Papahānaumokuākea Marine National Monument

6600 Kalaniana'ole Highway, Suite 300 - Honolulu, Hawai'i - USA 96825

State of Hawai'i, National Oceanic and Atmospheric Administration, Office of Hawaiian Affairs, and U.S. Fish and Wildlife Service. 2008. Nomination of Papahānaumokuākea Marine National Monument for Inscription on the World Heritage List. Honolulu, Hawai'i. 280 pages

EXECUTIVE CHAMBERS  
HONOLULU

LINDA LINGLE  
GOVERNOR

December 5, 2008

The Honorable Dirk Kempthorne, Secretary  
United States Department of Interior  
Washington, DC 20240

Dear Mr. Secretary:

It is with great honor that the State of Hawaii recommends that the Papahānaumokuākea Marine National Monument be nominated as a United Nations Educational, Scientific and Cultural Organization (UNESCO) World Heritage site. The nomination of this site has been a key goal of my administration and I enthusiastically support it. Covering a vast area in one of the world's most isolated archipelagos, the protected islands and atolls of Papahānaumokuākea offer a unique seascape dotted with islets that are rich in ecological, geological and cultural heritage. Hawaii recognizes the significance of Papahānaumokuākea's consideration as a mixed natural and cultural site with an associative cultural landscape administered under provisions of the Convention Concerning the Protection of the World Cultural and Natural Heritage (Convention).

On June 15, 2006, President George W. Bush issued Presidential Proclamation 8031 establishing the Northwestern Hawaiian Islands Marine National Monument under the authority of the Antiquities Act of 1906 (AA)(16 U.S.C. 431). The site was later renamed by Presidential Proclamation 8112 as the Papahānaumokuākea Marine National Monument to reflect its Native Hawaiian cultural significance. The Monument protects natural, cultural and historic resources encompassed within an area of approximately 139,793 square miles (362,075 square kilometers) around the Northwestern Hawaiian Islands, a place that has seen increasing levels of protection since 1909.

In recognition of the obligation under Article 5 of the Convention, and in coordination with the federal Co-Trustees, the National Oceanic and Atmospheric Administration and the U.S. Fish and Wildlife Service, Hawaii shall, insofar as possible, take all appropriate measures including legal, scientific, technical, and administrative, necessary for the protection, conservation, and preservation of the outstanding universal value of the Monument and its resources. This obligation is satisfied through the protective measures taken in the President's Proclamations, State and federal implementing regulations, and the management plan.

Hawaii fully supports the United States' efforts to nominate Papahānaumokuākea Marine National Monument to the UNESCO World Heritage List, and offers any needed assistance to ensure the nomination successfully navigates the approval process through the U.S. and UNESCO.

Sincerely,

A handwritten signature in black ink, appearing to read "Linda Lingle".

LINDA LINGLE

UNITED STATES DEPARTMENT OF COMMERCE  
The Under Secretary of Commerce  
for Oceans and Atmosphere  
Washington, D.C. 20230

DEC - 5 2008

The Honorable Dirk Kempthorne  
Secretary  
U.S. Department of the Interior  
Washington, D.C. 20240

Dear Mr. Secretary:

It is with great enthusiasm that the National Oceanic and Atmospheric Administration (NOAA) recommends the Papahānaumokuākea Marine National Monument be nominated as a United Nations Educational, Scientific, and Cultural Organization (UNESCO) World Heritage site. Covering a vast area in one of the world's most isolated archipelagos, the protected islands and atolls of Papahānaumokuākea offer a unique seascape dotted with islets rich in ecological, geological, and cultural heritage. NOAA recognizes the honor of Papahānaumokuākea's consideration as a mixed natural and cultural site with an associative cultural landscape administered under provisions of the Convention Concerning the Protection of the World Cultural and Natural Heritage (Convention).

On June 15, 2006, President George W. Bush issued Presidential Proclamation 8031 establishing the Northwestern Hawaiian Islands Marine National Monument under the authority of the Antiquities Act of 1906 (AA)(16 U.S.C. 431). The site was later renamed by Presidential Proclamation 8112 as the Papahānaumokuākea Marine National Monument to reflect its Native Hawaiian cultural significance. The Monument protects natural, cultural, and historic resources encompassed within an area of approximately 139,793 square miles around the Northwestern Hawaiian Islands, a place that has been given increasing levels of protection since 1909.

In recognition of the obligation under Article 5 of the Convention, and in coordination with its Co-Trustees: the State of Hawaii, the U.S. Fish and Wildlife Service, and NOAA, shall take all appropriate measures including legal, scientific, technical, and administrative necessary for the protection, conservation, and preservation of the outstanding universal value of the Monument and its resources. This obligation is satisfied through the protective measures taken in the President's Proclamations, implementing regulations, and the management plan.

NOAA supports the United States' efforts to nominate Papahānaumokuākea Marine National Monument to the UNESCO World Heritage List, and offers any needed assistance to ensure the nomination successfully navigates the approval process through the United States and UNESCO.

Sincerely,

William J. Brennan, Ph.D.  
Acting Under Secretary of Commerce  
for Oceans and Atmosphere

THE ADMINISTRATOR

## United States Department of the Interior

FISH AND WILDLIFE SERVICE  
Washington, D.C. 20240

December 5, 2008

Honorable Dirk Kempthorne  
Secretary, U.S. Department of the Interior  
Washington, DC 20240

Dear Mr. Secretary:

The U.S. Fish and Wildlife Service (Service) heartily endorses the nomination of Papahānaumokuākea Marine National Monument as a United Nations Educational, Scientific and Cultural Organization (UNESCO) World Heritage site. As recognized both by President Theodore Roosevelt some 100 years ago and by President George W. Bush in 2006, these remote islets, reefs, and waters offer a wealth of natural, cultural, and historic resources that truly deserve not only national but international acknowledgment. It is an honor for the Service to support consideration of Papahānaumokuākea as a mixed natural and cultural site with an associative cultural landscape administered under provisions of the Convention Concerning the Protection of the World Cultural and Natural Heritage (Convention).

Numerous natural treasures of international significance are found within Papahānaumokuākea, including the clearest illustration of "hotspot" island progression in the world, the largest tropical seabird rookery in the world, numerous threatened and endangered species, literally thousands of endemic species found nowhere else in the world, and one of the few remaining predator-dominated coral reef ecosystems in the world. Equally significant are Papahānaumokuākea's cultural resources, including unique archaeological sites on Nihoa and Mokumanamana, the strong association of the seascape with the cosmology and oral traditions of Native Hawaiians, and its continuing opportunities to allow Native Hawaiian practitioners to perpetuate customary practices such as wayfinding.

In recognition of the obligation under Article 5 of the Convention, and in coordination with its Co-Trustees, the State of Hawai'i and the National Oceanic and Atmospheric Administration, the U.S. Fish and Wildlife Service will, insofar as possible, take all appropriate measures including legal, scientific, technical, and administrative, necessary for the protection, conservation, and preservation of the outstanding universal value of the Monument and its resources. This obligation will continue to be met through the protective measures required by the National Wildlife Refuge System for the two National Wildlife Refuges within Monument boundaries and by the Presidential Proclamation establishing Papahānaumokuākea Marine National Monument, its implementing regulations, and its management plan.

Thank you for your efforts to recognize this unique natural and cultural treasure. If we can provide any further assistance during the nomination's consideration by the United States and UNESCO, please contact Barry W. Stieglitz, Project Leader, Hawaiian and Pacific Islands NWRC at (808) 792-9540.

Sincerely,

DIRECTOR

'O Hinapūko'a  
'O Hinapūhalako'a  
'O Hina kupukupu  
'O Hinaikamalama  
Hua ka 'ōhua, lu'u ke koholā  
Aloha kahi limu kala, kia'i 'ia e ka 'ākala noho i uka  
Hānau ka pe'a, puka ka pe'ape'a i ke kai  
He 'īna'i ka 'īna, 'ono i ka huna o ka pa'akai  
Manomano ka 'ike li'u o ka houpō o Kanaloa  
Koiko'i lua ho'i na ka lehulehu, 'o ku'u luhi ia  
Hanohano wale ka 'āina kūpuna, 'o nā moku lē'ia  
No Papahānaumokuākea lā he inoa

- Na Kainani Kahaunaele a me Halealoha Ayau

The sunrise of Kāne at Ha'eha'e shines bright  
The rays of the sun spread throughout Hawai'i  
I yearn for the deep knowledge  
The knowledge of Kanaloa who lives in the ocean  
The Hu'akai wind is of Lehua that swims in the sea  
Rich is the pit of Kūhaimoana in the seaspray of Ka'ula  
Kū is of the loulu (endemic fan palm) and our respect grows for  
Nihoa, isle of birds  
Manu o kū (white tern) flies in a bunch and leads the nation  
The multiple forms of Hina of coral and moon  
The 'ōhua (juvenile wrasse, tang, unicorn, parrot fish) spawns,  
the whale dives  
Love for the limu kala (Sargassum seaweed), whose land  
counterpart is the 'ākala (Hawaiian raspberry)  
The pe'a (Hawaiian bat) gives birth to the pe'ape'a (starfish) in  
the sea  
The 'īna (endemic sea urchin) is the seasoning, delicious with salt  
The deep knowledge of our Kūpuna lies in the depths  
Extremely important for us to grasp, it is my passion  
Honored of the land of my ancestors, the abundant islands  
A name song for Papahānaumokuākea

- by Kainani Kahaunaele and Halealoha Ayau

Cultural practitioners Kainani Kahaunaele and Halealoha Ayau made a gift of this *mele* (name song), *No Papahānaumokuākea*, to the Papahānaumokuākea Marine National Monument in November 2007. This *mele* celebrates Papahānaumokuākea's outstanding natural, historical, and cultural resources, and exemplifies the way in which the site's natural and cultural significances are intertwined. When chanted, such as in opening public meetings, the *mele* is offered in honor of and to give thanks to the place and to the *kūpuna* (elders). An audio recording of practitioners chanting the *mele*, *No Papahānaumokuākea*, is included (see Appendix P).

## Executive Summary

### Country

United States of America.

### State, Province, or Region

Papahānaumokuākea Marine National Monument is comprised of lands and waters under the management, control and jurisdiction of the United States of America, and also includes lands and waters of the State of Hawai'i.

### Name of Property

"Papahānaumokuākea Marine National Monument"

Papahānaumokuākea (pronounced Pa-pa-HAH-nou-mo-koo-AH-keh-ah) comes from an ancient Hawaiian traditional chant concerning the genealogy and formation

of the Hawaiian Islands. An explanation of the meaning and process for naming Papahānaumokuākea is found at the beginning of Section 2.a.

### Geographical Coordinates (See Figure 1.1a)

The center point for the geographic coordinates is:

N 25°20'56.652" W 170°8'44.952"

The outer boundaries include:

N 22°53'35.016" W 161°2'9.456"

N 28°37'41.196" W 179°14'43.764"

*Nesting Great Frigatebirds (Iwa) and aquamarine lagoons link the land and sea in this vast seascape*  
(Photo: James Watt)

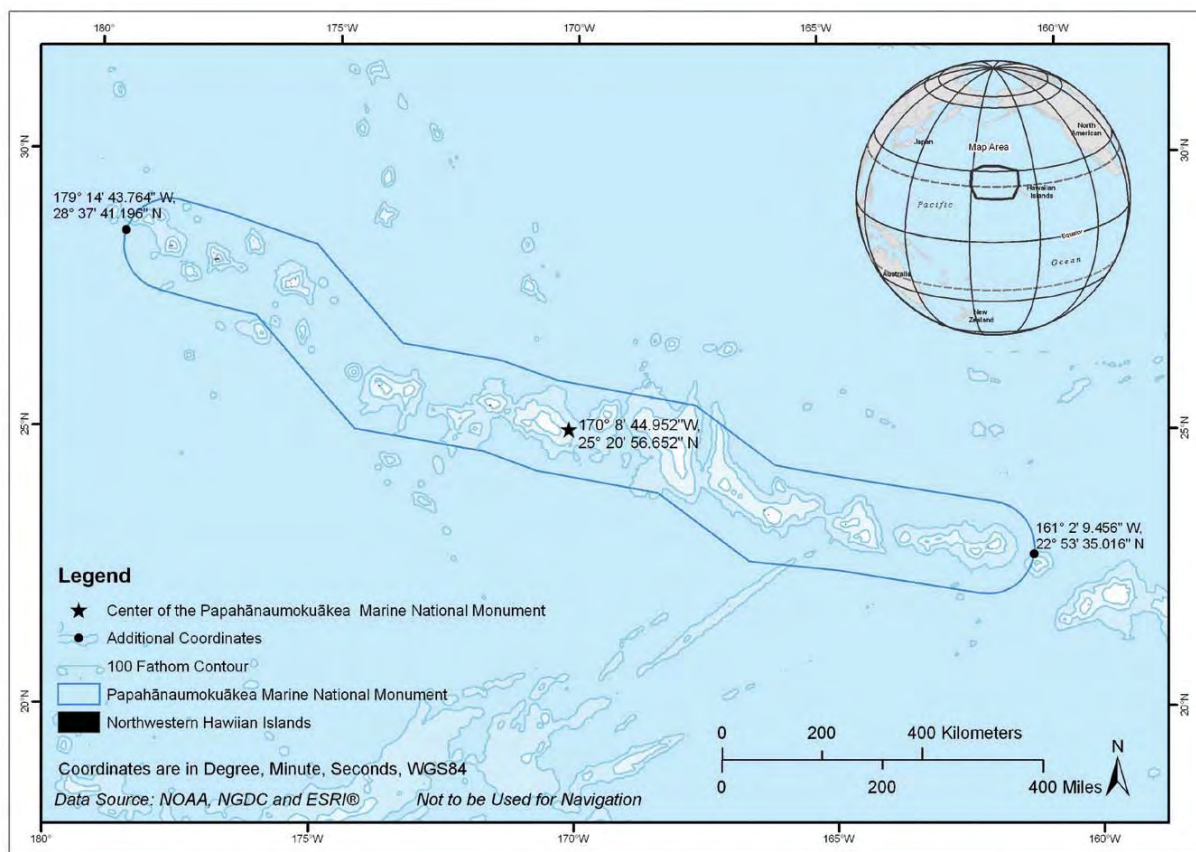

Figure 1.1a Proposed Nominated Area: Papahānaumokuākea Marine National Monument geographic coordinates

### Textual Description of the Boundaries of the Nominated Property

Papahānaumokuākea is situated in the northwestern portion of the Hawaiian Archipelago, located northwest of the Island of Kaua’i. It encompasses an area of approximately 36,207,499 hectares (362,075 square kilometers or 139,797 square miles). Spanning a distance of approximately 1,931 kilometers (1,200 miles or 1,041 nautical miles), the region, 185 kilometers wide (115 miles or 100 nautical miles), is dotted with small islands, islets, reefs, shoals, submerged banks, and atolls that extend from subtropical latitudes to near the northern limit of coral reef development (see Figure 1.2).

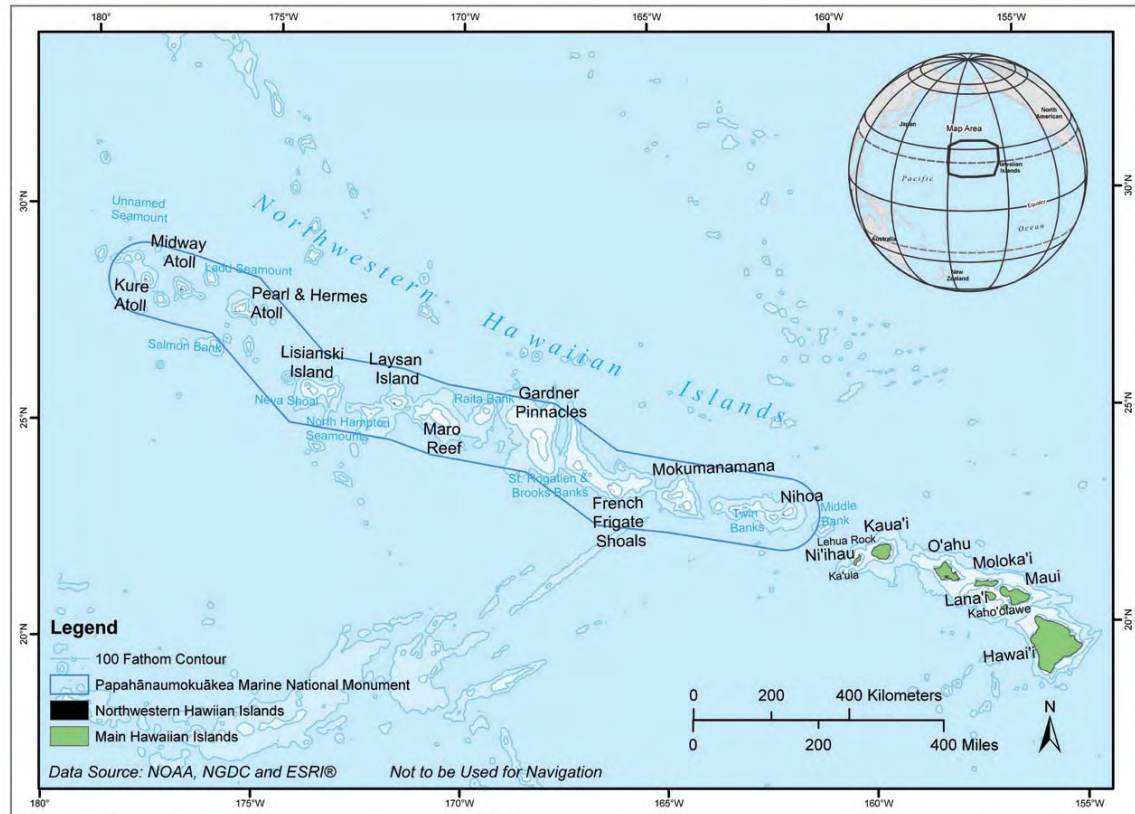

Figure 1.2 Proposed Nominated Area: Papahānaumokuākea Marine National Monument overview

4

Location of proposed nominated property in the Pacific Ocean

## Statement of Outstanding Universal Value

Covering a vast area in one of the world's most isolated archipelagos, Papahānaumokuākea Marine National Monument encompasses a significant expanse of low-lying islands and atolls, predator dominated coral reef ecosystems, and marine and terrestrial flora and fauna that show significant patterns of enhanced speciation with numerous endemic and endangered species. It is a unique seascape, rich in ecological, geological and cultural heritage.

The islands and atolls of Papahānaumokuākea comprise an important prototype and outstanding example of ongoing geologic processes and the clearest illustration of 'hotspot' island progression in the world. The sheer isolation of these islands and waters causes Papahānaumokuākea to function as an intact miniature evolutionary universe. It contains innumerable excellent examples

of ecological and biological evolutionary processes (such as dramatic examples of adaptive radiation) that continue undisturbed, resulting in very high rates of endemism. The region provides a crucially important habitat for the conservation of many endangered or threatened species of global concern. Papahānaumokuākea is also a sacred cultural landscape, a region of deep cosmological and traditional significance to the living Native Hawaiian culture that contains a host of intact and significant archaeological sites. The entire region provides a largely undisturbed ancestral environment, whose preservation both illuminates and embodies the Hawaiian concept of the literal and spiritual kinship of all things in the natural world, including man, and represents the site where life originates and the place where spirits return after death.

#### Criteria Under Which Property is Nominated

Papahānaumokuākea is nominated for inscription to the World Heritage List as a mixed site for its natural and cultural values and as an associative cultural landscape under the following criteria:

*Native Hawaiian people consider Papahānaumokuākea as one of Hawai'i's last-remaining places of abundance, or 'āina momona (Photo: James Watt)*

#### Criterion iii: "to bear a unique or at least exceptional testimony to a cultural tradition or to a civilization, which is living or which has disappeared"

Papahānaumokuākea's remarkable archaeology and significant ritual sites (*heiau*) bear exceptional testimony to the shared historical origins of all Polynesian societies, and to the growth and expression

*The Hawaiian Monk Seal is one of 22 IUCN-listed endangered species dependent on Papahānaumokuākea for survival (Photo: James Watt)*

Over 90% of the threatened Green Turtle nestings in Hawai'i occur within Papahānaumokuākea (Photo: James Watt)

of a culture that evolved from the last and most difficult wave of cross-Pacific Polynesian migration. As the only Mystery Islands (once-inhabited but now abandoned outposts at the farthest reaches of Polynesian migration) that continue a cultural association with their indigenous people, the islands of Nihoa and Mokumanamana can reveal much about cultural resilience in a changing environment.

**Criterion vi: “to be directly or tangibly associated with events or living traditions, with ideas, or with beliefs, with artistic and literary works of outstanding universal significance”**

Papahānaumokuākea, as an associative cultural landscape, represents core elements of Native Hawaiian cosmology and tradition. The islands northwest of the Tropic of Cancer are believed to lie within the region of primordial darkness from which life originates and to which it returns. For a culture that considers nature and civilization to be part of a genealogical whole, Papahānaumokuākea

offers a “place of abundance” to reconnect with an ancestral environment, and its seas are also a traditional and contemporary testing ground for the revitalized art of Polynesian wayfinding.

**Criterion viii: “be outstanding examples representing major stages of earth’s history, including the record of life, significant on-going geological processes in the development of landforms, or significant geomorphic or physiographic features”**

The string of islands in Papahānaumokuākea, 1,931 kilometers long, comprise a classic, important and unparalleled example of later stages of island and atoll evolution. The archipelago has provided some of the most compelling confirmation of current theories of global plate tectonic movements.

**Criterion ix: “be outstanding examples representing significant on-going ecological and biological processes in the evolution and development of terrestrial, fresh water, coastal and marine ecosystems and communities of plants and animals”**

Papahānaumokuākea is a spectacular example of evolution in isolation, which results in enhanced speciation and a phenomenally high degree of endemism in both the marine and terrestrial flora and fauna. The coral reef ecosystems of Papahānaumokuākea also represent one of the world’s last apex predator dominated ecosystems, a community structure characteristic of coral reefs prior to significant human exploitation.

**Criterion x: “contain the most important and significant natural habitats for in-situ conservation of biological diversity, including those containing threatened species of outstanding universal value from the point of view of science or conservation”**

The region is home to, and a crucial refuge for, many endangered, threatened, and endemic species, including critically endangered marine mammal, bird, and plant species for whom it is the last or only refuge anywhere on earth. Papahānaumokuākea is also the largest tropical seabird rookery in the world.

#### **Integrity**

Papahānaumokuākea is a pristine marine ecosystem, which allows biological and ecological processes and systems to continue undisturbed, to a degree seen in few other places on earth. It includes all key areas and ecosystems that are needed to maintain ecological integrity and the long-term conservation of its unique diversity. Papahānaumokuākea is also a complete and intact cultural and maritime landscape that is in continuous use by its cultural

*Schooling lauiliwili, the endemic Milletseed Butterflyfish (Chaetodon miliaris) (Photo: James Watt)*

descendants, Native Hawaiians. Its densely scattered, well-preserved and varied archaeological sites have been subject to very few human disturbances.

### Authenticity

The authenticity of Papahānaumokuākea lies in the continuing strong association of the landscape with the cosmology and oral traditions of Native Hawaiians, the embodiment of an ancestrally pristine and spiritually meaningful marine environment, and the perpetuation of customary practices such as wayfinding.

### Requirements for Protection and Management

Papahānaumokuākea is protected by a significant federal and state legal regime, including an extensive management plan; enforcement, surveillance, and monitoring activities; and severe restrictions on access. Tourism is restricted to limited numbers at only one site, on Midway Atoll. The area is managed to provide opportunity for significant input and advice from key stakeholders and has a long history of public engagement.

## Native Hawaiian Culture and Papahānaumokuākea

**“You only know where you are on the ocean by memorizing where you came from.”**

– *Nainoa Thompson, Master Hawaiian Navigator*

### Sailing to Papahānaumokuākea

The vast seascapes and tiny islands of Papahānaumokuākea, found uninhabited or abandoned at the time of Western contact in the 18th century, represent the outer limits of the story of Pacific voyaging and settlement—an epic migration that began more than 6,000 years ago, when groups of seafarers left the islands of Southeast Asia and voyaged east into the Pacific Ocean. By 1200 BC, their descendents had reached the islands of Tonga and Sāmoa in the mid-Pacific, now known as western Polynesia. Navigating using only natural signs and knowledge as they journeyed across vast expanses of open ocean, over the next two millennia these Pacific voyagers would explore and populate a 10-million-square-mile area of the Pacific bounded by the points of the Polynesian Triangle: Hawai’i in the north, tiny Rapa Nui (Easter Island) in the South, and the islands of Aotearoa (New Zealand) in the southwest. It was one of the greatest human migrations ever undertaken. Polynesia (“many islands”) now comprises an area strongly related in culture, in landscapes and in seascapes,

yet abounding in distinct cultural heritages uniquely adapted to the environment of each place.

Polynesian voyagers arrived in the isolated Hawaiian Archipelago around 300 AD. They found islands with fertile soils, abundant water, and reefs rich with marine life. In relative isolation from their ancestral origins, the Native Hawaiian culture evolved into a culture finely attuned to its immediate and unique natural surroundings. They created agricultural terraces along the hillsides; extensive water paddies for their staple food, *kalo* (taro), in the valleys; fishponds over the shallow reefs; and sustainable nearshore and pelagic fisheries management.

Where resources and land are obviously limited, as on an island, highly skilled resource management often evolves out of necessity. Native Hawaiians developed complex resource management systems and specialized skill sets to ensure that the fertile soils and rich reef and pelagic environments they found could be sustained for future generations. Traditional, sustainable practices, such as the Hawaiian system of *ahupua’a* (land divisions inclusive of the deep sea through mountain peaks), utilized seasonal patterns in weather and their effects on species abundance and distribution, ecological zonation, and land-sea connectivity to manage resources effectively. The foundation of this culture was a nuanced awareness of, and responsive intimacy with, the patterns and processes of their specific natural environment.

Native Hawaiians explored and settled the archipelago, inhabiting the main Hawaiian Islands and venturing into the region to the northwest, now known as Papahānaumokuākea. This chain of far-flung islands and atolls, and the waters surrounding them, continue to be respected as a sacred zone, a place containing the boundary between Ao, the world of light and

the living, and Pō, the world of the gods and spirits, of primordial darkness, from which all life comes and to which it returns after death.

Papahānaumokuākea is as much a spiritual as a physical geography, rooted deep in Native Hawaiian creation and settlement stories. Many oral traditions say that Native Hawaiians are genealogically related not only to the living creatures that make up the land and ocean ecosystems, but to the islands and atolls themselves. In relatively recent times, the islands of Papahānaumokuākea have become known as the Kūpuna (Revered Elders or Ancestors) Islands, in part because they are geologically older than the main Hawaiian Islands, and because, according to Hawaiian oral tradition, these islands themselves are ancestors to Native Hawaiians. Thus, Hawaiians not only look to their Kūpuna

Islands for *‘ike* (knowledge), but they also have a deeply embedded *kuleana* (privilege and responsibility) to care for their *kūpuna*. Each island is a teacher; each island has its own, unique message to impart.

### Where Nature and Culture Are One

The most famous Hawaiian creation chant, the Kumulipo, tells of the birth of the world from the darkness of Pō, beginning with the simplest known form of life, the coral polyp, and progressing to the more complex forms (see Appendix B for more text from the Kumulipo). As time passes, life begins to be created in sibling pairs, a land creature or plant for every sea creature or plant. These twins almost always share similar names; they are often also linked in real-life cycles, with one blooming on land as the other becomes fertile or abundant in the sea.

O ke au i kāhuli wela ka honua  
 O ke au i kahuli lole ka lani  
 O ke au i Kūka‘iaka ka lā  
 E ho‘omāmalama i ka mālama  
 O ke au o Makali‘i ka pō  
 O ka walewale ho‘okumu honua ‘ia  
 O ke kumu o ka lipo, i lipo ai  
 O ke kumu o ka Pō, i pō ai  
 O ka lipolipo, o ka lipolipo  
 O ka lipo o ka lā, o ka lipo o ka pō  
 Pō wale ho-‘i  
 Hānau ka pō

At the time when the earth became hot  
 At the time when the heavens turned about  
 At the time when the sun was darkened  
 To cause the moon to shine  
 The time of the rise of the Pleiades  
 The slime, this was the source of the earth  
 The source of the darkness that made darkness  
 The source of the Pō that made night  
 The intense darkness, the deep darkness  
 Darkness of the sun, darkness of the night  
 Nothing but night  
 The night gave birth

– From the beginning of the Kumulipo: A Hawaiian Creation Chant

Hānau ka Manauea noho i kai  
 Kia‘i ‘ia e ke Kalo-manauea noho i uka  
 He pō uhe‘e i ka wāwā...  
 Hānau ka Puakī noho i kai  
 Kia‘i ‘ia e ka Lauaki noho i uka  
 He pō uhe‘e i ka wāwā...

Born was the *Manauea* moss living in the sea  
 Guarded by the *Manauea* taro plant living on land  
 Darkness slips into light...  
 Born was the *Puakī* seaweed living in the sea  
 Guarded by the ‘*Aki ‘aki* rush living on land  
 Darkness slips into light

Polynesian origins and distinctive adaptations to the archipelago; it is also a last remaining “place of abundance” for oceanic apex predators and migratory birds, where a uniquely Hawaiian natural world continues in its entirety.

Biologists speak of Papahānaumokuākea’s ecosystem, dominated by apex predators, as a rare benchmark for an intact marine system. Native Hawaiians experience this as a natural environment

The intense observation of the complex kinship of all things in the natural world, on which Hawaiians depend for their physical sustenance and voyaging prowess, is also coded into the Hawaiian creation story. The strong interweaving of these natural elements are the roots of the Hawaiian culture, language and spiritual understanding.

that hews to ancestral behaviors, rhythms, and proportions, where the ecological and spiritual links have not been frayed or broken. Native Hawaiians who have been to Papahānaumokuākea note that *ulu*, or hunting jackfish, behave more boldly in Papahānaumokuākea than they do in the main Hawaiian Islands. Along with sharks, they own the waters. They attack birds sitting on – and flying immediately above – the water, and will look swimmers directly in the eye in the form of a challenge to one’s ability in, and responsibility to, those waters.

These and other natural encounters can often be considered *hō’ailona*, natural signs communicated by ancestors and gods who manifest themselves in nature. These signs occur most clearly in a place like Papahānaumokuākea, where nature has not been subjugated. Atmospheric activities, too, such as rainbows, rain, wind and cloud formations, can express either godly or ancestral approval of proposed actions in this sacred place or provide warning. (When a group of Native Hawaiian cultural practitioners voyaged from Kaua’i in the main Hawaiian Islands to Mokumanamana—an island of paramount spiritual importance—in Papahānaumokuākea for the summer solstice in 2007, they reported having seen clouds in very unusual formations: “They appear

## 22

Papahānaumokuākea is an expansive Hawaiian natural and cultural seascape, encompassing both land and sea, in which these relationships are vibrant and largely unfettered by human development. It is an immense associative cultural seascape – a Hawaiian place where man is, as in the Kumulipo, the little brother of the land and sea. And it is a place where Hawaiians can go to immerse themselves in this foundational understanding, ensuring the continuity of the generational bond and commitment to this sacred place.

Today, Papahānaumokuākea’s pristine habitats are valued in part because they are a baseline for what a marine environment would look like without human exploitation. For Native Hawaiians, Papahānaumokuākea is a baseline for the culture. Nihoa and Mokumanamana, the two islands closest to the main Hawaiian Islands, possess intact archaeological sites that illuminate shared

almost human in form and resemble people walking toward the Northwest. These cloud formations are all signs that help the expedition members prepare mentally, physically and spiritually for the journey. (Tsuha 2007).

Today, we praise Papahānaumokuākea's high rates of marine endemism in a world where ecological diversity is imperiled. For Native Hawaiians, each endemic species occupies an induplicable place in the spiritual as well as physical universe. It is not only a member of the family of nature, but a path to meaning and understanding. When a species is lost, that understanding is lost forever.

Native Hawaiian resource management, which relies heavily on the interconnectedness of land and sea (and is reflected in spiritual and artistic works such as the Kumulipo) informs the current management of the Papahānaumokuākea Marine National Monument. Across the globe, very few natural sites, however well protected, blend the management of terrestrial, marine, and cultural resources in this way. In an age that realizes that our planet is small and our resources finite, Native Hawaiian cultural knowledge, as seen through the current management of Papahānaumokuākea, can provide a fine example. The dualistic pairing of land and sea organisms in the Kumulipo maintains "the theme of survival, urgency for life and preservation of the species with procreation and evolution as the sinew.... The dichotomy of land-ocean pairing strengthened the notation for procreation and survival of the species" (Kanahele, 1997).

The Native Hawaiian relationship to Papahānaumokuākea has evolved along with the living Hawaiian culture, but Papahānaumokuākea continues to be considered a sacred region, and its people have maintained a vital connection with it. William Ailā, a member of the Papahānaumokuākea Native Hawaiian Cultural Working Group, says, "Access to the Northwestern Hawaiian Islands allows

Hawaiians to make connections with the land, the ocean, the fish, the sharks, the monk seals – and the spirits and our ancestors that are still there. The Monument region is not strictly a scientific laboratory; it's a place that has its own life force."

### Navigating Into the Future

Ancient Polynesians navigated by the art of wayfinding, using natural observations often missed by modern sailors, such as the stars, ocean swells, clouds, sun, seabirds and reflections in the sky of distant, aquamarine waters in atolls. Today, after 600 years without traditional inter-archipelagic voyaging, there is a Pacific-wide resurgence of the ancient art and skill of wayfinding (non-instrument navigation), spurred by the journeys of *Hōkūleʻa*, an 18-meter, double-hulled sailing canoe built in Hawaiʻi to test the voyaging capabilities of such canoes and their navigators.

As in generations past, the contemporary apprentice Hawaiian wayfinder's first open-ocean training ground takes them from the main Hawaiian Islands into Papahānaumokuākea, the Kūpuna Islands. A Native Hawaiian saying, "*Nānā i ke kumu*," means "Look to the source." It contains a subtle double meaning: while *kumu* means source, it also means teacher. This saying offers insight into the important role that *kūpuna*, who are also teachers, play in traditional Hawaiian society. Hawaiians are exhorted to turn to their *kūpuna* for knowledge, and to in turn respect and care for those *kūpuna*, as we must all learn from Papahānaumokuākea and respect and care for this unique place.

Papahānaumokuākea is a truly mixed site, where not only nature and culture are one, but where two seemingly opposite ways of thinking—spiritual and scientific, indigenous and western—can learn to coexist, to find common cause, to witness and care for the earth, and to navigate into the future.

*Identification of the Property*

# 1. Identification of the Property

(Photo: James Watt)

## 1.a Country

United States of America.

## 1.b State, Province or Region

Papahānaumokuākea Marine National Monument is comprised of lands and waters under the management, control and jurisdiction of the United States of America, and also includes lands and waters of the State of Hawai‘i.

## 1.c Name of Property

“Papahānaumokuākea Marine National Monument”

Papahānaumokuākea (pronounced Pa-pa HAH-nou-mo-koo-AH-keh-ah) comes from an ancient Hawaiian traditional chant concerning the genealogy and formation of the Hawaiian Islands, and a deep honoring of the dualisms of life. An explanation of the meaning and process for naming the property is found at the beginning of Section 2.a.

### Popular and Historic Names

Table 1.1: Other popular or historic place names for the property

The Northwestern Hawaiian Islands (NWHI)
The Kūpuna (Elder) Islands
The Leeward Islands
Nā Moku Manamana
Nā Moku Papapa

Throughout this document, several placenames are used. In general, “Papahānaumokuākea” sufficiently refers to the place, although the terms “Northwestern Hawaiian Islands” or “NWHI” are used when referencing biogeography or when quoting publications employing these placenames. When referring to management authorities and the like, this document applies the term “the Monument”.

### Names of Individual Islands/Reefs/Shoals

Table 1.2: Names of individual islands, reefs, shoals (from SE to NW)  
(\* indicates primary name used today)

Native Hawaiian Name(s)	English Name(s)
*Nihoa, Moku Manu	Nihoa Island, Bird Island
*Mokumanamana	Necker Island
Kānemiloa‘i, Mokupāpapa	*French Frigate Shoals
Pūhāhonu	*Gardner Pinnacles
Ko‘anako‘a, Nalukākala	*Maro Reef
Kauō	*Laysan Island, Moller Island
Papa‘āpoho	*Lisianski Island
Holoikauaua	*Pearl and Hermes Atoll
Pihemanu	*Midway Atoll, Brook Island, Middlebrook Islands
Mokupāpapa, Kānemiloa‘i	*Kure Atoll

\*For a more detailed treatment of these names, an explanation of their history and meaning, please see Section 2

### 1.d Geographical Coordinates to the Nearest Second

The geographic center point for Papahānaumokuākea is:

N 25°20'56.652" W 170°8'44.952"

The geographic coordinates are listed below. All are depicted on Figure 1.1:

- N 22°53'35.016" W 161°2'9.456"
- N 22°14'22.740" W 162°5'53.736"
- N 23°52'49.512" W 161°44'32.748"
- N 22°57'25.092" W 166°36'0.000"
- N 24°12'41.868" W 168°22'51.024"
- N 25°47'5.892" W 167°36'43.200"
- N 24°36'17.892" W 170°47'34.836"
- N 24°40'55.092" W 166°3'21.600"
- N 26°14'15.342" W 170°23'2.580"
- N 24°56'14.244" W 171°50'11.436"
- N 26° 35' 5.892" W 171°30'50.436"
- N 26°50'53.592" W 173°30'47.556"
- N 25°16'37.092" W 174°24'50.436"

- N 27°14'45.960" W 176°29'52.620"
- N 28°34'55.092" W 175°19'44.436"
- N 27°35'52.188" W 178°29'54.384"
- N 29°14'26.124" W 178°8'46.932"
- N 28°37'41.196" W 179°14'43.764"

### 1.e Maps Showing the Boundaries and Management of the Nominated Property

#### (i) Bathymetric Map

Please see Appendix A for a map of the property printed on a National Oceanic and Atmospheric Administration (NOAA) nautical chart, which also includes bathymetric references.

#### (ii) Location Map

Please refer to Figures 1.2 and 1.3, for an overview map and management area map, respectively.

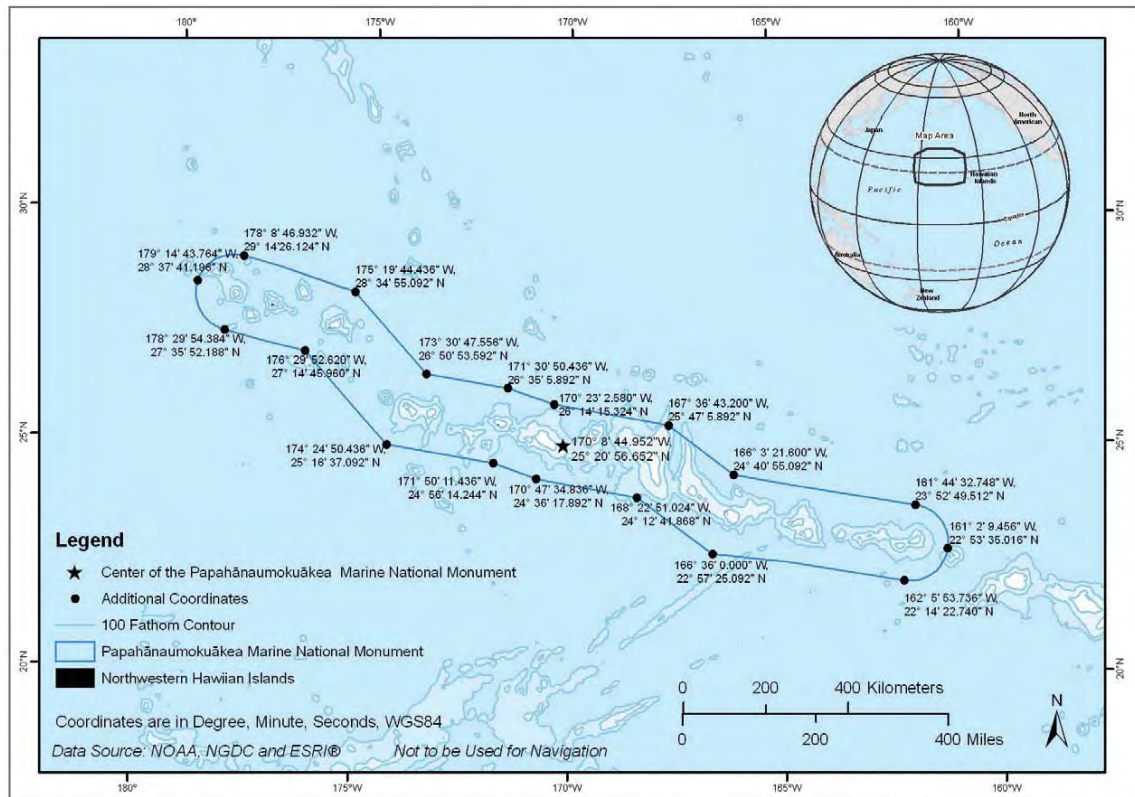

Figure 1.1b Proposed nominated area: Papahānaumokuākea Marine National Monument geographic coordinates (inclusive)

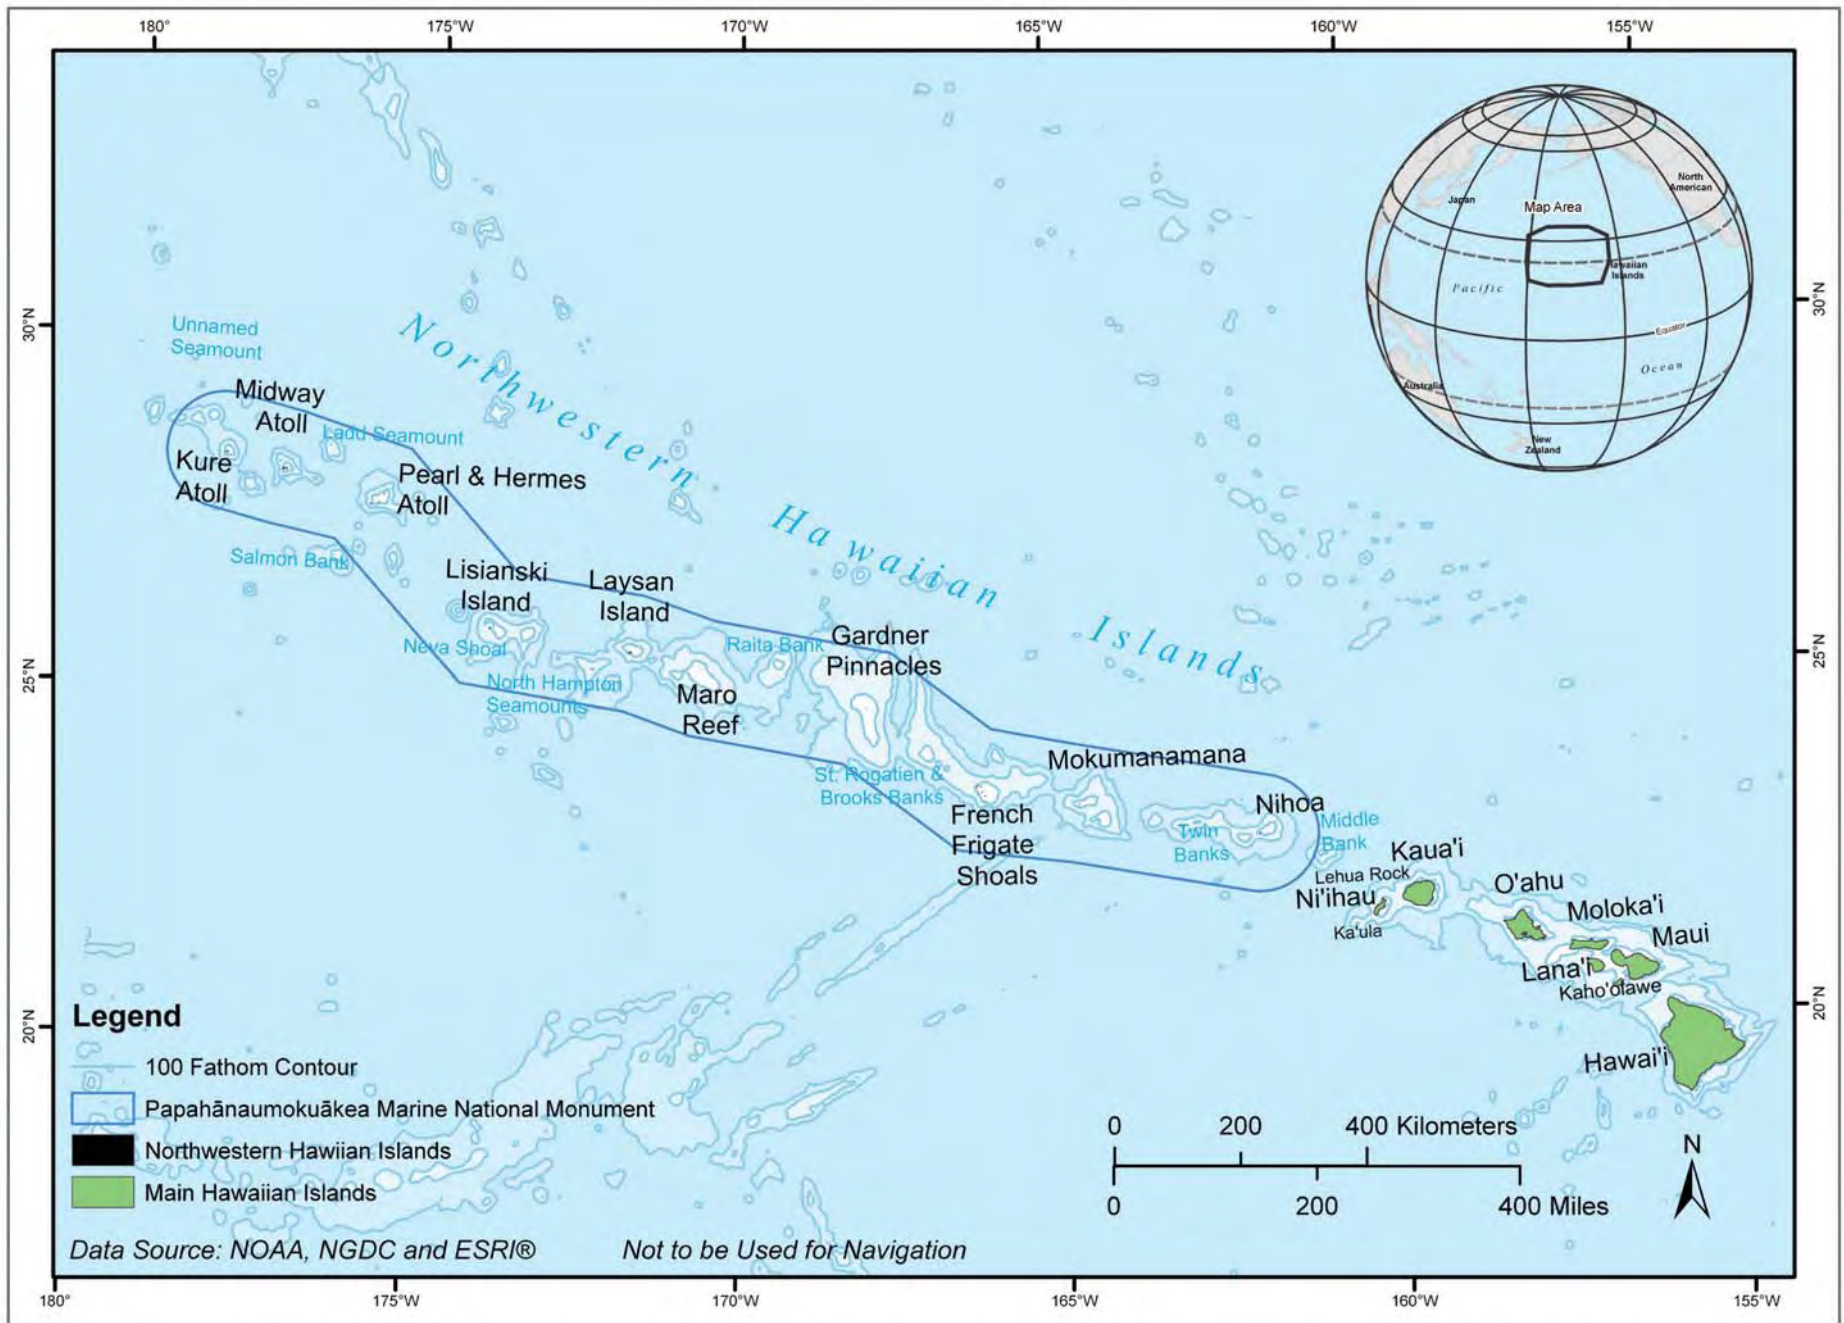

Figure 1.2: Proposed nominated area: Papahānaumokuākea Marine National Monument overview

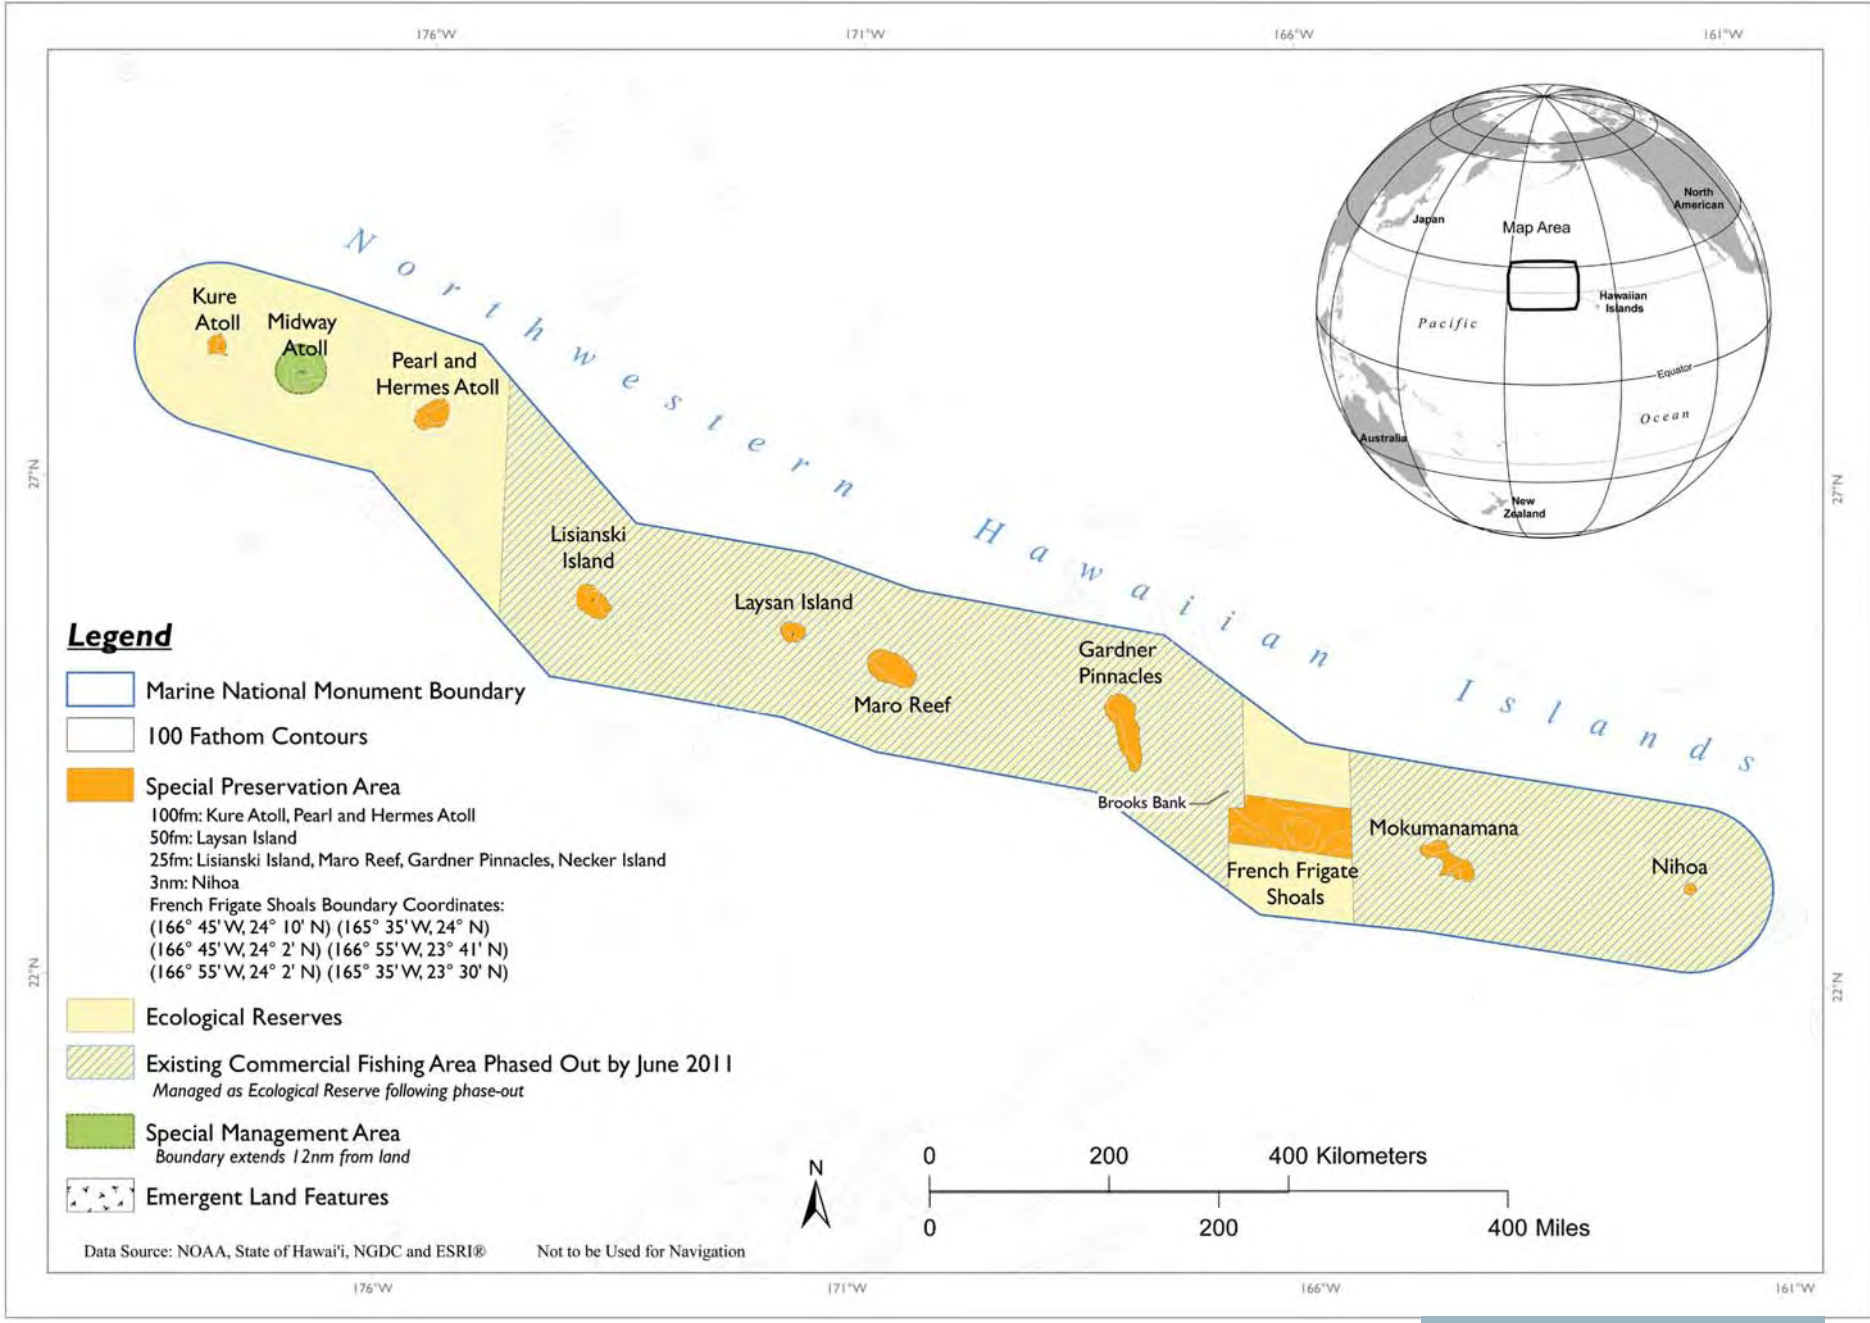

Figure 1.3: Management area of Papahānaumokuākea

**(iii) Other Maps and Buffer Zone Discussion**

Upon review of the Report of the International Expert Meeting on World Heritage and Buffer Zones, WHC-08/32.COM/7.1 (22 May 2008), and the underlying Operational Guideline paragraphs 103-107 and Recommendation 11.b., it has been determined that a Buffer Zone is not necessary for the conservation of the natural and cultural heritage of outstanding universal value in Papahānaumokuākea Marine National Monument. Papahānaumokuākea has one of the largest marine protected area boundaries in the world. The areas around the boundary of Papahānaumokuākea do not contain any land or land-based sources of pollution.

