or discharging or depositing any material outside the Monument that subsequently injures Monument resources, except discharges incidental to vessel use, such as approved marine sanitation device effluent, cooling water, and engine exhaust are also prohibited. The United States strictly regulates entry into the Monument and, for those vessels subject to United States jurisdiction, requires the mandatory use of vessel monitoring systems on those vessels that may be allowed into the Monument for specific purposes.

## **7 Shore-based facilities to support operation of the system**

7.1 The shore-based Authority is the United States Coast Guard's Communications Area Master Station Pacific (CAMSPAC). CAMSPAC provides maritime distress communication services and safety and weather broadcasts to commercial and recreational mariners, and also provides secure voice communications and record message delivery services for all United States Coast Guard cutters, aircraft, and shore units. Additionally, CAMSPAC is one of the United States Coast Guard's Pacific Area's (PACAREA) Continuity of Operations sites. CAMSPAC delivers contingency and interagency communication services for Incident Commanders by deploying a state-of-the-art transportable communications centre. CAMSPAC is the Operational Commander of the United States Coast Guard's Pacific Area Communications System, consisting of communication stations in Honolulu Hawaii, Kodiak Alaska, and remote facilities in Guam. There are approximately 150 people assigned to CAMSPAC.

7.2 CORAL SHIPREP will use INMARSAT-C communications equipment. A computer server handles and sorts incoming reports and sends the return message. Incoming reports are text messages that arrive via either internet e-mail or telex. When the ship reporting system server receives a report, the server sends the ship a specific return message. Area co-ordinators will monitor and update the information to the server for inclusion in the outgoing message.

## **8 Alternative communication if the shore-based facilities fail**

8.1 NAVTEX Broadcast Notice to Mariners may be used to notify mariners of the temporary failure of the system and can provide mariners with basic information necessary to navigate safely through this area.

8.2 For those ships reporting through INMARSAT-C, the standard protocol now used for such systems will be used to re-route incoming and outgoing communications through an alternative address and it is expected that this will minimize the system's downtime, though a short delay may occur.

## **9 Measures to be taken if a ship does not report**

9.1.1 All means will be used to encourage and promote the full participation of the ships recommended to submit reports.

9.1.2 If reports are not submitted by those ships required to report and the ship can be positively identified, appropriate action will be taken – including interaction with the flag State – in accordance with customary international law as reflected in the 1982 United Nations Convention on the Law of the Sea.

APPENDIX

**GEOGRAPHICAL CO-ORDINATES**

**SHIP REPORTING SYSTEM**

(Reference chart: United States 19016 (2007 edition; 19019, 2007 edition; 19022, 2007 edition.)

\*\*\*

isopropylamine salt of glyphosate, the ethanolamine salt of glyphosate, the dimethylamine salt of glyphosate, the ammonium salt of glyphosate, and the potassium salt of glyphosate on the food commodities cattle, meat byproducts at 5.0 ppm; egg at 0.05 ppm; goat, meat byproducts at 5.0 ppm; grain, aspirated fractions at 310 ppm; hog, meat byproducts at 5.0 ppm; horse, meat byproducts at 5.0 ppm; poultry, meat, at 4.0 ppm; poultry, meat byproducts at 1.0 ppm; sheep, meat byproducts at 5.0 ppm; soybean, seed at 20.0 ppm; soybean, forage at 100.0 ppm; soybean, hay at 200.0 ppm, and soybean, hulls at 120 ppm as discussed in Unit II of this document.

**VI. Statutory and Executive Order Reviews**

This final rule establishes tolerances under section 408(d) of FFDCA in response to a petition submitted to the Agency. The Office of Management and Budget (OMB) has exempted these types of actions from review under Executive Order 12866, entitled *Regulatory Planning and Review* (58 FR 51735, October 4, 1993). Because this final rule has been exempted from review under Executive Order 12866, this final rule is not subject to Executive Order 13211, entitled *Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use* (66 FR 28355, May 22, 2001) or Executive Order 13045, entitled *Protection of Children from Environmental Health Risks and Safety Risks* (62 FR 19885, April 23, 1997). This final rule does not contain any information collections subject to OMB approval under the Paperwork Reduction Act (PRA), 44 U.S.C. 3501 *et seq.*, nor does it require any special considerations under Executive Order 12898, entitled *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations* (59 FR 7629, February 16, 1994).

Since tolerances and exemptions that are established on the basis of a petition under section 408(d) of FFDCA, such as the tolerance in this final rule, do not require the issuance of a proposed rule, the requirements of the Regulatory Flexibility Act (RFA) (5 U.S.C. 601 *et seq.*) do not apply.

This final rule directly regulates growers, food processors, food handlers, and food retailers, not States or tribes, nor does this action alter the relationships or distribution of power and responsibilities established by Congress in the preemption provisions of section 408(n)(4) of FFDCA. As such, the Agency has determined that this action will not have a substantial direct

effect on States or tribal governments, on the relationship between the national government and the States or tribal governments, or on the distribution of power and responsibilities among the various levels of government or between the Federal Government and Indian tribes. Thus, the Agency has determined that Executive Order 13132, entitled *Federalism* (64 FR 43255, August 10, 1999) and Executive Order 13175, entitled *Consultation and Coordination with Indian Tribal Governments* (65 FR 67249, November 9, 2000) do not apply to this final rule. In addition, this final rule does not impose any enforceable duty or contain any unfunded mandate as described under Title II of the Unfunded Mandates Reform Act of 1995 (UMRA) (Public Law 104-4).

This action does not involve any technical standards that would require Agency consideration of voluntary consensus standards pursuant to section 12(d) of the National Technology Transfer and Advancement Act of 1995 (NTTAA), Public Law 104-113, section 12(d) (15 U.S.C. 272 note).

**VII. Congressional Review Act**

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report to each House of the Congress and to the Comptroller General of the United States. EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of this final rule in the **Federal Register**. This final rule is not a “major rule as defined by 5 U.S.C. 804(2).

**List of Subjects in 40 CFR Part 180**

Environmental protection, Administrative practice and procedure, Agricultural commodities, Pesticides and pests, Reporting and recordkeeping requirements.

Dated: November 19, 2008.

**Donald R. Stubbs,**

*Director, Registration Division, Office of Pesticide Programs.*

■ Therefore, 40 CFR chapter I is amended as follows:

**PART 180—[AMENDED]**

■ 1. The authority citation for part 180 continues to read as follows:

**Authority:** 21 U.S.C. 321(q), 346a and 371.

■ 2. Section 180.364 is amended as follows:

■ a. By removing the entries cattle, meat byproducts; egg; goat, meat byproducts; grain, aspirated fractions; hog, meat byproducts; horse, meat byproducts; poultry, meat; poultry, meat byproducts; sheep, meat byproducts; soybean, forage; soybean, hay; soybean, hulls; and soybean, seed from the table in paragraph (a).

■ b. By redesignating paragraph (a) introductory text and the remainder of the table as paragraph (a)(1) and by adding paragraph (a)(2) to read as follows:

**§ 180.364 Glyphosate, Tolerance for residue.**

(a) \* \* \* (1) \* \* \*

(2) Tolerances are established for combined residues of glyphosate, N-(phosphonomethyl)glycine and its metabolite N-acetyl-glyphosate (expressed as glyphosate) resulting from the application of glyphosate, the isopropylamine salt of glyphosate, the ethanolamine salt of glyphosate, the dimethylamine salt of glyphosate, the ammonium salt of glyphosate, and the potassium salt of glyphosate on the food commodities:

Commodity	Parts per Million
Cattle, meat byproducts ...	5.0
Egg .....	0.05
Goat, meat byproducts .....	5.0
Grain aspirated fractions ..	310.0
Hog, meat byproducts .....	5.0
Horse, meat byproducts ...	5.0
Poultry, meat .....	4.0
Poultry, meat byproducts ..	1.0
Sheep, meat byproducts ..	5.0
Soybean, forage .....	100.0
Soybean, hay .....	200.0
Soybean, hulls .....	120.0
Soybean, seed .....	20.0

**Papahānaumokuākea Marine National Monument Proclamation Provisions**

**AGENCIES:** National Oceanic and Atmospheric Administration (NOAA),

Department of Commerce (DOC); United States Fish and Wildlife Service (USFWS), Department of the Interior (DOI).

**ACTION:** Final rule.

**SUMMARY:** NOAA and the USFWS are publishing final regulations to establish a ship reporting system for the Papahānaumokuākea Marine National Monument. This action implements measures adopted by the International Maritime Organization requiring notification by ships passing through the Monument without interruption.

**DATES:** This rule is effective January 2, 2009.

**ADDRESSES:** For copies of the environmental assessment or other related documents, please write to: T. Aulani Wilhelm, Monument Superintendent (NOAA); 6600 Kalanianaʻole Highway, 300, Honolulu, HI 96825. Written comments regarding the burden-hour estimates or other aspects of the collection-of-information requirements contained in this final rule may be submitted to (enter office name) and by e-mail to [David\\_Rostker@omb.eop.gov](mailto:David_Rostker@omb.eop.gov), or fax to (202) 395-7285.

Copies of the final environmental assessment may be viewed and downloaded at <http://hawaiireef.noaa.gov/>.

**FOR FURTHER INFORMATION CONTACT:** T. Aulani Wilhelm, Monument Superintendent (NOAA); 6600 Kalanianaʻole Highway, 300, Honolulu, HI 96825; (808) 397-2657.

**SUPPLEMENTARY INFORMATION:**

### I. Statutory and Regulatory Background

On June 15, 2006, President Bush established the Northwestern Hawaiian Islands Marine National Monument (Monument) by issuing Presidential Proclamation 8031 (Proclamation); (71 FR 36443, June 26, 2006) under the authority of the Antiquities Act (Act) (16 U.S.C. 431). The Proclamation reserves all lands and interests in lands owned or controlled by the Government of the United States in the Northwestern Hawaiian Islands (NWHI), including emergent and submerged lands and waters, out to a distance of approximately 50 nautical miles (nmi) from the islands. The outer boundary of the Monument is approximately 100 nmi wide and extends approximately 1200 nmi around coral islands, seamounts, banks, and shoals. The area includes the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, the Midway Atoll National Wildlife Refuge/Battle of Midway National Memorial, and the Hawaiian Islands

National Wildlife Refuge. The Monument was renamed the Papahānaumokuākea Marine National Monument by Proclamation 8112 (72 FR 10029, February 28, 2007).

The Proclamation provides that the Secretary of Commerce, through NOAA, has primary responsibility regarding the management of the marine areas of the Monument, in consultation with the Secretary of the Interior. The Secretary of the Interior, through the USFWS, has sole responsibility for management of the areas of the Monument that overlay the Midway Atoll National Wildlife Refuge, the Battle of Midway National Memorial, and the Hawaiian Islands National Wildlife Refuge, in consultation with the Secretary of Commerce. Further, the Proclamation provides that nothing in the Proclamation diminishes or enlarges the jurisdiction of the State of Hawaii. The Monument includes state waters, including the Northwestern Hawaiian Islands State Marine Refuge and State Seabird Sanctuary at Kure Atoll. The State currently holds the submerged and ceded lands of the NWHI in trust. This public trust is overseen by the Office of Hawaiian Affairs through an amendment to the Constitution of the State of Hawaii. The State of Hawaii has primary responsibility for managing the State waters of the Monument.

In 2006 NOAA and USFWS published joint regulations codifying the provisions of the Proclamation (71 FR 51134, August 29, 2006). With certain exceptions, the Proclamation and the joint regulations restrict access to the Monument to persons who have been issued Monument permits. Vessels that do not have permits cannot enter the Monument except for uninterrupted passage through the Monument and notice must be provided to NOAA by telephone, fax, or e-mail not less than 72 hours and not more than one month prior to passing through the Monument. Notice must also be provided not more than twelve hours after the vessel has exited the Monument. All of the terms of the Proclamation and the regulations are applied in accordance with international law.

The Proclamation directed the Secretary of State, in consultation with the Secretaries of Commerce and the Interior, to take appropriate action to enter into negotiations with other governments to make necessary arrangements for the protection of the Monument and to promote the purposes for which it was established. The proclamation further directed the Secretary of State to seek the cooperation of other governments and international organizations in

furtherance of the purposes of the Proclamation and consistent with applicable regional and multilateral arrangements for the protection and management of special marine areas.

In April 2007 and in accordance with the Proclamation, the United States proposed to the International Maritime Organization (IMO), a specialized agency of the United Nations, that the Monument be designated as a Particularly Sensitive Sea Area (PSSA) to protect the attributes of the fragile and integrated coral reef ecosystem from potential hazards associated with international shipping activities. The U.S. noted in its proposal that the burden on international shipping by the proposed PSSA and its associated protective measures would be minimal while its objectives—increased maritime safety, protection of the fragile environment, preservation of cultural resources and areas of cultural importance significant to Native Hawaiians, as well as facilitation of the ability to respond to developing maritime emergencies—would be significantly furthered. PSSA designation had been granted previously to only ten marine areas globally, including the marine areas around the Florida Keys, the Great Barrier Reef, and the Galapagos.

On April 3, 2008, the IMO designated the Monument as a PSSA. As part of the PSSA designation process, the IMO adopted U.S. proposals for associated protective measures consisting of (1) expanding and consolidating the six existing recommendatory Areas To Be Avoided (ATBAs) in the Monument into four larger areas and enlarging the class of vessels to which they apply; and (2) establishing a ship reporting system for vessels transiting the Monument, which is mandatory for ships 300 gross tons or greater that are entering or departing a U.S. port or place and recommended for other ships. The system requires that ships notify the U.S. shore-based authority (i.e., the U.S. Coast Guard; NOAA will be receiving all messages associated with this program on behalf of the Coast Guard) at the time they begin transiting the reporting area and again when they exit. Notification is made by e-mail through the Inmarsat-C system or other satellite communication system. It is estimated that almost all commercial vessel traffic will be able to report via Inmarsat-C.

The PSSA and associated protective measures were adopted to provide additional protection to the exceptional natural, cultural and historic resources in the Monument. Requiring vessels to notify NOAA upon entering the reporting area will help make the

operators of these vessels aware that they are traveling through a fragile area with potential navigational hazards such as the extensive coral reefs found in many shallow areas of the Monument. The PSSA is now in effect, and the IMO has provided for an effective date for the associated protective measures of May 1, 2008.

NOAA and USFWS are establishing the infrastructure that will be required to maintain an international ship reporting system and to ensure that information regarding PSSA designation will be incorporated into nautical charts and other information sources. This rule implements the mandatory ship reporting system as adopted by IMO, establishes the reporting area using the IMO boundary coordinates, and publishes the coordinates of the four ATBAs.

## II. Vessel Reporting Requirements

These regulations apply to vessels that do not have permits to enter the Monument and that pass through the Monument without interruption. These regulations do not change the exemptions at 50 CFR 404.8 (activities necessary to respond to emergencies or necessary for law enforcement purposes) and 404.9 (activities and exercises of the Armed Forces, including those of the United States Coast Guard) and, therefore, do not apply to vessels covered by those exemptions. As explained further, below, these regulations also do not apply to sovereign immune vessels.

The regulations accomplish the following actions:

(1) Modify the current notification requirements (at 50 CFR 404.4) for passing through the Monument without interruption and add several new associated terms and definitions (at Sec. 404.3);

(2) Establish a reporting area around the Monument, extending outward ten nautical miles from the Monument boundary but excluding the ATBAs within the Monument;

(3) Describe the categories of vessels that are subject to the reporting requirement;

(4) Specify the type of information regarding the vessel, its location, etc. that is required in the e-mail to NOAA

and that is to be sent in a reporting format that is consistent with the reporting system adopted by IMO;

(5) Allow for vessels that do not have e-mail capability to continue to comply with the current prior notification requirements;

(6) Recommend voluntary participation in the reporting system for all other vessels that are not required to notify NOAA; and

(7) Publish the revised boundaries of the four voluntary ATBAs.

Each of these elements is described below.

### A. Modification of Existing Notification Requirements

Monument regulations at 50 CFR 404.4 prohibit entry into the Monument except in certain situations. One of the exceptions is for vessels passing through the Monument without interruption. Those vessels, however, are currently required to provide notice prior to entering and after leaving the Monument. Notification of entry must be provided at least 72 hours, but no longer than 1 month, prior to the entry date. Notification of departure from the Monument must be provided within 12 hours of leaving. Notification may be made by e-mail, telephone, or fax and must include the following information: Position when making the report; vessel name and IMO identification number; name, address, and telephone number of owner and operator; United States Coast Guard documentation, state license, or registration number; home port; intended and actual route through the Monument; general categories of any hazardous cargo on board; and length of vessel and propulsion type (e.g., motor or sail).

These changes to the regulations replace the current notification requirements for vessels that have e-mail capability. Vessels without e-mail capability will continue to provide notification in advance and upon exiting the Monument as described previously but the type of information to be provided is modified by these regulations as indicated below.

The following terms are being added to the definitions at 50 CFR 404.3 to facilitate implementation of the proposed ship reporting requirements:

“Areas to be avoided”; “Categories of hazardous cargoes”; “IMO”; and “Reporting area.” The definitions to these terms are contained in the text of the regulations.

### B. Reporting Area

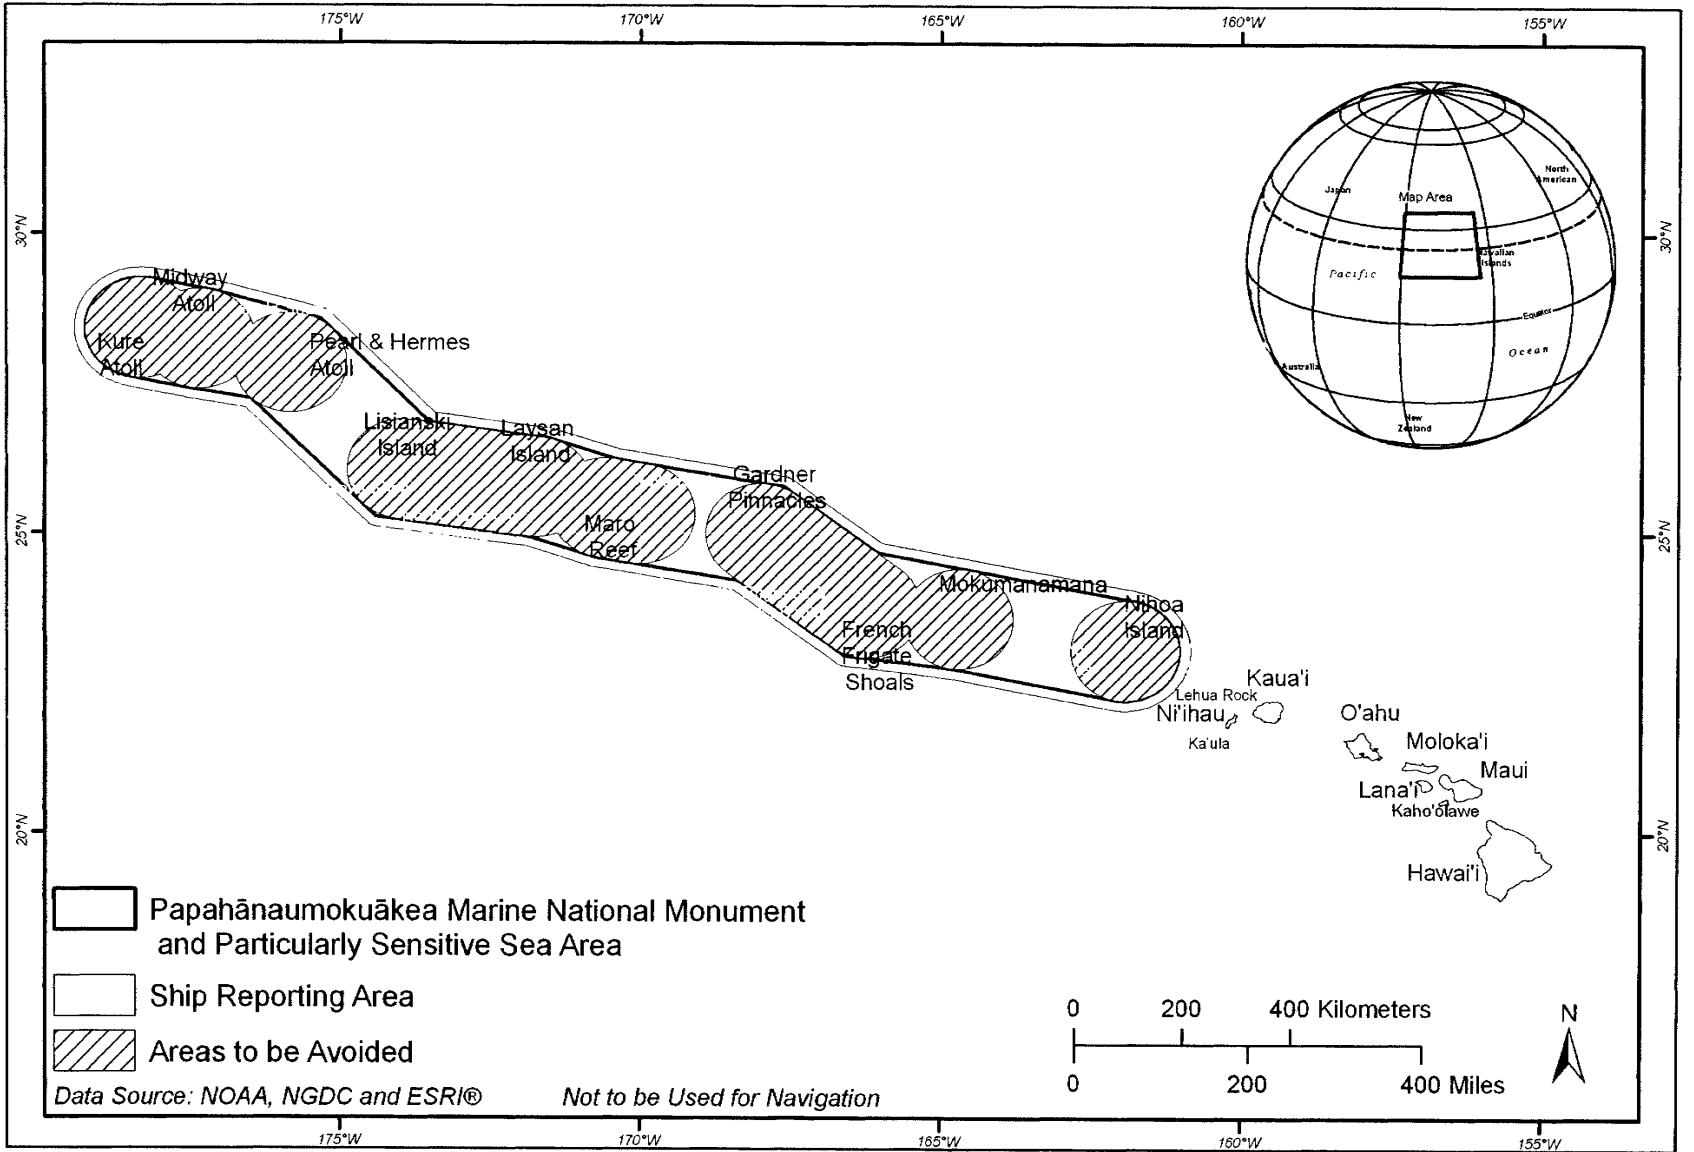

The regulations create a reporting area extending ten miles out and entirely around the Monument boundary. The coordinates of the area are set forth in Appendix D of the regulations and are the same as the coordinates that were adopted by IMO when it accepted the PSSA in principle and adopted the associated protective measures for the PSSA in 2007. Certain categories of vessels (described below) that intend to pass through the Monument without interruption are required to e-mail certain information at the time they cross the reporting area boundary and again when they exit the reporting area after having passed through the Monument.

The reporting area does not include the ATBAs within the Monument. As such, vessels that pass through an ATBA while passing through the Monument must notify NOAA at the time they exit the reporting area and enter the ATBA, and again when they exit the ATBA and re-enter the reporting area.

There are three large areas of the Monument (within the reporting area) that are not within the IMO-designated ATBAs. These breaks between the four ATBAs allow for primarily north-south passage through the Monument. From west to east, these areas are in the following locations and are shown in Figure 1: Between the ATBAs extending around Pearl and Hermes Atoll and Lisianski Island; between the ATBAs around Maro Reef and Gardner Pinnacles; and between the ATBAs around Mokumanamana (Necker Island) and Nihoa Island. It is anticipated that vessels will navigate through the Monument via these areas. Vessels passing through the Monument in these areas are only required to send e-mail notification upon entering the reporting area and again upon leaving it.

Appendix G: Particularly Sensitive Sea Area

### *C. Vessels That Are Required To Provide Notification*

All vessels of the United States—regardless of size—are subject to the proposed reporting requirements. All foreign vessels greater than 300 gross tons and that are either going to or coming from a U.S. port or place are required to participate in the ship reporting system. Foreign vessels of any size that are heading to or coming from a U.S. port or place are also required to provide e-mail notification if they experience an emergency while crossing through the reporting area. Although e-mail capability is now routine on vessels greater than 300 gross tons and is also widely used by many smaller vessels, vessels of the United States less than 300 gross tons that do not have e-mail capability remain subject to the advanced notice reporting requirements currently in effect. These vessels will continue to be required to follow the current reporting process: Provide notice by telephone, fax, or e-mail not less than 72 hours but not more than one month prior to entering the Monument for uninterrupted passage and to provide notification of departing the Monument within 12 hours of leaving.

Vessels are not required to provide notification if they operate in the reporting area but remain outside of the Monument, such as fishing vessels fishing outside the Monument boundary. However, if the operator of a vessel within the reporting area decides to cross uninterrupted through the Monument all of the notification requirements will then apply. In no case may the vessel lawfully pass through the Monument until notification had been provided, consistent with these regulations.

The reporting requirements do not apply to vessels of the Armed Forces and the United States Coast Guard because the prohibitions in the Proclamation and the regulations do not apply to their activities and exercises (50 CFR 404.9(a)). In addition, the ship reporting system adopted by the IMO specifically exempts all sovereign immune vessels from the reporting requirement and, therefore, the regulations published today do not apply to these vessels. Vessel sovereign immunity is interpreted in light of relevant provisions of international instruments, such as the IMO-adopted ship reporting system, Article 36 of the United Nations Convention on the Law of the Sea, and Chapter 5, Regulation 1 of the International Convention for the Safety of Life at Sea. This is consistent with provisions of the Proclamation and

the regulations that state the Proclamation shall be applied in accordance with international law. No restrictions shall apply to or be enforced against a person who is not a citizen, national, or resident alien of the United States (including foreign flag vessels) unless in accordance with international law.

### *D. Specific Information and Reporting Format Required for Entry and Exit Notifications by Vessels With E-mail Capability*

The information that each vessel must submit and the format in which it must be submitted are shown in Appendix E to the regulations. The information to be provided upon entering the reporting area and the reporting format are based on and consistent with the reporting requirements adopted by IMO and include: Vessel identification information (i.e., name, call sign, flag, IMO identification number); date and time of entry; position; true course; speed in knots and tenths; destination and estimated time of arrival; intended route through the reporting area; vessel draft; categories of hazardous cargoes on board; any vessel defects or deficiencies that restrict maneuverability or impair normal navigation; any pollution incident or goods lost overboard within the Monument, reporting area, or the U.S. EEZ; contact information for the vessel's agent or owner; vessel size (length overall, gross tonnage) and type; and total number of persons on board. Information required when the vessel leaves the reporting area includes: Vessel identification information (i.e., name, call sign, flag, IMO identification number); date and time of exit; position; and any pollution incident or goods lost overboard within the Monument, reporting area, or the U.S. EEZ.

The system that is being established to receive the notifications is based on Inmarsat-C and NOAA will assume the cost associated with Inmarsat-C transmissions to the e-mail address provided under this program. This rule does not require a vessel to install or use Inmarsat-C, but NOAA will not assume costs associated with e-mail transmissions sent through other satellite communications systems. Vessel owners who receive an Inmarsat-C charge for any e-mail sent to NOAA pursuant to these regulations will be reimbursed upon invoicing NOAA with a copy of the charges.

### *E. Specific Information and Reporting Format Required for Entry and Exit Notifications by Vessels Without Onboard E-mail Capability*

Vessels of the United States less than 300 gross tons that do not have onboard e-mail capability are required to submit the following information not less than 72 hours but not more than one month prior to entering the Monument for uninterrupted passage: Vessel identification information (e.g., name, call sign, flag, IMO identification number); date and time of entry; position (as applicable); destination and estimated time of arrival; intended route through the Monument and the reporting area; vessel draft; categories of hazardous cargoes on board (as applicable); any vessel defects or deficiencies that restrict maneuverability or impair normal navigation; contact information for the vessel's agent or owner; vessel size (length overall, gross tonnage) and type; and total number of persons on board. Upon exiting the Monument these vessels must provide the following information within 12 hours of leaving: Vessel identification information (e.g., name, call sign, flag, IMO identification number); date and time of exit; position; and any pollution incident or goods lost overboard within the Monument, reporting area, or the U.S. EEZ. This information may be submitted by nonvessel-based e-mail (e.g., from home or office), fax, or telephone. Once a vessel is equipped with an onboard e-mail system, however, it must comply with the requirements for vessels with that capability, including the reporting format shown in Appendix E to the regulations.

### *F. Voluntary Participation in the Ship Reporting System by All Other Vessels*

Vessels that are not required to participate in the ship reporting system are nevertheless strongly urged to participate on a voluntary basis. Participation will help make the operators of these vessels aware that they are traveling through a fragile area with potential navigational hazards such as the extensive coral reefs found in many shallow areas of the Monument. Voluntary participation will increase maritime safety, protection of the fragile environment, preservation of cultural resources and areas of cultural importance significant to Native Hawaiians. Participation will also facilitate the ability to respond to developing maritime emergencies.

### *G. Modification of the Areas To Be Avoided (ATBAs)*

An ATBA is an area within which either navigation is particularly hazardous or it is exceptionally important to avoid casualties. As such, ATBAs should be avoided by all ships, or certain classes of ships. While ATBAs can be mandatory (i.e., vessels are required by applicable law to avoid and operate outside of the area) most are voluntary and vessels may travel through them. The IMO adopted six voluntary ATBAs in the Northwestern Hawaiian Islands in 1980. Part of the action taken in 2008 by the IMO was to enlarge the six original ATBAs so that they now connect in certain places resulting in four larger ATBAs. This rule publishes the coordinates of these four ATBAs. The coordinates are attached to the regulations as Appendix C. The ATBAs are not part of the reporting area and vessels that enter any ATBA while passing through the Monument without interruption must provide an exit notification upon entering the ATBA, an entry notification again upon reentering the reporting area, and a second exit notification when the vessel departed the reporting area and the Monument on the other side. Thus, transiting through the Monument via an ATBA requires four reports as compared with the two reports required for transiting the Monument between the ATBAs.

### **III. Response to Comments**

Comments on the proposed rule and the draft environmental assessment were received from the following: The Department of the Navy; the United States Coast Guard; the Missile Defense Agency; and the Marine Mammal Commission. The comments did not result in any changes to the proposed regulations but additional discussion has been added to the preamble of this final rule to clarify that the reporting requirements do not apply to activities and exercises of the Armed Forces (including those carried out by the United States Coast Guard) or to sovereign immune vessels of foreign nations. The comments are summarized below together with responses from NOAA and FWS.

*Comment 1:* It should be clear that the Armed Forces exception in 50 CFR 404.9 applies to the new ship reporting regulations.

*Response:* The reporting regulations do not affect the Armed Forces exception to the prohibitions set forth in the Proclamation and in the regulations at 50 CFR 404.9. The reporting regulations do not apply to activities and exercises of the Armed Forces,

(including those carried out by the United States Coast Guard) that are consistent with applicable laws. The Armed Forces exemptions in the Proclamation and at 50 CFR 404.9 are not affected by these regulations.

*Comment 2:* Clarify that the regulations do not affect international legal principles governing freedom of navigation for sovereign immune vessels in international waters, such as foreign warships, and law-enforcement craft.

*Response:* Language has been added to section 404.4(c) to clarify that the regulations do not apply to sovereign immune vessels in international waters. The ship reporting system adopted by the IMO specifically exempts all sovereign immune vessels from the reporting requirement and, therefore, the regulations published today do not apply to these vessels. This is consistent with provisions of the Proclamation and the regulations that state the Proclamation shall be applied in accordance with international law. No restrictions shall apply to or be enforced against a person who is not a citizen, national, or resident alien of the United States (including foreign flag vessels) unless in accordance with international law.

*Comment 3:* The ATBAs are recommendatory and ships should not be required to report their entry into or exit from Monument ATBAs.

*Response:* The regulations do not require vessels to report when they enter or exit ATBAs. They do, however, require vessels to notify the U.S. shore-based authority (NOAA, on behalf of the U.S. Coast Guard) whenever they enter or exit the Reporting Area. As adopted by the IMO and implemented by these regulations, the ATBAs are outside of the Reporting Area. A vessel entering an ATBA is required to notify NOAA because it is exiting the Reporting Area and it must send another e-mail when it reenters the Reporting Area from an ATBA or anywhere else that is outside of the Reporting Area.

*Comment 4:* Modify the reporting requirements to: (a) Ensure that all vessels in the reporting area or Monument immediately report any emergencies; (b) clarify that emergencies include any accidents, pollution incidents, or losses of cargo that could pose a risk to natural and cultural resources; and (c) identify the types of information to be reported in cases of emergencies.

*Response:* At this time, NOAA and FWS are maintaining the regulations as proposed to implement the measures recommended by the IMO, but will consider a separate rule making to address whether and how to require the

reporting of emergencies in the Monument. The scope of such a rule could apply to a broader category of vessels than those simply passing through the Monument without interruption and could include vessels entering the Monument pursuant to permits. Such a rule would also be applied in accordance with international law.

*Comment 5:* Include in the ship reporting system a return message describing why special precautions are needed in the area, the Areas To Be Avoided, other relevant protection measures and appropriate information (e.g., permit requirements for any activity other than uninterrupted passage through the Monument).

*Response:* A return message will be sent back to vessels that provide e-mail notification and will include relevant information such as precautions while in the Monument and other matters.

## **IV. Classification**

### *A. National Environmental Policy Act*

An environmental assessment has been prepared to evaluate the proposed revisions to the reporting requirements and resulted in a Finding of No Significant Impact (FONSI). Copies are available at the address and Web site listed in the **ADDRESSES** section of this rule.

### *B. Executive Order 12866: Regulatory Impact*

This rule has been determined to be not significant within the meaning of Executive Order 12866.

### *C. Executive Order 13132: Federalism Assessment*

NOAA has concluded this regulatory action does not have federalism implications sufficient to warrant preparation of a federalism assessment under Executive Order 13132. The State of Hawaii was consulted during the promulgation of this rule.

### *D. Paperwork Reduction Act*

This rule contains a collection-of-information requirement subject to the Paperwork Reduction Act (PRA) and which has been approved by OMB under control number 0648-0548. Public reporting burden for entry and exit notification is expected to average 15 minutes per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. In the proposed rule, NOAA and FWS requested public comment regarding this collection of information and

burden estimate. No comments were received.

#### *E. Regulatory Flexibility Act*

The Chief Counsel for Regulation of the Department of Commerce certified to the Chief Counsel for Advocacy of the Small Business Administration (SBA) that this rule would not have a significant economic impact on a substantial number of small entities.

The factual basis for this certification is as follows:

The regulations establish a ship reporting system for the Monument. When transiting the Monument, all U.S. vessels, all foreign-flag vessels 300 gross tons or greater that are going to or coming from a U.S. port or place, and all foreign-flag vessels of any size coming from a U.S. port or place and experiencing an emergency while crossing through the reporting area are required to participate in the reporting system. Specific information is required to be transmitted via e-mail to NOAA upon entry into and exit from the reporting area. Vessels without onboard e-mail capability will continue to provide notification as originally required by the Monument regulations at 50 CFR part 404, and the information provided is essentially the same as required previously.

The SBA establishes size standards for determining whether a U.S. entity is a small business. The size standards relevant to this proposed rulemaking are: finfish fishing (NAICS Code 114111): Average annual receipts of \$4.0 million or less; and deep sea freight transport (NAICS Code 483111): average employment of 500 employees or less. Approximately 120 U.S. fishing vessels are expected to be impacted by this rulemaking, and all are considered to be small entities. U.S. freight transport vessels are expected to be affected by this rulemaking, though none are considered to be small entities. All vessels without e-mail capability are considered to be small entities.

The cost of the regulation is not expected to be significant. It is expected that vessels transiting the Monument will remain outside of the designated ATBA's to avoid navigational hazards in the ATBA's. For these vessels, two e-mails will be required for compliance with the proposed rule: One upon entering the reporting area and one upon exiting the reporting area. For those vessels that cross into the ATBA's, four e-mails will be necessary. Because the ATBA's are not part of the reporting system, the vessel will enter and exit the reporting area twice. The cost of sending an e-mail varies depending on the type of service, the provider rates and the

length of the message but is estimated to be approximately \$1.75 per entry report e-mail sent via Inmarsat-C. The exit report should cost approximately \$0.50. It will take approximately 15 minutes or less to send each e-mail.

Because NOAA is paying for the monetary cost of e-mail transmissions using the Inmarsat-C system, this cost will not be accrued by any small entities. Entities using other e-mail systems, however, will bear the monetary cost of e-mail transmission in addition to the time cost. For those vessels without on-board e-mail capability, cost of compliance for notification prior to entry is expected to be the cost of a standard fax or e-mail charge, or will be free if the information is provided by telephone using the 1-800 number listed in the regulations. An exit notification made within 12 hours will require the use of a satellite telephone, the cost of which will be subject to rate variables. However, the content to be conveyed is relatively brief and can be provided in approximately one minute.

Given the minimal cost of compliance with this rulemaking, the impact of this rule is not expected to be significant. As a result, a regulatory flexibility analysis is not required and none has been prepared.

#### **List of Subjects in 50 CFR Part 404**

Administrative practice and procedure, Coastal zone, Fish, Fisheries, Historic preservation, Intergovernmental relations, Marine resources, Monuments and memorials, Natural resources, Reporting and recordkeeping requirements, Wildlife, Wildlife refuges.

Dated: November 21, 2008.

**Jane C. Luxton,**

*General Counsel, National Oceanic and Atmospheric Administration.*

Dated: November 20, 2008.

**Lyle Laverty,**

*Assistant Secretary for Fish and Wildlife and Parks.*

■ Accordingly, for the reasons set forth in the preamble, NOAA and USFWS amend part 404, title 50 of the Code of Federal Regulations as follows:

#### **PART 404—[AMENDED]**

■ 1. The authority citation for part 404 continues to read as follows:

**Authority:** 16 U.S.C. 431 *et seq.*; 16 U.S.C. 460k-3; 16 U.S.C. 1801 *et seq.*; 16 U.S.C. 742f, 16 U.S.C. 742l, and 16 U.S.C. 668dd-ee; 16 U.S.C. 1361 *et seq.*; 16 U.S.C. 1531 *et seq.*, Public Law 106-513, Sec. 6(g) (2000).

■ 2. In § 404.3, definitions for “Areas to be avoided,” “Categories of Hazardous

cargoes,” “IMO,” and “Reporting area” are added alphabetically as follows:

#### **§ 404.3 Definitions.**

\* \* \* \* \*

*Areas to be avoided* means the four designated areas that should be avoided by vessels that are conducting passage through the Monument without interruption. Appendix C sets forth the coordinates of these areas.

\* \* \* \* \*

*Categories of hazardous cargoes* means goods classified in the International Maritime Dangerous Goods (IMDG) Code; substances classified in chapter 17 of the International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk (IBC Code) and chapter 19 of the International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk (IGC Code); oils as defined in MARPOL Annex I; noxious liquid substances as defined in MARPOL Annex II; harmful substances as defined in MARPOL Annex III; and radioactive materials specified in the Code for the Safe Carriage of the Irradiated Nuclear Fuel, Plutonium and High-Level Radioactive Wastes in Flasks on Board Ships (INF Code).

\* \* \* \* \*

*IMO* means the International Maritime Organization.

\* \* \* \* \*

*Reporting area* means the area within the coordinates set forth in Appendix D.

\* \* \* \* \*

■ 3. Revise § 404.4 to read as follows:

#### **§ 404.4 Access to Monument.**

(a) Entering the Monument is prohibited and thus unlawful except:

- (1) As provided in §§ 404.8 and 404.9;
- (2) Pursuant to a permit issued under §§ 404.10 or 404.11; or
- (3) When conducting passage without interruption in accordance with paragraphs (b) through (f) of this section.