One potential threat to the natural and cultural heritage in the area surrounding the boundary of Papahānaumokuākea would be from vessel traffic. This threat has been addressed in protective measures authorized by the International Maritime Organization (IMO).

Papahānaumokuākea’s boundary is approximately 50 nm from the coral reefs. There are six (6) Areas to Be Avoided (ATBA) that have been adopted by the IMO to protect eight of the coral reef areas of the NWHI from ship traffic. Each of the ATBAs extends

*Remains of the Kaiyo Maru No. 25 shipwreck on Laysan Island (Photo: James Watt)*

out 50 nm (92.6 km) from the center of the islands or atolls, to keep ships well away from the coral reef ecosystem and resources.

Additionally, the IMO has designated Papahānaumokuākea Marine National Monument as a Particularly Sensitive Sea Area (PSSA). The PSSA boundary coincides exactly with the boundary of Papahānaumokuākea. An IMO authorized recommendatory ship reporting area has also been established. This ship reporting area is a band 10 nautical miles (18.5 km) wide, surrounding the Papahānaumokuākea Marine National Monument boundary and PSSA. This reporting requirement reminds vessels of the existence of this area and its navigational hazards well before they enter the boundary of Papahānaumokuākea and PSSA. The ship reporting system is mandatory for ships 300 gross tons and greater, fishing vessels, and for all vessels, in the event of a developing emergency situation, that are in transit through the reporting area. In addition, Papahānaumokuākea’s boundary, management plan and regulations were originally developed to protect monk seals, sea turtles, and seabirds from fishing operations.

In sum, the boundary of Papahānaumokuākea and PSSA, along with the management plan and regulations, provide adequate protection of the natural and cultural heritage in Papahānaumokuākea. Figure 1.4 below provides details on the PSSA boundary designated by IMO, and defines the six Areas to be Avoided (ATBAs).

*Life ring from a passing vessel. Threats from vessel traffic include objects washed overboard while in transit (Photo: James Watt)*

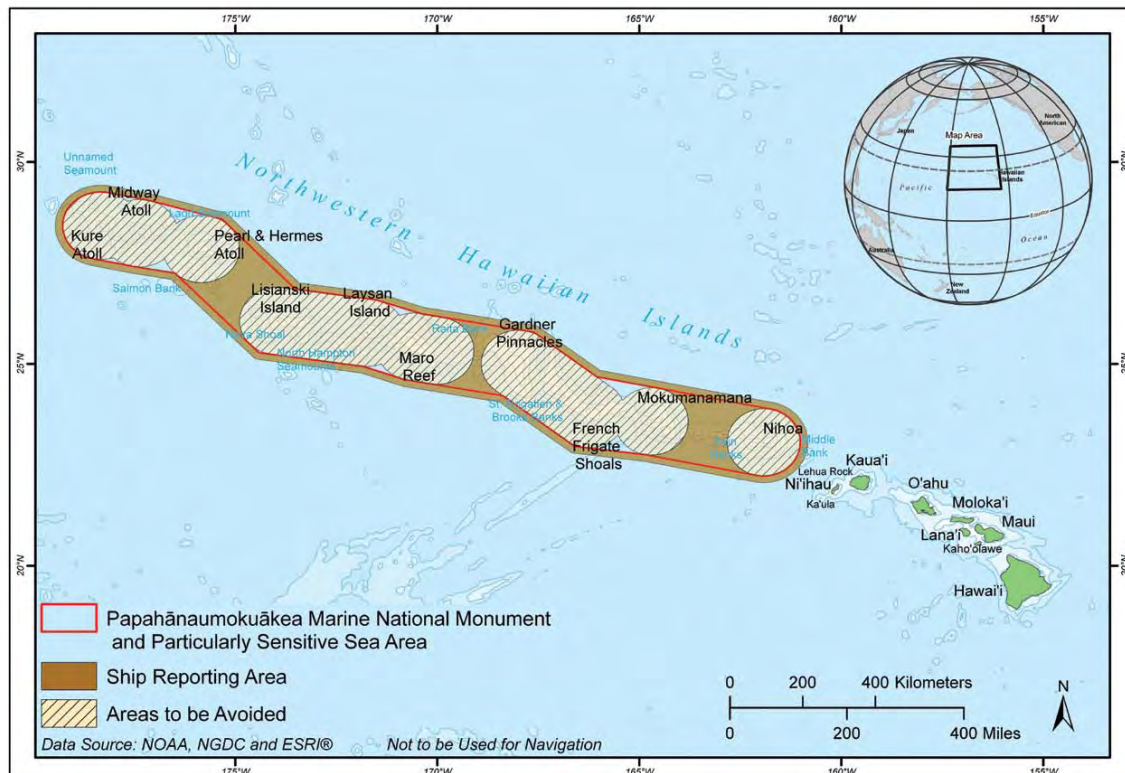

Figure 1.4 Proposed nominated area: Papahānaumokuākea Marine National Monument and Particularly Sensitive Sea Area (PSSA)

### 1.f Area of Nominated Property

The area of the nominated property is 36,207,499 hectares. No buffer zone is proposed for inscription. The area and perimeter of the property are also expressed in various formats below:

Table 1.3: Papahānaumokuākea Marine National Monument perimeter estimates

	Statute Miles	Kilometers	Nautical Miles
Length	1,200	1,931	1,041
Width	115	185	100

The following table describes the total area of the property and also details how little of the property is actually terrestrial versus marine.

Table 1.4: Area of lands and waters in Papahānaumokuākea Marine National Monument

Area in question	Sq. Stat. Mi	Sq. Km	Acres	Hectares
Marine waters	139,792	362,061	89,467,228	36,206,099
Emergent land	5	14	3,459	1,400
Total Area	139,797	362,075	89,470,688	36,207,499

## A HISTORIC MOMENT: ESTABLISHING A MARINE NATIONAL MONUMENT

On June 15, 2006, President George W. Bush made conservation history when he signed Presidential Proclamation 8031 creating the largest fully protected marine conservation area on the planet in the Northwestern Hawaiian Islands. By applying the authority of the Antiquities Act, which gives the President discretion to declare objects or places of scientific or historic interest a national monument, he created the Northwestern Hawaiian Islands Marine National Monument.

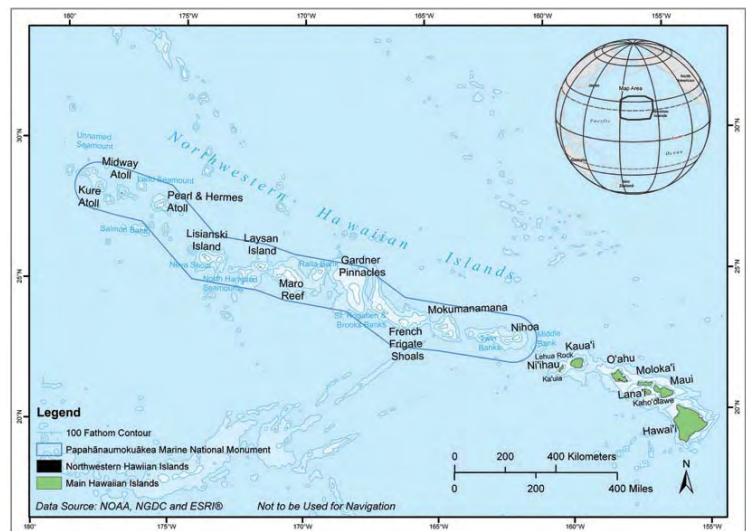

President George W. Bush signs Proclamation 8031 at the White House, joined by Mrs. Laura Bush and (left to right) Hawai'i congressional delegates U.S. Rep. Neil Abercrombie, U.S. Rep. Ed Case, U.S. Sen. Daniel Akaka; U.S. Commerce Secretary Carlos Gutierrez; Hawai'i Gov. Linda Lingle; filmmaker Jean-Michel Cousteau; oceanographer Dr. Sylvia Earle and U.S. Interior Secretary Dirk Kempthorne. White House photo by Eric Draper.

# *A Historic Moment*

"Our duty is to use the land and seas wisely, or sometimes not use them at all. Good stewardship of the environment is not just a personal responsibility, it is a public value," said the President in his proclamation speech explaining why it was necessary to close off such a large area for the sake of conservation.

The region is so vast that if laid atop the continental United States it would cover the approximate distance from Las Vegas, NV to Dallas, TX.

*"To put this area in context, this national monument is more than 100 times larger than Yosemite National Park, larger than 46 of our 50 states, and more than seven times larger than all our national marine sanctuaries combined. This is a big deal."*

*~ President George W. Bush*

Support for the protection and preservation of the Northwestern Hawaiian Islands was overwhelming, with more than 52,000 public comments submitted during the 5 years of the proposed national marine sanctuary designation process, the majority in favor of strong protection. This public sentiment was part of what inspired the President to issue the Proclamation.

By creating a marine national monument President Bush immediately granted the waters of the Northwestern Hawaiian Islands our nation's highest form of marine environmental protection. "The Northwestern Hawaiian Islands are a beautiful place," he said, "and with the designation of the Northwestern Hawaiian Islands Marine National Monument, we are making a choice that will leave a precious legacy."

## Overview of the Proclamation

The President's proclamation creating the Northwestern Hawaiian Islands Marine National Monument has given nearly 140,000 square miles of land and ocean our nation's highest form of marine environmental protection. It honors our commitment to be good stewards of America's natural resources, shows what cooperative conservation can accomplish, and creates a new opportunity for ocean education and research for decades to come. The national monument will:

- Prohibit unauthorized access to the monument;
- Provide for carefully regulated educational and scientific activities;
- Preserve access for Native Hawaiian cultural activities;
- Enhance visitation in a special area around Midway Atoll;
- Phase out commercial fishing over a 5 year period; and
- Ban other types of resource extraction and dumping of waste.

Protection was effective immediately and includes requiring permits for access into the monument. Permits may be issued for activities related to research, education, conservation and management, Native Hawaiian practices, non-extractive special ocean uses, and recreation. Protections also include the prohibition of commercial and recreational harvest of precious coral, crustaceans and coral reef species in monument waters; the prohibition of oil, gas and mineral exploration and extraction anywhere in the monument; the prohibition of waste dumping; and the phase out of commercial fishing in monument waters over a 5-year period.

*Description and History of Property*

## 2. Description and History of the Property

### 2.a Description of the Property

#### Introduction

As one of the world's largest protected marine areas, Papahānaumokuākea Marine National Monument includes a vast area of the Pacific. Extending for a distance of roughly 1,930 kilometers by 185 kilometers, the property covers an area of approximately 362,075 square kilometers (140,000 square miles) (see Section 1 for maps of the property.) At both the regional and global levels, Papahānaumokuākea is a rich natural and cultural reserve of outstanding spiritual, scientific, conservation and aesthetic value. As a nomination for a mixed natural-cultural World Heritage site, this section addresses the property's natural and cultural aspects in turn.

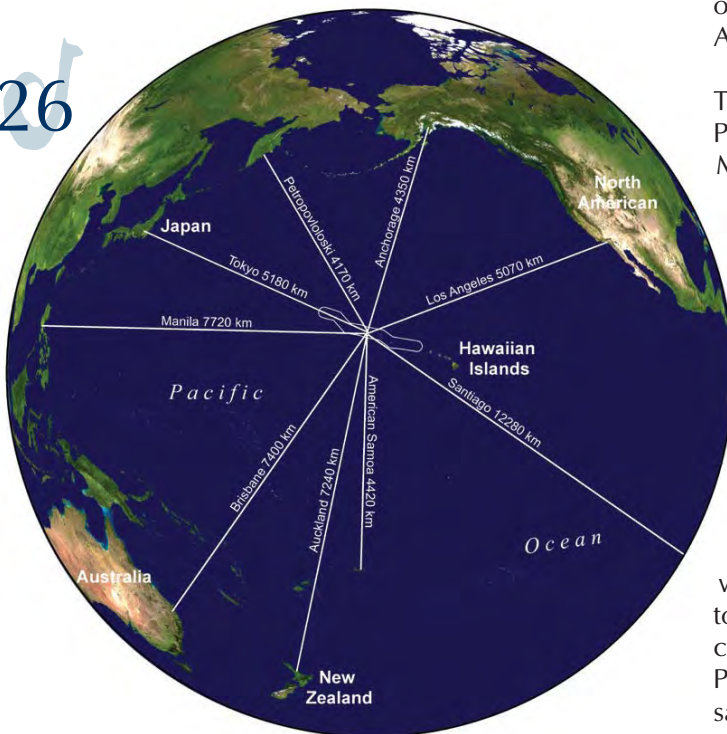

Threatened Green Turtles basking on East Island, French Frigate Shoals (Photo: George Balazs)

Papahānaumokuākea Marine National Monument is located between approximately 22° N and 30° N latitude and 161° W and 180° W longitude within the north central Pacific Ocean. When overlain on the continental United States, this property would cover the distance from Washington, D.C. to the midwest, or within Europe, the distance from Amsterdam to Moscow.

The islands and atolls of Papahānaumokuākea Marine National Monument constitute the northwestern three quarters of the one of the world's longest and most remote island chains. This expansive stretch of islands is referred to as the Northwestern Hawaiian Islands (NWHI), in past decades as the Leeward or Kūpuna Islands (Islands of the Revered Elders or Ancestors), and now as Papahānaumokuākea (see box). The area has played and continues to play a significant role in the culture and traditions of Native Hawaiians. From the time of the first Polynesian voyagers who peopled the Hawaiian Archipelago to the present renaissance of Hawaiian culture, Native Hawaiians have considered Papahānaumokuākea a profoundly sacred place.

Significant archaeological sites, strong oral traditions, and the living culture's continuing

26

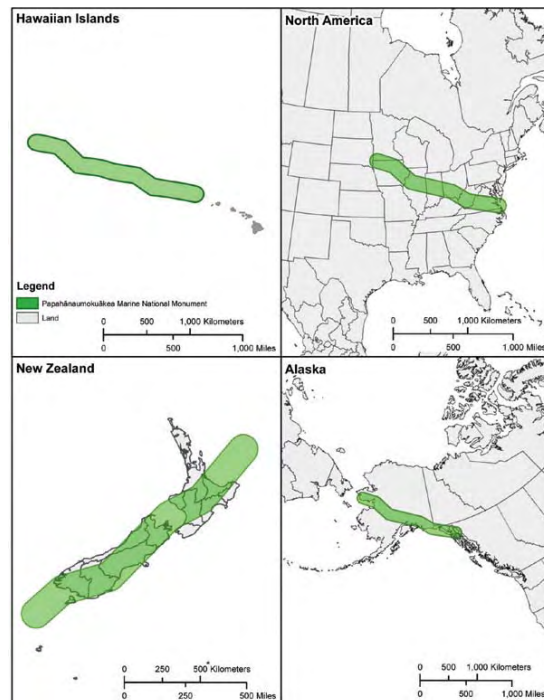

Papahānaumokuākea Marine National Monument's distance from major metropolitan areas

association with the region confirm a deep relationship between the Hawaiian people and Papahānaumokuākea. Today, the region's exceptional natural integrity is fundamental to the perpetuation of the Hawaiian culture; Papahānaumokuākea is known as one of the last "places of abundance," where Native Hawaiians can interact with and experience an intact and abundant natural world similar to the world of their ancestors. All archipelagic wildlife are regarded as ancestors to Native Hawaiians (Malo 1951); the region itself is revered as the place from where spirits come and to which they return after death. The geological and natural life forms defined in this section are inhabitants of the NWHI and referred to in the Kumulipo, a genealogical *oli* (chant) that frames the evolution of life from the simplest of creatures to the most complex. In the Native Hawaiian worldview, the interface between natural and cultural resources is seamless. Hence, Papahānaumokuākea is a longstanding site of outstanding associative value to the living Hawaiian culture, and ultimately the global community.

### Hānau Moku – The Birth of the Islands

Birth—creation—is a central pillar of traditional cultures across the globe. In Native Hawaiian culture, human life comes not only from two biological parents, but from a complex spiritual and literal genealogy that ties humans with a bond of kinship to everything else, both living and non-living, in the natural world. Pō, the primordial female darkness from which all life springs and to which it returns after death, is seen as giving birth to the world, its natural components, all of the Hawaiian gods, and humans. The union of her progeny, Kumulipo and Pō'ele, gives rise to all the creatures of the world, beginning in the oceans with the coral polyp—a genealogy that, like current theories of evolution, starts with the simplest known life form and moves to the more complex.

Native Hawaiians view the rising of magma from deep within the earth as the birthing of the islands—the physical manifestation of the union between the earth mother,

*Papahānaumokuākea Marine National Monument superimposed over other land masses*

Papahānaumoku (literally, "goddess who gives birth to the islands"), and the sky father, Wākea. The symbolism of this union is also the foundation for the name of the property: Papahānaumokuākea.

In the Native Hawaiian culture, *kūpuna* (elders, or ancestors) are accorded reverence and respect, and are looked to as teachers by right of their greater experience. Native Hawaiians consider the islands of Papahānaumokuākea (also called the Kūpuna Islands in recent times) to be their *kūpuna*. Each island is a teacher, and each island has its own unique story and message. As the younger generation, humans are tasked to *mālama* (care for) the *kūpuna*. It is also humankind's *kuleana* (responsibility) to take the time to listen to their wisdom.

The following box describes how the property received its name. Native Hawaiian practitioners undertook a deliberative and thoughtful process to give the region a name reflective of both its natural and cultural heritage, as well as its future as a vast and sacred protected place.

# The Naming of Papahānaumokuākea

Native Hawaiian artist Solomon Enos renders deities Papa and Wakea's creation of the Hawaiian Islands  
<http://www.solomonenosgallery.com/>

For Native Hawaiians, place names are an important way to preserve information about an area's geology, its history, natural and supernatural phenomenon specific to it, or its uses by gods and men. As a place changes over time, so may its name. Historically, Native Hawaiians referred to the Northwestern Hawaiian Islands as Nā Moku Manamana (Branching Islands), Nā Moku Papapa (Flat Islands) and nā papa kahakukea o Lono (the low white-marked isles of Lono (one of the four principal Hawaiian gods)) (Kepā Maly 2 November 2008, personal communication; Fornander 1918). In recent times, Native Hawaiians have called the isles of this region the Kūpuna (Revered Elder) Islands.

Hawaiian cultural practitioners and *kūpuna* when the area was designated as a federal monument. The name specifically relates to one of the stories contained within the Kumulipo: the *mo'olelo* which tells the story of Papahānaumoku (a mother figure who is personified in the earth) and Wākea (a father figure who is personified in the expansive sky). These two figures, either together or separately, are responsible for the creation or birthing of the entire archipelago, and they are the most recognized ancestors of the Native Hawaiian people (Beckwith 1951, Malo 1951, Fornander 1918). The name Papahānaumokuākea is reflective of the region's natural and cultural heritage and its future as a vast, sacred, protected and procreative place.

The preservation of these names, together, as Papahānaumokuākea, strengthens Hawai'i's cultural foundation and grounds Hawaiians to an important part of their historical past. Taken apart, "Papa" (earth mother), "hānau" (birth), "moku" (small island or land division), and "ākea" (wide) bespeak a fertile woman giving birth to a wide stretch of islands beneath a benevolent sky, the dramatic imagery of which is on full display in the region.

Papahānaumokuākea describes a hope for regeneration, which Hawaiians hope to see not only in their Kūpuna Islands, but in the main Hawaiian Islands and their culture as well. Papahānaumokuākea is a name that will encourage abundance and energize the continued procreative forces of earth, sea and sky. It reminds everyone that spiritual inspiration supports the physical world. Papahānaumokuākea will help to continue life for everything that procreates and gives birth; it is a continuum and everything that is part and parcel of Native Hawaiians' home world, the Hawaiian Archipelago.

### Natural Processes and Systems in Papahānaumokuākea

#### Geology

Beginning 250 kilometers northwest of the main Hawaiian Island of Niʻihau, the ten islands and atolls of this Pacific chain extend for 1,931 kilometers. None of the included islands is more than five square kilometers in size, and all but four have an average mean height less than ten meters above sea level. As a group, these islands represent a classic geomorphological sequence, consisting of highly eroded high islands, near-atolls with volcanic pinnacles jutting from surrounding lagoons, true ring-shaped atolls with roughly circular rims and central lagoons, and secondarily raised atolls, one of which has an interior hypersaline lake. In addition, more than 30 submerged ancillary banks and seamounts have been discovered around these islands.

Hawaiian - Emperor Seamount Chain

The geological progression along the Hawaiian Ridge continues northwestward beyond the last emergent island, Kure Atoll, as a chain of submerged platforms that makes a sudden northward bend to become the Emperor Seamounts, which extend across the entire North Pacific to the base of the Kamchatka Peninsula in Russia. This unbroken chain of progressively more senescent volcanic structures essentially tracks the movement of the Pacific tectonic plate over the past 80 million years, and has provided some of the strongest evidence upon which current theories of hotspot-mediated island formation and global plate tectonic movements have been based.

Formed millions of years ago, these islands were created by a deep-sea volcanic “hotspot” now located south of the island of Hawaiʻi, which formed a sequential series of underwater shield volcanoes that became islands as they rose above the ocean’s surface. These once-lofty

islands have been transported northwest by the movements of the Pacific Plate to their current locations (Dalrymple et al. 1974). Due to the pervasive and unrelenting forces of subsidence and erosion, all that remains today are small patches of ancient land, shoals and reefs that lie where significant mountains once loomed. Nowhere else in the world is this progression illustrated in such an unambiguous and linear fashion. Papahānaumokuākea also includes a unique example of an atoll at the critical “Darwin Point,” the northernmost threshold for coral reef existence. Kure Atoll is the northernmost coral reef in the world, and has reached the latitude at which coral growth rates, which decrease in cooler temperatures, are matched by the rate of subsidence of the island.

*Oceanography*

Among the dominant natural controls over the ecosystems of Papahānaumokuākea Marine National Monument are climatic and oceanographic forces. The area lies at the northern edge of the oligotrophic tropical Pacific, near the 18 °C sea surface isotherm, a major ecological transition zone in the northern Pacific. This boundary, also known as the “Transition Zone Chlorophyll Front,” varies in position both seasonally and annually, and periodically moves across the property boundary surrounding the northern atolls of Kure and Midway. This, in turn, influences overall ocean productivity, and the resultant recruitment success of many species such as Hawaiian Monk Seals and ocean-feeding seabirds (Polovina et al. 2008; Baker, Polovina and Howell 2007). The northernmost atolls are also in a position where they are occasionally affected by an episodic eastward extension of the Western Pacific warm pool, which can lead to higher summer ocean temperatures at Kure than are found in the more “tropical” waters of the main Hawaiian Islands further to the south. This can cause greater temperature fluxes that

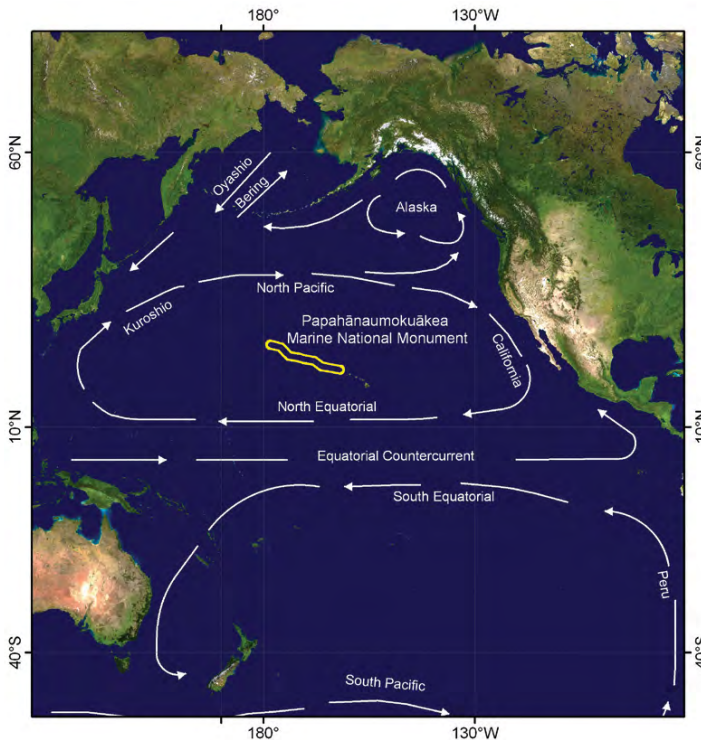

*Papahānaumokuākea’s islands and shoals are the oldest lands in the Hawaiian archipelago (Photo: James Watt)*

can in turn influence the home ranges and diversity of many species. This interplay of oceanography and climate is not fully understood, but adds a level of dynamics not seen in most other tropical atoll ecosystems and is a useful natural laboratory for understanding phenomena such as periodic coral bleaching and the effects of the Pacific Decadal Oscillation, El Niño and La Niña ocean circulation patterns.

Ocean currents, waves, temperature, nutrients, and other oceanographic parameters and conditions influence ecosystem composition, structure, and function in Papahānaumokuākea on both temporal and spatial scales. Spatial variability in oceanographic conditions ranges from a localized temperature regime that may affect a small portion of a reef to a temperature regime that influences Papahānaumokuākea as a whole. Temporal variability in ocean conditions may range from hourly and daily changes to seasonal, annual, or decadal cycles in nutrient inputs, sea level heights, current patterns, and other large-scale

30

*Major circulation patterns of the Pacific Ocean*

*Papahānaumokuākea encompasses intact reef and pelagic ecosystems (Photo: PMNM)*

oceanographic processes (Polovina et al. 1994). Currents play an important role in the dispersal and recruitment of marine life in Papahānaumokuākea on both scales.

Surface currents in the NWHI are highly variable in both speed and direction (Firing and Brainard 2006), with long-term average surface flow being from east to west in response to the prevailing northeast trade wind conditions. The direction

of surface water flow also accounts for certain unusual biogeographic relationships between Papahānaumokuākea and other allochthonous areas, such as Johnston Atoll to the south (Grigg 1981), as well as patterns of endemism, population structure, and density of reef fish within the archipelago itself (DeMartini and Friedlander 2006) (Figure 2.1). The highly variable nature of the surface currents is due in large part to eddies created by

local island effects on large-scale circulation. The distribution of corals and other shallow-water organisms is also influenced by exposure to ocean waves. The size and strength of ocean wave events have annual, interannual, and decadal time scales. Annual extratropical storms (storms that originate outside of tropical latitudes) create high waves during the winter, greatly affecting marine and terrestrial areas, as the elevation of a large portion of terrestrial habitat is less than the height of some of the waves that pass through.

*Tinker's Butterflyfish (Chaetodon tinkeri) is found at Johnston Atoll and in the Hawaiian Islands; illustrating the oceanographic and biodiversity links between the two regions. (Photo: L.A. Rocha, HIMB)*

*Natural Habitats*

Papahānaumokuākea also supports a diverse and unique array of both marine and terrestrial flora and fauna. With a spectrum of elevations ranging from abyssal ocean basins at depths of more than 4,600 meters below sea level to rugged hill slopes and cliff tops on Nihoa and Mokumanamana at elevations up to 275 meters above sea level, the property represents a complete holistic cross section of a Pacific archipelagic ecosystem. Habitats encompassed within the property include deep pelagic basins, submarine escarpments, deep and shallow coral reefs, shallow lagoons, littoral shores, dunes, and dry grasslands and shrublands. Twenty-five percent of the nearly 7,000 known marine species found in the region are found nowhere else on earth, and a significant number of the terrestrial plants, birds and insects are endemic. Papahānaumokuākea also provides habitat for 23 plant and animal species formally listed under the Endangered Species Act (ESA) as threatened and endangered. Papahānaumokuākea’s isolation from continental land masses and minimal human footprint allow the study of natural habitats and ecosystem dynamics, including the response to climatic variability and global climate change, in a relatively undisturbed setting. The protective measures in place contain the necessary elements to support the key ecological processes that are essential for the long-term conservation of the ecosystems and the biological diversity they contain throughout Papahānaumokuākea.

The terrestrial and marine habitats of the Northwestern Hawaiian Islands are integrally linked, particularly on the atolls. It is through the synergistic process of terrestrial erosion and coral growth that atolls are formed. The islands of an atoll are a part of the reef. Shallow-water habitats range from exposed boulders and large underwater banks formed from the basaltic remnants of former high islands at Nihoa, Mokumanamana and Gardner Pinnacles, to the extensive coral reef habitats in the protected lagoons of the atolls. The shallow-water habitat includes

intricate and reticulated reefs that form a complex network of reef crest, back reef, patch reef, and lagoons with high coral cover. Outer reef habitat is exposed to much higher wave energy and includes fore-reef and reef slope environments with spur and groove channels and varying percentages of coral cover directly related to wave exposure.

The total land area of the NWHI is extremely small at 1,400 hectares, but crucially important for the survival of both marine and terrestrial species, many that spend part or most of the year at sea and come ashore to breed, nest or pup such as turtles, seabirds and monk seals. All the low islands are mostly arid with no fresh water resources, except during seasonal rains. Nihoa, Mokumanamana and Laysan have small fresh water seeps. Only the higher and larger islands of Nihoa, Laysan, Lisianski, and Midway support year-round vegetation; many of the smaller and lower islands are periodically overwashed by seawater.

*Figure 2.1a: Biomass comparisons between the Northwestern Hawaiian Islands (NWHI) and the main Hawaiian Islands (MHI) by trophic group. (Apex = apex predators, Sec = secondary consumers, Pri = primary consumers)*  
 (Photo: James Watt, Figure: Alan Friedlander)

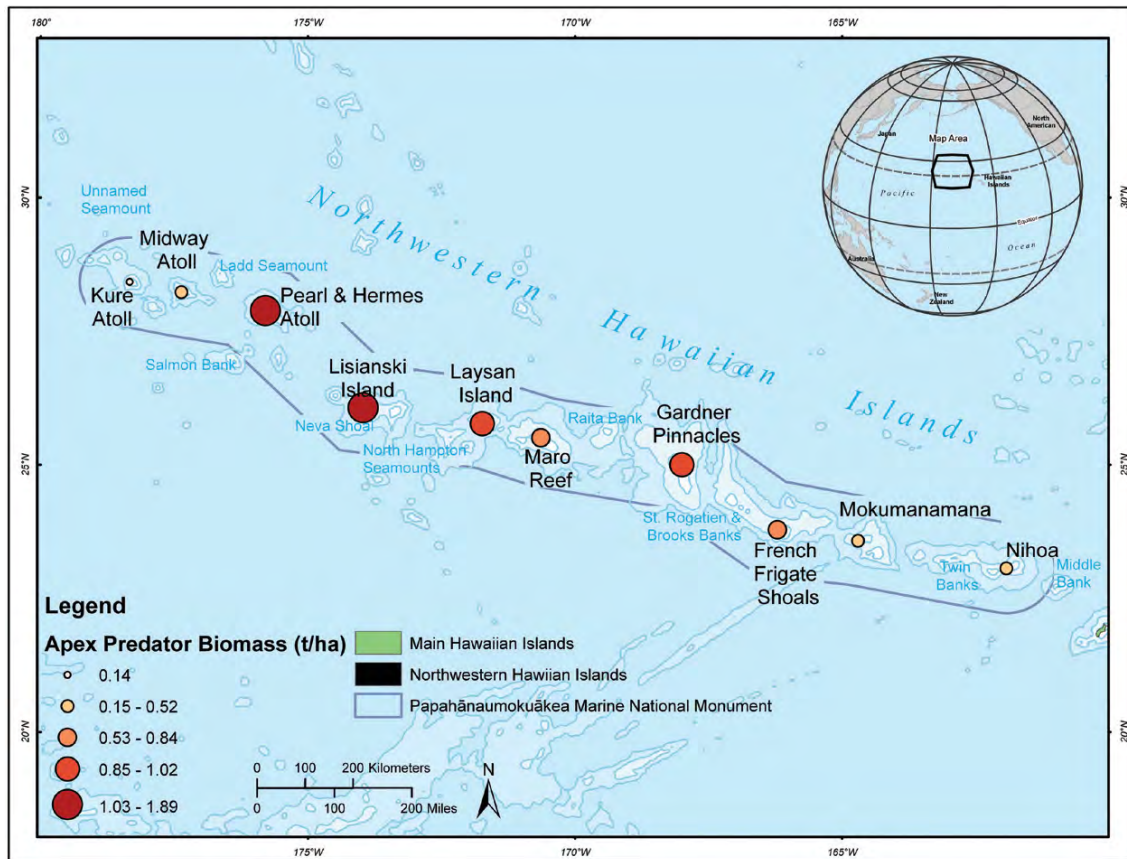

Figure 2.1b: Geographic pattern of apex predator biomass density (tons/ha) in the NWHI (data from surveys conducted 2000-2002).

### Top Predator Dominated Ecosystem

The shallow marine component of the property is nearly pristine, and has been described as a “top predator dominated ecosystem,” an increasingly rare phenomenon in the world’s oceans (Friedlander and DeMartini 2002). Recent research suggests that the global oceans have lost more than 90% of large predatory fishes (Meyers and Worm 2003). Large, predatory fish such as sharks, Giant Trevally, and groupers that are heavily depleted by fishing and therefore rarely seen in populated areas of the world are extremely abundant in the waters of Papahānaumokuākea. With low fishing pressure and physical isolation from human impacts, the average biomass of fish in Papahānaumokuākea is three times greater than in the main Hawaiian Islands. More than 54% of the total biomass consists of apex predators such as large jacks or trevally, sharks and other species (Figures 2.1a and 2.1b).

### Marine Endemism

Papahānaumokuākea is characterized by a high degree of endemism in reef fish species, particularly at the northern end of the chain, with endemics comprising over 50% of the population in terms of numerical abundance (DeMartini and Friedlander 2004) (Figure 2.2). Endemism of corals is also high, with 30% of species being found only in the Hawaiian Archipelago. These endemics also account for 37%–53% of visible stony corals found in Papahānaumokuākea in all shallow reef areas surveyed (Friedlander et al. 2005). Fifteen of the 17 endemic species are in the genera *Montipora*, *Porites*, or *Pocillopora*. Due to Papahānaumokuākea’s remoteness, studies of small benthic or cryptic species are sparse, but with the inception of National Monument status, there have been increased efforts to document these groups. Preliminary faunal inventories indicate that many constituent species remain undocumented, and even new coral species are still being discovered

# Endemic Sea Life

This tailored attunement of species to a specific place is called **endemism**. No other coral reefs of similar size and expanse on the planet have a higher rate of endemism than Hawaii's.

◀ SADDLE WRASSE

BANDIT  
ANGELFISH  
*Apolemichthys arcuatus*

The downside of Hawaii's endemism is that there is no replacement pool should our corals and marine life perish. This vulnerability underscores one of nature's hard-won lessons: that the rarest of creatures are sometimes the most valuable.

and Susan Middleton

Papahānaumokuākea contains countless endemics, and is home to many rare, threatened and endangered species, including 22 IUCN Red-Listed species, many for whom it is the last or only refuge anywhere on earth.

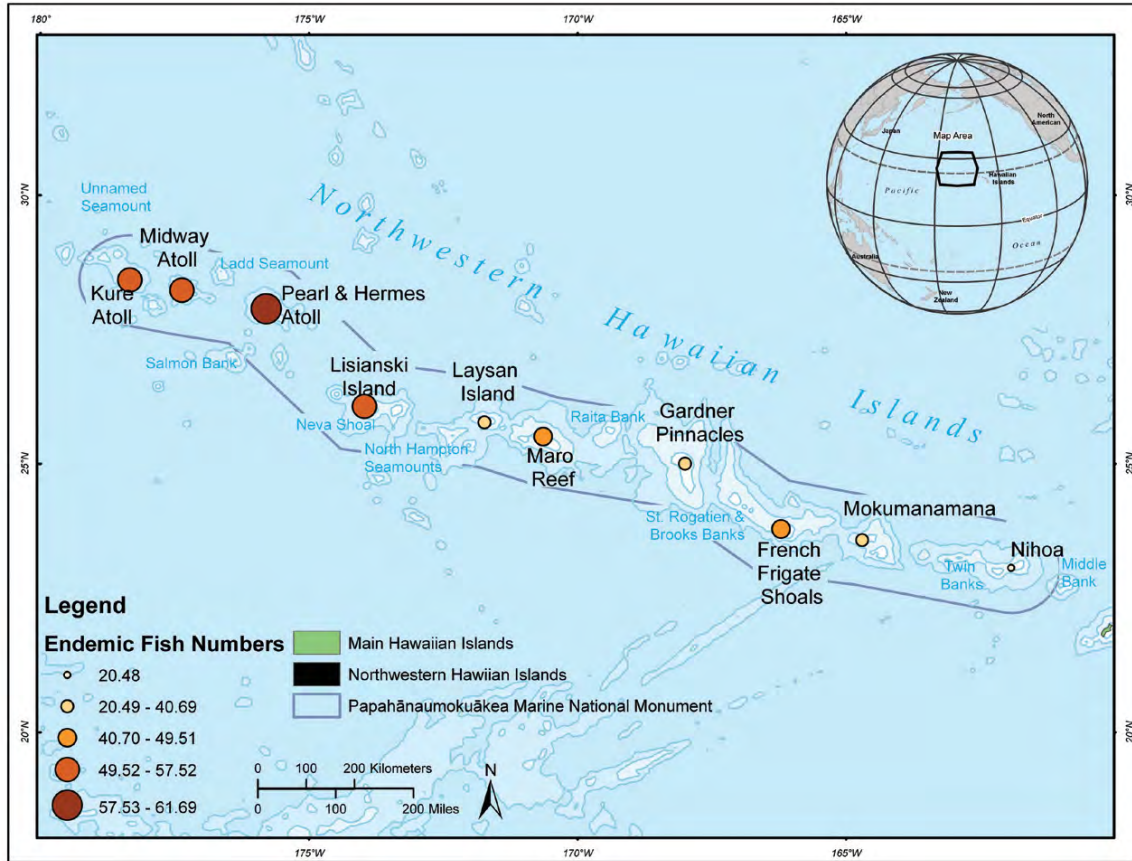

Figure 2.2: Percent fish endemism at each of ten emergent Papahānaumokuākea reefs (data from surveys conducted 2000–2002)

36

(Waddell and Clarke 2008). Given this, it is expected that the marine species lists of Papahānaumokuākea will continue to expand as improving funding, technology and research tools allow exploration and documentation of the region’s reefs.

*Marine and Bird Life in Papahānaumokuākea*

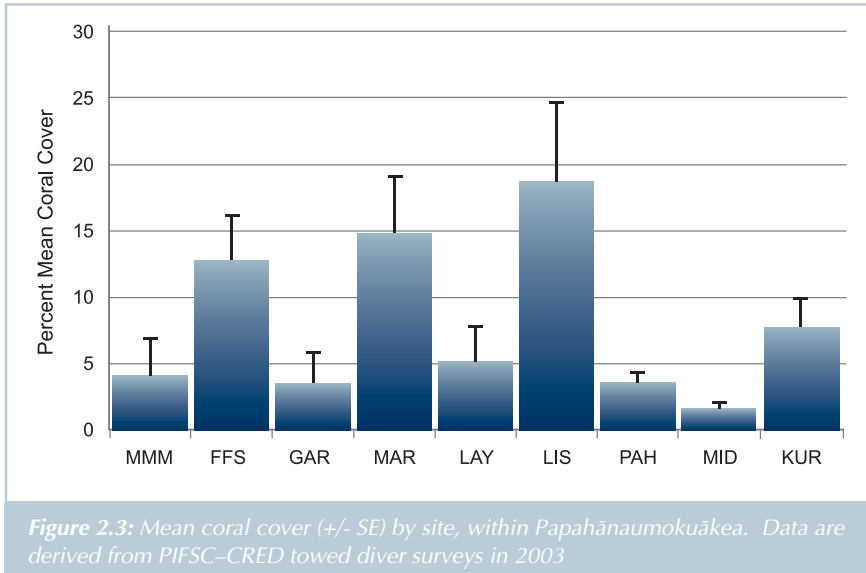

**Algae**

The marine algal flora in Papahānaumokuākea are diverse and abundant, although community dynamics are poorly understood. There are 353 species of macroalgae and two seagrass species known in Papahānaumokuākea (McDermid and Abbott 2006). Large numbers of Indo-Pacific algal species have been documented here that are not present in the main Hawaiian Islands, such as the green calcareous alga (*Halimeda velasquezii*). The species composition of the macroalgae community is relatively similar throughout

Papahānaumokuākea, with representatives of the Chlorophyta, Rhodophyta, Phaeophyta, branched coralline, crustose coralline, Cyanophyta, and turf algae occurring in varying combinations, with green algae having the largest biomass and area coverage (Vroom and Page 2006). Green algae in the genus *Halimeda*, which contributes greatly to sand formation, was found in more than 70%

Healthy native algal species abound in Papahānaumokuākea (Photo: Amy Baco-Taylor)

Live coral cover is highest in the middle of the chain, with Lisianski Island and Maro Reef having 59.3% and 64.1% of their respective available substrate covered with living corals (Maragos et al. 2004) (Figure 2.3). Coral cover varies significantly across Papahānaumokuākea from these high rates at Maro and at Lisianski to minimal coverage at most of the other reef sites. Coral species richness is also highest

of all quadrates during area-wide surveys in 2004 (Vroom and Page 2006). An island-specific checklist of the nonvascular plants of Papahānaumokuākea can be found in Eldredge (2002). In contrast to the main Hawaiian Islands, where alien species and invasive algae have overgrown many coral reefs, the reefs of Papahānaumokuākea are largely free of alien algae, and high natural herbivory results in natural algal assemblages.

### Corals

Fifty-seven species of stony corals are known in the shallow subtropical waters (depths of less than 33 meters) of Papahānaumokuākea, with an additional 28 species that are currently either undetermined or undescribed (Miller et al. 2004, 2006; Waddell and Clarke 2008). Despite Papahānaumokuākea's high latitudes (which makes coral growth progressively more difficult), a similar number of species of coral have been reported for the NWHI as the main Hawaiian Islands, with 59 recorded species (Friedlander et al. 2005).

in the middle of the chain, reaching a maximum of 41 reported coral species at French Frigate Shoals (Maragos et al. 2004).

Stony corals are less abundant and diverse at the northern end of the archipelago (Kure, Midway, and Pearl and Hermes), and off the exposed basalt islands to the southeast (Nihoa, Mokumanamana, La Pérouse, and Gardner) (Figure 2.4). At these sites, soft corals such as *Sinularia* and *Palythoa* are more abundant. Table coral in the genus *Acropora* is not found anywhere in the main

Hawaiian Islands, but seven species are recorded for Mokumanamana, Gardner, Pearl and Hermes, Neva, French Frigate Shoals, Maro, and Laysan, with the highest number of species and colonies at French Frigate Shoals. These colonies of coral may have been established from larvae traveling in currents or eddies from Johnston Atoll, 724.2 kilometers to the south (Grigg 1981; Maragos and Jokiel 1986).

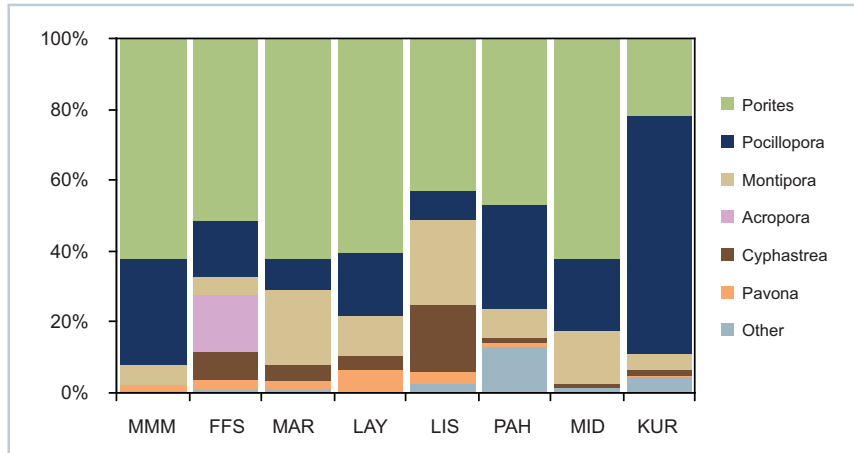

Figure 2.4: Relative abundance of coral taxa genera throughout Papahānaumokuākea (Data are derived from colony counts within belt transects during 2006 surveys)

### Benthic shallow-water invertebrates

With the exception of coral and lobster species, the marine invertebrates of Papahānaumokuākea are very poorly known. Only two comprehensive collections of these groups of animals were conducted prior to 2000: the 1902 *Albatross Expedition*, in which the collected organisms were deposited at the Smithsonian Institution, and the 1923 *Tanager Expedition*, in which the collection was deposited at the Bishop Museum. In 2000, the NWHI Reef Assessment and Monitoring Program was established, and it continues to the present to assess the biota of all ten emergent reef areas and shallow waters (<20 meters) in Papahānaumokuākea (Friedlander et al. 2005). While this work is ongoing, a number of new species have already been recorded for Hawai'i, some of which may turn out to be endemic to Papahānaumokuākea (DeFelice et al. 2002).

Other-worldly texture of mushroom corals; shown here, *Fungia scutaria* (Photo: James Watt)

By 2005, a total of 838 species from 12 orders had been identified. Many species are still being worked on by taxonomic experts around the world and have yet to be identified (Friedlander et al. 2005). In 2006, a Census of Marine Life research expedition explored the biodiversity of small, understudied, or lesser known invertebrate, algal, and microbial species at French Frigate Shoals. Although thorough taxonomic identifications and molecular analyses of the samples collected will take many years to complete, preliminary findings suggest that approximately 2,300 unique morphospecies were collected and photographed during the 16 days of sampling (Fig 2.5). An estimated 30–50 collected specimens are thought to be species new to science, including new species of crabs, corals, sea cucumbers, sea squirts, worms, sea stars, snails and clams. From this expedition, well over a hundred new species records, including

Banded Spiny Lobster or ula (*Panulirus marginatus*), of the deepwater banks (Photo: James Watt)

sponges, corals, anemones, flatworms, segmented worms, hermit crabs, crabs, sea slugs, bivalves, gastropods, octopus, sea cucumbers, sea stars, and sea squirts, will likely be identified for French Frigate Shoals. Relatively high diversity was found for sponges, bryozoans, eulimid gastropods, hermit crabs, echinoderms, and ascidians, but other invertebrates, including corallimorph anemones, galatheid squat lobsters, porcellanid crabs, pea crabs, and coral barnacles, had strikingly low diversity or were absent. Interestingly, about one third of all invertebrate morphospecies collected were either found only once or found at only one site. A possible new family of ascidian (sea squirt) for Papahānaumokuākea, Mogulidae, was collected. Likewise, a new species of coral that could not even be identified to family level was found and photographed. An estimated 48 new species records of Opisthobranch mollusks for French Frigate Shoals were collected, 27 of which appear to be new records for Papahānaumokuākea.

### Reef fish

The extreme isolation of Papahānaumokuākea and its distance from the diverse fish population centers of the Western Pacific contribute to a lower fish species richness relative to other sites (Mac et al. 1998). A total of 258 species have been documented from Midway Atoll (Randall et al. 1993). Total species richness observed on surveys show a positive linear relationship with the total area of reef in shallow waters, a relationship that is consistent with most theories of island biogeography and likely reflects the greater diversity of habitats at larger islands or atolls (Waddell and Clarke 2008). Although part of one continuous chain, fish assemblages differ among reef types. The three true atolls

A Stocky Hawkfish or po'ō pa'a (*Cirrhitis pinnulatus*) peers from Kure Atoll's reefs (Photo: James Watt)

(Kure, Midway and Pearl and Hermes) as well as the partial atoll French Frigate Shoals, contain fish assemblages that are different from the basalt islands of Mokumanamana, Gardner Pinnacles and Nihoa. In addition to fish species differing with various island types, species also differ among latitudinal gradients. Many species of wrasses and damselfish exhibit a higher latitudinal bias; they are found significantly more often at northern sites (Kure and Midway Atolls) than at more southern locations.

Papahānaumokuākea's long-term protection from fishing pressure has resulted in high standing stocks of fish that are more than 260% greater than the main Hawaiian Islands. As mentioned above, the fish community of the coral reef ecosystem of

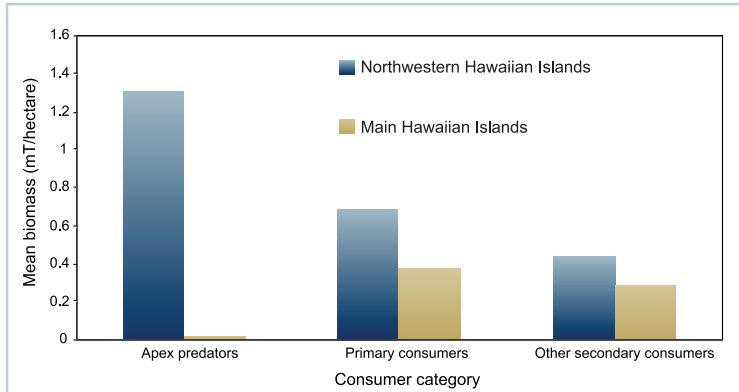

Figure 2.5: Unique morphospecies collected at FFS by phylum in 2006 surveys

Papahānaumokuākea also shows a very different structure than the main Hawaiian Islands and most other places in the world. The shallow-reef fish community is remarkable in the abundance and size of fish in the highest trophic levels. Apex predator biomass on fore-reef habitats in Papahānaumokuākea is 1.3 metric tons per hectare, compared to less than 0.05 metric tons per hectare on fore-reef habitats in the main Hawaiian Islands (Fig 2.6).

**Figure 2.6:** Comparison of biomass in major trophic guilds between the Northwestern Hawaiian Islands and the main Hawaiian Islands  
 (Source: Friedlander and DeMartini 2002 Data are derived from colony counts within belt transects during 2006 surveys)

Areas with the highest apex predator biomass include Pearl and Hermes Atoll, followed by Lisianski and Laysan Islands.

**Biota of deeper bank habitats**

The property also contains a significant component of deeper waters that surround the island platforms, an ecosystem type typically lacking in most of the world’s marine reserves. There are at least 15 banks at depths of 30 to 400 meters within Papahānaumokuākea, providing important habitat for bottomfish and lobster species, although only a few of these banks have been studied in any detail (Kelley and Ikehara 2006). These waters represent critical deepwater foraging grounds for Hawaiian Monk Seals (Parrish et al. 2002), important habitat for bottomfish and lobster species, and a spatial refuge for pelagic fishes such as tunas and their allies, which have been declared overfished in other regions throughout the world (Myers and Worm 2003). Surveys using deep-diving submersibles have established the presence of deepwater precious coral beds at depths of 365–406 meters; these include ancient

gold corals whose growth rate is now estimated to be only a few centimeters every hundred years, and whose ages may exceed 2,500 years (Roark et al. 2006). At depths below 500 meters, a diverse community of octocorals and sponges flourishes; these deepwater sessile animals prefer hard substrates devoid of sediments (Baco-Taylor et al. 2006). Deeper still, the abyssal depths of Papahānaumokuākea, while harboring limited biomass, are home to numerous scantily documented fishes and invertebrates, many with remarkable adaptations to this extreme environment.

**Biota of pelagic habitats**

Most of Papahānaumokuākea can be considered pelagic, or deep-water, habitat. The estimated area of all parts of Papahānaumokuākea with depths greater than 1,000 fathoms (1.8 kilometers) is 304,000 square kilometers (Miller et al. 2006). The deep waters are important insofar as they support an offshore mesopelagic boundary

community (Benoit-Bird et al. 2002), a thick layer of pelagic organisms that rests in the deep ocean (400–700 meters) during the day, then migrates up to shallower depths (surface to 400 meters) at night, providing a critical source of nutrition for open-ocean fishes, seabirds and marine mammals. These organisms that inhabit the upper layers of the mesopelagic zone have been surveyed at French Frigate Shoals, Lisianski, Pearl and Hermes, Midway, and Kure using echosounding technology (Lammers et al. 2006). This work confirmed the presence of a community of vertical migrators, consisting of fish, squid, and shrimp. This

(Photo: PMNM)

temporal variability in the structure of the biotic community is important to understand as the spatial patterns are studied. Mesopelagic fishes, in particular, are important prey for bigeye tuna, which tend to live at greater depths than the other tuna species. Overall, the fauna of Papahānaumokuākea's waters below standard SCUBA diving depths remains minimally surveyed and documented, representing an enormous opportunity for future scientific research in a system largely undisturbed by trawling or other forms of resource extraction.

The estimated millions of seabirds breeding in Papahānaumokuākea also depend on this pelagic habitat. They are primarily pelagic feeders that obtain the fish and squid they consume by associating with schools of large open-water predatory fish such as tuna and billfish (Fefer et al. 1984, Au and Pitman 1986). These fish—Yellowfin Tuna (*Thunnus albacares*), Skipjack Tuna (*Katsuwonus pelamis*), Mahimahi (*Coryphaena hippurus*), Wahoo (*Acanthocybium solandri*), Rainbow Runner (*Elagatis bipinnulatus*), Broadbilled Swordfish (*Xiphias gladius*), and Blue Marlin (*Makaira indica*)—are apex predators of a food web existing primarily in the epipelagic zone and found within the waters of Papahānaumokuākea. While both the predatory fish and the birds are capable of foraging throughout their pelagic ranges (which encompass the entire property and

A manta ray or hāhālua glides through waters near Mokumanamana (Photo: James Watt)

tropical Pacific Ocean), the birds are most successful at feeding their young when they can find schools of predatory fish within easy commuting range of the breeding colonies (Ashmole 1963; Feare 1976; Flint 1991). Recently fledged birds, inexperienced in this complex and demanding style of foraging, rely on abundant and local food resources to survive while they learn to locate and capture prey.

### Marine mammals

The marine and littoral ecosystems of the property are designated critical habitat for the Hawaiian Monk Seal, the world's second most endangered pinniped. Only 1,200–1,400 individuals exist, and models predict that the population will fall below 1,000 individuals within the next five years. While a few Hawaiian Monk Seals co-exist with humans in the main Hawaiian Islands, the great majority of the population lives among the remote islands and atolls of Papahānaumokuākea Marine National Monument. Their range generally consists of the islands, banks and marine corridors within Papahānaumokuākea, although individual animals may be found beyond this extensive area, sometimes farther than 90 kilometers from shore.

Studies of the movements and diving patterns of 147 Hawaiian Monk Seals in Papahānaumokuākea (consisting of 41 adult males, 35 adult females, 29 juvenile males, 15

Deep water habitats comprise over 90% of this protected area (Photo: PMNM)

Hawaiian Monk Seals and Green Turtles cohabitating on the beaches of Papahānaumokuākea  
(Photo: George Balazs)

juvenile females, 12 weaned male pups, and 15 weaned female pups) using satellite-linked depth recorders have determined that Monk Seal foraging range covers an area of approximately 48,156 square kilometers, or almost 14% of the total area of Papahānaumokuākea. Seals forage extensively at or near their breeding sites and breeding subpopulations, and haulout sites;

95% forage within 12 km of these sites. Several banks located northwest of Kure Atoll represent the northern extent of the monk seal foraging range (Stewart 2004a). (Recent research conducted with submersibles and remotely operated vehicles by NOAA's Office of Ocean Exploration has identified these areas as important habitat for precious corals (NOAA 2003).) The main terrestrial habitat requirements include haulout areas for pupping, nursing, molting and resting. These are primarily sandy beaches, but virtually all substrates are used at various islands in Papahānaumokuākea. The waters of Papahānaumokuākea are also home to more than 20 cetacean species, six of them federally and internationally recognized as endangered, although comparatively little is known about the distributions and ecologies of these whales and dolphins. Recent research by Johnston and others (2007) reveals that Papahānaumokuākea also may host many more humpback whales than originally thought.

### Marine reptiles

In addition to the important habitat for marine mammals within Papahānaumokuākea, the islands and atolls are also crucial breeding, nesting, and basking habitat for the Hawaiian population of Green Turtles. More than 450 nesting sites have been observed in Papahānaumokuākea, incorporating over 90% of the total nesting area for Green Turtles. The five species of sea turtles that occur in the NWHI are the Loggerhead (*Caretta caretta*), the Green (*Chelonia mydas*), the Olive Ridley (*Lepidochelys olivacea*), the Leatherback (*Dermochelys coriacea*), and the Hawksbill (*Eretmochelys imbricata*) (Figure 2.7). Section 4 provides additional information on population trends for these species, especially the Green Turtle.