(b) Any person passing through the Monument without interruption is subject to the prohibitions in §§ 404.5, 404.6, and 404.7.

(c) The following vessels, except vessels entitled to sovereign immunity under international law, passing through the Monument without interruption must participate in the ship reporting system as provided in paragraphs (d) and (e) of this section:

- (1) Vessels of the United States, except as provided in paragraph (f) of this section;
- (2) All other ships 300 gross tonnage or greater, entering or departing a United States port or place; and

(3) All other ships in the event of an emergency, entering or departing a United States port or place.

(d) Immediately upon entering the reporting area, the vessels described in paragraph (c) of this section must provide the following information by e-mail sent to *nwhi.notifications@noaa.gov* in the IMO standard reporting format and data syntax shown in Appendix E:

(1) Vessel name, call sign or ship station identity, flag, and IMO identification number if applicable, and either Federal documentation or State registration number if applicable.

(2) Date, time (UTC) and month of entry.

(3) Position.

(4) True course.

(5) Speed in knots and tenths.

(6) Destination and estimated time of arrival.

(7) Intended route through the Monument and the reporting area.

(8) Vessel draft (in meters).

(9) Categories of hazardous cargoes on board.

(10) Any vessel defects or deficiencies that restrict maneuverability or impair normal navigation.

(11) Any pollution incident or goods lost overboard within the Monument, the reporting area, or the U.S. EEZ.

(12) Contact information for the vessel's agent or owner.

(13) Vessel size (length overall, gross tonnage) and type.

(14) Total number of persons on board.

(e) Immediately upon leaving the reporting area, the vessels described in paragraph (c) must provide the following information by e-mail sent to *nwhi.notifications@noaa.gov* in the IMO standard reporting format and data syntax shown in Appendix E:

(1) Vessel name, call sign or ship station identity, flag, and IMO identification number if applicable, and either Federal documentation or State registration number if applicable.

(2) Date, time (UTC) and month of exit.

(3) Position.

(4) Any pollution incident or goods lost overboard within the Monument, the reporting area, or the U.S. EEZ.

(f)(1) Vessels of the United States less than 300 gross tonnage that are not equipped with onboard e-mail capability must provide notification of entry and the information described in paragraphs (d)(1), (2), (3) as applicable, (6), (7), (8), (9) as applicable, (10), (12), (13), and (14) of this section at least 72 hours, but no longer than 1 month, prior to the entry date. Notification of departure from the Monument and the

information described in paragraph (e) of this section must be provided within 12 hours of leaving. Notification under this paragraph may be made by e-mail, telephone, or fax, by contacting: (i) *E-mail: nwhi.notifications@noaa.gov*;

(ii) *Telephone: 1-866-478-NWHI (6944)*;

(iii) *Fax: 1-808-397-2662*.

(2) The information must be provided in the IMO standard reporting format and data syntax shown in Appendix E.

(g) All vessels passing through the Monument without interruption other than those described in paragraphs (c)(1) through (3) of this section should participate in the ship reporting system set forth in paragraphs (d) and (e) of this section.

■ 4. Add Appendix C to Part 404 to read as follows:

**Appendix C to Part 404—Boundary Coordinated for Papahānaumokuākea Marine National Monument Areas To Be Avoided**

**Appendix C—Geographical Coordinates**

*Areas To Be Avoided*

*Papahānaumokuākea Marine National Monument*

Reference chart: United States 540, 2008 edition; 19016, 2008 edition; 19019, 2008 edition; 19022, 2008 edition.

These charts are based on World Geodetic System 1984 Datum (WGS-84) and astronomic datum.

TABLE C-1—KURE ATOLL, MIDWAY ATOLL, AND PEARL AND HERMES ATOLL

Point	Latitude (N)	Longitude (W)
1	27°14'.76	176°29'.87
2	27°24'.95	177°33'.31

■ 6. Add Appendix E to Part 404 to read as follows:

**Appendix E to Part 404—Content and Syntax for Papahānaumokuākea Ship Reporting System**

Immediately upon crossing the reporting area boundary, notification should be sent as a direct e-mail to [nwhi.notifications@noaa.gov](mailto:nwhi.notifications@noaa.gov) in the prescribed format and data syntax shown. Use of batch message routing services which may delay receipt of a report should not be used. Failure to follow the exact format (e.g., extra information, extraneous characters, or double spacing) may cause the automated computer system to reject your report. **Note:** Report transmission costs via INMARSAT-C will be assumed by NOAA.

**E.1 Entry Notification Format**

Immediately upon entering the Reporting Area, vessels required to participate must provide the following information.

TABLE E.1—INFORMATION REQUIRED FOR ENTRY NOTIFICATION

Telegraphy	Function	Information required	Example field text
	System identifier	CORAL SHIPREP //	CORAL SHIPREP //
A	Ship	Vessel name/call sign/flag/IMO number/Federal documentation or State registration number if applicable //	A/OCEAN VOYAGER/C5FU8/BAHAMAS/IMO 9359165//
B	Date, time (UTC), and month of entry.	A 6-digit group giving day of month (first two digits), hours and minutes (last four digits) in coordinated universal time, suffixed by the letter Z (indicating time in UTC), and three letters indicating month //	B/271107Z DEC//

TABLE E.1—INFORMATION REQUIRED FOR ENTRY NOTIFICATION—Continued

Telegraphy	Function	Information required	Example field text
	System identifier	CORAL SHIPREP //	CORAL SHIPREP //
C .....	Position .....	A 4-digit group giving latitude in degrees and minutes, suffixed with the letter N (indicating north), followed by a single /, and a five-digit group giving longitude in degrees and minutes, suffixed with the letter W (indicating west) // [Report in the World Geodetic System 1984 Datum (WGS-84)].	C/2728N/17356W//
E .....	True course .....	3-digit number indicating true course // .....	E/180//
F .....	Speed in knots and tenths.	3-digit group indicating knots decimal tenths // .....	F/20.5//
I .....	Destination and estimated time of arrival.	Name of port city/country/estimated arrival date and time group expressed as in (B) //.	I/SEATTLE/USA/311230Z DEC//
L .....	Intended route through the reporting area.	Route information should be reported as a direct rhumbline (RL) course through the reporting area and intended speed (expressed as in E and F) or a series of waypoints (WP). Each waypoint entry should be reported as latitude and longitude, expressed as in (C), and intended speed between waypoints (as in F) // (Note: As many "L" lines as needed may be used to describe the vessel's intended route.).	L/RL/215/20.5// -OR- L/WP/2734N/17352W/20.5// L/WP/2641N/17413W/20.5// L/WP/2605N/17530W/20.5//
O .....	Vessel draft in meters.	Maximum present static draft reported in meters decimal centimeters //.	O/11.50//
P .....	Categories of Hazardous Cargoes*.	Classification Code (e.g. IMDG, IBC, IGC, INF) / and all corresponding Categories of Hazardous Cargoes (delimited by commas) // Note: If necessary, use a separate "P" line for each type of Classification Code.	P/IMDG/1.4G,2.1,2.2,2.3,3,4.1,6.1,8,9//
Q .....	Defects or deficiencies**.	Brief details of defects, damage, deficiencies or limitations that restrict maneuverability or impair normal navigation // (If none, enter the number zero.).	Q/Include details as required//
R .....	Pollution incident or goods lost overboard**.	Description of pollution incident or goods lost overboard within the Monument, the Reporting Area, or the U.S. Exclusive Economic Zone//(If none, enter the number zero.).	R/0//
T .....	Contact information of ship's agent or owner.	Name/address/and phone number of ship's agent or owner //	T/JOHN DOE/GENERIC SHIPPING COMPANY INC, 6101 ACME ROAD, ROOM 123, CITY, STATE, COUNTRY 12345/123-123-1234//
U .....	Ship size (length overall and gross tonnage) and type.	Length overall reported in meters decimal centimeters/number of gross tons/type of ship (e.g. bulk carrier, chemical tanker, oil tanker, gas tanker, container, general cargo, fishing vessel, research, passenger, OBO, RORO) //.	U/294.14/54592/CONTAINER SHIP//
W .....	Persons .....	Total number of persons on board // .....	W/15//

TABLE E.1 NOTES

\*Categories of hazardous cargoes means goods classified in the International Maritime Dangerous Goods (IMDG) Code; substances classified in chapter 17 of the International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk (IBC Code) and chapter 19 of the International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk (IGC Code); oils as defined in MARPOL Annex I; noxious liquid substances as defined in MARPOL Annex II; harmful substances as defined in MARPOL Annex III; and radioactive materials specified in the Code for the Safe Carriage of the Irradiated Nuclear Fuel, Plutonium and High-Level Radioactive Wastes in Flasks on Board Ships (INF Code).

\*\*In accordance with the provisions of the MARPOL Convention, ships must report information relating to defects, damage, deficiencies or other limitations as well as, if necessary, information relating to pollution incidents or loss of cargo. Safety related reports must be provided to CORAL SHIPREP without delay should a ship suffer damage, failure or breakdown affecting the safety of the ship (Item Q), or if a ship makes a marked deviation from a route, course or speed previously advised (Item L). Pollution or cargo lost overboard must be reported without delay (Item R).

**E.2 Prior Notification of Entry Format**

Vessels of the United States less than 300 gross tonnage that are not equipped with onboard e-mail capability must provide the following notification of entry at least 72 hrs, but no longer than 1 month, prior to entry date, utilizing the data syntax described above. Notification may be made via the following communication methods, listed in order of preference: E-mail [nwhi.notifications@noaa.gov]; fax [1-808-397-2662]; telephone [1-866-478-NWHI (6944), 1-808-395-NWHI (6944)].

TABLE E.2—INFORMATION REQUIRED FOR PRIOR NOTIFICATION

System identifier.	PRIOR NOTICE //.
Items .....	A, B, C (as applicable), I, L, O, P (as applicable), Q, T, U, W.

**E.3 Exit Notification Format**

Immediately upon leaving the Reporting Area, vessels required to participate must provide the following information. Vessels of

the United States less than 300 gross tonnage that are not equipped with onboard e-mail capability must provide the following Exit Notification information within 12 hrs of leaving the Reporting Area. Notification may be made via the following communication methods, listed in order of preference: E-mail [nwhi.notifications@noaa.gov]; fax [1-808-397-2662]; telephone [1-866-478-NWHI (6944), 1-808-395-NWHI (6944)].

TABLE E.3—INFORMATION REQUIRED FOR EXIT NOTIFICATION

Telegraphy	Function	Information required	Example field text
	System identifier	CORAL SHIPREP //	CORAL SHIPREP//

## Midway Atoll Vision

1

# 1. Vision

## VISION STATEMENTS

### PAPAHĀNAUMOKUĀKEA MARINE NATIONAL MONUMENT VISION:

To forever protect and perpetuate the ecosystem health and diversity and Native Hawaiian cultural significance of Papahānaumokuākea.

### MIDWAY ATOLL NATIONAL WILDLIFE REFUGE / BATTLE OF MIDWAY NATIONAL MEMORIAL VISION:

As part of the Papahānaumokuākea Marine National Monument, Midway Atoll is a unique and peaceful treasury of wildlife and history in the midst of the Pacific where nature rules, and the health of people, wildlife, and ocean are intrinsically connected. Native habitats and species dominate the Midway landscape, while remnants of the historic Battle of Midway are protected along with rehabilitated historic structures that support a cooperative interagency Monument field station. Coordinated management promotes ecological restoration, research, service-based tourism, and education to preserve and enhance this fragile island and coral reef system. Midway Atoll is the “window” to the Monument that offers people a rare opportunity to immerse themselves in the rich history, culture and ecology of the Northwestern Hawaiian Islands, a remote ecosystem of international significance. As a living classroom, Midway provides restoration and sustainability lessons for current and future generations worldwide to apply to their home communities.

## PROTECTED AREA MISSION AND PURPOSES

### PAPAHĀNAUMOKUĀKEA MARINE NATIONAL MONUMENT MISSION:

- Carry out seamless integrated management to ensure ecological integrity and achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian culture, and heritage resources for current and future generations.

### MIDWAY ATOLL NATIONAL WILDLIFE REFUGE PURPOSES:

- “...maintaining and restoring natural biological diversity within the refuge;
- providing for the conservation and management of fish and wildlife and their habitats within the refuge;
- fulfilling the international treaty obligations of the United States with respect to fish and wildlife;
- providing opportunities for scientific research, environmental education, and compatible wildlife-dependent recreational activities; and
- in a manner compatible with refuge purposes, ...recognize and maintain the historical significance of the Midway Islands consistent with the policy stated in Executive Order 11593 of May 13, 1971.” (Executive Order 13022, October 31, 1996).

### BATTLE OF MIDWAY NATIONAL MEMORIAL PURPOSE:

- “[S]o that the heroic courage and sacrifice of those who fought against overwhelming odds to win an incredible victory will never be forgotten.” (Secretary’s Order 3217, September 13, 2000)

All activities considered in this Conceptual Site Plan will be consistent with this mission and these purposes.

beach at Rusty Bucket

## PROTECTIONS AND SIGNIFICANCE OF MIDWAY

---

On June 15, 2006, President George W. Bush issued Presidential Proclamation 8031, which designated and protected 139,792 square miles of emergent and submerged lands and waters in the Northwestern Hawaiian Islands as a Marine National Monument. It was renamed in 2007 by Proclamation 8112 as the Papahānaumokuākea Marine National Monument. This action significantly enhanced protection for the region's natural, cultural, and historic resources, and established one of the world's largest marine protected areas. Papahānaumokuākea Marine National Monument is administered jointly by three Co-Trustees – the Department of Commerce, Department of the Interior, and the State of Hawai'i – and represents a cooperative conservation approach to protecting the entire ecosystem. Co-Trustee agencies in cooperation with the Office of Hawaiian Affairs manage the Monument through the Monument Management Board. The Monument area includes the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, Midway Atoll National Wildlife Refuge/ Battle of Midway National Memorial, Hawaiian Islands National Wildlife Refuge, the State Seabird Sanctuary at Kure Atoll, and Northwestern Hawaiian Islands State Marine Refuge.

The Monument designation encompasses and maintains agency management responsibilities for all existing federal and state terrestrial and marine protected areas, including Midway Atoll National Wildlife Refuge (NWR). Midway Atoll NWR is administered by the U.S. Fish and Wildlife Service (FWS) and is part of the Hawaiian and Pacific Islands National Wildlife Refuge Complex, which consists of 19 refuges. The FWS began operating an "overlay refuge" on Midway Naval Air Station in 1988. Administration of Midway Atoll was transferred to the FWS in 1996. In 2000, the lands and waters of Midway Atoll NWR were designated as the Battle of Midway National Memorial.

Midway Atoll plays a key role as a staging ground for multi-agency field operations throughout the Monument and is critical to the operations of the State Seabird Sanctuary at Kure Atoll. Due to its accessibility by airplanes and large vessels, and its existing infrastructure, such as housing, offices, laboratories, and food service, Midway serves as an operational focal point for resource protection, management, research, and education activities in the northern section of the Monument. Additionally, considering Midway's facilities and public interest, the Presidential Proclamation establishes Midway as the only area within the Monument that can support a recreational visitor program. Midway's strategic location and physical assets also make it the ideal location to reinstate dive facilities for conducting shore based marine management in the northern atolls; enhance small boat facilities in support of seasonal enforcement operations; establish a marine research station and short term field school opportunities; and enable a more comprehensive study of maritime heritage resources particularly from World War II.

As one of the Northwestern Hawaiian Islands, Midway Atoll is representative of a remarkably unique and important marine ecosystem. Located near the northern end of one of the highest-latitude coral reef ecosystems in the world, it is bathed in relatively cold water for coral reefs, making it a vital case study in the global incidence of heat-induced coral bleaching. Part of a volcanically created and subsiding island chain, Midway is an example of atoll formation, a poorly understood geological process that can contribute to our understanding of the relationship between climate,

*Laysan albatross nesting*

# 1. Vision

reef development, and carbon sequestration. Because of its remote location in the middle North Pacific, it is also an important node in the global network of ongoing biogeographical and oceanographic research.

Due to its geographic isolation, Hawai'i in general has a very high percentage of endemism, or occurrence of species that are found nowhere else in the world. Many of these species are threatened or endangered, often as a result of human activity; the isolation of the Monument provides them with a huge refuge habitat. Midway Atoll is host to a wildlife spectacle on land, including the largest colony of nesting albatrosses in the world. More than 20 species of seabirds – as many as 2 million birds – nest or rest at Midway. Finally, the Northwestern Hawaiian Islands are one of the last intact, predator-dominated coral reef marine ecosystems in the United States and the world, making it invaluable to scientists' understanding of marine ecology. It also hosts a high degree of marine endemism, reaching over 50% of fish biomass. The access to this remote ecosystem provided by the infrastructure at Midway enables unparalleled opportunity for studying these isolated marine ecosystems and for providing unique field study and comparative research opportunities.

In addition to its rich assemblage of marine life, Midway Atoll contains numerous heritage resources that collectively tell the story of commerce, military, transpacific communication, and human modification of the atoll environment. Despite its small size and remote location, Midway's strategic location in the middle of the Pacific Ocean has drawn great attention over the last 100 years. Notably, Midway's pivotal role in World War II, commonly known as the "Battle of Midway," and the sacrifices of military personnel who fought at Midway, are memorialized in history. Today, Midway contains 63 existing historic properties eligible for the National Register of Historic Places; these include defensive structures, military architecture, both industrial and residential, and architecture from the Commercial Pacific Cable Company period (1903) and World War II period.

The designation of Midway as a special management area of the Monument elevates the atoll's significance regionally and globally. Midway will be a hub of Monument-wide management and operations, and the only atoll where visitors can experience the Northwestern Hawaiian Islands. Bringing people to the place in a way that does not diminish, but rather enhances, the integrity of Midway Atoll is beneficial to the Monument. Equally important is bringing the place to people who cannot visit, so that the valuable lessons and experiences of Midway reach across the world to local communities.

A key question is: How do we tell the amazing story of the natural, cultural, and historic resources of the Northwestern Hawaiian Islands and support Monument operations while preserving the atoll's character and integrity? The Midway Atoll Conceptual Site Plan offers the opportunity to re-envision the island as a powerful case study in how humans can and must live in balance with a delicate ecosystem over a long timeframe. This precept is a vital one where the atoll's remoteness and terrestrial isolation make a model of sustainability essential. In addition, Midway Atoll has a delicate ecosystem and is of a scale where our actions, both positive and negative, quickly have an enormous impact. Midway Atoll can provide a vital biosphere experiment in a natural setting, which if we learn to manage successfully, could become a model of how to take better care of the planet at large, and a great source of environmental public awareness.

## 2. Project Mission / Purpose and Process

### MONUMENT PLANNING CONTEXT AND MIDWAY ATOLL CONCEPTUAL SITE PLANNING

#### MANAGEMENT PLANNING

The Monument Management Board recently completed a Monument Management Plan. To aid in development of the Central Operations and Coordinated Field Operations portions of the Monument Management Plan, the Co-Trustee agencies initiated two successive detailed planning processes. The first endeavor was a Papahānaumokuākea Marine National Monument requirements planning process designed to identify the agencies' existing assets and future infrastructure requirements Monument-wide. This present document, the Midway Atoll Conceptual Site Plan, is the result of the second endeavor. With the full range of agency goals, requirements, and constraints articulated for Midway in the Papahānaumokuākea Marine National Monument infrastructure requirements planning process, the Midway Atoll Conceptual Site Plan focuses with increased specificity on the required infrastructural and operational changes, offering a range of redevelopment options and solutions.

*Sea turtles resting on beach*

#### PAPAHĀNAUMOKUĀKEA MARINE NATIONAL MONUMENT REQUIREMENTS ASSESSMENT AND PLANNING

An important first step in effective site planning is the identification of existing assets alongside current and future field operational requirements. A multi-agency infrastructure requirements planning process took place over the course of six months in 2007, providing a general outline of people, programs, assets, and operations associated with the Monument. It summarized the functions and numbers of personnel along with the types of supporting facilities required at each location within the Monument. Those requirements were then combined to define a "Monument level" requirement at each location.

Recommendations from the requirements planning process guided development of this Midway Conceptual Site Plan. Specifically, the process identified the need for two consolidated operational strategies to be developed: one for Midway and one for the remaining locations within the Monument. The operational strategies will identify the needs of each agency, identify resource-sharing opportunities, and include mutually agreeable cost-sharing guidelines. Agencies are working to develop cooperative agreements that meet these needs.

One goal of the site and operational strategies is to promote a sustainable agenda. The Monument Management Board is working to adopt an aggressive, measurable goal to reduce conventional fuel consumption through a combination of conservation, green architecture, and renewable energy.

## SCOPE OF MIDWAY ATOLL CONCEPTUAL SITE PLAN

Midway Atoll is a hub of operations for all State and federal agencies conducting Monument resource protection, management, education, and research activities. It is the only location in the Monument that allows for recreational visitor experiences. All of these activities occur in an environmentally and historically sensitive area. As such, Midway requires careful and thoughtful conceptual site planning and development to ensure that our current vision for the Atoll's use and management over the next 15 years and beyond is aligned with the mission of the Monument, the purposes of the National Wildlife Refuge and the Battle of Midway National Memorial, and the mission of the National Wildlife Refuge System. Since Midway is the primary hub for agency activities and visitor programs within Monument boundaries and contains the most existing infrastructure, it is important that the conceptual site planning begin here. The lessons drawn from the development of this plan will result in a better process to plan for and coordinate all site infrastructure and field operations needs throughout the Monument to ensure that natural, cultural, and historic resources are minimally impacted, and critical resource protection, management, and research needs and requirements are addressed.

*FWS Planning Team members on Sand Island*

The Midway Atoll Conceptual Site Plan builds on the results of the Monument requirements planning process and the extensive infrastructural repair work that has taken place at Midway over the past 10 years. Since 2003, the Fish and Wildlife Service has implemented recommendations proposed by the Infrastructure Condition Assessment and Modification Report for Midway Atoll National Wildlife Refuge, commonly referred to as the “right-sizing” plan. When the Monument was established in 2006, it was necessary to revisit previous decisions and consider new interests and needs for managing the Northwestern Hawaiian Islands. With the designation, Midway Atoll and the rest of the Northwestern Hawaiian Islands were elevated to a status of national and global significance and public recognition. Under this plan, the Monument Management Board's goal is to protect and enhance the natural, cultural, and historic resources of Midway, while enabling more effective resource management and response to the northern Monument and providing opportunities for the public to experience its lessons and become champions of these special marine ecosystems of the Pacific.

## 2. Project Mission / Purpose and Process

### DESCRIPTION OF MIDWAY CONCEPTUAL SITE PLANNING PROCESS

Midway Atoll conceptual site planning began in Spring 2007 occurring in tandem with the Marine National Monument management planning effort.

Staff and consultants conducted site analysis, document review, workshops, and mapping to identify primary issues and goals specific to Midway design and planning. Key design guidelines and preliminary building programs based upon biological constraints and historic preservation objectives were developed. The team facilitated a workshop in July 2007 to present preliminary concepts and receive input from management partners.

Based on the workshop findings, the Planning Team refined the Midway Atoll alternatives and the preferred site alternative. The draft Midway Atoll Conceptual Site Plan Report was produced and reviewed in three cycles by FWS and the Monument Management Board. The Midway draft report was included within the Draft Monument Management Plan as Volume IV, and distributed for public review. The comments received regarding the draft conceptual site plan and draft management plan (Volume I) regarding Midway were taken into consideration in finalizing this plan.

This Midway Atoll Conceptual Site Plan should be considered as a conceptual document, not as a definitive operational plan or design blueprint. Much more work, including engineering studies, architectural drawings, and specific environmental analyses, will need to be completed prior to construction activities. Even so, this document provides an atoll-wide overview that will guide us into the future. The conceptual plan will be reviewed every five years as part of a review of the overall Monument Management Plan.

## MIDWAY ATOLL

MIDWAY ATOLL CONCEPTUAL SITE PLANNING

Site Overview

### 3. Site Overview

#### SITE ANALYSIS

Located near the far northern end of Papahānaumokuākea Marine National Monument, Midway Atoll is approximately 1,250 miles northwest of Honolulu, Hawai‘i. The second oldest coral atoll in the NWHI, Midway originated as a volcano approximately 27 million years ago. Midway Atoll comprises an elliptical outer reef nearly 5 miles in diameter, 580,392 acres of submerged reef and associated habitats, and three flat coral islands totaling approximately 1,549 acres. Sand Island (1,117 acres) and Eastern Island (366 acres) are the two most prominent coral islands of the Atoll, while Spit Island is only about 15 acres in size. Sand Island contains the highest number of historic resources as well as all visitor facilities.

Midway Atoll is an unincorporated territory of the United States and is the only atoll/island in the Hawaiian archipelago that is not part of the State of Hawai‘i. Midway Atoll National Wildlife Refuge is owned and administered by the U.S. Fish and Wildlife Service (FWS) on behalf of the American people and has international significance for both its historic and natural resources.

Key Midway Atoll site issues are described on the following pages.

#### BIOLOGICAL

Midway Atoll’s plant and animal species are protected under several Federal laws, including the Endangered Species Act, the Marine Mammal Protection Act, and the Migratory Bird Treaty Act. Twenty-three species of plants and animals listed under the Endangered Species Act are known to occur in the NWHI. These include the Hawaiian monk seal, several turtle species such as the green and loggerhead turtle, whale species, Laysan duck, short-tailed albatross, and a half-dozen native plant species. Midway is also home to several endemic species, found only in Hawai‘i, that merit special protection and management efforts.

Midway Atoll consists of vast expanses of coral reef, sediment beds, and algal substrate that support a wide array of species unique to the Hawaiian Archipelago. The three small, low-lying islands are protected by encircling barrier reefs, and are marine in character: constantly under the influence of ocean weather conditions, susceptible to periodic inundation, and constructed from oceanic materials. The islands support birds and terrestrial wildlife that prey on marine species and contribute to nutrient runoff into the shallows. The interdependence between the land and nearshore waters intrinsically connects the welfare of all Monument wildlife to the health of both terrestrial and marine ecosystems. This simple and profound reality is the underpinning of the integrated approach taken by the Co-Trustees to managing the Monument.

Midway is one of the few remaining predator-dominated coral reef marine ecosystems, an anomaly among modern marine ecosystems, but typical of the Northwestern Hawaiian Islands (DeMartini and Friedlander 2006). Abundant populations of sharks, jacks, grouper, dolphins, and other “top predators” live at Midway Atoll.

*1940s Officers' Quarters designed by Albert Kahn*

Approximately 200 Hawaiian spinner dolphins rest within Midway's lagoon and forage outside its reef. Bottlenosed, striped, spotted, and rough-toothed dolphins may occasionally be seen in the open ocean, as well as beaked, pilot, and endangered humpback whales.

*Spinner Dolphins*

Almost 2 million breeding seabirds of 19 species make Midway one of the most important breeding areas of seabird conservation in the Pacific. Midway supports the largest nesting colonies of both Laysan and black-footed albatrosses in the world. Midway's breeding populations of white terns, black noddies, and red-tailed tropicbirds constitute the largest colonies in the Hawaiian archipelago.

*Male frigatebird*

## HISTORICAL/CULTURAL

The first visitors to Midway Atoll were likely Polynesians/Hawaiians exploring the Pacific Ocean in deep-sea voyaging canoes. Although no physical evidence of their visits has yet been found, numerous oral histories and chants refer to distant low-lying islands with abundant birds and turtles providing record of Native Hawaiian knowledge and experience gained through these purposeful journeys. One Native Hawaiian name given to the atoll is "Pihemanu," which means "the loud din of birds." Today, Native Hawaiian history and cultural practices are a vital part of the Monument's management, and education and visitor programs at Midway provide important opportunities to feature the cultural significance of the Northwestern Hawaiian Islands alongside the natural and historic components.

Midway Atoll contains the most historic resources within the Monument. Numerous Federal laws, regulations, and policies mandate the protection and management of historic resources, including the National Historic Preservation Act of 1966, the Archaeological Resources Protection Act of 1979, and the Preserve America Executive Order of 2003 (Executive Order 13287). Historic resources at Midway Atoll include several sites, structures, artifacts, and places representative of the historic periods associated with early 20th Century transpacific communications and military operations. At Midway, there are four types of National Register eligible historic resources including:

1. a National Historic Landmark,
2. Cable Station, 3. Albert Kahn

#### SITE ANALYSIS

residential and industrial architecture, and 4. other historic elements, including Battle of Midway remnants not within the National Historic Landmark.

A Programmatic Agreement (1996) and Historic Preservation Plan (1999) were developed to guide management of the historic properties at Midway Atoll and will be updated to address preservation issues at Midway within the context of the recent Monument designation. The Midway Atoll Historic Preservation Plan focuses on long-term management and treatment for each of the 63 historic properties. It also identifies procedures for treating new discoveries and caring for museum collections, and includes recommendations for interpretation, education, and public outreach.

The Programmatic Agreement and Historic Preservation Plan prescribe one of six different treatment categories to the historic properties. The treatment categories are 1. reuse, 2. secure, 3. leave as-is, 4. fill in, 5. demolish, or 6. relocate. Many factors were used to determine the treatment category to which a historic property was assigned, including historic importance, interpretive value, overall setting, association with key historic themes, and structural integrity. Preservation treatment primarily focuses on adaptive reuse of the historic buildings; reconstruction is generally not viewed as an appropriate treatment.

In 2007, a cultural resources team of the FWS Pacific Region conducted further evaluations and provided treatment recommendation for specific buildings. Several buildings are severely deteriorated (e.g., Cable Station) or require significant repair (e.g., Seaplane Hangar). The Cultural Resource Team's recommendations were incorporated into the Midway Conceptual Site Planning process and are reflected in the Building Program and the Preferred Site Plan. Reuse of historic structures is a primary strategy that meets several goals: 1. repair and preserve historic structures, 2. avoid new development that would degrade historic landscape quality or wildlife habitat value, 3. meet agency operations and visitor needs, and 4. be cost-effective compared to new construction costs.

The historic properties require continual repair and maintenance according to the terms of the Historic Preservation Plan and the Secretary of the Interior's Standards for the Treatment of Historic Properties. The effects of weathering and erosion by saltwater, salt spray, salty soils, precipitation, plant growth, termites, solar radiation, and wind continue to threaten the integrity of the historic properties at Midway Atoll. Additionally, lead-based paint must be removed from structures to eliminate a hazardous material that is extremely toxic to the albatross populations.

Submerged historic resources around Midway will require additional understanding and warrant further consideration in their management. A careful study of the wrecks in the lagoon and nearshore rim of the atoll will be conducted. The submerged items need to be accurately identified in order to establish their historical association and eligibility to the National Register. Two Midway maritime heritage sites associated with World War II, the USS Macaw and a World War II-era Corsair, have been preliminarily documented.

## SAND, SPIT, & EASTERN ISLANDS HISTORIC CONDITIONS

MIDWAY ATOLL CONCEPTUAL SITE PLANNING

### 3. Site Overview

#### SITE ANALYSIS

##### UTILITIES AND OPERATIONS

Midway Atoll is so remote that it must operate independently as a small town. It operates its own power system, water treatment and distribution, facilities maintenance, sewage treatment, waste management systems, communications systems, and all the other operational necessities found in a small municipality.

##### DRINKING WATER SYSTEM

A new drinking water treatment system and distribution main were placed into service in October 2005.

The old system is no longer treated to drinking water standards and was left in place to provide firefighting water. This took care of the major public health-related concerns, but sections of the water delivery system need to be modified to complete the full system upgrade. The new treatment system is sized for a short-term maximum population of 200 persons at a per capita daily use rate of 100-gallons per day, totaling 20,000 gallons per day. However, the actual efficient operating capacity is much lower. A regular on-island population above 120 people will require added capacity.

Rainwater is collected in a pond, and then pumped to storage tanks. The new electrical grid was not extended to provide power for the rain water pumps. The pumps are grossly oversized for current needs and should be replaced with smaller units. Electrical power can be furnished by extending a new electrical grid, by installing a small generator, or by installing renewable energy systems. These pumps are operated infrequently, following significant rainfall events; thus a small portable generator may be an economical way to provide power.

*Caterpillar electric generator*

Stored rainwater is conveyed to the treatment plant via gravity flow through an existing pipeline. Gravity flow allows use of only about half the total stored volume of water. The total storage volume, approximately 12 million gallons, is greatly in excess of current use. Using a daily use rate of 20,000-gal, the system has about 300 days of water accessible via gravity flow. However, this same rainwater storage feeds the “old” water system. The old system leaks approximately 10,000-gpd, so that reduces the storage volume to approximately 200 days.

The existing pipeline that conveys untreated water to the plant is asbestos cement. This pipeline should be replaced. In addition, a small pump should be installed to pump stored water to the treatment plant, thus making the entire storage capacity available.

The new water distribution pipeline was connected to existing lateral service pipes at certain buildings through the core area of town (basically, from the FWS Office northward to the Clipper House restaurant). The distribution system would need to be extended to serve any newly constructed or remodeled facilities located outside the vicinity of the new water main.

The Inner Harbor area and the Cargo Pier area near the old fuel tank farm do not currently have drinking water service. Water that is available comes from the old system and is no longer potable. An evaluation will be conducted to determine whether these areas would be best served by new water pipes, new catchment systems, or left dry.

### 3. Site Overview

#### SITE ANALYSIS

##### ELECTRICAL GENERATION AND DISTRIBUTION

Electricity for the island is provided by combustion of JP-5 fuel in electrical generators. Two new electrical generator sets were installed to operate in an automatic duplex mode and were placed into service in approximately October 2005. These new generators were downsized from existing systems to better match generator capacity to connected load. For the most part, only one generator is needed to satisfy island electrical demand. When load exceeds the capacity of one generator, the second automatically comes on-line, automatically shutting off again when electrical demand reduces.

Maintenance activities can be accomplished on the “down” generator during that time. When the primary generator is due for service, the roles are switched and maintenance is then performed on the second generator. This style of engine-driven generator cannot be run continuously and must be periodically shut down for maintenance. Every few years, depending on operating hours, they must undergo a major engine overhaul. At that time, or whenever both smaller Caterpillar 3456 units are down, the system is run using the older, larger, but fully functional Caterpillar 3516 unit.

Current capacity for electrical generation is sufficient for existing population demand but nears maximum capacity during times of heavy load (summer). Existing and future projects will be evaluated with a goal to increase energy efficiency and transition to sustainable energy systems. The continuous adoption of energy conservation practices may increase the operational capacity of the existing electrical supply. If island population increases or electrical demand grows to require that two generators must run continuously, additional electrical generation would be necessary. This could be accomplished either by operating other existing generators or by installing sustainable energy

*Electrical switch gear*

generating devices such as solar water heaters, solar electric panels, incinerators, or gasification systems. The latter may also have the added benefit of using marine debris, solid waste, and alien species biomass to generate energy.

A new electrical distribution grid was constructed and placed into service in late 2006. The extent of this new grid was downsized in comparison to the existing old grid. The new grid was designed to supply electricity to only those facilities identified for future use, based on what was foreseeable in early January 2006. Facilities connected to the old grid are currently provided power through a backfeed to the old grid. The materials and equipment of the old grid are aged, in disrepair, and some are obsolete. As long as there are no failures in the old grid, all island facilities will continue to have electricity. When a failure occurs, it most likely will not be able to be repaired and all facilities connected to that portion of the old grid will go “dark.” The new grid does not extend services to the peninsula with the tug pier and finger piers, the old Fuel Farm area, or the large hangar. Either the new grid would have to be extended to serve any new developments or the facilities would be designed to generate their own energy. The same applies for any remodeled facilities that are currently connected to the old grid.

##### WASTEWATER SYSTEM

The current wastewater treatment and disposal system (central septic tanks with drainfield) is overloaded by storm water intrusion and suspected groundwater infiltration. A new sewer system and treatment and disposal system have been designed to meet a goal of efficiency and water conservation. The design serves only certain facilities located in the core area of town. Some work is being accomplished to eliminate storm water intrusion. Dispersed septic design as opposed to centralized septic is preferable for fitting smaller wastewater treatment clusters around sensitive habitat areas and avoiding bird nesting sites. Estimated construction cost of new wastewater system is approximately \$2 million. Implementation of a graywater utilization system and composting toilets will be considered with a goal of reducing demand on a wastewater system in new construction.

### SOLID WASTE DISPOSAL

General waste is collected and burned in an incinerator when adequate waste fuel is available, or in an open air pit when fuel is not available. Ashes are buried in the existing small landfill/dump. Aluminum cans are collected, compacted, and periodically sent (via barge) to a recycling facility in Hawai'i. Glass is collected, crushed, and buried in the landfill/dump. There is no adequate system in place to deal with hazardous waste (asbestos and lead specifically). This issue will be addressed before any planned reuse, renovation, remodeling, or removal of existing structures takes place.

*New fuel tanks lead industry in spill protection*

An incinerator or gasification system that could burn the waste as fuel to generate power is the type of technology needed on Midway to handle the island's waste long-term. It could also be modified to burn marine debris collected throughout the Monument. Several such machines are under development in the U.S. at this time but none are currently commercially available. Development of such incinerators should be tracked as plans for Midway develop, since burning waste for power would be a powerful cost and carbon-emissions savings.

### FUELING FACILITIES

Midway's fuel supply is delivered by barge approximately once a year. It is used to refuel aircraft, ships, and motor vehicles, as well as provide all of Midway's electricity. Roughly 65 percent of Midway's fuel is currently used to generate electricity.

A new modular fuel tank system became operational in October 2007. Storage capacity for fuel is currently 450,000 gal. That amount is anticipated to meet

FWS and Coast Guard annual fuel needs at present consumption levels. An additional tank for gasoline and a new fuels lab are scheduled for completion in late 2009. More fuel storage capacity will be installed to meet NOAA and State needs, largely for the operation of small boats and equipment for land-based marine research and management operations.

### TELECOMMUNICATIONS

A new fiber optic distribution system was constructed during 2006/2007. The satellite antenna was relocated and partially refurbished in October 2007. Satellite service is in the process of being upgraded. These upgrades will only moderately improve telecommunications for the existing island population and are not designed to allow expansion of the system to additional customers. Any new offices/programs on Midway will have to invest in additional upgrades/additions to the system in order to meet their telecommunication needs.

In 2008 and in partnership with the Midway Atoll National Wildlife Refuge, NOAA's Office of National Marine Sanctuaries purchased an additional antenna for installation on Midway, including T1 speed communications capacity for education, outreach, and research purposes. In 2009 the link will be used for telepresence to classrooms and schools from Midway Atoll, and will provide capacity for remote wildlife viewing via wildlife cams in the near future. The new equipment will also provide emergency fail-over for existing satellite equipment in case the primary link goes down.

Due to its isolation in the North Pacific, Midway is an important location for many types of data collection. In order to realize its scientific, enforcement, and educational potential, Midway will require additional data transmission capabilities, such as Internet 2 links.

*Satellite telecommunications*

### 3. Site Overview

#### SITE ANALYSIS

##### AVIATION AND MARINE TRANSPORTATION

Midway Atoll is accessible by two transportation modes: aviation and marine vessel. Currently there is no visitor welcome area at either Henderson Airfield or the Inner Harbor.

Midway is used as a required emergency landing site for extended twin-engine operations (ETOPS) flights across the Pacific Ocean. Under current regulations, twin-engine aircraft must be within a maximum of 180 minutes from a Part 139 certified airfield in case of an emergency. Midway's 7,900-foot runway is capable of handling almost any type of aircraft.

Relatively few flights are conducted in the Monument, and most of them are to and from Midway Atoll. Henderson Airfield on Sand Island handled a total of 86 flights during 2007. Most of these, 51 flights, were by Gulfstream aircraft operated by Maritime Air, the charter company used by FWS/FAA. The next largest user is the U.S. Coast Guard, which had 18 flights to Midway in 2007. The remaining flights were a mix of military and civilian aircraft, most associated with special events held during the year. A new airport operations center was constructed southwest of the current hangar in 2007.

*Most visitors arrive by plane to Midway Atoll*

*Cruise ships occasionally visit Midway Atoll NWR*

Marine traffic in the waters around Midway Atoll primarily consists of research ships, merchant ships, and occasionally Coast Guard vessels, recreational boats, and passenger vessels. Midway Atoll receives day visitors mainly via a small number of vessels. Three passenger vessels visited Midway Atoll in 2004. In 2005, 2006, and 2007, one passenger vessel visited the atoll each year (Maxfield 2007 pers. com.). No passenger vessels visited in 2008. Due to port security requirements at Midway, when large passenger vessels do visit they offload passengers 3 to 4 miles outside the lagoon and transport them ashore in small boats.

##### POLLUTANTS AND TOXIC MATERIALS

###### Building Materials

All historic buildings on Sand Island contain hazardous materials such as lead-based paint or asbestos. These toxic materials pose health and safety concerns for humans and wildlife. Lead paint flakes are ingested by albatross chicks, causing growth deformities and mortality. Lead-based paint abatement is a high priority action for Sand Island structures.

###### No Dig/Landfill Areas

"No Dig" areas, found on both Sand and Eastern Islands, are Land Use Controls remaining from the closure of the Navy base. Areas identified for land use restrictions are former landfills or areas where contamination or solid waste was left in place at or below 4 feet from the surface. Restrictions were placed on these sites to avoid future exposure of humans or wildlife to potentially contaminated soil or groundwater. Human activities that expose potentially contaminated soil or groundwater within the site footprints would transfer the responsibility for the site from the Navy to FWS. Although the

*Old fuel tanks located in "no-dig" area*

contaminants are expected to degrade through time, the amount and rate of degradation are unknown. Therefore, these land use restrictions will remain in place in perpetuity to protect humans and wildlife.

One area on Sand Island that needs continued monitoring and potentially further remediation is known as the Old Bulky Waste Landfill. This site is an uncharacterized landfill that was created by the disposal of scrap metal, used equipment, and unconsolidated waste off the south shore of Sand Island to create a peninsula approximately 1,200 feet long by 450 feet (average) wide by 9 feet high (Navy 1995). It is surrounded on the three seaward sides by an approximately 10-foot-thick band of concrete and stone rip rap. Wastes known to have been deposited in the landfill are metals (lead, cadmium, chromium, and nickel), gasoline, battery acid, batteries, mercury, lead-based paint, solvents, waste oil, PCBs, dioxins, furans, transmission and brake fluids, vehicles, equipment, tires, and miscellaneous debris (BRAC SI 1996 vol. 1). The landfill was covered in approximately 2 to 2.5 feet of soil in an attempt to contain the waste. Currently the Old Bulky Waste Landfill is eroding, and the soil placed on top is sifting into the debris, causing large holes to open up around the edge and in the center of the landfill. Additionally, burrowing birds are bringing up buried soil and nesting below the cover. Over 500 bird burrows have been counted in the landfill.

### Marine Debris

Marine debris accumulation on the reefs and beaches of NWHI is a staggering problem, and an estimated 57 tons of new debris enters NWHI on an annual basis (Dameron et al. 2007). Marine debris, especially derelict fishing nets and gear, plastics, and hazardous materials, is a severe chronic threat to shallow ecosystems such as Midway Atoll. It adversely impacts the endangered Hawaiian monk seal, threatened and endangered sea turtles, albatrosses, and other wildlife species which become entangled in or ingest these materials. Large masses of fishing nets degrade coral reef health by shading, abrading, or dislodging fragile corals or by preventing reef regeneration.

Over 15 agencies and partner groups have worked since 1996 to remove large accumulations of marine debris. The total debris removed from 1996 to 2008 in NWHI was 610 tons. Midway staff periodically clean the beaches and reefs to remove entanglement hazards and collect the ongoing accumulation of plastics, glass, and metal for eventual disposal in Honolulu, sent by barge at great expense. As discussed in the **Electrical Generation and Distribution** section, this cost may be defrayed through on-site incineration or gasification, generating electricity as a byproduct.

### TERRESTRIAL ALIEN SPECIES

Human occupation and development at Midway Atoll has transformed the atoll since the Commercial Pacific Cable Company established its operation on Sand Island in 1903. The cable company attempted to make the “sand spit” as self-sufficient as possible through the cultivation of gardens and small livestock. Due to the lack of organic soil on the islands, barge loads of soil were brought from O’ahu and Guam, and contained not only the organic matter that made gardening possible, but also all the associated soil organisms such as ants, centipedes, fungi, and other nonnative species.

Additionally, trees and ornamentals were planted on Sand Island, such as ironwoods, eucalyptus, and acacia. So successful were these introductions that, by 1922, an estimated two-thirds of Sand Island was covered with imported vegetation. The black rat (*Rattus rattus*) was successfully exterminated on Midway in 1997; however, mice (*Mus musculus*), along with various species of ants, termites, wasps, ticks, and mosquitoes, continue to infest the island. Mosquitoes are of special concern as they are potential vectors for diseases such as West Nile virus, avian malaria, and avian pox. Termites have compromised most of the historic wooden buildings on Midway.

Tons of marine debris pollute Pacific Ocean and islands

### 3. Site Overview

#### SITE ANALYSIS

The number of alien land plants in the NWHI varies from only 3 introduced at Nihoa to 249 introduced at Midway Atoll. The level of threat from introduced plants also varies between species. For example, the invasive plant golden crownbeard (*Verbesina encelioides*) displaces all native vegetation in nesting areas, causing entanglement and heat prostration and killing hundreds of albatrosses each year (J. Klavitter, pers. com. 2007).

#### MARINE ALIEN SPECIES

Several alien species also threaten Midway's waters and reefs. One alien fish species and four alien invertebrate species are known to exist at Midway. One additional alien invertebrate species was found on a ship's hull at Midway and is thought not to be established at Midway. Although the ecological implications are unclear so far, at a minimum these species compete for resources with native species. Two of the invertebrate species have the potential to change the character of coral reefs where they become established.

Several other species have been identified as potential threats to Monument waters including Midway, having been documented in the main Hawaiian Islands or isolated locations in the Northwestern Hawaiian Islands. These include two fish species, one octocoral species, two algae species, and two invertebrate species. In particular the octocoral and algal species have the potential to alter the character of coral reefs where they become established.

Although marine alien species have been found at Midway, they are not believed to currently impact its infrastructure.

*Fish school in Eastern Island shallows*

*Golden crown-beard is a major invasive plant*

#### CLIMATE CHANGE AND SEA LEVEL RISE

Sea level rise is expected to have significant effects on the islands within Papahānaumokuākea Marine National Monument (Baker et al. 2006). Projected terrestrial habitat loss by 2100 among French Frigate Shoals, Pearl and Hermes Atoll, and Lisianski is expected to be 3 to 65% under a median scenario (48 cm rise), and 5 to 75% under the maximum scenario (88 cm rise). Spring tides would probably periodically inundate all land below 89 cm (median scenario) and 129 cm (maximum scenario) in elevation. Although Midway Atoll was not included in this study, Sand and Eastern Islands are more similar to Lisianski Island, which is expected to lose about 5% of its land area by 2100 (Baker et al. 2006). The environmental consequences of island inundation would likely be greater for Midway, with its buried toxic materials.

Changes in sea surface temperatures have been demonstrated to cause coral bleaching. Mass coral bleaching in the NWHI occurred in 2002, and was most severe in the three northernmost atolls, including Kure, Pearl and Hermes, and Midway. The occurrence of coral bleaching in the cool waters of the Northwestern Hawaiian Islands has been interpreted by some as indicative of climate change (Kenyon et al. 2006).

The measured increase of carbon dioxide in the atmosphere has been linked to ocean acidification, which slows the growth of coral reefs, and in some cases is predicted to dissolve them (Fine and Tchernov 2007). This is of great concern for Monument managers.

*C5 plane amid gooney birds*

## CHALLENGES AT MIDWAY ATOLL

Midway Atoll is a highly unique setting that presents tremendous challenges and issues that must be considered in all planning and design efforts. This Conceptual Site Plan, along with ongoing work by Co-Trustee and other agencies, begins to suggest some creative solutions to address these compelling problems. Some of the key challenges specific to Midway include the following points:

- Sand Island and Eastern Islands are highly disturbed landscapes greatly impacted by human use since the early 1900s. Dredging and filling of the land and water environments, nonindigenous plant and animal species introduction, and disruption of native species habitats are some indicators of the tremendous manipulation of the atoll.
- Global impacts adversely affect Midway Atoll's biological health. These adverse effects include marine debris accumulation (several tons of plastic washed up to shore annually), sea level rise, elevated sea surface temperatures, sea water acidification, and the possibility of changing ocean currents and wave patterns.
- Midway Atoll contains both historically and biologically unique features. Preservation and enhancement of the historic and ecological systems must be carefully evaluated from the lens of both perspectives.
- Carrying capacity is very limited on Midway Atoll due to its small land mass, sensitive biological and historic resources, and limited infrastructure. This capacity may be slightly increased, but human activities such as on the ground management and restoration activities, research, education, recreation, etc., must fit within this overarching constraint.
- Creative education and interpretation opportunities such as remote learning offsite, or sustainable tourism onsite, must be developed that help elevate public awareness while not creating impacts.
- Toxicity and hazardous materials cleanup at Midway Atoll is a major priority for ecological health, historic preservation, and public safety.
- Remote location of Midway Atoll creates impediments to transporting goods, materials, and people on- and off-island. Modes of travel to Midway and related logistical constraints are pivotal issues. Disposal and removal of surpluses or damaged items or materials is also problematic as the expense involved in proper disposal is prohibitive.
- High construction costs due to logistics
- Limited construction techniques
- Harsh climate conditions for materials
- Severely deteriorating buildings and infrastructure
- Limited staff and funding
- Development restrictions based on contaminants, historic conditions, and wildlife

## Midway Atoll Improvement Guidelines and Principles

4

## 4. Midway Atoll Improvement Guidelines and Principles

### GOALS

---

Design and planning goals developed for Midway Atoll are aligned with the Papahānaumokuākea Marine National Monument Management Plan goals.

**GOAL 1**—Protect, preserve, maintain, and where appropriate restore the physical environment and the natural biological communities and their associated biodiversity, habitats, populations, native species, and ecological integrity.

**GOAL 2**—Support, promote, and coordinate research, ecosystem characterization, and monitoring that increases understanding of the NWHI, improves management decision-making, and is consistent with conservation and protection.

**GOAL 3**—Manage and only allow human activities consistent with Proclamation 8031 to maintain ecological integrity and prevent or minimize negative impacts for long-term protection.

**GOAL 4**—Provide for cooperative conservation including community involvement that achieves effective Midway Atoll operations and ecosystem-based management.

**GOAL 5**—Enhance public understanding, appreciation, and support for protection of the natural, cultural, and historic resources.

**GOAL 6**—Support Native Hawaiian practices consistent with long-term conservation and protection.

**GOAL 7**—Identify, interpret, and protect Monument historic and cultural resources.

**GOAL 8**—Offer visitors opportunities at Midway Atoll to discover and appreciate the wildlife and beauty of the NWHI, enhance conservation, and honor its unique human history.

### DESIGN GUIDELINES AND PRINCIPLES

---

The Planning Team developed Design Guidelines and Principles that will inform appropriate design and planning efforts at Midway Atoll. These guidelines reinforce the key concept that Midway will become a “model of sustainability.” They provide the framework for preserving and enhancing Midway’s ecological and historic values in the course of implementing the Monument Management Plan at the Midway site-scale.

Several of these principles are mutually reinforcing, with each principle independently pointing to a common solution. For example, removing lead-based paint from historic structures removes a toxic substance that directly impairs wildlife and human health while preserving the historic integrity of these buildings. Adaptively reusing existing historic structures prolongs their life cycle and preserves their historic value while also meeting lodging, operations, research, and visitor services needs, simultaneously reducing the need for new construction that would adversely impact native species and habitat. Generating electricity with localized alternative energy devices to reduce carbon emissions and increase energy efficiency may save the cost of wiring the structure to the existing utility grids. Similarly, installing an incinerator or gasification system in order to avoid the high costs and carbon emissions of burning transported fuel reduces the need to ship much of Midway’s waste to Honolulu. Building new structures on existing concrete pads within the historic core/redevelopment zone helps to meet the “no net habitat loss” principle while also staying in character of Midway’s historic development patterns.

Design solutions such as these which meet several of the stated principles should permeate the Midway Atoll redesign plans. Midway Atoll is sufficiently small that opportunities exist to design ‘closed’ systems, minimizing required inputs, wastes, and operational costs.

Overarching design principles also include compliance with numerous Federal requirements, including those for accessibility such as the Rehabilitation Act of 1973 (as amended), Section 504 and 508; and the Architectural Barriers Act (ABA) of 1968.

### PROTECT HISTORIC STRUCTURES & LANDSCAPES

- ✓ Protect, maintain, and interpret historic resources.
- ✓ Follow Secretary of the Interior Standards to protect and maintain buildings that maintain integrity and/or identified as historically significant and eligible for or listed on the National Historic Register.
- ✓ Follow Secretary of the Interior Standards to protect historic landscape features and characteristics
- ✓ Follow National Historic Preservation Act (36 CFR Part 800) to document historic buildings and structures that do not exhibit integrity and will be secured in place (building envelope is sealed) or demolished. Salvage materials and leave footprints or ruins for interpretation that are safe and compatible with wildlife.
- ✓ Explore adaptive re-use of historic buildings

### PROTECT HABITAT & BIOLOGICAL RESOURCES

- ✓ Adhere to National Wildlife Refuge System principle "Wildlife comes first"
- ✓ Protect, maintain, enhance habitat and biological resources
- ✓ No net loss of habitat
- ✓ Construct new structures in footprints, building foundations, or pads of non-historic footprints
- ✓ Remove invasive species
- ✓ Protect nest sites
- ✓ Reduce high structures to minimize bird strikes
- ✓ New construction will not interfere with wildlife
- ✓ Remove pollutants (lead based paint, shore debris, toxic substances)
- ✓ Protect shallow water systems and reef sites
- ✓ Restore native habitat where feasible

### ALTERNATIVE ENERGY SYSTEMS & WASTE REDUCTION

- ✓ Reduce consumption
- ✓ Use energy efficient strategies and alternative energy systems
- ✓ Consolidate power generators and power sources
- ✓ Construct new structures that are energy-efficient or generate own energy
- ✓ Recycle materials for construction or enhancement projects
- ✓ Evaluate the use of alternative fuels for transportation and equipment

### OPERATIONS AND MAINTENANCE

- ✓ Address current and future maintenance needs
- ✓ Communicate management plan to staff, e.g., training in historic resource protection, biological resource protection
- ✓ Consolidate development (utilities, infrastructure, buildings)
- ✓ Appropriate infrastructure matched to current/new development and operations

### SUSTAINABLE ARCHITECTURE & LANDSCAPE ARCHITECTURE

- ✓ Re-use existing structures that still have integrity
- ✓ Sustainable design (materials, energy, etc.)
- ✓ Recycle materials, e.g., scrap metal, glass, ropes, etc.)
- ✓ Construct pre-fabricated components off-site
- ✓ Apply Performance Standards for new construction
- ✓ Apply sustainable design standards such as LEED
- ✓ Use termite-resistant building materials

### DESIGN AESTHETICS

- ✓ Maintain historic character
- ✓ Build new structures in the historic or tropical vernacular
- ✓ Reduce noise pollution
- ✓ Reduce light pollution

### VISITOR USE & EXPERIENCE

- ✓ Limit human presence to appropriate visitation levels
- ✓ Zones of use (direct visitor uses while protecting wildlife and habitat)
- ✓ Regenerative design, e.g. hydroponic gardens
- ✓ Develop facilities to accommodate visitors
- ✓ Eco-tourism focus: wildlife/historic landscape immersion experience; interpretation/education
- ✓ Service and volunteer work opportunities offered to visitors
- ✓ Midway Site will be a demonstration model for sustainability
- ✓ Develop opportunities for people who cannot visit to learn about Midway Atoll (e.g., website, cam, online environmental data)

### BUILD PARTNERSHIPS AND MANAGEMENT-DRIVEN RESEARCH

- ✓ Collaborative management and development (FWS/NOAA/State of Hawai'i)
- ✓ Develop new partnerships and alliances
- ✓ Corporate sponsorships
- ✓ Research opportunities

DECEMBER 2008

## DESIGN GUIDELINES & PRINCIPLES

### MIDWAY ATOLL CONCEPTUAL SITE PLANNING

## 4. Midway Atoll Improvement Guidelines and Principles

### MANAGEMENT ZONES AND SITE ZONES

#### SAND ISLAND MANAGEMENT ZONES

The Planning Team delineated Management Zones for Midway Atoll, including Sand Island, Eastern Island, and Spit Island. These zones show the physical areas where specific management, planning, and development activities occur.

The zones are as follows:

##### Marine Protection Zone

Protected shoreline and marine habitat that supports bird, wildlife, and fish species, and their critical life activities such as resting, feeding, nesting, fledging, migrating, etc. No public access is allowed.

##### Revegetation/Habitat Zone

Midway Atoll is a highly disturbed system that hosts pervasive invasive plant species, toxic materials, and human development remnants that, taken together, have created significant adverse impact on indigenous species and their habitat. Most of the islands within Midway Atoll are designated as the Revegetation/Habitat Zone to focus efforts on restoring atoll habitat and enhancing species populations.

##### Beach Zone

Shoreline that is open to the public for passive recreation and educational activities such as walking, bird and wildlife watching, and beach viewing. Primarily this zone occurs on the north beach of Sand Island. No beach access is available on Spit Island, and the only access allowed on Eastern Island is via the boat dock.

##### Inner Harbor Zone

This zone includes the historic Inner Harbor and its associated shoreline, piers, and facilities. One of two approaches to the island (by boat or airplane), the inner harbor zone is critical to visitor arrival, transportation of services and goods, and water-based activities (e.g., ecotourism via passenger vessels, marine research, rescue operations, security).

#### Airfield Operations Zone

The Airfield Operations Zone on Sand Island comprises the active Henderson Airfield and includes the new operations center, the old hangar, the active runway, and inactive runway portions. One of two approaches to the island (by boat or airplane), the airfield operations zone is critical to visitor arrival, transportation of services and goods, and aviation activities (ecotourism via air travel, research, emergency operations, security).

#### Freshwater Protection Zone

The Freshwater Protection Zone is a large triangular portion of the runway area from which surface water is collected in the catchment basin and then pumped into the three freshwater storage tanks.

#### Historic and Primary Development Zone

The Historic and Primary Development Zone designates Sand Island's historic core and redevelopment area. It delineates an area that is highly significant in terms of historic development patterns on Sand Island related to the Cable Company historic period (early 1900s) and World War II historic period (1940s). Several historic structures and features are contained within this zone. Conversely, this zone indicates the primary area where development of new facilities or adaptive reuse of existing or historic structures is an appropriate activity.

*Albatrosses and people*

*BEQ Barracks: replace with "green-designed" multi-plex units*

## 4. Midway Atoll Improvement Guidelines and Principles

### MANAGEMENT ZONES AND SITE ZONES

#### No Dig Areas/Landfill Zone

The “No Dig” areas are sites that contain contaminated soils or other materials, and cannot be built upon or otherwise disturbed. These sites include Old Bulky Waste Landfill on the south beach point, and the old fuel farm on the north beach.

The “No Dig” areas were designated in the Base Realignment and Closure process (BRAC) as Land Use Controls where digging below 4 feet is prohibited (or FWS assumes all responsibility). These areas, and several landfills, were determined to not necessitate further cleanup unless the controls were not effective. The Old Bulky Waste Landfill, however, is an example where the control is not sufficient and further remediation needs to be addressed through the BRAC process.

#### Sand Island Building Treatment and Site Zones

The Planning Team assessed site zones and building treatment opportunities within Sand Island’s Core Historic Zone. Evaluation factors included the following: 1. FWS historic treatment recommendations; 2. current and historic functions as well as potential future uses; 3. architectural and structural integrity; and 4. spatial organization of roads, operations, buildings, and landscape.

BOQ barracks

Cable Station building complex

Termite damage to structural roof members of historic Machine Shop

### ALTERNATIVES CONSIDERED

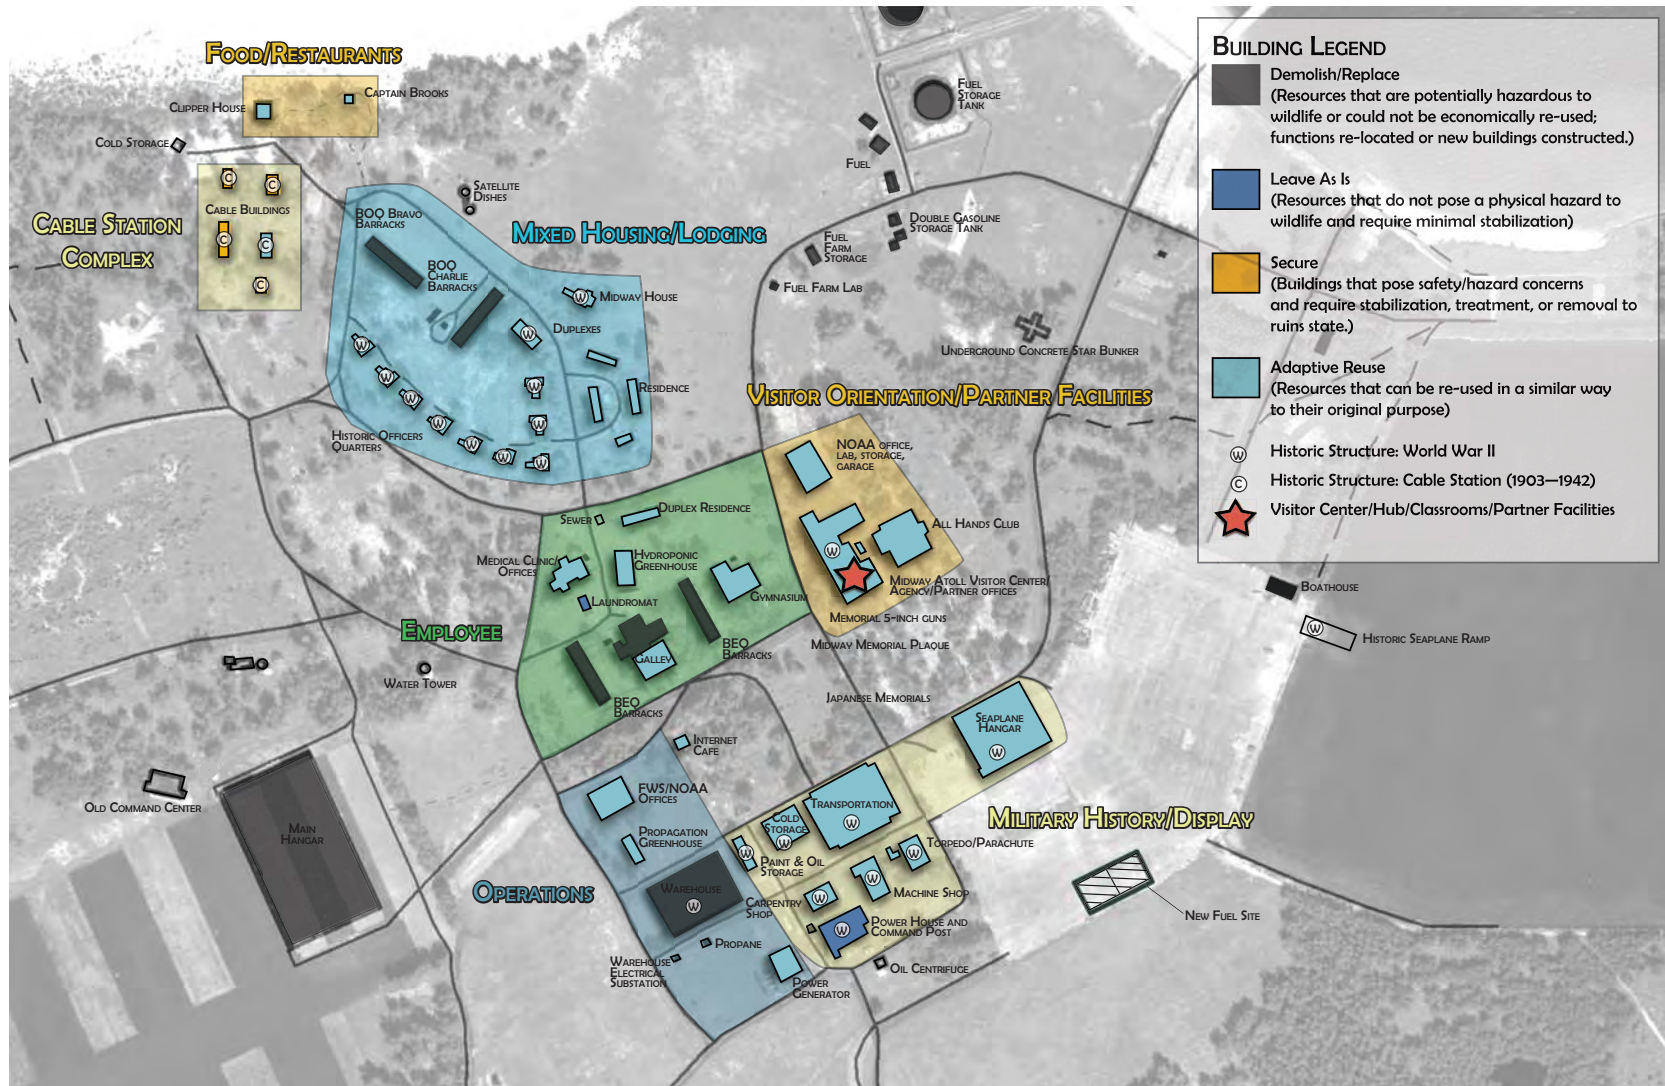

In the draft conceptual site plan, three alternatives were considered. Based on that analysis and the public comments received, Alternative B, “Model for Sustainability” was selected for this final plan.

In brief, Alternative A would have maintained current management activities in place at Midway at the time of the Proclamation. Alternative C was focused on accelerated restoration of Midway Atoll habitat and species, as well as on historic preservation efforts. As much onsite treatment as possible would have occurred under Alternative C. Resources, staff, facilities, and programs would have been primarily dedicated to restoring Midway Atoll’s natural habitat and historic landscape to the highest functioning state over the next 15 years. The maximum overnight population would have increased to 180 persons, and ecotourists would have been replaced by volunteer service workers.

Officers' Quarters

## 4. Midway Atoll Improvement Guidelines and Principles

### A “MODEL FOR SUSTAINABILITY:” INTEGRATED BIOLOGICAL, HISTORIC, AND VISITOR PROGRAMS (PREFERRED ALTERNATIVE)

This model, identified in the draft plan as Alternative B and the ‘preferred alternative’, provides an integrated approach for enhancing protection and understanding of biological and historic resources at Midway Atoll/Sand Island while providing a moderate increase in visitor services and interpretive, educational, and research programs and facilities. It also provides an operational hub for agencies within the Monument.

Resources will be allocated to elevating the programs and facilities in three areas: 1. biological protection, understanding, and restoration; 2. historic resource preservation and adaptive reuse; and 3. visitor education and interpretation.

Short-term overnight visitation will not exceed 50 people, while seasonal or long-term contractors and researchers will not exceed 100 people, thus totaling

no more than 150 people on any given night. The increased island population from the current regular capacity of 120 people will require enhancements in utility systems infrastructure. Up to three large groups of day visitors per year will primarily access the island via passenger vessel or aircraft, and generally no more than 400 people will be on-island at any one time.

New facilities and systems will utilize green design and energy principles. Midway’s physical structures as well as interpretive and education programs will emphasize the atoll’s sensitive resources and its role in worldwide resource conservation and human history.

Key activities implemented under this model include the following:

- Treat, stabilize, and clean-up all World War II-era historic buildings (e.g., rehabilitation, lead-based paint removal) to use for lodging, operations, and visitor services (approximately 18 buildings)
- Rehabilitate/repair Cable building #643 for interpretation. Partially dismantle other four Cable Station historic structures to ensure human and wildlife safety, leaving the concrete cores for interpretive purposes. Salvage recyclable materials such as windows and doors for use in Cable building #643
- Demolish B, C, and BEQ Barracks (4 buildings total) and replace in same footprint with smaller scale, energy-efficient multiplex units
- Construct low-impact-style shelters (< 200 sf) on existing concrete pad(s) or demolished building footprints as temporary lodging or ecotourism overnight facilities
- Reuse one Officers Quarters building as a hostel to accommodate overnight visitors
- Rehabilitate historic Midway Mall to serve as the new “Midway Atoll Visitor Center;” facility will be a multi-purpose center containing visitor facilities, multi-agency offices, and classrooms

Green turtle © James Watt

## 4. Midway Atoll Improvement Guidelines and Principles

### A “MODEL FOR SUSTAINABILITY:” INTEGRATED BIOLOGICAL, HISTORIC, AND VISITOR PROGRAMS (PREFERRED ALTERNATIVE)

---

- Demolish nonhistoric structures or structures that do not meet the Secretary of the Interior Standards for historic preservation, and create habitat in vacated areas
  - Expand biological enhancement, marine management, and research programs as part of multi-agency and partnership effort
  - Plan, design, and build a marine laboratory/quarantine facility
  - Construct a Hawaiian monk seal captive care facility
  - Remediate all lead-based paint and other toxic materials related to structures, facilities, and soils that are creating exposure hazards to humans and wildlife within 15 years
  - Monitor landfills and, if necessary, enact further remediation within 15 years
  - Construct a new boathouse, dive center, and storage facility to facilitate marine-based activities
  - Expand the new fuel farm to meet Co-Trustee needs
  - Construct new ramp/boat dock near location of historic seaplane ramp
  - Construct two welcome facilities for visitors arriving by ocean vessel and by airplane
  - Replace and upgrade finger piers in the Inner Harbor
  - Expand drinking-water capacity to meet needs for 30 additional people
  - Expand sewage and solid waste disposal capacity
  - Install new satellite antenna for telepresence, remote wildlife viewing, and research use
- Benefits of implementing this model include:
- o Visitation volumes do not exceed Midway Atoll’s carrying capacity
  - o No further net loss of biological and historic resources occurs
  - o Significant improvements are implemented to enhance biological and historic resources
  - o Midway’s exceptional historic resources are preserved and interpreted
  - o Facilities and infrastructure are upgraded to meet projected lodging, operations, visitation, safety, and maintenance needs
  - o Several biological research and habitat initiatives are implemented, e.g., Hawaiian monk seal captive care facility
  - o Educational and interpretive program is greatly enhanced; public outreach and stewardship opportunities are actively promoted at local, onsite scale to global, remote scale
  - o Partnerships and coalitions encouraged under this site plan may attract more funding dedicated to biological and historic preservation activities on Midway and throughout the Monument, e.g., development of a marine lab or research station, programming for field schools and other education programs
  - o Sustainable low-impact development at Midway will serve as a model of sustainability for remote field operations fostering conservation, recycling, and reduction of fossil fuel use
  - o Facilities, whether renovated or new, will incorporate sustainable design principles to enable the reduction of fossil fuel usage
  - o Implementation of priority projects will enable Co-Trustee investment in the atoll, greatly enhancing the field operational capacity of the Monument overall

*Midway Atoll provides important habitat for albatrosses*

## 4. Midway Atoll Improvement Guidelines and Principles

### SUMMARY OF MIDWAY ATOLL/SAND ISLAND CONCEPTUAL SITE MODEL

---

#### **MAXIMUM POPULATION ON MIDWAY ATOLL**

As indicated in the following table, the maximum overnight population allowed on Midway Atoll will be 150 people, which at any one time may include transient, short-term, seasonal, and permanent personnel. The average daily population range is expected to be between 100-120 people during the year. Total visitation to Midway is constrained by the existing infrastructure; levels above 120 people will require additional infrastructure support on the island as outlined in Chapter 3 of this document, **Site Overview**. The personnel requirements for Midway were developed through a multiagency requirements planning process. They will be regularly assessed and may be modified in light of evolving agency needs and infrastructural constraints at Midway to ensure that each agency's goals continue to be achieved and mandates satisfied.

At varying times of the year, Midway's overnight population may be comprised of different types of users, which are described below. Although the combined totals of personnel may seem to exceed the daily maximum capacity, proper scheduling will minimize overlap of these various groups to ensure that the overall overnight population does not exceed 150 people.

**Transient use.** Individuals stay on Midway less than 1 week, and typically include VIPs and agency representatives, such as employees departing or joining a NOAA, Coast Guard, or military vessel stopping at Midway or State personnel en route to Kure Atoll. They may also include agency personnel or contractors with a specific assignment on Midway, such as repairing or installing infrastructure or supporting a large group of day visitors. Since most of the field activities within the Monument occur during the summer and early fall, it is likely transient use will peak during the months of July through October. The maximum number of transients on island will depend upon the availability of housing, but the typical daily maximum will likely be fewer than 15 people.

**Short-term use.** Individuals stay on Midway from 1 to 4 weeks, and include agency staff and visitors participating in the approved visitor program. The number of people participating in the visitor program may not exceed 50 at any one time, and generally is much lower. The number of visitors usually peaks during albatross season, November through June. Short-term agency staff would likely include researchers, biologists, or marine debris cleanup personnel conducting projects at Midway Atoll; such use is concentrated in the summer and fall months. The maximum number of short-term visitors on island will depend upon the availability of housing, but the typical daily maximum will likely be fewer than 50 people.

*Black-footed albatross chick*

*Green turtle*

**Seasonal use.** Individuals stay on Midway from 1 to 8 months, and include agency staff and volunteers. Agency staff are typically involved in leading the visitor program, habitat restoration, seabird monitoring, or Hawaiian monk seal monitoring and captive care programs, while volunteers assist in these efforts. During major construction projects, seasonal use may also include contractors. The maximum number of seasonal personnel on island will depend upon the availability of housing, but the typical daily maximum will likely be fewer than 30 people.

**Permanent use.** Individuals stay on Midway more than 8 months during the year, and consist of FWS or NOAA staff (including enforcement personnel) and FWS contractors operating the atoll's infrastructure. The maximum number of permanent staff on island will depend upon the availability of suitable housing, but could be up to 20 agency staff and 65 contractors. Combined, the typical daily maximum will likely be fewer than 80 people.

**Day use.** In addition to overnight use of Midway, the Co-Trustees have established a limit on the number of day-use-only visitors to the atoll. A maximum of three large groups (50-800 people) of day visitors per year may visit the atoll. These visitors typically stay no more than 4 to 8 hours and arrive via aircraft or large passenger vessel. No more than 400 day visitors may be on the island at one time, unless specific arrangements have been approved for a special event, such as a ceremony commemorating an anniversary of the Battle of Midway.

If in the future the Co-Trustees desire to increase the maximum overnight population level above 150 people or the day visitor limit above 800 people, FWS would first need to determine that such use would be compatible with the purposes of the Refuge and the mission of the National Wildlife Refuge System, as required by the National Wildlife Refuge System Administration Act of 1966, as amended. Such proposals also would require analysis under the National Environmental Policy Act, as well as potentially the Endangered Species Act and other applicable laws.

*Coral reef and shallow water protection is a vital activity*

## 4. Midway Atoll Improvement Guidelines and Principles

### SUMMARY OF MIDWAY ATOLL/SAND ISLAND CONCEPTUAL SITE MODEL

Description/Theme	Integrated Biological, Historic, and Visitor Programs
	Coordinated management and operations program at Midway
Maximum overnight population	150
Average Population Range	100–120
Day Visitors	Up to 3 large groups of <800 annually; <400 ashore at once
<b>UTILITY SYSTEMS</b>	
Drinking Water	Increase capacity for up to 30 added people during regular periods
Electricity	Increase capacity for up to 30 added people during regular periods
Sewage	Increase capacity for up to 30 added people during regular periods
Solid Waste Disposal	Increase capacity for up to 30 added people during regular periods
<b>LODGING FACILITIES</b>	
<i>Officer Quarter Residences</i>	
	Reuse 1 officer quarter structure as hostel for short-term visitors
	Reuse 1 structure for short-term visitors
	Reuse 7 structures for seasonal or permanent staff

Description/Theme	Integrated Biological, Historic, and Visitor Programs
<i>Barracks</i>	
BOQ Bravo	Replace B barracks structure with (2) cable-style multiunit 2-story structures for short-term visitor lodging
BOQ Charlie	Repair C barracks to maximize capacity for interim. Eventually replace barracks structure with (3) multiunit 2-story structures for short-term visitor lodging
BEQ Barracks (1)	Replace barracks structure with (3) 8-plex 1 or 2-story structures for employees
BEQ Barracks (2)	Replace barracks structure with (3) 8-plex 1 or 2-story structures for employees
<i>Duplexes</i>	Maintained as seasonal/permanent staff lodging
<i>Low-Impact Shelters</i>	Up to 12 new primitive shelters constructed
<i>Midway House</i>	Maintained as FWS Midway Manager residence
<b>NUMBER OF HOUSING UNITS</b>	
Hostel style 1200 sf	2
Duplex Style <900 sf	11
2-story 12 x 24 Units 330 sf	48–56
8-plex 1 or 2-story structures <340 sf	48–96
Officers Quarters residences	8
Low impact shelters<200 sf)	3
<i>Total Number of Housing Units</i>	123-179

## 4. Midway Atoll Improvement Guidelines and Principles

Description/Theme	Integrated Biological, Historic, and Visitor Programs
Cable Station Buildings	Repair one cable station building (#643). Remaining cable structures partially dismantled for safety, historic landscape is interpreted
<b>FOOD SERVICE AND ENTERTAINMENT FACILITIES</b>	
Clipper House	Expand or replace for additional kitchen, and cold storage and dining facilities
Captain Brooks	Maintained as is
Galley Bldg	Reuse as café/store/entertainment center
All Hands Club	Demolished or reused for partner facilities; functions moved to other buildings (e.g., Galley)
<b>AGENCY OFFICES AND VISITOR FACILITIES</b>	
FWS Office Building	Agency offices and visitor services move into Midway Mall Visitor Center; maintain existing office building
Midway Mall	Midway Atoll Visitor Center established with visitor services, agency offices, and classrooms
Contractor Admin Building	Maintained as is
Gymnasium	Repaired and operational; used for emergency shelter

Description/Theme	Integrated Biological, Historic, and Visitor Programs
<b>RESEARCH/LAB/STORAGE</b>	
Old Commissary Building	Reused for agency offices, and shared research facilities e.g., cold storage/lab
Equipment Storage	Expanded in existing structures
Seaplane Hangar	Use for equipment storage; replace roof and restore glass façade for interpretation and/or exhibitory
Educational Classrooms/lab/library/ workroom	Phase I of Midway Mall Visitor Center
Monk Seal Holding Tanks	Yes
Biological Quarantine Facility	Yes
Monk Seal Captive Care Facility	Yes
<b>BOATING FACILITIES</b>	
Large Dock for Barges or Ships	Cargo pier maintained as is; fuel pier abandoned—disposition TBD
Midsized Dock for medium research vessels	Existing tug pier rehabilitated Tug pier replaced and upgraded
Seaplane/boat ramp for small vessels	New dock constructed in Inner Harbor; new dock/ramp built near seaplane ramp
Finger Docks for small vessels	Replace & upgrade finger piers in the Inner Harbor
Boat House	Replaced with new facility combined with dive infrastructure

## SUMMARY OF MIDWAY ATOLL/SAND ISLAND CONCEPTUAL SITE MODEL

---

Description/Theme	Integrated Biological, Historic, and Visitor Programs
<b>AIRPORT FACILITIES</b>	
Runway	North strip removed and restored to habitat within 10 years
Main Hangar	Demolished and restored to habitat within 10 years
Airport Terminal Welcome Building and Staging Area	Constructed
<b>HABITAT ENHANCEMENT</b>	
Old Fuel Tank Area	Demolished and area restored to habitat; new fuel tank area located south of seaplane hangar
Abandoned, derelict, or non-historic structures	Reuse, maintain as is, or demolish
Vegetative Buffer in Inner Harbor Area	Yes
Upland Habitat	Invasive vegetation removed and restored to native habitat (controlled w/in 15 yrs)
Shoreline Edge	Additional protection to direct public access away from sensitive areas
Coral Reef System	Investigate coral reef habitat improvements; metal wreckage removal

## Midway Atoll Conceptual Site Plan

5

## 5. Midway Atoll Conceptual Site Plan

### INTRODUCTION

---

The Planning Team selected the “Integrated Biological and Historic Preservation and Visitor Services—A Model for Sustainability” for implementation. This model provides an integrated approach for enhancing protection of biological and historic resources at Midway Atoll/Sand Island while providing a moderate increase in visitor services and interpretive and educational programs and facilities. The model meets the Monumentwide vision to “forever protect and perpetuate the ecosystem health and diversity and Native Hawaiian cultural significance of Papahānaumokuākea” by focusing on species and habitat recovery. The concept also recognizes Midway’s special role as a hub of the Monument for resource protection, management and research activities, and as the only atoll open to the public, the touchstone where humans can be immersed in the Northwestern Hawaiian Islands’ rich history, wildlife, and Pacific marine environment.