More than 450 Green Turtle nesting sites have been documented in Papahānaumokuākea (Photo: James Watt)

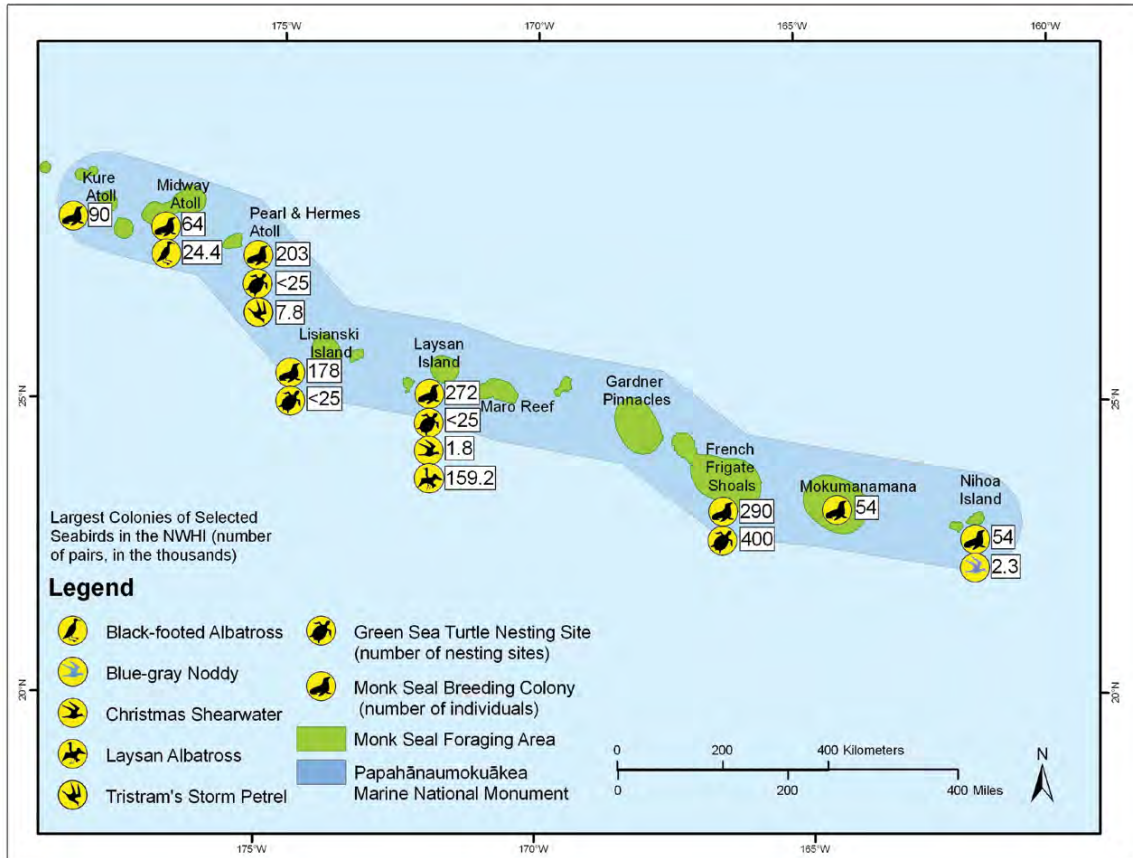

Figure 2.7: Population sizes and nesting sites of rare seabird species, Green Turtles and Hawaiian Monk Seals in the Pacific Island region (Sources: Stewart 2004a; Balazs and Ellis 2000; Kushlan et al. 2002; Fefer et al. 1984)

### Seabirds

In addition to the purely terrestrial biota, more than 14 million seabirds rely on the tiny islets in the chain, 5.5 million of which nest annually. This includes 99% of the world's Laysan Albatrosses (listed as vulnerable by the International Union for Conservation of Nature (IUCN), 98% of the world's Black-footed Albatrosses (listed as endangered by the IUCN), and important populations of the Short-tailed Albatross (listed as endangered by the IUCN). The small islands and atolls of the property thus form a major portion of the current total tropical seabird nesting habitat of the United States as a whole. Eleven of the 21 species were classified as highly imperiled or of high conservation concern at the broad scale of the North American Waterbird Conservation

Plan (eastern north Pacific, western north Atlantic, and Caribbean) (Table 2.1). At the regional scale (Pacific Islands), six species were included in these highest-concern categories: Laysan, Black-footed, and Short-tailed Albatrosses; Christmas Shearwater; Tristram's Storm-Petrel; and Blue-gray Noddy. The importance of Papahānaumokuākea to seabirds is further discussed in Section 3.

**HIRYU**  
United States and Japanese ships sunk during the Battle of Midway, June 4-7, 1942.

Between 1996 and 2005, 294 metric tons of marine debris were removed from Pearl and Hermes Atoll, more than half of all nets and other large debris removed from the Monument's reefs.

During World War II, Midway served as an important naval air station and submarine refit base. The atoll was attacked twice, first on December 7th 1941, and again during the pivotal Battle of Midway, June 4-6, 1942. This Corsair is one of the remnants of military presence during WWII.

Pearl and Hermes Atoll has the highest percentage of endemic fish species of any area in the Hawaiian Archipelago. Over half of all fish recorded here are only found in Hawai'i. The masked angelfish, *Genicanthus personatus*, is one of these endemic species.

With approximately 100 individuals, French Frigate Shoals has the largest Hawaiian monk seal colony in the Monument.

**Shorebirds**

Forty-seven species of shorebirds have been recorded in Papahānaumokuākea. Most of these are classified as infrequent visitors or transients, but Papahānaumokuākea does support regionally significant populations of four migrants: Pacific Golden-Plovers (*Pluvialis fulva*), Bristle-thighed Curlews (*Numenius tahitiensis*), Wandering Tattlers (*Tringa incana*), and Ruddy Turnstones (*Arenaria interpres*). Most of these birds arrive in July and August and return to the Arctic to breed in May, but some of the younger individuals may skip breeding their first summer and remain in Papahānaumokuākea. While there, these species use all the habitats available for foraging and sometimes concentrate in large numbers in the hypersaline lake at Laysan and in the artificial water catchment pond on Sand Island at Midway Atoll. The rat-free islands of Papahānaumokuākea provide important wintering sites for the

rare Bristle-thighed Curlew, because they are flightless during molt and require predator-free sites. This species and Pacific Golden-Plovers are listed as species of high conservation concern in the National and Regional Shorebird Conservation Plans (Engilis and Naughton 2004) and are designated Birds of Conservation Concern by the FWS at the regional and national scale (FWS 2002).

### Terrestrial Life in Papahānaumokuākea

#### Terrestrial biota

In contrast to the marine systems of Papahānaumokuākea, the terrestrial area of the property is comparatively small, but supports significant endemic biodiversity. This includes 145 species of endemic arthropods, six species of endangered endemic plants, including an endemic palm, and four species of endemic birds, including remarkably isolated species such as the Nihoa Finch, Nihoa Millerbird, Laysan Finch, and Laysan Duck, one of the world's rarest ducks. Three of these species (Nihoa Finch, Nihoa Millerbird, and Laysan Duck) are deemed critically endangered by IUCN, and the Laysan Finch is listed as vulnerable. In addition, millions of seabirds use the area for breeding and foraging, and numerous shorebird species overwinter on the islands or transit through during their migrations to the north and south. At least six species of terrestrial plants found only in the region are listed under the U.S. Endangered Species Act, some so rare that due to the difficulty of surveying these remote islands, they have not

been documented for many years. IUCN lists *Cenchrus agrimonioides* var. *laysanensis* from Laysan as extinct, though biologists hold hope that it may still exist. *Amaranthus brownii*, endemic to Nihoa, is deemed critically endangered by IUCN, while *Pritchardia remota* is considered endangered. Although still poorly documented, the terrestrial invertebrate fauna shows significant patterns of precinctive speciation, with endemic species described from Nihoa, Mokumanamana, French Frigate Shoals, Laysan, Lisianski, Pearl and Hermes, and Kure.

#### Terrestrial invertebrates

The native terrestrial arthropods and land snail communities of Papahānaumokuākea are the least-well-studied of the animal groups (Table 2.2), but are perhaps the most seriously affected by human activities and introductions. In particular, the many species of ants that have accidentally reached all the islands of the archipelago except Gardner Pinnacles have had enormous effects on these native terrestrial invertebrates. The entomofauna of Papahānaumokuākea includes some groups of insects that demonstrate dramatic adaptive radiations. One such group is the seedbugs, specifically the genus *Nysius*, which shows the complete range of feeding types: from host-specific plant feeders, to diverse plant hosts, to omnivorous feeding, and finally to predator/scavengers. It is a rare occurrence to find herbivory and carnivory occurring within the same genus. Nowhere else in the world is there a lineage like the Hawaiian *Nysius* in which to explore the evolution of carnivory in Heteroptera. Some of these species are single-island endemics and of particular conservation concern because of their limited ranges.

Table 2.2: Number of terrestrial arthropod species in Papahānaumokuākea summarized by order and island  
(Source: Nishida 1998; Nishida 2001)

Terrestrial Arthropod Species	Nihoa	Mokumanamana	French Frigate Shoals	Gardner Pinnacles	Laysan Island	Lisianski Island	Pearl and Hermes	Midway Atoll	Kure Atoll
<b>Anthropoda</b>	<b>221</b>	<b>84</b>	<b>108</b>	<b>11</b>	<b>234</b>	<b>59</b>	<b>109</b>	<b>507</b>	<b>155</b>
Arachnida	42	10	10	4	34	6	16	85	35

Chilopoda	2	2	1		1		1	1	2
Anostraca					1				
Isopoda	3	3	3		3	3	5	9	3
Amphipoda						1			

### Terrestrial plants

The land plants of Papahānaumokuākea are typically salt-tolerant and drought-resistant species of the beach strand and coastal scrub. The number of native species found at each site is positively correlated with island size but negatively influenced by the number of alien species occurring at the site (Table 2.3). The three sites with airstrips and a longer history of year-round human habitation have much larger populations of alien species of land plants. At least three species of Papahānaumokuākea endemic plants (*Achyranthes atollensis*, *Phyllostegia*

*variabilis*, and *Pritchardia* species, all of Laysan Island) are believed to have gone extinct since European contact. Other native species and genera have found refuge in areas of Papahānaumokuākea where rats were never introduced, and now occur at much greater densities than they do in the main Hawaiian Islands (e.g., *Pritchardia remota* and *Sesbania tomentosa*, commonly known as ‘ōhai).

At least six species of terrestrial plants found only in the region are listed under the U.S. Endangered Species Act.

Table 2.3: Biogeographic description of land plants of Papahānaumokuākea Marine National Monument (number of species that have been observed at each site in previous 20 years)

Island	Emergent Land Area (ha)	Island endemic	Indigenous to Hawai‘i and other Pacific Islands	Alien	Total no. of Species
Nihoa	69	3	14	3	20

Kure Atoll	89	0	12	36	48

48

### New Species Discovery

As further described in Section 3, the rates of marine endemism in Papahānaumokuākea are unparalleled in the Pacific and most

of the world. In addition, the sheer mass of apex predators in the marine system is simply not seen in areas subject to higher levels of human impact. Overall, the property represents one of the last unspoiled marine wilderness areas remaining on the planet, and virtually every scientific exploration to the area is a voyage of discovery. In the course of one three-week research cruise in the fall of 2006, conducted as part of the global Census of Marine Life project, more than 100 cryptic species new to science were discovered at French Frigate Shoals alone. Many more such voyages are necessary in order to gain a more comprehensive understanding of insular patterns of speciation and endemism within Papahānaumokuākea as a whole, but even the data in hand strongly support international recognition of this unique ecosystem.

*Papahānaumokuākea exemplifies how nature and culture are one (Photo: James Watt)*

### *Papahānaumokuākea's Associative Cultural Landscape*

This section describes Papahānaumokuākea's Native Hawaiian cultural heritage, specifically the elements that make the property a significant associative cultural landscape.

### *The World of Gods and Spirits*

Papahānaumokuākea is a sacred area, which contains the boundary Pō, a place of darkness that is reserved for their many revered gods and ancestral spirits. The best-known genealogical and creation chant of Hawai'i, the Kumulipo, describes the Hawaiian universe as being comprised of two worlds: Pō and Ao, the realm of light where Native Hawaiians and the rest of Hawai'i's living creatures reside. Native Hawaiians believe that Mokumanamana, in southeastern Papahānaumokuākea, represents the boundary between these two worlds.

Hawaiians know the waters of the tropics as the safest for navigation, and they mark the sacredness of that multi-dimensional realm with celestial gods. The sun's path, which Hawaiians mark as the sequential points on the horizon at which it rises and sets throughout the year, is bordered by the points at which it travels furthest north (*Ke ala nui polohiwa a Kāne* – The long, black shining road of Kāne) and furthest south (*Ke ala nui polohiwa a Kanaloa* – The long, black shining road of Kanaloa). These two gods are considered

major gods of Tahiti, Tuamotu, O'ahu and Kaua'i (Lilikalā Kame'eiehiwa 22 November 2008, personal communication). The boundary of Kāne crosses Mokumanamana ("island of great spiritual power").

The name *Ke ala nui polohiwa a Kāne* refers to death, or the westward road of the ancestral spirits. Native Hawaiians believe that when a person's physical body dies, their spirit travels to *leina*, or portals found on each island. If the individual had lived a *pono* (righteous) life, they would be transported from the *leina* westward to Pō (Beckwith 1970). This spirit realm is represented by the islands and surrounding waters to the northwest of the island of Mokumanamana.

Most of Mokumanamana's *heiau* (shrines) follow the crest of the island, tracking the sun, and it is believed that the solar solstice hits the carefully placed upright stones of these *heiau* at a significant angle (Pualani Kanahale 2 July 2008, personal communication). This line of massive stones may be a physical manifestation of the celestial and spiritual significance of this island as a representation of a crossing between Pō and Ao. "The stone heiau are clues left behind by our ancestors, and are so precious because we don't know everything the ancestors knew, with their superior understanding of direction and the stars" (Lilikalā Kame'eiehiwa 21 November, 2008, personal communication).

# Cultural Heritage Sites Within Papahānaumokuākea

Partly because Mokumanamana is crossed by the Tropic of Cancer, it is considered the sacred boundary between Pō and Ao.

-  Tropic of Cancer - Ke ala nui polohiwa a Kane - The long black shining road of Kane.
-  Papahānaumokuākea Marine National Monument Boundary
-  Voyagers from mythical, ancient, and modern times have traversed Papahānaumokuākea's seascape, as recounted in myriad oral traditions

# *hānaumokuākea*

Upright stones are oriented to sun's angle on the summer solstice. Spanning the length of Mokumanamana's kua (spine, crest), the upright stones are part of the highest concentration of ceremonial sites in the archipelago.

Pre-contact native Hawaiian archaeological sites at Nihoa.

Mokumanamana, with its many *heiau*, is believed to play a critical role in Native Hawaiian rituals because of its position on the Tropic of Cancer. Native Hawaiians believe that a person's shadow is the physical manifestation of their spirit, and therefore, that a person has the most *mana* (spiritual power) when they have no shadow, such as at midday, because the spirit is considered to be united with the body. This is the time when rituals and prayers are conducted, as priests are at the peak of their spiritual powers. Nowhere else in Hawai'i does the sun hang overhead longer than on the summer solstice at Mokumanamana. It is believed that Mokumanamana is an important and powerful place to hold ceremonies, because on the summer solstice, a priest's shadow remains united with his or her body—and the priest's power remains concentrated—for the longest period at any time of the year, anywhere in the archipelago.

As the boundary between Pō and Ao, Mokumanamana today serves as a critical place for ongoing Native Hawaiian cultural research into celestial movements, particularly during major solar events. In 2007, renowned Native Hawaiian cultural practitioner and researcher Pualani Kanahale and a group of cultural practitioners called Ha'ae Wale Ka Hānauna Lolo visited Mokumanamana to study the relationship between the island's *heiau* and the path of the sun during the summer solstice.

Another famous Hawaiian *mo'olelo* (story, historical narrative) tells the story of how a family of important gods and goddesses followed the sun's path in an easterly direction, down the island chain. Pele, the fire or volcano goddess, accompanied by her sister Hi'iaka, sailed from Kahiki (Tahiti) to the Northwestern Hawaiian Islands, continuing on

to Lehua and the main Hawaiian Islands, all the way down the archipelago until she found her current home in the active volcano of Kīlauea, on Hawai'i Island.

The migration *mo'olelo* of Pele and Hi'iaka, two sisters from Tahiti, tells of them first landing in the NWHI on an island named Mokupāpapa, "some point northwest of Hawai'i, along that line of islets, reefs, and shoals which tail off from Hawai'i as does the train of a comet from its nucleus" (Emerson trans. 1915). Pele left her brother Kānemiloha'i on Mokupāpapa, with instructions to build it up for habitation because it was not much more than a reef. Pele and Hi'iaka sailed southeast from Mokupāpapa, landing at Nihoa, where they briefly left another brother.

These gods are considered to be part of a volcano clan that traveled overseas and underground, creating the volcanic hotspots of Hawai'i and following the sun's path, to the east (Pualani Kanahale 2 July 2008, personal communication).

### Hawaiian Voyaging and Wayfinding (Non-instrument Navigation)

Today, Papahānaumokuākea's cultural landscape, dominated by the ocean, plays a critical role in two major living traditions of Native Hawaiians: Hawaiian voyaging and wayfinding. The voyaging route between Kaua'i (in the main Hawaiian Islands) and Nihoa and Mokumanamana is used today as the best training ground for apprentices of Hawaiian wayfinding, non-instrument navigation, before undertaking a long, open-ocean voyage beyond the archipelago.

At Papahānaumokuākea, an array of attributes unique in the archipelago makes

Skillful was the steering of Kamohoali'i  
Until we landed on the island named Lehua....

the area “the ideal training platform” for novice Hawaiian wayfinders (Nainoa Thompson 4 October 2008, personal communication). Apprentice navigators are challenged to sail to Nihoa from Lehua, a small, crescent-shaped island near Kaua’i and Ni’ihau. Oral histories document that this navigational test was used in generations past; it is an ideal route for a novice navigator to prove new skills in reading the celestial and ocean environment (Maly 2003). The navigator must find an island that cannot be seen on the horizon, but is still within a relatively short sail from the safety and provisions of a larger island. Oral tradition tells that in fair weather, canoes would sail first from Kaua’i to Lehua, which is known as a navigational “pointer” to Nihoa.

On Nihoa, there is no artificial lighting to aid the apprentice navigator, and the island’s small physical size (0.68 square kilometers) and low-lying nature (the highest point measures 275 meters) require astute observations of the sun, stars, swells, seabirds and the Hawaiian wayfinder’s other signposts of navigation. Today, novice Hawaiian wayfinders are considered qualified to attempt to navigate a canoe on long-distance, trans-Pacific sails after they have successfully guided a voyage from Kaua’i to Nihoa. Once the voyages to Nihoa, and then Mokumanamana, have been made, the islands themselves contain archaeological sites that continue to be used to educate apprentice navigators and allow for direct communication with the elements and the gods who are personified in those elements (Pualani Kanahale 2 July 2008, personal communication).

Even apart from apprentice sails, Papahānaumokuākea is a major destination for traditional voyaging. Traditional double-hulled Hawaiian voyaging canoes have traveled throughout Papahānaumokuākea in recent years. In 2004, *Hōkūle’a* sailed from the main Hawaiian Islands to

## Language and Writing

Until relatively recently, Native Hawaiian culture relied exclusively on oral traditions (*oli* (chant); *mele* (song); *mo’olelo* (story); *mo’okū’auhau* (genealogy); and *hula* (dance)) to transmit knowledge. When reading and writing were introduced to Hawai’i after Western contact, Native Hawaiians took to them quickly, and by the 1860s—less than a century later—the Native Hawaiian community was almost universally literate (Silva 2004). As a result, many oral traditions were documented and preserved in books, journals and newspapers; however, many more were either lost or continued to be transmitted only orally, to trusted recipients, in accordance with Hawaiian custom. This application relies on oral sources—first-hand accounts of widely respected Hawaiian cultural practitioners, who are considered reputable sources of information in the Hawaiian culture—as well as on academic and historic references.

Throughout this document Hawaiian words are written with appropriate diacritical marks and defined in English. As with other languages that employ diacritical marks, such as French and Spanish, the Hawaiian language uses them as part of the alphabet and the language. Words can have very different meanings when diacriticals are missing or misplaced. (For example, *ka* means “your,” while *ka’u* means “mine;” *onaona* means “fragrant, sweet-smelling scent,” while *’ona’ona* means “drunk.”) The *kahakō* (macron) represents an emphasized or stressed vowel sound in a Hawaiian word, as exemplified by the word, *kūpuna* (revered elders, ancestors), as differentiated from *kupuna* (a singular elder or ancestor). The *’okina* (glottal stop), which indicates a consonant sound produced by closing and suddenly opening the glottis, occurs in many Pacific languages, and can be reproduced in English by saying any word that begins with a vowel, such as “open” or “above.” It is represented by the symbol ‘, as in the word Hawai’i.

# Hawaiian Wayfinding

(non-instrument navigation)

The ancient and modern training grounds for Hawaiian wayfinding (non-instrument navigation)  
(Photo: Polynesian Voyaging Society)

Kure Atoll, the farthest edge of the former Hawaiian Kingdom, and back. Moreover, the *ʻOhana Waʻa* (family of canoes) serve as the traditional vehicles that deliver cultural practitioners to Nihoa and Mokumanamana for religious ceremonies. In two separate voyages in 2003 and 2005, *Hōkūleʻa* and *Hōkūalakaʻi* brought the cultural group Nā Kupuʻeu Paemoku to Nihoa and Mokumanamana for ceremonial purposes.

Oral traditions reveal this seascape's place in Hawai'i's legendary voyaging traditions. *Kūpuna* (elders) from Niʻihau and Kauaʻi Islands (which are closest to Papahānaumokuākea and the people of which have traditionally had the most access to and relationship with the islands to the northwest) have shared knowledge passed down through generations about a voyaging "route" to Tahiti (Maly 2003). Although trans-Pacific voyaging is thought to have ceased in the 15th century (Kirch and Kahn 2007), some Niʻihau traditions state that Nihoa and/or Mokumanamana served as an embarkation and debarkation point for these voyages (Maly 2003). Traditions from Hawaiʻi Island support this,

Hawaiian wayfinding evolved from the system of non-instrument navigation used by Polynesians to routinely make long voyages across thousands of miles of open-ocean. Between 3,000 and 4,000 years ago—millennia before open-ocean sailing was undertaken elsewhere in the world—ancestors of the Native Hawaiians developed the world's first blue-water sailing technology, engineering sophisticated ocean-going vessels capable of ranging thousands of miles over open-ocean, and creating a reliable navigational system based on observations of the natural world. Navigators voyaged based on a lifetime of studying the motion, rising and setting of specific stars; the weather and times of travel; wildlife species (which congregate at particular positions); the directions of swells on the ocean; the colors of the sea and sky (clouds cluster and reflect at the locations of some islands); and the angles for approaching harbors. From the first peopling of the Hawaiian Archipelago through the 15th century, wayfinding enabled regular contact and trade between Hawaiʻi and Oceania.

All but lost for several generations, Hawaiian wayfinding has undergone a revival in recent decades, led by Nainoa Thompson, the first Hawaiian master wayfinder to navigate across the Pacific in several centuries. Thompson has developed a system of wayfinding, or non-instrument navigation, that synthesizes traditional principles of ancient Pacific navigation and modern scientific knowledge. Hawaiian wayfinding has contributed to a revival of traditional voyaging arts across Polynesia; it is now being taught in schools throughout Hawaiʻi and the Pacific. This science, art, and skill uses a plethora of environmental cues to navigate without instruments:

Master navigator Nainoa Thompson (left) instructing in the art and science of wayfinding.  
(Photo: Polynesian Voyaging Society)

**The sun:** The points on the horizon where the sun rises and sets represent the main guide for navigators without instruments. Says Thompson: "Sunrise is the most important part of the day. At sunrise you start to look at the shape of the ocean—the character of the sea. You memorize where the wind is coming from. The wind generates the swells. You determine the direction of the swells, and when the sun gets too high, you steer by them. And then at sunset we repeat the observations. The sun goes down—you look at the shape of the waves. Did the wind change? Did the swell pattern change?"

**The stars:** "The star compass is the basic mental construct for navigation," says Thompson. "We have Hawaiian names for the houses of the stars—the places where they come out of the ocean and go back into the ocean....If you can identify the stars, and if you have memorized where they come up and go down, you can find your direction. The star compass is also used to read the flight path of birds and the direction of waves. It does everything."

**Ocean swells:** On cloudy days or nights, when the sun and stars are not visible, an expert navigator (perhaps lying in the bow of the canoe) can sense up to five unique swell patterns at once. Listening to the patterns of waves slapping against the hull, and sensing the pitch and roll of the canoe, helps navigators to determine direction.

**Seamarks:** Navigators also rely on seamarks, which have been called "signposts in the ocean" for an experienced navigator: Seamarks, or distinctive natural occurrences that occur at predictable places along a sea route, are found along routes between islands and indicate to the navigator that he is at a certain point along his route. Examples of Pacific seamarks include a region where flying fish leaped in pairs, a zone of innumerable jellyfish, an area of numerous terns, and an area of sharks and numerous red-tailed tropic birds.

**The moon, the planets, winds, landmarks, and north and south pointers** are other aspects of the sky and sea that Hawaiian wayfinders use to set up a voyage strategy, hold a canoe's course while tracking position during the voyage, and finally find land after reaching the vicinity of the destination.

Hōkūle'a in the main Hawaiian Islands  
(Photo: Polynesian Voyaging Society)

*Papahānaumokuākea, the training grounds for  
ancient and modern Hawaiian wayfinders*

a human population center (and in distinct contrast to the degraded state of most of the main Hawaiian Island ecosystems), Papahānaumokuākea is relatively free of anthropogenic impacts, and remains one of the only places where Native Hawaiian practitioners have direct access to the living manifestation of oral traditions and can gain insights into the traditional relationships between man and nature.

suggesting that in recent centuries, Ni’ihau and Kaua’i were particularly known for deep-sea voyaging wisdom (ibid.). The late *kupuna* Eddie Ka’anā’anā spoke of Native Hawaiians voyaging from Hawai’i Island to join family members in Ni’ihau to sail from there to Papahānaumokuākea. His family told him that they did this to fish and to *holo moana*—to train to gain navigational knowledge (ibid.).

### Place of Abundance

Papahānaumokuākea’s nearly pristine marine natural resources (e.g., a predator-dominated ecosystem, high levels of endemism, crystalline waters, and unharvested marine resources) are of deep cultural significance to Native Hawaiian people. Since nature and culture are considered to be one and the same, the protection of one of the last nearly pristine, natural, marine ecosystems in the archipelago is seen as akin to preserving the living culture. Also, absent

For example, the apex predators that dominate the region’s nearly pristine marine ecosystem are seen by Native Hawaiians through a spiritual and cultural lens. Sharks are the most common *‘aumakua* (family guardian spirit) of fishing families; often honored as protectors of entire island districts; and represent the physical form of such highly revered gods as Kamohoali’i, who guided his sister Pele through Papahānaumokuākea when she arrived in Hawai’i, and Kūhaimoana, who lives in the waters between Nihoa and Ka’ula, near Ni’ihau (Beckwith 1970). Jacks are known to be larger, more abundant and to behave much more boldly in Papahānaumokuākea than they do in the main Hawaiian Islands. For Native Hawaiians, the visible dominance of these predators has a resonant spiritual significance.

Native Hawaiian practitioners today say that Papahānaumokuākea represents one of Hawai’i’s last-remaining *‘āina momona*, or “places of abundance” (Mahina Duarte 19 November 2008, personal communication), a point reiterated repeatedly across the state in focus groups facilitated by Monument managers. It is also one of the preminent locations for experiencing and

56

Native Hawaiian people call it one of the “last-remaining places of abundance”, or *‘āina momona* (Photos: James Watt)

understanding *hō'ailona* (signs, omens in nature) that occur in pristine environments. In addition, because environmental change occurred so quickly and profoundly in the main Hawaiian Islands' marine ecosystems, Papahānaumokuākea serves, for Native Hawaiians, as a “standard” (i.e., a pristine ecosystem akin to those their ancestors experienced) to contextualize and help traditional management skills evolve to modern-day settings.

### Papahānaumokuākea's Archaeological Resources

Nihoa and Mokumanamana feature an array of Native Hawaiian archaeological sites unique among known sites in the Hawaiian archipelago and Polynesia. Both islands are listed on the National Register of Historic Places (see Appendix C), and feature archaeological landscapes containing original materials that largely have not been subject to the anthropogenic disturbances (invasive species, development, etc.) that have commonly occurred at sites found in the main Hawaiian Islands. In addition, the view planes of the islands' religious sites—an element that is particularly critical in Hawaiian culture—are also undisturbed, an extremely rare condition in Hawai'i, where

development has altered most traditional Native Hawaiian religious sites and their surrounding environments.

The few radiocarbon dates from cultural materials found on Nihoa and Mokumanamana have been imprecise at best, estimating human colonization of the islands between 1000 and 1700 AD (Ckeghorn 1988). Oral traditions, historical ship logs and archaeological research point to periods of continuous activity in these islands for at least the past thousand years.

All documented Native Hawaiian archaeological sites in Papahānaumokuākea are on Nihoa and Mokumanamana, although a basalt artifact was found on Lisianski Island in 1991, and research on the region has not yet been completed (Kekuewa Kikilo'i 2008, personal communication). Although interest is not lacking, Papahānaumokuākea's isolation and regulatory protections mean that a scant 18 days of archaeological characterization of Mokumanamana's sites have been conducted between 1923 and the present. This is a meager baseline in comparison with most known archaeological sites. The first archaeological study of Nihoa, conducted by Kenneth P. Emory of the Bishop Museum in 1923 and 1924 (Emory 1928), remains its

*Nihoa's cultural sites and objects. Clockwise: shrine, residential site, terrace, religious site, and a rock bowl (Photos: Kehau Souza)*

Residential sites, burial sites, shelter caves and agricultural terraces of Nihoa (Photos: David Boynton)

most thorough. Emory recorded 66 of the now 89 known sites and collected approximately 130 artifacts that continue to be stored at Bishop Museum (see online database at <http://www2.bishopmuseum.org/nwhiobjects/index.asp>). Expeditions in the 1980s (Cleghorn), 1990s (Irwin), and 2000s (Graves, Kikiloi, Raymond) along with interviews with Native Hawaiian practitioners (e.g., Maly 2003), have contributed to site characterization and interpretation.

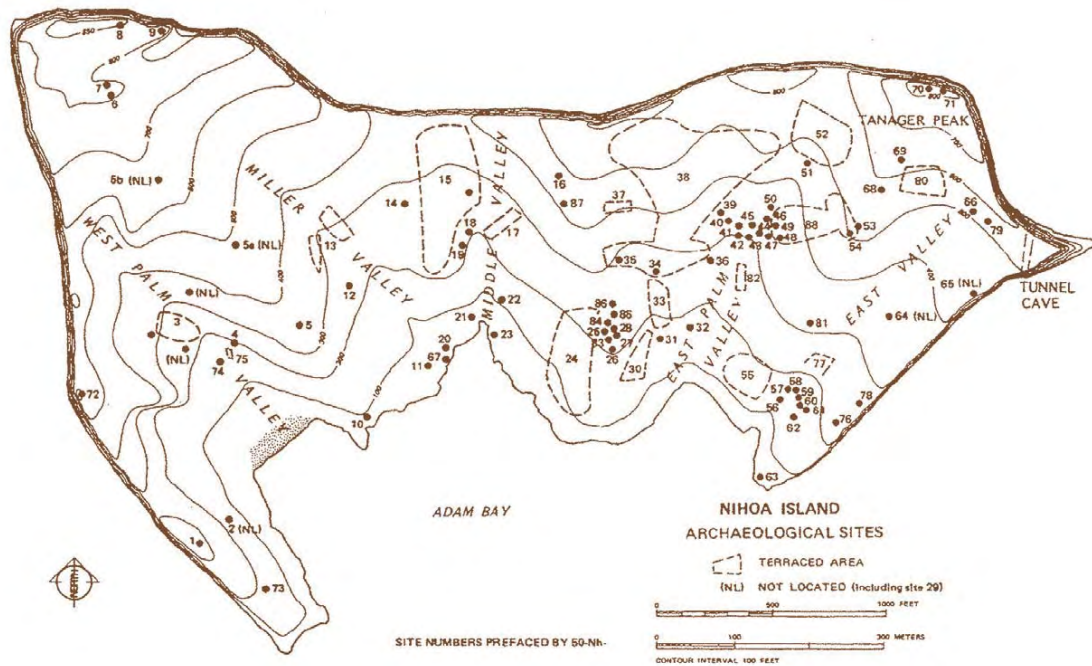

There are 89 identified archaeological sites on Nihoa and 52 on Mokumanamana, making them some of the densest scatters of prehistoric structural sites in Hawai'i. Nihoa and Mokumanamana hold 45 *heiau* (shrines) between them. These *heiau* are made of well-paved terraces and platforms with single, large, upright stones or, more commonly, rows of uprights. The two islands also feature rare, intact archaeological landscapes of a variety of ancient site types, including residential sites, habitation terraces for dryland agriculture and a plethora of ceremonial complexes. Survey and excavation have recovered other types of material culture, including exceptionally detailed stone human-like figures; evidence of cooking, food preparation and storage, manufacture of stone tools and fishing gear; evidence of subsistence activities such as

fishing and collecting other marine resources, and cultivating dryland crops such as sweet potato; and ritual activities, including burial of the dead. For example, Bowl Cave, the largest shelter on Mokumanamana, yielded artifacts that included bowls, adzes, fishing sinkers, an awl, a chisel and hammerstone, and a bit of *wiliwili*, the lightest Hawaiian wood, which was often used for building outriggers on Hawaiian canoes.

#### Nihoa's archaeological sites

It is posited that Native Hawaiians lived on Nihoa for a 700-year period, between 1000 and 1700 AD (Cleghorn 1988).

Exceptionally well-made terraces believed to be habitation sites feature dry-laid stone masonry walls, with one (Site 41) measuring some 8.5 meters long by 5.5 meters wide, and reaching 2.4 meters in height. Over 8.4 hectares—or 13% of Nihoa's landscape—is covered by agricultural terraces cut into rock slopes and carefully faced with stone walls. The island's inhabitants captured rainwater in catchments and from seeps in the three main valleys (Evenhuis and Eldredge 2004). These agricultural systems and the available potable water from seeps and rain collection may have sustained a population of up to 100 people (Cleghorn 1988)(Table 2.4). The residents

quarried local rocks to build landing areas for their canoes, enclosures, shelters, tools and containers.

Nihoa’s residential and agricultural sites are joined by burials, ceremonial terraces, platform foundations, and many rock shelters, which also may have served as habitation

sites, transformed by constructing walls, one (Site 58) as high as three meters, to create shelter from the harsh sea winds and storms. Artifacts recovered from Nihoa include finished and unfinished stone adzes, hammerstones, grindstones, finished and unfinished stone bowls, a bone fishhook, bone awls, and stone fishing weights (Cleghorn 1988).

### Mokumanamana's archaeological sites

Featuring original and intact materials, Mokumanamana was never inhabited but served regularly and continuously as a ritual site and place of worship. With 52 known archaeological sites, Mokumanamana does not appear to have supported a permanent population. Instead, the island seems to have served a primarily religious function, as 33 ceremonial shrines (basaltic uprights, believed to be celestially oriented, rising from stone altars), span the *kua* (spine) or mountain crest of the island. These meticulously laid out shrines at Mokumanamana's ridge top are accentuated with exceptionally well-fitted stone pavings and upright stones, possibly representing the gods and ancestors in alignments; these sites served and continue to serve as impressive ritual points on the landscape.

With a nearly 2:1 ratio to other archaeological site types on the island, the ceremonial sites on Mokumanamana represent what is believed to be the highest concentration of *heiau* (shrines) in the entire archipelago (Emory 1928). These *heiau* vary slightly in design, but generally feature rectangular platforms, courts and upright stones. One of the largest of these ceremonial sites (Site 1) measures 18.6 meters by 8.2 meters, with about 11 uprights stones of what are believed to be the original 19 still standing. Emory notes that the largest

basaltic upright on the island was about 1.2 meters, with the average being 0.76 meters in height.

The *heiau* at Nihoa and Mokumanamana share common attributes with very few structures found in the main Hawaiian Islands; only at Mauna Kea on Hawai'i Island, and Haleakalā on Maui, were similar shrines found. These *heiau* are unique traditional Hawaiian architectural forms of stone masonry work and resemble those of inland Tahiti (called *marae*) and similar structures in the Marquesas (Emory 1928). They are some of the best preserved early temple designs in Hawai'i, and have played a critical role in understanding Hawai'i's strong cultural affiliation with Tahiti and the Marquesas, and Native Hawaiians' role in the migratory history and human colonization of the Pacific (Cleghorn 1988).

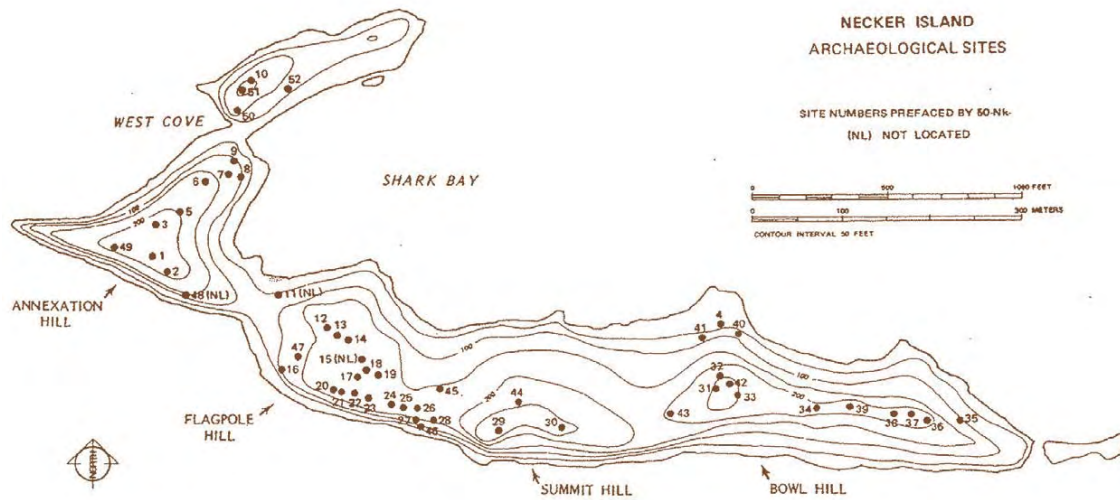

Stone figurines (*ki'i*) found at Mokumanamana provide another intriguing archaeological link between Hawaiians and Eastern Polynesian cultures. *Ki'i*, ranging from 20 to 45 centimeters tall, were found with a design and manner of carving that Emory believed posed a direct link to similar statues found in the Marquesas Islands. They have moon faces and large, male genitals. All of them were removed from the island by the Annexation Party in 1894, making it difficult to further study the archaeological links between Hawaiians and other Polynesians in situ (Table 2.5).

### Nihoa and Mokumanamana: Two "Mystery Islands in the Pacific"

The archaeology of Nihoa and Mokumanamana is even more remarkable in the context of their geographical isolation, the limited resources of the islands, and the

Mokumanamana's ceremonial structures (left) and stone male images (right) (Photos: Kikiloi and Emory, respectively)

constant sea voyaging to and from the main Hawaiian Islands required to establish and sustain these human presences.

Nihoa and Mokumanamana are “Mystery Islands,” a term used by archaeologists to describe islands scattered throughout the Pacific Ocean that exhibit signs of human settlement, but were mysteriously

found abandoned by the time of Western contact (Kirch 1988; Irwin 1992). Mystery Islands share similar characteristics, such as stark isolation, limited marine and terrestrial resources, poorly developed soils, unpredictable weather patterns, and small geographic size (Kirch 1988a). Nihoa and Mokumanamana are the only Mystery Islands still associated with descendants of an original culture that continues to use and have strong ties to the islands’ oral and physical traditions as well as their natural and cultural resources.

adaptation and evolution of Polynesian cultures to their individual environments, and the contribution of Polynesian voyaging skills and deep-sea canoe technology to this last and most difficult wave of human migrations in the Pacific (Howe 2006).

the Cook Islands; Raoul in the Kermadec Islands; Rose in Sāmoa; and Norfolk Island, among others (Di Piazza and Pearthree 2004; Irwin 1992). Nihoa and Mokumanamana are among the smallest Mystery Islands in terms of size, along with Suvarrow, Rose and McKean.

The Mystery Islands include Nihoa and Mokumanamana; Pitcairn and Henderson of the Pitcairn group; Howland, Manra, Orona, Kanton, Phoenix, Enderbury and McKean in the Phoenix Islands; Washington, Fanning, Christmas, Caroline, Flint and Malden in the Line Islands; Palmerston and Suvarrow in

*Individual Island Descriptions*

The following section contains brief descriptions of the individual islands within Papahānaumokuākea Marine National Monument, and their salient physical, biological, cultural and archaeological characteristics. The most commonly used name for each island is given first, with alternative names provided parenthetically. It should be noted that for the islands beyond Mokumanamana (Necker), the Hawaiian names provided are not yet in use on many modern maps. The Hawaiian placenames for Papahānaumokuākea’s islands and atolls derive from diverse historic sources (for instance, from ancient chants, historic newspapers, and others). Table 2.6 summarizes the emergent and shallow reef areas on each island; further information is provided in the island-by-island descriptions.

Table 2.6: Island-by-island comparisons of land and reef areas (hectares)

Island	Emergent Land	Reef Area <10 fathoms
Nihoa	69	55
Mokumanamana	19	213
French Frigate Shoals	38	46,921
Gardner Pinnacles	2	34
Maro Reef	1	18,762
Laysan Island	414	2,367
Lisianski Island	148	20,270
Pearl & Hermes Atoll	39	40,336
Midway Atoll	592	8,000
Kure Atoll	89	6,791

## Nihoa

23°03'N, 161°56'W

*“He pu’u kolo i Nihoa.”* (“Crawling up the cliffs of Nihoa.”) This traditional Hawaiian saying is a compliment to one who perseveres in a challenging situation (Pukui 1997). Nihoa has many craggy cliffs, and the rough surf in winter makes landing there even more difficult than during the trade wind swells of summer. Hawaiian names often have multiple connotations; “Nihoa” means jagged” or “toothed,” and probably refers to the island’s profile, which resembles a tooth.

Nihoa is located approximately 250 kilometers northwest of Ni’ihau, the closest of the main Hawaiian Islands. Measuring roughly 0.69 square kilometers, this island is the largest emergent volcanic island within Papahānaumokuākea and the tallest, reaching an elevation of 275 meters at Miller Peak. It is also Papahānaumokuākea’s geologically youngest island, with an age calculated at 7.3 million years (Clague 1996), only a little older than Ni’ihau.

Nihoa is a deeply eroded remnant of a once-large volcano, and the large basaltic shelf of which it is a part stretches 28.9 kilometers in a northeast-southwest direction and averages between 34 and 66 meters deep (NOAA 2003). The island’s two prominent steep, fortress-like sea cliffs are clearly visible from a

(Photos: David Boynton)

*On Nihoa’s stark landscape, the endemic Nihoa Finch resides among ancient heiau (temple) and 13th c. residential sites*

(Photo: James Watt)

distance. Its northern face is a sheer cliff made up of successive layers of basaltic lava, within which numerous volcanic dikes are visible. From its high northern cliffs, the island declines southward, with an average slope of 23° (Johnson 2004).

The island’s surrounding submerged reef habitat totals approximately 575 square kilometers and is a combination of uncolonized hard bottom, macroalgae, pavement with sand channels and live coral, and uncolonized volcanic rock (NOAA 2003), supporting at least 127 species of reef fish and 17 species of corals.

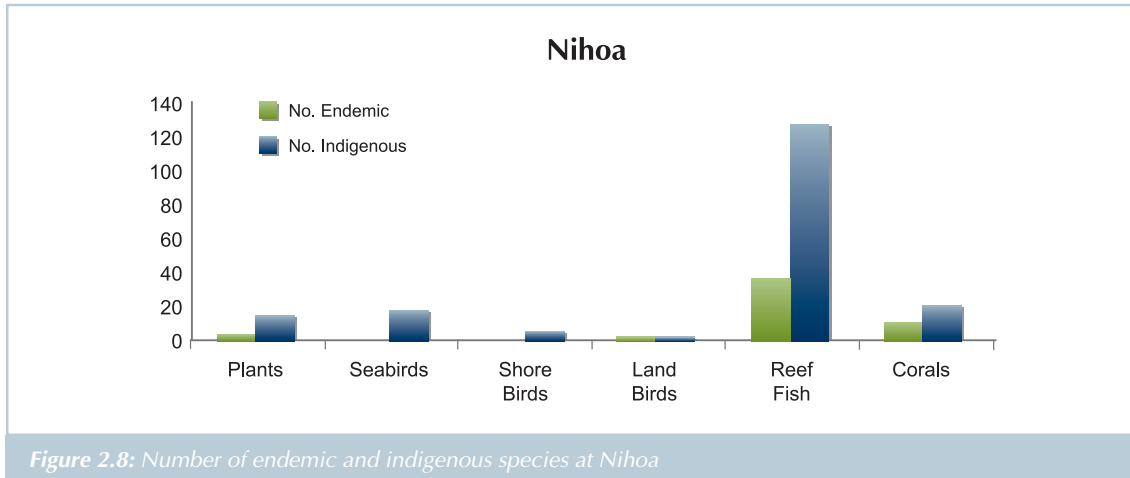

Nihoa: benthic habitat, bathymetry and satellite imagery

Another historical name for Nihoa is Moku Manu, or “Bird Island.” Nihoa’s seabird colony boasts one of the largest populations of Tristram’s Storm-Petrel, Bulwer’s Petrel, and Blue-gray Noddies in the Hawaiian Islands. The avifauna of the island includes two endemic passerine birds: the Nihoa Finch (*Telespiza ultima*) and the Nihoa Millerbird (*Acrocephalus familiaris kingii*), both listed as endangered under the federal ESA.

The island is a unique example of a lowland native coastal community, resembling lowland communities that once occurred commonly on the main Hawaiian Islands but are now almost completely eliminated due to the pressures of human population (Wagner et al. 1990). The island’s vegetation can be

classified as part coastal mixed community (*Sida* mixed shrub and grassland) and coastal dry shrubland dominated by ‘ilima (*Sida fallax*), ‘āweoweo (*Chenopodium oahuense*), and ‘ōhai (*Sesbania tomentosa*). The island supports 21 native plant species, including three endemics: a palm or loulou (*Pritchardia remota*), an amaranth (*Amaranthus brownii*), and an herb (*Schiedea verticillata*) (Wagner et al. 1999). The arthropod fauna of the island includes 33 species of mites, three species of spiders, and 182 species of insects, 17 of which are endemic, including a katydid (*Banza nihoa*), a giant tree cricket (*Thaumatogryllus conantae*), two species of seed bugs (*Nysius nihoae* and *Nysius suffusus*), and a trapdoor spider (*Nihoa mahina*) (Evenhuis and Eldredge 2004).

As was noted previously, Nihoa exhibits clear evidence of habitation in prehistoric times. Sites thought to date between the 13th and 15th centuries include 25 to 35 house terraces, 15 ceremonial structures, burial caves, bluff shelters, and agricultural terraces. Numerous artifacts found on Nihoa establish a close relationship with Native Hawaiian culture in the main Hawaiian Islands, and to the first settlers of Hawai'i who sailed through the Pacific on large voyaging canoes. Nihoa also has a rich cultural heritage, with at least 89 known *wahi kūpuna* (ancestral sites) constructed by the pre-contact Hawaiians

who inhabited the island for approximately 700 years (until 1700 AD); the island is listed on the National Register of Historic Places. This island also has significant soil development for agriculture along with constructed terraces, which suggests investment in agricultural food production. As many as 100 people are estimated to have lived on Nihoa at one time, but the relative shortage of fresh water was likely a limiting factor (Cleghorn 1988). Because fresh water and food could be found there, Nihoa may have been a good place for voyagers to stop and resupply their canoes.

**Mokumanamana  
(Necker Island)**

23°35'N, 164°42'W

Mokumanamana is often translated as a branching or pinnacled island, which is an apt description, but many people who have studied its high density of religious and cultural sites suggest that the repetition of the word “*mana*” (spiritual power) after the word “*moku*” (island) is likely to be even more significant, and related to the 33 shrines on the island that follow the *kua* (spine) of the island, and that the Hawaiian axes of life and death cross directly over Mokumanamana. On Mokumanamana, a total of 52 archaeological sites have been documented, including the 33 ceremonial features, the highest density of religious sites found anywhere in the Hawaiian archipelago.

Mokumanamana is a dry volcanic island shaped like a fishhook, and includes approximately 0.19 square kilometers of land. Geologists believe the island, with an estimated age of 10.6 million years, was once the size of O’ahu in the main Hawaiian Islands, and attained a maximum elevation of 1,036 meters (Clague 1996); millennia of erosion have left its highest point, at Summit Hill, now only 84 meters above sea level. Wave action has eroded the remainder of the original island into a submerged shelf approximately 64 kilometers long and 24 kilometers wide.

(Photo: Emory)

(Photo: US FWS)

Mokumanamana sits on the axes of the Hawaiian universe and boasts the highest concentration of ceremonial sites in the archipelago (Photo: James Watt)

While this shelf supports more than 1,538 square kilometers of coral reef habitat (which, in turn, support 125 reef fish species and 18 coral species), severe wave action and currents in the exposed areas tend to inhibit coral growth. The bank provides excellent habitat for spiny lobsters (*Panulirus marginatus*) and slipper lobsters

Mokumanamana: benthic habitat, bathymetry and satellite imagery

(*Scyllarides squammosus*), especially in areas of variable intermediate relief (Parrish and Polovina 1994).

Because of its limited size, Mokumanamana supports only five indigenous plant species and no land birds, but does harbor three species of mites, two species of spiders, and 70 species of insects, of which 11 are endemic. These include a large weevil (*Rhycogonus biformis*), two species of seed bugs (*Nysius neckerensis* and *Nysius chenopodii*), and a trapdoor spider (*Nihoa hawaiiensis*) (Evenhuis and Eldredge 2004). Sixteen species of seabirds breed here, including the Black Noddy (*Anous minutus*), which historically was called the Necker Island Tern.

Figure 2.9: Number of endemic and indigenous species at Mokumanamana

Mokumanamana also occupies a special place in the Native Hawaiian world-view. It bears 33 *heiau* (ceremonial sites) with standing stones that stretch the length of the island's central spine, suggesting that it was visited by Native Hawaiians for spiritual and navigational purposes. It is believed that Mokumanamana played a central role in Hawaiian ceremonial rites and practices a thousand years ago because it is directly in line (23° 34.5' N latitude) with the rising and setting of the equinoctial sun along the Tropic of Cancer. Mokumanamana, like Nihoa, shows clear evidence of prehistoric Hawaiian visitation. With its numerous religious sites and no evidence of long-term settlement, the island appears to have been used primarily for worship by visitors from other Hawaiian Islands. Mokumanamana's ceremonial sites, which contain upright stone features, share

similarities with sites found on Mauna Loa and Mauna Kea, on Hawai'i Island, and on Haleakalā, on Maui. These ceremonial sites also closely resemble Tahitian temples, possibly establishing a link between this site and early Polynesian culture, as Emory first noted (1928). Moreover, Emory pointed out that the carved basalt human figurines found here exhibit similarities to those found in the Marquesas. Emory considered the sites of Mokumanamana to be a "pure sample of the culture prevailing in Hawai'i before the thirteenth century." Despite its dense concentration of religious sites, Mokumanamana is considered too small and dry to have supported human inhabitants for any length of time. Mokumanamana also is listed on the National Register of Historic Places as an Island Archaeological District.

68

Mokumanamana's wide banks support large pelagic fauna (Photos: James Watt)

### French Frigate Shoals (Kānemilohaʻa and Mokupāpapa)

23°145'N, 166°10'W

The first atoll to the northwest of the main Hawaiian Islands, Kānemilohaʻi is also the midpoint of the archipelago and the largest coral reef area in Hawaiʻi. On this low, flat area, the volcano goddess Pele is said to have left one of her brothers, Kānemilohaʻi, as a guardian during her first journey to Hawaiʻi from Kahiki (Tahiti). Pele continued down the archipelago until finally settling in Kīlauea, Hawaiʻi Island, where she is said to reside today (Beckwith 1970).

Neither French Frigate Shoals, nor any of the other islands further to the northwest, bear Native Hawaiian archaeological sites, although there is plentiful evidence in oral traditions and historical documents (see Section 2.a) that Native Hawaiians not only knew of the islands and atolls beyond Mokumanamana, but created *moʻolelo* (stories, oral histories) that wove them into their foundational creation stories.

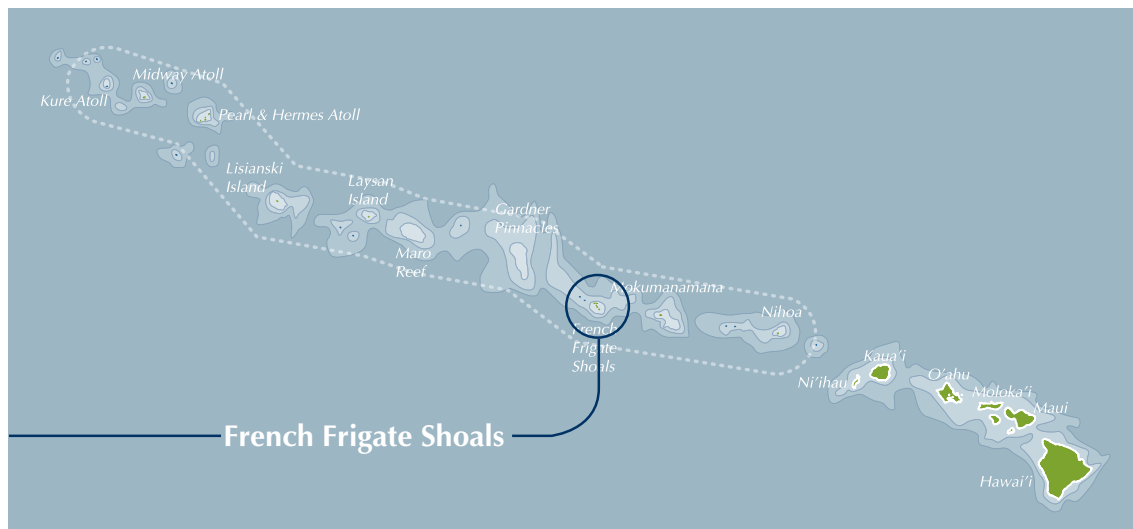

French Frigate Shoals is the largest atoll in the chain, taking the form of an 18-mile-long (28.9 kilometers) crescent. It is estimated to be 12.3 million years old (Clague 1996). The shoals consist of 0.38 square kilometers of total emergent land, surrounded by approximately 931 square kilometers of coral reef habitat, with a combination of sand, rubble, uncolonized hard bottom, and crustose coralline algae

*Pennant Banner Fish, Leopard Blenny, and Great Frigatebird of French Frigate Shoals* (Photos: James Watt)

in the windward and exposed lagoon areas, and patch and linear coral reefs in more sheltered areas (NOAA 2003b). Tern Island in the atoll is the site of a FWS field station, which occupies a former U.S. Coast Guard Long-Range Aids to Navigation (LORAN) station that closed in 1979.

69

French Frigate Shoals: benthic habitat, bathymetry and satellite imagery

Within Papahānaumokuākea, French Frigate Shoals is the center of diversity for corals (more than 41 species, including the genus *Acropora*, which is all but absent elsewhere in Hawai'i) and reef fishes (178 species). A relatively deep (25 to 30 meters) coral reef at this atoll has been recently discovered to function as a spawning site for the Giant Trevally, *Caranx ignobilis* (Meyer et al. 2007), an important finding in relation to the population dynamics of top predators.

The lagoon is also unusual in that it contains two exposed volcanic pinnacles representing the last vestiges of the high

70

French Frigate Shoals

Figure 2.10: Number of endemic and indigenous species at French Frigate Shoals

island from which the atoll was derived, as well as nine low, sandy islets. The sand islets are small, and can shift position, disappear and reappear with seasonal changes. In 1923, the *Tanager Expedition* mapped 16 islets (Amerson 1971). In 1963, Whaleskate was a vegetated island of 0.068 square kilometers (Amerson 1971); by 1998, it had completely disappeared (Antonelis et al. 2006). These islets provide crucial habitat for the world's largest breeding colony of the imperiled Hawaiian Monk Seal, which is listed as endangered under the ESA and is also internationally

recognized as critically endangered by IUCN. The atoll's sandy islets also provide nesting sites for 90% of the threatened Green Turtle population breeding in the Hawaiian Archipelago. In addition, 19 of Hawai'i's 22 breeding seabird species are found on French Frigate Shoals, giving it the highest species richness of breeding seabirds within Papahānaumokuākea. The dry coastal shrublands of the larger islets within the atoll also support an endemic seed bug (*Nysius frigatensis*), a moth (*Agrotis kerri*), and a mite (*Phauloppia bryani*) (Usinger 1942; Nishida 2002).