Resources will be allocated to elevating the programs and facilities in three primary areas: 1. biological and ecological understanding, protection, and restoration; 2. historic resource preservation and adaptive reuse; and 3. visitor education and interpretation.

Protection, research, and restoration of atoll systems and species, and protection of historic resources are promoted activities within the appropriate level of human interaction. Consideration is given to the atoll’s carrying capacity—how many people, structures, and facilities the island system can support without adverse impact to its health. Visitation will be increased approximately 16% over the recommended capacity targeted in the Interim Visitors Services Plan. Short-term overnight visitation will not exceed 50 people, while seasonal or long-term contractors and researchers will not exceed 100 people, thus totaling no more than 150 people on any given overnight. Day visitors will continue to visit the island with a maximum of three large groups of no more than 800 people per year, and generally no more than 400 visitors on Sand Island at any one time. Maximum overnight population will increase from the current level of 120 people to 150 people.

The focus of management and development of Midway facilities and programs will be on sustainability and sustainable tourism; creating the lowest carbon footprint possible on Midway Atoll is a primary goal. New and adapted facilities and systems will utilize green design and energy principles, and reduce consumption and waste. Midway’s physical structures in combination with its interpretive and education programs will emphasize the atoll’s sensitive resources and its role in worldwide conservation, ecological systems, and human history.

Patterns of uses are grouped into Site Zones:

- Visitor Orientation and Partner Facilities
- Mixed Housing/Lodging
- Employee
- Cable Station
- Food/Restaurants
- Military History and Display
- Operations

Each primary building within the Historic and Primary Development Zone is identified by color code in the map on page 51, in terms of appropriate historic treatment. The treatment categories are: 1. demolish and replace functions to another building, or replace existing structure; 2. leave as is, and stabilize structures that do not pose threats to wildlife or humans; 3. secure structures that pose hazards to wildlife or humans; and 4. adaptive reuse of structures that have sufficient historic or structural integrity to be used as a Midway Atoll facility.

## SAND, EASTERN, AND SPIT ISLANDS MANAGEMENT ZONES

As described in Chapter 4, Sand Island is zoned according to the following physical areas where specific management, planning, and development activities are appropriate: Marine Protection Zone, Revegetation/Habitat Zone, Beach Zone, Inner Harbor Zone, Freshwater Protection Zone, Airfield Operations Zone, No Dig/Landfill Zone, and Historic and Primary Development Zone.

The Historic and Primary Development Zone designates Sand Island's historic core and redevelopment area; it delineates an area that is highly significant and contains several historic structures and features eligible for listing on the National Register of Historic Sites. This zone indicates the primary area where development of new facilities or adaptive reuse of existing or historic structures should occur. This proposal will not only help preserve the integrity of the historic landscape, but will also protect wildlife and their habitat by limiting development to existing structures or impacted areas.

Specific activities for Sand Island are described in detail in the following section, **Sand Island Conceptual Site Plan**.

### EASTERN ISLAND

Eastern Island is primarily zoned in Marine Protection Zone and Revegetation/Habitat Zone. No new major development or structures are proposed for this unoccupied island, which provides critical shoreline and island habitat for birds and marine wildlife. Limited human access is provided via a boat dock and trails. Eastern Island's role during World War II is instrumental in the interpretation of Midway Atoll's incredible history. Numerous historic features remain, including the World War II runway, artillery, bunkers, and sand dune airplane revetments.

Eastern Island has been the focus of successful restoration and wildlife enhancement efforts. Volunteers and staff have removed large areas of the exotic species *Verbesina encelioides* and have planted native bunchgrass (*Eragrostis*) species. Biologists successfully created freshwater wetlands and established a Laysan duck population on Eastern Island.

Ongoing activities will continue to focus on habitat protection and restoration, and the interpretation of historic and biological features. No overnight visitation occurs on Eastern Island, and visitors will arrive for day visits only for the purpose of interpretation, volunteerism, or study of the island's history and ecology.

Activities for Eastern Island include the following:

- Continued restoration of native habitat and species (e.g., remove invasive plants, enhance bird habitat, reintroduce native species, etc.)
- Participatory restoration and research programs
- Build upon Eastern Island historic interpretation and educational program, guided tours, and protection and rehabilitation of historic sites
- Reconstruct sand dune airplane revetment with built-in crew/sleeping area
- Improved trail system linking historic features and memorials
- Determine appropriate treatment of historic runway, e.g., trails, historical interpretation, or partial habitat restoration
- Installation of remote wildlife viewing cameras for monitoring and educational purposes

### SPIT ISLAND

Spit Island is primarily zoned in Marine Protection Zone and Revegetation/Habitat Zone. It is important habitat for monk seals, sea turtles, birds, and other wildlife. No public access is allowed, and no development will occur on Spit Island to promote thriving wildlife populations and habitat. Spit Island will continue to support research and biological programs.

WWII airplane revetment on Eastern Island

## 5. Midway Atoll Conceptual Site Plan

### SAND ISLAND CONCEPTUAL SITE PLAN

#### MARINE AND SHORELINE PROTECTION

The Marine Protection Zone designates protected shoreline and fringing marine habitat on Sand Island that supports wildlife and their critical life activities such as resting, feeding, nesting, fledging, migrating, etc. Public access is generally not allowed in these sensitive shoreline areas, and these areas will remain undeveloped. However, biological programs, research, and management activities will continue to occur. Key actions for this zone are as follows:

- Limit human access mainly to the pursuit of biological programs, research, and management
- Install permanent moorings at regularly used anchorages to prevent coral reef damage
- Conduct coral reef rehabilitation projects when and where appropriate, using the best available information about predisturbance conditions.
- Reinforce, repair, or improve limited trail access, viewpoints, and signage, create viewing stations for wildlife watching
- Evaluate the potential for natural beach restoration, particularly along hardened or rip-rapped shorelines such as the South Beach, and the shoreline near Turtle Beach. Further studies are required to determine feasibility.

Reef habitat recommendations from the Monument Management Plan include the following strategies and activities from section 3.2.3, **Habitat Management and Conservation Action Plan** (HMC):

**Strategy HMC-1:** Within 15 years, develop and implement a strategy for restoring the health and biological diversity of the shallow reefs and shoals where anthropogenic disturbances are known to have changed the ecosystem, using best available information about predisturbance conditions.

**Activity HMC-1.1:** Identify and prioritize restoration needs in shallow water reef habitats impacted by anthropogenic disturbances within 5 years.

**Activity HMC-1.2:** Analyze historical and present impacts on reef growth at Midway Atoll and determine factors limiting nearshore patch reef growth to facilitate restoration of natural reef building.

**Activity HMC-1.3:** Where feasible, implement appropriate restoration activities.

#### HABITAT RECOVERY

Despite the incredible abundance of terrestrial and aquatic wildlife, wonderful beaches, and crystal clear water, Midway Atoll is a highly disturbed atoll system containing invasive plant and animal species, toxic materials in building materials and soils, and human developments that have created significant adverse impact on indigenous species and their habitat. Most of the Midway Atoll is designated as the Revegetation/Habitat Zone in this Conceptual Site Plan to focus efforts on restoring atoll habitat and enhancing species populations.

The conceptual plan for habitat management and restoration at Midway Atoll over the next 15 years is to increase the amount of habitat available for all species of breeding seabirds, overwintering migratory birds, Laysan ducks, and potential future translocated native birds by removing nonhistoric abandoned structures and pavement installed by the U.S. Navy, controlling and eradicating nonnative vegetation, and planting and seeding appropriate native plants.

As described in the Monument Management Plan's section 3.3.2, **Alien Species Action Plan**, FWS will control or eradicate golden crown-beard (*Verbesina encelioides*), ironwood (*Casuarina* spp.), haole koa (*Leucaena leucocephala*), castor bean (*Ricinus comunus*), Spanish needle (*Bidens* sp.), lantana (*Lantana camara*), pluche ( *Pluchea indica*), cheeseweed (*Malva parviflora*), poinsettia (*Euphorbia cyathophora*), Guinea grass (*Panicum maximum*), vervain

Black-footed albatrosses

## 5. Midway Atoll Conceptual Site Plan

### SAND ISLAND CONCEPTUAL SITE PLAN

(*Verbena litoralis*), umbrella plant (*Cyperus alternifolius*), nonnative morning glory (*Convolvulaceae*), ivy gourd (*Coccinia grandis*), black mustard (*Brassica nigra*), buffel grass (*Cenchrus ciliaris*), New Zealand spinach (*Tetragonia tetragonioides*), Chinese banyan (*Ficus microcarpa*), sand bur (*Cenchrus echinatus*), and spiny pigweed (*Amaranthus spinosus*).

Over the 15-year life of the plan approximately 937 acres of nonnative vegetation (coastal mixed grasses and shrubs) will be restored to a native dominated landscape. Native species used for restoration will be chosen on the basis of historical records at Midway and historical and pollen records from Laysan Island and will include bunchgrass (*Eragrostis variabilis*), naupaka (*Scaevola sericea*), morning glory (*Ipomoea pes caprae*, *I. indica*), *Solanum nelsonii*, *Capparus sandwichiana*, *Chenopodium oahuense*, and *Lepidium bidentatum*.

Approximately 118 acres of abandoned buildings and paved areas will be removed and converted into useable habitat. Demolition costs are estimated at several million dollars, however, so this will likely be a longer-term activity. The refuge will remediate lead-based paint from buildings and the surrounding soil to prevent adverse effects to wildlife.

Additionally, the Monument Management Plan includes the following activities related to habitat recovery in Midway Atoll (for detailed information, see section 3.2.3, **Habitat Management and Conservation Action Plan (HMC)**):

**Strategy HMC-4:** Within 10 years, restore and maintain coastal mixed grasses and shrubs on all the coralline islands and atolls of the Monument using best available historical information about the original indigenous ecosystem.

**Activity HMC-4.1:** Propagate and outplant native species chosen on the basis of historical records at Midway and historical and pollen records from Laysan Island in 250 acres of vegetated area at Midway Atoll, focusing on the original footprint of the island and then moving to the dredge spoils section.

**Strategy HMC-8:** Maintain no more than 150 acres of ironwood woodlands on Sand Island, Midway Atoll, to provide seabird nesting and roosting habitat for the life of the plan.

**Activity HMC-8.1:** Remove ironwood on Sand Island from 50 acres outside designated woodland and control young ironwood in areas managed for grass and shrubs.

**Strategy HMC-2:** Within 10 years, investigate, inventory, and map sources of known contamination from historical human uses of the NWHI and, where appropriate, coordinate with responsible parties to develop plans and complete cleanup actions.

**Activity HMC-2.7:** Conduct ecological risk assessment to determine allowable lead levels in soils at Midway and remove lead from buildings and soils to nonrisk levels.

#### No Dig Areas/Landfills

The “no dig” areas are sites that contain contaminated soils or other materials that cannot be disturbed. These sites include the Old Bulky Waste Landfill on the South Beach point and the old fuel farm on the North Beach.

The “No Dig” areas were designated in the Base Realignment and Closure process (BRAC) as Land Use Controls where digging below 4 feet is prohibited (or FWS assumes all responsibility). These areas, and several landfills, were determined to not necessitate further cleanup unless the controls were not effective. The Old Bulky Waste Landfill, however, is an example where the control is not sufficient and further remediation needs to be addressed through the BRAC process.

South point at Old Bulky Waste landfill

To the extent feasible, it is recommended that the “No Dig/Land Fill” areas that contain contaminated soils and/or facilities be enhanced for habitat. The largest area is in the vicinity of the old fuel tanks in the northeastern part of Sand Island. It is proposed that the tanks and associated facilities be removed, and nonnative vegetation be replaced with native vegetation. Further plans and procedures for remediation of an area such as the fuel farm are required to ensure that contaminated areas are clean and will not impair wildlife.

Additionally, the Monument Management Plan includes the following activities related to land fills and dumps in Midway Atoll (see section 3.2.3, **Habitat Management and Conservation Action Plan (HMC)**):

**Strategy HMC-2:** Within 10 years, investigate, inventory, and map sources of known contamination from historical human uses of the NWHI and, where appropriate, coordinate with responsible parties to develop plans and complete cleanup actions.

**Activity HMC-2.2:** Work with partners and responsible parties to verify the integrity of known landfills and dumps and to conduct additional remediation if necessary.

## HISTORIC RESOURCES

Within the Monument Management Plan (see section 3.1.3, **Historic Resources Action Plan (HR)**), five strategies affecting historic resources at Midway Atoll are identified for achieving the desired outcome of identifying, interpreting, and protecting historic resources in the NWHI.

**Strategy HR-1:** Update the Midway Atoll Historic Preservation Plan to meet the present needs of the Refuge and Monument within 1 year.

**Strategy HR-2:** Implement, supervise, and monitor the historic preservation treatments identified in the Midway Atoll Historic Preservation Plan at two historic properties each year.

**Strategy HR-3:** Prepare an updated Battle of Midway National Historic Landmark nomination within 4 years.

**Activity HR-3.4:** Implement repair and maintenance treatments at National Historic Landmark features within 6 years.

**Strategy HR-4:** Improve the function and capacity of the Midway museum within 8 years.

**Activity HR-4.1:** Prepare a Scope of Collections Statement within 5 years.

**Activity HR-4.2:** Remodel the Midway museum space within 7 years.

**Activity HR-4.3:** Organize and curate collections within 8 years.

Midway Mall interior: ideal space for offices, classrooms, and visitor services

Native bunchgrass successfully restored on Eastern Island

Midway Atoll offers important historic preservation and interpretation opportunities

Historic WWII Torpedo shop with parachute tower

## 5. Midway Atoll Conceptual Site Plan

### SAND ISLAND CONCEPTUAL SITE PLAN

---

**Strategy HR-6:** Conduct archaeological and historical research on the historical events and structures at Midway Atoll NWR within 15 years.

**Activity HR-6.2:** Conduct archaeological investigation of the Commercial Pacific Cable Station site within 10 years.

Additional strategies and activities targeted at understanding and protecting Midway Atoll's submerged historic resources are found in the Monument Management Plan in Section 3.1.4, **Maritime Heritage Action Plan** (MH):

**Strategy MH-1:** Document and inventory maritime heritage resources throughout the life of the plan.

**Activity MH-1.2:** Plan and carry out coordinated field mapping surveys of selected sites annually.

#### COORDINATED FIELD OPERATIONS

As a hub of operations for the Monument, Midway Atoll is the primary focus of the Coordinated Field Operations Action Plan in the Monument Management Plan. The following activities related to an integrated program in Midway Atoll are included (see section 3.6.3, **Coordinated Field Operations Action Plan** (CFO), for details):

**Strategy CFO-1:** Conduct necessary site planning and infrastructure improvements to increase safety and enhance Monument field operations capacity over the life of the plan.

**Activity CFO-1.1:** Initiate and complete necessary planning to implement the Midway Atoll Conceptual Site Plan.

**Activity CFO-1.3:** Develop alternative energy systems and waste reduction strategies for the Monument within 2 years.

**Activity CFO-1.4:** Plan for use of sustainable engineering, technology, and landscape architecture for facilities and assets throughout the Monument.

**Strategy CFO-3:** Maintain and improve housing and field camp safety and operational efficiency using short-, medium-, and long-term approaches to protect Monument resources across the life of the plan.

**Activity CFO-3.1:** Design and construct pilot low-impact shelter.

**Activity CFO-3.2:** Utilize the existing footprint of Bravo Barracks for replacement housing at Midway Atoll.

**Activity CFO-3.3:** Utilize the existing footprint of Charlie Barracks for replacement housing at Midway Atoll.

**Activity CFO-3.4:** Rehabilitate "Officers Row" Housing at Midway Atoll.

**Strategy CFO-4:** Meet fuel requirements for aircraft, vessel, utility, and equipment needs at Midway Atoll to support operations to protect and manage Monument resources.

**Activity CFO-4.1:** Maintain recently replaced fuel farm at Midway Atoll.

**Activity CFO-4.2:** Develop biodiesel fuel capacity or other sustainable fuel types at Midway Atoll within 2 years.

**Strategy CFO-5:** Rehabilitate critical utility systems and ailing structures and facilities at Midway Atoll within 5 to 15 years.

**Activity CFO-5.1:** Rehabilitate water catchment and distribution system.

**Activity CFO-5.2:** Rehabilitate septic and wastewater systems.

**Activity CFO-5.3:** Treat all wooden historic structures at Midway Atoll for termites.

**Activity CFO-5.4:** Evaluate and optimize food services as necessary.

**Activity CFO-5.5:** Rehabilitate seaplane hangar.

**Activity CFO-5.6:** Repair inner harbor sea wall.

**Strategy CFO-6:** Within 5 years, improve the small boat operational capacity to enable quick, reliable access to the region in support of protection and management and continue to enhance the program throughout the life of the plan.

**Activity CFO-6.1:** Inventory, maintain, and coordinate the use of small boats and related field resources.

**Activity CFO-6.2:** Within 2 years, station additional vessels at Midway for use during the summer marine research field season.

**Activity CFO-6.3:** Within 5 to 10 years, station a small research/enforcement vessel at Midway Atoll.

**Activity CFO-6.4:** Construct new finger piers inside of Midway's inner harbor.

**Activity CFO-6.5:** Redevelop existing boathouse at Midway into a multiuse facility.

**Activity CFO-6.6:** Evaluate needed improvements to Pier No. 1 in the ship basin and the Tug Pier at Midway Atoll.

**Activity CFO-6.7:** Make needed improvements to or replace the pier at Eastern Island.

**Strategy CFO-8:** Develop a safe and comprehensive dive operations program for Monument management activities within 5 years.

**Activity CFO-8.1:** Refurbish or replace the dive recompression chamber at Midway.

**Activity CFO-8.3:** Incorporate a dive operations center into the refurbished boathouse facility at Midway.

**Strategy CFO-9:** Provide for necessary research, education, visitor, and administrative facilities that will further the protection of Monument resources across the life of the plan.

**Activity CFO-9.1:** Design a marine laboratory at Midway and develop in phases.

**Activity CFO-9.2:** Complete planning for and construct a captive care monk seal facility on Sand Island.

**Activity CFO-9.4:** Complete Phase I rehabilitation of Midway Mall and the commissary building.

**Activity CFO-9.5:** Construct airport welcome center on Sand Island within 2 years.

## **SAND ISLAND BUILDING PROGRAM**

The four guiding principles of architectural design and construction on Midway are defined as: Sustainability, Historical Integrity, Biological Integrity, and Tropical Aesthetic.

Each construction project at Midway will be considered through the lens of sustainability and a low carbon footprint, taking into account use of nontoxic, durable materials; recycling building materials; natural solar and ventilation techniques; high energy efficiency; shared facilities and infrastructure; low massing of smaller buildings in place of cumbersome 3-story structures; on-site renewable power generation, on-site water catchment, and on-site waste treatment at each building; etc.

The Historic and Primary Development Zone designates Sand Island's historic core and redevelopment area; it delineates an area that is highly significant in terms of historic development patterns. Several historic structures and features are contained within this zone. This zone indicates the primary area where development of new facilities or adaptive reuse of existing or historic structures is an appropriate activity. Reusing existing historic structures is a very high priority to protect the cultural landscape and historic structures. Reuse of existing structures or the construction of new structures will fit the historic character of Sand Island (1900s Cable House style or 1940s Albert Kahn style), and will have either no impact or a positive impact on wildlife and habitat.

Design of new or renovated buildings will also take into account the tropical building vernacular, including platform construction, peaked roofs, and overhangs.

## 5. Midway Atoll Conceptual Site Plan

### SAND ISLAND CONCEPTUAL SITE PLAN

---

Clustering development to reduce the extent of disturbance and create efficiencies in infrastructure and operations is a key recommendation. Reusing existing facilities and keeping the building program within the “Historic Zone” is another sustainability strategy in that it reduces the requirement to extend utilities, roads, equipment, and resources across the island.

With the limited window for construction and the likelihood that any construction will have to be tightly contained with limited areas for staging because of albatross habitat, the need for quality premanufactured, component construction would be desirable. This is not to be confused with mobile trailer type construction, which is contrary to the building guidelines that gained general acceptance with the client group.

Performance Standards for New Construction should be applied, as follows:

1. Energy-Efficiency Measures—Areas for Energy Savings:
  - Conservation through Building Design: Reduce Energy Consumption
  - Insulated building envelope, possibly “green roofs”
  - Weatherproofing
    - Airtight seals at windows and doors
  - Energy-efficient window glazing (Low-E)
  - Optimize daylighting strategies
  - Optimize natural ventilation strategies
  - Economize heating/cooling system
  - Energy-efficient equipment and appliances
    - Energy Star rated
2. Landscape and Site Design
  - Wind protection
    - Native landscape plantings clustered around buildings
    - Earthen berms to provide wind protection
  - Solar orientation

3. Alternative Energy Systems

- Solar hot water heater
- Full photovoltaic system
- Fuel cells
  - Powered by hydrogen generated from electrolysis
  - Only if system does not impact local coral reef ecosystems

#### STRATEGIES TO ADDRESS SEA LEVEL RISE AND CLIMATE CHANGE

Midway power currently relies entirely on fossil fuel. Alternative energy systems should be explored, such as solar power, hydrogen fuel cells, or water-powered micro-turbines. Further study is required to measure the benefits of these alternative energy methods and their potential impacts to wildlife, birds, and marine systems. A goal for Sand Island is to have a plan in place within 15 years for alternative energy system(s) such as solar to replace the current power generation.

Midway’s islands will be affected by sea level rise through loss of land and higher spring tides, therefore restoration activities should be focused on the highest elevational areas and the original footprints of the islands. One possible mitigation measure to counter the effects of sea level rise in the NWHI may be beach nourishment, whereby sand is strategically deposited onto beaches (Baker et al. 2006).

Selective removal of rip-rap and bulkheads to restore natural beach deposition processes and shoreline habitat is one strategy that has successfully been applied to marine shorelines. It is recommended that a shoreline restoration/stabilization study be performed within the next 5 years. Careful study is required to assess the current condition of seawalls, and to determine which seawalls need to be retained to protect the structures and landfill behind them, and which shoreline sections may be restored to a natural beach condition.

Managing a significant portion of the atoll as native grass and shrublands and a smaller portion of the atoll as ironwood will not only be beneficial to seabirds for breeding and resting habitat but will also demonstrate a commitment for carbon sequestering whenever possible (Conant et al. 2001; Shan et al. 2001).

Acquisition of a new airplane and small research vessel would enable fewer overall trips and increased transportation efficiency. Vessels should also be fueled by appropriately sourced biodiesel or other fuels if possible.

### **SAND ISLAND BUILDING PROGRAM WITHIN CORE HISTORIC/DEVELOPMENT ZONE** **Lodging**

The Planning Team evaluated visitor capacity, visitor type, and length of stay in considering lodging needs. The maximum total population for any given overnight is set for 150 people. Short-term lodging is required for visitors, researchers, agency staff, and others who stay on Sand Island from 1 night to 2 weeks. Longer-term lodging is required for volunteers, staff, researchers, and others who stay on the island on a seasonal or permanent basis from 2 weeks to year-round. Additionally, emergency overnight lodging may be required due to the island's remoteness and isolation.

Given the varying lodging needs, the Planning Team identified a range in housing facility types to accommodate these diverse visitors while maximizing the existing structures and minimizing development impacts. Refer to Summary Table for details on housing units and visitor capacity. Housing facilities will

*Cable House architectural vernacular may be applied to new lodging design*

*Energy efficient and smaller scale multiplex units will replace BOQ barracks*

*Officers' Quarters rehabilitated as residences*

comply with accessibility requirements included within the Rehabilitation Act of 1973 (as amended), Section 504 and 508; and the Architectural Barriers Act (ABA) of 1968. The lodging types are as follows:

**Officers' Quarters**—Reuse eight historic officers' quarters as residences (approximately 1,600 sf each) for visitors, seasonal, or permanent staff. Convert one building into a bunkhouse with limited amenities to accommodate overnight visitors. The bunkhouse could accommodate about 14 people.

**Duplexes**—Repair and maintain existing duplexes (approximately 900 sf per unit). Duplexes can accommodate about 11 people, generally seasonal or permanent staff.

**2-Story Cable-Style Units**—Construct module units in place of Charlie and Bravo Barracks. Make structural repairs to Charlie Barracks immediately, and replace within 15 years. Replace Bravo Barracks by year 2010. New module structures will be constructed on existing pads, but designed in smaller units. The possibility of constructing buildings on pilings to allow better flow of wildlife and habitat and higher energy efficiency will be evaluated. These units will primarily house short-term visitors, researchers, and staff, but could easily accommodate seasonal or permanent staff and volunteers as well. Space and capacity: 12' x 24' units at 330 sf will house 48–56 people.

**8-plex 1 or 2-story Units**—Construct 1- or 2-story 8-plex units in place of BEQ Barracks 1 and 2. New module structures will be constructed on existing pads,

## 5. Midway Atoll Conceptual Site Plan

### SAND ISLAND CONCEPTUAL SITE PLAN

but designed in smaller units and potentially on pilings to allow better flow of wildlife and habitat, and higher energy efficiency. These units will primarily house seasonal or permanent staff. Space and capacity: 12' x 25' units at 340 sf will house 48–96 people, depending on whether the structure is a single- or double-story building.

**Low-Impact Shelters**—As an optional short-term shelter type, construct clusters of low-impact shelters on existing concrete pads or on pads of demolished buildings within the residential district. Potential sites will be evaluated to rule out conflict with wildlife. These shelters will incorporate the design principles of Pacific Island regional architecture, e.g., simple structures, durable, nonpolluting and/or recycled materials, etc. These shelters will not be air-conditioned spaces. Natural ventilation, cooling, and weather protection will be designed into the structures. The footprint of each structure will be <200 square feet. These units will provide lodgings for ecotourists, visitors staying less than 1–2 nights, or emergency guests, and will demonstrate sustainable design principles. A pilot low impact structure/shelter will be developed within 4 years to determine the feasibility of such a design. The pilot will be constructed within the Sand Island housing zone.

**Emergency Shelter**—The existing gymnasium could be used for emergency shelter. Repairs to the gymnasium are required, e.g., roof replacement.

#### OTHER SAND ISLAND BUILDINGS

**Cable Station Buildings**—Most of these early 1900s structures are in extremely derelict condition and pose hazards to birds, wildlife, and humans. However, they are critical to telling the early Midway story related to the Commercial Pacific Cable Company period. FWS Cultural Resources staff has assessed these structures and their recommendations are incorporated into a proposal to the State Historic Preservation Office. All but one structure (#643) would be partially dismantled due to safety issues for people and wildlife. Building materials would be removed and recycled, as well as hazardous paint and materials, yet the structures' remnants would remain in place for the preservation and

interpretation of the historic landscape. Further assessment is required to determine the exact extent and methods for deconstruction. Building #643 would be stabilized and repaired to a level where the structure does not pose safety or toxicity hazards, and could be interpreted.

**Seaplane Hangar**—Repair of the roof is required to maintain the current structure. The Seaplane Hangar will be rehabilitated to the extent feasible to achieve functions of storage and potential military display. For example, the glass façade may be replaced.

**Military Historic Structures**—Several World War II-era structures still exist that historically were and still are part of island maintenance and operations. These include, among others, the Paint Shop, the Metal Shop, and the Carpentry Shop. These structures require repair and maintenance to protect the historic integrity of the buildings, and to remove hazardous materials, such as lead-based paint and asbestos, that pose threats to wildlife and humans.

#### VISITOR SERVICES AND FACILITIES

**Midway Atoll Visitor Center**—The Midway Mall will be rehabilitated and reused as the hub of Midway Atoll. It will become a multifunctional building, including visitor center, educational facilities and classrooms, museum/library, agency offices, and partner offices. Designed by 1940s industrial architect Albert Kahn, Midway Mall offers a lot of character and interest, and has a large amount of space to accommodate diverse activities. Its strategic location in the core historic/development area and easy access for Sand Island visitors are also positive features.

Midway Atoll Visitor Center: hub of agency offices, educational facilities, and visitor services

**Visitor Welcome Centers**—Welcome centers are required at the Inner Harbor and at Henderson Airfield, to greet, orient, and stage visitors arriving by boat or airplane. These centers will be modest, possibly open-air structures that would likely include interpretive exhibits.

Additionally, the Monument Management Plan and Visitor Services Action Plan recommend the following strategies and activities (see section 3.4.3, **Midway Atoll Visitor Services Action Plan (VS)**):

**Strategy VS-1:** Implement the Midway Atoll Visitor Services Plan, providing visitor opportunities for up to 50 overnight guests at any one time.

**Activity VS-1.1:** Provide visitors with opportunities for wildlife-dependent recreation to enhance their knowledge and appreciation of the Monument's natural resources.

**Activity VS-1.2:** Provide visitors with opportunities to learn about and appreciate the Monument's cultural and historic resources.

*Clipper House*

*Captain Brooks*

## FOOD SERVICES

**Clipper House**—The Clipper House presently serves as the primary food service facility for Midway. Overall food services will need to be expanded to accommodate future population increases and enlargement of the Clipper House, reuse of older existing food service facilities, or construction of a new dining facility will be evaluated.

**All Hands Club**—Structure will be reused for agency operations and management due to its proximity to Midway Mall. Alternatively, the existing structure will be demolished and the area restored for habitat. Current functions will be moved to other facilities, e.g., the Galley building or Captain Brooks.

**Captain Brooks**—Will be maintained as is.

**Galley Building**—Galley Building will be reused as gift shop, snack bar, and Internet service for both visitors and staff. The rear half of the structure is in poor condition and will be demolished.

**Hydroponic Greenhouse**—Hydroponic greenhouse is used for growing produce so that Midway is more self-sufficient in terms of food production.

*Sand Island transportation: foot, cart, or bicycle*

## 5. Midway Atoll Conceptual Site Plan

### AGENCY RESEARCH AND OPERATIONS FACILITIES CONCEPT

---

**Midway Mall**—Co-Trustee offices and other partner facilities move into Midway Mall, which will also provide visitor services, classrooms, and other functions. Midway Mall is the hub of agency operations on Midway Atoll and field operations in the northern part of Papahānaumokuākea Marine National Monument. The primary hub of operations for NWHI is based in Honolulu FWS, NOAA, and State offices.

**Fish and Wildlife Services Office**—FWS office retained for additional office facilities.

**Marine Laboratory**—Wet lab, dry lab, refrigeration, quarantine, and office space will be integrated into a Marine Laboratory building. The Old Commissary Building's proximity to Midway Mall suggests reuse of the building for agency research or biological programs. However, several buildings will be evaluated for this purpose.

**Monk Seal Captive Care Facility**—NOAA has expressed interest in creating a new Monk Seal Captive Care Facility on Sand Island. A suggested location for this facility is near the Inner Harbor on existing asphalt pad. This location is close to water, transportation, and the agency facilities housed in Midway Mall.

The following are the NMFS monk seal research program facilities needs:

#### SEAL HOLDING

- a. For the first 5 years seal holding will consist of pools sufficient to hold 10–12 seals and the potential to isolate individuals. This could be accomplished with four 20' diameter holding tanks each enclosed with dry resting area to a combined foot print of 30' x 30' for each of the four tanks.
- b. It is anticipated that after 3–5 years, twice that holding would be used.
- c. The total footprint in the first phase will be about 4,500 sq ft with an addition expandable capacity to approximate total of 8–9,000 sq ft.

#### WATER

- a. Source—1000–1200 gpm sea water for 10–12 juvenile seals.
- b. Semi-open or closed systems could be considered when conducting environmental analysis.

#### ANCILLARY STRUCTURES

- a. Fish prep—200 sq ft area will be necessary to support the 10–12 seals
- b. Freezer—seal food will depend on the potential schedule of resupply.
- c. Housing for 6 animal care personnel and 2–3 associated seal scientists/biologists

**Quarantine Facility**—required for biological species protection and recovery programs administered by FWS and/or NOAA.

**Holding Tanks**—required for biological species protection and recovery programs administered by FWS and/or NOAA.

*Midway Mall interior*

*Midway Mall reused as Midway Atoll Visitor Center*

*Monk seal*

*Chugach offices and Medical Clinic*

*Biological research is a vital Midway Atoll activity*

*Nursery pen for Laysan duck reintroduction on Sand Island*

## 5. Midway Atoll Conceptual Site Plan

### INNER HARBOR CONCEPT

The Inner Harbor area includes the historic Inner Harbor and its associated shoreline, piers, and facilities. One of two approaches to the island (by vessel or aircraft), the Inner Harbor zone is critical to visitor arrival, transportation of services and goods, and water-based activities (e.g., ecotourism via passenger vessels, marine research, rescue operations, security).

Several improvements to the Inner Harbor zone are recommended. The current seawall around the perimeter of the basin is extremely degraded and requires assessment and repair. Additionally, concrete rubble and other materials in-water near the west docking area impede vessel travel and anchoring; these materials need to be removed after determination of toxicity issues.

A new ramp and pier is proposed at or near the vicinity of the historic seaplane ramp in the west Inner Harbor area. The presently used ramp is too shallow to launch or load boats onto trailers without “floating the trailer out” beyond the launching vehicle. Further historic analysis is needed to determine if the seaplane ramp may be redesigned as a ramp suitable for boat launching, or whether it should remain in place and a new ramp and pier be constructed nearby. Additionally, a series of finger piers are needed to accommodate small or mid-sized boats.

If an additional mid-sized pier is required to separate uses (e.g., operations versus visitors), a second pier could potentially be sited in the inner harbor.

Further analysis will be necessary to finalize the location of any new infrastructure in the inner harbor.

The existing boathouse is periodically flooded by surface flows across the large asphalt surface. The structure will be resited further upland and possibly elevated on the existing concrete pad and reconstructed as a new boathouse/dive center to meet interagency needs. The boathouse will include a dive center, storage for marine-associated equipment, and potentially a temporary bunkhouse space for short-term use and limited interim lab space until other facilities are renovated or reconstructed.

A small welcome kiosk may be appropriate onshore in the Inner Harbor in the northwest corner of the Inner Harbor to greet and orient visitors arriving by water. Paths and circulation routes to the Midway Atoll Visitor Center will be clearly delineated along existing or historic routes.

Visitor arrival by boat

Inner Harbor seawall

new FWS boat

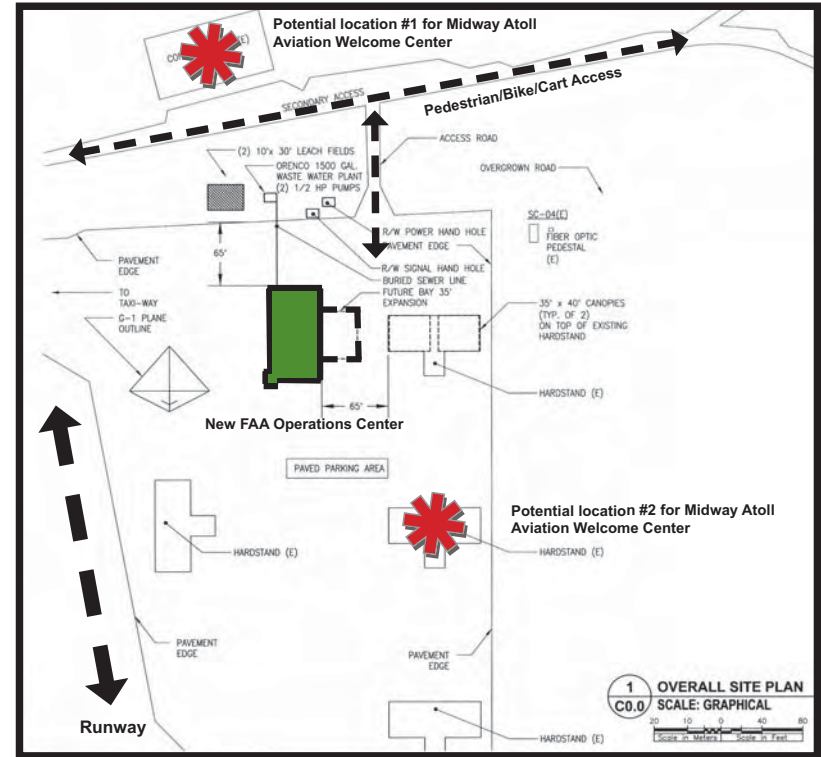

**INNER HARBOR CONCEPTUAL PLAN**  
**MIDWAY ATOLL CONCEPTUAL SITE PLANNING**

# 5. Midway Atoll Conceptual Site Plan

## AIRPORT WELCOME CENTER CONCEPT

The Airfield Operations Zone on Sand Island includes the runway and the new Henderson Airfield operations center. One of two approaches to the island (by boat or aircraft), the Airfield Operations zone is critical to visitor arrival, transportation of services and goods, and aviation activities (ecotourism via air travel, research, emergency operations, security).

A new small Welcome Center will be appropriate to greet and orient visitors arriving by airplane. While the new operations center is now in place, there is no shelter to gather or greet visitors. Preliminary concepts for a Welcome Center indicate two potential locations that may be appropriate to build this facility. The proposed alternatives locate the structure on existing concrete or asphalt pads that are in close proximity to existing circulation routes but avoid conflict with airplane operations. Further analysis and coordination with FAA and Midway operations will be necessary to finalize the location of the Welcome Center.

Midway Atoll Aviation Node

Visitor arrival on Sand Island is a big event

## Priority Actions and Next Steps

## 6. Priority Actions and Next Steps

### PRIORITIZATION AND IMPLEMENTATION

This Plan provides long-term guidance for management decisions at Midway, including best estimates of future needs and project activities. These estimates are substantially above current construction budget allocations, and are included primarily for strategic planning and program prioritization purposes, although they also serve to make the public aware of the costs of possible actions. This plan does not constitute a commitment of funds, or a commitment to request funds, by Federal or State agencies. All funding for actions included here is subject to the budgeting and appropriations processes.

The following narrative provides a preliminary framework for beginning to organize actions in terms of implementation schedule. Agency partners will work together to identify project priorities, roles and responsibilities, potential funding sources, and comply with appropriate environmental assessment requirements. These projects are important to support Monument operations as a whole, benefiting all of the agencies involved with its management.

#### ANNUAL MAINTENANCE

Through the Base Operations and Support Services (BOSS) contract for operation of Midway, FWS and the Federal Aviation Administration (FAA) fund routine cyclical preventive maintenance and minor repairs of equipment and facilities. Larger maintenance projects, such as roofing replacement, are also routinely completed as an addition to the contract. Both FWS and FAA add funds for routine maintenance projects that are over and above the scope of the BOSS contract.

These two funding sources allow for required maintenance work to be completed over the course of a year to both historic and nonhistoric buildings and facilities. This ongoing program will continue throughout the life of the plan to ensure that Midway's infrastructure is maintained in the best possible condition within available funding.

Larger, more expensive projects are either:

- a) Developed and put into the Service's database for Deferred Maintenance projects for which the Service receives an annual appropriation from Congress. Midway's extensive infrastructure needs have provided justification for those larger Midway projects and their resultant funding. This has allowed the Service to systematically work toward reducing the large maintenance backlog at Midway, and it is anticipated that this level of support will continue throughout the life of this plan.
- b) Funded by the FAA's Airport Capitol Improvement Program. Funding is provided to the FWS to support the design and construction of new airfield infrastructure (Airport Operations Building), or the improvement of existing facilities (resurfacing the runway).

#### HISTORIC RESOURCES

Maintenance of many of Midway's significant historic buildings and facilities is included in the BOSS contract described above and as such is ongoing. However, it does not include all the historic elements as described in the Historic Preservation Plan, which makes maintenance of those elements outside the scope of the contract and a management challenge for the Service. As outlined in the Monument Management Plan (Section 3.1.3 Historic Resources Action Plan), the Historic Preservation Plan will be rewritten

within the next year to be consistent with this Conceptual Site Plan and reflect the Service's commitment to reuse as many of Midway's historic buildings as possible to meet the Monument's and Refuge's needs at Midway. To maintain those buildings, structures, and facilities, additional funding must be found. The Service will work with other federal agencies, private organizations, veterans' groups, and others to find the support needed to maintain these important aspects of Midway's history.

### **PRIORITY MAINTENANCE/CONSTRUCTION PROJECTS AT MIDWAY ATOLL**

#### ***Design and Construct Airport Welcome Center on Sand Island***

\$500,000 — 2 years

A small passenger terminal/welcome facility will be constructed at the airport to handle passenger arrival and departures from Midway. This simple facility will offer restrooms, baggage handling, information, and a waiting area for staging passengers out of the weather.

#### ***Develop Biodiesel Fuel Capacity or Other Sustainable Fuel Types***

\$750,000 — 2 years

In an effort to advance the use of sustainable technologies at Midway, small boats, vehicles, and heavy equipment will be evaluated and, where feasible, transitioned to the use of biodiesel. This fuel could be stored on the existing concrete pad along the north wall of the inner harbor. Alternatively tanks could be located near the newly constructed fuel farm on the southwest corner of the inner harbor.

#### ***Utilize Existing Footprint of Bravo Barracks for Replacement Housing***

\$10 million — 3 years

Demolition costs for existing building must be included in construction cost. Bravo Barracks replacement is essential in order to provide safe housing for permanent island residents and transients working on future maintenance/construction projects.

#### ***Complete Phase I Rehabilitation of the Commissary Building and Midway Mall***

\$2 million — 3 years

Collectively the commissary building and the Midway Mall present ideal central locations for Co Trustee and partner office, classroom, storage, and basic laboratory space. Phase I rehabilitation of the commissary will include cleaning and maintenance, construction of office and classroom space, and a feasibility study of how best to incorporate solar power and other sustainable design principles. The Midway Mall will require more substantial design and a preservation plan for renovation to provide basic office and storage space along with visitor information.

#### ***Design and Construct a Pilot Low Impact Shelter***

\$1.3 million — 4 years

Construct a low impact shelter for short term housing in the housing zone. The housing will be constructed as a sustainable design pilot project intended to showcase the synergistic potential of innovative design on the island. The design may elevate the building off the ground, providing for human habitation while increasing the total amount of available wildlife habitat, and providing environmental security from tsunamis and storm surges. This structure will incorporate

## 6. Priority Actions and Next Steps

### PRIORITIZATION AND IMPLEMENTATION

Pacific Island regional design principles to consider local wind and sunlight patterns, will aim to be nonpolluting, and will incorporate recycled materials. The use of solar power, composting toilets, and, if needed, a small rain catchment system will be explored in an effort to sustain the building off the power grid and minimize wildlife impacts.

#### **Treat All Wooden Historic Structures for Termites**

\$2 million — 5 years

By treating all wooden/historic structures immediately we buy ourselves 5–10 more years to find funding for ultimate rehabilitation/restoration. Without treatment these structures either need to be rehabilitated immediately or abandoned forever.

*Metal pillbox, Eastern Island*

#### **Rehabilitate Water Catchment/Distribution System**

\$3 million — 5 years

Reliable water will be required to support any future build-up.

#### **Rehabilitate Septic/Wastewater Systems**

\$2 million — 5 years

Reliable septic/wastewater systems will be required to support any future build-up. To reduce the required capacity and cost of the system, on-site composting and waste reduction will be considered.

#### **Redevelop Existing Boathouse into New Boathouse, Dive Center, and Water-based Storage Facilities**

\$1.5 million — 5 years

Redevelop the existing boathouse at Midway into a multipurpose boathouse, dive center, and storage facility to support agency operations in the northwestern end of the Monument. The facility will have

maintenance bays and equipment for servicing small boats; a dive locker including a compressor, recompression chamber; and appropriate storage and work areas. The dive center may also support the visitor program. The building will be re-sited or reconstructed and potentially raised to address concerns of flooding on the seaplane pad.

#### **Rehabilitate/Replace Finger Piers along the Inner Harbor**

\$450,000 — 5 years

To meet small boat needs, within 5 years construct/rehabilitate three finger piers. These piers may be used for fueling, loading, and short-term in-water storage of vessels. These vessels will be used to support programs at Midway and neighboring atolls in the future.

#### **Design a Marine Laboratory and Develop in Phases**

\$2.25 million — 5 years

A variety of needs will be met by a marine laboratory at Midway. An evaluation and planning effort will help determine if the research and educational needs of potential users will be best met by developing several small facilities over time, or by a modular design that allows new requirements to be filled as they arise. Initially the lab would provide basic amenities to augment research and education capacity including field schools, seasonal research, and long-term monitoring. Wet/dry lab infrastructure, quarantine standards, and possibly freezer space will be included in the plan. Several locations are well-suited for a small laboratory, including the old commissary building adjacent to the Midway Mall, as well as several sites on the seaplane apron. The commissary building may be ideal for a first phase location and could help support the Hawaiian monk seal captive care program.

*Green turtle on Eastern Island*

### ***Complete Full Rehabilitation of Midway Mall***

\$8 million — 10 years

Midway Mall would be rehabilitated as the “Midway Atoll Visitor Center” and would be used as Co-trustee office space and for other potential partner personnel, as well as a hub for visitor services, classrooms, and education. Phase I rehabilitation would allow for agency offices and be completed within 3 years.

### ***Rehabilitate Officers’ Row Housing***

\$5 million — 10 years

The 10 historic Officers’ row houses serve as examples of historic Albert Kahn architecture and will be restored. This increased housing capacity will accommodate increased agency and partner personnel.

### ***Remodel or Replace Clipper House***

\$1.75 million — 10 years

The Clipper House presently serves as the primary food service facility for Midway. Overall food services will need to be expanded to accommodate future population increases and enlargement of the Clipper House, reuse of older existing food service facilities, or construction of a new dining facility will be evaluated.

### ***Rehabilitate Seaplane Hangar***

\$2.5 million — 10 years

Due to its size (large enough to hold heavy equipment, boats, workshops, etc.), its location (short distance from inner harbor and boat ramp) and its historic significance (designed by Albert Kahn, still contains scars from the Battle of Midway), this building needs to be utilized and preserved. Rehabilitation work will be guided by a detailed preservation plan.

### ***Utilize Existing Footprint of Charlie Barracks for Replacement Housing***

\$10 million — 10 years

Charlie Barracks replacement is essential in order to provide safe housing for island visitors and transient personnel. Demolition costs for the existing building must be included in the construction cost. This replacement is expected to take place within 10 years.

### ***Repair Inner Harbor Sea Wall***

\$20 million — 15 years

The harbor is critical to operations at Midway. Any future expansion of docking/pier facilities in the harbor must be preceded by the repair of the existing sea wall.

## 6. Priority Actions and Next Steps

### PRIORITIZATION AND IMPLEMENTATION

---

#### REQUIREMENTS PLANNING PROCESS

Many of the priority projects listed above are the result of a Monument-wide field requirements planning process that took place in the fall of 2007. The goals of this process were to outline general infrastructure requirements within the Monument by matching projected field requirements with priority management needs. During this process the Monument Management Board analyzed current and future management needs and projected personnel, infrastructure, and equipment requirements to meet them. In addition, efforts were made to identify areas of overlap that could be consolidated to make field operations as efficient as possible.

The results of this process constitute a detailed vision of the long-term field requirements, primarily for Midway and neighboring atolls, but also for the Monument as a whole. These detailed requirements must have the appropriate infrastructure such as buildings, power, and water; as well as associated means of transportation, such as vessels and aircraft. The priority maintenance and construction projects listed above along with the activities in the Monument Management Plan's section 3.6.3, Coordinated Field Operations Action Plan, will support these requirements over the next 15 years.

Specific field requirements that were identified during the field requirements planning process include increases in visiting and permanently stationed personnel to oversee regular research, education, cultural, historic, management, and protected species work based out of Midway, but servicing neighboring atolls as well. Activities associated with this work will be phased in over time as the attendant infrastructure and modes of transport are developed in a way that is compatible with resource protection. The small boat and diving assets, supply needs, air transport, laboratory facilities, housing, and visitor outreach needs that were coarsely defined during the requirements process have been refined in the Midway Conceptual Site Plan and will be thoroughly evaluated and acted upon based on the strategies and activities found in the Monument Management Plan.

#### ASSESSMENT OF MIDWAY CONCEPTUAL SITE PLAN DURING THE MANAGEMENT PLAN 5-YEAR REVIEW

The Monument Management Plan will be reviewed every 5 years. The review represents an essential element of the adaptive management process and includes public involvement, characterization of issues, and review and evaluation of action plans. The Midway Atoll Conceptual Site Plan is part of the Monument Management Plan and will be assessed as part of this broader five-year plan review, or as needed, to determine if changes need to be made to this 15-year conceptual plan. This will also provide an opportunity to review the Midway Conceptual Site Plan after other site plans (i.e., Tern Island, Kure Atoll) are developed.

#### SUMMARY

Several other high-priority projects (habitat, cleanup, and visitor services projects) have been identified for Midway Atoll during the process of developing this Conceptual Site Plan and the larger Monument Management Plan. For detailed information on these projects, please refer to the appropriate Actions Plans contained in the Monument Management Plan.

As the Monument Management Board and partners work toward implementation of the Monument Management Plan, it is important for all parties to find ways to make incremental steps that will lead toward the many larger projects described in this document and the Plan. By working together and combining resources to achieve common goals, agencies and partners can realize the benefits and synergy that come from people working together. This Conceptual Site Plan offers an achievable view of Midway's future considering the resources that already exist and those that hopefully will be available in the future. The vision of Midway as presented in this plan is something that can be completed within the next 15 years—it will be a challenge and an opportunity for all involved to be a part of that transformation.

# PUBLIC COMMENTS AND RESPONSES

## INTRODUCTION

In accordance with the National Environmental Policy Act (NEPA) of 1969 and Hawaii Revised Statutes (HRS) Chapter 343 Environmental Impact Statement Law, this final environmental assessment provides responses to comments on the four volume draft document, which included the Monument Management Plan, its associated compliance documents and the environmental assessment (EA). In compliance with those regulations, Volume V of the final document includes a list of agencies, organizations, and individuals commenting on the Draft EA (DEA), copies of their comments, and responses to the substantive environmental issues raised in the comments.

The DEA for the implementation of the Papahānaumokuākea Marine National Monument Management Plan in the Northwestern Hawaiian Islands was circulated for public review and comment from April 23, 2008, to July 23, 2008. Public meetings were held during the review period to provide the public with the opportunity to ask questions about the project and to comment on the DEA. As summarized in Table 1, a total of ten meetings were held on six different Hawaiian islands and in Washington, DC, as follows: three meetings on O‘ahu, two meetings on the Island of Hawai‘i, and one meeting each on Maui, Lāna‘i, Moloka‘i, and Kaua‘i and in Washington, DC. With a grand total of 231 people attending the public meetings, 87 individuals provided public testimony. Comments given at these public meetings were recorded in transcripts taken by court reporters.

<b>Date</b>	<b>Location</b>	<b>Number of Attendees</b>	<b>Number of Speakers</b>

---------------	--	----	----

In addition to comments received at public meetings, written comments were accepted via e-mails, individual letters, and form letters throughout the review period. A total of 6,347 written comments were received. Table 2 shows a breakdown of the written comments received.

<b>Table 2</b>	
<b>Other Comments</b>	
E-mails	74
Letters	27
Form letters/e-mail	6,246
Total	6,347

The following pages show comments received that relate to the four-volume Monument Management Plan/EA and the Monument Management Board's (MMB) responses to those comments. The MMB reviewed and considered all comments and determined whether or not they were substantive and warranted further analysis and documentation. While the MMB greatly appreciates the participation of all those who commented, not all comments required further analysis or changes to the Final EA. The MMB noted in the individual responses when further analysis or changes were made.

#### **COMMENT RESPONSE**

This section contains comments made by individuals and the respective MMB responses. Based on their content, comments are organized with regard to the comment categories. Within comment categories, comments were further organized into summarized comments and unique comments. Summaries of some comments were developed, where several individual comments expressed the same concern. The response to these summarized comments received the same response. Other comments were grouped. These grouped comments are numbered within the table and then received a response that applies to all of the comments in the group. Unique comments were comments which were not similar to other comments received and merited unique responses. In addition, some comments that we received were not relevant to the MMP (i.e. comments about past DoD NEPA documents, activities that occur outside the Monument), such comments are not included here.

<b>Comment Category 1 - Advisory Body/Public Involvement</b>	
<b>Summarized Comments</b>	
1-01. Comment	<p>Many comments were received stating that the Monument should establish some sort of citizen-based advisory body to ensure continued public participation in the management of the Monument. The comments provided many different ideas and descriptions for various types of public advisory bodies and offered in-depth suggestions relating to member representation, composition, roles, and responsibilities.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) I support full public participation in the management of our public trust resources. Please establish a citizen’s advisory council.</li> <li>2) To maintain a transparent and accountable decision-making process, the meetings of the MMB must be open to public participation and scrutiny. We strongly advocate that the MMB include public representatives and the meeting themselves be open to the public, including public comment and access to meeting minutes.</li> <li>3) The DMMP fails to establish a meaningful form of citizen advisory body. The DMMP must include a public Monument Advisory Council (“MAC”), which operates under sunshine laws, and includes Native Hawaiians, representatives of the conservation community who have been active in NWHI protections, independent scientists not affiliated with or employed by the Trustees or “Trustee partners” and independent educators as voting members of the council. Additionally, the placement of at least two members of the MAC on the Monument Management Board (“MMB”), by amendment to the Memorandum of Understanding (“MOU”) would ensure public oversight and participation in management decisions.</li> <li>4) The DMMP must include a public Monument Advisory Council, which operates under sunshine laws, and includes Native Hawaiians, representatives of the conservation community who have been active in NWHI protections, independent scientists not affiliated with or employed by the Trustees or “Trustee partners” and independent educators as voting members of the council. Outlined below are proposed terms of membership based in large part on the membership requirements of the current Reserve Advisory Council (RAC): 1. 3 Native Hawaiian representatives, including one elder, with experience or knowledge regarding Native Hawaiian subsistence, cultural, religious, or other activities in the Northwestern Hawaiian Islands 2. 3 representatives from the non-federal science community with experience specific to the NWHI and with experience in at least one of the following areas: marine mammal science, coral reef ecology, native marine flora and fauna of the Hawaiian Islands, oceanography 3. 3 representatives from non-governmental wildlife/marine life, environmental, and/or conservation organizations 4. one citizen at large representative.</li> <li>5) The Papahānaumokuākea Marine National Monument is a treasure belonging to all Hawaiians and the Nation. I</li> </ol>

**Comment Category 1 - Advisory Body/Public Involvement**

am very concerned that you have failed to build an advisory body, similar to the Research Advisory Council, and a robust public-comment process into the management plan. The public and stakeholders must be given the opportunity to provide input to and review of the management of the monument if it is truly going to be the nation's Monument.

- 6) Please establish a citizen's advisory council
- 7) Please let the concerned public have participation in the decisions of our beloved marine ecosystem and wildlife!!! Mahalo nui loa!
- 8) Then I have assorted concerns I'll go through. One is I tried to understand all the ins and outs but I kind of gave up. Basically I think in the management of the Monument there should be Native Hawaiians and there should be citizens involved. A long time ago I worked on a disability committee, a state committee. The agency staff and the citizens had equal standing on the committee. So there were folks with disabilities there. The agency staff would come and say, "Oh, we've got this wonderful program and it's doing this and that." And a person with disabilities would speak up and say, "Hey, you know what? By the time your program gets down to me this is what actually happens in the real world." I think with that involvement of the people who are being affected and the people that know what's going on who have a totally different perspective is really valuable. Let's see. A lot of my comments are from KAHEA, the Hawaiian Environmental Alliance. And they felt that the vision of the plan should include perpetuating Hawaiian culture. And I agree with that. That should be there from the get-go, from the top down.
- 9) And I strongly object to watering down any public or citizen-based or participation in decision-making. In fact the public should be involved for both advice and consent just like the congress does, not just "Here's our mana'o" and the agencies can choose to follow it or not. It's very important that Native Hawaiians and the public be included because they're the right-holders. They're not the stakeholders. They're the right-holders.
- 10) There was enthusiastic and widespread public participation and informed comment during the preparation of the former Draft Plan lead by an effective Reserve Advisory Council composed of representatives of all of the stakeholders generated solid support, as the public "bought in" to the evolving Plan. Withdrawal of the Department of Commerce to draft a substantially different new plan behind closed doors, for two years absent any public or agency input or oversight, and the virtual disbanding of RAC, turned public support to suspicion and guaranteed that the new Management plan would be greeted by a solid phalanx of critics (9). By spurning all advice, this tactic repels all help, especially now, when help is crucial to acceptance. Restoration of the Reserve Advisory Council, with provision for meaningful input into all aspects of Monument planning, permitting, activities and regulation, and maximum transparency of all Monument activities, is essential to regaining

**Comment Category 1 - Advisory Body/Public Involvement**

credibility, political support and future funding. The Proclamation mandates and the Management Plan recognizes the need for transparency and public involvement in planning process and rule making, and yet NOAA suspended RAC oversight and public scrutiny while drafting this Plan, and has no plan for reactivation of RAC or a Monument Advisory Council.

- 11) There should be a citizen-based public commission/council comprised of a cross-section of the public and government representatives, a member from each main Hawaiian island, an educator, a member of OHA, an artist, writer, a journalist, and fishermen all to be members of this commission with legal authority to grant all permits.
- 12) Also an independent citizen-based advisory council should be involved in decisions including all permitting.
- 13) There is an obligation to ensure that the public is informed and able to participate in decision-making about the management of the Monument. Throughout the Management Plan there is a commitment to keep the public informed of activities affecting the Monument. It is important that there is meaningful public participation with adequate notice and opportunity for comment. At present, management decisions, including permit processing, are decided by a board. Board meetings should be open and accountable to the public and board members should be guided by strict conflict of interest standards. Additionally, permit applications should be announced in the Federal Register and the public given an opportunity to comment prior to any authorizations. To ensure the protection of the Monument's sensitive wildlife and habitat, it is vitally important that the permit process be subject to public and environmental review.
- 14) I think having a public participation and, you know, people from various sectors being involved in the ongoing management in the sense of giving comments or recommendations is really important. If there is some way of having an advisory council that is collaborative of all the agencies, not just one, I think that would be something that can worth pursuing.
- 15) I'd like to echo the calls for having a Monument Advisory Council. I believe the Council has to be citizen based. The council has to be full participation, has to advise all three agencies. We respect the idea of Friends of the Monument which it's a great idea. It's a great idea it doesn't take the place of something that provides oversight for legal authority, legal responsibility. The only thing I would ask in commenting on the state's draft is make enhancements, meeting fairly regularly. Something that meets once a year is not sufficient, needs to meet far more often, quarterly at the least. Part of that should also include the opportunity for members of the advisory council to attend the Monument nature board meetings. Sort of close the loop of public transparency. Ensure there's oversight, and accountability in every decision that's made.

**Comment Category 1 - Advisory Body/Public Involvement**

- 16) I think it's going to be a real challenge to figure out whether you want an advisory, and in what capacity, and who individuals would change in that position. But it's really critical, in my opinion, if you have both the well-informed advice from a variety of folks, but you also have an opportunity for people to show their appreciation and interest in the area as friends groups do so effectively in refuge system and the parks system and other places. I think a friends group at Midway is a good example of people who have really come together to exercise their support for that.
- 17) So I thank everybody for, you know, coming out and allowing the public process. And yes, like Dave Rainey said, we did want a national-monument status, though some kind of an advisory body should have been incorporated.
- 18) The Draft Management Plan does not meet the public's long-standing demand that the management of the Northwestern Hawaiian Islands empower Hawaiian decision-makers to protect Hawai'i's public trust resources for generations to come. This plan closes the door on meaningful public participation in management decisions. Without a citizen-based Monument advisory council with the legal authority to oversee and advise on management activities, this plan will continue the same flawed system that has granted unlimited access to the Northwestern Hawaiian Islands and will dump the precautionary principle like dirty bilge water by failing to find out the total human impact in the region or assess its carrying capacity.
- 19) And you must have a community advisory team working side-by-side with you so that we can know that this area is really being protected and not just going to be rubber stamped.
- 20) We fully support a Monument Advisory Council as an effective means of meeting the unique public participation issues related to the Monument.
- 21) First of all, we also strongly support the establishment of a Monument Advisory Council similar to the Reserve Advisory Council which is citizen based. These are citizen resources. These are public resources. And I think as good as the people are in the state and federal government they can't forget that we care about this resources and they belong to all of us. And I think, you know, tapping into the citizens' body of knowledge or expertise is really a good thing. So we'd like to see a little more citizen participation in a very formalized way such as a MAC I guess it would be instead of RAC.
- 22) There's a question here: Why can't isn't there any public involvement in this, in the Management Planning process? And it says: Well, it will just be basically, essentially too much of a hassle to allow the public involvement. That's really shocking. It's only because of public involvement you have these protections.
- 23) Fourth, I'd like to talk briefly about the Citizen Advisory Council. You know, the importance, again when we

**Comment Category 1 - Advisory Body/Public Involvement**

talk about stepping beyond administrative boundaries to, like, really be able to get together and figure out a way to have an advisory council that's both, um, has enough weight to be a true advisory body but also has enough autonomy to really reflect what the public wants in a sort of grass roots way.

- 24) I'd also like to just share a bit of an anecdote of a story that I had the opportunity to testify in Washington, DC as well. I will say this on behalf of everyone in this room this is a great turnout compared to what we had there in the public. I was the only person who testified in Washington, DC. After I was done there was a bit of a Q and A sort of session. There was a gentleman from the Ocean Conservancy that asked a question. And it points to something that has been brought up thus far by some of the other testifiers. He asked why the Reserve Advisory Council wasn't recommended to be extended in the current Management Plan. And the response from the gentlewoman from NOAA was that the intention was to have something like that. I want to applaud that idea. It was a little bit confusing because I didn't understand why it wasn't in there. She said, "Yeah, we really want to do that." I want to say please do that and create a Monument Advisory Council. And I guess I was curious why it wasn't in there in the first place. So I had concern that even though the folks who put together the Management Plan had interest in doing that and were willing to go on record to say that they wanted to see that. But I didn't understand why it wasn't in there. So that was a concern but also something that I was excited to hear that they did want to actually include that as well.
- 25) I think the Citizens Advisory Group being taken out of this is a big mistake. We need people involved, the public involved and informed because agencies have political pressures put on them. They're not completely free from those contradictions. With the public you can at least have a more independent voice that's also advocating for the resource. The Native Hawaiians constituency must also have, I think, an effective role in determining decisions about the Monument. That means not just an advisory role, not just an educational role but actually having an impact on decisions that will affect the resource.
- 26) It's also why we're asking to have the public more involved. These are public trust resources. We love the Northwestern Hawaiian Islands. It has captured people's hearts. We need to be involved. There was a point in time when the Reserve Advisory Council was more active and people were involved. We were focused on bringing the place to the people. People were engaged. But since the establishment of the Monument things have gone quiet. In the last two years you've been able to develop this Management Plan with no public input. I think it's part of the reason why it's impossible to expect that people will be able to review all of the documents that are in here. We're talking six, eight major documents in just 75 days. That's not meaningful public participation. That's why we're also asking for the establishment of a Monument Advisory Council. People have spoken eloquently to the need to have these citizen experts provide an independent oversight and advice to the

**Comment Category 1 - Advisory Body/Public Involvement**

managers.

- 27) A citizen's advisory council with voting rights and authorities is truly shared governance of the NM. Interest groups with no authorities are not effective and only serve to cloud the issue of true citizen involvement.
- 28) The citizen based advisory council must be included as a partner equally in all dealings with the public. After all, citizen participation is one of the key roots of our democratic process.
- 29) Finally, we believe that continued discourse with the public on the future of the monument is vital to its success. While we recognize that the monument staff can draw upon a number of conceptual paradigms which will encourage public input and dialogue, we feel strongly that the creation of a Friends group, with its membership open to interested and concerned citizens, represents the most effective and democratic model available. Through the creation of a Friend-style organization for the Papahānaumokuākea Marine National Monument a wide array of constituencies can be represented, including native Hawaiians, former military personnel, birders, photographers, scientists and concerned citizens from across the nation. While the Friends of Midway Atoll National Wildlife Refuge will always be a distinct entity, we encourage the creation of a Friend-like organization for the monument. We believe such an organization would have a broad scope, mandate and membership.
- 30) There must be a citizen-based public commission Council comprised of a cross section of the public and government representatives. A member from each main Hawaiian Island, an educator, a member/representative of OHA, an artist/writer, a journalist, and a fisherman all to be members of this commission with legal authority to grant all permits.
- 31) Please establish a Monument Advisory Council with the authority to oversee and advise all three co-Trustees and with the same strict conflict of interest requirements that made the original Reserve Advisory Council so successful.
- 32) Please also include 2 public seats on the currently closed Monument Management Board.
- 33) On Jan 22, 2004, the citizen based Reserve Advisory Council approved some goals and objectives that should be reinstated into this management plan. These goals and objectives were developed over years in a transparent, public, and aboveboard process. It is curious that these have been taken out. The public needs to be the major part of this process. I do not feel confident that The Secretaries of Commerce (United States military), Governor of The State of Hawaii (tourism, University of Hawaii research groups), and OHA (States interests- not Hawaiians) as trustees will put resource protection as the main priority or “primary purpose” in managing the NWHI. It is unreasonable to have us believe given their track records that these stakeholders would put

**Comment Category 1 - Advisory Body/Public Involvement**

protection before profit.

- 34) Again, clearly the mission, the goals, and the objectives that were established through an open and public process by the Reserve Advisory Council have been substantially weakened. This is the heart. This is the constitution of this protected area. If that's weakened we don't really have anything to talk about as a basis. So we need to reinstate that.
- 35) The establishment of the Papahānaumokuākea Marine National Monument was preceded by years of input from the public and stakeholder groups that identified several key principles to be incorporated into the Monument's goals. Those principles included: a. Making protection of the Northwestern Hawaiian Islands, their wildlife, and ecosystems the core and preeminent purpose of the Monument, and that all other considerations and activities must not impair this purpose; and b. Maintaining the "natural character" of the Northwestern Hawaiian Islands. I am distressed to see that these principles, and others, are not incorporated into the draft Monument Management Plan, which leaves the Northwestern Hawaiian Islands incompletely protected and open to activities that will impair their health and resilience.
- 36) The RAC is concerned that an Alliance based on the "Friends" model could end up being dominated by the larger, wealthier NGOs who can afford to travel to and attend meetings, and lobby for their particular interests as well as for funds for the Monument. However, the RAC does like the fact that the "Friends" groups often has an office within the FWS's office and its can and do communicate regularly with the FWS staff. Ultimately the RAC concluded that the advantages of an Advisory Council (AC) model outweigh those of the Friends model. Therefore, the RAC recommends that Constituency Building and Outreach Action Plan Activity CBO-3.5 be amended as follows.

Council: After considering input from the Secretary of Commerce, the Secretary of the Interior, and the Governor of the State of Hawaii, the Monument Management Board (MMB) shall establish a thirteen-member Monument Advisory Council (Council) pursuant to Proclamation 8031 of June 15, 2006 and section 315 of the National Marine Sanctuaries Act (16 U.S.C. 1445a) as amended, to provide citizen input, recommendations and assistance regarding the protection and management of the Papahānaumokuākea Marine National Monument. The Federal Advisory Committee Act (5 App. U.S.C.) shall not apply to the Council.

Functions: The Council shall: (A) review reports, plans, and permitted activities pursuant to the purposes, policies, and management requirements of the Monument, other pertinent laws, and international conventions; (B) recommend to the Secretaries, the Governor, and to other agency officials such steps as it considers necessary or desirable for the protection, conservation, and management of the natural, cultural and historical

**Comment Category 1 - Advisory Body/Public Involvement**

resources of the Monument; and (C) in cooperation with the National Oceanic and Atmospheric Administration (NOAA), the US Fish & Wildlife Service (FWS), and the State of Hawaii, recommend such measures as it considers necessary or desirable to further the purposes and policies of Presidential Proclamation 8031, Executive Orders 13178 and 13196, the National Marine Sanctuaries Act, the National Wildlife Refuge System Administration Act as amended by the National Wildlife Refuge System Improvement Act, the State of Hawaii rules establishing the Northwestern Hawaiian Islands Marine Refuge, and all other applicable laws and regulations, including provisions for the protection and exercise of the traditional cultural practices of Native Hawaiians.

Voting members: The Council shall include thirteen voting members: (A) Three Native Hawaiian representatives, including one Native Hawaiian elder with experience or knowledge regarding Native Hawaiian subsistence, cultural, and religious practices in the Northwestern Hawaiian Islands. (B) Three representatives from the science community with experience specific to the Northwestern Hawaiian Islands and with expertise in at least one of the following areas: (i) marine mammal science (ii) coral reef ecology (iii) native flora and fauna of the Hawaiian Archipelago (iv) oceanography (v) any other scientific discipline the Secretaries and the Governor determine to be appropriate (C) Three representatives from nongovernmental wildlife, marine life, environmental, or conservation organizations with a demonstrated interest in conservation and protection of Monument resources, (D) two education and outreach representatives (E) one representative from the ecotourism industry, and (F) one citizen at large. No employee of the Departments of Commerce, Interior, or the State of Hawaii shall be eligible to fill a voting seat on the Council. However, a person working under a government-supported grant or contract involving no more than 19 hours of work per week may be eligible. The RAC recommends that 13 alternates that meet the above qualifications also be appointed. The alternates shall represent constituents in their particular area of expertise, but not any particular Council member. Co-trustees and other agency representatives may participate in Council meetings as ex-officio members, but shall not vote as they have other avenues for input into the management process. The Council as a whole shall meet at least three times a year, with any additional work done between meetings by Council subcommittees. The Council shall elect a Chair, Vice Chair, and Secretary to serve as the Executive Committee of the Council and to act in its behalf as needed. The RAC recommends that the Co-Trustees request Congress to exempt the Council from the Federal Advisory Committee Act.

Compensation and Expenses: The voting members of the Council shall be reimbursed for actual expenses incurred in the performance of their duties, including travel expenses and per diem in lieu of subsistence

Staffing, Assistance and Communication: The MMB shall provide administrative support for the Council,

<b>Comment Category 1 - Advisory Body/Public Involvement</b>	
	<p>convene meetings of the Council and its subcommittees, and make available to the Council such staff, information, administrative services, office space, or assistance that they determine are reasonably required to enable the Council to carry out its functions and communicate effectively</p> <p>The MMB shall keep Council members informed of Monument activities and operations during and between Council meetings, including research plans and results, permits, reports and assessments, and other matters and shall solicit Council input on and help with such matters. The RAC believes that the Council could be particularly helpful in reviewing cumulative impact assessments, annual reports on permitted activities, and conducting evaluations, including the 5-7 year management review plans. A Council representative should be invited to attend meetings of the MMB. The RAC believes the Council can serve as an informed and influential voice at meetings of the State of Hawaii Board of Land &amp; Natural Resources</p> <p>Public Participation and Procedural Matters: The RAC recommends that the following guidelines be adopted with respect to the conduct of business meetings of the Council: (A) Each Council meeting should be open to the public, and interested persons should be permitted to present oral or written statements on items on the agenda at designated and appropriate times. (B) Emergency meetings may be held at the call of the chairman of the Council or presiding officer. The Council may establish subcommittees to facilitate its work. (C) Minutes of each meeting of the Council should be kept and contain a summary of the attendees and matters discussed.</p>
1-01. Response	<p>As stated in CBO-3.5, the Co-Trustees are committed to establish a Monument Alliance within 1 year, composed of individuals who represent communities and stakeholders interested in the Monument’s stewardship. The Alliance will provide individual advice and recommendations to the Monument management agencies regarding the management of Monument resources over which the Co-Trustees have responsibilities. It will serve as a community-based forum to exchange information; provide community input and individual recommendations on Monument policies, activities, and management; advocate for Monument conservation; and enhance broader community and public understanding. Within 2 years after the release of the Monument Management Plan, the Co-Trustees will charter the Alliance as an advisory committee under the Federal Advisory Committee Act (FACA), or as a FACA-exempt advisory body, in order to allow the Alliance to provide consensus advice to the Co-Trustees, per the amended Memorandum of Agreement. Meetings of the Monument Alliance will be convened on a regular basis, with specific topics identified for each meeting. The meetings will be well publicized and open to the public, and will be held at various locations to facilitate participation by a broad range of constituents.</p>
1-02. Comment	<p>Several comments were received suggesting the public comment period be extended to allow more time for public comment.</p>

**Comment Category 1 - Advisory Body/Public Involvement**

## Comments:

- 1) We're given a three minute timing to make comment on 1200 pages in a public forum. That's a little bit of a problem. I would like to echo Dave Raney's statement, a plea for more time for an extension of public comment period. What we are finding -- I have been working along with KAHEA, also working on this for about 10 years -- what we're finding going over it is that sentence-by-sentence some of the most important protective language has been stripped out of what was in there originally. The original draft Management Plan had aban, for example, on bioprospecting. That language has been removed from the original. The Reserve Council -- the Northwestern Hawaiian Islands Reserve Council which first developed goals and objectives weakened by NOAA in 2005 and absolutely further weakened sentence-by-sentence through this interagency process that has happened over the past year. So there's a great deal of concern about the 3 minute limit. Even -- it sounds generous to have 75 days. But you know these guys had three years to go through the 1200 pages. We are looking at the Reserve Advisory Council and their efforts to grapple with this.  
  
I attended the meeting, the first meeting where the RAC really discussed this. They only made it through a fraction of the comments that they themselves had submitted. And I would say admittedly they themselves probably haven't even read the 1200 pages of this thing. Again, a strong plea for a much longer public process and a chance to provide full input. There are a lot of concerns which we'll be submitting in written comments. But just to flag some of them.
- 2) The importance of public input has been mentioned earlier but there has been two years now elapsed where the public has largely been excluded from the development plans that we're reviewing tonight. We were given a quite ample 75-day period. That is good. But I note that the Reserve Advisory Council has really only recently begun to develop its comments on the draft plan. Sierra Club would like the benefit of reviewing the Reserve Advisory Council comments as we prepare ours. And if the Reserve Council needs more time to complete its review of these documents and prepare its comments and recommendations, then I request that the deadline for comments be extended as necessary.
- 3) One thing that keeps coming up over and over again over the last couple of months is that people have no idea what's going on. They think the Monument's protected. But there's a lot to review in here basically. There's a lot. And it's not in layman's terms. It's not at 6th grade reading level like all newspapers. It's just not accessible information. I think there should be more time for the public to review it.
- 4) Finally, the DMMP would greatly benefit from the expertise and unique perspective of a thorough public review. Therefore, we request an extension of the public comment period. The DMMP includes several major

<b>Comment Category 1 - Advisory Body/Public Involvement</b>	
	<p>documents, including 22 action plans, ## compatibility reviews, an Environmental Assessment, a Cultural Impact Statement, the Draft Midway Visitor Services Plan, and a Conceptual Site Plan for the development of Midway. These documents, totaling 1,200 pages in length, were developed over a 2-year process by the Co-Trustees without the benefits of public participation. Adequate review and effective comments cannot be achieved in only 75 days. The low attendance at the recent public hearings in Hawai'i and Washington D.C. is an indication that the community is not yet sufficiently engaged in this crucial decision-making process.</p> <p>5) To have a 1200-page document that the public has 75 days to comment on is sort of inadequate. We know that you yourselves having put together this document can appreciate the difficulty. And we ask that you really respect the intelligence of the public. People can, given enough time, given help and facilitation can understand what's going on and have things to say about it and have really strong ideas about what should be going on in the Northwestern Hawaiian Islands. We ask that you extend the 75-day comment period.</p>
1-02. Response	The 75-day public comment period was extended by an additional 15 days, for a total of 90 days, in order to give people additional time to review the document and submit comments. In addition to opportunities to provide comments during public meetings, there were ample opportunities to provide comments during the 90-day public comment period.
<b>Unique Comments</b>	
1-03. Comment	So I really appreciate your coming out to Kaua'i and taking public comments and sharing with us. Also, really hard for me to come up, speak in an air conditioned room and sit and listen. So I want to share kind of an afterthought. But I look around, there's not much of my peers in this room here. And, it's our generation that's going to continue to move whatever we come up with this plan forward and enforce it and just perpetuate it. So the thought was that maybe next time if we can have some warm mamaki tea and some awa, sit in a circle on a mat, talk story where I know my generation would be very comfortable with that. It would open our hearts and our minds up, could articulate a little better. Really show our, the manana'o from our hearts. It's really hard for me to come up to the mic.
1-03. Response	During the 90-day public comment period, people could provide comments in one of several ways: submit written comments (via letter, fax, or e-mail), submit written comments at any of the 10 public hearings, provide oral testimony at any of the 10 public hearings, or tape record oral comments at any of the 10 public hearings. In addition, before each of the 10 public meetings, Monument staff provided an open house forum where information corresponding to the action plans was available and staff was present to answer specific questions. Staff will consider other ways to involve the public in the future, including smaller working groups.
1-04.	Section 3.6 Achieving Effective Monument Operations

<b>Comment Category 1 - Advisory Body/Public Involvement</b>	
Comment	Based upon the enthusiastic, universally positive and thoughtful suggestions made at the well attended first round of public hearings on a Draft Monument Plan, whereas the new Draft Plan has drawn very sparse attendance and universally critical comments, it is clear that the public buys into and supports plans and policy where they have played an effective role in formulation, but rejects as “not made here” plans and policy formulated in private with little to no transparency. In order to regain credibility, and political and financial support, it is imperative that the RAC be reconstituted and reconvened to consider the comments and criticisms of this new Plan, to offer consensus amendments, and for RAC suggestions to be seriously considered.
1-04. Response	The Reserve Advisory Council (RAC) was established by Executive Order 13178 in December 2000 to provide advice and recommendations to NOAA on the development of the Northwestern Hawaiian Islands Coral Reef Reserve Operations Plan and designation and management of any Sanctuary. While, the RAC is not an advisory body for the Monument or the other Co-Trustees, NOAA convened the RAC during the public comment period to review and provide specific comments to NOAA on the Draft Monument Management Plan. The three Co-Trustees are legally required to consider all public comments received, including those by the RAC, and, as necessary and appropriate, to revise the draft documents. This task cannot be delegated to a nonagency entity.
1-05. Comment	The RAC recommends that until a Native Hawaiian co-trustee is added, the interim OHA representative should continue to convene meetings of the Native Hawaiian Cultural Working Group and forward its recommendations to the MMB.
1-05. Response	The MMB commits to regular consultation and engagement with Native Hawaiians and to the formal establishment of the Native Hawaiian Cultural Working Group, which was convened originally as part of the RAC. The working group is now convened by OHA and is consulted on permit applications and other issues; the group will continue to be convened and formalized (see Strategy NHCI-1 and Activity NHCI-1.1). This provides one of many methods for involving Native Hawaiians. Those volunteer members of the working group have already made a large commitment to accept responsibility for the protecting and perpetuating Papahānaumokuākea and Native Hawaiian cultural connections to this place.
1-06. Comment	On top of that I think there should be working groups that allow the public, that guide the public through those volumes. That would also include the Navy EIS Range Expansion Plan. Yeah, there’s realistic working groups that can put a little bit of this information in terms that people that would want to care about it if they knew they should care about it, can understand. And giving them community involvement in decisions like the Monument Advisory Council.
1-06. Response	During the 90-day public comment period, 10 public hearings were held. Before each public meeting, Monument staff provided an open house forum where information corresponding to the action plans was available and staff answered

<b>Comment Category 1 - Advisory Body/Public Involvement</b>	
	<p>specific questions. In the future, staff will consider other ways, including establishing working groups or holding additional information meetings, to help the public better understand the documents. The Monument Management Plan is a roadmap, and many of the activities will involve other opportunities for the public to be involved and to provide input. In particular, the Action Plan on Community Building and Outreach (CBO) includes a number of strategies and activities involving the public that we envision over the life of the plan. Finally, the plan will be reviewed every five years.</p>
1-07. Comment	<p>We are also concerned that some of the key concepts developed by the Reserve Advisory Council and included in the draft Sanctuary Goals and Objectives appear to be missing from the Draft Monument Management Plan. Specifically, we support:</p> <ul style="list-style-type: none"> <li>• restoring language requiring maintaining the “natural character” of the NWHI as part of the Monument mission;</li> <li>• including language pertaining to the “public trust” nature of the NWHI;</li> <li>• restoring the core principle requirement that officials “authorize only uses consistent with the primary purpose of resource protection;”</li> <li>• making clear that all research permits must demonstrate that permitted activities are “necessary for effective management of the region;”</li> <li>• restoring the requirement that permits shall be authorized “only if such uses do not threaten the natural character or biological integrity of any ecosystem of the region.”</li> </ul> <p>Because the Monument vision, mission, guiding principles and goals provide the basic framework for all management activities, it is particularly important that this section of the DMMP respect the years of hard work of the Reserve Advisory Council with regards to these overview issues.</p>
1-07. Response	<p>As required by Presidential Proclamation 8031, the draft plan for the proposed National Marine Sanctuary was modified to create the Monument Management Plan. Thus, much of the Reserve Advisory Council’s previous work is still found within the plan. In response to these comments, the MMB modified the Vision, Mission, and Goals 1, 2, and 3 in Table 2.1 to better reflect a commitment to resource protection. In addition, the MMB has identified eleven guiding principles for managing the Monument. The seventh guiding principle “errs on the side of resource protection when there is uncertainty in available information on the impacts of an activity“ and honors the approach of “do no harm.“ This is consistent with the precautionary principle in which historic, cultural, and natural resource protection and integrity is favored.</p>
1-08.	<p>To maintain a transparent and accountable decision-making process, the meetings of the MMB must be open to public</p>

<b>Comment Category 1 - Advisory Body/Public Involvement</b>	
Comment	participation and scrutiny. We strongly advocate that the MMB include public representatives and the meeting themselves be open to the public, including public comment and access to meeting minutes.
1-08. Response	The MMB was established under the December 2006 MOA. Membership does not include public representatives because the MMB was designed to provide those agencies with management responsibilities a forum to achieve the requirements of Proclamation 8031 and objectives in the MOA. The MMB provides a necessary forum for the agencies to deliberate together and do their job. Although MMB meetings to date have not included a public comment component, in the future, the MMB may consider holding open house meetings and other venues for providing information to the public (see Vol. I, Constituency Building and Outreach, Activities CBO-3.1 and CBO-3.2).
1-09. Comment	Table 2.1: Change the Language in Goal 4 to: “Provide for cooperative conservation including community involvement and stake-holder input that achieves affective Monument operations and ecosystem-based management.”
1-09. Response	We recognize that stakeholders, including rights holders, have played a crucial role in seeking greater protection for the Monument. As part of the broader community, we will continue to seek stakeholder input. The MMB believes that existing language referring to community involvement includes stakeholders, so no change is warranted.