**Gardner Pinnacles  
(Pūhāhonu)**

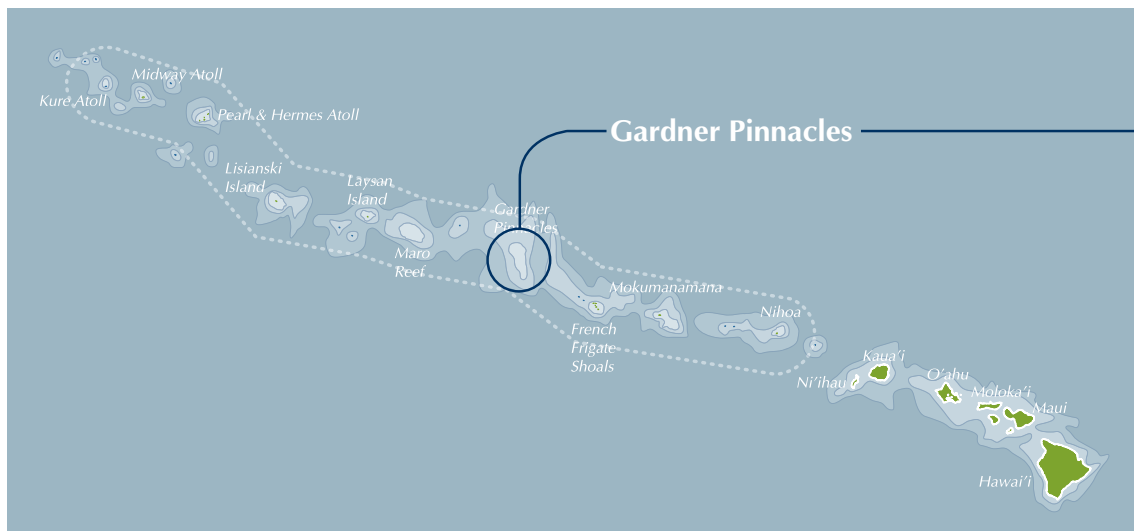

25°02'N, 168°05'W

“He pūko’a kū no ka moana.” (“A large rock standing in the sea.”) This traditional Hawaiian saying describes someone who is stubborn, unchangeable, or determined. It is also a suitable description for Pūhāhonu (surfacing of a sea turtle for air/breath), which looks a bit like a turtle’s beak coming up for air.

Gardner Pinnacles’ two emergent volcanic peaks are estimated to be 15.8 million years in age (Clague 1996). These are the oldest high islands in the Hawaiian chain. In scale, these pinnacles are small, the largest reaching only 55 meters high, with a diameter of approximately 180 meters. Because of their limited size, they support only a single species of land plant (*Portulaca lutea*) and a few terrestrial arthropod species, but they are an excellent, rat-free habitat for seabirds, which roost and breed there (Clapp 1972). Guano from at least 12 subtropical seabird species gives the peaks a “frosted” appearance. Landings and terrestrial surveys rarely take place due to the difficulty of getting ashore under all but the calmest ocean conditions.

Gardner Pinnacles, the oldest high islands in the Hawaiian Archipelago  
(Photos: James Watt)

Gardner Pinnacles: benthic habitat, bathymetry and satellite imagery

These remnant volcanic pinnacles are surrounded by approximately 2,425 square kilometers of coral reef habitat, most of which is in waters of greater than 20 meters in depth, harboring 124 reef fish species and 27 species of corals. The intertidal bases of the pinnacles are studded with large populations of 'opihi, endemic Hawaiian limpets that have been seriously depleted by overharvesting elsewhere in the main Hawaiian Islands.

Figure 2.11: Number of endemic and indigenous species at Gardner Pinnacles

**Maro Reef**  
(Ko'anako'a and Nalukākala)

25°22'N, 170°35'W

The name Ko'anako'a literally means the settlement of coral, referring to Maro's expansive coral reefs. Another name for Maro, Nalukākala, describes surf that arrives in combers, such as the surf that froths over shallow reefs.

Maro Reef is a submerged open atoll, 19.7 million years old (Clague 1996). At very low tide, only a small coral rubble outcrop of a former island breaks above the surface; as a result, Maro supports no terrestrial biota. The shallow-water reef system, however, is extensive; covering nearly 2,023 square kilometers, Maro is the largest coral reef in Papahānaumokuākea. It is also one of the chain's most ecologically rich shallow-water marine ecosystems, with 64.1% coral cover over the entire area (which is among the highest coral-cover percentage observed in Papahānaumokuākea) (Maragos et al. 2004).

The documented marine biota at Maro Reef includes 37 species of corals and 142 species of reef fish, with endemic fish abundance making up half of all those recorded here. Maro's reefs are intricate

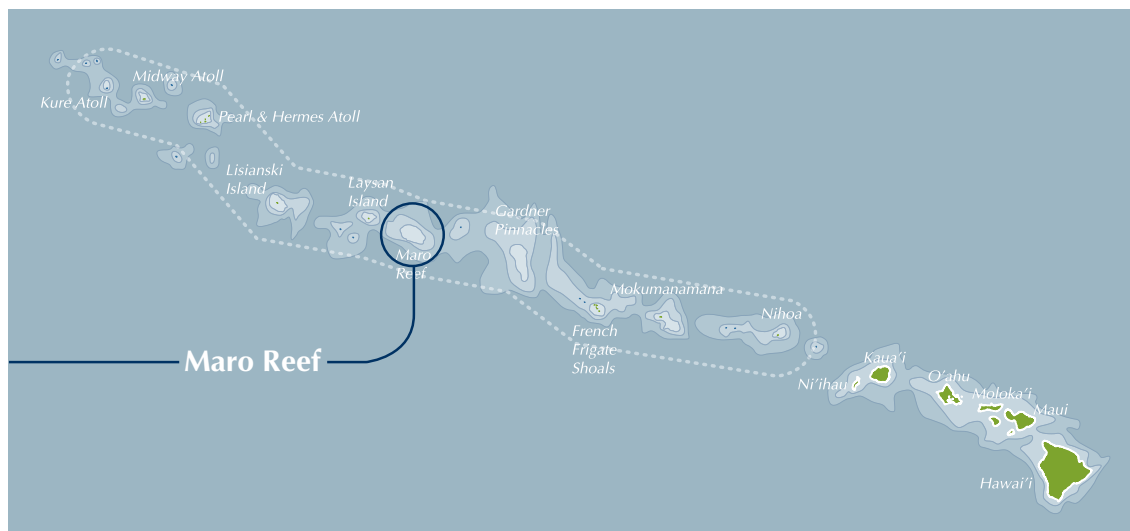

(Photo: James Watt)

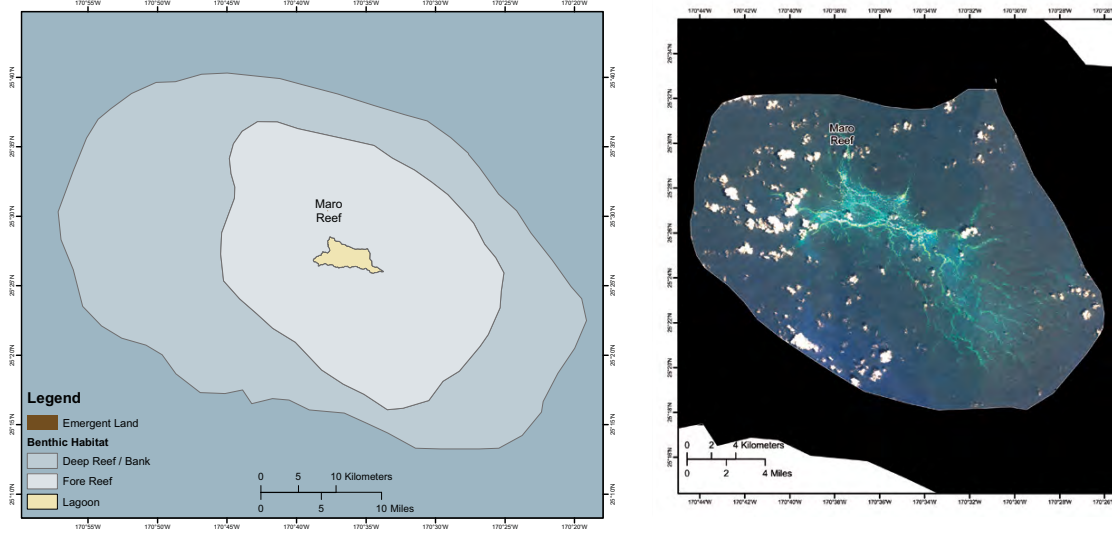

Maro Reef's sealife abounds with traditionally important fish, like the ulua (jacks) (Photo: USFWS)

and reticulated, forming a complex network of reef crests, patch reefs, and lagoons. Deepwater channels with irregular bottoms occur between these shallow reef structures, but navigation through them is difficult and hazardous. Cover types range from unconsolidated, with 10% or less macroalgae cover, to areas with greater than 10% coral or crustose coralline algae (NOAA 2003). Because the outermost reefs absorb the

Maro Reef: benthic habitat, bathymetry and satellite imagery

majority of the energy from the open ocean swells, the innermost reticulated reefs and aggregated patch reefs are sheltered and have the characteristics of a true lagoon. This platform's structural complexity means that its shallow reefs are still poorly charted and largely unexplored.

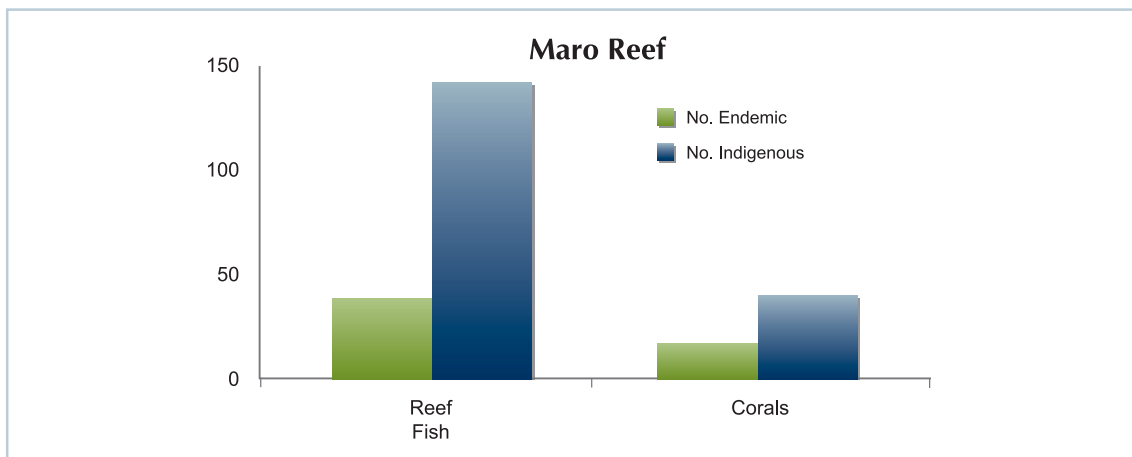

Figure 2.12: Number of endemic and indigenous species at Maro Reef

**Laysan Island  
(Kauō)**

25°46'N, 171°45'W

Kauō (egg) describes both the shape of this island, and perhaps also refers to the abundant seabirds that nest here.

Laysan is a raised atoll, estimated to be 20.7 million years old (Clague 1996), with a maximum elevation of approximately 15 meters above sea level. It represents the second-largest island in Papahānaumokuākea, with a land area of approximately 4.1 square kilometers, surrounded by close to 405 square kilometers of coral reef.

Most of the reef area at Laysan lies in deeper waters, with a small, shallow-water reef area in a bay off the southwest side of the island. The reef system as a whole supports 131 species of reef fishes and 27 species of corals.

Laysan is also home to a semi-permanent FWS field camp to support wildlife monitoring and habitat restoration. The island's ring of sandy dunes surrounds a 40-hectare hypersaline interior lake, a feature unique within the Hawaiian Archipelago and rare within the Pacific as a whole. Because of its average elevation of about 12 meters, Laysan is well vegetated, supporting at least 30 species of flowering plants. The original flora included five endemic subspecies prior to human contact (Athens et al. 2007), many of which were driven to extinction

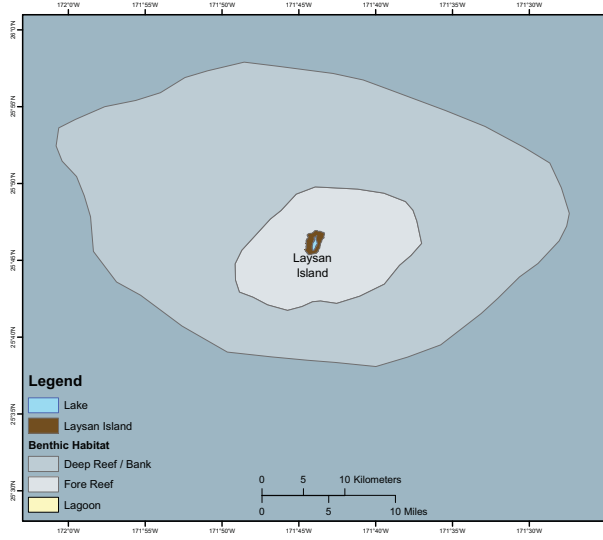

*Laysan's namesakes, the Laysan Duck and the Laysan Finch, grace this atoll's shores (Photos: James Watt)*

by the misguided introduction of rabbits in 1902 during the guano mining era (Ely and Clapp 1973). The plant community is divided into five different rings around the interior hypersaline lake: (1) coastal shrubs, (2) interior bunchgrass, (3) vines, (4) interior

## 2. Description and History of the Property

Laysan Island: benthic habitat, bathymetry and satellite imagery

shrubs, and (5) wetland vegetation (Newman 1988). The island also previously harbored five endemic birds, of which two, the Laysan Finch (*Telespiza cantans*) and the Laysan Duck (*Anas laysanensis*), still survive (Pratt et al. 1987). In addition, approximately two million seabirds nest here, including boobies, frigatebirds, terns, shearwaters, noddies, and the world's second-largest Black-footed and Laysan Albatross colonies.

The island also supports a relatively rich arthropod fauna, including a large endemic

weevil (*Rhyncogonus bryani*), four endemic moths, an endemic wasp, and three endemic mites. A successful 12-year eradication project to remove the invasive sandbur *Cenchrus echinatus*, a plant that had displaced native vegetation over 30% of the island, has been completed, and an active ecological restoration project is underway to bring back a number of other plants and animals that were lost after the introduction of rabbits (Morin and Conant 1998).

Aquamarine waters lap the shores of Laysan Island  
(Photo: James Watt)

### Lisianski Island (Papa'āpoho)

26°04'N, 173°58'W

“Papa'āpoho” describes a flat area with a depression or hollow, which is exactly how the raised atoll of Papa'āpoho (or Lisianski) is shaped. This 23.4-million-year-old island (Clague 1996), about 1.9 kilometers across, consists of an elevated rim surrounding a broad central depression, although unlike Laysan it does not enclose an interior saline lake. With approximately 1.6 square kilometers of emergent land, it is the third largest island within Papahānaumokuākea.

The coral cover on the platform around the island, called Neva Shoal, is extensive, totaling over 1,174 square kilometers with an average of almost 60% cover of the substrate. There are 24 coral species at Lisianski, and 124 species of reef fish, with fish species abundances endemic to the Hawaiian Archipelago making up 58% of all those recorded here.

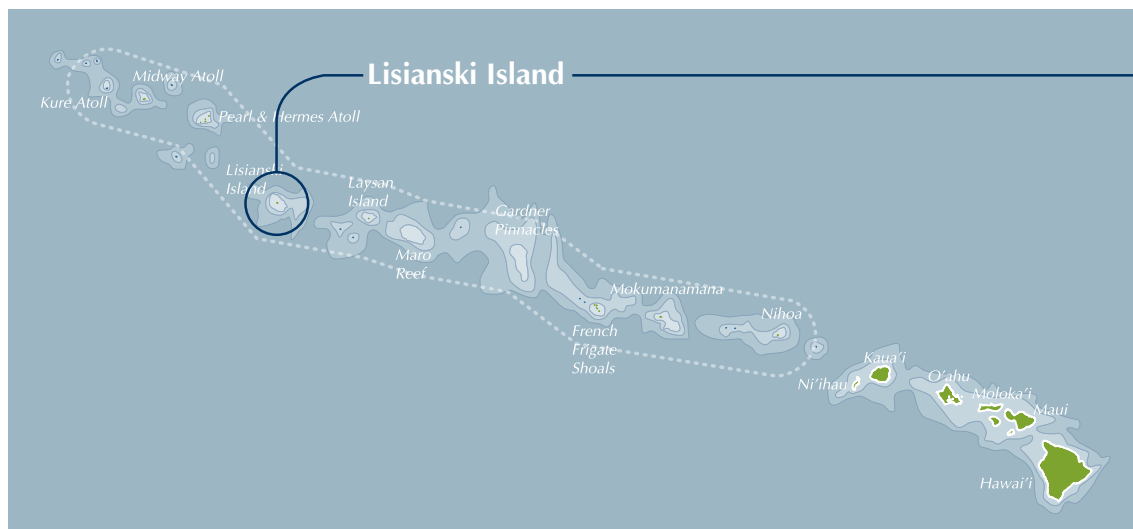

Lisianski suffered ecological perturbations similar to those on Laysan due to guano mining and the release of rabbits in 1903 (Tomich 1986). It supports no endemic land plant or bird species, although it does harbor an endemic seed bug (*Nysius fullawayi flavus*) and an endemic moth (*Helicoverpa minuta*) (Usinger 1942; Nishida 2002). The island also hosts large Bonin Petrel and Sooty Tern colonies, as well as a variety of other seabirds. Lisianski also has the only grove of

(Photo: Rob Shallenberger)

Lisianski Island is a popular breeding ground for Hawaiian Monk Seals (Photo: James Watt)

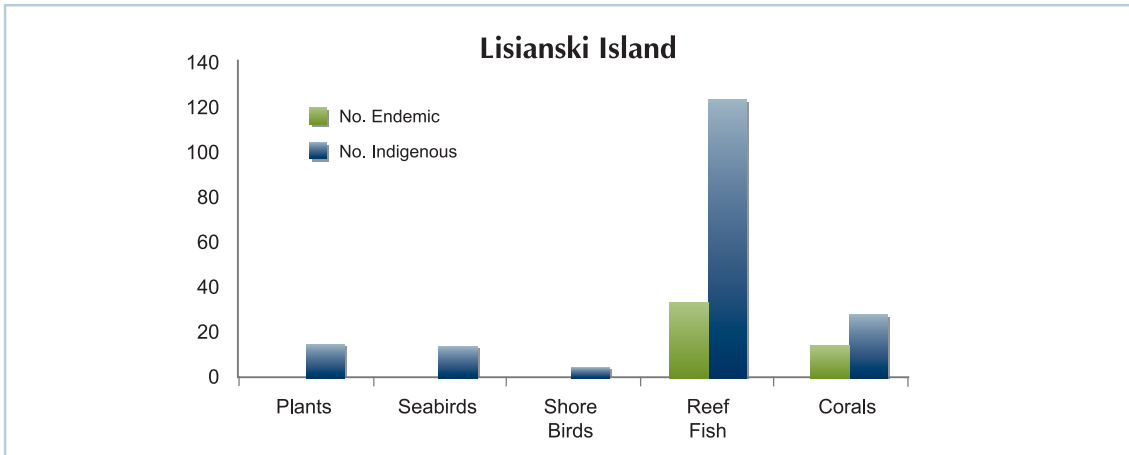

*Lisianski Island: benthic habitat, bathymetry and satellite imagery*

*Pisonia grandis* trees in the entire Hawaiian Archipelago; this tree is dispersed by seabirds and is favored as a nesting site for many tree-nesting seabird species

As part of a biological and paleontological study in the summer of 1990, an archaeologist conducted excavations and investigated the possibility of early Native Hawaiian occupation of Lisianski. Although wave action on the island had scoured any potential evidence of previous human habitation within the shoreline, the archaeologist did find “an unmodified fine-grained basalt flake as well as a polished granite pebble” that were foreign to the island (Ziegler 1990). Study continues on that material evidence, and a more thorough examination of the island has yet to occur.

*Figure 2.14: Number of endemic and indigenous species at Lisianski Island*

### Pearl & Hermes Atoll (Holoikauaua)

27°50'N, 175°50'W

The name Holoikauaua celebrates the Hawaiian Monk Seals that haul out and rest here. Holoikauaua relates to the word 'Īlioholoikauaua, which refers to a seal and literally means "the quadruped running in the rough seas."

Pearl and Hermes Atoll is a large atoll with several small islets. It covers 0.39 square kilometers of land and is surrounded by over 1,214 square kilometers of coral reef habitat. The atoll has an estimated age of 26.8 million years (Clague 1996) and in its entirety is more than 32 kilometers across and 19.3 kilometers wide, with dunes rising well above sea level. Unlike Lisianski and Laysan to the southeast, Pearl and Hermes Atoll is a true atoll, fringed with shoals, permanent emergent islands, and ephemeral sandy islets. These features provide vital dry land for Monk Seals, Green Turtles, and a multitude of seabirds, with 16 species breeding here. The islets are periodically washed over when winter storms pass through the area. The atoll boasts the highest rate of reef fish endemism in the Hawaiian Archipelago;

(Photo: James Watt)

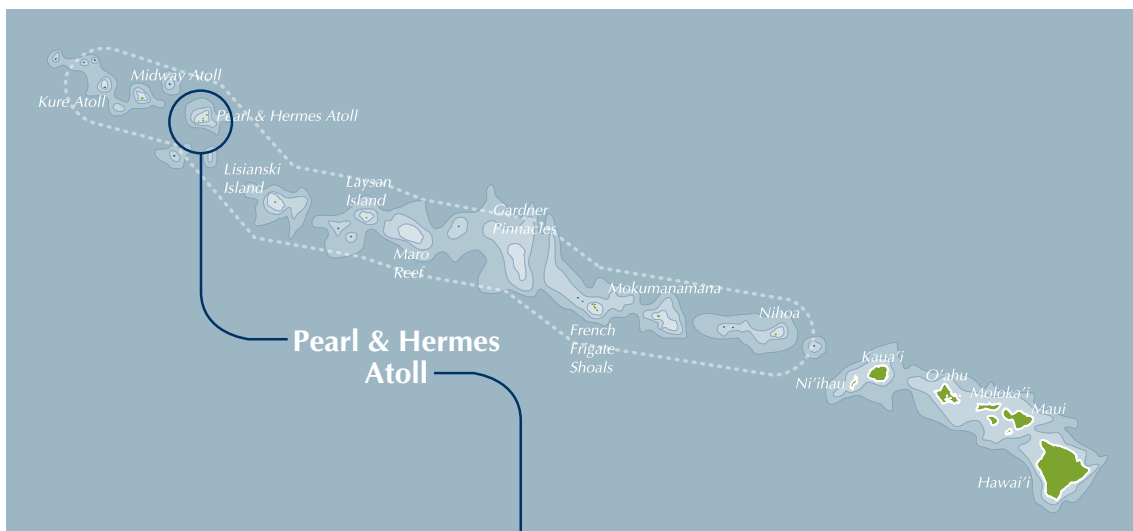

Pearl and Hermes Atoll contains the highest percentage of endemic fish species in the archipelago. Shown here: a school of Hawaiian Squirrelfish (ʻalaʻihi).

(Photo: US FWS)

endemic species represent 62% of the numerical density of reef fish present at Pearl and Hermes Atoll. Coral species richness is high as well, with 33 species present. The atoll also supports the second largest population of Hawaiian Monk Seals in the archipelago.

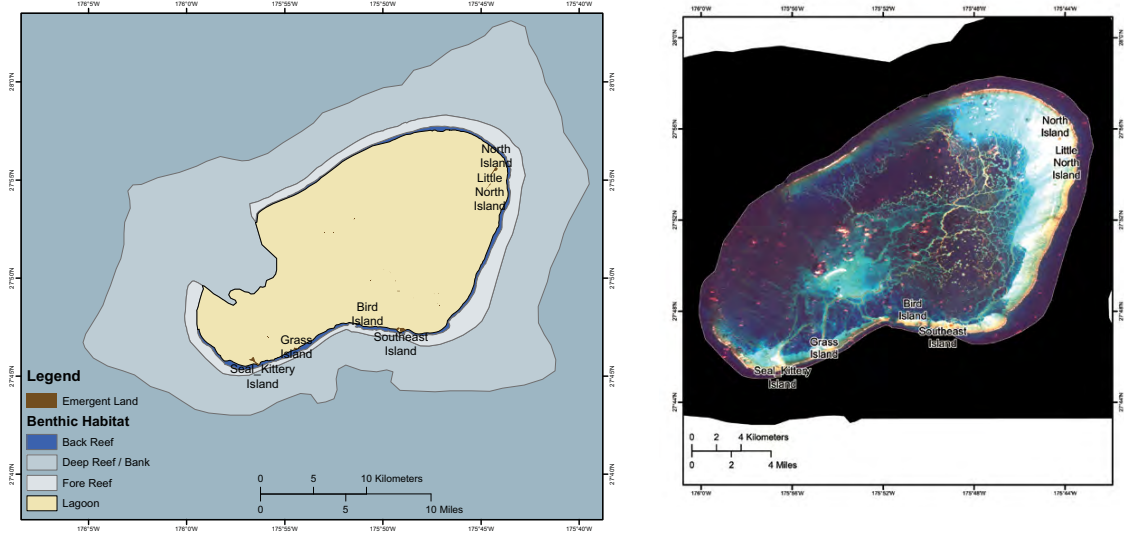

The permanent islands with higher dunes also support an endemic subspecies of native seed bug (*Nysius fullawayi* ssp. *infuscatus*) (Usinger 1942). Pearl and Hermes also hosts a small population of endangered Laysan Finches that were translocated here in the 1960s.

82

### Midway Atoll (Pihemanu, Brook Island, and Middlebrook Islands)

27°50'N, 175°50'W

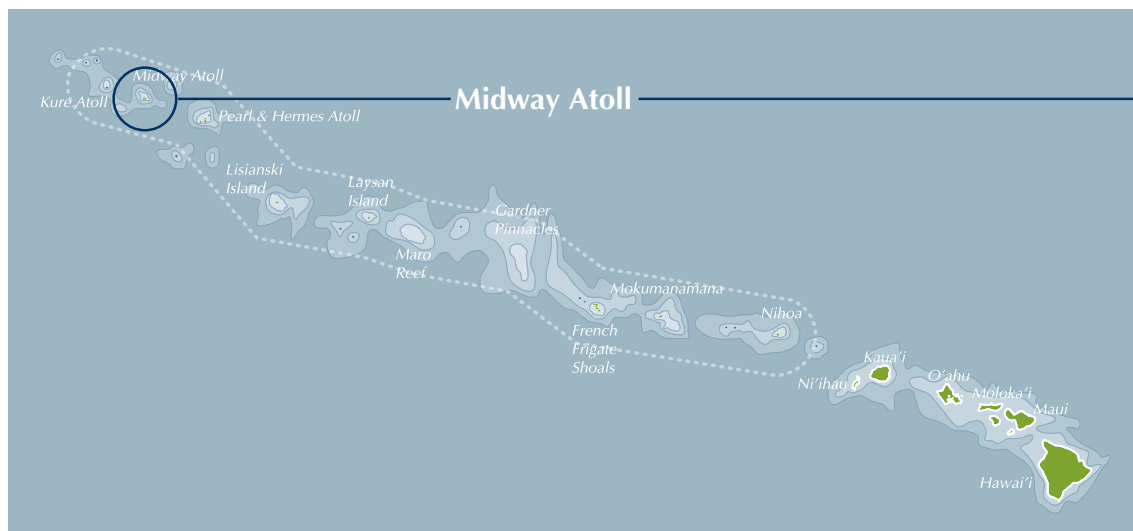

Midway Atoll's Hawaiian name, Pihemanu, evokes the loud din of birds that one hears on this atoll.

Midway Atoll consists of three sandy islets: Sand (4.56 square kilometers), Eastern (1.36 square kilometers), and Spit (0.05 square kilometers) for a total of 5.97 square kilometers in terrestrial area. These islets lie within a large, elliptical barrier reef measuring approximately 8 kilometers in diameter. The atoll, which is 28.7 million years old (Clague 1996), is surrounded by more than 356 square kilometers of coral reefs. In 1965, the U.S. Geological Survey tested Darwin's theory of atoll formation by drilling test bores at Midway, and hit solid basaltic rock 55 meters beneath Sand Island and 378 meters beneath the northern reef (Ladd et al 1967).

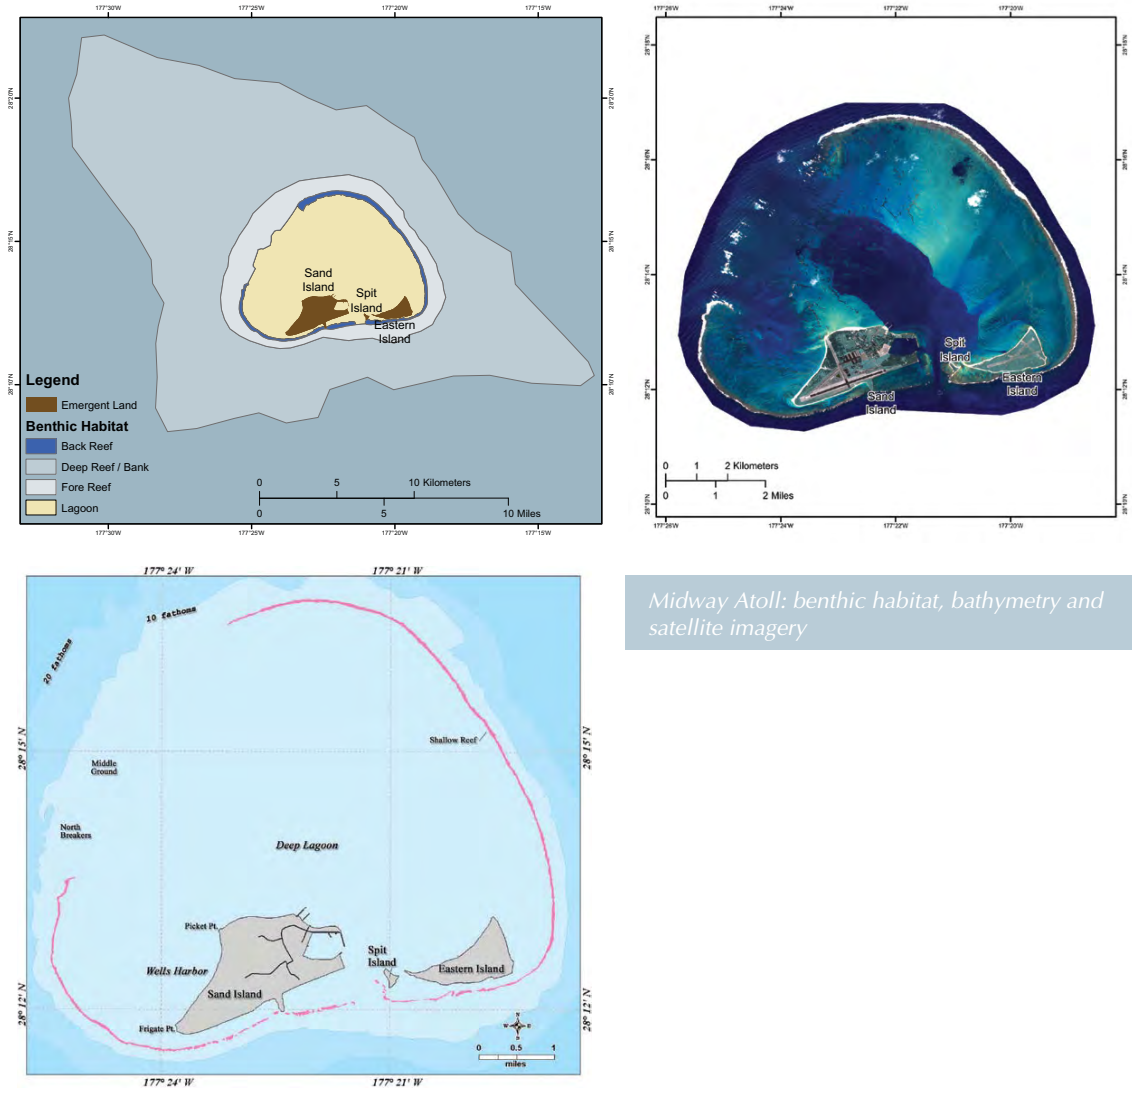

Numerous patch reefs dot the sandy-bottomed lagoon, supporting 163 species of reef fishes and 16 species of corals.

Although Midway's native vegetation and entomofauna have been greatly altered by more than a century of human occupation, the island boasts the largest nesting colonies of Laysan and Black-footed Albatrosses in the world, forming the largest combined colony of albatrosses on the planet. The Navy, FWS, and U.S. Department of Agriculture-Wildlife Services (USDA Wildlife Services) successfully eradicated rats from Midway in the 1990s, and

Figure 2.16: Number of endemic and indigenous species at Midway Atoll

invasive ironwood trees have been entirely removed from Eastern Island. Currently the cover on all of the islands at Midway is approximately 30% paved or structures, 23% grass and forbs, 18% woodland, 7% sand and bare ground, 22% shrublands, and <0.23% wetland. A translocated population of Laysan Ducks is supported by the introduced insect community at Midway, and a large program of invasive weed eradication and native plant propagation is ongoing.

Canaries introduced in 1910 still breed among the historic buildings that housed the beginning of cable communications across the Pacific in the early 20th century. The atoll and surrounding seas were also the site of a pivotal battle of World War II; Midway was also an active Navy installation during the Cold War.

*Spinner Dolphins are just one of more than 20 marine mammal species sighted in Papahānaumokuākea's waters*  
(Photo: James Watt)

**Kure Atoll**  
(Mokupāpapa and Kānemiloha'i)

23°03'N, 161°56'W

Mokupāpapa literally means flat island, and the name was ascribed to Kure Atoll by officials of the Hawaiian Kingdom in the 19th century, when King David Kalākaua disbursed an official envoy to the atoll to take “formal possession” of it. At the time, Kure was known in the kingdom as Ocean Island, but Hawaiian Kingdom officials indicated that Kure was “known to ancient Hawaiians, named by them Moku Papapa and recognized as part of the Hawaiian Domain” (Department of Hawaiian and Pacific Studies, Bishop Museum 2002).

Kure Atoll is the most northwestern island in the Hawaiian chain and occupies a singular position at the “Darwin Point”: the northern extent of coral reef development, beyond which coral growth cannot keep pace with the rate of geological subsidence. At present, Kure’s coral is still growing slightly faster than the island is subsiding, keeping the atoll above sea level. North of Kure, however, where growth rates are even slower, the drowned Emperor Seamounts foretell the future of Kure and all of the Hawaiian Archipelago. As Kure Atoll continues its slow migration atop the Pacific Plate and moves into slightly cooler waters, it too will cease to maintain sufficient coral growth, and will eventually slip below the surface.

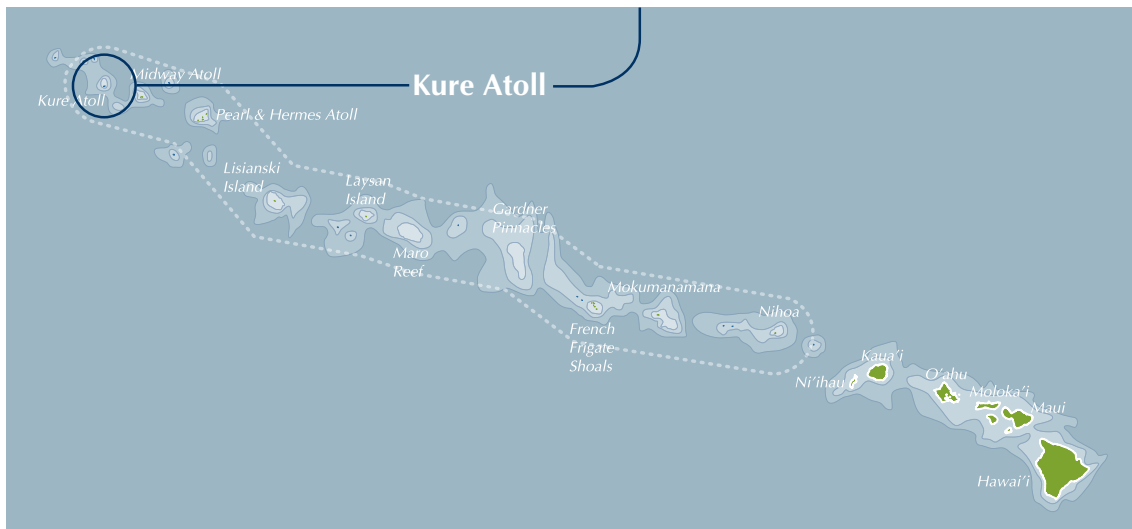

This 29.8 million year old atoll (Clague 1996) is nearly circular, with a reef 10 kilometers in

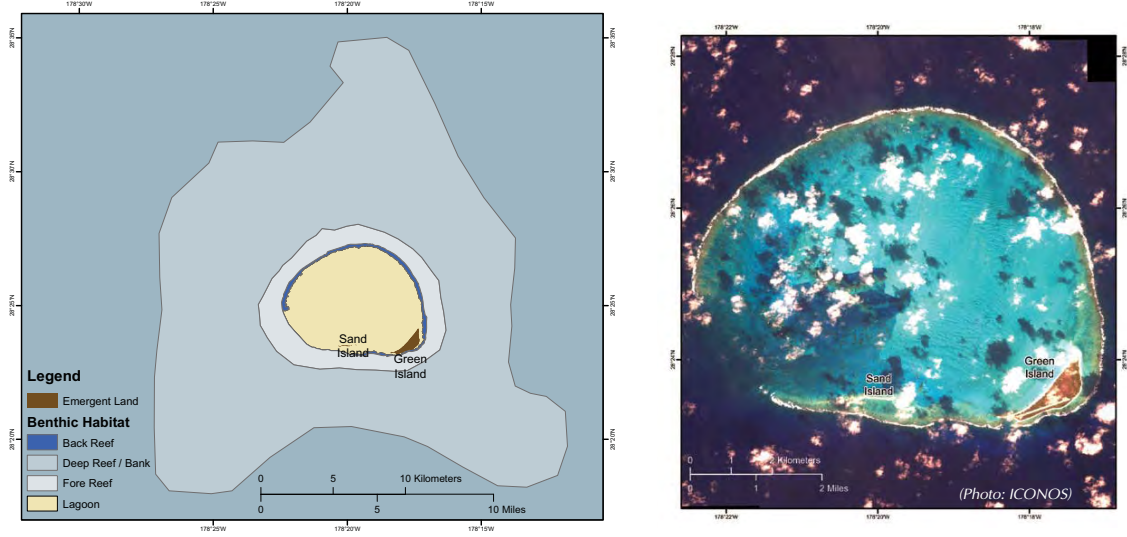

*Kure Atoll, the northernmost island in the chain, sits at the Darwin Point (Photo: James Watt)*

diameter enclosing a lagoon with two islets comprising over 0.89 square kilometers of emergent land, flanked by almost 324 square kilometers of coral reef habitat. The outer reef forms a nearly complete circular barrier around the lagoon, with the exception of passages to the southwest, and the associated marine habitats support 155 species of reef fishes and 27 species of coral. Abundance of fish species endemic to the Hawaiian Archipelago compose 56% of all fish abundance recorded here.

Kure Atoll: benthic habitat, bathymetry and satellite imagery

Of the two enclosed islets, the only permanent land is found on crescent-shaped Green Island, which rises to 6 meters above sea level and is located near the fringing reef in the southeastern quadrant of the lagoon. In addition to harboring an apparently endemic mite (*Hemicheyletia granula*), the atoll is also an important albatross breeding site, and the lagoon supports a population of Spinner Dolphins (*Stenella longirostris*).

87

Figure 2.17: Number of endemic and indigenous species at Kure Atoll

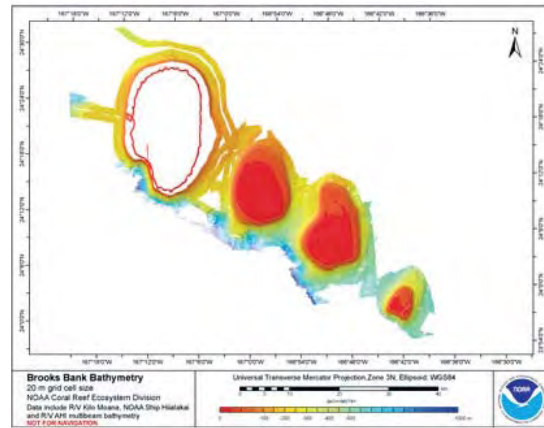

## Banks and Seamounts

Approximately 30 submerged banks lie within Papahānaumokuākea (Miller et al. 2004). Deepwater banks and seamounts are one of Papahānaumokuākea’s least-studied environments. Recent use of shipboard mapping technologies, submersibles, and remotely operated vehicles, however, has provided valuable information to characterize the physical and biological components of these ecosystems. Multibeam mapping expeditions have revealed dramatic geologic features, including knife-edge rift zones, seafloor calderas, sea-level terraces, submarine canyons, underwater landslide scars and debris fields, and previously unmapped seamounts (Smith et al. 2003; Smith et al. 2004).

(Photo: Amy Baco-Taylor)

Bathymetric mapping of an underwater seamount

Submersible surveys on South Pioneer Ridge (Pioneer Bank) and at two unnamed seamounts, one east of Laysan Island and the other east of Mokumanamana, have revealed the presence of various substrate types, deposited when these geologic features were at sea level (Smith et al. 2004). In some areas, dense communities of corals (ahermatypic) and sponges at depths approaching 1,000 fathoms (1,830 meters) obscure the underlying

substratum. The deepwater marine plants of the area are a mixture of tropical species, species with cold-temperature affinities, and species with disjunctive distributions, suggesting alternative biogeographical patterns and dispersal routes from the main Hawaiian Islands (McDermid and Abbott 2006).

All of these banks provide prime habitats for bottomfish and other associated fish species that are important food sources for Hawaiian Monk Seals. Such banks also support populations of Spiny and Slipper Lobsters, and colonies of precious gold, pink, and black corals that have been heavily disturbed in much of the remainder of the Pacific by the use of physically damaging harvest methods, such as trawling. These deep-living corals are unique in that they reside below the depth where enough light penetrates for photosynthesis, and derive their energy from the capture of plankton and small, organic particles from the water column with their tentacles, rather than relying on the symbiotic dinoflagellate algae, known as zooxanthellae, that virtually all shallow-water reef-building corals harbor in their cells.

88

A deepwater submersible prepares to dive  
(Photo: James Watt)

## 2.b History and Development of the Property

The human history of Papahānaumokuākea can be divided into two historical periods: Native Hawaiian history before Western contact (~300–1778 AD); and post-contact history (1778–present), including the Hawaiian Renaissance of the late 20th century to the present.

### *Native Hawaiian History Before Western Contact*

The Polynesian settlement of the Pacific Ocean began around 300 BC, when the first seafarers set off from Sāmoa and Tonga to explore the waters around them. Over the next 1,300 years, these voyagers would employ a sophisticated, non-instrument navigational system as they journeyed across the ocean, establishing their presence across a more than 10-million-square-mile triangle of the Pacific. They founded settlements on Aotearoa (New Zealand) in the west, on Rapa Nui (Easter Island) in the east, Hawai‘i in the north, and on hundreds of islands in between (Howe 2006). The epic journeys to these far-flung points were the last wave of migration in the Pacific, and represented the apex of Polynesian voyaging and navigation skills.

More than 1,500 years ago, Polynesian voyagers arrived in the Hawaiian Archipelago, the Polynesian Triangle’s northernmost point, where they found islands filled with abundant natural resources. Over the next millennia, Native Hawaiians, the descendents of the first Polynesians who discovered Hawai‘i, made the islands into a landscape that sustained both man and nature, creating agricultural terraces along the hillsides and extensive water paddies for their staple food, *kalo* (taro), in the valleys, constructing fishponds over the shallow reefs, and managing sustainable nearshore and pelagic fisheries.

While the majority of the populace lived in the main Hawaiian Islands (the eight volcanic islands from Hawai‘i Island in the south to Ni‘ihau in the north), the islands and atolls of Papahānaumokuākea were both considered deeply sacred and visited

regularly for cultural and subsistence resources. On Nihoa, Native Hawaiians established permanent and semi-permanent habitation sites, agricultural terraces, and burial grounds. It is believed that Hawaiians on Nihoa fished, raised crops, and staged the construction of sacred ritual sites on Mokumanamana. *Kūpuna* (elders) on Kaua‘i and Ni‘ihau say that their families visited Nihoa and Mokumanamana for weeks to months at a time, throughout the period of Western Contact, although after the United States’ annexation of Hawai‘i, much of this happened in secret (Maly 2003).

Papahānaumokuākea as a primary training ground for apprentice navigators, and Nihoa, Mokumanamana and French Frigate Shoals served as resource gathering places, as evidenced in Native Hawaiian oral histories and the journals of Captain James Cook. One of Captain Cook’s crewmembers, David Samwell, reported that while near Ni‘ihau, they planned to “set sail in the morning for Mokoopapappa [sic], a small, low Island uninhabited which the Indians tell us lies to the Westward of us at a distance of a day’s sail from here, where there are plenty of Turtle” (Beaglehole 1967).

### *Papahānaumokuākea in the Post-Contact Era*

When Europeans arrived in the Hawaiian Archipelago in the late 18th century, they found a thriving society of between 250,000 and one million Native Hawaiians (Stannard 1989), with a distinct culture and complex social and religious systems. Papahānaumokuākea was very much a part of Native Hawaiian geography and life; Captain James Cook’s crews encountered a Native Hawaiian canoe returning from the Northwest Hawaiian Islands with a vessel full of seabirds and turtles. Some of the highest-ranking Native Hawaiian chiefs of the 19th century, including Queen Ka‘ahumanu, King Kamehameha IV, King David Kalākaua and Queen Lydia Lili‘uokalani, visited Nihoa to reconnect with the island.

In 1898, five years after Queen Lili‘uokalani was overthrown by the self-

proclaimed Provisional Government of Hawai‘i, the archipelago (which included Papahānaumokuākea) was collectively acquired by the United States through a domestic resolution called the “Newlands Resolution.”

Through *mele* (song), *mo‘olelo* (story), *oli* (chant), *hula* (dance), *mo‘okū‘auhau* (genealogy) and archaeological resources, Hawaiians maintained continuous ties to the islands to the northwest. Using these cultural resources, Native Hawaiians recount the travels of seafaring ancestors between Papahānaumokuākea and the main Hawaiian Islands. Archival resources written in the Hawaiian language have played an important role in providing this documentation, through a large body of information published more than a hundred years ago in local newspapers (e.g., Kaunamano 1862; Manu 1899; Wise 1924). More recent ethnological studies have highlighted the continuity of Native Hawaiian traditional practices and histories in the Northwestern Hawaiian Islands. Only a fraction of these have been recorded, and many more exist only in memories and life histories.

Starting in the 1960s and 1970s, a scant lifetime after American annexation, Native Hawaiians launched a movement of resistance to Western assimilation by looking to their *kūpuna* (revered elders and ancestors) and other sources to reclaim their language, music, *hula* (traditional Hawaiian dance) and history. Part of this renaissance included the strengthening of bonds with sacred places and a return of traditional skills and knowledge to the center of cultural life; Papahānaumokuākea has played a pivotal role in both of these movements.

### Native Hawaiians and Papahānaumokuākea in the Modern Era

The *ea* (sovereignty and life), as well as the *kuleana* (responsibility), for the entire Hawaiian archipelago continues to exist in the central beliefs of many present-day Native Hawaiians—a perspective formally recognized by the U.S. Apology Resolution (U.S. Public Law 103-150), a joint resolution of Congress signed by President Clinton in 1993. The Apology Resolution states, in part, that “The Congress ... apologizes to Native Hawaiians on behalf of the people of the United States for the overthrow of the Kingdom of Hawaii on January 17, 1893 with the participation of agents and citizens of the United States, and the deprivation of the rights of Native Hawaiians to self-determination;...” (see Appendix D for full text of the Apology Resolution).

In 1997, an organization called Hui Mālama I Nā Kūpuna O Hawai‘i Nei repatriated sets of human remains to Nihoa that had been collected by archaeologists in the 1924–1925 Bishop Museum *Tanager* Expeditions (Ayau and Tengan 2002). Hui Mālama seeks to return the *mana* (life-force, spirit, and power) of the *kūpuna* (ancestors) to existing and future Native Hawaiian life.

90

(Photo: Na‘alehu Anthony)

The Hōkūleʻa, a modern-day replica of ancient double hulled sailing canoes, approaches Nihoa in 2005 (Photo: Naʻalehu Anthony)

This repatriation set the stage for a reawakened relationship between Native Hawaiians and the NWHI in 2000, when President Clinton signed the Executive Orders creating the NWHI Coral Reef Ecosystem Reserve. With new channels of access possible, the cultural group Nā Kupuʻeu Paemoku traveled to Nihoa on the traditional double-hulled voyaging canoe *Hōkūleʻa* in 2003 to conduct traditional ceremonies. The following year, in 2004, *Hōkūleʻa* sailed more than 1,200 miles (1,931 km) to the most distant end of the archipelago, visiting Kure Atoll as part of a statewide educational initiative called “Navigating Change.” Concurrently, the *ʻOhana Waʻa* (literally, family of canoes – an organization representing the Hawaiian voyaging community and their seven canoes, inclusive of those currently sailing and those under construction) recognized that the ancient sailing route between Kauaʻi and Nihoa was still an appropriate training route for the next generation of Native Hawaiians interested in reestablishing the traditional system of navigation practiced by their ancestors.

In 2005, Nā Kupuʻeu Paemoku again sailed to Papahānaumokuākea, this time to Mokumanamana, where they conducted protocol ceremonies on the summer solstice. During the 2007 solstice, as a follow-up to the 2005 access, the Hawaiian cultural group Haʻae Wale Hānauna Lolo ventured to Nihoa and Mokumanamana to conduct its own cultural research initiatives and to better understand the relationships between the *wahi kūpuna* (ancestral places) and the northern pathway-of-the-sun.

## Timeline of Events: Official Hawaiian presence in NWHI following Western Contact

### 1822

Queen Kaʻahumanu travels to Nihoa and claims it under the Kamehameha Monarchy.

### 1856

Nihoa is reaffirmed as part of the existing territory of Hawaiʻi by authority of Alexander Liholiho, Kamehameha IV.

### 1857

King Kamehameha IV voyages to Nihoa. He instructs Captain Paty on the *Manuokawai* to verify the existence of other lands in the northwest. Paty travels to Nihoa, Mokumanamana, Gardner, Laysan, Lisianski, and Pearl and Hermes.

### 1857

The islands of Laysan and Lisianski are declared as new territory under the domain of the Kingdom.

### 1885

Princess Lydia Liliʻuokalani and a scientific expedition visits Nihoa on the ship *Iwalani*.

### 1886

King David Kalākaua, through Special Commissioner Colonel James Harbottle-Boyd, claims possession of Kure Atoll (Ocean Island).

### 1893

The Hawaiian government is overthrown by the Provisional government, with the assistance of Minister John L. Stevens and the U. S. military.

### 1898

The archipelago, inclusive of the Northwestern Hawaiian Islands, are collectively ceded to the United States through a domestic resolution, called the “New Lands Resolution.”

Wreck of the *McCaw*. In August 2008, two 19th century shipwrecks were discovered in Papahānaumokuākea (Photo: Tane Casserly)

Reestablishing ceremonies and practices in Papahānaumokuākea “complete[s] the cycles we have in all of our stories,” says Pualani Kanaka’ole Kanahale, a *kumu* (teacher of cultural practices) and leader of Ha’ae Wale Hānauna Lolo.

### Maritime Heritage and Maritime Archaeology

The Hawaiian Islands have a rich maritime history; specific remnants of this are preserved in Papahānaumokuākea Marine National Monument. Following Captain James Cook’s first encounter with Hawai’i, the presence of European and American vessels at the main Hawaiian Islands slowly began to increase, and early European voyages of discovery included several encounters with the Northwestern Hawaiian Islands. The French navigator Jean François de Galaup, Comte de La Pérouse (Cook’s contemporary) made brief surveys of Mokumanamana and French Frigate Shoals in 1787. Russian navigators such as Urey Lisianski also conducted surveying expeditions in this portion of the Pacific in 1805. In the mid 19th century, American surveying efforts by N.C. Brooks (1859), Lieutenant John Brooke (1859), and Captain William Reynolds (1867) added to the growing body of knowledge on the area.

Western whalers, in their early search for productive areas, encountered the low and uncharted atolls on their passages westward from Honolulu and Lahaina, Maui to the

whale-rich seas off Japan, the Japan Grounds, which extended from Japan eastward to Kure Atoll (Richards 1999). Several of the islands, therefore, received their Western names from the early landings and/or shipwrecks of these Pacific whalers. Midway was originally sighted by Captain Daggett of the New Bedford whaler *Oscar* in 1839. Laysan was reportedly discovered by the American whaling ship *Lyra* prior to 1828. Pearl and Hermes Reef is named for the twin wrecks of the British whalers *Pearl* and *Hermes* in 1822. Gardner Pinnacles was named by Captain Allen on the Nantucket whaler *Maro* in 1820, the same year the ship came across Maro Reef. Whaling, which decimated marine mammal populations worldwide, carried with it major ramifications in terms of oceanic discovery, cultural contact, economic development, and political expansion.

Seafaring activity in the Hawaiian Islands quickly became culturally mixed. Hawaiian chiefs purchased and operated numerous schooners and brigs, and Native Hawaiians found employment on a wide range of sailing vessels. Many were well aware of the evolving whaling industry, and were recruited and served on board whaling ships. It is estimated that 500 Hawaiian sailors shipped out annually onboard Western whalers during the peak of the Pacific whaling era, between 1840 and 1860 (Chappell 1997: 180).

There are ten known whaling shipwrecks in the Northwestern Hawaiian Islands (see Appendix E). Five of these shipwreck sites (*Pearl* 1822, *Hermes* 1822, *Parker* 1842, *Gledstones* 1837, and an unidentified 19th century whaler) have been documented by field survey. These are the earliest wrecks yet found in Hawaiian waters, and provide a rare archaeological glimpse into this period of whaling in the Pacific. Whaling shipwrecks are an example of the international importance of this region in the early 19th century, when whale oil fueled the cities of the Industrial Era, and drove ships halfway around the globe in search of this invaluable resource.

The U.S. Guano Act of 1856, which enabled commercial claims to many remote and

uninhabited islands in the Pacific, heralded the hunt for mineral resources. Several of the Northwestern Hawaiian Islands were leased by private companies for guano extraction. The local development of facilities supporting these activities was most significant on Laysan Island, where a small community existed from the 1890s through the early 20th century. Guano works among the atolls necessitated supply ships and passage for contract laborers, increasing local vessel traffic in the region.

The U.S. Navy's interest in Midway destined the atoll to play a distinctive role in history. Captain William Reynolds of the USS *Lackawanna* took formal possession for the U.S. in August 1867, making Midway Atoll the first islands annexed beyond the West Coast. The harbor had been erroneously described as similar to Honolulu, both roomy and safe, and the low Sand and Eastern Islands as "productive for agriculture." These were unrealistic claims at best, but early in the age of steam navigation, the U.S. sought transpacific coaling stations and the establishment of commercial links to East Asia. The effort was not without a cost, as the USS *Saginaw*, a Civil War-era gunboat, was lost at nearby Kure Atoll in 1870. The Midway Islands were the first fruits of Secretary of State William Seward's expansionist policies, and grew in political importance during the American period.

The islands were not the only focus of activity. Commercial fishing in the waters surrounding the islands of Papahānaumokuākea began with the arrival of large sailing vessels that hailed from ports around the world. These vessels left the reefs and shoals with cargoes of shark meat, fins and oil, turtle shells and oil, and sea cucumbers. Commercial harvesting of tuna, bottomfish, lobsters, and other marine animals in the region continued through the 20th century.

Throughout this period, Papahānaumokuākea presented significant hazards to shipping because of the low, inconspicuous nature of the islands, which makes their shoals and reefs difficult to detect from the water,

*Cavernous cauldrons indicate this shipwreck was likely a historic whaling vessel (Photo: Tane Casserly)*

and their often incorrect location on marine charts. This, combined with the increase in commercial activities over time, has made Papahānaumokuākea into a veritable graveyard of maritime disaster in the 19th century. Fortunately, the frequent proximity of sandy "desert" islands, not barren at all but rich in terms of marine mammals, seabirds, and ocean resources, granted castaways the opportunity for survival. Many tales of shipwreck in these islands present similar themes: unexpected groundings on low coral atolls, difficult survival on turtles, seals, fish and bird eggs, and construction of craft from debris for rescue voyages eastwards back to the main Hawaiian Islands. Also, not surprisingly, several commercial outfits in the main Hawaiian Islands sent local schooners on "wrecking" or salvage cruises to the northwestern atolls.

Currently, 60 known shipwreck sites are known in Papahānaumokuākea, the earliest dating back to 1822. Combined with known aircraft losses, there are a total of 127 potential maritime resource sites, giving Papahānaumokuākea a significant and basically undisturbed marine archaeological legacy. These submerged historical resource sites are international in scope and represent a cross-section of the many cultures that engaged in Pacific seafaring history. Twenty-five of these sites have been confirmed by field survey. Because maritime archaeology is such a new field of research in Papahānaumokuākea, discoveries of new shipwreck sites in this region occur frequently. Each new survey of the area yields further important information to add to the inventory and assessment of shipwreck sites in this area.

*Fertile grounds for maritime archaeology*

(Photo: James Watt)

only two shipwreck sites, both located in Australia, yield similar information to the shipwreck sites in Papahānaumokuākea. In late summer 2008, two additional shipwrecks were discovered, the *Gledstones* (which was lost in 1837) and an unidentified 19th century whaler.

**The American period**

The Kingdom of Hawai'i was officially annexed by the U.S. in 1898. Claims to the Northwestern Hawaiian Islands, substantiated by the former Kingdom, were transferred (except Midway) to the Territory of Hawai'i.

Statehood for the Territory occurred in 1959, following World War II and subsequent large-scale social, political, and economic transformations in the Pacific.

Hawai'i and the Northwestern Hawaiian Islands played a crucial role in global communications. In 1903, a transpacific submarine cable was completed via Honolulu, Midway, and Guam. Residence at Midway also meant an increasing awareness of the area by the American government. Illegal poaching in the remote archipelago prompted the first U.S. Marine presence at Midway, and in 1909 President Theodore Roosevelt declared the whole area (with the exception of Midway) the Hawaiian Islands Reservation, for the protection of seabirds.

In fall 2002, for example, a multi-agency research expedition that included a small team of maritime archaeologists conducted the first systematic survey for maritime cultural resources in the distant portion of the archipelago. The study area encompassed the islands and atolls stretching from Nihoa in the south to Kure in the north. In 2003, maritime archaeologists conducted a survey of selected sites at Kure and Midway Atolls. The 2003 work featured the discovery of the wreck site of the USS *Saginaw*, lost at Kure Atoll in 1870. In 2005, the maritime archaeology team focused on documenting the 19th century whaling shipwreck sites at Pearl and Hermes Atoll and Kure Atoll. Non-invasive survey of three wrecks, the British whalers *Pearl* and *Hermes* (which sank in 1822), and the American whaler *Parker* (which sank in 1842), were initiated. Further follow-up surveys were conducted to the newly discovered whalers in 2006, and a yet-to-be-identified site known as the "Oshima" wreck. In 2007, the maritime archaeology team discovered the 1917 wreck of the four-masted schooner *Churchill*, lost under mysterious circumstances while in transit with copra (dried coconut meat) from Tonga to Seattle, Washington. Very little maritime archaeological work has been conducted in atoll environments, and pelagic whaling vessels in an archaeological context are a rare discovery; for global comparison,

*A textured ecological, cultural, and historic islandscape* (Photo: James Watt)

With the first “round-the-world” cable message sent by President Roosevelt on July 4, 1903, and the subsequent construction of the Pan American Airways facilities (see Midway Atoll overview, below), Midway became a crucial connection for the Pacific region and the world. The U.S. Navy’s interest in the strategic location of Midway centered on its use as a seaplane base, and in 1940, construction of the naval air station at Midway was begun. Growing infrastructure at Midway reflected its strategic importance as a trans-Pacific communication and transportation hub.

World War II had a dramatic impact on the region. Tern Island at French Frigate Shoals was initially developed as a naval facility for staging aircraft. Besides the naval air station at Midway, the Navy also built a major submarine refit and repairs base. Together, these areas comprised a vital center for submarine, surface fleet, and aviation operations. In fact, the Hawaiian Sea Frontier forces stationed patrol vessels at most of the islands and atolls.

Midway Atoll itself was the focus of one of the most important naval battles in the war’s Pacific theater. In June 1942, the Japanese Imperial Navy attempted the invasion of the atoll. Ultimately, four Japanese aircraft carriers and one American carrier were sunk, and hundreds of aircraft shot down. The Imperial Japanese Navy was forced to withdraw. This was a watershed moment in the Pacific; had the invasion succeeded, America’s line of

defense would have retreated to the West Coast. The majority of the sea battle took place between 160 to 300 kilometers to the north of the atoll, but an intense air fight was waged directly over and around the atoll itself (see Midway Atoll overview, below). Numerous Japanese and American planes splashed down into the waters surrounding Midway, and many of these sites are now war graves. At least 67 naval aircraft are recorded as being lost in the vicinity of the Northwestern Hawaiian Islands. These submerged aircraft reflect the important aviation legacy of Midway and the surrounding region.

Midway Atoll today is designated as a National Memorial to the Battle of Midway. Nine defensive structures related to the Battle of Midway were designated as a National Historic Landmark in 1986. Numerous other structures are eligible for placement on the National Register of Historic Places.

#### *Overview of Each Island – History and Development of the Property*

##### **Nihoa – 23°03’N, 161°56’W**

The islands of Papahānaumokuākea, particularly in its southeastern portion, were used through the time of James Cook’s expeditions by Native Hawaiians as seasonal dwelling sites for fishing, turtle harvest and feather gathering. Nihoa and Mokumanamana are thought to have been utilized by Native Hawaiians periodically until well into the Western era, with voyages continuing, in

*Schools of Convict Tangs or manini thrive in Papahānaumokuākea (Photo: James Watt)*

secret, into the 20th century for the gathering of turtles, fish, bird feathers and eggs (Tava and Keale 1989; Maly 2003).

In 1789, Captain Douglas of the *Iphegenia* was the first Westerner to visit Nihoa. Several Hawaiian ali'i (royalty) journeyed to Nihoa in the next century. In 1822, Hawaiian Queen Ka'ahumanu visited the island with her husband, King Kaumuali'i, chief of Kaua'i. They rediscovered historic evidence of prior habitation, as the Queen had learned from *oli* (chant) and *mele* (song) passed down through the generations (Rauzon 2001). King Kamehameha IV, or Alexander Liholiho, formally annexed Nihoa for the Hawaiian Kingdom in 1857 (Paty in Emory 1928). In 1885, Queen Lili'uokalani and her 200-person entourage landed on Nihoa, to study the palms, wildlife and artifacts on the island (Bishop in Emory 1928).

**Mokumanamana (Necker Island) – 23°35'N, 164°42'W**

Mokumanamana was documented by La Pérouse in 1786. Captain John Paty claimed Mokumanamana for the Kingdom of Hawai'i in 1857, per the request of King Kamehameha IV, and that claim was later contested, with the island being annexed again by Hawai'i's Provisional Government in 1894. The British once sought to lease the island as a communications cable relay station, but the idea was quashed by the American

Congress. More recently, the island was used by the military for bombing practice.

**French Frigate Shoals (Kānemiloha'i) – 23°145'N, 166°10'W**

French Frigate Shoals was first encountered by Europeans when La Pérouse, sailing with the frigates *Boussole* and *Astrolabe* nearly ran aground there in 1876. Military activities during World War II resulted in significant alterations to the atoll, with Tern Island being largely dredged up and formed into the shape of a runway to serve as a refueling stop for planes en route to Midway. The original seawall, runway, and some structures remain. The U.S. Coast Guard occupied Tern and East Islands from 1944 until the 1970s and ran a LORAN station, evidence of which still remains.

The U.S. Fish and Wildlife Service has maintained a field station at Tern Island since 1978, staffed by two permanent employees and a handful of volunteers. National Marine Fisheries Service also maintains staff on the island in support of Hawaiian Monk Seal and Hawai'i Green Turtle projects.

**Gardner Pinnacles (Pūhāhonu) – 25°02'N, 168°05'W**

Gardner Pinnacles was given its Western name by Captain Allen on the Nantucket whaler *Maro*, who encountered the island in 1820. The land area of this island is not large, and the two rocky pinnacles that project above the water are difficult to land on. As a result, there is no record or evidence of any previous human activity.

**Maro Reef (Ko'anako'a) – 25°22'N, 170°35'W**

Captain Allen of the *Maro* first charted Maro Reef in 1820, when he recognized the danger of the area and steered clear of it. The reefs and shoals of Maro Reef are so extensive and vast, that it is thought that this area was generally avoided by mariners. There are at least six recorded shipwreck losses at Maro Reef, beginning in 1852.

*Hawaiian Morwong, common in Papahānaumokuākea*  
(Photo: James Watt)

**Laysan Island (Kauō) – 25°46'N, 171°45'W**

On May 1, 1857, Captain John Paty of the Hawaiian schooner *Manuokawai* landed on Laysan and annexed it to the Hawaiian Kingdom. During his visit, Captain Paty commented on the great number of albatross nests and guano deposits on the island. Scientific expeditions to Laysan continued in 1859, with Lieutenant J.M. Brook's visit aboard the *Fenimore Cooper* to collect soundings, positions and physiographic data to make a chart of the island for the United States Hydrographic Office.

In 1890, Laysan was leased by the Hawaiian Kingdom to the North Pacific Phosphate and Fertilizer Company for a period of 20 years. Guano mining and digging occurred on Laysan from 1892 to 1904, when the supply was exhausted. This period saw the construction of several buildings, including a lighthouse and a small railroad, which supported this trade; between 100 and 125 tons of guano could be shipped from Laysan per day (Ely and Clapp 1973). Today, the only obvious terrestrial remnants of this operation on Laysan are guano piles, pieces of rail, and human grave sites. Large 19th century anchors, which may have served as moorings for the guano landing, lie submerged near the shore.

By 1900, Japanese feather poachers began raids on Papahānaumokuākea, slaughtering thousands of albatross and other birds for their plumage. This prompted President Theodore Roosevelt to issue Executive Order No. 1019 on February 3, 1909 to set aside all the islets and reefs from Nihoa to Kure (except Midway) as the Hawaiian Islands Reservation. In April 1923, Laysan was visited by the U.S.S. *Tanager* in what became known as the *Tanager* Expedition. The objective of this mission was to make scientific observations and collections of the flora and fauna in the NWHI for the U.S. Bureau of Biological Survey (Bryan 1978). The party of explorers established a camp on shore for one month, and made detailed records and collected specimens of the various forms of life on Laysan (Macintyre 1996). The previous guano business venture had also introduced rabbits to the island to augment the food supply in 1903. The rabbits' unchecked herbivory and breeding resulted in the almost complete de-vegetation of the island. In 1923, the

scientists of the *Tanager* Expedition successfully eradicated the last rabbit, but not in time to prevent the extinction of at least three native land birds and an unknown number of plants and terrestrial invertebrates.

Since 1991, FWS has operated a semi-permanent field camp on Laysan, with efforts focused on eradicating invasive plant species and restoring native habitats. Active restoration in the form of control and eradication of introduced mammals, insects, and plants is occurring at several islands in Papahānaumokuākea. The most comprehensive of these restorations is occurring at Laysan Island. The plant community present today is descended from either the surviving seed bank, adventive species that have re-colonized, or plantings in the decades following the guano business venture. Of the 27 plant species documented in early observations and three more discovered in recent pollen cores of Laysan Lake, 18 still grow at Laysan, along with 11 species of alien plants. A 12 year effort to eradicate the invasive grass *Cenchrus echinatus* has succeeded, though biologists remain vigilant should any seeds resprout. Efforts to restore the plant community to its pre-contact state are proceeding, with a year-round camp where staff are propagating and out-planting eight species (five for re-introduction and three for enhancement of existing small populations). All replanting is conducted using the original species or closest relatives from similar habitats. Replanted plants are started from carefully processed seeds to prevent accidental introductions of fungus and insects. To date, two of six previously extirpated species are reproducing independently, and another two have been out-planted and have survived at least one annual cycle.

Efforts to fill the ecological niche of the extinct Laysan Millerbird (*Acrocephalus familiaris familiaris*) will be carried out using birds from the only remaining Millerbird population within Papahānaumokuākea (at Nihoa; *Acrocephalus familiaris kingi*) as soon as the habitat is judged ready to support the species at Laysan Island. Similar restoration efforts are also occurring at Midway and French Frigate Shoals, and are planned for other terrestrial sites in the archipelago.

Numerous researchers have worked on Laysan, including biologists from the U.S. Geological Survey. They have established an additional population of the endangered Laysan Duck at Midway Atoll.

**Lisianski Island (Papa'āpoho) - 26°04'N, 173°58'W**

Lisianski gained its Western name in 1805 when the Russian exploring ship *Neva* grounded on the reef. Under the command of Captain Urey Lisianski, the *Neva* was sailing from Sitka to Macao to meet the *Nadeshda*, her sister ship, on Russia's first circumnavigation of the world (Clapp). The ship was re-floated, but was once again driven into a reef, and the crew began repairs on the battered ship during a break in the weather (Bryan 1978).

Early expeditions to Lisianski include a visit by Captain Benjamin Morrel, Jr., of the ship *Tartar*, who wrote about the inland bird rookeries, Green Turtles, sea-elephants (probably Hawaiian Monk Seals) on the beach, and the lack of any fresh water (Clapp and Wirtz 1975). Captain John Paty arrived at Lisianski in 1857 to take possession of the island for the Hawaiian Kingdom and estimate the amount of guano there (ibid.). Lisianski was later visited by the bark *Gambia*, the schooner *Ada* (which collected sharks, turtles, and sea cucumbers), and the schooner *Kaalokai*, which was hired for an ornithological survey of Lisianski (Bryan 1978). Evidence shows that little guano mining took place at Lisianski, though several Japanese feather poachers raided the island in the early 1900s (Bryan 1978). The first scientific visit to Lisianski occurred in 1928 by the *Moller*, an exploring vessel under the command of Captain Stanikowitch. The team made

observations of the island and collected several species of birds, and their records comprise the first list of bird species on Lisianski (Clapp and Wirtz 1975).

**Pearl and Hermes Atoll (Holoikauaua) - 27°50'N, 175°50'W**

Pearl and Hermes Atoll derives its Western name from the two British whaling ships, the *Pearl* and the *Hermes*, that wrecked on the reef on April 24, 1822 while sailing in consort to the newly discovered Japan whaling grounds. One of the carpenters on board the *Hermes*, James Robinson, supervised the building on the beach of a small 30-ton schooner they named *Deliverance*. Though most of the crew elected to board the passing ship *Earl of Morby*, Robinson and 11 others took possession of the nearly finished *Deliverance*, sailed her back to Honolulu, and eventually sold her there for \$2,000. The remains of the *Pearl* and the *Hermes*, the oldest wrecks in Hawai'i, were discovered in 2004. National Historic Register nominations are in process.

Following a few scientific expeditions to Pearl and Hermes Atoll in the early 1900s, the atoll was home to a short-lived pearl fishery after pearl oysters were discovered in the lagoon in the 1920s. Military activity occurred at the atoll in the mid 1930s and continued through the end of the Battle of Midway (Amerson et al. 1974).

Each summer for nearly two decades, personnel from the U.S. Fish and Wildlife Service and National Marine Fisheries Service have established temporary field camps at Pearl and Hermes to monitor bird and Hawaiian Monk Seal populations. Neither permanent

structures nor year-round human activities occur on these islands.

**Midway Atoll (Pihemanu, Brook Island and Middlebrook Islands) – 28°15'N, 177°20'W**

Of all of the islands within Papahānaumokuākea Marine National

This 3-inch gun on Midway's Eastern Island defended the atoll during the Battle of Midway (Photo: Pete Leary)

Monument, Midway Atoll has been most affected by human activity.

In 1903, the Commercial Pacific Cable Company established Midway as a link in the first around-the-world communications cable. The employees of the Midway Cable Station built five concrete buildings, cultivated a garden with imported soil, and planted ironwood trees, which then spread around the island, as wind breaks.

(Photo: FWS)

In 1935, Pan American Airways constructed a base for its amphibious “flying boats” at Midway. The facility included tourist and employee amenities such as a hotel, a solar hot water system, tennis courts, baseball fields, and a golf course.

In 1941, as World War II raged in Europe, the United States commissioned the Naval Air Station Midway. The military expanded the harbor and developed a seaplane landing basin. They constructed runways on Eastern Island, several defensive batteries, and the infrastructure to support a few thousand military personnel. December 7, 1941, saw not only the famous attack on Pearl Harbor, but also one on strategically important Midway. Japanese destroyers shelled Sand Island for two hours, damaging several buildings, including the seaplane hangar and power plant.

On June 4, 1942, more than one hundred Japanese planes zoomed toward Midway as American military aircraft, PT boats, and anti-aircraft batteries tried to slow their progress. Japanese bombs blasted the seaplane hangar, torpedo and bomb-sighting building, Navy mess hall, administration offices, brig, and other buildings, and damaged several more on Sand Island. On Eastern Island, bombs hit the mess hall, power plant, gasoline lines, sick bay, command post, post exchange, engineering tents and runways. Dark smoke rose from blazing oil tanks. The 17-minute attack left the buildings of Midway Atoll in ruins.

Meanwhile, a massive sea and air battle raged 480 km north of Midway Atoll. The U.S. Navy sank four Japanese aircraft carriers and shot down 292 planes. The Japanese defeat in the

Battle of Midway has been called the “turning point of World War II in the Pacific” (Allen 1950: 63 in Yoklavich 1993: 29)

After World War II, the military base at Midway continued to support American military presence in the Pacific until 1993, when the Naval Air Facility was closed. From 1983 to 1997, the Navy and FWS conducted a massive cleanup of Midway Atoll. All the buildings and structures from Eastern Island have been removed. On Sand Island, most of the Cold War–era buildings, 106 underground storage tanks, 15 large above-ground tanks, connecting pipelines, subsurface petroleum, PCB, and DDT-contaminated soil, and large amounts of metal debris were removed. Rats were eradicated.

Today, the FWS maintains a small staff and volunteer program on Midway. They work to remove invasive vegetation, plant native vegetation, collect marine debris, monitor wildlife populations, provide educational activities for visitors, restore historic structures, and clean up contaminants. Midway is not unlike a very small town in its needs for electricity, food service, sewage treatment, and communication. A FWS contractor with 60 employees provides infrastructure support on the island. An airport on Sand Island serves the needs of staff, visitors, and as an emergency diversion site for trans-Pacific commercial aircraft.

**Kure Atoll (Mokupāpapa, Kānemilohaʻi, Ocean Island and Cure) –  
23°03'N, 161°56'W**

Historical records contain references to contact with Kure Atoll in 1799 by Captain

Don J. Zupiani of the Spanish vessel *Senhora del Pilar*, who named the island Patrocinio (Woodward 1972). In 1804, the ship *Ocean* arrived at the island, and its captain named the island “Ocean Island” (Bryan 1967). In 1835, Admiral Krusenstern of the Russian Navy stated that Captain Kure, a Russian navigator, landed on the atoll and named it Kure. The exact date when Kure visited the atoll is not known.

Kure Atoll has seen a history of several shipwrecks and scientific expeditions. Following the wreck of the British collier *Dunnottar Castle* in 1886, King Kalākaua, the Hawaiian Monarch, dispatched the *Waialeale* to rescue the crew and take possession of the island. On September 20, 1886, Colonel James H. Boyd of the *Waialeale* took formal possession of Kure, naming the island Mokupāpapa (Bryan 1978). The U.S. Government acquired Kure as part of the Territory of Hawai‘i on July 7, 1898, and in February 1909, Kure Atoll became part of the Hawaiian Islands Reservation when President Theodore Roosevelt signed Executive Order No. 1019 (Bryan 1978). Kure Atoll was under control of the U.S. Navy between 1936 and 1952, after which

it was turned back over to the Territorial Government of Hawai‘i (Woodward 1972).

Unlike Midway and French Frigate Shoals, Kure Atoll was not modified during World War II. The U.S. Navy did install a radar reflector in 1955, and opened large areas for albatross in 1959, but no other alterations were made to the island until the U.S. Coast Guard established a LORAN (Long Range Aids to Navigation) station on Green Island, commissioned on March 17, 1961 (Woodward 1972). Promising to protect the flora and fauna on Kure Atoll, the Coast Guard leased Green Island from the Hawaiian Commissioner of Public Lands. Kure was chosen because its isolation enabled clear electronic transmissions for navigational purposes without interference (Gibbs 1977). The Coast Guard built a 1,220-meter runway and a 190-meter-high LORAN tower, along with several structures that included a barracks, a signal/power building, a transmitter building, a pump house, and seven fuel tanks (Woodward 1972). The Coast Guard maintained the station until 1992.

In 1993, the State of Hawai‘i Department of Land and Natural Resources, Division of Forestry and Wildlife (DLNR/DOFAW) worked with the Coast Guard to demolish the majority of the buildings on the island. Only one small brick house, a storage shed, a water tank, and the runway remain on Green Island. DLNR/DOFAW manages Kure Atoll as a State Wildlife/Seabird Sanctuary. Since 1994, DOFAW has set up an annual field camp on the island to monitor seabird populations, conduct habitat restoration, monitor Hawaiian Monk Seals and remove the marine debris from the shoreline and coral reefs. National Marine Fisheries Service has an annual field camp each summer on Kure Atoll to monitor Hawaiian Monk Seals. For the past five years, researchers have also been monitoring a resident population of *nai‘a* (Hawaiian spinner dolphins) in the atoll.

100

Monitoring the extent of coral bleaching in Papahānaumokuākea (Photo: James Watt)

### History of Research in Papahānaumokuākea

Assessment, monitoring and mapping of the flora and fauna in the Northwestern Hawaiian Islands began nearly a century

ago as exploratory research voyages set sail primarily to collect data and specimens for cataloging purposes. These Western scientific voyages began with the R/V *Albatross* expedition in 1902. The scientific expedition, conducted by the U.S. Fish Commission, visited what were then referred to as the “Leeward Islands,” including what is now known as Nihoa, Laysan and Midway. The expedition purpose was mainly to collect samples from the deeper waters around the Hawaiian Islands, and to document newly discovered species of deep-water fishes and invertebrates. In addition to the marine studies, the crew conducted terrestrial explorations, documenting key species as well as collecting photographs of many now-extinct species such as the flightless Laysan Rail.

Following the *Albatross* expedition, the next notable scientific voyage was the R/V *Tanager* expedition of 1923–1924. While technically the second phase of exploration (the first by post-contact Native Hawaiians), the *Tanager* was perhaps the first voyage driven entirely by scientific inquiry. Archaeologists and biologists documented archaeological sites and conducted numerous types of surveys all the way to the western edge of the NWHI. Perhaps of most importance was the *Tanager’s* documentation of human impact to terrestrial systems. While on Laysan, scientists witnessed the extinction of the endemic Laysan ‘*apapane* (Hawaiian honeycreeper, with crimson body and black wings and tail (*Himatione sanguinea freethi*)) when the three remaining birds died during a storm. They also recorded the vast changes in vegetation and birdlife that had taken place over the previous 20 to 30 years. During this period, mining for guano, the introduction of rabbits, and the harvest of seals and birds took an enormous toll on the island ecosystem. Of the 27 species of plant life that were originally documented before these extraction activities, only four remained in 1923 (Grigg 2006). In addition to documenting ecological change, archaeologists at Nihoa and Mokumanamana discovered extensive artifacts and ruins, some of which are unlike any known from the main Hawaiian Islands.

Shipboard analysis of coral health (Photo: James Watt)

Historical scientific expeditions, such as the Rothschild and Schauinsland expeditions of the late 1890s, the *Albatross* in 1902, and the *Tanager* in 1923 and 1924, briefly explored the islands in the pursuit of scientific knowledge. However, their activities were generally limited to species inventories and the collection of large numbers of specimens. For example, the 1896 Schauinsland expedition collected at least 271 skins of 25 bird species, whereas J. J. Williams’ trip in 1892–1893 yielded “several barrels of stuffed birds.”

From 1963 through 1969, numerous voyages were made to the NWHI as part of the Pacific Ocean Biological Survey Program (POBSP) and the Smithsonian Institution. A number of biologists took part in ten trips to French Frigate Shoals, where numerous specimens were collected and data were gathered. The main goals of this program were to

101

Pristine Papahānaumokuākea reef with numerous *Acropora* coral colonies, a species extremely rare in the main Hawaiian Islands (Photo: James Watt)

learn what plants and animals occurred on the islands, the seasonal variations in abundance and reproductive activities, and the distribution and population of the pelagic birds of that area. During this project, more than 10 million square kilometers of the central Pacific Ocean were surveyed, and numerous publications were released in the Smithsonian's *Atoll Research Bulletin*.

Following the vast POBSP studies of the 1960s, the Tripartite NWHI Fishery Investigation expeditions in the mid 1970s aimed to establish information baselines on the flora and fauna in the area. These expeditions were unique in that three major agencies (National Marine Fisheries Service, U.S. Fish and Wildlife Service, and the Hawai'i Division of Fish and Game) actively collaborated to create an integrated research program in the NWHI. This collaboration provided a unique opportunity to document the relationships between species and assess the effects of commercial fishing and other activities on the region's ecosystems. This endeavor also launched the first intensive marine-based research expedition. Although the Tripartite expeditions laid the groundwork for management plans covering a variety of resources, much of the research of these expeditions was geared toward resource assessment, with a primary focus on commercially important species.

In the late 20th century, scientific research efforts underwent a paradigm shift, becoming more focused on knowledge and conservation of the natural ecosystems. This shift stemmed from the recognition that increased technology and human populations have created significant pressures on ocean ecosystems. In 2000, the State of Hawai'i, U.S. Fish and Wildlife Service, NOAA and several research institutions launched the NWHI Reef Assessment and Monitoring Program (NOWRAMP) to characterize and monitor coral reefs and establish a baseline for comparison and to facilitate monitoring temporal changes in the ecosystem. In addition to this group, NOAA has also initiated a comprehensive mapping effort using satellite imagery, multibeam sonar, and other remote sensing techniques to provide detailed characterizations of benthic habitats.

Several NOAA vessels have been commissioned primarily to support the research and mapping activities in the area that has become known as Papahānaumokuākea, and as a result multiple scientific projects have been initiated in the region. These activities range from basic monitoring of various species and environments to technologically advanced studies incorporating the latest scientific tools such as genetic analyses, satellite tagging, and deep water submersibles. More

recent scientific voyages to Papahānaumokuākea Marine National Monument are far less extractive, and are of extraordinary benefit to the preservation and protection of the area's natural resources. These cruises generally take tiny biopsies of corals, or collect feathers or scat from the beaches, and using modern laboratory techniques, have produced important information on key management issues such as population connectivity. Papahānaumokuākea is one of the world's largest marine protected areas; an enhanced understanding

## Laysan Duck

Papahānaumokuākea Marine National Monument is home to one of the world's rarest ducks, *Anas laysanensis*, commonly known as the Laysan Duck. Having the most restricted range of any duck species worldwide, the remaining Laysan Ducks have been relegated to a single naturally occurring population on one island in the Northwest Hawaiian Islands.

The species was extirpated from most other

islands of the Hawaiian Archipelago after the arrival of the first humans approximately 1,500 years ago. Bones of the Laysan Duck have been found on the islands of Hawai'i, Maui, Moloka'i, O'ahu, Kaua'i and Lisianski. Total estimated population sizes on Laysan Island have ranged from seven to 688 adult birds in the past century, while a recent population estimate cites 459 adults. Viability models for species with small populations and high isolation predict a high risk of extinction due to catastrophic, environmental, genetic, and/or demographic stochasticity. As a result, the Laysan Duck is the subject of intensive active management, research and restoration actions.

The recovery of the Laysan Duck focuses on the following actions: 1) management to reduce risks to the Laysan Island population; 2) protection and enhancement of suitable habitat; and 3) actions to reduce or eliminate threats sufficient to allow successful reestablishment of additional wild populations.

Activities to increase the longevity of this species in recent years have focused on translocations to establish the species on additional islands and atolls within Papahānaumokuākea. Midway Atoll, part of the National Wildlife Refuge System, was chosen as the most promising site for initial translocations. Eighteen months of extensive habitat restoration and modification were required to prepare for the arrival of the ducks. Refuge staff and volunteers excavated nine shallow freshwater seeps, removed non-native plants, planted native vegetation to provide cover, forage and nesting habitat and constructed 16 holding aviaries to provide for a "soft-release" of the translocated ducks.

Within three years, and while overcoming the challenges of working in the most remote island system in the world, these teams have successfully established breeding populations of Laysan Ducks on two different islands of Midway Atoll, and are now at work preparing for the translocation and establishment of a third population on yet another island. The creation of additional breeding populations has greatly reduced the likelihood of extinction of the Laysan Duck, and the team's continuing efforts toward further reintroducing the species, expanding its range and increasing its population size has set the species on the road to recovery.

An endangered Laysan Duck nurtures its newly hatched brood on Midway Atoll National Wildlife Refuge. The Laysan Duck, *Anas laysanensis*, is one of the rarest ducks in the world (Photo: Jimmy Breeden)

of this place through management-driven research continues to benefit the understanding of ecosystem management and interpretation.

Overall, the most recent scientific expeditions to the NWHI are not unlike the voyages undertaken at the turn of the century. As in initial expeditions, the primary focus of research in recent and forthcoming expeditions is of comprehensive data collection, and with the technology now available, new discoveries. To advance scientific understanding of the region, Papahānaumokuākea is working toward synthesis of all the various data and modeling programs to allow an in-depth understanding of the area and the processes on which the health of the region depends. With the wealth of new information being collected each year, this information can be utilized to combine and synthesize the vast ranges of information from various agencies and institutions, and from them, develop a new management paradigm.

#### *Management in the Modern Era*

104

Due to its remote location, the property has suffered relatively few major human perturbations. During the 19th and 20th centuries, the NWHI faced many extractive uses as Honolulu became an important port in the Pacific, and provided a convenient jumping-off point. Extractive activities included whaling, hunting of monk seals and birds, and fishing for shark, turtle, sea cucumbers, and pearl oysters. Terrestrially, several of the islands were leased for guano extraction, and feathers and albatross eggs were collected. The most significant activities of this nature occurred on Laysan and Lisianski Islands and Midway Atoll. All of these activities ceased by the early 20th century, when American President Theodore Roosevelt acknowledged the need to protect the region's birds, setting aside the islets and reefs of the Northwestern Hawaiian Islands (except Midway Atoll) as the Hawaiian Islands Reservation. Since then, numerous efforts have been made to eradicate alien species, and to protect, preserve, maintain and, where appropriate, restore natural communities,

including habitats, populations, native species, and ecological processes as a public trust for current and future generations.

The lands and the waters of Papahānaumokuākea have always been remote, and therefore not heavily accessed. Thus, use of the natural resources of the property was historically minimal and sporadic. In recent years, human access to the property has been primarily limited to commercial fishing, conservation and management, and research activities. At times, longline, crustacean and bottomfish fisheries have operated in Papahānaumokuākea. However, even before the designation of the National Monument, only the bottomfish fishery continued to operate under a limited-entry system. This fishery continues to operate in Papahānaumokuākea, limited to no more than eight permitted vessels that are capped in terms of catch. All commercial fishing will cease in 2011, as per terms of Presidential Proclamation 8031.

Current management strategies result in careful scrutiny of activities within the property, with particular attention to cumulative impacts. This oversight ensures that any potential negative human impact to the natural resources of Papahānaumokuākea will be negligible.

Management and conservation activities that take place within Papahānaumokuākea Marine National Monument undergo the same rigorous review and permitting process as scientific activities. Examples of management and conservation activities include the continuation of a decade-long effort to remove marine debris from the coral reefs and beaches of the property, alien plant species removal projects on several islands, and restoration of native plant and animal species.

*Justification for Inscription on the  
 World Heritage List*

## 3. Justification for Inscription on the World Heritage List

Papahānaumokuākea Marine National Monument is nominated as a mixed cultural and natural heritage site with a cultural landscape under criteria (iii), (vi), (viii), (ix) and (x).

### 3.a Criteria Under Which Inscription Is Proposed

**Criterion iii: to bear a unique or at least exceptional testimony to a cultural tradition or to a civilization, which is living or which has disappeared.**

#### *Peopling of Polynesia and the marae-ahu-heiau Ritual System*

All Polynesian cultures have a shared history and descend from an Ancestral Polynesian Culture, which developed in a Western Polynesian homeland sometime in the mid-later first millennium BC (Green 1986; Kirch 1984; Kirch and Green 1987, 2001). As Polynesians voyaged and settled the remote parts of Eastern Polynesia from this Western homeland, isolation led to marked social change, particularly after inter-archipelago long-distance voyaging ceased in the 15th century.

*Pale anemone crab* (Photo: Susan Middleton & David Liittschwager)

The *marae-ahu-heiau* complex found throughout Eastern Polynesia refers to ceremonial sites, often monumental in size, where individuals and communities had structured relationships with the ancestors and gods and where socio-political rites were carried out (Green 1993). There is growing evidence that ritual sites were also used for astronomical reckoning in order to link the lunar calendar with the agricultural calendar and seasonal festivals (Kirch 2004a, 2004b). The *marae-ahu-heiau* ritual architecture found throughout Eastern Polynesia has a court – either a pavement or an enclosure, with representations of the gods (upright stones, sculptures, etc.)

and an *ahu* (altar). That these types of religious sites throughout Eastern Polynesia have a shared morphology and use demonstrates the common ancestry of all Eastern Polynesian religions and religious architecture.

The 45 shrines of Nihoa and Mokumanamana, built sometime between

**“The Last Frontier: The Pacific Islands were the most difficult and therefore the last places on earth to be reached by humans. With that settlement, humankind finally reached the end of the habitable world.”**

– **K. R. Howe**, in *Vaka Moana (“Ocean Sailing Canoes”): Voyages of the Ancestors, the Discovery and Settlement of the Pacific*. *Hawai’i is the most isolated archipelago in the world, and one of the last two, if not the last, Pacific island chains to be reached by humans.*

1000 and 1700 AD consist of well-paved terraces and platforms with single uprights or more commonly, rows of uprights. In the Hawaiian Archipelago, they show rare shared connections to other Eastern Polynesian cultures that use lines of uprights to represent the gods, namely the Society Islands and Tuamotu Islands of Central Eastern Polynesia (Green 1996; Emory 1928). They are the only *heiau* in the Hawaiian Archipelago, apart from a few exceptions found in remote high-altitude zones (Mauna Kea and Haleakalā), that incorporate these elements. The Papahānaumokuākea ceremonial sites demonstrate both the common ancestry for all Eastern Polynesian religions and ritual architecture (Graves and Sweeney 1993), as well as the diversity in religious architecture that developed as socio-political institutions diverged through time and Eastern Polynesian cultures became more isolated and regionally focused after 1450 AD.

Other facets of the material culture in Papahānaumokuākea clearly demonstrate cultural affinities to Central Eastern Polynesia. These include exceptionally detailed stone figures that lack counterparts in stone or wood figures

found in Hawai'i (Cleghorn 1988), but resemble sculpted *ki'i* (god figures) recovered from the Marquesas Islands in Central Eastern Polynesia (Chavaillon and Olivier 2007). The layout of temples at Nihoa and Mokumanamana is hypothesized to relate to the observations of celestial phenomena used to coordinate the lunar and agricultural calendars, similar to ritual sites documented in both Mangareva (Central Eastern Polynesia) (Kirch 2004a; McCoy 2008) and elsewhere in Hawai'i (Kirch 2004a; McCoy 2008). Thus, the archaeological landscapes of Nihoa and Mokumanamana demonstrate ties to earlier ancestral cultures to the West, yet aspects of their form and layout also provide exceptional examples of how the Native Hawaiian culture evolved, adapted and changed in its relative isolation. The Papahānaumokuākea cultural and marine landscape has importance on a world-wide scale as a rare undisturbed example of the long-term history of settlement, evolution and change in the Oceanic Island region.

#### *Intact Cultural-Marine Landscape*

Skill in voyaging enabled not only discovery, but also continued use of remote regions that lacked basic resources for sustenance. Despite a dearth of fresh water, these islands were important residential and ceremonial sites for a resilient pre-contact Hawaiian community. Nihoa and Mokumanamana feature rare, intact archaeological landscapes of residential sites, agricultural terraces, and ceremonial complexes from settlements where Native Hawaiians resided between 1000-1700 AD (Cleghorn 1988). A diverse range of ancient site types are well represented, including habitation terraces and rock shelters, some of substantial size and expert architecture, extensive terraces for dryland agriculture, and a plethora of shrines and *heiau/marae* for ritual activities. Survey and excavation have recovered artifacts suggesting that a range of activities were carried out by pre-contact Native Hawaiians on these islands. These include daily domestic activities (cooking, food preparation and storage, manufacture of stone tools and fishing gear), subsistence activities (fishing and collecting marine resources, cultivating dryland crops), and ritual activities (including burial of the dead). Native Hawaiians

presently use the area as a navigational testing ground and to perform varied rituals in the ceremonial landscape.

The lack of intensive use or development in Papahānaumokuākea has left these archaeological landscapes in remarkably pristine condition. In pre-contact Hawai'i, settlements extended from the coast to the interior island regions in generally pie-shaped patterns termed *ahupua'a*, which encompassed resources of both the land and the ocean (Kirch 1985). Most cultural landscapes within the Hawaiian Islands, particularly those situated near the coast, have been detrimentally affected by modern development. Papahānaumokuākea is arguably the only place in the Hawaiian Islands with a fully intact pre-contact archaeological landscape where the full suite of site types are preserved, coupled with a near to pristine natural marine environment. As such, it represents an exceptional treasure to the worldwide community and to descendant Native Hawaiians who continue to have a living cultural connection with these land and sea resources.

#### *Mystery Islands and Adaptations to Remote Island Environments*

Papahānaumokuākea is particularly significant in this context because Nihoa and Mokumanamana are both "Mystery Islands" – the once-inhabited but now abandoned outposts at the farthest reaches of Polynesian migration – which have been integral in describing how Polynesia

*Residential sites on Nihoa (Photo: David Boynton)*

**Papahānaumokuākea “... completes the cycles we have in all of our stories. We always have these cycles in our stories... the sun rising at Kumukahi [Hawai‘i Island] and then setting way over in the West [Papahānaumokuākea].”**

– *Pualani Kanaka‘ole Kanahela* during the re-commencement of the ancient Summer Solstice voyage to Mokumanamana. She says of the significance of cultural practitioners visiting Papahānaumokuākea: “We’re completing the cycle of the sun. And then the new cycles begin.... When we go back to Hawai‘i, we begin the cycle of rebirth all over again.”

was purposefully (rather than accidentally) peopled, as was suggested earlier in the 20th century). Archaeological studies have been highly influential in understanding how sustained inter-archipelago and

The islands and atolls in Papahānaumokuākea represent minute wayfinding targets in the vast Pacific Ocean (Photo: PMNM)

inter-island voyaging were required to sustain human life on Polynesian Mystery Islands (Diamond 2005; Weisler 1994, 1995, 1997, 2002). As Weisler (1996: 627) notes, “so-called Mystery Islands,” with their marginal ecological conditions and isolation taxed the capabilities of Polynesian colonization to the physical and social limits. They document not only how Polynesians settled marginal places with minimal resources but offer an example of a remarkable achievement in the history of human life: how humans adapted to some of the most isolated and extreme living conditions on earth.

In archaeological or anthropological terms, Nihoa and Mokumanamana have a fully “transported” and human modified landscape, with the remains of hundreds of stone

masonry features and earthen and rubble fill terraces. Despite these islands’ remote character and marginal resources (e.g., lack of fresh water, materials for building, food, anchorages) deep-sea sailing canoes and wayfinding expertise transported people and resources from the main Hawaiian Islands to these Mystery Islands. Such efforts are thought to have been expended because of Mokumanamana’s spiritual significance as the boundary between the realm of the living and the realm of the afterlife.

Other Polynesian Mystery Islands have seen archaeological research and have intact prehistoric archaeological remains (Henderson-Pitcairn; the Phoenix-Line Islands, Norfolk Islands, and the Kermadecs). However, among these, those in Papahānaumokuākea stand apart from the rest. They not only have the highest density of ritual and ceremonial sites among the Mystery Islands, but they have unique ritual sites documenting both the evolution of Polynesian societies and their shared past connections to ancestral cultures in the West. They are also, significantly, the only Mystery Islands with a living descendant community that currently uses and has strong ties to the islands’ cultural and natural resources.

**“It is the edge of the Hawaiian universe...”**

– *Halealoha Ayau*, Hawaiian cultural practitioner on why Papahānaumokuākea is a place of such fundamental importance to the Native Hawaiian people and culture.”

**Criterion vi: to be directly or tangibly associated with events or living traditions, with ideas, or with beliefs, with artistic and literary works of outstanding universal significance.**

Native Hawaiian culture continues to evolve in great part through the perpetuation of a rich oral tradition. Genealogies and cultural meanings are still passed down through *oli* (chant) and *mele* (song), as are histories, natural resource management knowledge, philosophies, and medicinal and spiritual knowledge. Papahānaumokuākea is the spiritual, physical, or practical site of a host of traditions that are central to Native Hawaiian culture and understanding.

### The World of Gods and Spirits

Papahānaumokuākea is considered a sacred area, from which Native Hawaiians believe all life springs, and to which spirits return after death. The longest recorded traditional Hawaiian chant, the Kumulipo (source of deep darkness), recounts how all life forms came and evolved out of the primordial darkness, called Pō.

Unlike the Maori *iwi* (tribes) of *Aotearoa* (New Zealand), Native Hawaiian genealogies in their homeland do not begin with the naming of the canoe on which their ancestors arrived, but instead establish a familial

relationship with the creation of the land they inhabit, the Hawaiian Islands. Oral histories of the generations of Hawaiians extend back more than 900 generations, linking all Hawaiians to Wākea (sky father) and Papa (earth mother), to the first living creatures of land and sea, and to the elements themselves (Kame‘eleihiwa 2007).

The Kumulipo tells of the births of the universe’s first life forms, considered to be gods by Native Hawaiians, beginning with the deep darkness of night and the coral polyp, continuing with emergence of the archipelago’s various plants and animals, and ending with the birth of Native Hawaiians.

The Kumulipo describes the Hawaiian universe as being comprised of two worlds: Pō, the deep darkness reserved for gods and spirits, and Ao, the realm of light where the living reside. Native Hawaiians believe that Mokumanamana represents the boundary between these two worlds. In astronomical terms, this boundary crosses the Tropic of Cancer, which runs across Mokumanamana.

Native Hawaiians also believe that when people die, their spirits travel to portals, called *leina* in Hawaiian, located on each main Hawaiian Island. From these portals, spirits embark on a journey out of Ao, and into the west, to Pō. Once again, this spirit realm of Pō is represented by the islands and their surrounding waters located to the northwest of Mokumanamana.

As the boundary between Pō and Ao, Mokumanamana today serves as a critical place for ongoing Native Hawaiian cultural research into the significance of celestial movements, particularly during major solar events such as the summer solstice. Native Hawaiian tradition holds that a person’s shadow is the physical manifestation of their spirit. Therefore, Hawaiian ceremonies are held during periods of the day when the shadow cannot be seen, and power is therefore concentrated in the body: the transitions at dusk and dawn, and at noon. The sun hangs overhead the longest on the summer solstice, June 21, along the Tropic of Cancer, making Mokumanamana a powerful place to hold summer solstice ceremonies.

*Blowing a conch shell and chanting, Hawaiian practitioners greet their ancestors (kūpuna), give thanks, and ask their permission to land on Nihoa and Mokumanamana (Photo: Na‘alehu Anthony)*

In 2007, renowned Native Hawaiian cultural practitioner and researcher Pualani Kanahale and a group of cultural practitioners called *Ha'ae Wale Hānauna Lolo* visited Mokumanamana to study the relationship between the island's *heiau*, or shrines, and the path of the sun during the summer solstice. Native Hawaiian cultural researchers are committed to continuing this research, as well as to conducting other studies, on both Nihoa and Mokumanamana. These research opportunities are important to the maintenance and continued growth of strong bonds between Native Hawaiians and the Northwestern Hawaiian Islands.

In addition, Native Hawaiians rely on access to Nihoa and Mokumanamana to conduct ceremonial rites associated with the deities connected with these places, such as Kāne, the god of life and fresh water, and Kanaloa, the god of the deep ocean.

*One of the The Last-Remaining Places  
of Abundance (ʻĀina Momona)*

The natural integrity of Papahānaumokuākea is exceptional. In a Pacific and Hawaiian

context, this integrity is of paramount cultural importance, particularly in comparison to the largely degraded terrestrial and marine ecosystems in the main Hawaiian Islands. Terrestrial, and particularly marine environments, that remain relatively lightly affected by humans, with high rates of endemism and life that is unique to the Hawaiian Archipelago, are crucial to an indigenous understanding of the important relationships between ocean and land; between living things in a unique, fragile and induplicable ecosystem; and particularly between humankind and the natural world. These understandings, central to the Native Hawaiian world-view, are passed down through oral histories and traditions, but require a living, physical manifestation to have more than abstract or historical meaning. Papahānaumokuākea serves a critical function today for Native Hawaiians who are seeking ways to not only reconnect and expand their cultural practices, but also ways to improve degraded natural environments in the main Hawaiian Islands, to which their cultural practices are intrinsically linked.

*A Green Turtle or honu glides above Acropora (Table Coral)*  
(Photo: James Watt)

Papahānaumokuākea provides Native Hawaiians and the broader public a region to observe and learn from that is nearly pristine and unspoiled. This example can teach valuable lessons in conservation that can be applied to the archipelago's main islands (see Section 2.a) and beyond, to other places that seek to integrate indigenous knowledge of sustainable management practices with current Western paradigms of conservation. In particular, islands such as Nihoa and Mokumanamana offer examples of how the ancestors of Native Hawaiians implemented their traditional knowledge to sustain their presence on remote islands with fragile environments.

In this living classroom, Hawaiian practitioners are learning by comparison about how their environments in the main Hawaiian Islands have been altered. For example, on the July 2008 Educators of Oceania research cruise to Papahānaumokuākea, Hawaiian practitioners conducted surveys of reef habitat to help determine traditional Hawaiian indicators of change to

the main Hawaiian Islands' reefs. Papahānaumokuākea also provides the potential to be an inspirational example of how to integrate indigenous and Western management practices, providing a model for other culturally and ecologically invaluable properties (see Section 5).

### *Hawaiian Voyaging and Wayfinding (Non-Instrument Navigation)*

Today, Papahānaumokuākea serves a critical role in two significant, living, Native Hawaiian traditions: voyaging and wayfinding. The voyaging route between Kaua'i and Nihoa is used today, as it has been for generations, as a major training and testing ground for novice navigators studying modern Hawaiian wayfinding aboard traditional, double-hulled Hawaiian voyaging canoes.

This route is the only one from the main Hawaiian Islands where neither the launching point nor the target destination is visible for an extended period during the course of the voyage, thereby offering a close simulation of a long-distance voyage without the added

*One of Hawai'i's last-remaining places of abundance: intact coral reef ecosystems, plentiful wildlife, and viewsapes unchanged for centuries (Photos: James Watt)*

*Just as in ancient times, Papahānaumokuākea is the proving ground today for apprentice Hawaiian wayfinders (non-instrument navigators)* (Photo: PVS)

dangers of testing endurance. It is also the only voyaging route that offers this simulation while being close enough to the main Hawaiian Islands to ensure safety and access to provisions. These characteristics make this route “the ideal training platform” for novice Hawaiian wayfinders, according to Nainoa Thompson, Master Hawaiian Navigator. Today, novice Hawaiian wayfinders are considered ready to attempt navigation of a long-distance voyage after they have successfully guided a voyage from Kauaʻi to Nihoa, with a possible additional leg to Mokumanamana. The roundtrip from Kauaʻi to Mokumanamana can be completed within four days, compared to a 30-day, one-way voyage from Hawaiʻi to Tahiti (Kālepa Babayan 18 June 2008, personal communication; Dennis Chun 19 June 2008, personal communication; and Nainoa Thompson 4 October 2008, personal communication).

The connection between Native Hawaiian voyaging and Papahānaumokuākea is not limited to the training of navigators. Traditional, double-hulled Hawaiian voyaging canoes have traveled throughout Papahānaumokuākea in recent years. In 2004, *Hōkūleʻa* sailed from Kauaʻi all the way to Kure Atoll and back as part of the educational “Navigating Change” voyage (see Section 2.b). Moreover, the five existing and two under-construction Hawaiian voyaging canoes will continue to serve as the traditional vessels to deliver cultural practitioners to Nihoa and Mokumanamana

for religious ceremonies. The use of traditional canoes offers an opportunity to maintain a level of cultural integrity that is appropriate for these ceremonies. In two separate voyages in 2003 and 2005, the voyaging canoes *Hōkūleʻa* and *Hōkūalakaʻi* brought the cultural protocol group *Nā Kupuʻeu Paemoku* to Nihoa and Mokumanamana for ceremonial purposes.

**Criterion viii: to be outstanding examples representing major stages of earth’s history, including the record of life, significant on-going geological processes in the development of landforms, or significant geomorphic or physiographic features**

The 1,931 kilometer long string of islands, atolls, and banks in Papahānaumokuākea Marine National Monument form a major portion of the Hawaiian-Emperor Archipelago, the world’s longest and oldest volcanic chain (Grigg 1997), and an unparalleled example of sequential volcanic hotspot island formation and evolution. Each of the islands in the Hawaiian-Emperor Archipelago began as a submarine volcano on the ocean floor. This volcanic “hot spot,” currently located near the island of Hawaiʻi, the southernmost Hawaiian Island, has been active for at least 80 million years. Gradual tectonic movement of the Pacific plate to the northwest carries each emerging island slowly away from the hotspot, creating a chain of volcanic islands.

113

*Remote and low-lying Nihoa and Mokumanamana help wayfinders simulate trans-Pacific voyaging - while within safe reach of port* (Photo: Naʻalehu Anthony)

Papahānaumokuākea’s islands, atolls and associated submerged banks comprise a classic geomorphologic sequence illustrating what can happen in an island’s middle and late age—with eroded high islands, near-atolls with volcanic pinnacles jutting from surrounding lagoons, true ring-shaped atolls with circular rims and central lagoons, secondarily raised atolls, and submerged banks, rich with marine life, where islands once stood.

Coral reef and then atoll formation proceed in parallel with an island’s formation and senescence. When a submarine volcano rising from a seafloor hotspot reaches the level of the photic zone, where sunlight is present, coral reefs begin to form. As the islands are transported by plate motion to the north and northwest, these reefs continue to grow around the island margin, and the islands themselves are moved off the hotspot and begin to erode and subside. Eventually the volcanic core disappears altogether, and the classic ring-shaped atoll is left behind.

Papahānaumokuākea encompasses the northernmost three-quarters of the Hawaiian Archipelago. The oldest of these, Kure, is estimated to be ~27 million years old, whereas Nihoa, the youngest within Papahānaumokuākea, is estimated to be 7.2 million years old, and is the closest to the active volcanic hotspot at Kīlauea in the main Hawaiian Islands,

Model of Hawaiian atoll formation  
(Patti Gallagher-Jones/FWS)

(Rubin 2001). Nowhere else in the world is this progression illustrated in such an unambiguous and linear fashion (Figure 3.1).

As one moves up the Northwestern Hawaiian chain from southeast to northwest, the islands clearly and dramatically illustrate the stages in the volcanic island growth cycle, containing all stages of island/atoll/seamount progression. At Papahānaumokuākea’s relatively younger southwestern end, Nihoa and Mokumanamana are volcanic in nature, the eroded peaks of much larger islands that are mostly subsided and now form the basis for large banks that ring the emergent land. Moving northwest, French Frigate Shoals represents a site where only La Pérouse Pinnacle, a steep-sided basalt sea stack, still exists above sea level in the middle of the original volcano that forms the foundation for the surrounding atoll. Gardner Pinnacles are steep basalt sea stacks surrounded by an extensive bank, where coral growth did not keep pace with the island’s subsidence. Moving further northwest, one encounters islands that are true atolls, rings of coral reef that outline what were once large land masses, long since eroded. Drilling projects on Midway in the late 1960s confirmed that these islands were built above the sea by lava flows that were subsequently weathered and partially truncated

Figure 3.1: Age of volcanoes within the Hawaiian Archipelago  
(Data: Clague and Dalrymple (1987))

in pre-Miocene time, submerged and covered by successive layers of limestone left behind from coral growth (Ladd et al. 1976).

Papahānaumokuākea includes a unique example of an atoll at the critical “Darwin Point,” the northernmost threshold for coral reef existence (Grigg 1982). Kure Atoll is the northernmost coral reef in the world and has reached the latitude at which coral growth rates, which decrease in cooler temperatures, are matched by the rate of subsidence of the island. North of the Darwin Point, reefs can no longer grow fast enough to counteract subsidence, and along with the underlying platforms become seamounts and guyots that eventually disappear into

Model of volcanic island growth progression, from island to atoll to seamount (Richard Grigg)

the ocean depths at the northern end of the Hawaiian-Emperor chain (Grigg 1997). Papahānaumokuākea includes 30 submerged banks and guyots, and many of these may already be too deep to re-emerge at sea level through coral growth.

These once-lofty islands have been transported northwest by the movements of the Pacific Plate to their current locations. Due to the pervasive and unrelenting forces of subsidence and erosion, all that remains today are small patches of ancient land, shoals and reefs that lie where significant mountains once loomed. Nowhere else in the world is this progression illustrated in such an unambiguous and linear fashion.

116

**Criterion ix: to be outstanding examples representing significant on-going ecological and biological processes in the evolution and development of terrestrial, fresh water, coastal and marine ecosystems and communities of plants and animals**

Landscapes and seascapes that have evolved and continue to progress largely without man's interference are increasingly rare. Due to the remote and nearly undisturbed nature of the ecosystem at Papahānaumokuākea, ecological and biological processes are continuing much as they have since these lands first rose from the seafloor and then moved with the Pacific plate to the North.

At 1,400 hectares, the total land area of Papahānaumokuākea is extremely small, but is crucially important for the survival of both marine and terrestrial species, many that spend part or most of the year at sea and come ashore to breed or nest; these include turtles, monk seals, and seabirds.

The interdependence among these species is exemplified by such interactions as large schools of pelagic tuna driving the smaller bait fish to the surface, where they are preyed upon by thousands of seabirds who rely on these apex predators for a key food source.

#### *Marine Endemism*

Of the ~7,000 marine species found in Papahānaumokuākea Marine National Monument, over one quarter are found nowhere else on the planet. This high degree of endemism represents the highest reef fish endemism rates in the Pacific (20%–63% by area). It is also a spectacular example of evolution in isolation, which results in speciation and a high degree of endemism. The rate of endemism within coral reef fishes increases as one moves northwest up the island chain, with endemics in the far northwest comprising over 50% of the population in terms of numerical abundance. For example, at Nihoa, just 20% of numerical abundance of the 127 fish species are endemic, whereas

at the northern three atolls of Pearl and Hermes, Midway and Kure, the rates of abundance of endemism among fish species are as high as 62%, 54%, and 56%, respectively (DeMartini and Friedlander 2004) (Figure 3.2).

Oceanic islands are unique, and on each island, evolution frequently follows a different course, often with remarkable results. In some cases, there is as much diversity between islands in the property as there is among the islands as a whole; some genera of corals only occur in a few of the atolls and nowhere else in Hawai'i.

Over the course of the past five years, field expeditions to Papahānaumokuākea have collected numerous samples of marine plants and animals that were not previously described, or are new records for a site. On an expedition of discovery and baseline data collection in 2000, more than seven new and different species of sponges were discovered at Pearl and Hermes Atoll (Maragos and Gulko 2002). In 2006, during the Census of Marine Life (CoML) expedition, more than one hundred new cryptic species were collected. Recent surveys of corals, including those conducted during the census at French Frigate Shoals, reveal that as many as 40% of the coral species are endemic, with most still yet to be described.

Apex predators abound within Papahānaumokuākea's waters  
(Photo: James Watt)

### Top Predator Dominated Ecosystem

Papahānaumokuākea's coral reef ecosystem represents one of the world's last remaining top predator dominated systems, a rare and intact community structure characteristic of coral reefs prior to human exploitation. The coral reef ecosystem is diverse and healthy, and supports an abundance of wide-ranging top predators such as sharks and jacks. These apex predators represent 54% of the biomass in Papahānaumokuākea, compared with 3% of the biomass in the main Hawaiian Islands—the latter number being consistent with human-populated regions worldwide (Figure 3.3).