<b>Comment Category 2 - Agency Coordination</b>	
<b>Summarized Comments</b>	
2-01. Comment	<p>The comments below suggest the Draft Monument Management Plan allows activities that would not be allowed under state law in the NWHI refuge (e.g., special ocean uses, recreation, research, and education) and that State regulations are not being adequately represented.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) The questions and answers paper that was handed out in this meeting is quite alarming in that, for example, there’s a question: How can I visit the Monument? And it states that: All of these things can be carried out in Monument waters including special ocean uses, recreation, research and education. There’s no mention that state waters do not allow those activities. This is just one example of the way that state rules are not represented.</li> <li>2) We’d also like to see a better incorporation of sort of the state regulations and state protection for the refuge, the state refuge. In the Management Plan there’s a little bit of a disconnect there. Of course the state is a co-manager. But when you read the plan, at least sort of the management actions in the plan I think there does need to be a little bit better coordination because some of the state protections are stronger than what are being proposed in</li> </ol>

<b>Comment Category 2 - Agency Coordination</b>	
	<p>the plan.</p> <ol style="list-style-type: none"> <li>3) The state refuge, which was the first solid attempt at setting this place aside, needs to be an equal partner in this Monument management scheme. The state refuge regulations aren't even in the appendices of this Management Plan which goes to show how forgotten it is.</li> <li>4) When we're looking at the modifications that have been made to the draft Management Plan over the last couple of years, the action plans themselves do not seem to include the state requirements.</li> </ol>
2-01. Response	<p>The State of Hawai'i Administrative Rules, Title 13, Chapter 60.5, established the NWHI Marine Refuge “to support, promote, and coordinate appropriate scientific research and assessment, and long-term monitoring of the refuge resources.” State refuge regulations specifically allow for persons to enter the Refuge for the purposes of scientific research, education, and subsistence and cultural practices by Native Hawaiians. State prohibitions and regulations will continue to apply in state waters that are within the Monument. The proclamation specifically states that nothing in this proclamation shall be deemed to diminish or enlarge the jurisdiction of the State of Hawai'i.</p>
2-02. Comment	<p>The comments below concern how the Co-Trustees will accomplish seamless integrated management of the Monument and its resources.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) I applaud your commitment to “seamless integrated management” between the Co-Trustees, but I remain skeptical about your ability to pull it off. The Management Plan makes confusing references to the “primary” responsibilities of each Trustee and states that “each agency retains their spheres of jurisdiction, responsibility, and expertise.” Yet, the Plan does not explain, in real world terms, how that will be accomplished. Also, the Plan does not explain the function and scope of responsibility for each of the various boards and committees.</li> <li>2) I'm interested in, quite frankly, in how well this concept of seamless integrated management will work. They're nice words, but I'm sure you can appreciate better than any of us what it means to work together in areas of confusing jurisdiction. I give you real credit for trying, and I hope it succeeds. If it does, it will be a first time this sort of thing worked that way. I do point out there were some -- there is still some confusion -- it would be surprising if there wasn't -- in the document about overlapping jurisdictions and how you can reconcile in one place saying no one has primary responsibility or the state has primary responsibility and somewhere else describe things in geographic terms that are so confusing. So I would urge you to try and give that the sort of layman test and see if people who haven't been caught up in all this bureaucracy so long can really understand what it means when I say this is how the jurisdiction is now split in the Northwestern Hawaiian Islands.</li> </ol>

<b>Comment Category 2 - Agency Coordination</b>	
2-02. Response	<p>The three principal entities with responsibility for managing lands and waters of the Monument—NOAA, USFWS, and the State of Hawai‘i (collectively, the Co-Trustees)—have developed the Monument Management Plan and other mechanisms, such as coordinated permit, education, research, and communications programs. The seven agencies that make up the MMB are the NOAA National Marine Sanctuary Program, NOAA National Marine Fisheries Service, FWS National Wildlife Refuge System, FWS Pacific Islands Fish and Wildlife Office, Hawai‘i DLNR Division of Aquatic Resources, Hawai‘i DLNR Division of Forestry and Wildlife, and the Office of Hawaiian Affairs. The agencies meet regularly to coordinate their respective activities, priorities, and permit reviews. This relationship is further described in section 2.2 (Policy Framework) and in a Memorandum of Agreement among the Co-Trustees (see Volume III, Appendix F). Furthermore, the MMB is developing a charter for the MMB, which will provide specifics on the roles, responsibilities, and activities for the MMB.</p>
2-03. Comment	<p>The comments below seek further clarification on the roles and responsibilities of the Co-Trustees, MMB and ICC in the management of the Monument and its resources.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) It’s created a unique opportunity for agencies to come together and manage this resource and it’s probably unprecedented in any place that I can think of in the world where this has happened in such a short time. The things that I have noticed that concern me is it’s still NOAA’s efforts and the Fish and Wildlife’s efforts. This is the same ecosystem but we really do need to, I think separate -- stop separating -- there’s still seal camps and then there’s Fish and Wildlife camps. So at some point it would be nice to have Monument camps. So that’s something -- that would be -- it’s difficult to shake off the old places that you come from. And it would be nice to get, start changing some of the names.</li> <li>2) It wasn’t clear to me what the distinction between the Monument Management Board and the Interagency Coordinating Committee is. And I talked to a few folks during the break to try and get some insight into that.</li> <li>3) In line with this concern is how the agencies involved will interact, so as to really care for and respond to needs or necessities {things that can’t ‘wait’} of the Monument and the life within, as well as the human management side of things. And to make sure there isn’t too much if any lack as any change happens. Often this will be on several levels, so a real substance to “smooth” transition requires a lot more than what is being offered. Even with educated volunteers or willing experts, in small or larger numbers. Communication and cooperation in a bureaucracy is shaky at best, which bodes not well for the NWHI if things go wrong especially. If setting it up is so complex and detailed, how much more so will managing it be? Especially with the changing or integrating of laws and other to theoretically connect them all. Especially if it concerns non-U.S. groups. It may not be possible</li> </ol>

<b>Comment Category 2 - Agency Coordination</b>	
	<p>to just connect anything like that. If it depends on law and policy it will be hard, at best. And nearly impossible at worst, and of course worst case scenario means impossible at it's most severe. At each listed step major agencies and sometimes more than one, are involved in a stated step, this makes just setting it up very complex. That only states that it will be that much more so for the users and those who apply for permits. When it's hard at the top, it'll be as difficult at the bottom or worse. The last part of the Interagency concerns is AC-3.3, the World Heritage issue. Should this occur, it will be that much more complex for all involved. If you've ever heard of red tape, that will be a forest in a jungle of it. Meaning any who use or pass through it, whether for official, casual or purposeful reason, will be potentially scared off before they can get in. Which in some cases may be the intent, as sad and regretful as that may be. People in power have hardly changed since known time, it's only the ways used rather than the views. The use of law goes on the assumption that nobody will follow good actions or intent if it isn't there or that control is necessary, and as often it's those in power that abuse it, which makes things worse. Hopefully it won't be as bad for the NWHI. Bureaucracy is red tape applied, only time will tell.</p>
<p>2-03. Response</p>	<p>The three Co-Trustees, U.S. Department of Commerce, U.S. Department of the Interior, and the State of Hawai'i signed a MOA in 2006, which provided for coordinated administration of all federal and state lands and waters within the boundaries of the Monument. The MOA established the seven-member MMB to coordinate day-to-day management at the field level. The MMB is composed of the NOAA National Marine Sanctuary Program, NOAA National Marine Fisheries Service, FWS National Wildlife Refuge System, FWS Pacific Islands Fish and Wildlife Office, Hawai'i DLNR Division of Aquatic Resources, Hawai'i DLNR Division of Forestry and Wildlife, and the Office of Hawaiian Affairs. While each agency remains responsible for carrying out its statutory responsibilities, the MMB meets regularly to promote interagency coordination and strives to achieve successful collaboration across multiple agencies. The Co-Trustees are committed to work together to improve agency coordination, communications, efficiency, and resource and facility sharing.</p> <p>The MOA also established an Interagency Coordinating Committee (ICC) to help coordinate state and federal agency activities that occur in the Monument, to facilitate getting information from these other agencies about Monument resources that could help in the management of the site, and, when feasible, to obtain assistance in implementing various strategies and activities contained in the Monument Management Plan. This is a forum to exchange information, to promote collaboration, and when necessary, to discuss and resolve issues. Unlike the MMB, the ICC does not have a fixed membership; it meets periodically or as specific topics require, and participation is based on the relevancy of their activities or mandates within the Monument and the specific need for agency expertise to address specific issues. Representation on the ICC has included the MMB agencies plus the Coast Guard, Environmental Protection Agency, US Geological Survey, and Department of Defense. Information about the ICC can be found in the Monument</p>

<b>Comment Category 2 - Agency Coordination</b>	
	Management Plan Agency Coordination Action Plan, Activities AC-2.2, 2.3, 2.4, and 3.1.
2-04. Comment	<p>The comments below recommend the Monument Management Plan be consistent with the precautionary principle, in which historic, cultural and natural resource protection and integrity be favored when not enough information is known about potential effects of particular undertakings.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) HHF recommends that the Management Plan make an explicit commitment to the precautionary principle, in which historic, cultural and natural resource protection and integrity be favored when not enough information is known about potential effects of particular undertakings. The approach of “do no harm” in the face of uncertainty will help to protect the resources for which the monument is created.</li> <li>2) The precautionary principle approach includes: a duty to take anticipatory action to prevent harm; a duty to consider all the reasonably foreseeable costs and benefits, in the short and long term, when making decisions; a duty to make decisions in a transparent, participatory and informed manner with the best available information; and a duty to select the option with the least potential impact on the environment. This approach to decision-making must be properly explained and followed throughout in the DMMP.</li> <li>3) The precautionary principle, as so many have said before, is the cornerstone of making sure we do not make the same mistakes in the Northwestern Hawaiian Islands that we made in the main Hawaiian Islands.</li> <li>4) Restructure the Action Plans to ensure they abide by the Precautionary Principle, Executive Orders, and the State “do no harm” standard.</li> </ol>
2-04. Response	<p>The MMB has identified eleven guiding principles for managing the Monument. The seventh guiding principle “Errs on the side of resource protection when there is uncertainty in available information on the impacts of an activity.” It honors the approach of “do no harm,” which is consistent with the precautionary principle in which historic, cultural, and natural resource protection and integrity is favored.</p>
2-05. Comment	<p>The comments below concern the methods for handling disagreements that may arise between Co-Trustee agencies.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) 3.5.1 Agency Coordination Action Plan                      Ocean Conservancy supports the stated desired outcome of this plan to: “Successfully collaborate with government partners to achieve publicly supported, coordinated, coordinated successful/effective management in Papahānaumokuākea Marine National Monument.” [emphasis added] We recommend adding the additional adjectives “successful” and/or “effective” as modifiers for “management” to further strengthen this plan. The</li> </ol>

<b>Comment Category 2 - Agency Coordination</b>	
	<p>Action Plan itself is somewhat limited and unclear and would benefit from some additional detail and development, especially given inherent challenge of multiple agencies working together. As we stated in the above section on “Management Framework”, one important means to address challenges of working together would be to identify and develop a fair and effective method of addressing differences of opinion between the Co-Trustees in a timely manner.</p> <p>2) The MOA lays out an internal method of handling management disagreements that may arise between the Co-Trustees:</p> <p>“If the members of the MMB disagree on an issue of Monument resource management, they shall present their differences to each other in writing, and they shall discuss them. The MMB should be the first body to attempt resolution of any disagreement. If the MMB fails to resolve their differences within 30 days after identification of the disagreement, or immediately upon determination that the MMB has reached an impasse, the matter shall be elevated to the SEB for resolution.” However, the MOA does not provide guidance for determining how to resolve such differences of opinion if the Co-Trustees do not agree at the SEB level. Given the likelihood of differences of opinion amongst agency staff, Ocean Conservancy recommends that the Co-Trustees identify and agree in advance to a process for handling disputes that cannot be quickly resolved by the SEB. Specifically, we are concerned that potential disagreements not result in delays or inaction on important management issues pending resolution of any disputes. We recommend that disagreements amongst the Co-Trustees be resolved in a manner that favors the more protective management option under consideration. We further recommend that the Draft Monument Management Plan specifically identify a fair and effective method of addressing differences of opinion between the Co- Trustees in a timely manner. For example, in many instances, a simple majority vote of the three Co-Trustees might be sufficient. More significant disagreements could potentially be resolved by the Council on Environmental Quality. We advise that specific mechanisms for effectively resolving disputes be spelled out clearly in the Draft Monument Management Plan and agreed to by the Co-Trustees.</p>
2-05. Response	<p>Although in almost all cases, agreements are being reached at the MMB level, standard federal processes for resolving issues between federal agencies would be used if necessary. In the case of the Monument, the federal agencies would also be coordinating closely with the State of Hawai‘i in any decision making.</p>
2-06. Comment	<p>The comments below seek clarification on how lead agencies were determined for some of the management activities.</p> <p>Comments:</p> <p>1) It’s not clear from the narrative how the assignment of “lead” was determined for some of the management activities. For example, why was NOAA assigned the lead for the unified permit application process, the</p>

<b>Comment Category 2 - Agency Coordination</b>	
	<p>emergency response activity and the science action plans? It seems to me that leadership for these activities should be shared.</p> <p>2) Table 3.1.1: Summary of Strategies...Science (p. 115) - In the table on page 115 we note that the lead agency for Activity MCS-1.1: Continue to characterize types and spatial distribution of shallow-water marine habitats, is NOAA. Shouldn't the Department of Land and Natural Resources be the lead agency for shallow water studies? Near shore waters are the jurisdiction of the state and they should be the lead agency on monitoring that takes place in state waters.</p>
2-06. Response	<p>At the end of each Action Plan is a summary table that lists which agency has the lead for coordinating each activity. The lead agency is responsible for providing much of the staff and other resources (such as funding, volunteers, infrastructure, vessels, and aircraft) to implement the activity and is responsible for coordinating with other agencies to monitor and report the progress of the project(s). Other MMB agencies may participate in shared decision making and implementation of the activity, depending in their respective mandates and agency resources.</p>
2-07. Comment	<p>The comments below suggest the Monument Management Plan does not include the requirements of the other Executive Orders (EO) that apply to the Northwestern Hawaiian Islands. These orders were not rescinded by the Proclamation, yet some of the action plans contain language which does not fulfill the requirements of existing EO protections.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) The EO's, the executive orders, need to be carried forward. The language from the executive orders needs to be articulated in the Management Plan.</li> <li>2) They also do not seem to include the requirements of the executive orders. This Management Plan was initially drafted when the federal agencies were hoping that the executive orders which established reserve protections would be withdrawn and removed. Those orders were not withdrawn yet the language still remains in some of the action plans which absolutely does not fulfill the requirements of the existing executive order protections. Let's see. Just touch on some of the brief, brief concerns here.</li> </ol>
2-07. Response	<p>Presidential Proclamation 8031 directed the Secretaries of Commerce and Interior to review and modify, as appropriate, the interagency agreements developed for the coordinated management of the Hawaiian Islands Coral Reef Reserve and to modify, as appropriate, the plan developed by NOAA's National Marine Sanctuary Program through the public designation process. The proclamation also prescribed specific actions in regard to public access, vessel monitoring systems, restrictions, armed forces actions, commercial fishing, sustenance fishing, and permitting. These provisions were codified in a final rule for the Monument (71 FR 51134). The Monument Management Plan was developed to be consistent, as much as possible, not only with the protections outlined in the Hawaiian Islands Coral Reef Ecosystem</p>

<b>Comment Category 2 - Agency Coordination</b>	
	Reserve Executive Orders (13178 and 13196), but other applicable federal and state regulations that apply to the Co-Trustees management agencies and the specific requirements of the Presidential Proclamation. The proclamation prescribes certain uses that are not contemplated by the other Executive Orders, and as such the original mission, vision, goals and objectives prepared for the Reserve were appropriately modified.
<b>Unique Comments</b>	
2-08. Comment	<p>The State of Hawaii led the way towards the designation of this Monument by establishing the visionary NWHI State Marine Refuge. This Refuge is the largest “do no harm” area in all of Hawaii and it specifically protects Native Hawaiian cultural access rights, prohibits commercial extraction - like fishing- and allows only appropriate scientific research. It enforces these standards through a one-strike rule that bars future permits to any applicant that has violated a past permit.</p> <p>Although the State of Hawaii is an equal partner in the management of the Monument, as outlined in the Memorandum of Agreement between the three Co-Trustees, the DMMP barely acknowledges the State Refuge in the 22 action plans to manage the Monument. If the State Refuge is not only fully integrated in the management of the Monument, then it will ultimately become an after-thought of forgotten protections with no funding or administrative support.</p>
2-08. Response	The State of Hawai‘i is and will remain an integral Monument Co-Trustee and will partner in implementing many of the strategies and activities listed in the Management Plan, as resources and staffing allow. The Monument Management Plan incorporates applicable state requirements and activities into relevant strategies and activities, and is fully consistent with the requirements of the NWHI Marine Refuge and the State Seabird Sanctuary at Kure Atoll, as set forth in the Hawaii Administrative Rules Title 13. Activities prohibited by state regulations will remain prohibited in those areas.
2-09. Comment	And then, finally, it’s just a comment, many of us worked really hard in State and in the Federal agencies on the statewide Conservation -- no, statewide Comprehensive Wildlife Conservation Strategy. That’s not mentioned in this. And there’s over 100 pages of documentation on actions to be taken for the Northwest Hawaiian Islands and for the very same species listed in your management plan. And I think they should be somehow integrated. I don’t think there’s a huge amount of overlap.
2-09. Response	The statewide Comprehensive Wildlife Conservation Strategy is an initiative led by the Department of Land and Natural Resources. This Monument Management Plan is consistent with the requirements of the NWHI Marine Refuge and the State Bird Sanctuary at Kure Atoll, set forth in the Hawai‘i Administrative Rules Title 13, Chapters 60.5 and 125. The Monument Management Plan was developed in close coordination with the State of Hawai‘i Department of Land and

<b>Comment Category 2 - Agency Coordination</b>	
	Natural Resources staff to ensure consistency with state requirements. Many of the specific strategies and activities are fully consistent with the provisions of this wildlife conservation strategy. Further, the State of Hawai‘i is and will remain an integral partner and participant in implementing many of the strategies and activities listed in the Monument Management Plan and will look to ensure that Monument activities are complementary to the plan. Links to the statewide Comprehensive Wildlife Conservation Strategy are now incorporated in Action Plan 3.2 of the Monument Management Plan.
2-10. Comment	Table 3.1.2: Summary of Strategies . . . And History (pp. 126-127) On the second page of the table, Activity NHCH-5.1: Integrate Native Hawaiian values and cultural information into general outreach and education programs, the lead agency listed is NOAA. Shouldn't the lead agency be the Office of Hawaiian Affairs which would have a better understanding of Hawaiian Culture and how it may be interpreted through outreach and educational programs? At the very least, some local entity should be the lead in carrying out this activity not a federal agency.
2-10. Response	The Office of Hawaiian Affairs (OHA) only within the last 18 months became an active and engaged agency in the conservation and protection of the NWHI. OHA provides part of a staff member's time to participate on the MMB but beyond this has yet to dedicate any full-time staff to Papahānaumokuākea. Many of the strategies and activities in the Monument Management Plan are designed to build capacity within Native Hawaiian communities and organizations to conduct outreach and education programs to support Papahānaumokuākea. NOAA ONMS is the agency with the most institutional knowledge and experience in working with Native Hawaiian communities related to the Monument. In addition, capacity building is needed across all agencies.
2-11. Comment	Where the management plan calls for additional plans or research, including a preservation plan for the monument generally and an updated preservation plan for Midway Atoll, meaningful public input and participation is necessary. Historic Hawai‘i Foundation would like to be a consulting party in the preservation planning, as well for specific undertakings that may affect historic resources.
2-11. Response	The MMB is committed to working with appropriate user groups, stakeholders, and the general public to develop future natural resource and historic research and preservation plans. At the appropriate time, Monument staff will welcome such input from interested parties.
2-12. Comment	The Management of the Monument must fully implement the permit requirements, penalty structure, and prohibitions against sustenance fishing and waste dumping.

<b>Comment Category 2 - Agency Coordination</b>	
2-12. Response	The Monument permitting process is detailed in Volume III, Appendix A. The MMB meets regularly to review and apply the criteria before issuing any permits. Likewise, the MMB is working with each agency's law enforcement office and its respective legal counsel to ensure that all prohibitions are enforced.
2-13. Comment	The proposed management plan for the Papahānaumokuākea monument is fundamentally flawed because it is a piecemeal multi-governmental mess of jurisdictions and regulations. The only solution will be the creation of an independent agency to manage the monument. The sooner this is realized the better. The current structure and the proposed structure of a management body will only continue the dysfunctional and inadequate protection of the monument. At the recent International Coral Reef Symposium Dr. Terry Hughes, ARC center of Excellence for Coral Reef Studies, noted that the most significant factor for the management of the Great Barrier Reef (GBR) in Australia was the wise move by the government to create the GBR Authority with independent control over the management of the reefs. Dr. Hughes noted the dysfunction and overall failure of the US Coral Reef Task Force as an example of how not to manage a reef ecosystem. The current and proposed management plans for the NWHI resemble the US Coral Reef Task Force in its complexity and vulnerability to multi-agency conflicts and politics.
2-13. Response	The MOA identified three Co-Trustees (NOAA, FWS, and the State of Hawai'i) with the responsibility for managing the Monument. Subsequently, through an MOA, management responsibility was expanded to a seven-member board of the NOAA National Marine Sanctuary Program, NOAA National Marine Fisheries Service, FWS National Wildlife Refuge System, FWS Pacific Islands Fish and Wildlife Office, Hawai'i DLNR Division of Aquatic Resources, Hawai'i DLNR Division of Forestry and Wildlife, and the Office of Hawaiian Affairs.
2-14. Comment	Institutional Arrangement for Management (pp. 81-82) It is unclear from the description of the institutional arrangement for management how decisions will be made by the Senior Executive Board (SEB). Will they make decisions by consensus, by majority vote or by some other method? Who calls meetings of the SEB and who chairs them? We are also curious as to how the Monument Management Board (MMB) will function. Who chairs this group and how will they operate? How will the SEB, the MMB and the interagency coordinating committee interact with each other and with the staff? With so many layers of management it seems likely that problems will occur.

<b>Comment Category 2 - Agency Coordination</b>	
2-14. Response	<p>As stated in the MOA among the Co-Trustees for promoting coordinated management of the Monument (Appendix F), the SEB provides policy guidance to their respective agency staff assigned to carry out Monument management activities. The day-to-day management and decisionmaking of the Monument is the responsibility of the MMB agencies, but if there are conflicts or disagreements, the SEB provides a means to resolve such disputes. As the primary purpose of the SEB is to provide interagency guidance and resolve internal agency policy issues and disputes, meetings are scheduled only as needed. Because the purpose of these meetings is not to convey information to the public or to get public input or comment, they are not open to the public.</p> <p>However, in order to foster greater public involvement, the Co-Trustees are committed to establish a Monument Alliance within 1 year, composed of individuals who represent communities and stakeholders interested in the Monument’s stewardship responsibilities. The Alliance will provide individual advice and recommendations to the Monument management agencies regarding the management of Monument resources over which the Co-Trustees have responsibilities. It will serve as a community-based forum to exchange information; provide community input and individual recommendations on Monument policies, activities, and management; advocate for Monument conservation; and enhance broader community and public understanding. Within 2 years after the release of the Monument Management Plan, the Co-Trustees will charter the Alliance as an advisory committee under the Federal Advisory Committee Act (FACA), or as a FACA-exempt advisory body, in order to allow the Alliance to provide consensus advice to the Co-Trustees, per the amended Memorandum of Agreement. Meetings of the Monument Alliance will be convened on a regular basis, with specific topics identified for each meeting. The meetings will be well publicized and open to the public, and will be held at various locations to facilitate participation by a broad range of constituents.</p>
2-15. Comment	<p>...all I see in there are we’re going to go this in two years or three years or four years. I think it would be very important and crucial step to actually say we need to have this done by this date. So you can mark it on the calendar and say it needs to be done at this point in time. Because, you know, you look at that and say done in two years, done in two years starting when? When the final draft is done? Starting two years from when you start the project? So you could put that off forever. So I think it’s just a important thing to have it set in stone.</p>
2-15. Response	<p>Most strategies in the Action Plans have a projected timeline for completion, which begin once the Monument Management Plan has been approved for implementation.</p>
2-16. Comment	<p>Page ES-2 of the draft management plan states that “The management framework for the Monument includes key elements to move toward an ecosystem approach to management.” OHA is pleased by this sentence and urges the coordinated management of this area to consistently bear this mind. OHA also is pleased by the intent to adhere to the</p>

<b>Comment Category 2 - Agency Coordination</b>	
	<p>National Wildlife Refuge (NWR) system principle of “wildlife comes first.” The opening paragraph on page two of the draft management plan begins with: Proclamation 8031 states that the Secretary of Commerce, through NOAA, has primary responsibility regarding the management of the marine areas of the Monument, in consultation with the Secretary of the Interior. The Secretary of the Interior, through FWS, has sole responsibility for the areas of the Monument that overlay the Midway Atoll National Wildlife Refuge, the Battle of Midway National Memorial, and the Hawaiian Islands National Wildlife Refuge, in consultation with the Secretary of Commerce. Nothing in the Proclamation diminishes or enlarges the jurisdiction of the State of Hawai‘i. The State of Hawai‘i, through the Department of Land and Natural Resources, has primary responsibility for the Northwestern Hawaiian Islands Marine Refuge and State Seabird Sanctuary at Kure Atoll.</p> <p>OHA is understanding of this bit of jurisdictional wrangling and appreciates that this confusing picture was painted for us; however, we will hold the co-managers to their stated goal of creating “a comprehensive and coordinated management regime to achieve the vision, mission, and guiding principles of the Monument and to address priority management needs over the next 15 years.” OHA understands the vision to be to forever protect the health, diversity, and resources of the area and the mission to be to carry our “seamless” integrated management to protect area ecosystems, Native Hawaiian resources, and heritage resources for all time.</p> <p>OHA is hopeful that the co-managers of this area will gain valuable experience that can be applied to other remote Pacific Island complexes that sorely need an integrated management regime that focuses more on the resources and less on jurisdiction.</p>
2-16. Response	The Co-Trustees are committed to working together to achieve a mutual goal of creating “a comprehensive and coordinated management regime to achieve the vision, mission, and principles of the Monument and to address priority management needs over the next 15 years.”
2-17. Comment	p. 155 ln 24 Change from: “promote streamlining among the action agencies and consulting agencies,” To: “promote timely and effective coordination among the action agencies and consulting agencies,”
2-17. Response	We have made the suggested change to Volume I (see Threatened and Endangered Species Action Plan - Strategy TES-8).
2-18. Comment	First, we need to better incorporate the executive orders and the state regulations. Classic example, independent teams. There’s no state regulations. So you have Monument regulations. You have no laws and things that have to be followed but the Refuge is part of the Monument to the extent the state determines the Refuge regulations have to be exercised.
2-18.	The Monument boundary includes state waters, including the NWHI State Marine Refuge and the State Bird Sanctuary

<b>Comment Category 2 - Agency Coordination</b>	
Response	at Kure Atoll. Nothing in the Presidential Proclamation diminishes or enlarges the jurisdiction of the State of Hawai‘i, which has primary responsibility for managing the state waters of the Monument. The Monument Management Plan is fully consistent and complementary with the requirements of the NWHI Marine Refuge and the State Bird Sanctuary at Kure Atoll, as set forth in the Hawaii Administrative Rules Title 13, Chapters 60.5 and 125. All other applicable state regulations and laws will continue to apply in state waters in addition to Monument regulations. Further, the Monument Management Plan was developed in close coordination with the Hawai‘i Department of Land and Natural Resources and Office of Hawaiian Affairs staff to ensure it coordinated and was consistent with state requirements. On August 29, 2006, NOAA and FWS published a final rule in the <i>Federal Register</i> (71 FR 51134) to codify the federal provisions of the Presidential Proclamation to provide additional notice to the public and other interested parties of the terms of the proclamation and activities that are prohibited or regulated and thereby facilitate improved compliance.
2-19. Comment	<p>3.5.1 Agency Coordination Action Plan</p> <p>Furthermore, we recommend the following improvement to Strategy AC-3: “Promoting international, national, and local agency and non-governmental collaborations to increase capacity building and foster networks that will improve management effectiveness “ [emphasis added] In addition to governmental agencies, there are many stakeholder, non-governmental groups working towards and addressing the goals of this strategy across the Pacific. Ocean Conservancy would like to see the Monument actively engaged in such initiatives. The Co- Trustees currently are members of the Hawai‘i Conservation Alliance and work with many stakeholder groups, and thus are already engaged in collaborations with stakeholders that could be expanded. One such effort currently underway involves the International Union for Conservation of Nature (IUCN), Ocean Conservancy, and Stanford University’s Center for Ocean Solutions. Dubbed the “Pacific Ocean Initiative”, this effort will join together business leaders, non-governmental organizations (NGOs), and governments of all levels (cities, states/provinces, and nations) around the Pacific to tackle the major threats to our ocean health in a coordinated and cooperative plan of action — comparable to the International Climate Action Partnership — that builds upon and coordinates existing state and federal programs in the U.S. and their analogs in other Pacific countries. The Co-Trustees should actively participate in this important effort.</p>
2-19. Response	The Agency Coordination Action Plan focuses on coordination among state and federal government agencies. Support for initiatives such as the Pacific Ocean Initiative is included under Constituency Building and Outreach, Activity CBO-3.3, Continue to seek out and support partnership opportunities that focus on Oceania-related issues.
2-20. Comment	It is not clear who is included as “monument staff” and who is not. Are all NOAA, FWS and DLNR employees, staff or is it a smaller group of staffers hired specifically for the monument office? This needs to be clarified as many activities in this and other sections are attributed to the “monument staff” (e.g. providing data on seabird population and status,

<b>Comment Category 2 - Agency Coordination</b>	
	<p>collecting and fingerprinting washed up oil, etc) but it is unclear who is actually performing this work.</p> <p>In addition, the agency actually conducting the work and/or analyses in each action should be identified so that readers and decision-makers can understand how the agencies are working together and whether their combined resources are being be used effectively and efficiently (and whether they would be so used under each of the action alternatives). The use of the generic term “MMB“ obscures these details and is a disservice to readers and decision makers, especially in these times of limited agency resources and large environmental changes. For example, if one agency has a research program in place, it would be wasteful for another agency to obtain the resources and scientific expertise to establish its own program as opposed to supporting the already existing program. The current text does not allow readers to review or provide comments on this important issue.</p> <p>References to “monument staff” need to be clarified as above and the actual agency that would do each task needs to be clearly identified so that readers and decision-makers can understand how the agencies are working together and whether their combined resources are being be used effectively and efficiently (and whether they would be so used under each of the action alternatives). The use of the generic term “MMB“ obscures these details and is a disservice to readers and decision makers, especially in these times of limited agency resources and large environmental changes. For example, if one agency has a research program in place, it would be wasteful for another agency to obtain the resources and scientific expertise to establish its own program as opposed to supporting the already existing program. The current text does not allow readers to review or provide comments on this important issue.</p>
2-20. Response	<p>Under the new paradigm of Papahānaumokuākea Marine National Monument, the three Co-Trustee agencies will be working together and pooling resources to the extent possible. The Monument Management Plan includes an agency lead for each of the activities. Each of the other agencies will participate in activities as time, funding, interest, and mandate dictate. It is impossible to predict exactly which staff members will be tapped to work on the varied tasks of the Monument Management Plan. The intent of the Monument Management Plan is to allow for the pooling of the limited agency resources and avoid duplicative efforts.</p>
2-21. Comment	<p>Ocean Conservancy strongly supported the bid for World Heritage Site status for the Monument and will continue to advocate for Activity AC-3.3: Support the bid for World Heritage Site status. There are few places in the United States or the World that have the combined environmental and cultural significance to the planet that is found within the Papahānaumokuākea Marine National Monument. It is only appropriate that these areas be recognized internationally for the unique world resource that it is.</p>
2-21. Response	<p>We agree and will continue to work toward gaining World Heritage status for the Monument.</p>

<b>Comment Category 2 - Agency Coordination</b>	
2-22. Comment	Table 2.1: Change the Mission Statement to: “Carry out seamless integrated management to restore natural biological communities and achieve strong, long-term protection and perpetuation of NWHI native ecosystems, Native Hawaiian traditional and customary cultural and religious practices, and heritage resources for current and future generations.”
2-22. Response	We have modified the Mission Statement to say, “Carry out seamless integrated management to ensure ecological integrity and achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian culture, and heritage resources for current and future generations.”
2-23. Comment	<p>Agency Coordination Action Plan – Section 3.5.1</p> <p>We applaud the initiatives to facilitate inter-agency cooperation and establish a process to learn from mistakes and amend agreements. The Draft Plan allows agreements discussed in Activity AC-2.1 to specify “crosscutting budget initiatives.” Instead of allowing such initiatives, the Management Plan should require formalization of inter-agency budget requests and expenditures. Given the crucial role of funding to the success of the Plan and protection of the NWHI ecosystem and cultural resources, a mere discussion is insufficient. On a similar note, Activity AC-2.2 should contain deadlines for development of needed interagency agreements, grants, and memoranda of agreement. The sooner these arrangements are developed, the more smoothly, efficiently, and successfully the Monument will be run.</p>
2-23. Response	<p>Agreements are in place among some of the Co-Trustees that allow for the efficient exchange of resource sharing, including funds as appropriate. For Activity AC-2.2, the MMB agencies are already working on many of the agreements as staff time allows during this planning phase. The MMB agrees that expediting these agreements will help the Monument function more smoothly, efficiently, and successfully.</p> <p>Prioritization of activities in the management plan is not a linear process, nor is it necessarily measured by the amount of funds allocated. Several factors apply when setting the implementation schedule and allocating funds; these include available resources (but are not limited to natural, cultural, and historic resource needs), funding, agency capacity, completion of necessary planning and environmental review, and community input and support. Each MMB and partner ICC agency develops annual budget projections and priorities and allocates funds based on its own programmatic, legal, and policy requirements. The cycle and timelines for funding and planning vary.</p> <p>The management agencies coordinate in areas where program priorities overlap. For example, one agency may take the lead on behalf of all responsible agencies that have a common mandate. In other areas of overlap, multiple agencies may share responsibility for carrying out the activities to address core management needs, thereby creating a strengthened and shared focus. Doing so creates synergy and uses public funds more efficiently within the co-management structure. The seven MMB agencies are committed to annually sharing implementation schedules and priorities to identify</p>

<b>Comment Category 2 - Agency Coordination</b>	
	opportunities where coordination and efficiencies would apply.
2-24. Comment	In talking about how much public input and passion are put into this over the years. So the testimony based on regional councils worked to develop vision, mission, goals, objectives. These need to be better reflected in the management plan. These are documents that were already vetted, already approved, voted on, very lengthy public open process, took a lot of work. And according to proclamations those should have been the foundation of the document that we have before us today. Unfortunately it is not. So I would encourage the managers to go back to those original documents, those original vision statements, mission statements and then have those be the foundation.
2-24. Response	<p>As described in Section 2.1 of the Monument Management Plan, Executive Order (EO) 13178, as amended by EO 13196, established the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve and directed NOAA, in consultation with state and federal partners, to develop a plan to guide the operations of the reserve. EO 13178 also established a RAC to provide advice and recommendations on the development of a reserve operations plan and the designation and management of any sanctuary. The reserve operations plan was finalized in 2005 and is the foundation for the development of the draft Sanctuary management plan. When the Monument was designated in lieu of a Sanctuary, the Presidential Proclamation directed the Co-Trustees to modify the draft Sanctuary management plan in developing a plan to manage the Monument. In November 2006, Co-Trustee agency representatives met to review the vision, mission, and goals and modified them to reflect Proclamation 8031 and to be consistent with the policies, mandates, rules, and regulations of each agency. While changes were made to the earlier vision, mission and goal statements, the negotiated language is consistent with them. Within the management plan, many of the original objectives have been incorporated at the action plan level, but again some strategies and activities were modified to be consistent with the Proclamation and the FWS Comprehensive Conservation Plan requirements.</p> <p>In response to these comments, the MMB modified the Vision, Mission, and Goals 1, 2, and 3 in Table 2.1 to better reflect a commitment toward resource protection.</p>

<b>Comment Category 3 - Alien Species</b>	
<b>Summarized Comments</b>	
3-01. Comment	<p>The comments below concern the use of <i>Gambusia affinis</i> as an approach for the eradication of mosquitoes.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) Pg 197 - Using mosquito fish displaces mosquitoes (they just go some where else), and is an ineffective management method. Introducing mosquito fish to new areas also depletes any remaining native (aquatic)</li> </ol>

### Comment Category 3 - Alien Species

invertebrates that may still be there.