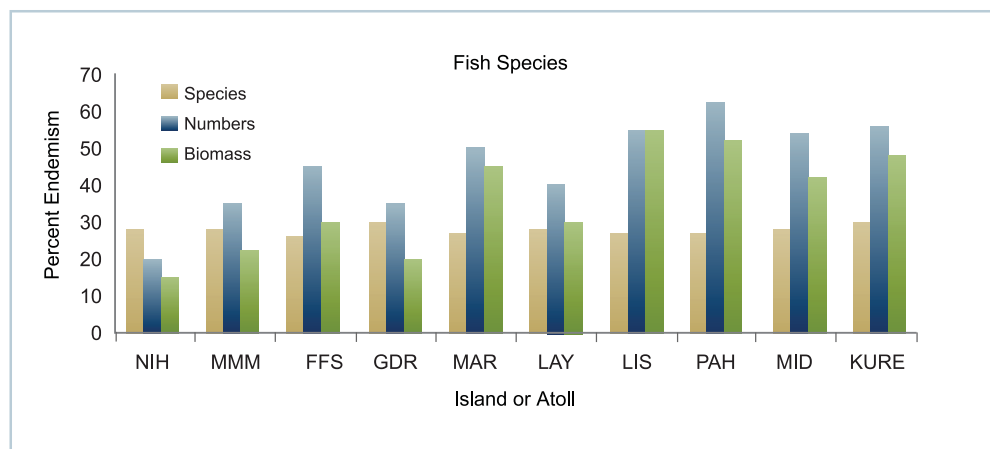

Figure 3.2: Various measures of percent endemism (based on species occurrence, and on numerical and biomass densities) at each of 10 Papahānaumokuākea islands and atolls, illustrating patterns of endemism with latitude (from DeMartini and Friedlander 2004)

Figure 3.3: Comparative biomass of large predators, lower carnivores, and herbivores among coral reef ecosystems of the world

### Terrestrial Endemism

The terrestrial area of Papahānaumokuākea is comparatively small, but it is a critically important component of the ecosystem. More than 14 million seabirds nest, rest and breed on the tiny islets in the chain, including 99% of the world's Laysan Albatrosses (listed as vulnerable by IUCN) and 98% of the world's Black-footed Albatrosses (listed as endangered by IUCN).

The extinct Laysan Honeycreeper, and the extant Nihoa Finch and Laysan Finch, are all members of the family Drepanididae, the Hawaiian honeycreepers, a family

that underwent one of the world's most spectacular avian radiations from a single ancestral species. This remarkable proliferation of species from a single ancestral type is often compared to the evolutionary radiation of Darwin's finches on the Galapagos Islands.

Representatives in many other taxa of plants and animals that have undergone similar radiations also occur in Papahānaumokuākea. The endangered fan palm, *Pritchardia remota*, found only on Nihoa, is most closely related to three endangered *Pritchardia* species found in remote areas of the main Hawaiian Islands. The entomofauna of Papahānaumokuākea also includes some groups of insects that demonstrate dramatic adaptive radiations. One such group is the seed bugs, specifically the genus *Nysius*, which shows the complete range of feeding types: from host-specific plant feeders, to diverse plant hosts, to omnivorous feeding, and finally to predator/scavengers. It is a rare occurrence to find herbivorous and carnivorous seed bugs within the same genus. Nowhere else in the world is there a lineage like the Hawaiian *Nysius*, which exemplifies evolution of carnivory in Heteroptera.

118

(Photo: Dave Boynton)

**Criterion x: contain the most important and significant natural habitats for in-situ conservation of biological diversity, including those containing threatened species of outstanding universal value from the point of view of science or conservation.**

The terrestrial and marine habitats of Papahānaumokuākea are crucial for the survival of many threatened species, several of which are found on only one island, or have limited ranges. Some of these species are of particular conservation concern because of their limited ranges. IUCN recently named the unprotected Emperor Seamounts, the northernmost part of the Hawaiian-Emperor Archipelago, as first on its list of “High Seas Gems”—“areas of concentrated abundance or diversity, rarity, naturalness, or vulnerability.” Papahānaumokuākea, the protected neighboring section of this archipelago, shares these qualities.

#### *Largest Tropical Seabird Rookery in the World*

Papahānaumokuākea is home to more than 14 million birds living seasonally in what is collectively the largest tropical seabird rookery in the world. Twenty-one species of tropical and subtropical seabirds breed in Papahānaumokuākea. Virtually all of the world’s entire populations of Laysan Albatross and Black-footed Albatross live there (see Table 3.1), as well as populations of global significance of Red-tailed Tropicbirds, Bonin Petrels, Tristram’s Storm-Petrels, and White Terns.

#### *Refuge for Rare Species*

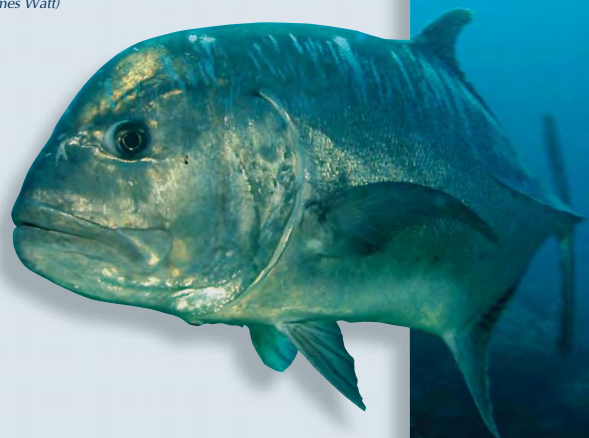

Many species of plants and animals still exist in Papahānaumokuākea that once occurred in the main Hawaiian Islands (as evidenced by their presence in the fossil record), but could not survive after the arrival of humans and their commensal mammals. In all, there are 23 species found in the property that are listed under the U.S.

Most reef systems around the world have seen a dramatic reduction of large predatory fish, and this is disturbing, since healthy populations of predator species are a good indicator of an ecosystem’s overall health. When predator populations are greatly reduced by fishing and other human activities, the normal structure of the reef community is disrupted.

More than half the weight (biomass) of all fish on NWHI coral reefs consists of large top-level predators like sharks and jacks. In contrast, only 3 percent of the fish biomass on main Hawaiian Islands reefs is composed of these predatory fish, several of which are highly prized food and game fishes. It is likely that this difference results from human impacts such as fishing and habitat loss from shoreline development. These activities, largely absent in the NWHI, make it one of the last places on Earth where scientists can study the ecology of a coral reef ecosystem without large-scale human disturbance. Such studies provide new insights into how Hawaiian coral reef ecosystems function, and the impacts of removing large predators.

*Galapagos sharks (Carcharhinus galapagensis) (top) and Giant Trevally (Caranx ignobilis) (bottom) are a few of the abundant top level predators in Papahānaumokuākea waters*  
(Photos: James Watt)

Critical seabird refuge and rookery (Photo: FWS)

Endangered Species Act, and there are undoubtedly many more that might be eligible for listing, especially in the case of terrestrial arthropods (Evenhuis and Eldridge 2004). Additionally, Papahānaumokuākea is home to 22 IUCN Red-Listed species. Furthermore, Papahānaumokuākea contains countless endemics, often species that have ranges limited to a single island. Four endangered endemic land birds are found in the property, and nowhere else in the world. The critically endangered Laysan Duck was once more widespread around the Hawaiian Archipelago but now occurs in only two places: 1) a small, relict population on Laysan Island where it breeds and forages around Laysan’s unusual hypersaline lake; and 2) in a recently translocated population at Midway Atoll.

120

*Habitat for Numerous Species of Global Significance*

Papahānaumokuākea is the most important habitat for in-situ conservation of a number of endangered species (Table 3.1).

Table 3.1: IUCN Red-Listed species found within Papahānamokuākea

Species	IUCN Red List Status
Hawaiian Monk Seal	Critically Endangered
Laysan Albatross	Vulnerable
Black-footed Albatross	Endangered
Nihoa Finch	Critically Endangered
Nihoa Millerbird	Critically Endangered
Laysan Finch	Vulnerable
Laysan Duck	Critically Endangered
Green Turtle	Endangered
Hawksbill Turtle	Critically Endangered
Olive Ridley Turtle	Vulnerable
Leatherback Turtle	Critically Endangered
Loggerhead Turtle	Endangered
Nihoa Banza Conehead Katydid	Vulnerable
<i>Pritchardia remota</i>	Endangered
<i>Amaranthus brownii</i>	Critically Endangered
Giant Grouper	Vulnerable
Blue Whale	Endangered
Fin Whale	Endangered
Humpback Whale	Least Concern
North Pacific Right Whale	Endangered
Sei Whale	Endangered
Sperm Whale	Vulnerable

### Marine

Hawaiian Monk Seals are found only in Hawai'i, with the main breeding subpopulations located throughout the NWHI and a small but growing population in the main Hawaiian Islands. This population represents one of only two monk seal populations remaining anywhere, as the monk seals of the Caribbean are extinct and the populations of the Mediterranean monk seals are perilously low, at below 350 individuals. In 1988, the National Marine Fisheries Service designated critical habitat for the Hawaiian Monk Seal from shore to 20 fathoms around every island, atoll, and bank of Papahānaumokuākea, except Sand Island at Midway Atoll. This habitat includes "all beach areas, sand spits and islets, inner reef waters, and ocean waters" (50 CFR Part 226).

The property also provides nearly the entire nesting habitat for the threatened Hawaiian Green Turtle. On the undisturbed beaches of these remote atolls, both male and female turtles come ashore to bask on the beach in broad daylight, a behavior no longer seen in most

other parts of the world. The critically endangered Hawksbill and Leatherback turtles, and the endangered Olive Ridley and Loggerhead turtles, are also found in Papahānaumokuākea. In addition, the waters of Papahānaumokuākea are home to more than 20 cetacean species, six of them federally and/or internationally recognized as endangered. Recent research by Johnston et al. (2007) indicates that Papahānaumokuākea contains two-thirds of the humpback whale wintering habitat in the Hawaiian Archipelago. This study documented for the first time breeding and calving activity of humpback whales within Papahānaumokuākea.

*Critical habitat of the endangered Hawaiian Monk Seal, found only in Hawai'i (Photo: James Watt)*

Altogether, besides the 23 identified endangered species (U.S. ESA) found within the property, there are also hundreds, if not thousands, of endemic species. Papahānaumokuākea is the last or only home for these creatures, and they require continued protection to assure their existence.

**Terrestrial**

The terrestrial area of Papahānaumokuākea is very small compared to its marine area, and only the larger and higher islands are of sufficient size to support significant and diverse plant biota. All islands are dry, with minimal fresh water resources. Remarkably, given these limitations, the terrestrial areas of Papahānaumokuākea also support significant endemism. All the islands and atolls of Papahānaumokuākea except Gardner Pinnacles, Maro Reef and Midway support endemic species that are specific to their respective islands. This includes at least 145 species of endemic arthropods, six species of endangered endemic plants (including an endemic palm), and four species of endemic birds, including remarkably isolated species such as the Nihoa Finch, Nihoa Millerbird, Laysan Finch, and the Laysan Duck, one of the

world’s rarest ducks. Three of these species (Nihoa Finch, Nihoa Millerbird, and Laysan Duck) are deemed critically endangered by the IUCN (Table 3.1), and the Laysan Finch is listed as vulnerable. In addition, as mentioned previously, millions of seabirds use the area for breeding and foraging, and as a transit corridor for migrations to the north and south.

At least six species of terrestrial plants found only in the region are listed under the U.S Endangered Species Act, some so rare that because of the difficulty of surveying these remote islands, they have not been documented for many years. The IUCN lists *Cenchrus agrimonioides* var. *laysanensis* from Laysan as extinct, though biologists hold hope that it may still exist. As noted in Table 3.1, *Amaranthus brownii*, endemic to Nihoa, is deemed critically endangered by the IUCN, while *Pritchardia remota* is considered endangered. Although it has yet to be documented thoroughly, the terrestrial invertebrate fauna shows significant patterns of clear precinctive speciation, with endemic species described from Nihoa, Mokumanamana, French Frigate Shoals, Laysan, Lisianski, Pearl and Hermes, and Kure.

The endangered endemic loulu palm, *Prichardia remota*, (inset) is one of six endemic terrestrial plants of the region listed as endangered (inset photo: Alex Wegmann Lower photo: James Watt)

## Seabird Species

The vast majority of breeding seabirds in the Hawaiian Archipelago nest on the low sandy islands and atolls of the NWHI. Due to the remoteness of the area, seabirds are by far the most dominant animals of the emergent lands. Approximately 14 million seabirds comprising over 20 species use the NWHI as their primary nesting site. As a result, the NWHI is considered one of the largest and most important assemblages of tropical seabirds in the world.

When the sheer numbers of seabirds present in the Papahānaumokuākea are compared to the total landmass available, it is apparent how populous these seabirds are, as every acre of emergent land, on average, contains more than 4,015 seabirds (9,922 seabirds per hectare), which equates to approximately 1 seabird per square meter.

The following list represents the diversity of breeding seabird species:

Black-footed Albatross	<i>Phoebastria nigripes</i>
Laysan Albatross	<i>Phoebastria immutabilis</i>
Bonin Petrel	<i>Pterodroma hypoleuca</i>
Bulwer's Petrel	<i>Bulweria bulwerii</i>
Wedge-tailed Shearwater	<i>Puffinus pacificus</i>
Christmas Shearwater	<i>Puffinus nativitatis</i>
Tristram's Storm-Petrel	<i>Oceanodroma tristrami</i>
Red-tailed Tropicbird	<i>Phaethon rubricauda</i>
White-tailed Tropicbird	<i>Phaethon lepturus</i>
Masked Booby	<i>Sula lepturus</i>
Red-footed Booby	<i>Sula sula</i>
Brown Booby	<i>Sula leucogaster</i>
Great Frigatebird	<i>Fregata minor</i>
Little Tern	<i>Sternula albifrons</i>
Gray-backed Tern	<i>Onychoprion lunatus</i>
Sooty Tern	<i>Onychoprion fuscatus</i>
White Tern	<i>Gygis alba</i>
Blue-gray Noddy	<i>Procelsterna cerulean</i>
Brown Noddy	<i>Anous stolidus</i>
Black Noddy	<i>Anous minutes</i>

Greater than 98 percent of the world's Laysan and Black-footed Albatrosses nest in the islands and atolls of the NWHI. Papahānaumokuākea also supports several other colonies of global significance, such as the Bonin Petrel, Christmas Shearwater, Tristram's Storm-Petrel, and the Gray-backed Tern.

Conservation of these seabird species is a high priority for the Monument, as 11 of the 21 species recorded inside Papahānaumokuākea boundaries have been classified as highly imperiled or of high conservation concern at the broad scale of the North American Waterbird Conservation Plan.

### 3.b Statement of Outstanding Universal Value

Covering a vast area in one of the world's most isolated archipelagos, Papahānaumokuākea Marine National Monument encompasses a significant expanse of low-laying islands and atolls, predator dominated coral reef ecosystems, and marine and terrestrial flora and fauna that show significant patterns of enhanced speciation with numerous endemic and endangered species. It is a unique seascape, rich in ecological, geological and cultural heritage.

The islands and atolls of Papahānaumokuākea comprise an important prototype and outstanding example of ongoing geologic processes and the clearest illustration of 'hotspot' island progression in the world. The sheer isolation of these islands and waters

causes Papahānaumokuākea to function as an intact miniature evolutionary universe. It contains innumerable excellent examples of ecological and biological evolutionary processes (such as dramatic examples of adaptive radiation) that continue undisturbed, resulting in very high rates of endemism. The region provides a crucially important habitat for the conservation of many endangered or threatened species of global concern. Papahānaumokuākea is also a sacred cultural landscape, a region of deep cosmological and traditional significance to the living Native Hawaiian culture that contains a host of intact and significant archaeological sites. The entire region provides a largely undisturbed ancestral environment, whose preservation both illuminates and embodies the Hawaiian concept of the literal and spiritual kinship of all things in the natural world, including man, and represents the site where life originates and the place where spirits return after death.

**Criterion iii:** Papahānaumokuākea's remarkable archaeology and significant ritual sites (heiau) bear exceptional testimony to the shared historical origins of all Polynesian societies, and to the growth and expression of a culture that evolved from the last and most difficult wave of cross-Pacific Polynesian migration. As the only Mystery Islands (once-inhabited but now abandoned outposts at

the farthest reaches of Polynesian migration) that continue a cultural association with their indigenous people, the islands of Nihoa and Mokumanamana can reveal much about cultural resilience in a changing environment.

**Criterion vi:** Papahānaumokuākea, as an associative cultural landscape, represents core elements of Native Hawaiian cosmology

124

(Photo: Andy Collins)

and tradition. The islands northwest of the Tropic of Cancer are believed to lie within the region of primordial darkness from which life originates and to which it returns. For a culture that considers nature and civilization to be part of a genealogical whole, Papahānaumokuākea offers a “place of abundance” to reconnect with an ancestral environment, and its seas are also a traditional and contemporary testing ground for the revitalized art of Polynesian wayfinding.

**Criterion viii:** The string of islands in Papahānaumokuākea, 1,931 kilometers long, comprise a classic, important and unparalleled example of later stages of island and atoll evolution. The archipelago has provided some of the most compelling confirmation of current theories of global plate tectonic movements.

**Criterion ix:** Papahānaumokuākea is a spectacular example of evolution in isolation, which results in enhanced speciation and a phenomenally high degree of endemism in both the marine and terrestrial flora and fauna. The coral reef ecosystems of Papahānaumokuākea also represent one of the world’s last apex predator dominated ecosystems, a community structure characteristic of coral reefs prior to significant human exploitation.

**Criterion x:** The region is home to, and a crucial refuge for, many endangered, threatened, and endemic species, including critically endangered marine mammal, bird, and plant species for whom it is the last or only refuge anywhere on earth. Papahānaumokuākea is also the largest tropical seabird rookery in the world.

## Integrity

Papahānaumokuākea is a nearly pristine marine ecosystem, which allows biological and ecological processes and systems to continue undisturbed, to a degree seen in few other places on earth. It includes all key areas and ecosystems that are needed to maintain ecological integrity and the long-term conservation of its unique diversity. Papahānaumokuākea is also a complete and intact cultural and maritime landscape that is in continuous use by its cultural descendants, Native Hawaiians. Its densely scattered, well-preserved and varied archaeological sites have been subject to very few human disturbances.

## Authenticity

The authenticity of Papahānaumokuākea lies in the continuing strong association of the landscape with the cosmology and oral traditions of Native Hawaiians, the embodiment of an ancestrally pristine and spiritually meaningful marine environment, and the perpetuation of customary practices such as wayfinding.

## Requirements for protection and management

Papahānaumokuākea is protected by a significant federal and state legal regime, including an extensive management plan; enforcement, surveillance, and monitoring activities; and severe restrictions on access. Tourism is restricted to limited numbers at only one site, on Midway Atoll. The area is managed to provide opportunity for significant input and advice from key stakeholders and has a long history of public engagement.

(Photo: James Watt)

### 3.c Comparative Analysis

The inscription of Papahānaumokuākea Marine National Monument would contribute to a balanced and representative World Heritage List. While oceans comprise 70% of the earth's surface, the World Heritage List represents relatively few coastal, marine and small island natural sites. The World Heritage Marine Programme identified that out of the 800-plus sites inscribed on the World Heritage List, only about 4% have significant marine components. Significant marine sites with an associative cultural landscape are currently absent from the List. None of the approximately 30 tropical World Heritage sites, and none of the 25 mixed World Heritage sites, represents an associative cultural landscape with marine components, although several sites are currently being proposed.

As recognized by the UNESCO World Heritage Global Strategy (Paragraphs 54-58 of the Operational Guidelines, 2005), natural and mixed sites are priorities for future inscription in the World Heritage List. In addition, in 2007, IUCN identified a gap in the World Heritage List's representation of sites in the Pacific, relating to marine systems, as well as cultural landscapes (IUCN 2007). The recent ICOMOS Thematic Study, "Cultural Landscapes of the Pacific Islands" explores cultural landscapes of the Pacific as rich in associative value and a priority for future site inscription. This study identifies "movement of peoples" and "storied places that explain origin and development" as particularly strong themes in the Pacific region. Papahānaumokuākea is discussed as an example of a site that would meet this description (Smith and Jones 2007). In concert with IUCN and ICOMOS, The World Heritage: Pacific 2009 Programme reflects a concerted effort to encourage and facilitate the inscription of more Pacific sites, stating that despite "extraordinary cultural and biological diversity and richness, the Pacific is the most under-represented sub-region."

#### Natural

#### Global Comparison of World Heritage sites - Biology

The majority of sites with tropical marine components on the World Heritage List are managed for their terrestrial biodiversity, rather than their marine component (Hillary et al. 2003). Of the more than 400 atolls and reef islets in the world, only three have been inscribed as World Heritage sites: East Rennell, Aldabra, and Atol da Roca, which are all raised atolls. World Heritage sites that include marine and/or cultural components (New Caledonia Lagoons, Galapagos, Great Barrier Reef, Cocos Island, the Gulf of California, Hawai'i Volcanoes National Park, Tongariro National Park, Tubbataha Reef in the Philippines) have been successfully established by only a few nations in Oceania, and no World Heritage sites currently include coral reef components of the central deep Pacific.

Lobe coral (*Porites lobata*) at Lisianski Island  
(Photo: James Watt)

The most logical natural comparison in the World Heritage portfolio is the Galapagos Islands, another isolated Pacific archipelago with a marine component. Although the Galapagos Islands are in the Pacific, they do not share Papahānaumokuākea's Polynesian cultural history and association; its variety of natural features and habitats (among them, true atolls, low reef islands, seamounts, and banks), and its superlative illustration of geologic island evolutionary history.

Papahānaumokuākea's expansive and intact top predator dominated ecosystem is one of the last remaining representations of world's oceans and reefs prior to significant human exploitation. Several World Heritage marine sites (Cocos Island, Galapagos, the Great Barrier Reef, Lagoons of New Caledonia, Malapelo, and Tubbataha) also have remnant apex predator components, but in these areas, the top predators are mostly sharks (rather than the diversity found at Papahānaumokuākea). Furthermore, their marine ecosystems are not exclusively top predator dominated (Figure 3.3). At Papahānaumokuākea, apex predators such as jacks, groupers and sharks remain more than half the biomass, in contrast to the 3% top-predator biomass in the main Hawaiian Islands and human-populated regions worldwide. Large predatory fish (giant trevally and grouper), which are heavily over-harvested worldwide, are still abundant and dominant in Papahānaumokuākea's nearly pristine marine ecosystem.

#### **Comparative richness and endemism - marine**

The Indo-Pacific region contains the world's richest assemblage of reef fishes and marine invertebrates. Most of this biota, however, is inadequately sampled and most have yet to be taxonomically characterized. In regard to making comparisons of marine biota among

*Big-scale Soldierfish abundant in Papahānaumokuākea*  
(Photo: James Watt)

various sites in the Indo-Pacific region, reliable data is available primarily for reef fishes, shallow water corals (occurring at depths of less than 30 meters), and marine mollusks. These groups have been relatively well sampled across the region, leading to confidence that the comparative data derived from them is accurate. They are also used by major conservation organizations such as Conservation International as focal groups for rapid assessment surveys and conservation prioritization.

**Reef Fish:** Papahānaumokuākea leads the list of the top 10 "hotspots" for reef fish endemism within the Pacific and Indian Oceans (Allen 2007). Although many World Heritage marine sites exhibit fairly high levels of endemism (Coiba National Park, East Rennell, Galapagos, Lagoons of New Caledonia, and Malapelo are all good examples), within these sites, the vast majority of species are widespread throughout the region due to their planktonic mode of larval dispersal. Only in a few peripheral and isolated areas of the Indo-Pacific, such as the Red Sea, the Marquesas Islands, and the Hawaiian Islands, are significant concentrations of locally endemic species encountered.

These peripheral areas of highly concentrated endemism are in turn priority candidates for the highest level of biodiversity conservation efforts due to the globally unique composition of their marine biota. In comparison to other protected sites in more equatorial settings, or in closer proximity to large islands or continental coastlines, the overall species richness of Papahānaumokuākea may not seem exceptional. At present, 250 species of reef fishes are recorded from Papahānaumokuākea, compared to 88 at Rapanui, 310 in the Cocos Islands, 449 in the Galapagos Islands, 463 in northwest Madagascar, 518 in the Phoenix Islands, 852 in Samoa, and 1,500 on the Great Barrier Reef of Australia (Randall et al. 1977; Allen 2003; Allen 2007). However, when compared to these other sites, the rate of species endemism in Papahānaumokuākea is much higher at 23%, compared to 6% in the Cocos Islands, 19% at Easter Island, 12% in the Galapagos Islands, and 1% in both the Phoenix Islands and on the Great Barrier Reef of Australia (Allen 2007) (Figures 3.4 and 3.5).

Figure 3.5: Comparison of World Heritage Site reef fish endemism rates (Source: PMNM)

described earlier in this section, endemism rates vary on individual island and reef scale, with a general trend for a higher rate of endemism toward the northwest, farther from human population centers.)

These high rates of endemism at both archipelago and individual atoll level serve to emphasize the unique composition of the Papahānaumokuākea reef fish biota (Figure 3.5).

**Coral:** In regard to scleractinian coral species richness, Papahānaumokuākea supports 57 documented species in shallow waters less than 30 meters deep (Maragos, 1995), compared to 23 species at Coiba Island in Coiba National Park, a World Heritage site off western Panama, 127 species in the Society Islands, 130 species in the Phoenix Islands, 230 species in Fiji, 320 species in New Caledonia, 323 species in northwest Madagascar, and 400 species on the Great Barrier Reef of Australia, all of which are more equatorial in location (Bennett 1971; Chevalier 1973; Maté 2003; Turak 2005). However, as with reef fishes, the lower richness total is offset by a very high rate of local endemism (Figure 3.6). Recent surveys of corals reveal that that as many as 40% of the coral species are endemic, with most still yet to be described (Maragos 2008).

128

Papahānaumokuākea’s endemic fishes comprise more than 50% of Papahānaumokuākea’s population in terms of numerical abundance, and represent 23% of the number of species (Figure 3.5). (As

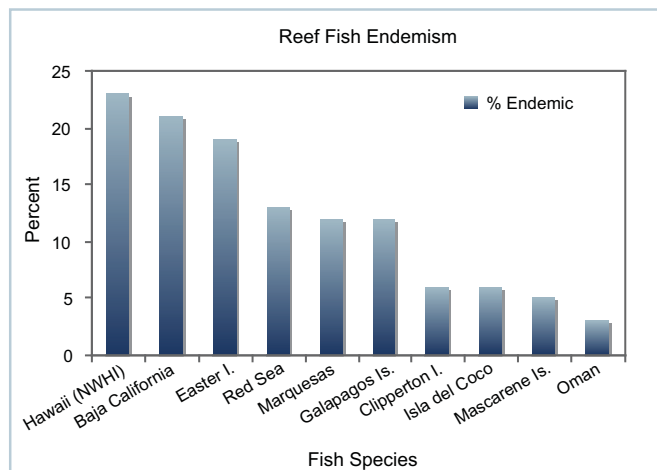

Figure 3.4: Top 10 coral reef hotspots, based on percentage of endemic reef fishes of the total fish fauna (Source: PMNM)

**Algae:** The reefs of Papahānaumokuākea are also notable in that much of their structure is composed of crustose coralline algae rather than hermatypic corals. Species inventories of such coralline algae are in an incipient phase, but promise to reveal high species richness totals and similarly high rates of local endemism. (For example, the Great Barrier Reef of Australia supports 500 species of marine algae in addition to its 400 species of corals, and the same ratio in New Caledonia is 320 coral species to 336 algal species (Garrigue and Tsuda 1988).) Such algae-to-coral species ratios are likely to be even higher in an archipelago such as the NWHI that lies near the Darwin Point. Therefore, in evaluating the overall richness of the coral reef composition in Papahānaumokuākea, this unique mix of structural components must also be taken into account and further highlights the globally unique natural environment of the area.

**Invertebrates:** Among shallow-water marine invertebrates, 838 species representing 12 orders are currently documented from Papahānaumokuākea; however, endemism rates within most of this assemblage have not yet been established. Comparative species richness data for such marine invertebrates on a Pacific-wide basis is far less comprehensive than that for reef fishes or corals, and assessments of endemism nearly absent. As such, only limited comparisons can be made with other areas, and are, to some extent, misleading since the available data comes from larger, older islands in closer proximity to continental source areas. In regard to marine mollusks, Papahānaumokuākea supports 378 species, compared to 453 at Coibá, 525 in northwestern Madagascar, 643 in eastern New Guinea, 802 in New Caledonia and 4,000 on the Great Barrier Reef of Australia (Bennett 1971; Perez and Vasquez 2000;

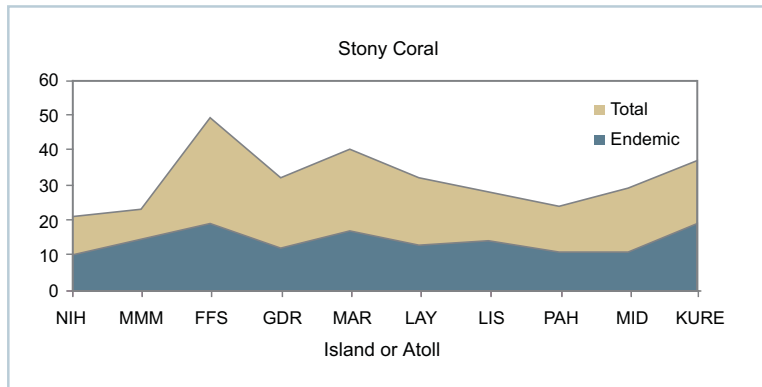

Figure 3.6: Total and endemic species of stony coral in Papahānaumokuākea by location (Source: PMNM)

Laboute and Richer de Forges 2004; Wells 2005). Asterioids in Papahānaumokuākea total 11 species, compared to 54 in New Caledonia; for echinoderms, the comparative totals are 26 species in Papahānaumokuākea and 43 in New Caledonia; for ophiuroids, the comparative totals are 21 in Papahānaumokuākea versus 57 in New Caledonia; and for holothuroideans, the totals are 17 Papahānaumokuākea species versus 55 New Caledonian species (Laboute and Richer de Forges 2004). As with reef fishes and scleractinian corals discussed previously, the overall richness numbers must be balanced with the realization that a high proportion of the Papahānaumokuākea taxa, having evolved in relative isolation, are locally endemic and the ecosystem is therefore unique. In marine mollusks, this endemism rate is 20% for the overall fauna; certain groups such as the Turrinae (turrid shells) have endemism rates approaching 60% (Kay 1979).

Of shallow water marine invertebrates, 838 species representing 12 orders are documented in Papahānaumokuākea (Photo: James Watt)

*A hotspot of marine endemism*  
(Photo: James Watt)

### Comparative richness and endemism - terrestrial

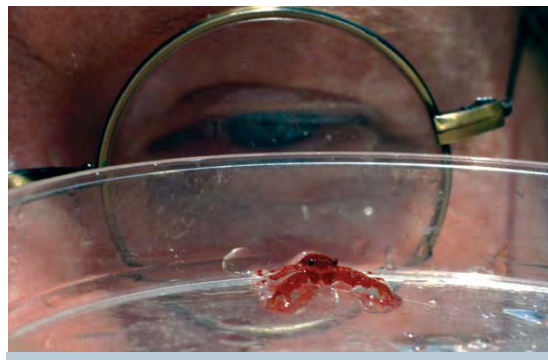

Endemism rates for terrestrial fauna in the islands of Papahānaumokuākea are also high, with numerous single-island endemics. These include four species of land birds, four endemic plant species, at least 35 endemic species of insects, spiders and mites, and six species of endemic land snails. This concentration of terrestrial endemism is exceptional in the context of the insular Pacific as a whole, east of the Tonga Trench, where most isolated atoll chains support a relatively limited biota composed of widespread, dispersive generalists. For example, across the 153 atolls comprising the Marshall, Gilbert, Line, Phoenix, and Tuamotu archipelagos of the central Pacific, there are only four endemic bird species (BirdLife International 1988). Therefore, on an endemic-species-per-island basis, the rate of bird endemism in Papahānaumokuākea is 20 times higher than in the vast archipelagos that lie to the south and southwest.

Papahānaumokuākea is home to one of the largest and most important assemblages of tropical seabirds in the world, with more than fourteen million birds representing 21 species. More than 95% of the world's populations of Laysan and Black-footed Albatross nest here, and Bonin Petrel, Tristram's Storm-Petrel, Red-tailed

Tropicbird, and White Tern have all settled Papahānaumokuākea in colonies of global significance. In fact, BirdLife International has indicated that a total 17 seabird species trigger global International Bird Areas criteria in the Northwestern Hawaiian Islands (i.e., 17 species are present in globally significant numbers). These include: Gray-backed Tern; Sooty Tern; Brown, Black and Blue-gray Noddies; White Tern; Red-tailed Tropicbird; Masked Booby; Red-footed Booby; Great Frigatebird; Bonin Petrel; Bulwer's Petrel; Wedge-tailed Shearwater; Christmas Shearwater; Black-footed Albatross; Laysan Albatross; and Tristram's Storm-Petrel (Ben Lascelles, Marine IBA Officer, BirdLife International, 2008).

In total numbers and biodiversity of tropical seabirds, this is greater than the community of marine birds in the Phoenix Islands Protected Area that is also being proposed for nomination. There are also similarities to other, more high-latitude, sites already holding World Heritage status. The presence of one of the world's largest albatross breeding colonies of any species (Laysan Albatross, Midway Atoll) invites comparison with World Heritage sites such as Heard Island, Macquarie Island, Gough Island, and the New Zealand Subantarctic Islands, all of which are important colonies for several species of Southern hemisphere albatrosses.

Other similarities between these World Heritage sites in the subantarctic are the presence of intact seabird communities representing species exhibiting the range of foraging and nesting behaviors appropriate

*Many new species still to be discovered*  
(Photo: James Watt)

Red-footed Booby in the sunset of French Frigate Shoals (Photo: James Watt)

for the ecosystem. The subantarctic seabird communities are characterized by higher species diversity than found anywhere in the tropics, which may reflect the very different ecological situation there of higher primary productivity and more habitat options allowing for benthic and littoral foraging guilds not observed in typical tropical seabird communities. That complete seabird communities persist at all the sites described above demonstrates another common element between these sites: the absence or relatively recent human introduction of terrestrial mammals such as rats. Henderson Island (23°S latitude in the Pacific) is a World Heritage site of enormous importance to four beleaguered species of gadfly petrels (Genus *Pterodroma*) that have been extirpated by rats from most of the other islands in the world on which they nest. In the north, Papahānaumokuākea provides some of the last safe havens for another gadfly petrel species, the Bonin Petrel, as well as other small petrels that cannot coexist with introduced mammals.

Papahānaumokuākea provides the vast majority of breeding, nesting and foraging habitat for the endemic Hawaiian monk seal (*Monachus schauinslandi*), one of the last two remaining species of monk seals on the planet. The fully protected beach, near shore, and deep bank ecosystems of Papahānaumokuākea provide essential habitat for this IUCN-listed critically endangered species. In contrast, the Mediterranean monk seal (*Monachus monachus*) which once ranged throughout the Mediterranean Sea and Black Sea, has declined in numbers to fewer than 350 remaining individuals, and is currently fully protected in only a small portion of its former range.

#### Global Comparison of Physical Characteristics of Reef Archipelagos - Geology

#### Comparison of Pacific, Indian and Atlantic archipelagos

The world's three deep oceans with tropical components (Pacific, Indian, and Atlantic) support approximately 84 island archipelagos that fall within the latitudes of 30° North and South; half of these (58) are in the Pacific Ocean.

**Pacific Ocean:** Of the Pacific archipelagos, 28 are: 1) derived from volcanoes associated with a continental shelf, 2) located on continental slopes, 3) greatly influenced or modified by subduction at deep ocean trenches near continental margins, or 4) large islands of continental origin. Nine archipelagos in the Pacific consist entirely of ancient low-reef islands and atolls in the stable central Pacific: Line, Tuamotu, Tokelau, Gilbert, Marshall, Tuvalu, Yap, Phoenix, and Ha'apai. These archipelagos are situated in an area of the central Pacific that lacks hotspots and significant seismic activity. An additional five of the remaining 30 archipelagos consist of only a single island (Minami Torishima (Marcus), Niue, Nauru, Kosrae, and Rapanui), and are not comparable to the Hawaiian Islands. The remaining Pacific archipelagos were formed by the action of oceanic hotspots on the deep ocean floor; however none of these are as ancient or as vast as the Hawaiian Islands. Papahānaumokuākea also contains a clear,

linear illustration of all the different stages of atoll formation and decay, from high islands to submerged seamounts. Additionally, the northwestern end of the Hawaiian Archipelago within Papahānaumokuākea exhibits high levels of endemism of species associated with coral reefs. As mentioned earlier, Papahānaumokuākea is part of the Hawaiian-Emperor Archipelago, recently included as one of just ten sites in a new publication from IUCN promoting “High Seas Gems: Hidden Treasures of our Blue Earth.”

**Indian Ocean:** Of the ten tropical and subtropical archipelagos in the Indian Ocean, only two (Chagos and Mascarene archipelagos) were formed from seismic activity associated with the mid-ocean ridge or by deep-sea trench subduction zones. Only the Chagos Archipelago is of comparable magnitude, but it was created by geological processes vastly different from those of Papahānaumokuākea. In total, none of the Indian Ocean groups exhibit comparable habitats and origins, and only a few species are common to both sub-regions.

**Atlantic Ocean:** Of the ten island archipelagos within 30 ° N and S latitudes in the Atlantic Ocean proper, nine are

associated with seismic origin on the Mid-Atlantic Ridge, or are of continental shelf origin. Although corals are present at some of these locales, only the Florida Keys–Dry Tortugas support viable coral reef habitat. None share any of the Pacific reef-associated species and only a few share Pacific reef-associated genera. The two large Caribbean archipelagos bordering the Atlantic (Greater and Lesser Antilles) are under the jurisdiction of dozens of separate governments. All but a few islands are heavily populated, and are strongly influenced by adjacent continents and associated geological composition, trenches, volcanic eruptions, uplifting, and other tectonic activities. All of the coral reef ecosystems there are relatively new, and formed from geological processes occurring in the Miocene, three million years ago. (By comparison, Kure Atoll was formed about 27 million years ago.)

In summary, there is very little basis on which to make comparisons of Papahānaumokuākea with Atlantic-Caribbean archipelagos, or with other archipelagos in the deep Pacific Ocean. Even within the northeast central Pacific, the Papahānaumokuākea reef-associated fauna

is significantly different from those of its closest neighbors to the south, based on comparisons of coral-associated communities.

**Comparative volcanic hotspot archipelago formation**

The linear archipelagos of the insular Pacific have been hypothesized to represent island chains that formed sequentially above relatively fixed hotspot plumes as the Pacific Plate moved northward and then northwestward from the Late Cretaceous to the present day (Wilson 1963, 1965; Morgan 1971, 1972). As a result, the eastern Pacific in

View of the main Hawaiian Islands from space  
(Photo: NASA)

particular contains a set of northwest-to-southeast trending island groups that record the geological signatures of these plate-hotspot interactions. The most prominent of these are the Hawaiian, Society, Marquesas and Austral chains, all of which have been well-investigated geologically.

**Hawaiian Islands:** Among the archipelagos listed above, the Hawaiian Archipelago provides by far the best-delineated and least interrupted illustration of a hotspot process in action. From the newest eruptive volcanic seamount at Lōʻihi, south of the island of Hawaiʻi, to the nearly senescent atoll of Kure in the northwest, the Hawaiian Archipelago exemplifies the entire 30 million year span of the progression and erosion sequence associated with the lifespan of hotspot-associated islands within an archipelago (Clague 1996). Geologically significant portions of this sequence have been well documented within Papahānaumokuākea. This area includes mature high islands in the final stages of post-shield erosion (Nihoa, Mokumanamana), incipient atolls with only remnant bedrock pinnacles (French Frigate Shoals, Gardner Pinnacles), mostly submerged atolls (Maro Reef), approximately 30 drowned banks, secondarily raised atolls (Laysan, Lisianski), and true atolls (Pearl and Hermes, Midway). The oldest representative (Kure Atoll) lies at the “Darwin Point,” where further atoll formation is precluded by progressively cooler sea temperatures that do not allow enough upward growth of coral to keep pace with downward isostatic island subsidence. As such, the area provides the world’s foremost illustration of the entire process of hotspot island formation and subsidence. Papahānaumokuākea, in particular, exemplifies the later stages of this process, including examples of the type of senescence that follows atoll formation.

**Society Islands:** Other major hotspot-associated island chains in the eastern Pacific region possess similar underlying geological dynamics and island age progressions (Dupuy et al. 1989), but the overall patterns are less clearly and explicitly displayed. In the Society Islands, for instance, there has been an apparent

lateral “bleed” of magma into fracture zones that run perpendicular to the main axis of the hotspot trace (Guillou et al. 2005). This has resulted in the formation of island pairs of roughly similar age to either side of the putative underlying hotspot track (Bora Bora–Tupai, Raiatea–Tahaa, Maiao–Moorea). In addition, the Society Island chain exhibits a significant half-million-year hiatus in its central sector, with no extant islands lying between Huahine (2.4 My) and Maiao (1.9 My). As compared to the intact and constant geological illustration visible with the Hawaiian Archipelago, it represents a much more complicated and less definitive example of the general hotspot-associated island chain pattern.

**Marquesas Islands:** The Marquesas Islands, another hotspot-associated island chain, also provide an imperfect example of process and pattern, due to the irregular age progression among the constituent islands. Although there is a general age progression from older to younger islands, running from Eiao (7.5 My) in the northwest to Fatu Hiva (1.4 My) in the southeast, several islands in the middle of the chain have yielded isotopic dates that span much of the apparent age of the archipelago as a whole. For instance, the lavas of Ua Pou have erupted over a period of four million years, from 5.6–1.6 My (Duncan et al., 1986), and those of Hiva Oa over a period of nearly 900,000 years, from 2.47–1.59 My (Woodhead, 1992), confounding the predicted age progression. One possible explanation for this is that the hotspot trace moved across an old, inactive subduction zone, which, in a manner somewhat analogous to the Society Islands system, allowed magma to “bleed” upward through a zone of crustal weakness for anomalously long periods of time during the formation of the two aforementioned islands. Whatever the underlying cause, the age progression anomalies in the Marquesas render them a far less compelling illustration of the hotspot pattern than is seen in the Hawaiian Archipelago.

**Austral Islands:** The Austral Islands provide the system most closely comparable to Papahānaumokuākea. The age progression along the length of the Austral Islands

Archipelago is linear and progressive, from Rimatara (21 My) in the northwest to the currently active MacDonal seamount in the southeast (Barszczus and Liotard 1985). The constituent islands were formed from single, discrete volcanoes, uncomplicated by lateral magmatic migration along other regional structures. The islands of the Australs, however, are small and limited in number, and the chain possess no true atolls. In addition, Dupuy (1988) has questioned whether the current chain is the product of only a single hotspot, given the wide range of radiometric dates from Rurutu and Tubuai (Liotard and Barszczus 1989; Maury et al. 1994). The relatively long duration of volcanism at these islands may once again be due to the transgression of a fracture zone across the hotspot trace, similar to the situation in the Society Islands. Therefore, the Austral Islands are not as unequivocally illustrative of the overall process of hotspot island formation, erosion, and senescence, as is Papahānaumokuākea, and in addition do not show the many different, and related, stages of atoll formation from high islands to submerged seamounts.

Within the Pacific Plate as a whole, approximately twenty-five linear volcanic chains of putative hotspot origin have been recognized. Clouard and Bonneville (2005) compiled 1,685 published radiometric ages for 290 of the volcanic islands contained within these archipelagos in order to determine whether such linear island groupings were likely to be of true hotspot origin. These authors concluded that “Among the twenty-five volcanic chains for which ages are available, almost all show inconsistencies with the classical fixed-hotspot theory, and more inconsistencies appear as information on ages become available. These inconsistencies include wrong rate of progression (e.g., Pukapuka ridge), a trend incompatible with Pacific absolute plate motion (e.g., Marquesas Islands), lack of an active hotspot for each of the oldest chains except Louisville and Hawai’i and even for a younger chain (e.g., Austral Islands), occurrence of several volcanic stages on the same seamount (e.g., Sāmoa Islands), no age

progression at all (e.g., Northwest Pacific seamounts) with clusters of intraplate volcanism (e.g., Line Islands), and geographical distribution of seamounts away from the proposed hotspot track (e.g., Tarava and Musicians seamounts).” The only volcanic chains for which radiometric dating was unequivocally consistent with the hotspot formation hypothesis were the Austral Islands, Easter Island, the Foundation Seamounts, the Louisville chain, the Pitcairn Islands, the Society Islands, and the Hawaiian-Emperor chain. As noted above, all of these except the Louisville, Austral, and Hawai’i chains lack an active hotspot. Among the latter three chains, none of the Louisville volcanoes are currently above sea-level, although forty of them were emergent islands at some time in the past (Lonsdale 1988), and the Austral Islands present previously noted anomalies in terms of radiometric dating on Rurutu and Tubuai. Thus, even when considered in the context of the entire Pacific, the Hawaiian Archipelago still emerges as the prime exemplar of the hotspot archipelago model, with a particularly well preserved age progression within Papahānaumokuākea in the archipelago’s older northwestern sector.

#### *Global Comparison of Islands, Atolls and Reefs – Summary*

Almost 75% of the planet’s islands and atolls are found in the Pacific Ocean. Volcanic islands, low reef islands, and atolls in the deep tropical Pacific Ocean basin span a distance of more than 14,800 km from Palau in the far western Pacific to French Polynesia in the southeastern Pacific (Bryan 1953; Wiens 1962; Maragos and Holthus 1995; Maragos et al. 1996; National Geographic 1999). Over this broad expanse of the globe, only the Hawaiian Archipelago is recognized as a distinct large marine ecosystem (LME). In the rest of Pacific, the areas in the southeast, central, northwest, and southwest do not have similar distinction, but are recognized as separate geographical provinces with biologically related systems (Maragos et al. 2008).

As noted previously, of the numerous islands, atolls, and archipelagos in the Pacific, the islands of the Galapagos Archipelago invite the closest comparison of biological fauna, yet these islands do not share the natural, cultural or historical relationship of Papahānaumokuākea. Both are distinctive examples of irreplaceable locales. The only other Pacific areas that have been afforded significant levels of protection are a few of the islands and reefs within the jurisdiction of Palau and the uninhabited atolls and low reef islands of the Phoenix Islands Protected Area within the central Pacific, which were recently designated by the Government of Kiribati as one of the largest marine protected areas in the world.

Other World Heritage properties that are close comparisons to Papahānaumokuākea, both in terms of magnitude and as marine sites, are Tubbataha Reef in the Philippines, the Great Barrier Reef of Australia, the lagoons of New Caledonia, and the Belize Barrier Reef. However, these properties are comprised of the fringing reefs of large continental areas, rather than isolated

island chains, and they are affected by their proximity to their respective continental shelves and slopes of Australia and Central America. Because of this close proximity, these sites are subject to stressors such as pesticides and nutrients from agriculture, as well as runoff and sedimentation stemming from their adjacent large continental land mass.

Papahānaumokuākea, as a largely uninhabited and untrafficked sector of the world's most isolated archipelago, is not subject to any of the stressors associated with fringing continental reefs. In addition, the Great Barrier Reef and the Belize Barrier Reef, due to their proximity to other land masses, tend to contain a marine fauna that is representative of the region in general, in contrast to the specialized and highly endemic fauna found in Papahānaumokuākea. The Great Barrier Reef Marine Park Authority allows regulated tourism in over 99% of the Park. This lies in stark contrast to Papahānaumokuākea, where entry is prohibited except by permit, and limited recreation is permitted only at Midway Atoll, representing a very small portion of the area as a whole.

*Isolation from continental land masses and population centers protects Papahānaumokuākea's reefs* (Photo: James Watt)

**Cultural**

*Comparison To Other World Heritage Sites*

The current World Heritage List contains some 60 sites of cultural landscapes inscribed for spiritual, social, and/or historical value associated with a place. Listed in Table 3.2 are the World Heritage sites most comparable to Papahānaumokuākea because their cultural heritage either is prevaillingly cosmological, relates to more intangible than tangible cultural heritage, or is a site in the Pacific region.

*Table 3.2: Comparable World Heritage Sites to Papahānaumokuākea and summary of their cultural significance*

Site	Year	Criteria	Summary of Site's Heritage
Tongariro National Park (New Zealand)	1993	vi	Mountains of cultural and religious significance for the Maori people symbolize the spiritual links between this community and its environment. The park has active and extinct volcanoes, a diverse range of ecosystems and spectacular landscapes.
Rio Abiseo National Park (Peru)	1990, 1992	iii	Pre-Inca mini-caves, and 36 previously unknown archaeological sites at altitudes between 2,500 and 4,000 meters. Located in rainforests characteristic of this region of the Andes. High level of endemism among the fauna and flora found in the park.
uKhahlamba Drakensberg Park (South Africa)	2000	i, iii	Diversity of habitats protects a high level of endemic and globally threatened species, especially birds and plants. Caves and rock-shelters with the largest and most concentrated group of paintings in Africa south of the Sahara, made by the San people over a period of 4,000 years. The rock paintings represent the spiritual life of the now extinct San people.
Pyrénées – Mont Perdu (Spain, France)	1997	iii, iv, v	Mountainous, pastoral landscape reflecting an agricultural way of life that was once widespread in the upland regions of Europe but now survives only in this part of the Pyrénées. Past European society, landscape of villages, farms, fields, upland pastures and mountain roads. Human settlement since 40,000 -10,000 BC. Mt. Perdu unifies Heavens and Earth. Interaction between nature and culture; land belongs to local communities.
Ibiza, Biodiversity and Culture (Spain)	1999	ii, iii, iv	Phoenician port of the Phoenician-Carthaginian period, exemplifies the important role played by Mediterranean economy in protohistory. Renaissance military architecture, a profound influence on the development of fortifications in the Spanish settlements of the New World.
Laponian Area (Sweden)	1996	iii, v	The Arctic Circle region of northern Sweden is the home of the Saami, or Lapp people. It is the largest area in the world (and one of the last) with an ancestral way of life based on the seasonal movement of livestock... huge herds of reindeer [led] towards the mountains through a natural landscape [of] glacial moraines and changing water courses.

*Table 3.2 (continued): Comparable World Heritage Sites to Papahānaumokuākea and summary of their cultural significance*

Site	Year	Criteria	
Ohrid Region (The former Yugoslav Republic of Macedonia)	1980	i, iii, iv	Situated on the shores of Lake Ohrid, the town of Ohrid is one of the oldest human settlements in Europe. Built mainly between the 7th and 19th centuries, it has the oldest Slav monastery (St Pantelejmon) and more than 800 Byzantine-style icons dating from the 11th to the end of the 14th century. After those of the Tretyakov Gallery in Moscow, this is considered to be the most important collection of icons in the world.
Göreme National Park and the Rock Sites of Cappadocia (Turkey)	1985	i, iii, v	Capadocian Monasticism village, convent. Rock-hewn sanctuaries that provide unique evidence of Byzantine art in the post-Iconoclastic period. Dwellings, troglodyte villages and underground towns – the remains of a traditional human habitat dating back to the 4th century – can also be seen there.
Hierapolis-Pamukkale (Turkey)	1988	iii, iv	Springs in a cliff almost 200 m high feed calcite-laden waters at Pamukkale (Cotton Palace). Mineral forests, petrified waterfalls and a series of terraced basins. Late 2nd century BC kings of Pergamon established the thermal spa of Hierapolis. Ruins of the baths, temples and other Greek monuments.
St. Kilda, Hebrides Islands (United Kingdom of Great Britain and Northern Ireland)	1986, 2004, 2005	ii, v	Volcanic archipelago, one of the biggest sanctuaries of wildlife and marine life in the North Atlantic. Bronze Age Christian artifacts from the 10th C and evidence of Viking invasions.
Le Morne Cultural Landscape (Mauritius)	2008	iii, vi	A natural fortress, the rugged mountain that juts into the Indian Ocean in the southwest of Mauritius was used as a shelter by runaway slaves (maroons) through the 18th and early years of the 19th centuries. A symbol of the slaves' fight for freedom, their suffering, and their sacrifice.
Uluru-Kata Tjuta National Park (Australia)	1994	v, vi	Spectacular geological formations that dominate the vast red sandy plain of central Australia. Uluru, an immense monolith, and Kata Tjuta, rock domes located west of Uluru, form part of the traditional belief system of one of the oldest human societies in the world. Traditionally owned by the Anangu Aboriginal people.
Chief Roi Mata's Domain (Vanuatu)	2008	iii, v, vi	Closely associated with oral traditions surrounding the last paramount chief of Vanuatu, this site includes Chief Roi Mata's residence, the site of his death, and his mass burial site. Representative of Pacific chiefly systems.

Table 3.2 describes comparable sites and summarizes these sites' heritage and/or importance to the associated culture, while Table 3.3 demonstrates what Papahānaumokuākea offers to the World Heritage List in comparison with these sites. Papahānaumokuākea represents both a seascape and a sacred site associated with a living indigenous culture. Of World Heritage cultural and mixed sites comparable to Papahānaumokuākea, none represents all these qualities, as Table 3.3 illustrates.

*Agricultural terraces of Nihoa (Photo: David Boynton)*

**Table 3.3:** Comparison of Papahānaumokuākea to relevant cultural landscape World Heritage Sites. Green-colored cells illustrate similarities, while tan represents dissimilarities.

Site	Living Culture	Marine Cultural Components	Sacred Site
Papahānaumokuākea Marine National Monument (Proposed, U.S.A.)	Yes	Yes	Yes
Tongariro National Park (New Zealand)	Yes	No	Yes
Rio Abiseo National Park (Peru)	No	No	No
uKhahlamba Drakensberg Park (South Africa)	No	No	Yes
Pyrénées – Mont Perdu (Spain, France)	Yes	No	Yes
Ibiza (Spain)	No	Yes	No
Laponian Area (Sweden)	Yes	No	No
Ohrid Region (Macedonia)	No	No	Yes
Goreme National Park and the Rock Sites of Cappadocia (Turkey)	No	No	Yes
Hierapolis-Pamukkale (Turkey)	No	No	Yes
St. Kilda, Hebrides Islands (U.K.)	No	No	No
Le Morne Cultural Landscape (Mauritius)	Yes	No	No
Uluru-Kata Tjuta National Park (Australia)	Yes	No	Yes
Chief Roi Mata’s Domain (Vanuatu)	Yes	No	Yes

In terms of sacred sites that are inscribed on the World Heritage List, Papahānaumokuākea is most closely comparable to Tongariro, Uluru-Kata Tjuta, and Kakadu national parks. The cultures associated with each of these three sites are considered indigenous to their lands: the Native Hawaiian, the Maori, the Anangu and the several Aboriginal peoples of Kakadu. All three places are crisscrossed by ancient oral traditions and pathways of the gods of the indigenous peoples of each place.

Like Papahānaumokuākea, the mountains and volcanoes in the heart of Tongariro National Park have cultural and religious significance for an indigenous people, the Maori, and symbolize the spiritual links between the community and its natural environment. Additionally, Tongariro is considered the place from whence life originated and to which spirits return after death, as is Papahānaumokuākea in the Hawaiian belief system. The Maori and Native Hawaiian cultures are both the results of the last wave of Pacific migration to outlying

points on the Pacific triangle. Both sites have strong cultural and spiritual ties, but they also, due in part to the distance between them and the geography and topography of both of their homelands, host cultures that evolved very differently. Because the Maori of Tongariro are not a voyaging *iwi* (tribe), Papahānaumokuākea would be the only World Heritage site that preserves and perpetuates the invaluable wayfinding and seafaring culture of Polynesia as well as the distinctive Hawaiian culture.

Uluru-Kata Tjuta National Park’s singular geology – in the form of the world’s largest, natural monolith and other red rock formations, and its sacredness to Australia’s aboriginal Anangu people – parallel Papahānaumokuākea’s striking example of island and atoll geologic evolution and its sacredness to Native Hawaiians. However, the Anangu continue to live, hunt and gather in Uluru-Kata Tjuta, unlike Native Hawaiians in Papahānaumokuākea, and the two cultures and their respective landscapes (one landlocked and one largely ocean) are quite divergent.

Moreover, the two sites differ greatly in their controls on access.

Nonetheless, Uluru-Kata Tjuta and Kakadu national parks, both in Australia, are comparable Pacific region mixed sites whose natural features include both unique examples of either geology or a complex variety of ecosystems and are sites that are part of the traditional belief systems of the Aboriginal people representing a way of life. The Anangu of Uluru-Kata Tjuta expressed their cultural link to their landscape much as Native Hawaiians express their strong link to Papahānaumokuākea: the cultural landscape includes the interaction and co-evolution of the people with the place, and the natural resources of the place are inherently cultural resources via the indigenous peoples' genealogical, spiritual and cultural associations with them. Indigenous connections to individual environments are almost universal, but their particular expression is always unique; neither of these Australian mixed sites includes a voyaging, island, or seascape component, nor the Native Hawaiian expression of their relationship with a unique ecosystem. These indigenous Australian and Hawaiian sites are very different expressions of the way nature, culture, and spiritual belief have intertwined in the Pacific.

### Comparison to Hawai'i Volcanoes National Park

The State of Hawai'i contains one other World Heritage site: Hawai'i Volcanoes National Park (HAVO). While there are undoubtedly significant cultural associations between the Native Hawaiian people and this site, HAVO's inscription is for its geological phenomena only, and not for any cultural criteria. Kīlauea, Hawai'i's most active volcano protected in HAVO, is also an extremely sacred place for Native Hawaiians, comparable perhaps to Mauna Kea, Haleakalā, and Papahānaumokuākea – all of which are places of the gods (*nā akua*). In addition,

the migration story of the fire goddess Pele connects Papahānaumokuākea and Kīlauea; Hawaiian mythology tells that the goddess first arrived in the Hawaiian Archipelago in the Northwestern Hawaiian Islands and then traveled southward through the island chain until finally settling in Kīlauea, her current home. (This highlights the possibility of a serial nomination inscribing HAVO for cultural criteria in the future.) Kīlauea has deep cultural significance to Native Hawaiians, but it does not include a cultural seascape, nor is it inscribed for its archaeology.

### Comparison to Other Places Significant to Living Indigenous Cultures

As noted throughout this application, Papahānaumokuākea is the sacred realm of Pō, the place where life originated and the place to which spirits return after death. No other location in the Hawaiian Archipelago serves in this capacity. The islands in the archipelago located southeast of Mokumanamana represent Ao, the world where the living reside. While each of the main Hawaiian Islands have *leina* (leaping off points, from whence spirits travel to the afterlife), no place serves as the final destination for these traveling spirits, other than the region to the northwest, beyond Mokumanamana.

*Papahānaumokuākea's pristine viewsapes are said to foster ho'ailona, or omens in nature (Photo: James Watt)*

Sea urchins, called “wana” in the Hawaiian language, are both a delicacy and storied in ancient myths (Photo: James Watt)

The concept of Pō and Ao is pan-Polynesian. It is found, for example, in the traditions of New Zealand, Tahiti and Tuamotu (Best 1976; Henry 1928; Stimson 1933; Walker 1990). All of these cultures consider Pō to be a dark place of origin, and Ao to be a place of daylight and humans. While the demarcation between these points is relatively clear in Native Hawaiian culture, such is not as obviously the case in other cultures (Stimson 1933).

Regionally, Tongariro National Park, as stated earlier, inspires a similar level of reverence for the Maori tribe Ngati Tuwaretoa. They believe that life began in Tongariro and that spirits return there, much as Native Hawaiians believe occurs in Pō, within Papahānaumokuākea.

Globally, Polynesian seascapes tell a unique story of astounding voyaging and settling abilities; the sea looms large in mythic and practical landscapes across the Pacific region. To many Polynesian cultures, the sea is as legible, as filled with distinct zones, resources, histories, and stories, as the land. As quoted in the December 2007 ICOMOS Thematic Study by Anita Smith and Kevin L. Jones, “Cultural Landscapes of the Pacific Islands”:

“through senses, lore, observation, technology, skill, mythology and myriad other ways, the ocean of the Micronesians [and other Pacific Island peoples] was and in some cases still is an utterly knowable place in its form and texture and its link with the guiding heavens connecting the strange place that is always beyond the knowable world, the horizon where spirits below meet the spirits above. This is a seascape traversed by known seaways a place of paths that linked communities” (Rainbird in Smith and Jones 2007: 61-62).

The natural attributes that made this complex, multidimensional, ocean-dominated world were both practical and metaphysical. The Polynesian universe “comprised not only land surfaces, but the surrounding ocean as far as they could traverse and exploit it, the underworld with its fire-controlling and earth-shaking denizens, and the heavens above with their hierarchies of powerful gods and named stars and constellations that people could count on to guide their way across the seas. [Polynesians’] world was anything but tiny” (Hau’ofa 1994: 152).

A vast Pacific seascape whose natural integrity and spiritual significance has been preserved over time, such as Papahānaumokuākea, is invaluable both to the culture it supports and to a global understanding of an alternative, closely symbiotic model between nature and mankind. Because Native Hawaiian culture continues to thrive, Papahānaumokuākea is not only a window to the past, but a foundational classroom for a living culture that still reveres the place and the traditional activities that can, and do, continue to occur only there.

Throngs of fish in Papahānaumokuākea’s seascape (Photo: James Watt)

### Comparison to Other Places of Abundance

The site's marine ecosystems are unquestionably the most pristine in the Hawaiian Archipelago, as explored in detail in the Natural Resources Comparative Analysis (above). In Native Hawaiian terms, Papahānaumokuākea's pristine cultural landscape is considered an *'āina momona* (place of abundance). Across the Hawaiian Archipelago, marine ecosystems experienced extraordinarily lopsided anthropogenic impacts: the main Hawaiian Islands' oceans have been severely impacted, while the seas of Papahānaumokuākea still abound with endemic reef fish, apex predators, seabirds, and turtles.

On a global scale, the natural comparative analysis clearly states that Papahānaumokuākea is a rare predator dominated ecosystem, possesses some of the highest rates of endemism for marine and terrestrial species in the world, and that the region is home to one of the largest and most important assemblages of breeding tropical seabirds in the world. While there are other comparatively pristine environments in the Pacific, such as the Phoenix Islands and Kingman Reef, Papahānaumokuākea provides an unspoiled environment that most closely resembles what ancestral Native Hawaiians interacted with on a daily basis and to which many of their current cultural practices are most closely linked. Papahānaumokuākea is the only place where Native Hawaiian cultural practices (wayfinding, celestial protocol) can occur in such a pristine natural place, and among *wahi kūpuna* (archaeological, cultural sites) of such integrity.

Because oral traditions are Native Hawaiians' baseline for the status of their ancestors' environment, being able to compare past stories with present circumstances in a nearly pristine environment is invaluable. Cultural baselines and interpretations can provide clues to solving problems for which western scientific

Seabirds in Papahānaumokuākea help guide navigators to land and are valued as endangered species (Photo: Ocean Futures Society)

baselines are relatively recent. Traditional knowledge based on cultural resiliency can only help to manage this place and others similar to it.

### Comparison to Other Voyaging Nations

Across the Pacific, low-lying, small islands and atolls have been used as navigational tests for apprentice navigators preparing to undertake long, open-ocean voyages. For example, people of Satawal, Lamotrek and Polowat in the Central Caroline Islands use the uninhabited island of West Fayu as a test for apprentice navigators to see if they have mastered navigational lessons. The 55-mile crossing from Satawal to West Fayu continues to be used today to see if a navigator is able to take on the responsibility of navigating a voyaging canoe to the tiny island's fishery, which continues to supply the people of Satawal (Woodward et al. 1998).

In Hawai'i, these islands are Nihoa and Mokumanamana, which are the only places in the archipelago that closely mimic open-ocean conditions without the attendant dangers. This

141

**“The voyage from Kaua’i-Ni’ihau to Nihoa is the final step in the training for young navigators before they can go deep-sea. The leg represents the ultimate test. It’s a one- to two-day voyage that requires every discipline employed in long-distance voyage, except extreme fatigue. It’s the ideal training platform.”**

– Nainoa Thompson, Hawaiian master navigator

*Marae shrines on Niihau* (Photo: Kekuewa Kikiloi)

navigational testing path from Kauaʻi to Niihau, and on to Mokumanamana, is the only one available to Native Hawaiians today.

Many other voyaging nations and cultures, from Vikings to Greeks to Tahitians to Maori, continue to use models of traditional voyaging vessels to conduct cultural ceremony, much as Native Hawaiians do in Papahānaumokuākea and elsewhere. For Native Hawaiians, who continue to chart tens of thousands of miles on voyaging canoes, navigational knowledge is often place-specific, and the integral training can only be done in home waters, where novice navigators can apply some of their life experience in environmental observations and associations. Moreover, the cultural ceremonies and protocol associated with Niihau, Mokumanamana and the other atolls up the chain, can only happen off of those shores where appropriate respect can be paid to their ancestors, in their particular spiritual, natural and geological manifestations.

142

#### *Comparison to Other Mystery Islands*

Mystery Islands are remote islands with extreme environments that exhibit evidence of Polynesian settlement but were abandoned by the time of Western contact. There are at least 25 of these islands: Niihau and Mokumanamana in Hawaiʻi; Pitcairn and Henderson of the Pitcairn group; Howland in the Phoenix Islands; Washington, Fanning and Christmas in the Northern Line Islands and Malden in the central group; Palmerston and Suvarrow in the Cook Islands; the subtropical islands of the Kermadecs, and Norfolk Island (Irwin 1992). Mystery Islands have world-wide significance. Understanding in

a regional context how increasingly isolated communities on smaller remote islands, such as Niihau and Mokumanamana or Pitcairn and Henderson, were able to remain connected to larger high islands with more diverse resources, such as the main Hawaiian Islands or Mangareva, has significance to other regions such as the Mediterranean, where inter-island communication was an essential activity in the past to ensure the movements of goods and people to sustain life on both the isolated islands and the relevant mainlands (see DiPiazza and Pearthree 2001a, b; Rolett 2002; Weisler 1997; and see Cherry 1985 for the Mediterranean).

Niihau and Mokumanamana are distinctive within the Mystery Island group in a number of ways. Other Mystery Islands in Eastern Polynesia have intact settlement landscapes, but none has the high density and intact preservation of ritual sites that Niihau and Mokumanamana possess, nor do they have the marae shrines that exhibit the adaptation of Eastern Polynesian culture. Niihau and Mokumanamana are also unique among Mystery Islands for the maintenance of a living cultural connection.

#### *Comparison to Other Archaeological Sites*

Listed on the National Register of Historic Places, Niihau and Mokumanamana possess a combined 141 archaeological sites, making them some of the densest scatters of prehistoric structural sites in Hawaiʻi. In addition, these islands feature archaeological landscapes that contain original materials that largely have not been subject to the anthropogenic disturbances (invasive species, development, etc.) very common among the main Hawaiian Island sites. The view planes of the islands' religious sites – an element that is critical in Hawaiian culture – are also undisturbed, an extremely rare condition in Hawaiʻi, where telescopes, coastal and urban development, and diverted freshwater, among other things, have adversely altered most religious sites and their surrounding environments. Moreover, the stone upright sites on Niihau and Mokumanamana are a rare style of *heiau* in the Hawaiian Archipelago,

otherwise found only atop the extinct volcanoes of Mauna Kea on Hawai'i Island, and at the top of Haleakalā on Maui.

As a whole, Papahānaumokuākea plays a critical role in understanding the nature of Polynesian migration and settlement in the Pacific. All of the islands of Papahānaumokuākea were either empty at the time of first Western contact or abandoned, having been occupied some time prior (Kirch 1988a). All of the islands of Papahānaumokuākea are small, geographically isolated, and lacking sufficient resources to allow self-sustainability or demographic stability (in initial and later stages of colonization). These environmental limitations are thought to be the main reasons why interaction was so vital to these regions (Irwin 1990, 1992: 174-180).

### 3.d Integrity and Authenticity

#### Cultural

#### Cultural Authenticity

Papahānaumokuākea continues to be considered a spiritual place of the gods for Native Hawaiians and is valued for its pristine wilderness of terrestrial and marine habitats. As noted above, oral histories and archaeology indicate the extensive length of time that Native Hawaiians have experienced and respected Papahānaumokuākea. Oral histories provide interpretations of still existing natural resources and phenomena in terms of ancestral voyages and origin stories specific to Papahānaumokuākea. The concepts of the reciprocity exchange of *hānai a 'ai* (to care for and eat from) and "*nānā i ke kumu*" ("look to the source") also help to express the *kuleana* (privilege and responsibility) for Native Hawaiians to protect, honor and give back to Papahānaumokuākea, its natural resources, and its spiritual significance.

There is a continuing, centuries-old Hawaiian protocol of protecting

these sites and offering gifts to the place and spirits, as part of the reciprocal nature of the Native Hawaiian culture. Since the time of European contact with the islands, the region has continued to mainly be used for resource harvesting and perpetuation of cultural and religious traditions by Native Hawaiians.

Papahānaumokuākea continues to be a preeminent location for experiencing and understanding seascape (inclusive of the islands connected by the sea) *hō'ailona* (signs, omens in nature) that occur in pristine environments. These *hō'ailona* often come to Native Hawaiians via the natural forms taken by their ancestors who have pertinent advice to give them from the spiritual world. They come in many potential forms, such as encounters with sharks or giant trevally; cloud forms rising in welcoming or foreboding shapes over sacred sites; the ocean suddenly making a distinctive color or surface change that bespeaks a warning or a benevolent presence; a normally high-soaring bird skimming the ocean surface and flying directly toward a person, etc. Many believe that anyone, if they are open to the experience and appropriately inspired by the situation and location, can receive *hō'ailona*. In Papahānaumokuākea, because of its pristine beauty and direct, unimpeded links to Native Hawaiians' spiritual, historical and ancestral origins, these *hō'ailona* are distinct, regular and available for the culturally and spiritually aware mind to interpret and understand. It is partly because of these experiences that Native Hawaiians value the

*Mokumanamana's upright stones silhouetted by the sunset. The upright stones line the 'spine' of the island and are oriented to the movements of the sun across the year (Photo: Kekuewa Kikiloi)*

unparalleled opportunities provided by the islands, atolls, reefs, ocean and atmosphere of Papahānaumokuākea to not only reconnect with and learn from their past, but better prepare for their future.

### Native Hawaiian knowledge and practice

The authenticity of Papahānaumokuākea's significant role in Native Hawaiian culture stems from several lines of evidence:

- (1) Oral traditions – Native Hawaiian customs have been passed down over multitudes of generations through oral traditions, including *mo'olelo* (stories), *mele* (songs), place names and *mo'okū'auhau* (genealogies);
- (2) Historical record – after Western contact, scholars both Native Hawaiian and non-Native recorded a wide range of Hawaiian traditions in journals, books and Hawaiian language newspapers and periodicals, dozens of which were published between 1834 and 1948;
- (3) Existing community knowledge – modern day oral history projects conducted over the years with *kūpuna* have also preserved many Native Hawaiian traditions.

part of the reason Papahānaumokuākea is so revered and cherished by Native Hawaiians is “because many different navigators came through. Pele from the north. Others from Kahao'olawe. Others from Ni'ihau. Many different groups came here, settled here, on many different courses and canoes...Many of us have connections through our genealogies, or who used to fish up there. It's about us, and our connection to our ancestors who also looked at the same stars, who also voyaged to this place” (William Ailā 18 June 2008, personal communication).

The migration *mo'olelo* (story) about Pele, the revered volcano goddess, lists the many islands she visited as she traveled from her home in Tahiti to the Hawaiian Archipelago. As Pele is one of the most important Hawaiian gods, a host of different stories describe her arrival in the Hawaiian Islands, with several mentioning her plan to travel to Mokumanamana and her actual visit to Nihoa (Beckwith 1951; Westervelt 1916).

The name Papahānaumokuākea itself pays tribute to the two gods who are most widely attributed to the parenting of the Hawaiian Islands and the Native Hawaiian people: Papahānaumoku, the goddess of the earth, and Wākea, the god of the sky. Descriptions of their union are found in such sources as the epic creation chant the Kumulipo, below, as well as a number of other published materials, many dating back to the 19th century (Kaiāikawaha 1835; Malo 1839; Kamakau 1865; Fornander 1918). For example, in his 1839 book *Mo'olelo Hawai'i*, Hawaiian scholar David Malo noted that all Native Hawaiians, commoners and chiefs alike, were descended from Papa and Wākea. In 1835, another Hawaiian scholar, named Kaiāikawaha, documented a version of the Papa and Wākea creation story that lists the birth of a number of islands after Nihoa. The names provided may be the ancient names of the Northwestern Hawaiian Islands.

144

Specific examples of evidence from the historical record and oral history projects that document the Native Hawaiian people's close relationship to Papahānaumokuākea can be found below in the discussion on authenticity. These include verbatim quotes from 18th and 19th century newspapers and periodicals, reports of the Board of Genealogy of Hawaiian Chiefs, the Bishop Museum on-line Mele Index, oral histories, traditional stories, early explorer's journals (including Captain James Cook's), and manuscripts of *mele* (song), *oli* (chant), and *pule* (prayer).

Many oral traditions about the NWHI recount voyages through these islands, from the times of antiquity to present day. As recorded in oral histories, Native Hawaiians and their gods have traveled up and down Papahānaumokuākea throughout the past two millennia. Cultural practitioner William Ailā says that

Eia na aina i hanau mai ai maloko mai o ke kanaka i puka mai ai. O Papahanau moku ka wahine o ka Hanau – Akea ke kane, moe laua, ko ka laua keiki, a hanau mai ka laua hiapo he pohaku o Kahikiku, oia ka mua,

*Excerpt and translation provided by Kekuewa Kikilo.*

About 50 Hawaiian language newspapers and periodicals were published between 1834 and 1948. This body of archival literature has provided, and will continue to provide, invaluable documentation regarding Native Hawaiian traditions in the Northwestern Hawaiian Islands. For example, the six-part serial “He wahi Kaaono Mokulehua,” printed in the Hawaiian language newspaper “Ka Hoku O Ka Pakipika” in 1861 through 1862 relays a story of a man named Mokulehua who visits the islands west of Nihoa and Mokumanamana. The story provides a list of places he visited, with names that may be ancient, forgotten names for islands in Papahānaumokuākea.

system. At more than 2,000 lines long, the Kumulipo was first chanted to honor the 18th century chief Kalaninuiʻiamamao, and has been passed down through the generations of the highest ranking Native Hawaiian chiefs. Multiple interpretations exist surrounding the exact translations, and multiple editions were written in the 19th century. King David Kalākaua commissioned the publication of a version of the chant as a pamphlet in 1889, and his sister, Queen Liliʻuokalani, later translated it into English.

The Kumulipo (source of deep darkness) tells the history of how all life forms came and evolved from the region of Pō, in Papahānaumokuākea, beginning with the coral polyp – the building block for all life. Through a series of eight more wā (stages), came the various life forms of the earth, culminating with the birth of man.

146

The predominant Native Hawaiian creation story, the Kumulipo, exemplifies the fundamental importance of Papahānaumokuākea to the Hawaiian belief

*“It was night / So night was born” Kumulipo, Queen Liliʻuokalani version (Photo: James Watt)*

After Western contact with the Hawaiian Archipelago, which brought with it Western customs and viewpoints, the region continued to be important to the evolving Hawaiian culture. Some of the highest-ranking Hawaiian royalty of the 19th century visited the Northwestern Hawaiian Islands, including Queen Ka'ahumanu, King Kamehameha IV, and King David Kalākaua (Department of Hawaiian and Pacific Studies, Bishop Museum 2002). In 1822, Queen Ka'ahumanu visited Nihoa, which was said to be the source of Kaua'i's life-giving rain, with her husband, King Kaumuali'i, chief of Kaua'i. They rediscovered historic evidence of prior habitation, as the Queen had learned from *oli* (chant) and *mele* (song) passed down through the generations (Rauzon 2001). King Kamehameha IV (Alexander Liholiho) formally annexed Nihoa for the Hawaiian Kingdom in 1857, starting the process of formally claiming most of the NWHI. In 1885, Queen Lili'uokalani and her two-hundred-person entourage landed on Nihoa to study the palms, wildlife and artifacts on the island (Bishop, in Emory 1928).

Recent efforts to document the oral histories of today's Native Hawaiian *kūpuna* provide further evidence of the Native Hawaiian people's continuous relationship with Papahānaumokuākea. In 2003, Kepā Maly produced a comprehensive oral history project that contained excerpts from 130 interviews he conducted with Native Hawaiian *kūpuna* over 28 years. Maly's interviews with Kāwika Kapahulehua, a late kupuna from Ni'ihau and first captain of *Hōkūle'a*, revealed that the people from this island continued to voyage to Papahānaumokuākea into at least the late 19th century to fish and gather other resources. In addition, Rerioterai Tava and Moses Keale documented additional connections between the Ni'ihau people and Nihoa in the 1989 book "Ni'ihau: The Traditions of an Hawaiian Island." They recorded Ni'ihau traditions that indicate families from the island voyaged to Nihoa to fish and collect leaves, wood and grass for cordage. The connection between Ni'ihau and Nihoa is so well preserved that the people of the island still remember the exact time of year and type of wind that was used to sail from Ni'ihau to Nihoa (Maly 2003; Tava and

Keale 1989). Moreover, Native Hawaiian commercial fishermen continued to access the Northwestern Hawaiian Islands throughout the 20th century (Maly 2003), and apprentice traditional wayfinders continue to be tested by the navigational practical exam of "pulling Nihoa from the sea" (Nainoa Thompson 4 October 2008, personal communication).

### Cultural Integrity

#### Archaeological sites

The archaeological sites on both Nihoa and Mokumanamana retain their original designs, materials, and workmanship. Their settings on remote islands in the expansive Pacific Ocean distinguish the sites from any others in Hawai'i and in the world. In such remote settings, the sites remain virtually untouched, and human disturbance is minimal. In comparison, all known sites in the main Hawaiian Islands have been negatively affected by some combination of land use change, invasive species, cattle ranching, feral ungulates, and other anthropogenic disturbances.

Though impacted by the ravages of wind, rain, sea spray and time, as well as natural disturbances by nesting birds and overgrowth by endemic plants, the cultural sites on Nihoa and Mokumanamana retain many of their original attributes in a setting free from most human disturbances. The majority of the sites on both islands that are known to have existed are still there, and are in good condition and in their original locations. No buildings or other unrelated elements have affected the visual or metaphysical planes of these sites. Furthermore, under multiple layers of protections (each site has been protected within the Hawaiian Islands National Wildlife Refuge since 1909, has been listed on the National Register of Historic Places as Island Archaeological Districts since 1988, and is now protected within Papahānaumokuākea Marine National Monument), their integrity will be preserved to the full extent of federal and state authority.

These almost untouched cultural sites show little to no anthropogenic change since the time of their building and use. On Nihoa, some of the sites have slightly

deteriorated in the form of wall collapse; however the degree of deterioration does not detract from the overall integrity of the archaeological sites. Thirteen of the sites have been impacted by archaeological excavations carried out in the 1920s. On Mokumanamana, some of the sites are slightly deteriorated, and four sites have been impacted from what may be bomb craters, probably a result of practice bombing during World War II. Fortunately, based on prior, thorough documentation of the sites, current archaeologists recognize that these impacts are isolated and minimal, particularly because the island is so dense with archaeology; more than 40 sites have not been integrally compromised.

Papahānaumokuākea preserves a significant part of the natural ecosystem—with preserved viewplanes and no noise pollution—in which Native Hawaiian forbearers practiced their culture for hundreds of years. In being one of the last remaining places of abundance, or *‘āina momona*, Papahānaumokuākea has become critical to the maintenance of specific traditional Native Hawaiian knowledge and practices.

**Repairs:** To date, no repairs have been made on the archaeological sites on Nihoa and Mokumanamana. Current regulatory measures ensure that repairs would be performed using culturally appropriate techniques and protocols to honor the sites.

148

### Natural

#### Natural Integrity

As detailed throughout this application, the integrity of Papahānaumokuākea’s marine environment is nearly pristine, with minimal disturbances. Though some terrestrial environments still bear the imprints of mankind, they also showcase the resiliency of many native species and the potential for restoration through human endeavors. The property includes all the key areas and ecosystems necessary to maintain its ecological integrity and the long-term conservation of its remarkable and unique terrestrial and marine diversity, and it is of sufficient size to maintain associated

biological and ecological processes. The property still displays intact ecosystems, with a significant number and diversity of apex predators. The in situ conservation of numbers of endangered species is sustained through active management and restoration of their habitats.

#### Marine biota

While the vast majority of marine biota is thriving within Papahānaumokuākea, there is one species that is of great concern. Even after years of conservation and active management and recovery efforts, the Hawaiian Monk Seal population remains in decline. The current decline is thought not to be mainly human induced, but instead due to alterations in the environment, and habitat loss of preferred breeding grounds from global climate change and sea level rise. For the past two decades a concerted effort has been made to save the Hawaiian Monk Seal. Multiple federal and state entities, along with nongovernmental organizations, private sector entities, and countless individuals in local communities have worked to recover the species. These efforts have not been sufficient to prevent the continued decline in the species, however without these efforts, the situation would likely be much worse. Several key actions are currently underway to address current and potential threats to the Hawaiian Monk Seal in attempts to alter the trajectory of the population and move the species towards recovery. A detailed Recovery Plan has been established and is being implemented through several management strategies and activities and is detailed in Section 5.

Another concern for the marine sector of Papahānaumokuākea is the presence of invasive species. There are a total of 11 documented alien marine invertebrate, fish and algal species in the NWHI, with the highest concentrations occurring in the harbor at Midway Atoll. Although there are a limited number of marine alien species present, none thus far have caused significant disruptions to the surrounding ecosystem. While the remoteness and relative inaccessibility of the NWHI has helped to prevent the introduction of some

alien species to the area, these islands are vulnerable to introductions through a variety of activities. Therefore, stringent regulations and protocols are in effect to reduce the chance of alien species introductions (see Section 5).

Other threats to the marine ecosystem are further detailed in Section 4, and are mainly a result of broader influences originating outside of the boundaries of Papahānaumokuākea that eventually affects shallow water resources. Most notable among these are stresses resulting from marine debris and large-scale environmental effects such as climate change and ocean acidification. While preliminary studies have not shown significant effects thus far to shallow water marine communities, continued research is necessary to understand how the marine and terrestrial ecosystems will respond to these large-scale events.

#### **Terrestrial biota**

As noted in Section 2.b “History of Development”, the terrestrial ecosystems of the Northwestern Hawaiian Islands suffered significant perturbations at the turn of the last century and again during World War II.

However, over the last fifty years, the focus has been on recovery and restoration of the previously altered environments. While the history of human impact and alteration of the islands was at one time significant, the actual impact footprint is minimal compared to most other places on earth. Several species of endemic plants and animals are in fact thriving. Development activities have been limited to small-scale conversions of abandoned Coast Guard buildings at French Frigate Shoals and Kure Atoll following the closure and removal of many of the of Navy and Coast Guard facilities. Development at Midway Atoll has been restricted as well; plans are underway to remodel existing facilities to accommodate the new Visitor Services program (see MMP Volume IV).

Preventing the importation and establishment of alien invasive species, removing those already at the site, and restoring species lost to previous alien introductions are the biggest challenges of terrestrial stewardship in Papahānaumokuākea. There have been several intentional and non-intentional anthropogenic introductions of non-native plants and animals since the islands and atolls of Papahānaumokuākea were first discovered by humans. As many as 125

*Centuries of isolation have ensured the natural integrity of Papahānaumokuākea's reefs*  
(Photo: James Watt)

species of alien insects and spiders have been found on these islands, and some of them, particularly ants, are extremely destructive. Discussions on the impacts of non-native animals and plants are presented in greater detail in Section 4.

Significant efforts are underway to restore native biota on several of the islands and multiple recovery plans are in place for a variety of species including seabirds, shorebirds and plants. The following list highlights some of the terrestrial restoration and remediation efforts:

- Rats and rabbits, introduced to some of the islands centuries ago, were responsible for significant impacts to the terrestrial environment. Through intensive eradication efforts by multiple state and federal entities, all rats and rabbits have been successfully removed from the NWHI.
- A 12-year eradication project at Laysan Island successfully removed an invasive sandbar. Active restoration is underway and has reestablished a number of other plants and animals that were lost after the introduction of rabbits.
- Contaminants causing the mortality of endangered Laysan finches were identified and removed from Laysan Island beaches.
- Clean-up and remediation efforts have been undertaken by the Navy and Coast Guard at Midway Atoll, Kure Atoll and French Frigate Shoals.
- Invasive ironwood trees have been successfully eradicated from Eastern Island (Midway Atoll).
- Intensive invasive weed eradication, native plant restoration, and propagation programs are ongoing at Midway and Kure Atolls.
- Multiple species are recovering and thriving (see Section 4 for details of specific species trends).

In addition to these efforts, strict protocols are in place to combat further introduction of alien species. Section 5 further discusses the numerous protective management and regulatory measures currently in place to protect this remote and special region.

*Through concerted efforts to address current and potential threats to the Hawaiian Monk Seal, biologists hope to move the species toward recovery (Photo: James Watt)*

## 4. *State of Conservation and Factors Affecting the Property*

*Sand Anemone or 'okole*  
(Photo: Susan Middleton & David Liittschwager)

### 4.a Present State of Conservation of the Property

The state of conservation of the property is excellent, both in terms of the physical condition of the resources, as well as the conservation and regulatory measures in place to maintain it. In addition to stringent conservation laws, the preservation of the property is maintained and assured through detailed and thorough management plans, on-site restoration and monitoring activities, and associated practices described in Section 5.

As detailed in Sections 2, 3 and 5, several factors contribute to the property's exceptional state of conservation. These factors include:

1. The extreme isolation of Papahānaumokuākea Marine National Monument. The sheer size and remoteness of the area, situated in the north-central portion of the world's largest ocean, thousands of miles from any continental land mass or heavy human population pressures, has ensured that human-based impacts have been relatively few, and the biological, historic and cultural resources of this site are well preserved.

2. Regulatory protections and management initiatives. These are in place to protect ecosystem function and ensure reef resilience and resistance in the face of potential threats from global climate change or other climatic events.
3. Numerous species recovery and restoration plans. These are in place and are being actively implemented.
4. Emergency response and restoration plans. These are either in place or in development for human health and safety, and in response to unanticipated natural and anthropogenic events.
5. Commitment in policy and precedence to incorporating Native Hawaiian traditional knowledge, practice, and values into the management of the site.
6. Conducting, supporting and facilitating Native Hawaiian cultural and historic research relating to the area.
7. Providing access for Native Hawaiian cultural practices at Papahānaumokuākea.
8. Engaging the Native Hawaiian community in the management of Papahānaumokuākea.
9. Restricted public access via permitting systems and vessel monitoring and notification systems.
10. Rigorous quarantine requirements for all activities in Papahānaumokuākea to reduce introduction of alien species.
11. A phase-out of all commercial fishing by 2011, with current fishing limited to only eight active vessels fishing for deep-water species.

## Natural

### Species trends

More than 7,000 documented species are found within Papahānaumokuākea Marine National Monument and the vast majority of them are thriving. As outlined in Section 2, the property's coral reefs are considered nearly pristine and there is a very low

*Papahānaumokuākea is home to a large number of threatened and endangered species (Photo: James Watt)*

incidence of invasive species (Friedlander et al. 2005). Green Turtles are considered to be a resounding success story, with the number of females nesting at French Frigate Shoals rising steadily over the past 30 years (Balazs and Chaloupka 2004). Populations of most bird species are considered to be stable or increasing, based on intensive monitoring on three islands (FWS 2005).

As noted in Sections 2 and 3, Papahānaumokuākea is home to a large number of endangered species. Managing such species can be difficult, because they often have small population sizes, low genetic diversity, and other inherent traits that add to the complexity of their management. To properly account for these factors, considerable research on population stability and dynamics is required. Fortunately, a great deal of ongoing work devoted to such endangered species is being conducted within the property.

While the extreme geographic isolation and lack of direct human impacts is beneficial for the organisms of Papahānaumokuākea, it has historically limited the amount and diversity of scientific inquiry. As highlighted in Section 2.b, “History and Development

of the Property”, scientific expeditions have been patchy and topic-focused. Periods of exploration in the 1900s and 1920s generated the first views of species assemblages and structures, both above and below water. In the 1960s, research focused primarily on commercially important species, and until early 2000, the majority of scientific work conducted in the marine waters of the NWHI related to commercial fishery targets or rare and endangered species. Only in the last few years has research been expanded to the community- and ecosystem-based levels, incorporating monitoring of non-commercially important species such as smaller reef fish and invertebrates. With the federal and state protections that have been instituted since 2000, exploration and inquiry to quantify and track the status of all species in Papahānaumokuākea's waters have surged. As a result, species trend information will continue to grow for most major taxa.

The following provide examples of some of the species trend data currently available for groups of particular significance.

**Algae:** Increased efforts have been devoted to quantifying algal abundances and diversity in Papahānaumokuākea in recent years, with impressive results. Comprehensive algal sampling from 2000–2002 at French Frigate Shoals resulted in a 380% increase in the

153

*Pristine coral reef habitat (Photo: James Watt)*

numbers of species known from the region, with four of these species not previously found in the Hawaiian Archipelago (Vroom et al. 2005). As a result of recent investigations, Papahānaumokuākea has been documented to contain the highest percent cover of macroalgal species and lowest percent cover of living coral as compared with other geographic locations. This is likely due to the subtropical location of Papahānaumokuākea, which exposes reef communities to large seasonal variations in water temperature and current patterns as compared to other, more tropical, coral reef locations.

New species are often documented on research cruises (Photo: James Watt)

**Corals:** The abundance of shallow water corals of Papahānaumokuākea varies greatly between islands or atolls, but has remained fairly consistent in time (Figure 4.1). As noted previously, most locations contain relatively low coral cover with the exception of Maro Reef and Lisianski Island/Neva Shoals. In addition to percent cover, coral colony size–frequency distributions can provide important insight into characteristics of reef communities. Size–frequency distributions of all corals in belt transects throughout Papahānaumokuākea in 2003, 2004 and 2006 indicate generally similar distributions in all three survey years, suggesting stability in the complexity of the structural framework that provides shelter to many species of reef inhabitants (Waddell and Clarke 2008).

Scientists are still encountering new records of species or even new species on a continual basis. One expedition in 2006 yielded 11 new records of corals in Papahānaumokuākea. Although 57 species of corals have been documented in the property, many species occur at such low frequencies that they are not encountered in surveys. Thus, relatively few coral species numerically dominate in Papahānaumokuākea’s waters. Overall, three genera dominate the shallow water reef areas (Section 2, Figure 2.4). Given this, it is expected that the coral species list for Papahānaumokuākea will continue to expand as improving technology and research tools allow exploration and documentation of the generally unknown deeper reefs of the site.

Figure 4.1: Mean coral cover at permanent transects by location (Source: Maragos and Veit, USFWS unpublished data)

## *Exploring the Unknown*

# *Diving Deep Into Papahānaumokuākea Waters*

While the islands and atolls of the NWHI are known for their spectacular shallow water coral reefs, the majority of marine habitats residing within Papahānaumokuākea are largely unexplored. Deepwater habitats comprise over 90% of Papahānaumokuākea's area, yet are virtually unknown.

Deepwater portions of Papahānaumokuākea are thriving with organisms uniquely suited to deepwater survival; in recent years, researchers have found entire reefs complete with fish and crustaceans at depths of more than 5,000 feet. Since these areas occur in depths well below the limitations of SCUBA diving, managers and scientists have needed to find more advanced ways to explore the deepwater ecosystems. One such way is through the use of submersibles.

Each trip to the deep waters of Papahānaumokuākea brings records of mysterious new organisms and sheds light on the complexity and diversity of life in the deep. In 2007 scientists from the Hawaii Undersea Research Laboratory (HURL) set out to explore new research sites in Papahānaumokuākea, discovering multiple new deepwater coral and sponge beds in depths of 3,000 to 6,000 feet. During this voyage, the team discovered several new species, including a few so unusual that they may end up representing not only new species, but possibly a new genus. Scientists on this voyage also wanted to get a closer look at deep-sea coral communities. Unlike the corals of shallow waters, very little is known about the biology, ages, and growth rates of deepwater corals. Scientists have estimated that some living deepwater corals date back at least 10,000 years and can grow to more than 25 feet.

The dynamics of these deepwater ecosystems are only beginning to be revealed. Scientists have observed large numbers of commercially important but increasingly rare groupers and redfish among the sheltering structures of deep-sea coral reefs. These reefs may also hold insights to global threats, such as climate change. Because of their longevity, some deep-sea corals can serve as archives of past climate conditions that are important to understanding historical changes in global climate.

Papahānaumokuākea is potentially protecting numerous new species and information that may not be revealed for decades to come.

*A diverse group of deep sea corals, octocorals and zoanthids*

*(Photos: Amy Baco-Taylor)*

**Fishes:** Fish assemblages have been examined on an annual basis from 2000 onward, and monitoring data indicates that biomass of fishes of each trophic group (planktivores, secondary consumers, primary consumers and apex predators) have remained stable (Figure 4.2). A majority of the permanent monitoring sites are in the lagoon and backreef locations where sites can be sampled

on a more regular basis than forereef locations that are more vulnerable to weather and surf conditions. Inventories of apex predators account for 55% of the biomass of fishes in forereef locations. However, most of the large predators reside outside the reef, which means that apex predator densities at these permanent sites are underestimated (Friedlander and DeMartini 2002).

*Japanese Angelfish (Centropyge interrupta)*  
(Photo: James Watt)

Galapagos Shark  
or manō  
(Photo: James Watt)

Top predators play important roles in ecosystems by shaping communities. At Papahānaumokuākea, the apex predators consist of sharks, jacks and large snappers. Beginning in 2005, researchers

electronically tagged multiple Gray Reef Sharks, Galapagos Sharks, Tiger Sharks, Whitetip Reef Sharks, Green Jobfish and Giant Trevally to determine where and how far each species travels. Results indicate that most individuals of most species remain at their home atolls or islands. The only predator observed routinely moving among islands was the Tiger Shark, which not only moved between islands in Papahānaumokuākea but also between Papahānaumokuākea and the main Hawaiian Islands (MHI). The other sharks move extensively within atolls, but patterns and frequency of movement vary among species. The Giant Trevally and Green Jobfish (*Caranx ignobilis* and *Aprion virescens*) showed distinct, rhythmic patterns of movement with diel, tidal, and seasonal components (Meyer et al. 2007a, b).

**Reptiles:** Five species of sea turtles occur in the waters of Papahānaumokuākea, and all are listed under the federal Endangered Species Act. Only one of these species, the Green Turtle (*Chelonia mydas*), utilizes the shores of Papahānaumokuākea to bask and breed, with over 90% of the Green Turtle population in Hawai'i nesting at French Frigate Shoals. Monitoring of this species has taken place for the past 30 years, documenting a steady recovery of Green Turtles from their depleted state in the 1970s (Figure 4.3).

**Marine mammals:** The waters of Papahānaumokuākea are home to over 20 cetacean species, six of which are recognized as endangered and depleted under the U.S. Endangered Species Act and the U.S. Marine Mammal Protection Act. Papahānaumokuākea also hosts the largest population of one of the last two remaining species of monk seals in the world.

The Hawaiian Monk Seal is the only endangered pinniped occurring entirely within United States waters. The monk seal population is estimated to be approximately 1,200 individuals, a decrease of approximately 60% since the 1950s (Antonelis et al. 2006) (Figure 4.4).

**Figure 4.4:** Historical trend in non-pup beach counts of Hawaiian Monk Seals at the six main reproductive subpopulations  
(Source: Antonelis et al. 2006, updated by Baker, PIFSC)

studies include the following:

- Monk seal foraging range covers an area of approximately 48, 156 square kilometers, or almost 14% of the total area of Papahānaumokuākea.
- Seals forage extensively at or near their breeding sites and breeding subpopulations and haulout (basking) sites (95% within 12 km of these sites), except at French Frigate Shoals, where foraging distances were demonstrated to be greater.

Hawaiian Monk Seal (*Monachus schauinslandi*) basking (Photo: James Watt)

Even with significant conservation measures in place, in recent years, monk seal numbers have been declining

- The highest concentration of monk seal activity in Papahānaumokuākea is focused on French Frigate Shoals and surrounding banks.
- Seals move along specific corridors to travel between breeding sites and haulout sites. These corridors are closely associated with the NWHI submarine ridge. Seals likely forage along these corridors around subsurface features like reefs, banks, and seamounts.

at five of eight breeding sites in Papahānaumokuākea Marine National Monument (Figures 4.4, 4.5). Hawaiian Monk Seals are the last hope for the continuation of monk seals globally, and considerable efforts have been made over the last two decades to manage, study, and promote recovery of this species. A Hawaiian Monk Seal recovery plan was recently released, building on the conservation and restoration efforts already in effect.

Between 1996 and 2002, the movements and diving patterns of 147 Hawaiian Monk Seals in the NWHI (consisting of a mix of male and female adults, juveniles, and pups) were monitored with satellite-linked depth recorders. Overall findings of these

**Figure 4.5:** Estimated abundance of monk seals at six breeding sites

**Seabirds:** Seabird colonies in Papahānaumokuākea constitute one of the largest and most important assemblages of tropical seabirds in the world, with 14 million birds representing 21 species (Naughton and Flint 2004). Six of the seabird species residing in Papahānaumokuākea have been classified in the highest concern categories of the North American Waterbird Conservation Plan. More than 98% of the world’s Laysan and Black-footed

Albatrosses nest here. Population trends have been monitored in the NWHI for decades and are stable or increasing for most species, although there is concern for a few, especially the albatrosses (Table 4.1). Monitoring has revealed periodic reductions in reproductive success for two species of albatross, but these reproductive variations appear to be correlated with El Niño weather events; reproductive success is stable for non-El Niño years (Seki 2004).

**Table 4.1:** Overview of seabird monitoring efforts. Gray boxes indicate species and sites that have not been surveyed since 1984. Brown boxes indicate an apparent increase of greater than 25% since 1984, and green a greater than 25% apparent decrease. Blue boxes indicate little change, and purple boxes represent new records for that species at that location. White boxes indicate that the species was not found at that location. ### Cultural

The state of conservation of physical elements of the cultural property (archaeological and cultural sites) is exceptional, both in terms of the physical condition of the resources and the conservation measures in place to maintain them. Native Hawaiian access to the site for the perpetuation of Native Hawaiian use and practices is vibrant and currently in an active period of growth. Conservation measures in place to perpetuate and protect Native Hawaiian practices and culture within Papahānaumokuākea as well as to integrate traditional Hawaiian management practices with Western ones are supported by the vision, goals, strategies and activities of Papahānaumokuākea Marine National Monument.

### Native Hawaiian Archaeological Sites

Strong protection measures, both ancient and modern, as well as the archipelago's remoteness from human populations, mean that the historic sites on Niihau and Mokumanamana are in an excellent state of preservation. The Northwestern Hawaiian Islands have long been revered by Native Hawaiians as a sacred place, and its recent federal and state legal protections have formalized, in the modern age, a triple bond among the islands, Native Hawaiian culture and the general public. The greatest threats to these sites have been from natural processes such as erosion and succession by

native flora and fauna. Some disturbance occurs from burrowing birds and encroachment from root systems of loulou palms, and general exposure to the harsh natural elements.

The condition of Niihau's and Mokumanamana's archaeological and ceremonial sites benefits greatly from the islands' impediments to access: a prohibitively remote location, rugged terrain with few safe areas for

landing, a stringent permitting process for access, and a several-day journey by boat. All provisions, food, water and shelter must be brought from the main Hawaiian Islands. The islands themselves are exposed to the elements, especially Mokumanamana, where the terrain consists mostly of steep, jagged cliffs, often pummeled by gusting winds. According to the archaeologists who have visited the site most recently (Anan Raymond 7 August 2008, personal communication), this explains why the cumulative on-island time in archaeological research totals only 18 days over an 80-year period, including all archaeological research, from the first studies in 1928 (Emory 1928) through the most recent five-day expedition in July 2008 (Kikiloi and Raymond 2008).

Regulated access to Niihau and Mokumanamana is allowed for small groups of cultural and spiritual practitioners for cultural ceremonies. These practices ensure continuity in the Native Hawaiian connection to Papahānaumokuākea; they also form the basis of the creation of a cultural protocol for all visitors to these islands.

Even with the existing level of preservation, both the U.S. Fish and Wildlife Service and the State Historic Preservation Division are considering a coordinated stabilization project for the archaeological sites in East Palm Valley, Niihau, to prevent future loss or damage to those sites. East Palm Valley contains residential features and

large, ceremonial features, one of which is comprised of five terraces (Site 50), and another feature with a large terrace platform holding many uprights and a cairn (Site 51). Extensive bird burrowing is disrupting many of the sites, interior surfaces and deposits, and perimeter and retaining walls. Uprooted, dead loulou palms have also upended portions of the surfaces (Site 43). All the uprights of one ceremonial feature in the Valley were removed by a previous expedition (Emory 1928), blurring the perimeter boundaries (Site 45). Potential stabilization sites include many of the terraces in East Palm Valley, in part because data has already been recovered from them, and their front retaining walls are showing significant collapse. The State Historic Preservation Division requires that any stabilization projects be done without the removal of cultural artifacts (see Nihoa Island Archaeological Sites).

*Status of Native Hawaiian Access  
and Perpetuation of Practices in  
Papahānaumokuākea*

Native Hawaiians have a spiritual and practical connection to Papahānaumokuākea that began with the creation story of the Hawaiian people; that connection has persisted in various forms through the present day. Physical remnants of *wahi kupuna* (ancestral places), Hawaiian language archival and oral resources, and historical accounts provide evidence of the various past uses of the NWHI and surrounding oceans by Native Hawaiians (Kaunamano 1862 in *Hoku a ka Pakipika*; Manu 1899 in *Ka Loea Kalaiaina*; Wise 1923 in *Nupepa Kuokoa*). Evidence indicates that Nihoa and Mokumanamana served as a home and a place of worship for at least a 700-year period (Cleghorn 1988) (see also Section 2). However, by the time of Western European contact with the Hawaiian Islands, the majority of the Hawaiian population knew the region only by repute, as relatively few individuals traveled to these remote islands and had seen them with their own eyes, except families from the northwesternmost main Hawaiian Islands of Kaua'i and Ni'ihau (Maly 2003),

Stone terraces at Nihoa (Photo: Monte Costa)

which are geographically closest to the Northwestern Hawaiian Islands. Yet, oral traditions maintaining the people's connection to Papahānaumokuākea persisted. The oral transmission of knowledge and practice has ensured threads of continuity in Hawaiian people's cultural connection to the NWHI, even in periods when access was more limited than in the past. Despite the waning and waxing of actual access to the NWHI, the islands continuously remained in oral tradition. "We always have these cycles in our stories. The sun rising at Kumukahi (Hawai'i Island) and then setting way over in the West. And this [Papahānaumokuākea] is the West," says Pualani Kanaka'ole Kanahale, one of the foremost Native Hawaiian cultural practitioners, during a Solstice Ceremony at Mokumanamana in 2004. Today, Native Hawaiians remain deeply connected to the NWHI on genealogical, cultural, and spiritual levels. These connections are reinforced by Hawaiian wayfinding efforts, the resurgence of Solstice Voyages, and in other efforts to reinforce bonds between the people and the place.

In 2003, *Hōkūle'a* became the first voyaging canoe to visit Nihoa in many years. Its navigators and cultural practitioners aboard voyaged for one express purpose: "We made that trip to let our ancestors know that we didn't forget them, and to apologize to our ancestors for having been away so long" (Wilhelm 2008, personal communication).

Today, Native Hawaiian practices and activities within Papahānaumokuākea are vibrant, and are experiencing a

period of rapid growth. Highlights of significant Native Hawaiian activities at Papahānaumokuākea since 1997 include these events:

- In 1997, an organization called Hui Mālama i Nā Kūpuna o Hawai‘i Nei repatriated to Nihoa sets of human remains that had been collected by archaeologists in the 1924–1925 Bishop Museum Tanager Expeditions (Ayau and Tengan 2002).
- In 2003, a cultural protocol group, Nā Kupu‘eu Paemoku, traveled to Nihoa on the voyaging canoe *Hōkūle‘a* to conduct traditional ceremonies.
- In 2004, *Hōkūle‘a* sailed more than 1,900 kilometers to the most distant end of the island chain to visit Kure Atoll as part of a statewide educational initiative called “Navigating Change.” The crew officially began their voyage into Papahānaumokuākea by performing cultural protocols at Nihoa. From there, they sailed up the chain, stopping to help remove invasive species and marine debris from the various atolls, pay their respects to each Kupuna Island, and document for school children and

resource managers a basis of comparison of the health of the main Hawaiian Islands’ coastal and reef ecosystems.

- In 2005, Nā Kupu‘eu Paemoku continued their cultural progress and sailed to Mokumanamana to conduct protocol ceremonies on the summer solstice.
- Nihoa serves as a present-day navigational test for traditional, voyaging wayfinders. The ‘Ohana Wa‘a (family of Hawaiian voyaging canoes) has begun testing apprentice navigators by determining if they can sail, without instrumentation, to Nihoa from Lehua, a small, 215-meter-high, crescent-shaped island near Kaua‘i and Ni‘ihau.
- Kekuewa Kikilo (Ph.D. dissertation, University of Hawai‘i at Mānoa) continues to conduct archaeological research at Papahānaumokuākea, studying the historic and cultural sites on Nihoa and Mokumanamana.

Presidential Proclamation 8031, which established the Papahānaumokuākea Marine National Monument, recognizes that the NWHI have great cultural significance to Native Hawaiians and provides a means to

The Hawaiian sailing canoe *Hōkūle‘a* navigating using traditional wayfinding methods (Photo: Monte Costa)

promote access to Papahānaumokuākea for cultural purposes by establishing a permit category specifically to allow Native Hawaiian practices. The Proclamation defines these practices as cultural activities conducted for the purposes of perpetuating traditional knowledge, caring for and protecting the environment, and strengthening cultural and spiritual connections to Papahānaumokuākea that have demonstrable benefits to the Native Hawaiian community. This may include, but is not limited to, the non-commercial use of Papahānaumokuākea resources for direct personal consumption while in the property.

The Monument Management Plan (MMP) implements the Proclamation and further outlines current and future planning, administrative and field activities to enhance the natural, cultural and historic resources in Papahānaumokuākea over a 15-year period. The Vision, Mission and two of the Goals outlined in the MMP reinforce the need to protect Native Hawaiian cultural access and recognize the cultural significance of Papahānaumokuākea to Native Hawaiians.

Monument Vision: “To forever protect and perpetuate ecosystem health and diversity and Native Hawaiian cultural significance of Papahānaumokuākea.”

Monument Mission: “Carry out seamless integrated management to ensure ecological integrity and achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian culture and heritage resources for current and future generations.”

The following goals and strategies are excerpted from the Monument Management Plan, and are numbered accordingly.

Goal 6: “Support Native Hawaiian practices consistent with long-term conservation and protection.”

Goal 7: “Identify, interpret and protect Monument historic and cultural resources.”

Traditional Hawaiian blessing prior to conducting research in Papahānaumokuākea (Photo: Ann Bell)

Several strategies and activities in the MMP support access to Papahānaumokuākea for Native Hawaiian use and practices. Specifically, the MMP contains a Native Hawaiian Cultural and History Action Plan with a desired outcome to:

*“Increase understanding and appreciation of Native Hawaiian histories and cultural practices related to Papahānaumokuākea Marine National Monument and effectively manage cultural resources for their cultural, educational, and scientific value.”*

Several strategies are specifically targeted at ensuring Native Hawaiian cultural access is promoted:

**Strategy 2: Conduct, support, and facilitate Native Hawaiian cultural access and research of the NWHI over the life of the plan.**

Activity 2.1: Continue to compile information and conduct new cultural and historical research about the NWHI.

Activity 2.2: Support Native Hawaiian cultural research needs.

Activity 2.3: Facilitate cultural field research and cultural education opportunities annually.

Activity 2.4: Convene a Native Hawaiian nomenclature working group.

Activity 2.5: Incorporate cultural resources information into the Monument Information Management System.

# BRINGING THE PLACE TO THE PEOPLE NAVIGATING CHANGE

“No longer do we seek only the knowledge of how to voyage between islands. We seek lessons to carry home to our children - ways to inspire the present generation to love and preserve our Earth as a sanctuary for those who will inherit it.”

— Nainoa Thompson,  
Navigator, Hōkūle‘a

Navigator Nainoa Thompson at Pearl and Hermes Atoll. Photo: NOAA.

Kamehameha School students explore NWHI through interactive exhibits at Mokuapāpapa Discovery Center in Hilo. Photos: James Watt.

Painting by Hilo Artist, Layne Luna. This mural covers one large wall at Mokuapāpapa Discovery Center for Hawai‘i’s Remote Coral Reefs, in Hilo, Hawai‘i.

Geologically the oldest in the Hawaiian chain, the Northwestern Hawaiian Islands (NWHI) offer a glimpse back in time to when the lands and waters were healthy and teeming with life. These still-wild ecosystems contain powerful lessons for those of us in the main Hawaiian Islands who are witnessing the decline of our finite island resources. They teach us the importance of caring for the natural world on which our lives and livelihoods depend, and they give us a living model to guide restoration efforts. The Hawaiian Archipelago is one of the few places in the world where large-scale comparisons of impacted and un-impacted reef and island ecosystems of similar species and geography can be made.

But the remoteness of this vast ocean region presents special challenges as to how these lessons can be shared. With access strictly limited, most people are unable to experience the place directly. Thus, the monument and its partners have created a spectrum of educational and experiential opportunities that indirectly connect people with the NWHI and its biological, historical and cultural wonders – in effect, “bringing the place to the people,” rather than the people to the place.

The monument’s educational initiatives include distance learning, presentations and events promoting ocean conservation, teacher workshops, and the Mokuapāpapa Discovery Center for Hawai‘i’s Remote

Coral Reefs in Hilo. In addition, a few educators each year are able to participate in expeditions to the region and subsequently share their experience with their students and communities. Articles and lesson plans from the past few years can be found at: [www.hawaiianatolls.org](http://www.hawaiianatolls.org)

In 2001, the NWHI co-trustees, Bishop Museum, the Polynesian Voyaging Society and a host of other community and government agencies joined forces to form the Navigating Change educational partnership. Inspired by the vision of the late Pinky Thompson and his son Nainoa, the partnership built an educational program that extends Hōkūle‘a journeys to the NWHI into schools statewide. These classroom voyages of discovery challenge students to change their values, attitudes and behaviors, and encourage them to get actively involved in community efforts to mālama and restore the marine and terrestrial environments where they live.

The Hawai‘i Maritime Center, next to Aloha Tower, also hosts an interactive Navigating Change exhibit where visitors can role-play being a scientist exploring the NWHI on a research cruise.

**To learn more about Navigating Change curriculum or up-coming teacher workshops, visit: [www.navigatingchange.org](http://www.navigatingchange.org)**

*The new national monument creates a new opportunity for ocean education and research for decades to come. Successful ocean stewardship depends on informed policy makers and an informed public.*

Activity 2.6: Continue to facilitate Native Hawaiian cultural accesses.

Activity 2.7: Establish agreements with local universities and museums to address possible curation, research, use, return, and repatriation of collections.

***Strategy 4: Plan, develop, and implement a Monument Cultural Resources Program over the life of the plan***

Activity 4.1: Prepare a Cultural Resources Program Plan.

Activity 4.2: Develop and implement specific preservation and access plans, as appropriate, to protect cultural sites and collections at Nihoa and Mokumanamana.

Activity 4.3: Initiate implementation of the Monument Cultural Resources Program.

Active and meaningful engagement between the Native Hawaiian community and the management of Papahānaumokuākea preceded its establishment as a monument. Since that time, programs engaging the Native Hawaiian community and supporting Native Hawaiian practices have expanded, and new collaborations continue to be established. Native Hawaiian programmatic areas continue to progress and are accentuated by new efforts to meet MMP goals.

**Native Hawaiian Cultural Working Group**

The Executive Order that designated the NWHI Coral Reef Ecosystem Reserve (the Reserve) in 2000 required that Native Hawaiians, among others, provide advice regarding management of the Reserve and ensuring the continuance of Native Hawaiian practices. It did so through provisions allowing for “culturally significant, noncommercial subsistence, cultural, and religious uses” in the Reserve by Native Hawaiians, and set aside three voting seats on the Reserve Advisory Council for Native Hawaiians. During its first five years of operation, the Advisory Council established a Native Hawaiian Cultural Working Group, which broadened the inclusion of Native Hawaiians in the operations of the Reserve

*Mokupāpapa Discovery Center in Hilo, Hawaii*  
(Photo: PMNIM)

and in planning for a proposed National Marine Sanctuary.

The Monument Management Board (MMB) includes representation by the Office of Hawaiian Affairs (OHA). Currently, OHA is the only State agency with a statutory mandate to advocate for Native Hawaiians and to assess the policies and practices of other agencies’ impacts on Native Hawaiians. OHA, on behalf of the MMB, will continue to convene the Native Hawaiian Cultural Working Group to obtain advice and guidance from Native Hawaiian cultural experts, including *kūpuna* (respected elders) and practitioners, on all Monument actions affecting Native Hawaiians and cultural resources at Papahānaumokuākea. Over time, the MMB may develop other mechanisms to bring together Native Hawaiians to participate in Papahānaumokuākea’s activities and management.