- 2) Page 197 Line 18: The eradication of mosquitoes at Midway Atoll should be a high priority, since mosquitoes are also human disease vectors. Use of mosquito fish, *Gambusia affinis*, is an antiquated and ineffective control that simply displaces mosquitoes to inaccessible sites (pipes, cisterns, drains, and ephemeral wetlands). *Gambusias* decimate aquatic invertebrates and compete with endemic and migratory waterfowl, and shorebirds for aquatic invertebrates. Introduced fish should not be employed within the National Monument when other methods are available for mosquito control. Where possible, *Gambusia* should be removed from habitat created specifically to support brood rearing by endangered Laysan ducks, since this invasive fish competes directly for aquatic invertebrates important for the downy duckling life stage, and degrade wetland habitat for migratory species
- 3) I am writing to express my opposition to the use of *Gambusia affinis* and BTI to eradicate mosquito populations in Activity AS-5.3: Control and if possible eradicate the two introduced mosquito species at Midway Atoll within 10 years using methods prescribed in the integrated Alien Species Management Plan. Several studies have demonstrated that *Gambusia affinis* are ineffective controls for mosquito populations (Hoy et al. 1972, Bence 1988, Courtenay and Meffe 1989, Blaustein 1992), in fact there is an excellent technical report that was published by the Michigan DNR as to whether or not they should use *Gambusia affinis* as a mosquito control. (Haas et al. 2003) that can be found online at:  
<http://www.michigandnr.com/PUBLICATIONS/PDFS/ifr/ifrilibra/technical/reports/2003-2tr.pdf>  
 They concluded not to use them after a thorough review of the literature that demonstrated the ineffectiveness of *Gambusia affinis* at reducing mosquito populations. In fact, *Gambusia affinis* has been shown to actually increase mosquito populations by preying upon natural mosquito predators, such as damselfly and dragonfly larvae that are likely to inhabit water bodies in Midway (Bence 1988). The presence of *Gambusia affinis* has also been shown to decrease the amount of time it takes for mosquito pupae to develop, a mechanism that increases their chances of survival to emergence (Blaustein and Karban 1990). Other studies have shown that ponds with *Gambusia affinis* support lower duckling/brood densities of Laysan ducks (M. Reynolds, pers comm.) as well as lower populations of koloa ducks (K. Uyehara pers comm.). Finally, I have been conducting studies that have correlated *Gambusia affinis* densities to increased total nitrogen concentrations in the water column. As many coastal ecosystems tend to be limited, increased N will likely increase algal and microbial production, further decreasing the habitat value for waterfowl and increasing a food source for mosquito larvae.  
 I am also concerned about the use of BTI. Studies have shown that BTI can significantly reduce other non target nematoceros flies, such as chironomids (Hershey et al. 1998), that are known to be important food sources for

<b>Comment Category 3 - Alien Species</b>	
	nesting and migrating birds. I hope that you will reconsider using these techniques for the eradication or control of mosquitoes, especially the introduction of <i>Gambusia affinis</i> . I think one of the best control techniques is the removal of standing water, which is also suggested as a technique.
3-01. Response	The military introduced the mosquito fish ( <i>Gambusia affinis</i> ) to control mosquitoes. These fish are currently found in the water catchment area, the water supply ponds, the water pipes and drains, and approximately half of the natural and man-made wetlands on Sand Island. There are no plans to distribute them further. While there are other methods of mosquito control, none are without some hazard to nontarget invertebrates. The Integrated Alien Species Management Plan will lay out an approach for mosquito eradication at Midway Atoll that optimizes safety to all components of the ecosystem and effectiveness in reducing or eradicating mosquitoes.
3-02. Comment	<p>The comments below concern whether the protocols identified in the Monument Management Plan would be implemented at all sites in the Monument to prevent the introduction of marine alien species.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) p. 197 ln 25-33 “To better understand the threat and respond to the invasive grasshopper <i>Schistocerca nitens</i>, a “Workshop to Identify Research and Mitigation Measures to Address the <i>Schistocerca nitens cricis</i> on Nihoa Island, Northwestern Hawaiian Islands” was held in 2005 (Gilmartin 2005). Addressing one of the recommendations, Monument staff will continue....”</li> <li>2) Pg 68 - Wouldn’t you prevent further importation of exotics if Midway and Tern were quarantined?</li> <li>3) Pg 89 - Wouldn’t you need to make Midway and Tern quarantined to “Prohibit introducing alien species from within or into the Monument”?</li> <li>4) Pg 161 - If “alien species are one of the greatest threats” then why no quarantine on Midway or Tern?</li> <li>5) OHA is aware that strict protocols are enforced for any visitors to Papahānaumokuākea to prevent further importation of invasive plants, animals, or insects. We are pleased that this dangerous threat is being approached with due care. However, we were surprised to read on page 68 of the draft management plan that these protocols are not used for Midway Atoll and Tern Island. Midway is certainly the place where the highest risk for introduction of invasives presents itself, and as such we inquire as to why protocols are not being used there.</li> <li>6) Under Activity AS-1.1: Complete an Integrated Alien Species Management Plan, the DMMP requires development of a plan that, “will incorporate individual Co-Trustee guidelines, as appropriate, for the most effective and collaborative efforts possible. Memoranda of agreement will be developed as necessary to adopt and implement agency guidelines...” Ocean Conservancy urges that the Integrated Alien Species Management</li> </ol>

<b>Comment Category 3 - Alien Species</b>	
	<p>Plan adopt the strictest guidelines of the three Co-Trustees and follow the precautionary approach when implementing these guidelines for all visits to the NWHI. Coordination of this effort is critical. The Monument should operate under one consistent set of best management practices to reduce confusion and increase likelihood of compliance. We recognize that best management practices may appropriately vary from island to island but urge that one set of rules be in place that governs the entire Monument rather than overlapping and possibly contradictory regulations.</p> <p>7) Activity AS-1.2: Develop best management practices to prevent, control, and eradicate alien species identifies that “One concern the plan will address is the need to prevent the spread of alien species within the NWHI, especially from Midway Atoll.” Since Midway Atoll is the most frequently visited area of the Monument, it is also the area most likely to serve as a gateway to introduction of alien species. Ocean Conservancy is concerned that although the Alien Species Best Management Practices are detailed and extensive as they apply to inter-island visits and activities at the more remote islands. They appear much weaker for Midway, where risk of introduction is highest. We urge implementation of more stringent protocols for all visitors and vessels entering Midway to avoid introductions at Midway that then may spread to other islands. Specifically, we recommend appropriate quarantines, freezing, or other treatment of luggage for employees, contractors, researchers, and visitors and that all aquatic gear for visitors is subject to the similar treatment of research gear in Appendix I. One simple way to reduce risks associated with aquatic gear would be to prohibit use of personal gear and require use of gear that remains on Midway.</p> <p>The DMMP states that “In addition, aircraft landing within the Monument are subject to inspection, as are all visitors and their luggage.” Ocean Conservancy urges adoption of a mandatory inspection policy. Given the predicted increase in visitors to Midway it is important that the Monument adopt an effective method of addressing the threats presented by a large number of transient visitors. We recommend development and adoption and strict enforcement of a comprehensive set of best management practices that cover all potential vectors of introduction including aircraft, luggage, shoes, clothing, equipment and vessels large and small, including cruise ships.</p>
3-02. Response	<p>Protocols for preventing marine alien species are identical for all the sites in the Monument. The Monument Management Plan text did not accurately reflect protocols also being employed at Tern and Midway.</p> <p>The text in Section 1.4 has been modified to state, “To prevent further importation of invasive organisms, mandatory quarantine protocols are enforced for any visitors to the NWHI. At all of the islands and atolls, except Midway and Tern, these include requiring the use of brand new or island-specific gear at each site and treatments, such as cleaning, using insecticide, and freezing, to minimize the transport of potentially invasive species to the islands. Protocols at</p>

<b>Comment Category 3 - Alien Species</b>	
	Midway and Tern Island are modified as necessary to accommodate the greater volumes of material coming in, but all possible procedures are still used to minimize additional introductions at these two sites.”
<b>Unique Comments</b>	
3-03. Comment	<p>The other one is -- pertains to alien species. And I am on -- I’m the vice chair of the Maui Invasive Species Committee pretty much since its inception, and I am the chair of the Vertebrate Subcommittee. So looking at what is provided in the action plans for alien species, I still think there needs to be more biosecurity measures. And, let’s see, I think I might remember more if I read it. I fully commend the management plan on the thoroughness and extreme important -- and the extremely important and sensitive issues incorporated into alien species treatment. I nevertheless feel that for each activity and alien taxa that appropriate rapid-response planning must be more fully explored, more formally -- formalized and funded. Active alien species surveillance with adequate funding to assure necessary equipment -- and readiness of trained staffing for rapid response to future new incursions is paramount to maintaining the integrity and biodiversity of the monument.</p> <p>To help guarantee success, there needs to be a well outfitted and equipped Papahānaumokuākea National Monument alien species rapid-response team functioning much on the same level with as much sophistication as the Brown Tree Snake Rapid Response Team does for the brown tree snake or the Oil Spill Response Workers for oil-spill incidents. And then, finally, with the alien species concern, I believe that in one section under AS-1.1, “Complete an Integrated Alien Species Management Plan, it is paramount to have an Alien Species Management Plan for the monument; however, for some invasions a time limit of two years to proceed to process -- excuse me -- for two years to process pesticide use proposals and Section 7 consultations will be too late to begin acting. Provision for preemptive pesticide use proposals and Section 7 consultations for all likely scenarios and circumstances should be added into the management plan needs and completed. These could then be shelved until actively needed. So there’s only a range of issues that -- you know, what pesticides might be used for an insect. And can we do the reviews, all the legal documentation and then shelf it so that when it’s needed, it can simply be pulled off the shelf and say, Okay. We’ve already approved it. Let’s go with it. That sort of preventive thing should be --</p>
3-03. Response	We agree with the level of detail and analysis you suggest for an adequate approach to biosecurity in the Monument and feel that the Integrated Alien Species Management Plan proposed in Activity AS-1.1 is the proper place for that planning. Two years is the estimated time frame for completing all necessary compliance documents regarding the situations and tools we can anticipate. Many of those are already in place and others are in progress.
3-04. Comment	Pg 172 - Ironwoods also take plenty of nesting habitat away from seabirds?

<b>Comment Category 3 - Alien Species</b>	
3-04. Response	We agree that ironwood ( <i>Casuarina</i> ) woodlands are not preferred habitat for many species of seabirds nesting at Midway. That is why we have identified it as a high priority for removal from most of the land areas at Midway Atoll where it occurs. We do recognize that these trees are providing nesting habitat for the largest colony of white terns ( <i>Gygis alba</i> ) in the central tropical Pacific, so it is imperative that adequate native species alternatives be provided for this population as their nest trees are removed.
3-05. Comment	I am very pleased that the plan recognizes the threat posed by invasive species and hope that sufficient resources will continue to be devoted to this vital set of activities.
3-05. Response	Development of a rapid response team was considered to be part of our rapid response action plan for alien species and is now explicitly included in Activity AS-1.2: Develop best management practices to prevent, control, and eradicate alien species.
3-06. Comment	Pg 198 - Mowing verbesina is an ineffective management tool. Mowers run over seabirds and crush burrowing seabirds while dispersing seeds.
3-06. Response	We agree that mowing is a tool that should be used only in circumstances where hazards to seabirds, seabird burrows, and Laysan ducks can be avoided. Mowing before verbesina has set seeds reduces the seed bank and has been used effectively for years.
3-07. Comment	Marjorie and others mentioned the risk of alien species, invasive species. We see that there really has been very little monitoring of cumulative impacts. There really has been no meaningful risk assessment. We are looking at this since the Reserve was established in 2000. We sort of see a pattern. We have seen the state refuge established with much stronger protections than in federal waters. And yet within a year of state refuge protection the new Monument Plan, the Coast Refuge Management Unit has actually served to further weaken efforts in state waters.
3-07. Response	Over the past several years the Monument has been addressing the issues of alien species introduction and working toward developing the Integrated Alien Species Management Plan. An initial study of marine invasive species, with recommendations for reducing the potential impact, was completed in 2006. An additional report on the specific locations of known alien species was completed in 2007. In addition alien species were included in the threat analysis that HIMB completed for the Monument.  The MMB recognizes the importance of evaluating the cumulative impacts of human activities conducted in the Monument and has begun to collect data for this analysis. Assessing and analyzing required permit reports for all permitted Monument human activities will be a primary means for resource managers to understand the cumulative

<b>Comment Category 3 - Alien Species</b>	
	impact of ongoing activities (see Activity P-2.2, Analyze permit data to inform management decision making). In addition, information about past activities, such as military uses and fishing, is critical to our understanding of the Monument's ecosystem and to establish a baseline for evaluating the health and condition of its natural, cultural, and historic resources and analyzing how current activities, either individually or cumulatively, are impacting Monument resources. Such past activity data is one of the many sources that will be incorporated into the PIMS (Activity IM-1.1, Activity IM-1.4, and Activity P-2.1).
3-08. Comment	Page 71 Line 28: The risk of mammalian predators and other predatory or competitive species, new diseases and disease vectors could devastate the fauna of the Monument. The impacts and risk of rats and other accidental introductions should be emphasized here. Again action plans for each island are needed for quick response to catastrophic species introductions.
3-08. Response	A "rat spill" plan to address preparation for rapid response in the event of an accidental release of rodents on Monument islands will be included in the Integrated Alien Species Management Plan. (AS 1.1), Similar quick response plans will be developed for the range of likely introductions in this plan.
3-09. Comment	Section 3.3 Reducing Threats to the Ecosystem. <sup>2</sup> Alien Species are most often introduced in ballast discharge or by tourists to Midway in Vol. IV. Disinfection protocols must be in place before any ships should be allowed entry to Monument waters.
3-09. Response	Best management practices for ballast water will be consistent with the State of Hawai'i comprehensive ballast water regulations (see Vol. III, Appendix G) and hull fouling program that is in preparation. They also are consistent with the Coast Guard's Mandatory Ballast Water Management Program for US waters, which requires that a vessel-specific ballast water plan be followed.
3-10. Comment	I fully commend the draft MMP on the thoroughness of the extremely important and sensitive issues incorporated in alien species treatment. I nevertheless feel that for each activity and alien taxa that appropriate rapid-response planning must be more fully explored, formalized and funded. Active alien species surveillance, with adequate funding to assure necessary equipment and readiness of trained staffing for rapid-response to future new incursions, is paramount to maintaining the integrity and biodiversity of the Monument. To help guarantee success, there needs to be a well out-fitted and equipped Papahānaumokuākea National Monument alien-species rapid-response team, functioning much on the same level with as much sophistication as the Brown Tree Snake Response Team does for the snake, or Oil-Spill Response Workers for oil-spill incidents.
3-10.	As part of the Integrated Alien Species Management Plan (AS 1.1), we will prepare contingency plans, with detailed

<b>Comment Category 3 - Alien Species</b>	
Response	response actions for all conceivable types of alien species infestations. Also, we considered developing a rapid response team to be part of our rapid response action plan for alien species, and it is now explicitly included in Activity AS-1.2: Develop best management practices to prevent, control, and eradicate alien species.
3-11. Comment	Regarding the mice on Sand Island, by all means, get rid of them. And clean out rodents on any other islands in the archipelago. I would think that it would take a lot less than five years to find a rodenticide that would not harm the birds.
3-11. Response	Sand Island, Midway Atoll, is the only island in the Monument that still has any rodents, so all additional rodent management besides eradicating house mouse is to prevent future rat and mouse introductions and to ensure that specific and detailed plans are in place to respond to any future rodent “spills.” Alien species control beyond the Monument is beyond the scope of this plan.
3-12. Comment	Nonnative problem species (such as rodents, nonnative plants) should be slated for removal throughout the archipelago. Great care should be instituted to prevent introduction of nonnative organisms, especially to the more pristine islands.
3-12. Response	The MMB agrees that the removal and prevention of nonnative species is a priority, and we included an Alien Species Action Plan (3.3.2) to address the detection, eradication, and where possible, continued prevention of invasive species.
3-13. Comment	Please do not allow military & commercial persons or equipment, tourists or divers to use NWHIs. Even research needs to be limited to minimize the risk of invasive seaweeds.
3-13. Response	In 2007, the MMB adopted the Disease and Introduced Species Prevention Protocols (see Vol. III, Appendix G.), which are applied to all permitted activities in the Monument. These strict protocols deal explicitly with dive gear, and all other equipment used in the water, including tender vessels that travel among the NWHI and between the NWHI and the main islands.
3-14. Comment	And also on the verbesina control, the funding goes up and down. We need to get a better source of funding to have a concerted effort to get Pearl, Hermes and Midway get this weed under control.
3-14. Response	We agree. The inclusion of Activity AS-6.1 in the plan to eradicate verbesina throughout the Monument affirms that consistent funding for this project is needed.
3-15. Comment	Last, we are concerned about invasives getting up there, even just accidentally by well-intended people. I think most of the Northwestern Hawaiian Islands are rat free or I think they’re rat free now. We don’t want to get to the point where we have rats again. All you need is a shipwreck with some rats onboard. That’s likely. We don’t want to spread more

<b>Comment Category 3 - Alien Species</b>	
	species of ants up there. The ants chew up the chicks and eat ‘em alive. We don’t want to lose seabirds to invasive ants. We’re very concerned about the more people go up there the more likely you’re going to have invasives established.
3-15. Response	We agree. Strategy AS-3 contains activities to prevent introducing or reintroducing alien species of all kinds.
3-16. Comment	What will happen when alien species and rat and mice populations infest the atolls, killing nesting birds, hatching turtles, plant root systems that act as cover and nesting structure for birds? Fire ants are a prime example of a noxious alien species introduced into Hawai‘i.
3-16. Response	We agree. All these threats, existing and potential, have serious consequences for Monument habitats and wildlife. How these invasive species are being removed and prevented is discussed in the Alien Species Action Plan.
3-17. Comment	Section 3.1 (New) Remediation and Restoration Plan. Removal of non indigenous terrestrial flora & fauna including ironwood, habitat restoration and reintroduction of endemic biota should be planned and proceed immediately following remediation. When the remediation and restoration has been completed, and the former terrestrial and marine ecosystems restored, a new plan for the Protection, Conservation and non consumptive use of Midway Atoll can be written, this time with public comment and RAC oversight and preventive measures to preclude further introduction of invasive exotic species. All cruise ships should be excluded from Monument waters until pending regulations intended to prevent unlawful discharge of wastes have been shown to be effective, and have been incorporated into the Plan and Permit system. All military artifacts deemed of historic value should be “curated” (removed from Monument islands and waters).
3-17. Response	The purpose of the Alien Species Action Plan is to detect, eradicate where possible, control, and prevent the introduction of alien species. Sand and Eastern Islands are highly disturbed environments that require extensive effort. It is unlikely with foreseeable budgets that they could ever be restored, particularly without violating historic preservation mandates. The Integrated Alien Species Management plan will prioritize eradication projects to eliminate alien species, focusing first on those that disrupt community species composition and ecological structure and function most severely.
3-18. Comment	Alien Species Action Plan: We recommend that NOAA take immediate steps to require any fishing vessel still allowed to fish in the area to have its hull thoroughly and completely cleaned before entering Monument waters. Fines for private vessels entering the Monument with their hulls still fouled should be set at very high levels so as to act as a real deterrent.
3-18.	All vessels are prohibited from releasing alien species in the Monument. We have shared this comment with the

<b>Comment Category 3 - Alien Species</b>	
Response	National Marine Fisheries Service, which manages the federal fishery that operates in the Monument and is a part of the MMB.
3-19. Comment	According to the DMMP, the development of the Integrated Alien Species Management Plan (Activity AS-1.1) will be led by FWS and the best management practices (Activity AS-1.2) will be led by FWS and NOAA (Table 3.3.2). Given the critical importance of these plans, Ocean Conservancy recommends that they be developed by the MMB in consultation with both terrestrial and marine experts.
3-19. Response	Although one agency might be listed as the lead, all other MMB members will be fully involved in developing and approving any step-down plan. We will involve both terrestrial and marine experts as appropriate and necessary.
3-20. Comment	p. 200 ln 18 "...require systematic investigations as outlined for the Nihoa grasshopper invasion on Nihoa (Gilmartin 2005) into..."
3-20. Response	An investigation for the grasshopper invasion on Nihoa is outlined in Activity AS-8.2.
3-21. Comment	p. 200 line 36 "...and best management practices (e.g. video title, author)..."
3-21. Response	We have modified the text in Activity AS-9.1 to say, "The outreach may consist of printed materials and videos, as well as presentations that are part of the permit application process and taxonomy training for staff and volunteers."
3-22. Comment	Strategy AS-4: should read "Eradicate nonnative mammals"
3-22. Response	There are no other species of nonnative mammals left in the Monument other than the house mouse. In the quarantine and prevention sections we generalize to include all mammals.
3-23. Comment	<p>3.3.2 Alien Species Action Plan</p> <p>In a recent survey of 25 scientific experts on the NWHI, alien species were identified as one of the top three threats to the NWHI.<sup>35</sup> In spite of the remoteness of the NWHI, eleven different alien marine invertebrate, fish and algal species have already been documented in Monument waters. With visitation to the Monument expected to increase, the risk of additional introductions is extremely high. Alien species infestations can permanently alter the Monument's ecosystem and, once introduced, these species are often impossible to eradicate completely. Prevention is therefore critical. Ocean Conservancy supports the regulatory prohibition on the release or introduction of alien species into the Monument and</p>

<b>Comment Category 3 - Alien Species</b>	
	implementation of best management practices such as mandatory hull inspections designed to avoid introductions. However, given the seriousness of the risk, it is critical that the alien species action plan is effective, enforceable and strictly enforced. It is not sufficient to rely on management measures (like ballast exchange protocols and best management practices) that may or may not actually be followed in practice. What is needed is essentially a zero tolerance approach to alien species with strict enforcement of all measures designed to avoid introductions.
3-23. Response	We agree and intend to fully enforce all regulations and protocols to prevent the introduction of alien species into the Monument.
3-24. Comment	In the section Activity AS-1.1: Complete an Integrated Alien Species Management plan it is paramount to have “An Integrated Alien Species Management Plan for the Monument” however, for some invasions a time limit of 2 years to process pesticide use proposals and Section 7 consultations will be too late to begin acting. Provision for Pre-emptive Pesticide Use proposals and Section 7 consultations for “likely scenarios and circumstances” should be added into the Management Plan needs, and completed, then shelved until actively needed.
3-24. Response	The IASP and associated compliance requirements will be updated every five years and will include such components as obtaining pesticide use permits and conducting ESA Section 7 consultations before they are needed to facilitate rapid response. See Monument Management Plan Activity AS-1.1.
3-25. Comment	Pg 155 - Sand Island should be taken off the list unless the Maui sp of <i>Pritchardia</i> is removed.
3-25. Response	We have modified the text to state, “Factors to consider include avoiding impacts on native species at establishment sites, finding suitable habitat, and choosing areas accessible enough to allow for planting and monitoring introduced populations. Mokumanamana, Laysan Island, Kure Atoll, and Eastern and Sand Islands at Midway Atoll should be considered as potential sites, providing there is no chance of interference with species endemic to the translocation sites and no related species at the destination site that might hybridize with the translocated plants.”
3-26. Comment	Page 67 Line 42: <i>Pluchea indica</i> is classified as a noxious weed known to negatively impact wetlands. The primary impact of introduced ants on Laysan Island is not their impact on Laysan’s seabirds, but their impact on the native endemic terrestrial invertebrate fauna (especially endemic lepidopteran larvae), and other important prey for to migratory and land birds, or ecosystem function.
3-26. Response	We have added this sentence to this paragraph in Section 1.4, “Invasive ant species have been detected at all of the islands in the Monument and pose threats to many components of the terrestrial ecosystem, most notably native

<b>Comment Category 3 - Alien Species</b>	
	terrestrial invertebrates (e.g., endemic lepidopteran larvae) and native plants. They also have been observed preying on the eggs and chicks of seabirds in the Monument.”
3-27. Comment	Within Strategy AS-5: add to existing text “Ensure that pesticide protocols include evaluation of potential impacts on native aquatic and marine species.”
3-27. Response	Pesticide use proposals are required for all pesticide applications in the Monument. These proposals require an analysis of all potential impacts to terrestrial and aquatic (freshwater and marine) species.
3-31. Comment	<p>3.3.2 Alien Species Action Plan</p> <p>In a recent survey of 25 scientific experts on the NWHI, alien species were identified as one of the top three threats to the NWHI.<sup>35</sup> In spite of the remoteness of the NWHI, eleven different alien marine invertebrate, fish and algal species have already been documented in Monument waters. With visitation to the Monument expected to increase, the risk of additional introductions is extremely high. Alien species infestations can permanently alter the Monument’s ecosystem and, once introduced, these species are often impossible to eradicate completely. Prevention is therefore critical. Ocean Conservancy supports the regulatory prohibition on the release or introduction of alien species into the Monument and implementation of best management practices such as mandatory hull inspections designed to avoid introductions. However, given the seriousness of the risk, it is critical that the alien species action plan is effective, enforceable and strictly enforced. It is not sufficient to rely on management measures (like ballast exchange protocols and best management practices) that may or may not actually be followed in practice. 3-31. Response	We agree and intend to fully enforce all regulations and protocols to prevent the introduction of alien species into the Monument.

<b>Comment Category 4 – Carrying Capacity</b>	
<b>Summarized Comments</b>	
4-01. Comment	<p>The comments below express concern about the overall number of people accessing the Monument.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) Please establish a numerical carrying capacity for the region based upon the Precautionary Principle and immediately conduct a cumulative assessment of the risks and impacts of human activity in the Monument.</li> <li>2) Fails to set a protective limit on all human activity in this delicate area, including military exercises, research, and tourism</li> <li>3) To add to that understanding cumulative impacts. So part of creating these, creating these priorities, thinking about what should go on up there is talking about cumulative impacts. What’s the carrying capacity of this resource? What can we realistically do up there? How many people can it take? How much vessel traffic can it take before we really start to see impacts? This is intimately related to the precautionary principle, and intimately related to how we implement this permitting system.</li> <li>4) We see an honest assessment of what the true intentions are for the Monument on page D-31, where language describes the expectation that research will greatly increase in the next ten years. This anticipated increase in research, which we find to be out of alignment with the vision and purpose of the Monument, also means more employees, visitors and impacts and thereby creates the need for greater scrutiny to be given to the cumulative impact analysis. We also see on page D-53 a statement that there is an expectation of future requests to grow in regards to commercial photography, videography, filming, audio recording, etc. This again call for greater scrutiny than currently exists in the cumulative impact analysis. Page D-80 creates a strong argument for why a more complete cumulative impact analysis is necessary, it states: “Although research projects for a single year may cause few, if any, negative resource impacts, it may in fact cause cumulative impacts over multiple years or when considered additively with all research projects in the Monument.” Yet despite this seemingly insightful awareness, there appears to be a strong and disturbing trend towards approving increasing and ongoing activity in the Monument that needs to be addressed.</li> <li>5) Conduct a comprehensive assessment of the risk and cumulative impact of past and proposed human activity in the Monument. This will require the Co-Trustees to prioritize who is allowed to enter this fragile area and for what reasons. This is especially important for research activities in the NWHI, which should only be allowed if they further a specific management goal and can demonstrate no harm to any Monument resources.</li> </ol> <p>Papahānaumokuākea is not a “natural laboratory,” as the DMMP describes it. It is a place of refuge, where no</p>

<b>Comment Category 4 – Carrying Capacity</b>	
	<p>human activity should be allowed unless absolutely necessary.</p> <p>6) Assess the risk and cumulative impact of all human activities affecting the region, including global warming. The current environmental assessment fails to adequately review the past, present, and likely future impacts of the human presence in the Monument. This information is crucial for proper management and should serve as the basis for numerical carrying capacity.</p> <p>7) The last point is that the plan proposes an increase in human activity. It should be looked at rather carefully if that's warranted.</p> <p>8) There must be a limit determined for the year in advance by the citizens council on the number of permits allowed for groups of tourists, scientific researchers, study groups and fishermen.</p> <p>9) There must be a limit on the number of tourists and researchers each year.</p> <p>10) To add to that understanding cumulative impacts. So part of creating these, creating these priorities, thinking about what should go on up there is talking about cumulative impacts. What's the carrying capacity of this resource? What can we realistically do up there? How many people can it take? How much vessel traffic can it take before we really start to see impacts? This is intimately related to the precautionary principle, and intimately related to how we implement this permitting system.</p> <p>11) Set a numerical carrying capacity based on the precautionary principle that to limit the number of people and vessels accessing this fragile region.</p>
4-01. Response	<p>Protecting the health, diversity, and resources of the NWHI ecosystems is the MMB's constant and highest concern. Although currently there are no specific annual limits on the number of people accessing the Monument, all human activities in the Monument are closely managed and monitored through the interagency permitting process (Strategy P-2 and Appendix A), the Papahānaumokuākea Information Management System (Activity IM 3.6.2), and the Evaluation Action Plan (Section 3.6.4). In addition, while the MMB restricts visitor access to Midway, it does not limit the total number of yearly visitors to Midway. However, the Midway Atoll Visitor Services Plan (Section 3.4.3, Appendix B) requires visitors to obtain a permit and sets limits on the number of overnight visitors and the number and size of large group visits. Data about the number, activities, and potential impacts of visitors is maintained in the Information Management System.</p> <p>The MMB recognizes the importance of evaluating the cumulative impacts of human activities conducted in the Monument and is collecting data for this analysis. Assessing and analyzing required permit reports for all permitted Monument human activities will be a primary means for resource managers to understand the cumulative impact of ongoing activities (see Activity P-2.2, Analyze permit data to inform management decision making). In addition,</p>

**Comment Category 4 – Carrying Capacity**

information about past activities, such as military uses and fishing, is critical to our understanding of the Monument’s ecosystem and to establish a baseline for evaluating the health and condition of the its natural, cultural, and historic resources and analyzing how current activities, either individually or cumulatively, are impacting Monument resources. Such past activity data is one of the many data sources that we will incorporate into the Information Management System (Activity IM-1.1, Activity IM-1.4, and Activity P-2.1).

A fundamental component of any threat or risk assessment is to have a baseline understanding of the Monument ecosystems and how these may be influenced by natural and human activities. Strategies MCS-1, Continue and expand research, characterization and monitoring of marine ecosystems, and MCS-2, Assess and prioritize research and monitoring activities, will provide the fundamental monitoring data and information that is essential, along with the human use and impact data described above, to conduct such assessments. While data is mostly collected and analyzed for local areas in the Monument, collectively it supports other efforts to evaluate the threats to the NWHI at a Monument or regional scale. In response to the comments, we have changed the text to the Monument Management Plan in Section 3.4.1, Permitting Action Plan, Permit Tracking, and Activity P-2.2.

Until a comprehensive analysis of threats, including human uses, is completed, the MMB as a matter of policy seeks to ensure that access is consistent with Proclamation 8031 and that, wherever possible, activities are combined to limit multiple visits to a given area. Carrying capacity could need to be assessed for biological, ecological, cultural, physical, social, infrastructure, and other conditions for any given area. However, the MMB must first focus its efforts on establishing baseline parameters for measuring changes to the health, quality, or function of Monument resources; then, we must assess the relative individual and cumulative impacts from human activities on these resources. Information collected and analyzed will depend on the activity and the specific ecosystem that the activity is conducted in. The results from the cumulative impact analysis, the risk assessment, and the monitoring conducted in the Monument will help define these values over time. It will not be possible to consider various carrying capacities for the Monument resources until these data can be analyzed. It will also be important that these values be regularly revisited as we learn more about the ecosystem and the changing environment.

As it pertains to the precautionary principle, the MMB has identified eleven principles for managing the Monument. The seventh Guiding Principle (Errs on the side of resource protection when there is uncertainty in available information on the impacts of an activity) honors the approach of “do no harm,” consistent with the precautionary principle in which historic, cultural, and natural resource protection and integrity is favored.

Presidential Proclamation 8031 prescribes numerous prohibitions and regulated activities to protect the Monument’s resources. However, as protective as these provision are, the Proclamation never intended to prohibit all human use and access to the Monument. The Proclamation made specific allowances for continuing a small, permitted commercial

<b>Comment Category 4 – Carrying Capacity</b>	
	<p>bottomfishery until 2011, limited sustenance fishing (if consumed in the Monument), vessel transit, and armed forces actions. The Proclamation also established a permit system to allow a narrow range of other activities, provided there is a finding that the activity is research designed to further understanding of the Monument resources and qualities, that it furthers educational value of the Monument, that it assists in the conservation and management of the Monument, and that it allows Native Hawaiian practices, special ocean use, and recreation. These permitted activities will be allowed only if there are adequate safeguards for the resources and ecological integrity of the Monument, and if the activity meets the findings of the proclamation (see Proclamation 8031, and Vol. III, Appendix D).</p> <p>We have changed the Monument Management Plan to address the concern about a natural laboratory.</p>
4-02. Comment	<p>The comments below stated that no humans should be allowed within the Monument.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) No humans.</li> <li>2) Keep the marine Monument free from all human footprint. This is the most biologically diverse ecosystem on the planet. The critically endangered species struggling to survive in a marine environment which is increasingly unhealthy due to human actions, marine mammals, turtles and birds are dying of plastic ingestion and entanglement in plastics as well as discarded fishing nets and gear by the hundreds of thousands every year. In certain areas of the ocean the suspended plastic particles outnumber plankton six to one. Overfishing is causing a devastating collapse of fish stocks and entire marine ecosystems. Fifty-two percent of the world’s fisheries are fully exploited and 24 percent are overexploited, depleted or recovering from collapse. The global fishing fleet is two to five times larger than what the oceans can sustain or support. Seventy-two percent of the world’s marine fish stocks are being harvested faster than they can reproduce. A full one fourth of all total catch, 27 million tons, is unintended bycatch. We’re wiping out the entire fish populations. Marine biologists say that the stocks of large ocean going fish have fallen by 80 to 90 percent. The critically endangered Hawaiian Monk seal’s dropping 4 percent a year. With under only 200 left that gives us less than 20 years to save this endemic rare species. Ninety percent of the Monk seals population lives in the Northwestern Hawaiian Islands.</li> <li>3) I am concerned about the use of this place. Every place, especially those sacred places, have a job, a role, something to teach. Papahānaumokuākea is considered wao akua, wao akua, sacred place. Wao akua were left wild and were seldom accessed by people because of their critical role in the process of life, death or creation and afterlife. I believe this is one of those places. It has been assigned many jobs over the years: Military, tourism, science and contemporary educator. It has been working very hard for a very long time trying to meet man’s needs. Now it deserves a rest, a time to recover and recoup. I ask all of us to reflect, slow the train, take</li> </ol>

<b>Comment Category 4 – Carrying Capacity</b>	
	<p>this time to think. This unique global universal resource deserves, requires new thinking about issues such as environmental justice, intellectual property rights and indigenous knowledge and needs.</p> <p>Any use of this sacred resource is a taking. And compensation should be paid possibly funding a study to better understand the akule fishery, a vital food in Hawai‘i. We don’t have much experience with places like this place. We must not get stuck on the steps we are comfortable with. We need to build new ones. Contemporary laws and timelines are not appropriate here. Let’s begin with rest. Do nothing until you and we are certain we have a pono plan. Give this place a break from all impacts. This is a sacred resource and it deserves nothing less. Do nothing. Respect it with rest.</p> <p>4) I would like to see the place kept absolutely empty. It was mentioned the navy being there, you know, they have a -- I can see the navy turning the whole place into kind of their private R &amp; R thing with hamburgers and hot dogs, vacation zone. And, you know, I think that it should be just left empty. There’s so much going on in the world that is of such pressing importance right now and if this could just do whatever it needs to do by itself with the exception of maybe divers going in and cutting nets and keeping that plastic coming out of the reefs and whatnot.</p> <p>5) No human footprint in NW Hawaiian Islands.</p> <p>6) My concern is too many people on fragile, fragile lands. I want to relate two stories of my life. I grew up in California. And from the mid ‘60s to the mid ‘80s I spent sometime every year in the High Sierras backpacking. Over those years as the population of California and the western United States increased obviously the numbers of people in the High Sierras increased. It’s devastating to see what had happened with that increase in pop -- in a very fragile environment. That’s one issue.</p> <p>The other, I grew up on the coast in California, Santa Barbara, California off of the Channel Islands. When I was a young boy you could go down on low tides and clam and take abalone from the rock, catch lobsters in shallow waters. That’s all gone. Not only is it all gone from along the coast but in the ‘50s, and ‘60s they cleaned pretty much the Channel Islands of all of the abalone and ruined a lot of the fisheries. So this is population. And this is what we’re talking about, population and fragile islands out here. The only way to protect ‘em is to put them off limits.</p>
4-02. Response	<p>Although the Monument is in a pristine condition, compared to the main Hawaiian Islands, the islands and atolls already have been impacted by humans. It is our responsibility to lessen those impacts and restore habitats, to the extent possible. We also need to understand the natural, cultural, and historic resources in order to best protect them. Outside influences, such as marine debris, alien species, and climate change, would continue to impact the Monument even</p>

<b>Comment Category 4 – Carrying Capacity</b>	
	without human presence. Also, by managing visitation, the MMB provides opportunities for the public to better understand the unique biological, cultural, and historic treasures of the Monument. The best opportunity to protect this area comes through the limited human activities included within the Monument Management Plan. Proclamation 8031 requires activities to be conducted with adequate safeguards for the resources and ecological integrity of the Monument.
<b>Unique Comments</b>	
4-03. Comment	In many cases, the individual project analysis represents a highly biased and incomplete measurement of the actual and potential negative impacts from proposed actions and is thus a misrepresentation of the interactive and cumulative impacts with a definite slant towards the beneficial impacts from the proposed projects. Among the many cumulative effects that are essentially disregarded include the negative impacts of proposed construction activities, increased visitor and tourist activity on Midway and throughout the Monument, dilution of, and transgressions against, Native Hawaiian Culture, and issues of fairness and equality in access to the Monument.
4-03. Response	<p>The Monument Management Plan includes a description of several strategies and associated activities the agencies will implement in the Monument over the next 15 years. In Volume 2 of the environmental assessment is a discussion about the potential environmental impacts from any of the Monument Management Plan strategies and activities. Although the Monument Management Plan and the associated environmental assessment describe these activities and their impacts in general terms, they cannot, for the most part, fully analyze the impacts of every action that will be taken or authorized by the agencies over the next 15 years. Agency actions are subject to NEPA and HRS Chapter 343. Each action will be reviewed and further NEPA compliance will be undertaken as appropriate. Some of these activities will be eligible for a categorical exclusion, while others will require the preparation of an environmental assessment or environmental impact statement, depending on the significance of the impacts. Volume 2, Section 1.8 describes the categorical exclusions for each of the agencies.</p> <p>Although the Monument Management Plan describes some general planning documents or conceptual site plans for Midway and other infrastructure projects that may include construction, the environmental assessment does not fully assess their environmental impacts. Such projects would require separate NEPA and HRS Chapter 343 analyses, including an assessment of compliance with state water quality standards and consultation with the US Army Corps of Engineers.</p>
4-04. Comment	There should be no more extractive research, no more tourism, no more military, no more footprints on the Northwestern Hawaiian Islands. You have a big responsibility to protect this very, very important area for all of us. You know, it will be on your conscience. When there is pilikia and problems up there it is you that are supposed to be

<b>Comment Category 4 – Carrying Capacity</b>	
	watching out for our best interests in protecting that area in the spirit of aloha `aina.
4-04. Response	<p>The overall emphasis on protecting the health, diversity, and resources of the NWHI ecosystems is our constant and highest concern. Although we have not included specific annual limits on the number of people accessing the area in the Monument Management Plan, we will be closely monitoring activities through the permitting process, the Papahānaumokuākea Information Management System, and the Monument evaluation process. The number of tourists visiting the Monument at any one time is also limited through the Midway Atoll Visitor Services Plan.</p> <p>Presidential Proclamation 8031 prescribes numerous prohibitions and regulated activities to protect the Monument’s resources. However, as protective as the provisions are, the Proclamation was never intended to prohibit all human use and access to the Monument. The Proclamation made specific allowances for the continuation of a small, permitted commercial bottom fishery until 2011, vessel transit, and armed forces actions. The Proclamation also established a permit system to allow a narrow range of other activities, provided there is a finding that the activity is research designed to further understanding of the Monument resources and qualities, that it furthers educational value of the Monument, that it assists in the conservation and management of the Monument, and that it allows Native Hawaiian practices, special ocean use, and recreation. These permitted activities will be allowed only if there are adequate safeguards for the resources and ecological integrity of the Monument, and if the activity meets the findings of the Proclamation (see Proclamation 8031, and Volume III, Appendix D).</p>
4-05. Comment	<p>A general and often used description of the anticipated impacts of the uses exist on page D-67. These sections list most, if not all, of the critical habitat and species within the monument and in many cases how they have been negatively impacted in the past, mostly through human activity. In particular the examples of coral reef devastation in Guam paint a horrifying picture of how the smallest error could produce catastrophic effects on the entire ecosystem. Most of these potential impacts are just acknowledged and then responded to by stating that USFWS will work to mitigate and does not foresee a problem. If these areas are so critical and sensitive, how is it that USFWS cannot foresee any problems arising from the myriad uses that they find to be compatible, especially when most negative impacts in the past or in similar environments are man made.</p>
4-05. Response	<p>The FWS considers activities in the National Wildlife Refuges of the Monument through the Compatibility Determination and permitting processes. Consideration is based on the benefits to protect, understand, and manage the NWHI ecosystems and to provide access in accordance with the proclamation, the National Wildlife Refuge System Administration Act, and other applicable laws. However, protecting the health, diversity, and resources of the NWHI ecosystems is our constant and highest concern. Foreseeable potential impacts are weighed against the foreseeable potential benefits. Through the compatibility determination and permitting processes, managers may allow activities</p>

<b>Comment Category 4 – Carrying Capacity</b>	
	and establish terms and conditions under which the activities are conducted so they do not materially detract from our ability to meet our primary conservation mission. Appendix C, Specific Terms and Conditions, provides some examples of terms and conditions for the compatibility determination mentioned.
4-06. Comment	Finally, on page D-151, we see an example of a signed refuge determination, which is what would be expected for a document of this importance. Strangely though, most of the others included in this appendix do not bear such marks and are simply left blank where signatures are called for. Does this render these determinations inadequate, incomplete or perhaps worse, not actually in accord with what the wishes and understandings of the necessary leaders whose signatures are conspicuously absent? For examples of unsigned documents please see D 8, 17, 27, 38, 49, 60, 74, 86, 110, 124.
4-06. Response	In accordance with National Wildlife Refuge System guidance, compatibility determinations are released for public review and comment before they are approved and signed. As indicated in the compatibility determinations for Midway Atoll Interim Visitor Service Plan in Appendix C, the signed compatibility determinations included within the Monument Management Plan were approved in May 2007 as part of the Midway Atoll Interim Visitor Services Plan. They remain valid until their specified reevaluation date. All compatibility determinations in the Monument Management Plan have been reviewed based on public comments, approved by the appropriate FWS officials, and signed.
4-07. Comment	The Monument is of cultural and religious significance to Native Hawaiians, not only at designated archeological sites but also throughout the entirety of its borders. USFWS needs to make greater efforts to be cognizant of the impacts that visitors will have, regardless of their “reason” for being in the Monument, on the inherent cultural value of this special place to Native Hawaiians. We see language in the Justification section on page D-25 that uses the phrase “may be enjoyed” when referencing Monument staff and managers relationship to the resources, which coincidentally precedes “protected in perpetuity.” This is indicative of treating the Monument as more of a playground than a Sanctuary.
4-07. Response	Under Presidential Proclamation 8031, recreational visitation within the Monument is limited to Midway Atoll. This visitor program enhances our ability to share the importance of the NWHI, as well as its sacred status to Native Hawaiian communities, and to share this with a broader group of people. We have modified the Operations of Monument Co-Managing Agencies compatibility determinations to remove the phrase “may be enjoyed.”
4-08. Comment	The protections afforded to a Monument seem to be less than those afforded to a Sanctuary, which concerns us.
4-08.	There are differences between protections afforded under Proclamation 8031 and those that would have been afforded

<b>Comment Category 4 – Carrying Capacity</b>	
Response	under the NMSA. However, much of the language of Proclamation 8031 was based on preliminary work done to propose the NWHI as a National Marine Sanctuary.
4-09. Comment	What will happen when increased demands of tourism (the cash crop) up the count of daily arrivals causing increased on the natural life of the atolls? Tourism never decreases, only increases.
4-09. Response	The Midway Atoll Visitor Services Action Plan and its associated Midway Atoll Visitor Services Plan will allow the program to grow from the current level of 40 overnight visitors to 50 overnight visitors within existing infrastructure limitations, at least for the next 15 years. We have not planned for expanding beyond that level.
4-10. Comment	Then I would also echo the other comments made here that we have a cap on the total number of tourists that are going to the Monument. People do not fight so hard to have a space if it's to be a place for the rich and famous. That's one of those political will things.
4-10. Response	We agree that the number of visitors at Midway should be limited. In the Midway Atoll Visitor Services Action Plan and its associated Midway Atoll Visitor Services Plan, we set that limit at no more than 50 overnight visitors at any one time, and no more than 800 day visitors (400 on-island at a time) at any one time for large-scale events (limited to no more than three per year).
4-11. Comment	And then later on they're talking about another picture of a house they're going to remodel, the Clipper house. The Clipper house presently serves the primary food service facilities for Midway, although the food service will need to be expanded to accommodate future population increases. Now, I suppose this thing they're talking about back here, the maximum of one hundred fifty people, that's one hundred fifty people for today, tomorrow, next year. But who's -- they said they're increasing it sixteen percent already to get up to one hundred fifty. They originally were one hundred and twenty. I'm wondering who's going to legislate whether it will be two hundred and fifty or three hundred people ten years from now? So I'm concerned about the numbers of people and how much of this stuff is going to be cleaned up. I guess that's my comments.
4-11. Response	The Midway Atoll Conceptual Site Plan, as part of the Monument Management Plan, proposes a 150-person maximum overnight population on Midway, an increase of 30 people over the current capacity. As Midway develops into an operational hub for the Monument, we envision an increased presence by NOAA and state staff, in turn requiring additional FWS contractor and staff support. The potential increase in the number of visitors from 40 to 50 also contributes to the increased population. Although the infrastructure, such as the Clipper House, may need to be enlarged to accommodate an increased population, the Co-Trustees support these enhancements as a means to improve Monument management.

<b>Comment Category 5 - Ecosystem Health</b>	
<b>Summarized Comments</b>	
5-01. Comment	<p>The comments below suggest the No Take Policy be considered in the implementation of the activities in the Monument Management Plan to ensure protection of resources in the Monument.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) Starting with the first sentence (1) and often reiterated throughout the entire Draft Management Plan, and, with strict limits, by the Proclamation 8031 (2), the mandate is that the entire Monument is a “fully protected marine conservation area,” warranting the “highest levels of protection possible” (3). This constitutes a No Take Policy within the Monument, consistent with the interpretation and enforcement of such designation in National Monuments, Refuges and Sanctuaries elsewhere and with the Marine Life Protection Act, and with law and policy of the State of Hawaii. “Thou Shalt Not Kill” or even remove any nonliving resources, is the acknowledged mandate, and the precautionary principal requires implementation of all measures necessary to preclude any potential take. This is very strong, even extreme law, but given Papahānaumokuākea’s irreplaceable biological treasure, cultural heritage and strategic importance to our very survival, a No Take Policy is not extreme, or even just prudent, it is fundamental to the motivation for the creation of the Monument, and consistent with the Native Hawaiian call for a pu‘uhonua, a place of refuge for the indigenous species of Paphanaumokuakea.</li> </ol> <p>Therefore, it is quite dismaying to find that No Take Policy is disregarded by large sections throughout the Plan, resulting in numerous, predictable, avoidable, and significant adverse environmental impacts unassessed by the “Environmental Assessment,” and numerous other substantial and predictable impacts being overlooked entirely. It makes no attempt to catalog these adverse impacts of Management Plan opening up the Monument to broad reaching human activities, as required by NEPA to constitute an Environmental Impact Statement, nor does it include the NEPA required avoidance and/or mitigation measures for resultant adverse impacts.</p> <ol style="list-style-type: none"> <li>2) Section 3.4 Managing Human Activities</li> </ol> <p>No Take Policy constitutes a Prime Directive to Trustees, management and staff to manage human activities to prevent adverse impacts on indigenous populations, to achieve maximum sustainable populations of endemic life forms, to restore, enhance and protect sustaining habitats, and to erase existing and prevent human footprints. While this leaves a wide latitude for non invasive observational activities and research endeavors, it also imposes heavy responsibilities on Monument Trustees and management to strictly regulate human activities to assure compliance with the Directive.</p>

<b>Comment Category 5 - Ecosystem Health</b>	
5-01. Response	In a system that has already suffered human impacts and continues to be exposed to stressors from outside the Monument, it is necessary to maintain some management presence and activity in order to gather information needed to improve protection, to understand the native biota, and, if possible, to restore habitats that have been damaged previously. Sometimes, this work involves the limited take of living resources, subject to all applicable laws.
5-02. Comment	<p>The comments below refer to the discussion of Pelagic Habitats in Volume I, section 1.1 of the Monument Management Plan.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) Volume I, page 22, lns 39: abyssal plains need an entirely separate heading.</li> <li>2) Volume I, page 23, ln 1: Most of the area can be considered pelagic habitat or deep-sea benthic habitat. These are not the same types of habitat.</li> <li>3) Throughout the plan there seems to be little mention of geological, chemical and physical oceanography of the PMNM. These variables are integral components to habitat characterization and activity in these areas should be specified in MCS-1.3.</li> </ol> <p>Not all deep-sea habitats are described in the plan. Each island receives a section but the various deep water habitats are not similarly treated. The section on banks and seamounts is good. However, all other deep water habitats are clumped together under “pelagic habitats.” In particular the treatment of abyssal habitats in this section is poor. For instance, it states on page 23 “The next zone is the abyssopelagic zone (13,123 to 19,685 feet) (4,000 to 6,000 meters), where there is extreme pressure and the water temperature is near freezing. This zone does not provide habitat for very many creatures except small invertebrates such as squid and basket stars.” Basket stars are not abyssopelagic but benthic. More importantly, this statement that the habitat does not provide habitat for many creatures is incorrect. Many creatures could imply numbers of taxa or numbers of individuals. Our baited camera work to 4000m last summer clearly showed an active assemblage of fishes and invertebrates at all depths (Yeh and Drazen, in press, see attached photo from 4000m of P&amp;H). Work in the abyssal plains of the Pacific, Atlantic, and elsewhere continue to show an astonishing diversity of small sediment dwelling animals. A diversity that has been compared to that in tropical rain forests. Some speculate that there could be million of species! In terms of abundance yes the numbers of animals are low. A distinction between numbers of taxa and numbers of individuals should be made. Most importantly the abyssal plains should be a separate habitat heading. This benthic habitat is probably the single largest in the PMNM.</p> <p>Volume I, page 23, ln 17: This is incorrect. The abyssal plains harbor an amazingly diverse fauna which has never been examined in the waters of the PMNM. In terms of abundance yes the numbers of animals are low. A</p>

<b>Comment Category 5 - Ecosystem Health</b>	
	distinction between numbers of taxa and numbers of individuals should be made. See my comments (major point) at beginning of management plan.
5-02. Response	There is not enough known about the abyssal plain to warrant a separate summary. However, the point is well taken that nonpelagic habitats, such as banks, are referenced in this section, so we have broadened the section heading to Pelagic and Deep-Water Habitats. We have also included relevant and appropriate text changes.
5-03. Comment	<p>The following comments were received referring to the discussion of Pelagic Habitats in section 1.1 of the Monument Management Plan.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) Volume I, page 6, lns 63-64: deep pelagic basins gives attention to the water column but the term abyssal plains should be applied to describe the benthic habitat</li> <li>2) Volume I, page 23, lns 1-3: total area of monument is 362061 so this is 84% of the monument area.</li> <li>3) Volume I, page 23, ln 18: basket stars don't live in the pelagic.</li> <li>4) Volume I, page 27, lns 4-6: geomorphology of PMNM also includes abyssal plains and submarine canyons</li> <li>5) Volume I, page 110, ln 27: this statement should also include abyssal plains.</li> <li>6) On page 9 it is stated that "Even deeper yet, the abyssal depths of the Monument, while harboring limited biomass, are home to many odd and poorly documented fishes and invertebrates, many with remarkable adaptations to this extreme." The biomass density is low however, due to its large area within the monument the total biomass of the abyssal community is quite large. I have used biomass estimates for large invertebrates (echinoderms, crustaceans, cnidarians) and fishes on the abyssal plain north of the NWHI (Smith 1992) to estimate the biomass on the abyssal plains of the monument. This estimate probably underestimates the biomass density in PMNM which is predominantly shallower than this station (5700 m). The estimate is 68900 to 74600 g wet mass km<sup>-2</sup>. This is a low density but with an area of 304,000 km for depths &gt; 2000m this yields a total PMNM deep-sea biomass of 21000 to 23000 metric tons. This "back of the envelope" calculation gives a good minimum estimate to be refined by additional research. Most importantly, it should illustrate that the statement in the draft management plan must be carefully reworded to illustrate both the low biomass density yet considerable biomass monument wide in abyssal habitats.</li> </ol> <p>Volume I, page 9, lns 22-25: The biomass density is low however, due to its large area within the monument the total biomass of the abyssal community is quite large. <b>Comment Category 5 - Ecosystem Health</b>	
	estimate the biomass on the abyssal plains of the monument. This estimate probably underestimates the biomass density in PMNM which is predominantly shallower than this station (5700 m). The estimate is 68900 to 74600 g wet mass km <sup>-2</sup> . This is a low density but with an area of 304,000 km for depths > 2000m this yields a total PMNM deep-sea biomass of 21000 to 23000 metric tons. This “back of the envelope” calculation gives a good minimum estimate to be refined by additional research. Most importantly, it should illustrate that the statement in the draft management plan must be carefully reworded to illustrate both the low biomass density yet considerable biomass monument wide in abyssal habitats.
5-03. Response	<p>The following changes have been made to the Monument Management Plan in response to the comments above:</p> <ol style="list-style-type: none"> <li>1. In response to Comment 6, the sentence has been reworded and expanded to two sentences: “Ever deeper yet, the abyssal depths of the Monument harbor low densities of organisms, and yet because of the large area of this habitat type within the Monument, the total biomass of the abyssal community is quite large. Occupying this habitat are odd and poorly documented fishes and invertebrates, many with remarkable adaptations to this extreme environment.”</li> <li>2. In response to Comments 4 and 5, the sentence has been reworded to: “Habitats contained within the Monument include deep pelagic basins, abyssal plains, submarine escarpments, ...”</li> </ol> <p>We agree with your comment and abyssal plains and submarine canyons have been included.</p>
<b>Unique Comments</b>	
5-04. Comment	Page 39 Terrestrial Invertebrates are mentioned; however the unique WETLAND invertebrates are ignored. Wetland invertebrates of the National Monument are unique resources and provide prey for migratory shorebirds, water birds, and endangered land birds.
5-04. Response	“Terrestrial” in this section refers to all invertebrates (insects and spiders) found in freshwater habitats and on dry land. In this case “terrestrial” is used to distinguish them from marine invertebrates, such as crustaceans (lobsters and crabs, for example).
5-05. Comment	My input on the management plan for Papahānaumokuākea Marine National Monument is that all land and ocean components should be managed for the benefit of native species of sea and bird life as well as other natural resources such as geological formations. As rising ocean levels is reducing land areas of the islands, management should include cooperating with international efforts to reduce global warming.
5-05.	The Monument Management Plan describes all general MMB management activities for the next 15 years. Describing

<b>Comment Category 5 - Ecosystem Health</b>	
Response	all the specific efforts needed to monitor and manage the direct and indirect effects of climate change on individual species, assemblages, and ecosystems is too detailed for this plan. Many of these activities will be detailed in the Natural Resources Science Plan (Activity MCS-2.1), which will be developed in the first year of implementation. Table 2.1, Monument Vision, Mission, Guiding Principles, and Goals, provides a framework for how the MMB manages the resources to protect natural and cultural resources. In order to carry out these purposes, the MMB is committed to cooperating with national and international entities to help implement the management plan to understand and address some of the global impacts on the Monument resources, such as marine debris and climate change. We have added language addressing global threats to Strategy MB-3.
5-06. Comment	Pages 72-73, lns 8-45 and lns 1-4 Discussion of lights and noise impacts fails to accurately capture the entire range of light and noise sources including an analysis of ambient light noise levels. “Noise” in the water is more accurately described as “energy” in the water. The discussion also inappropriately focuses on sonar by noting that it is of “particular concern.” This untoward singling out of the issue du jour should be deleted. This lack of analysis does a disservice to the species and the National Monument by ignoring all other sources and fails to provide an in-depth discussion of the entire range of sources, discussion of peer-reviewed scientific articles detailing why energy in the water is or may be an issue of concern and how energy in the water may or may not affect the many species that inhabit the National Monument.
5-06. Response	We have changed “noise” to “sound” in this section of the Monument Management Plan. This section includes a description of man-made sources of sounds in the marine environment, so the discussion of sonar in this section is appropriate.
5-07. Comment	Because unless you have a plan for restoring the fishery, unless you’re restoring lobsters you’re still going to have seal pups that are run down, alternative lunch. All of that also looks -- a few years ago when we were here it was pointed out that CPR, the island’s conservation, preservation, restoration. Yet restoration is virtually absent from the plan. Unless CPR as it says in the start it’s a management plan not a plan for protection. This is perhaps the biggest inconsistency you have. If you look at the first paragraph in your introduction your thoughts about, it talks about maximum protection for this resource. And yet we have a plan that emphasizes management. A lot of it from my way of thinking not too wise.
5-07. Response	The Society for Ecological Restoration defines ecological restoration as an “intentional activity that initiates or accelerates the recovery of an ecosystem with respect to its health, integrity, and sustainability.” Ecological restoration includes a wide scope of projects, including erosion control, nonnative species and contaminant removal, disturbed area revegetation, and native species reintroduction. The portions of the plan that include the greatest number of specific

<b>Comment Category 5 - Ecosystem Health</b>	
	<p>activities relating to restoration are the Habitat Management and Conservation Action Plan, the Threatened and Endangered Species Action Plan, and the Alien Species Action Plan. Strategy TES-1 specifies that the Monument should support activities that advance recovery of the Hawaiian monk seal, including investigating food limitations and taking action to increase juvenile survival.</p> <p>In response to several comments about the need to protect resources, the MMB has modified the Vision, Mission, and Goals 1, 2, and 3 in Table 2.1 to better reflect a commitment toward resource protection.</p>
5-08. Comment	I'm concerned about commercial activity flying airplane routes, flying above the area and other commercial activity that's passing through it and how they impact on the environment.
5-08. Response	The Maritime Transportation and Aviation Action Plan (3.3.3 MTA) describes actions to identify, investigate, and reduce threats to the Monument from maritime and aviation traffic.
5-09. Comment	The Kaua'i chapter of the Surfrider Foundations and National Coastal Environmental Group, 65 chapters in the United States, and we have one on Kaua'i, Maui and O'ahu. Our view of this draft plan is that it doesn't stress the things that we would hope were important for a marine protected area and national monument. That is it's a resource management plan, not a conservation plan. We're looking at leaving those islands alone and getting people out of there and letting nature restore itself. All that is all about building incinerators and having Navy guys there and shooting sonars, fishing and all kinds of extractive and disturbing things. Our view is that there are very few natural island chains left anymore. It's time that we stop taking, taking, taking all the time and just let nature restore itself. That's a big picture answer to your four-volume deal. I think we're all -- in the Surfrider Foundation we're all very disappointed that it's so extractive, disturbing and human centered. So that's our two cents.
5-09. Response	Presidential Proclamation 8031 requires the Co-Trustees to develop a management plan for the Monument. This plan was designed to incorporate the planning needs of all agencies. Although the Monument is pristine, compared to the main Hawaiian Islands, the islands and atolls already have been impacted by humans. It is our responsibility to lessen those impacts and restore habitats to the extent possible. We also need to understand the natural, cultural, and historic resources to best protect them. Outside influences, such as marine debris, alien species, and climate change, would continue to impact the Monument even without human presence. Also, by managing visitation, the MMB provides opportunities for the public to better understand the unique biological, cultural, and historic treasures of the Monument. The best opportunity to protect this area comes through the limited human activities included within the Monument Management Plan. Proclamation 8031 requires activities to be conducted with adequate safeguards for the resources and ecological integrity of the Monument.

<b>Comment Category 5 - Ecosystem Health</b>	
5-10. Comment	Page 63 Diseases: The avian diseases impacting or potentially impacting the endangered Laysan duck are omitted. These include Avian Botulism, and Echinuria identified by the NWHL (Dr. Thierry Work). Both pathogens have the potential to decimate shore and waterfowl populations of the National Monument. The risk of Avian Flu and West Nile or other emerging disease should be mentioned as risks.
5-10. Response	Readers are referred to the Laysan Duck Draft Revised Recovery Plan (FWS 2004) for more detail on pathogens and parasites that threaten this species and other migratory bird species see Section 3.2.2, the Migratory Birds Action Plan). Newly emerging diseases borne by insects are discussed in the Alien Species Action Plan (3.3.2)
5-11. Comment	The whole reason for a marine monument is TO PRESERVE, the reefs, seals, turtles, seabirds and of course fish and sharks. Any person who really sees and understands that environment up there in the Northwestern Hawaiian Islands knows that the GREATEST THREAT are the MASSIVE sections of broken off ghostnets. We cannot monitor this without some presence in the NW Hawaiian Islands, because satellite imagery will not show the monofilament nets. It is time for government to work hand in hand with industry to monitor and ensure that area remains in its most pristine condition. The coral gets snapped off and damaged, the seabirds, turtles, seals and all fish in the area of the ghost nets are threatened.
5-11. Response	We agree that one of the most significant threats to the NWHI is marine debris. The Marine Debris Action Plan (3.3.1) describes a range of activities proposed and ongoing in the Monument to secure and remove all kinds of marine debris, including derelict fishing gear such as nets.
5-12. Comment	I'm curious to know what is really being done about preserving our natural resources there. I care about the lobsters. You know, Wespac did a good job of destroying that fishery. And I'd like you to look into the kapu system. Because we have the kapu system now on the bottom fishing in the summer when they spawn and when we wouldn't fish for them anyway. And we lift it in the winter when the fish is very expensive. That's when the big money is made. So it just didn't make sense.
5-12. Response	Proclamation 8031 prescribes that all commercial fishing will end in June 2011. Other human uses are managed through a joint Monument permit system.
5-13. Comment	OHA also notes that page 155 of the draft management plan proposes to hybridize local endangered fauna with closely related species in order to save them. OHA has concerns about this proposal on its face. We seriously question the wisdom of hybridizing plant species and wonder, if we can save the hybrid, why we cannot save the original. This, too, begs potential cultural questions about genetically manipulating genealogical relations to native Hawaiians, and the potential for preserving our siblings in whole, rather than in part.

<b>Comment Category 5 - Ecosystem Health</b>	
5-13. Response	There is no proposal for any hybridization of species to save them in the plan. The recovery action of establishing new colonies of three Nihoa endemics ( <i>Amaranthus brownii</i> , <i>Schiedea verticillata</i> , and <i>Pritchardia remota</i> ) would be evaluated with respect to the risk of any of those species hybridizing with related species on another island. Actions would be taken to prevent any risk of hybridization. We have provided clarifying language in on page 155.
5-14. Comment	The prospect of having the entire Northwest Hawaiian Islands under federal protection is an incredibly significant stride forward for preservation of the ecological integrity and biological diversity of the marine and terrestrial environments. We believe that through federal protection and continued management, the monument has the potential to provide refuge for a number of endangered and threatened species, as well as species which are critical to a healthy ecosystem. We strongly recommend ongoing habitat and ecological restoration projects which will ensure the perpetuation of the broad diversity of floral and faunal species, many of which are endemic to the monument.
5-14. Response	Restoration and protection are the way toward perpetuating biodiversity in the NWHI. We have added language the plan affirming the role of ecological restoration.
5-15. Comment	The Monument Management Plan provides a good framework that COULD eventually lead towards conservation of its ecosystem and resources therein. Your Marine Debris Action Plan is a good example of what other action plans should strive for to achieve the necessary degree of conservation.
5-15. Response	We note your comment. The NWHI are under both federal and state protection.
5-16. Comment	Page 105, line 32 states that one of the desired outcomes of the action plans are to increase understanding of the distribution, abundances and functional linkages of organisms and their habitats in space and time to improve ecosystem based management in the Monument.  Comment: In numerous instances, the Monument Management Plan refers to the NWHI as the world's largest marine protected area and an area of global biodiversity conservation. As the world's largest marine protected area, the Monument can also provide insight for improved management throughout the Hawaiian Archipelago. As the Monument comprises nearly four fifths of the Hawaiian archipelago, we recommend that the Monument Management Plan include strategies to address the benefits to the MHI resulting from the spillover of reef and bottomfish and provide a means of measuring these benefits should they exist.
5-16. Response	The purpose of the Monument Management Plan is to describe strategies and activities that directly relate to the Monument's vision, mission, and goals. While some of the strategies and activities may have spillover effects that

<b>Comment Category 5 - Ecosystem Health</b>	
	benefit adjacent areas, including the MHI, it is outside the scope and authority of the Monument and this plan to include strategies to address benefits outside this area.
5-17. Comment	Second, remediation of past injury and restoration of habitat and populations to nominal levels must be the focus and priority.
5-17. Response	We agree. Restoration and protection are the way toward perpetuating biodiversity in the NWHI. We have added language to the plan affirming the role of ecological restoration. We revised Section 3.2.3, Habitat Management and Conservation Action Plan, to indicate that restoration will be undertaken using best available information about predisturbance conditions. This is discussed in Action Plans 3.2.1 and 3.2.3.
5-18. Comment	Based on CEQ regulations implementing the National Environmental Policy Act (NEPA), implementing the Monument Management Plan would be considered a major federal action (40 CFR § 1508.18). In terms of NEPA, an Environmental Impact Statement (EIS) should have been prepared to provide the public with a clear understanding of the environmental and socio-economic benefit of implementing the Monument and Monument Management Plan. Instead, an Environmental Assessment (EA) was prepared. However, the EA does not discuss or nor attempt to analyze the significance (overall or otherwise) of the proposed action to the protection of natural resources, marine heritage sites, the State of Hawaii and to the United States.
5-18. Response	The EA presents an analysis of the impacts of implementing the two alternatives. An EA is prepared to determine whether or not the action significantly impacts the environment, and, if so, an EIS should be prepared. Our conclusion is contained in the Finding of No Significant Impacts that accompanies the Monument Management Plan.
5-19. Comment	To rebuild the environments if possible, but also to alter them to “assure” the survival of some species by translocating them. Which may have consequences of its own even if the efforts are successful or don’t seem to have changing affects on the new placement. Part of this means, in detail, to use herbicides and other such substances, usually artificial. Is this for species survival or the humans’ comfort? Although it may help the animals or species in a given situation, even if it has no direct or immediate adverse affects that can be seen, that doesn’t mean it’s good. A minor affect that appears at first may alter the potential of restoring habitat further. In many ways stated intent is to restore in many cases and balance, but in the same ones or others at a given time set to add one feature or another to transplant a species to theoretically keep the species alive alters that given environment even so. There are no details, even theories, only ideals that are desired to be used, to control temporarily allowed alien species within the Monument before replacing them with “native alternatives” in some cases, those that exist, for both land and species management to keep land from being lost, to restore species numbers or to rebuild certain features. Would that not alter the landscape, even with any good results? To propagate species is an ideal action, but where and how are concerns. Why is also an issue, this is where

<b>Comment Category 5 - Ecosystem Health</b>	
	<p>details are necessary. And in some ways as often ignored for that purpose. Ideals are easier to justify. And where many plans, proposals, propositions and other enquiries usually falter, including in this one. Propagating other birds and other species on other islands, besides altering the land that's there, is also potentially damaging. Immediate or not isn't the point. What if a given chosen environment with the monument is adaptable, but acts as an invasive species in another way. Much further down the line within or beyond the 15-year period of the plan as it is. And an invasive species may not appear to do too much damage, too. But invasive means just that. Invasive, introduced. Throughout the MMP it frets over changes done in this way or that way. Just because an adoption in a given setting is possible doesn't mean it's not harmful. Another alteration it is, and therefore potential damage if done even so.</p>
5-19. Response	<p>Translocation as an ecological restoration tool is done only after intense analysis of all possible effects on other native species and habitats. In most cases it is considered as a method to reintroduce a species to a part of its former range. In other cases it may be a species that is a close relative to another that has gone extinct, so the translocation may serve to restore an ecological function and help to recover the translocated species. A species is never relocated without careful environmental review. There are no activities in the sections dealing with the Conservation of Wildlife and Habitats or the Alien Species Action Plan that are being proposed for human comfort.</p>
5-20. Comment	<p>First and foremost, I would like to say that it is of the utmost importance that Papahānaumokuākea and its inhabitants (birds, Monk Seals, fish, flora, fauna, etc.) on and around The NWHI receive the MAXIMUM PROTECTIONS. In reading this document I see a lot of focus on making The NWHI accessible to researchers, tourists, scientists, contractors, military, etc. I do not see resource protection as the "primary purpose" as the language would indicate.</p>
5-20. Response	<p>Access to the Monument is highly limited. In order to achieve the vision, mission, and goals of the Monument there must be some human presence, primarily to restore and correct previous human disturbance. The large amount of information in the document relating to human activity is there to ensure that there are strict controls on that activity that minimize harm to the Monument.</p>
5-21. Comment	<p>Habitat Management and Conservation Action Plan – Section 3.2.3</p> <p>The "active management" discussed in the introduction for this plan is precisely the type of management we applaud in the Monument. It is important that the Monument pursue active management, as appropriate, rather than just observed and researched, in order to achieve eternal protection of the NWHI ecosystem. At the same time we are concerned that some of the active management discussed in this plan is more hands-on and invasive than necessary. Management should avoid invasive research that is not closely associated with management priorities. When research is identified in the Management Plan, it would be beneficial to also identify how management actions will be influenced by the research priorities. As always, the focus should be on protection, not on research for research's sake. Research in the Monument</p>

<b>Comment Category 5 - Ecosystem Health</b>	
	<p>must have tangible benefits to NWHI ecosystem that the Monument was established to protect.</p> <p>While the activities discussed in Strategy HMC-8 for control of ironweed are necessary, there is no activity identified to replace this invasive with appropriate native species. In order to maintain appropriate habitat and prevent erosion, reintroduction of natives should go hand in- hand with removal of invasive species.</p>
5-21. Response	All research proposed for the Monument will be evaluated and prioritized with respect to its relevance for conservation. Activity HMC-4.1 provides for the propagation and out-planting of some native substitutes for alien plants that are slated to be removed at Midway.
5-22. Comment	Volume I, page 21, lns 30-32: abyssal plains in the monument have NEVER been studied
5-22. Response	Jeff Drazen’s drop-camera bait station has been deployed on a limited basis on the abyssal plain. Nevertheless, your point is well taken that very little work has been done on abyssal fauna. We have reworded this sentence as follows: “Deep-water banks, seamounts, and the abyssal plain are among the least studied environments of the NWHI.”
5-23. Comment	The final management plan for the Monument must have a vision statement that equally embraces the cultural and ecological significance of the region, such as: “that the health, diversity and resources of the vast NWHI - its unique wildlife and cultural significance - be protected forever.”
5-23. Response	We have amended the Monument’s Vision Statement, in part, on your suggestions. The MMB agrees that Native Hawaiian traditional knowledge is imperative to the management and understanding of all of the resources of Papahānaumokuākea, as recognized throughout the Management Plan. Please see, in particular, Activity NHCH-3.4 and Strategy NHCI-3, with its associated activities.
5-24. Comment	In Vol. I, section 2.5, page 99, lines 7-11 add “and function” into the existing text as follows (IN CAPITAL LETTERS). “Development and implementation of threat reduction protocols and monitoring are needed to protect, preserve, maintain and, where appropriate, restore natural communities, including habitats, populations, native species, and ecological processes, AND FUNCTION as a public trust for current and future generations”
5-24. Response	We have added the suggested text, “and function,” to section 2.5.
5-25. Comment	We believe it is important to add more details on deepwater corals in the monument to the “corals” section that starts on page 27. There is a lot of very valuable information provided in Parrish and Baco (2007) including the number of species of deepwater corals that have been documented in the Hawaiian Archipelago to date (137 gorgonian octocorals

<b>Comment Category 5 - Ecosystem Health</b>	
	and 63 species of azooxanthellate scleractinians), past harvesting techniques, stressors, etc. Just last November, two new potential genera of deepwater bamboo corals were collected by submersible at a single site off Twin Banks (Watling, pers comm).
5-25. Response	We have added additional information on deepwater corals to section 1.2.
5-26. Comment	One is the general concern that ecosystem function is not mentioned as one of the main guiding principles for Papahānaumokuākea, and I think that's very important. Restoring ecosystem function or having that as a goal is something that's not captured in the document. It might free up powers in the agencies to look at moving Cenchrus from island where it still is to islands where it is not because it's been there. Or moving birds that would bring a certain ecosystem function back to life. All those things should be urgently considered. And some of those moves might include translocations of birds, some of which have been named in the 1998 document for Laysan Island, which I think has been pretty much captured in your management plan, and also a document that's much newer, 2007, done by Marie Morin and Sheila Conant for translocations. I think that needs to be looked at again in terms of urgency. And I know how our agencies move. I think the urgency question is really important if there is changes in sea level and that it be looked at in view of an urgent matter.
5-26. Response	We have revised Goal number 1 to include the physical environment and additional language of ecological integrity (see definition in glossary). We have revised "ecosystem integrity" to "ecological integrity" to correspond with Monument regulations. In addition, ecological restoration has been added to the glossary.
5-27. Comment	Page 67 Line 30: omit the word "all". Recommend changing "kills 100's" to "believed to contribute to Albatross mortality". Since, this has never been quantified. The sentence describing the impact of seasonal dieback on Pearl and Hermes should be a separate sentence.
5-27. Response	We have replaced this sentence with, "For example, the invasive plant golden crownbeard ( <i>Verbesina encelioides</i> ) displaces almost all native vegetation in some nesting areas. This plant causes entanglement of albatross adults and chicks and increases chick mortality due to heat stress by reducing the birds' ability to use convective cooling for thermoregulation. At Southeast Island, Pearl and Hermes Atoll, verbesina has displaced almost all native vegetation. When it dies back each year the endangered Laysan finches ( <i>Telespiza cantans</i> ) suffer severe food and cover restrictions."
5-28. Comment	In regard to the Migratory Birds Action Plan, as part of MB-3.1, standardized monitoring plans must be carefully designed and implemented so that the data collected permit statistical analyses that can detect changes in population size

<b>Comment Category 5 - Ecosystem Health</b>	
	and key demographic parameters over time, such as reproductive success and survival. As part of MB-3.2, the monitoring of changes in habitat quality through monitoring bird reproductive performance and diet must be accompanied by the monitoring a suite of habitat variables including climatic variables, since climate change will impact the Monument’s bird species.
5-28. Response	We agree. Activities MB-3.1 and MB-3.2 prescribe monitoring of populations and breeding and foraging habitats for seabirds. Using these data to ascertain the effects of anthropogenic climate change on migratory birds will be a high priority.
5-29. Comment	Table 2.1: Goal 1: Protect, preserve, maintain, and where appropriate restore the physical environment and the natural biological communities and their associated biodiversity, habitats, populations, native species, and ecological processes as public trust resources.
5-29. Response	Table 2.1, Goal 1 now reads accordingly: “Protect, preserve, maintain, and where appropriate restore the physical environment and the natural biological communities and their associated biodiversity, habitats, populations, native species, and ecological integrity.”
5-30. Comment	...it feels as if you’ve separated, it’s almost like Papahānaumokuākea separate from Hawaii nei. It feels like that. For me, Hawaii nei is Hawaii nei, yeah? From way on top to all the way on the bottom. And I think we gotta look at it that way. So when we look at our ecosystem, we cannot just concentrate on the Northwest Hawaiian Islands or just our main Hawaiian islands. We need to look at the whole ecosystem as a whole. And I wish that we would put more effort into doing so, yeah?
5-30. Response	An understanding of the geological, biological, and cultural continuity of Hawai‘i is important for realizing the value that the NWHI have for informing us about all of Hawai‘i.
5-31. Comment	The use of Rodenticide is banned and forbidden by the Kupuna Council anywhere in the Northwestern Hawaiian Islands. Concern has been raised over the Draft Plan of the Northwestern Hawaiian Islands because it includes many practices that are against our cultural beliefs and are not viable solutions to solving problems. One such practice is invasive species program that allows the use of Rodenticide on the entire island to get rid of the name, “mouse.” This is absolutely in violation of the Executive Order that states, “The Hawaiians can indeed practice their age-old traditions in the Northwestern Hawaiian Islands.” The use of any toxic materials, herbicides Round-up or Rodeo, insecticides or other toxins interferes with our cultural practices. Due to the fact that the Northwestern Hawaiian Islands Management Plan is a federal undertaking, the use of poison is challenged because it is an “Adverse effect.” And in the Federal Planning and Historic Places text, that’s this one here, and in Federal Planning in section 106 by Thomas King it gives

<b>Comment Category 5 - Ecosystem Health</b>	
	an example of the use of poison and filing under section 800.5(a)(1). Also, if the Native Hawaiian organizations and the Kupuna Council are stating that they are against the use of poison, the federal agents must listen to our claims. Use of poison would also render a situation of neglect, due to unknown toxins and avoidance of the area it would cause. Site identity changes and contamination of the food chain render those projects unacceptable.
5-31. Response	<p>We share your concerns regarding the use of poisons, and we are taking the utmost care to ensure beneficial effects outweigh any potential harms. In this case, the nonnative invasive species are so abundant and virile that our options have become limited. Poisons are a necessary tool to prevent the loss of native ecosystems to invasive nonnative species, such as mice. However, when poisons are used, it is with caution, care, and concern for the biological and cultural resources that we are mandated to protect.</p> <p>As you referenced, under the National Historic Preservation Act (NHPA), if a federal undertaking may impact properties that either already are National Historic Properties or that may become so, a Section 106 consultation must be conducted. Until a programmatic agreement is executed for Monument management, each proposed activity within the Monument that may impact such properties has undergone, and will continue to undergo, Section 106 consultation. For example, both the FWS and the National Marine Fisheries Service have fulfilled Section 106 consultation requirements for management and conservation activities proposed on Nihoa and Mokumanamana. The State Historic Preservation Division is Hawai‘i’s State Historic Preservation Office, and the Office of Hawaiian Affairs is listed in the NHPA as a Native Hawaiian organization that must be consulted during any Section 106 process in Hawai‘i. Both of these agencies, as well as other Native Hawaiian organizations and individuals, have been, and will continue to be, consulted during the Section 106 processes mentioned above.</p>
5-32. Comment	Briefly, OHA notes that page 63 of the draft management plan states that “Increased carbon dioxide can also influence photosynthetic rates in plants, change plant species composition, lower nutrient levels, and lower weight gain by herbivores.” OHA was unaware of any herbivores in Papahānaumokuākea and we ask what they are.
5-32. Response	In this sentence “herbivore” means any organism that consumes living plants (including limu) or their parts. That would include everything from zooplankton that eat phytoplankton to marine and terrestrial snails, to sea urchins, to algae-eating fish, such as the yellow tang (lau-i-pala), to honu (green turtles) in the water and various insects and the Laysan finch and Nihoa finch on land.

<b>Summarized Comments</b>	
6-01. Comment	<p>The comments below suggest the Monument staff develop educational materials, including traveling teacher boxes, a textbook, curricula, experiential learning opportunities, school visits, and teacher workshops.</p> <p>Comments:</p> <ol style="list-style-type: none"> <li>1) Greater Monument focus or presence at teacher workshops and environment, science and education conferences.</li> <li>2) We need help for all our islanders, educate our own islanders.</li> <li>3) Development of traveling teacher boxes with pre-done lesson plans and supplies that can travel to schools in the outer islands. In my experience I have found that there is a serious disconnect with the kids and the knowledge that the Northwestern Hawaiian Islands even exists. This disconnect is more prevalent on islands besides Oahu which is often targeted in outreach.</li> <li>4) Emphasize experimental learning using both Northwestern Hawaiian Islands and Main Hawaiian Islands connections</li> <li>5) Use a rotating “guest” for school visits on the islands outside of Oahu</li> <li>6) I think funds should be available to contract educators to run teacher workshops in the CONTENTIAL U.S. to introduce teachers to the myriad of educational resources available relating to the monument. There has to be more than just curriculum on a website to educate the public about the monument and help them understand its enormous ecological value.</li> <li>7) Please help our young people on Kauai and throughout Hawaii learn more about the importance of the ocean, and especially about how to support visiting scientists. We need programs in our schools to teach our young people about our coasts, the ocean, and how to take care of it.</li> <li>8) Greater Monument focus or presence at teacher workshops and environment, science and education conferences.</li> <li>9) Programs that can help with teaching and reinforcing the correct values will go a long way in preparing our youth to become successful in all aspects of life. Papahānaumokuākea, like the main Hawaiian Islands, are one of the greatest community classrooms on the planet. The monument represents an outstanding opportunity to cultivate students through an experience that is unmatched in the world. The connection to the host Hawaiian culture through both management and education strategies need to be at the forefront in this management plan. Culture-based education and leadership models already exist that can and need to be incorporated into both a short and long-term management plan. It will be a critical investment and hopefully a model for others on the planet to follow. The Census 2000 was the first national census taken that was able to aggregate data on Native</li> </ol>