The Native Hawaiian Cultural Working Group provides guidance to the MMB through OHA. This group provided Papahānaumokuākea with its name and has offered support on permit review and the continuing development of permit conditions and cultural protocols as it relates to Native Hawaiian practices. The incorporation of Native Hawaiian culture into Monument management will gain the long-term support of, and greater understanding from, the host culture of the Hawaiian Archipelago.

## 4.b Factors Affecting the Property

### (i) Development Pressures

There are no development pressures affecting the property, nor are any anticipated in the future. The site's remoteness, along with stringent conservation laws and robust management practices ensure that development pressures are not a factor in the

Over 586 tons of marine debris have been removed from Papahānaumokuākea over the last 10 years  
(Photo: CRED, NOAA)

on the footprints of existing structures. Any designs for new structures will utilize new sustainable technologies to set an environmentally responsible development standard regarding the inhabited areas of Papahānaumokuākea. Additionally, within the Monument Management Plan outlines are presented for further support of field camps at French Frigate Shoals and Kure Atoll to aid in the monitoring of seabirds, sea turtles and monk seals.

(Photo: Susan Middleton & David Liittschwager)

### (ii) Environmental Pressures

#### Marine pollution

The major form of marine pollution both inside and outside of Papahānaumokuākea Marine National Monument boundaries is marine debris. As with many marine ecosystems around the world, marine debris is a constant threat to certain components of the ecosystems of Papahānaumokuākea (Selkoe et al. 2008). Although no commercial or recreational fishing is permitted in Papahānaumokuākea's waters, derelict fishing nets and gear, plastics and other ocean-borne debris are concentrated by ocean currents and wash up on the reefs and beaches of the property. Entanglement in marine debris has been identified as a major threat to the endangered Hawaiian Monk Seal; debris entanglement also threatens sea turtles, seabirds, cetaceans and coral reef organisms. An ongoing multi-agency marine debris clean-up program has removed more than 586 tons of debris from the property in the past ten years (Figure 4.6).

Fishing elsewhere in the Pacific has the potential to harm Papahānaumokuākea's highly migratory marine species, such as tuna, sharks, seabirds, and marine mammals that may otherwise forage or travel outside of the Papahānaumokuākea's protective boundaries.

Birds are also harmed by debris. Smaller types of marine debris made of plastic, such

166

property's future. Presidential Proclamation 8031 specifically forbids activities such as mining or other extractive practices. In addition, with very limited exceptions, the federal regulations for Papahānaumokuākea prohibit anyone from removing, moving, taking, harvesting, possessing, injuring, disturbing or damaging any of its living or nonliving resources, or attempting any of these actions unless authorized by a Monument permit (50 CFR § 404.7(a)). Modification of existing facilities (e.g., on Midway's Sand Island or Tern Island in French Frigate Shoals) occurs in strict compliance with refuge laws and regulations, applicable historic regulations, and National Environmental Policy Act requirements. The natural, cultural and historic resources of the property are well protected.

All improvements planned for Midway Atoll in the Midway Atoll Conceptual Site Plan (Volume IV of Monument Management Plan) will be made in existing structures or built

as disposable lighters, bottle caps, and other fragments, are ingested by adult albatrosses, shearwaters, and other seabirds when they feed at sea (Fry et al. 1987). These objects are subsequently fed to chicks and can cause direct and indirect injuries, often resulting in the death of young albatrosses. Additionally, this debris may increase the birds' exposure to and ingestion of organochlorine contaminants from plastic surfaces (Carpenter and Smith 1972).

### Terrestrial pollution

Past uses have contributed to significant modification and contamination throughout the region, especially at French Frigate Shoals, Midway Atoll, and Kure Atoll. Contamination at all these sites includes offshore and onshore contaminated debris such as batteries (lead and mercury), transformers with PCBs, capacitors and barrels. Debris washing ashore is another source of contamination on the islands. Studies have shown that soil can constitute up to 30% of the material a bird consumes, and hence soil contamination from the above substances is a substantial threat to the bird populations (Hui and Beyer 1998; Beyer et al. 1994). Lead-based paints on the former naval buildings at Midway can affect nearby albatross chicks; chicks that ingest paint chips have been found to have blood lead concentrations that cause immunological, neurological, and renal impairments, significantly decreasing their chances of survival. A significant effort is underway to remove the lead paint and to monitor the contaminated sites.

Marine debris are an ever-present threat for both terrestrial and marine species (Photo: James Watt)

Uncharacterized, unlined landfills remain on some of these islands. Kure Atoll and French Frigate Shoals both have point sources of PCBs due to former U.S. Coast Guard LORAN stations. While the Coast Guard has mounted cleanup actions at both sites, elevated levels of contamination remain in island soils, nearshore sediment, and biota. Additional continued landfills were left behind by the Navy on Midway Atoll. In response to these threats, emergency response mechanisms and ongoing cleanup and restoration activities will be maintained and enhanced.

### Alien species

The waters surrounding Papahānaumokuākea are nearly pristine. A total of 11 marine alien fish, invertebrates and algal species have been recorded in the NWHI (Table 4.2). Alien species may be introduced accidentally, such as with

vessel discharge, marine debris, or aquaculture, or intentionally, as in the case of a few species of snappers, grouper and algal species.

The magnitude of the problem of marine invasive species is far greater in the MHI than the NWHI. Efforts to control the accelerated introduction of alien species in the NWHI will focus on transport

Figure 4.6: Quantity of marine debris removal in Papahānaumokuākea (Source: PIFSC-CRED unpublished data)

Reef Assessment and Monitoring Program team preparing for rapid ecological assessments  
(Photo: James Watt)

mechanisms, such as marine debris, ships' hulls, and the discharge of bilge water from vessels originating from the main Hawaiian Islands and other ports. Existing Monument regulations and permitting requirements greatly reduce the chance of new introductions (for complete details see Appendix F, Appendix K Volume 1).

However, several of the islands and atolls of Papahānaumokuākea have been, in the past, heavily inundated by terrestrial alien species. Both Midway Atoll and Laysan Island have incurred multiple introductions, many of which transformed the landscapes. Some of the most invasive introductions were intentional, such as vegetation, rats, and rabbits that caused extensive damage. To date, rats and rabbits have been successfully exterminated in Papahānaumokuākea, but various other alien species still plague the inhabited islands and atolls. The number of alien land plants in Papahānaumokuākea varies from only three

introduced at Nihoa, to 249 introduced at Midway Atoll. Numerous efforts have been made to eradicate and restore the emergent lands to their native conditions, particularly at Laysan Island and Midway Atoll. Other management and restoration efforts are undertaken annually during the late spring through mid-fall field season. To prevent further importation of invasive plants, animals or insects, mandatory quarantine protocols are enforced for any visitors to all the islands of Papahānaumokuākea, with the exception of Midway Atoll and French Frigate Shoals. These protocols require the use of new or island-specific gear at each site and treatments such as cleaning, using insecticide, and freezing to minimize the transport of potential invasive species to the islands. For a full listing of terrestrial protocols, see Appendix F.

### Climate change

Climate change poses a threat to all coral reef ecosystems throughout the world, and the Papahānaumokuākea Marine National Monument is no exception. The increase in average global temperatures, sea-level rise and change in chemical concentrations in the world's oceans are typically cited as the results of global climate change. Regional predictions for the North Central Pacific Gyre area within the next 15 years are for surface temperature increases of 0.5 to 1.0 degrees Celsius, which is a smaller increase than that predicted for the Arctic and Northern hemisphere continental areas. Elevated sea surface temperatures such as those projected can lead to coral bleaching events, when corals expel their symbiotic algae and become white, or bleached. This

Ta'ape (*Lutjanus kasmirus*), a lutjanid snapper introduced in the main Hawaiian Islands in the 1950s, has spread to the waters of Papahānaumokuākea  
(Photo: James Watt)

Table 4.2: Marine alien species in Papahānaumokuākea

Species	Taxa	Native Range	Present Status in Papahānaumokuākea <sup>2</sup>	Mechanism of Introduction
<i>Hypnea musciformis</i>	Algae	Unknown; Cosmopolitan	Not Established; in drift only (MAR)	Intentional introduction to main Hawaiian Islands (documented)
<i>Diadumene lineata</i>	Anemone	Asia	Unknown; on derelict net only (PAH)	Derelict fishing net debris (documented)
<i>Pennaria disticha</i>	Hydroid	Unknown; Cosmopolitan	Established (PAH, LAY, LIS, KUR, MID)	Fouling on ship hulls (hypothesized)
<i>Balanus reticulatus</i>	Barnacle	Atlantic	Established (FFS)	Fouling on ship hulls (hypothesized)
<i>Balanus venustus</i>	Barnacle	Atlantic and Caribbean	Not Established; on vessel hull only (MID)	Fouling on ship hulls (documented)
<i>Chthamalus proteus</i>	Barnacle	Caribbean	Established (MID)	Fouling on ship hulls (hypothesized)
<i>Amathia distans</i>	Bryozoan	Unknown; Cosmopolitan	Established (MID)	Fouling on ship hulls (hypothesized)
<i>Schizoporella errata</i>	Bryozoan	Unknown; Cosmopolitan	Established (MID)	Fouling on ship hulls (hypothesized)
<i>Lutjanus kasmira</i>	Fish	Indo-Pacific	Established (NIH, MMM, FFS, MAR, LAY, and MID)	Intentional introduction to Main Hawaiian Islands (documented)
<i>Cephalopholis argus</i>	Fish	Indo-Pacific	Established (NIH, MMM, FFS)	Intentional introduction to Main Hawaiian Islands (documented)
<i>Lutjanus fulvus</i>	Fish	Indo-Pacific	Established (NIH and FFS)	Intentional introduction to Main Hawaiian Islands (documented)
<i>Cnemidocarpa irene</i>	Tunicate	Indo-Pacific	Established (FFS)	Fouling on ship hulls (hypothesized)
<i>Polycarpa aurita</i>	Tunicate	Indo-Pacific and Western Atlantic	Established (FFS)	Fouling on ship hulls (hypothesized)

Notes:

1 Zabin et al. 2003, Godwin 2002, DeFelice et al. 2002, Godwin 2000, DeFelice et al. 1998, McDermid (pers. com.)

2 NIH=Nihoa, MMM=Mokumanamana, FFS=French Frigate Shoals, MAR=Maro, PAH=Pearl and Hermes, LAY=Laysan Island, LIS=Lisianski Island, MID=Midway, KUR=Kure Atoll

phenomenon, which has already been observed in Papahānaumokuākea (Aeby et al. 2003; Kenyon and Brainard 2006), generally leads to partial or total mortality of the bleached coral and increases corals' susceptibilities to various diseases.

Ocean acidification, resulting from elevated CO<sub>2</sub> levels that occur in conjunction with climate change, would have multiple impacts to coral reef ecosystems, including decreased abundance of aragonite (a major building block for coral reefs) and the dissolution of coral substrate and structures (Vitousek 1994). These effects lead to pronounced decreases in coral growth rates (Hoegh-

Guldberg 2005; Henderson 2006). Ocean acidification does not only affect submerged reefs; it would similarly affect the carbonate-based island atolls, further expediting the natural subsidence of these islands and atolls.

Additionally, sea-level rise poses a significant threat to the terrestrial ecosystem. Recent modeling scenarios indicate that between 5% and 69% of some terrestrial habitats in Papahānaumokuākea could be lost due to rising sea levels by the year 2100 (Baker et al. 2006). Sea-level rise is likely to have a significantly deleterious effect on Hawaiian Monk Seal pupping sites, Green Turtle nesting areas

and Laysan Finch habitat, in addition to numerous other endangered and endemic species (Selkoe et al. 2008).

It should be noted that these environmental pressures are global in nature, and arise predominantly outside the boundaries of the property. The property includes all the key areas and ecosystems to maintain its ecological

*A fragile balance* (Photo: James Watt)

integrity, and is of sufficient size to maintain associated biological and ecological processes to assure resilience in the face of effects from climate change.

170

The possibility of cultural resilience, and managing for social-ecological resilience, in the face of global climate change has received increasing attention from academics, managers, and communities worldwide (e.g., MEA 2005) and has become a major topic in the science and management of coral reefs (Hughes et al. 2005). The coupled social-ecological resilience of Papahānaumokuākea remains an area of great concern. Engaging with traditional ecological knowledge and local ecological knowledge is increasingly considered integral to enhancing and managing for resilience (Berkes et al. 2003; Davis & Wagner 2003; Folke 2006).

Traditional Native Hawaiian knowledge and practice can provide a rich example of resilience in the face of extreme environmental and socio-cultural change. To address these current concerns, Monument staff are working

to interweave multiple forms of knowledge into the management of Papahānaumokuākea, as exemplified by the MMP vision, goals and strategies described in preceding sections. For example, Monument staff and Native Hawaiian practitioners hosted a workshop for Hawai'i-based coral reef managers entitled "Response to Climate Change (RtCC)." This five-day workshop, based on one designed by the Great Barrier Reef Marine

Park Authority, was re-designed to incorporate traditional Native Hawaiian knowledge into modern reef management practices.

### Diseases

The incidence of diseases affecting marine organisms is increasing globally, but the factors contributing to disease outbreaks remain poorly known. The overall average prevalence of coral disease is quite low in the NWHI as compared to other coral reef areas (Aeby 2006, Friedlander et al. 2005).

Most diseases are presumed to be caused by anthropogenic impacts. Hence, the nearly pristine nature of the coral reefs of the NWHI provides a unique opportunity to document baseline levels of disease in coral reefs (Aeby 2006). Recent studies have begun to document these disease baselines in corals and other associated marine animals such as fish and sea turtles. With documented cases of disease in the NWHI, protocols have been developed and are now incorporated in all permitted activities (see Appendix F for complete details).

### Transportation hazards and groundings

Hazards to shipping and other forms of maritime traffic such as shallow submerged reefs and shoals are inherent in the NWHI. The region is exposed to open-ocean weather and sea conditions year-round, punctuated by severe storm and wave events in winter. Hence vessel groundings and the release of fuel, cargo, and other items would pose real threats to the NWHI (Selkoe et al. 2008). Likewise, aircraft landing at Midway Atoll or Tern Island pose certain risks to

(Photo: James Watt)

wildlife and other resources, including bird strikes, introduction of alien species, aircraft crashes, and fuel spills. Certain management practices, such as requiring night landings and runway sweeps during albatross season at Midway, as well as alien species inspections, minimize these risks.

Historically, there have been numerous spills and shipwrecks in the property, and a few in more recent times. In April 2008, a designation by the International Maritime Organization (IMO), declared the waters of Papahānaumokuākea a “Particularly Sensitive Sea Area” (PSSA), implemented a mandatory ship reporting system and expanded and consolidated existing Areas To Be Avoided (ATBA) into four larger ATBAs. The designation puts into effect internationally recognized measures designed to protect marine resources of ecological or cultural significance from damage by ships, while helping keep mariners safe (see Sections 1.e, 5.a and 5.b). While accidents may still happen, careful permitting procedures, restrictions on entry to Papahānaumokuākea Marine National Monument, vast improvements in nautical charts, and vessel safety regulations now in place should keep this threat to a minimum.

### **Military presence**

Activities and exercises of the Armed Forces (including those of the United States Coast Guard) are conducted occasionally within Papahānaumokuākea’s boundaries. Navy vessels conduct training and participate in testing activities in the Hawai’i Range Complex (area encompasses North Central Pacific, within which Papahānaumokuākea

lies). These activities are described and analyzed in detail in the Hawai’i Range Complex Final Environmental Impact Statement (May 2008). In addition, vessels that support missile defense tests occasionally operate in Papahānaumokuākea’s waters.

Although Presidential Proclamation 8031 exempts activities and exercises of

the Armed Forces from the Proclamation’s prohibitions, all activities must be consistent with applicable laws. The Proclamation further states that “All activities and exercises of the Armed Forces shall be carried out in a manner that avoids, to the extent practicable and consistent with operational requirements, adverse impacts on the monument resources and qualities. In the event of threatened or actual destruction of, loss of, or injury to a monument resource or quality resulting from an incident, including but not limited to spills and groundings, caused by a component of the Department of Defense or the USCG, the cognizant component shall promptly coordinate with the Secretaries for the purpose of taking appropriate actions to respond to and to mitigate the harm, and if possible, restore or replace the monument resource or quality.”

These terms establish strong requirements to avoid adverse impacts to Papahānaumokuākea resources, if practicable and consistent with operational requirements, and require prompt coordination with the federal Co-Trustees if a resource loss or injury

3-inch gun, a remnant of the Battle of Midway  
(Photo: Michael Lusk, FWS)

occurs or is threatened. Furthermore, the military must adhere to all other applicable laws and regulations such as the Endangered Species Act, the Marine Mammal Protection Act, the National Wildlife Refuge System Administration Act, the National Historic Preservation Act, and the Migratory Bird Treaty Act.

The Monument Management Board (MMB) is working with representatives of the military to develop a consultation process prior to undertaking activities in Papahānaumokuākea, which will ensure that the resources and qualities of the property are not harmed.

#### **Native Hawaiian archaeological sites**

Ecological damage to Native Hawaiian archaeological sites to date is limited to that caused by burrowing birds and the root systems of loulou palms. A balance in preserving all of these natural and archaeological resources will be found. Any restoration undertaken should be planned and carried out with consideration to indigenous knowledge and approaches.

#### **The living cultural connection to Papahānaumokuākea**

Nature and culture are inseparable in the Native Hawaiian worldview. Thus, to Native Hawaiians, factors affecting the site's natural resources also affect the living cultural association to the site.

In addition, a variety of socioeconomic, political, and other factors have the potential to negatively impact the living cultural association between Native Hawaiians and Papahānaumokuākea. Some of these potential negative effects are exogenous (e.g., global economy; a decline in cultural transmission). However, the MMP has been proactive in its efforts to foster and enhance Native Hawaiian relationships to Papahānaumokuākea, addressing issues like Native Hawaiian access and the ability to practice culture, conduct research and meaningfully engage in Monument management. These activities are addressed thoroughly in Section 4.a, above, and the MMP (see Appendix K, Supporting Materials).

#### **(iii) Natural Disasters and Risk Preparedness**

Tropical storms and hurricanes are natural hazards that may occur at Papahānaumokuākea. However, only three hurricanes have approached the land masses in the property in the last fifty years. In 1959, Hurricane Patsy passed between Kure and Midway atolls. The last recorded hurricane affecting Papahānaumokuākea was Nele, which passed near Gardner Pinnacles in 1985. Damage from these rare events is likely to affect each of the islands differently, depending on the nature and severity of the event.

It is possible that the property could be adversely affected by a tsunami such as that experienced in Southeast Asia in 2004. Sea level measurement stations have been established at Midway and French Frigate Shoals as part of the Pacific Tsunami Warning Center's network. These stations provide information during tsunami events to help track the size and paths of tsunamis generated in the Pacific. At least six major tsunamis have affected the main Hawaiian Islands in the past sixty years. Of these six, four were generated in Alaska, one in Chile, and one near the southern coast of Hawai'i Island. In addition to damages caused by terrestrial inundation, tsunamis could also result in broken coral reef structures, as well as damage by sedimentation and piling of debris. As the marine ecosystem has evolved with periodic disturbance by tsunamis and seasonally high wave energy events, its capacity to recover fully from tsunamis and other wave events would be expected.

#### **Contingency plans for dealing with disasters**

The U.S. Fish and Wildlife Service (FWS) has various contingency plans for dealing with disasters. There are emergency plans and protocols for staff at Laysan, French Frigate Shoals, and Midway, in case of tsunami or hurricane (FWS 2007; FWS 2006) (see Appendix N). A full plan for Midway is laid out in the Midway Atoll NWR Facility Response Plan, (FWS 1999) (see Appendix N). For general emergency response at Midway, there is a Midway

Airport Emergency Response Plan; Appendix I of the Henderson Field Airport Certification Manual; November 30, 2006. On Laysan, an engineered hurricane shelter is provided for refuge in case of a hurricane. The FWS has also drafted a Rat Spill Contingency Plan (FWS 2000), outlining response protocols to be followed in the event of a ship grounding and subsequent introduction of rats to any of the islands or atolls.

The National Marine Fisheries Service (NMFS) also has extensive emergency plans for its operations conducted within the property (see Appendix N). Plans exist to provide support and guidance in the event of a medical emergency or severe weather event. Field personnel are trained in wilderness first aid and the use of emergency equipment in case of a medical emergency, hurricane, or tsunami. Through satellite phone/email communication with NMFS personnel in Honolulu as well as cooperating agencies (U.S. Coast Guard, Health Force Partners, FWS, DLNR) field personnel would work to determine the best course of action depending on the situation and location.

#### (iv) Visitor/tourism Pressures

The MMP contains a long-term visitor services plan, which in accordance with Presidential Proclamation 8031 allows recreational visitors only on Midway Atoll. Numbers of overnight visitors are limited to no more than 50 at any one time. The availability of transportation to Midway means that visitation levels are actually much lower than the maximum number allowed. Flights to Midway are infrequent and occur usually no more than once per week on a small, chartered plane. Visitor

programs are closely monitored to ensure they are causing no adverse effects. The property's managers have the ability to wholly control access by visitors through the permitting process. Midway's visitor program, which allows the public to learn about and experience this unique ecosystem, is expected to only bring benefits to Papahānaumokuākea.

In addition to provision for overnight visitors, it is equally important to allow day visitors to come to Midway Atoll—considered the window to Papahānaumokuākea. All visitors learn about and experience its unique wildlife and historic resources, as well as the natural and cultural resources of Papahānaumokuākea and its importance to Native Hawaiians. Day visits via larger aircraft or small passenger vessel allow a broader range of visitors, including World War II veterans and their families, many of whom have close direct ties with the atoll and who might otherwise have difficulty getting to Midway. The number of larger day visits of 50-800 people to Midway is limited to no more than three per year, with no more than 400 people ashore at any one time. In the past, Midway has hosted numerous large groups, numbering from 250 to 1,800 visitors each. However, the largest groups

taxed the ability to provide the high-quality visitor experience desired. Because groups are limited to existing roads and trails and are typically divided into smaller groups for walking tours, no negative impacts from these visits have been documented. Visitors remain in areas where albatrosses are already acclimated to human presence, and they are restricted from any area where Hawaiian Monk Seals or Green Turtles may be present.

These visits have had a strong positive effect on Midway’s guests, with many expressing their commitment to maintaining such special wildlife habitats, doing their part to reduce threats to wildlife, and their appreciation for those who valiantly fought the Battle of Midway. All groups must meet all Monument findings and requirements as specified in Presidential Proclamation 8031 and its implementing regulations at 50 CFR 404.11, including obtaining the appropriate (usually Special Ocean Use) Monument permit. In addition, passenger vessels and aircraft must meet specific Refuge requirements (see Section 5).

**(v) Number of Inhabitants Within the Property and the Buffer Zone**

174

Only three sites within Papahānaumokuākea are inhabited year-round and these are Midway Atoll, Laysan Island and Tern Island within French Frigate Shoals. The Laysan Island site is a temporary field camp with tents and other non-permanent structures that house staff and volunteers for up to 12 months at a time (see Table 4.3 for island-by-island occupancy details). Midway Atoll houses FWS staff and volunteers as well as up

to 50 contract workers who manage the daily operations at this site. At Tern Island, French Frigate Shoals, a permanent facility houses a small (2-6) permanent staff. In addition to the permanent staff, a few NOAA biologists are stationed there each summer to undertake population assessments for Hawaiian Monk Seals and Green Turtles.

Annual field camps to undertake population assessments and restoration activities have been set up for several years at Kure Atoll, Pearl and Hermes Atoll and Lisianski Island. The temporary field camps range in size from two to six staff and volunteers for up to six months during the late spring to early fall. The number of camps and personnel is subject to annual funding allocations and opportunities for access to these remote locations. See Appendix O for complete details on island-by-island staffing numbers.

Specifically:

**Number of inhabitants within the property and buffer zone**

Estimated population located within:

Area of nominated property: 130 (permanent and seasonal staff)

Buffer zone: N/A

Protection and Management

## 5. Protection and Management

### 5.a Ownership

All of the Papahānaumokuākea Marine National Monument property is owned or controlled by the Governments of the United States and the State of Hawai‘i. Pursuant to Presidential Proclamations 8031 of June 15, 2006 and 8112 of February 28, 2007, applicable laws and agreements, the U.S. Department of Commerce through the National Oceanic and Atmospheric Administration (NOAA), the U.S. Department of the Interior through the U.S. Fish and Wildlife Service (FWS), and the State of Hawai‘i are the government entities with legal authority, jurisdiction or control of Papahānaumokuākea. These three government entities are the Co-Trustees of the public interest. There is no private ownership of the Papahānaumokuākea Marine National Monument property.

#### Traditional or Customary Ownership

In 1893, the Kingdom of Hawai‘i, which included most of the Northwestern Hawaiian Islands, was overthrown with the involvement of certain United States officials and others. Some involved in the overthrow and others went on to create a provisional government and then the Republic of Hawai‘i, which assumed control of approximately 1.8 million acres of crown, government, and public lands of the Kingdom of Hawai‘i, including certain submerged and fast lands of the Northwestern Hawaiian Islands. Upon its annexation, the Republic ceded these lands to the United States in 1900. A majority of these lands were again ceded, this time to the State of Hawai‘i, upon statehood in 1959.

Under the terms of the statute admitting Hawai‘i as a state in 1959, the federal government granted title to Hawai‘i to most of the previously ceded lands and mandated that these ceded lands be held by Hawai‘i in public trust. In accordance with the Hawaii Organic Act of April 30, 1900, c 339, 31 Stat 141, and the Hawaii Admission Act of March 18, 1959, Pub L 86-3, 73 Stat 4, most of the islands of the Hawaiian Archipelago that were part of the Territory of Hawai‘i became part of the State of Hawai‘i as part of the public land trust. Hawai‘i’s lands continue to hold a considerable amount of legal, historical, and sentimental significance to Native Hawaiians. Pursuant to Section 5(f) of the Hawaii Admission Act, one purpose for which the ceded lands are held in trust by the State is “for the betterment of the conditions of native Hawaiians.”

The Native Hawaiian community has expressed a strong interest in participating in management decisions affecting Papahānaumokuākea. Respecting Native Hawaiian traditions and values and providing an effective degree of participation in the protection and stewardship of the area will provide an opportunity for Native Hawaiians to maintain ancestral connections to Papahānaumokuākea.

### *Representative Management Body*

The State of Hawai'i, FWS, and NOAA (collectively, the Co-Trustees) carry out coordinated management for the long-term comprehensive conservation and protection of the property. The representative body that manages, coordinates, plans and monitors activities within Papahānaumokuākea Marine National Monument is known as the Monument Management Board:

Monument Management Board  
Papahānaumokuākea Marine  
National Monument  
6600 Kalaniana'ole Highway, Suite 300  
Honolulu, Hawai'i 96825  
USA

The functional relationships among the Co-Trustees to coordinate management actions in Papahānaumokuākea are established and defined by a Memorandum of Agreement (MOA) that the Co-Trustees executed on December 8, 2006.

Per the MOA, policy guidance is provided by a Senior Executive Board, consisting of three senior level designees representing the Co-Trustees. In addition, the seven-member Monument Management Board coordinates management of the Papahānaumokuākea Marine National Monument at the field level, and includes designees from NOAA's Office of National Marine Sanctuaries and National Marine Fisheries Service, FWS's National Wildlife Refuge Program and Pacific Islands Fish and Wildlife Office, the State of Hawai'i Department of Land and Natural Resources' (DLNR) Division of Aquatic Resources and Division of Forestry and Wildlife, and the

Office of Hawaiian Affairs. Together, the Senior Executive Board and the Monument Management Board represent the combined policy and field-level management authority of the Co-Trustees, acting on behalf of the State of Hawai'i and the United States.

### *Restrictions on Public Access*

Presidential Proclamation 8031, which established Papahānaumokuākea Marine National Monument, as well as federal regulations promulgated by the U.S. Departments of the Interior and Commerce to implement the provisions of the Proclamation, prohibit entering the property unless permission has been granted by the Co-Trustees via a rigorous permit or notification system to manage activities that may affect Papahānaumokuākea's resources.

Any domestic vessel or persons passing through Papahānaumokuākea without interruption must notify an official designated by the Secretaries of Commerce and Interior at least 72 hours, but no longer than one month, prior to the entry date. Notification of departure from Papahānaumokuākea must be provided within 12 hours of leaving. Any vessel granted permission to enter and engage in activities within Papahānaumokuākea is required to have a vessel monitoring system (VMS).

As under international law, rights of navigation are respected, but regulated.

*A field party approaches their work site*  
(Photo: James Watt)

(Photo: State of Hawai'i Archives)

In this case, the regulation of access to Papahānaumokuākea by vessels has been reviewed and approved through processes of the International Maritime Organization (IMO). The IMO is a specialized agency of the United Nations responsible for measures to improve the safety and security of international shipping and protect the marine environment from threats associated with international shipping. Within the IMO, the Marine Environmental Protection Committee (MEPC) and the Maritime Safety Committee (MSC) have agreed that Papahānaumokuākea Marine National Monument be designated as a Particularly Sensitive Sea Area (PSSA).

The PSSA is complemented by the associated IMO protective measures of voluntary Areas To Be Avoided (ATBAs) and a ship reporting system (SRS). See Section 5.b for additional details.

178

There are, of course, the standard exceptions for official access that are necessary for certain emergency conditions, law enforcement purposes, and activities of the Armed Forces of the United States.

All Papahānaumokuākea prohibitions and restrictions are prescribed consistent with international law. The restrictions apply against foreign vessels and nationals within the territory and territorial sea, unless the application interferes with their international right of innocent passage. No prohibitions or restrictions are applied or enforced against a person who is not a citizen, national, or resident alien of the United States (including foreign flag vessels) outside of the 12-nautical-mile territorial sea unless in accordance with international law.

Consistent with international law, the U.S. has proclaimed a 12 nautical mile territorial sea, a 24-nautical-mile contiguous

zone, and a 200-nautical-mile Exclusive Economic Zone (EEZ). Foreign states are thus notified that U.S. laws regulating the exploration and exploitation of marine resources, such as oil and fisheries, also apply within the 200-nautical-mile EEZ/continental shelf. While it does not own the EEZ/continental shelf beyond its territorial sea, as a coastal state- the U.S. does have the necessary jurisdiction, authority and control over the resources and activities for long-term protection and management of Papahānaumokuākea resources as established under the Antiquities Act and other applicable laws.

In complement to federal law, Hawai'i State law administers the only public meeting process for permitting a limited access to Papahānaumokuākea areas and waters under state jurisdiction. Under the MOA, the Co-Trustees jointly issue permits for access and activities in Papahānaumokuākea.

## 5.b Protective Designations

Over the past century, the NWHI have been the focus of various conservation efforts by the United States, receiving increasing protections that have culminated in Proclamation 8031, which created Papahānaumokuākea Marine National Monument. In 1903, U.S. President Theodore Roosevelt sent in U.S. Marines to stop the slaughter of seabirds at Midway Atoll. In 1909, the remaining islets and reefs of the NWHI were placed within the Hawaiian Islands Reservation. And in 1940, the Reservation became the Hawaiian Islands National Wildlife Refuge through Presidential Proclamation 2416.

Within the last ten years, state and federal government have made the highest possible commitment to the long-term protection of this area, with the establishment and the designation of the area first as the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve under Presidential Executive Orders 13178 in 2000 and 13196 in 2001; the full protection of all State of Hawai'i waters in the Northwestern Hawaiian Islands upon creation of the Northwestern Hawaiian Islands Marine Refuge

**Table 5.1: Protections in Papahānaumokuākea Marine National Monument**

All commercial fishing eliminated as of 2011
All extractive activities restricted
Access only by permit or notification
No mining, drilling or exploring for oil or gas
No anchoring on coral
Tourism limited only to Midway Atoll
Vessel monitoring system required for all vessels permitted to enter Papahānaumokuākea
No use of explosives, poisons, or electrical charges
No introduction of non-indigenous species
Discharge or disposition of any materials prohibited or severely restricted
Quarantine protocols for moving between islands, access, disease, introduced species and organism sampling applied to all activities
Rigorous permit review system in place for approval of all activities
International Maritime Organization Particularly Sensitive Seas Area designation
Specific laws to protect endangered species, cultural and historic resources
Hull inspections and rat-free certification required for all vessels permitted to enter Papahānaumokuākea
Numerous general and specific permit conditions for all permitted activities

in 2005; and the creation of the Monument under Presidential Proclamation 8031 in 2006. The Co-Trustees are committed to preserving the ecological integrity of Papahānaumokuākea and perpetuation of the NWHI ecosystems, Native Hawaiian culture, and other historic resources. Table 5.1 summarizes many of the protections in Papahānaumokuākea.

In addition to the numerous overlays of protection designated within Papahānaumokuākea through the Hawaiian Islands National Wildlife Refuge, the Midway Atoll National Wildlife Refuge, the Battle of Midway National Memorial, the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, the Hawai'i State Seabird Sanctuary at Kure Atoll, and the Northwestern Hawaiian Islands Marine Refuge, the numerous laws detailed below are all in effect and enforced to ensure compliance. See Appendices G-J for full documents of measures listed below.

### *International Legal Measures*

#### **1. Areas to be Avoided “In the Region of the North-West Hawaiian Islands” (International Maritime Organization, 1981)**

Areas to Be Avoided (ATBAs) are navigation measures approved by the International

Maritime Organization (IMO). The IMO is the United Nations organization that promotes cooperation among governments and the international shipping industry to improve maritime safety and to prevent marine pollution. In 1981, six voluntary ATBAs were adopted by IMO to protect eight of the coral reef areas of the NWHI. Each of the ATBAs extend out 50 nautical miles from the islands to keep ships well away from the vibrant and integrated coral reef ecosystem and sensitive ecological resources. The ATBAs not only prevent groundings and oil spills, they also provide emergency response teams more time to mount a response to any maritime emergency developing outside of the ATBAs.

Reef fish at French Frigate Shoals (Photo: James Watt)

## 2. Papahānaumokuākea Marine National Monument designation as a Particularly Sensitive Sea Area (PSSA) by the International Maritime Organization (IMO), (April 3, 2008)

A PSSA is an area recognized by the IMO as requiring special protection because of its significance for recognized ecological, socioeconomic or scientific attributes which may be vulnerable to damage from international shipping activities. An area approved as a Particularly Sensitive Sea Area has specific measures that may be used to control the maritime activities, including routing measures, strict application of MARPOL discharge and equipment requirements for ships, such as oil tankers; and installation of Vessel Traffic Services (VTS).

The IMO's designation as a PSSA gives international recognition to the significance of the waters, coral and other resources of Papahānaumokuākea. The PSSA is complemented by associated IMO protective measures as voluntary Areas To Be Avoided (ATBAs) and a mandatory ship reporting system. The protective measures include amendments to the six existing Areas To Be Avoided (ATBAs), which were adopted by the IMO in 1981, and the adoption of additional ATBAs around Kure Atoll and Midway Atoll as well as three other areas between islands. The action expanded and consolidated the areas into four enlarged ATBAs. The ship reporting system, whose boundary extends an additional 10 nautical miles seaward of the PSSA/Papahānaumokuākea boundary, is mandatory for all ships 300 gross tonnage or greater that are going to or coming from a U.S. port or place, as well as for vessels involved in a developing emergency. Under the system, vessels are required to notify the U.S. when they cross into and out of the reporting area, including when they enter or exit an environmentally sensitive ATBA. The ship reporting area and related measures adopted by IMO provide additional notice to mariners of the significance and vulnerability of resources in Papahānaumokuākea, as well as potential hazards to navigation in the area, such as shallow coral reefs. The reporting requirements do not apply to sovereign immune vessels.

### *Federal Legal Measures Specific to Papahānaumokuākea and the Northwestern Hawaiian Islands*

#### 3. Executive Order 1019 – Hawaiian Islands Reservation (February 3, 1909)

Through this Executive Order, President Theodore Roosevelt set aside the islets and reefs of the Northwestern Hawaiian Islands (except for Midway Atoll) as a preserve and breeding ground for native birds. The order made it unlawful for any person to hunt, trap, capture, willfully disturb or kill any bird of any kind whatever, or take the eggs of such birds within the Hawaiian Islands Reservation. The reservation became known as the Hawaiian Islands National Wildlife Refuge on July 25, 1940, through Presidential Proclamation 2416.

#### 4. Executive Order 13022 – Administration of the Midway Islands, 61 FR 56875 (October 31, 1996)

Midway Atoll National Wildlife Refuge was created on April 22, 1988, as an “overlay” national wildlife refuge through a cooperative agreement with the U.S. Navy. Executive Order 13022 transferred jurisdiction and control over the atoll to the U.S. Fish and Wildlife Service. It required the atoll to be managed for the following purposes:

- (1) maintaining and restoring natural biological diversity within the refuge;
- (2) providing for the conservation and management of fish and wildlife and their habitats within the refuge;
- (3) fulfilling the international treaty obligations of the United States with respect to fish and wildlife;
- (4) providing opportunities for scientific research, environmental education, and compatible wildlife dependent recreational activities; and
- (5) in a manner compatible with refuge purposes, recognizing and maintaining the historic significance of the Midway Islands.

### **5. Department of the Interior Secretary's Order 3217 – Battle of Midway National Memorial (September 13, 2000)**

Congress provided the Secretary of the Interior the authority to designate Midway Atoll National Wildlife Refuge as the Battle of Midway National Memorial in Section 126 of Public Law 106-113, the Consolidated Appropriations Act for Fiscal Year 2000.

### **6. Executive Order 13178 - Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, 65 FR 76903 (December 4, 2000)**

On December 4, 2000, the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve (Reserve) was created by Executive Order 13178. The Reserve encompasses an area of the marine waters and submerged lands of the Northwestern Hawaiian Islands extending approximately 1200 nautical miles long (2,222.4 km) and 100 nautical miles (185.2 km) in width. As part of the establishment of the Reserve, Executive Order 13178 contains conservation measures that restrict some activities throughout the Reserve, and establishes Reserve Preservation Areas around certain islands, atolls, and banks where all consumptive or extractive uses are prohibited.

### **7. Executive Order 13196 - Final Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, 66 FR 7395 (January 18, 2001)**

On January 18, 2001, the process and establishment of the Reserve was finalized by issuance of Executive Order 13196. This Executive Order modified Executive Order 13178 by revising certain conservation measures and making permanent the Reserve Preservation Areas, with modifications. With this action, the establishment of the Reserve, including conservation measures and permanent Reserve Preservation Areas, was completed. The Reserve's outer boundary is essentially the same as the Papahānaumokuākea boundary. The Reserve prohibited certain activities that could harm natural and cultural resources and established preservation areas to provide additional protection in designated zones.

### **8. Presidential Proclamation 8031 of June 15, 2006, 71 FR 36443 (June 26, 2006)**

Presidential Proclamation 8031 of June 15, 2006 establishing the Northwestern Hawaiian

Islands Marine National Monument, by regulations at 71 FR 36443 (June 26, 2006); as amended by Presidential Proclamation 8112) (codified at 50 CFR Part 404) (2006) and under the authority of February 28, 2007, 72 FR 10031 (March 6, 2007) 16 U.S.C. 431 et seq.; 16 U.S.C. 460k-3; 16 U.S.C. 1801 et seq.; 16 U.S.C. 742f, 16 U.S.C. 742l, and 16 U.S.C. 668dd-ee; 16 U.S.C. 1361 et seq.; 16 U.S.C. 1531 et seq., Pub. L. No. 106-513, Sec. 6(g) (2000);

The Northwestern Hawaiian Islands Marine National Monument was established on June 15, 2006, by Presidential Proclamation 8031 under the authority of the Antiquities Act. The Proclamation reserves approximately 139,793 square miles of emergent and submerged lands and waters of the Northwestern Hawaiian Islands from all forms of entry, location, selection, sale or leasing or other disposition under public land laws. Presidential Proclamation 8112, dated February 28, 2007, amended Proclamation 8031 to give the property a Native Hawaiian name, Papahānaumokuākea, which was developed by Native Hawaiians.

There are numerous prohibitions against exploitation of Papahānaumokuākea resources and introduction of non-native species as well as restrictions on activities that may impact or injure area resources. See Table 5.1 at the end of this section.

### **9. Northwestern Hawaiian Islands Marine National Monument codifying regulations, 50 CFR Part 404 (2006)**

Federal regulations codifying the provisions of Proclamation 8031 were published on August 29, 2006 (50 CFR Part 404). The regulations generally prohibit exploitation or extractive use of natural, historical and cultural resources. With exceptions for law enforcement, emergency personnel, armed forces, and uninterrupted passage, access to Papahānaumokuākea is restricted to persons who have applied for and received permits to conduct approved activities. Commercial fishing is prohibited except for a small commercial fishery consisting of eight boats that will be allowed to continue fishing in certain areas of Papahānaumokuākea until June 2011. Thereafter, commercial fishing

will be completely prohibited. Limited fishing for Native Hawaiian cultural reasons and sustenance fishing for bottomfish and pelagic species in certain areas of Papahānaumokuākea may be authorized by permit.

**10. Northwestern Hawaiian Islands Marine National Monument regulations implementing IMO PSSA Mandatory Ship Reporting System, 50 CFR Part 404 (2008)**

Federal regulations implementing the IMO mandatory ship reporting system were published on December 3, 2008. The regulations amend the Monument reporting requirements at 50 CFR 404.4 to be consistent with and to implement the IMO ship reporting system as follows. The regulations establish a reporting area around the Monument that extends outward ten nautical miles from the Monument boundary but that excludes the ATBA's within the Monument. Vessel passing through the Monument without interruption must notify the United States by e-mail upon crossing into the Reporting Area and again upon exiting the Reporting Area. The notification must provide specific information regarding the vessel, its location, etc., and must be sent in a reporting format that is consistent with the reporting system adopted by IMO. Vessels that do not have e-mail capability remain subject to current regulations that require notification by various means (telephone, fax, e-mail) at least 72 hours but not more than one month before passing through the Monument without interruption. The ship reporting requirements do not apply to sovereign immune vessels including vessels of the United States Armed Forces (and the United States Coast Guard) but voluntary participation in the reporting system is recommended for all vessels.

*White Tern  
or manu o Kū*  
(Photos: Susan Middleton  
& David Liittschwager)

The Act authorizes the President to declare by proclamation such resources to be national monuments, and may reserve parcels of land for the proper care and management of such resources.

The Act provides criminal penalties for unlawful appropriation, excavation, injury or destruction of certain monument resources including but not limited to coral and cultural resources. It also provides authority for regulations and a permit system at each monument site created.

**12. Migratory Bird Treaty Act of 1918, as amended, 16 U.S.C. §§703-712**

This statute makes it unlawful to pursue, hunt, take, capture, kill or sell parts of live or dead migratory birds, giving equal and full protection to bird parts, such as feathers, eggs and nests. This law originally implemented a convention between the United States and Great Britain (for Canada). Later, the United States entered into similar agreements with Canada, Mexico, Japan, and Russia to protect migratory birds.

More than 800 species are currently on the list of protected migratory birds, some of which currently migrate to or through Papahānaumokuākea.

**13. Historic Sites, Buildings, Objects and Antiquities Act of 1935, 16 U.S.C. §§461-462, 464-467**

The Historic Sites Act declares it a national policy to preserve historic sites and objects of national significance and provides procedures for designation, administration and protection of such sites.

National Historic Landmarks, such as the World War II facilities designated on Midway Atoll on May 28, 1987, are named under the authority of this act.

**11. Antiquities Act of 1906, 16 U.S.C. § 431, et seq.**

The Antiquities Act of 1906 was the first general federal preservation law in the United States and provides protection for archaeological, historic or scientifically interesting resources on lands owned or controlled by the federal government.

**14. Fish and Wildlife Act of 1956, as amended, 16 U.S.C. § 742f**

The Fish and Wildlife Act establishes a comprehensive national fish, shellfish and wildlife resources policy with emphasis on the commercial fishing industry but also with a direction to administer the Act with regard to the inherent right of every citizen and resident to fish for pleasure, enjoyment and betterment and to maintain and increase public opportunities for recreational use of fish and wildlife resources. Among other things, it directs a program of continuing research, extension, and information services on fish and wildlife matters, both domestically and internationally.

**15. National Historic Preservation Act (NHPA) of 1966, 16 U.S.C. § 470 *et seq.***

The National Historic Preservation Act is intended to preserve historical and archaeological sites in the United States. Among other things, the act requires Federal agencies to evaluate the impact of all federally funded or permitted projects through a process known as Section 106 Review.

Section 106 of the NHPA is of particular importance since it requires Federal agencies to take into account the effects of their undertakings on historic properties. It also provides a process whereby representatives of Native Hawaiian organizations are afforded opportunity to comment on federal undertakings that may adversely affect Native Hawaiian historic properties.

**16. National Wildlife Refuge System Administration Act of 1966, as amended, 16 U.S.C. § 668dd-ee**

The National Wildlife Refuge System Administration Act of 1966, together with the Refuge Recreation Act of 1962, provides the principal management authority for the Midway Atoll and the Hawaiian Islands National Wildlife Refuges. The refuges are managed in order to conserve and enhance their fish, wildlife and plant resources and habitats. Islands, reefs and atolls administered as part of these refuges include Nihoa, Mokumanamana (Necker), French Frigate Shoals, Gardner Pinnacles, Maro Reef, Laysan Island, Lisianski Island, Pearl and Hermes Atoll, and Midway Atoll.

**17. Refuge Recreation Act of 1962, as amended, 16 U.S.C. § 460k-460k-4**

The Refuge Recreation Act authorizes the Secretary of the Interior to administer refuges, hatcheries, and other conservation areas for recreational use, when such uses do not interfere with the area's primary purposes. It provides for public use fees and permits, and penalties for violation of regulations. It also authorizes the acceptance of donations of funds and real and personal property to assist in carrying out its purposes. Enforcement provisions were amended in 1978 and 1984 to make violations misdemeanors in accordance with the uniform sentencing provisions of 18 U.S.C. §§3551-3586.

This Act applies in the two National Wildlife Refuges within Papahānaumokuākea: the Hawaiian Islands National Wildlife Refuge extending from Nihoa to Pearl and Hermes Atoll, and Midway Atoll National Wildlife Refuge.

**18. Coastal Zone Management Act of 1972, 16 U.S.C. § 1451, *et seq.***

In an effort to encourage states to better manage coastal areas, Congress enacted the Coastal Zone Management Act (CZMA). CZMA

*The Hawaiian Monk Seal (Monachus schauinslandi) and its critical habitat are protected by various federal laws (Photo: Susan Middleton & David Liittschwager)*

Laysan Ducks  
(Photo: James Watt)

provides grants to states that develop and implement federally approved coastal zone management plans. It also allows states with approved plans the right to review Federal actions to ensure they are consistent with those plans, and it authorizes the National Estuarine Research Reserve System. Hawai'i's coastal zone management program was approved in 1977 (Chapter 205A, Hawai'i Revised Statutes).

**19. Marine Mammal Protection Act of 1972, 16 U.S.C. § 1361, et seq.**

The Marine Mammal Protection Act makes it unlawful to harass, hunt, capture or kill any marine mammal in waters or on lands under the jurisdiction of the United States.

The Act applies to all marine mammals in Papahānaumokuākea, including all species of seals, dolphins and whales, thus some species enjoy protections in addition to those under the Endangered Species Act.

**20. Endangered Species Act of 1973, as amended, 16 U.S.C. § 1531, et seq.**

The Endangered Species Act was enacted in 1973 to provide protection for critically imperiled species from extinction. It provides for the conservation of species of fish, wildlife, and plants identified by NOAA or FWS as threatened or endangered species. The species listing is based on a number of factors including the scientific and other information available on the species and the ecosystems upon which they depend. Activities prohibited by the Act include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing or collecting, any species officially listed as endangered or threatened, or attempting any of these activities.

Animals in Papahānaumokuākea that are currently protected under the Act include the Hawaiian Monk Seal, sea turtles, great whales, Short-tailed Albatross, and four species of land birds—the Nihoa Finch, Nihoa Millerbird, Laysan Finch, and the Laysan Duck. In addition, six plant species found in Papahānaumokuākea are listed as endangered species. In 1988, the waters surrounding each of the islands and atolls in Papahānaumokuākea (except Sand Island, Midway Atoll) to a depth of 20 fathoms were designated as critical habitat for the Hawaiian Monk Seal.

**21. Magnuson-Stevens Fishery Conservation and Management Act of 1976, 16 U.S.C. § 1801, et seq.**

The Magnuson-Stevens Fishery Conservation and Management Act was enacted in 1976 and is the primary legal authority for the United States to manage fish stocks within federal waters out to the limit of the 200 nautical mile exclusive economic zone.

Eight commercial fishing boats are allowed to continue to fish for bottomfish and associated pelagic species in certain areas of Papahānaumokuākea until June 2011. The on-going fishing activities of these boats are regulated under the Magnuson-Stevens Act to prevent overfishing and to maintain the sustainability of the fish stocks.

**22. Fish and Wildlife Improvement Act of 1978, as amended (16 U.S.C. § 742I)**

The Fish and Wildlife Improvement Act authorizes the Secretaries of the Interior and Commerce to establish, conduct and assist with national training programs for State fish and wildlife law enforcement personnel. It also authorized funding for research and development of new or improved methods to support fish and wildlife law enforcement. The law also provides authority to the Secretaries to enter into law enforcement cooperative agreements with State or other Federal agencies.

**23. Archaeological Resources Protection Act (ARPA) of 1979, 16 U.S.C. § 470aa-mm**

The Archaeological Resources Protection Act was enacted to strengthen federal law prohibiting the looting and unwanted recovery

*Papahānaumokuākea contains over 120 sunken vessels and aircraft (Photo: James Watt)*

of archaeological resources from federal public lands. A main focus of ARPA is the regulation of legitimate archaeological investigation in accordance with professional archaeological standards for research, conservation and curation. The Act also strengthened the enforcement of penalties against those who loot or vandalize archaeological resources that exist under the Antiquities Act.

#### **24. Abandoned Shipwreck Act (ASA) of 1987, 43 U.S.C. §§ 2101-2106**

The Abandoned Shipwreck Act is a United States law meant to protect historic shipwrecks from treasure hunters and salvagers by transferring the title of the wreck to the state whose waters it lies in.

The ASA protects abandoned shipwrecks on the submerged lands of Hawai'i including those State submerged lands within the boundaries of Papahānaumokuākea. Abandoned shipwrecks on state submerged lands are owned and controlled by the State but jointly managed as a Papahānaumokuākea resource.

#### **25. Native American Graves Protection and Repatriation Act (NAGPRA) of 1990, 25 U.S.C. §3001 *et seq.***

NAGPRA provides a process for museums and Federal agencies to return certain Native American cultural items, such as human remains, funerary artifacts, sacred objects and objects of cultural patrimony, to lineal descendants and culturally affiliated Indian tribes and Native Hawaiian organizations. It also includes provisions for intentional and inadvertent discoveries of such cultural items, and penalties for noncompliance and illegal trafficking.

#### **26. Sunken Military Craft Act (SMCA) of 2004, Public Law 108-375**

The Sunken Military Craft Act provides for the protection of sunken U.S. military ship and aircraft wherever they are located; protection of sensitive archaeological artifacts and historical information; codification of existing case law, which supports federal ownership of sunken U.S. military ship and aircraft wrecks; provides a mechanism for permitting and civil enforcement to prevent unauthorized disturbance; and encourages the Secretary of State, in consultation with the Secretary of Defense, to enter into bilateral and multilateral agreements with foreign countries for the protection of sunken military craft. It does not affect salvage of commercial merchant shipwrecks, recreational diving, commercial fishing, or the laying of submarine cables; and does not relate to the routine operation of ships.

*A diver surveys the site of sunken WWII Corsair aircraft (Photo: James Watt)*

**27. National Environmental Policy Act of 1969, 42 U.S.C. 4321 et seq.**

NEPA requires federal agencies that are proposing a major action significantly affecting the quality of the human environment to prepare a detailed environmental impact statement (EIS) describing the impacts of the proposed action. NEPA provides a mandate and a framework for federal agencies to consider all reasonably foreseeable environmental effects of their proposed actions and to involve and inform the public in the decisionmaking process.

*State Legal Measures*

**28. Hawaii Organic Act of April 30, 1900, c339, 31 Stat. 141 Section 2; and Hawaii Admission Act of March 18, 1959, Pub. L. 86-3, 73 Stat. 4 Section 2**

The Organic Act of April 30, 1900 established the Territory of Hawai‘i, transferring sovereignty over the Hawaiian Islands from the Republic of Hawai‘i to the United States of America. The constitution and statutory law of the Republic of Hawai‘i were adopted in the Organic Act as the laws of Hawai‘i.

The Admission Act of March 18, 1959 (Admission Act) admitted Hawai‘i to the Union of the United States of America, and

established statehood status for Hawai‘i on an equal footing with the other states. Upon admission, most of the Northwestern Hawaiian Islands that were part of the Territory of Hawai‘i became part of the State of Hawai‘i.

**29. Constitution of the State of Hawai‘i, Article XI, Sections 1, 2, 6, and 9; and Article XII, Section 7**

The Constitution of the State of Hawai‘i, Article XI, Section 1, entitled “Conservation, Control and Development of Resources,” provides that “the State and its political subdivisions shall conserve and protect Hawaii’s natural beauty and all natural resources,” and also provides that “all public natural resources are held in trust by the State for the benefit of the people.”

Article XI, Section 2, establishes the management authority of one or more executive boards or commissions to manage natural resources including public lands set aside for conservation purposes.

Article XI, Section 6, establishes the State’s authority to manage and control “marine, seabed and other resources within the boundaries of the State, including the archipelagic waters of the State....”

Article XI, Section 9, provides that “each person has the right to a clean and healthful environment, as defined by laws relating to environmental quality, ....”

Article XII, Section 7 provides that the State shall “protect all rights, customarily and traditionally exercised for subsistence, cultural and religious purposes and possessed by ahupua‘a tenants who are descendants of native Hawaiians” “subject to the right of the State to regulate such rights.”

**30. Hawaii Revised Statutes (HRS): Title 1 - Chapter 6E; Title 10 - Chapter 128D; Title 12 - Chapters 171, 183C, 183D, 187A, 188, 190, 195D, 200; Title 13 – Chapter 205A; Title 19 - Chapters 339, 342D, 343;**

HRS Chapter 6E – Historic Preservation. Establishes the State’s Historic Preservation Division, and declares the intent to preserve, restore and maintain historic and cultural

Papahānaumokuākea is home to 14 million seabirds  
(Photo: Dan Suthers)

(Photo: Susan Middleton  
& David Liittschwager)

property through stewardship and trusteeship for future generations; claims state ownership to all historic, cultural and burial sites within its jurisdiction; establishes civil, administrative, and criminal (misdemeanor) penalties for violations of this chapter.

**HRS Chapter 128D – Environmental Response Law.** Creates a duty to report a release of a hazardous substance from a vessel; authorizes an appropriate state response to protect the public health, safety, and the environment. Civil penalties and injunctive relief may be sought for violations of this chapter. Knowing releases may be prosecuted as a Class C felony.

**HRS Chapter 171 – Public Lands, Management and Disposition of.** Establishes state authority for management of public lands, including preventing illegal activities and trespass. Administrative penalties may be sought for violations of this chapter. On July 7, 2008, Act 215 was signed into law, increasing the per day fines for encroachments upon public lands to \$1,000 per day for a first offense. Fines for prohibited use or activity on of public lands were also significantly increased, from \$500 per day, to \$5,000 per violation for a first violation. Repeat offenders may be liable for up to \$20,000 per violation and additional \$4,000 per day after notice is given if the violation persists.

**HRS Chapter 183C – Conservation District.** Recognizes the importance to conserve, protect, and preserve important natural resources, including fragile natural ecosystems, through appropriate management and use. All submerged lands in state territorial waters are zoned in the conservation district. Administrative fines and costs are

available for violations of this chapter. On July 7, 2008, Act 217 was signed into law revising Chapter 183C, HRS. It increased fines assessed from up to \$2,000 per violation, to up to \$15,000 per violation, and the possibility of fines of up to \$15,000 per day after notice is given and the violation persists.

**HRS Chapter 183D – Wildlife.** Gives DLNR authority for the management and administration of wildlife and wildlife resources of the state, including the establishment and maintenance of wildlife sanctuaries, forest reserves, and natural area reserves. Prohibits the taking or injury of wild birds. Criminal violations may be prosecuted as petty misdemeanors or misdemeanors. Administrative penalties are also applicable.

**HRS Chapter 187A – Aquatic Resources.** Allows the state to adopt regulations for the conservation and management of aquatic life in any area as appropriate, and encourages cooperation between DLNR and other governmental authorities; prevents or controls the introduction of alien aquatic organisms via handling of ballast water discharges. Criminal violations may be prosecuted as petty misdemeanors. Administrative penalties are also available under this chapter.

**HRS Chapter 188 – Fishing Rights and Regulations.** Regulates or prohibits the use or possession of certain types of fishing gear or methods. Section 188-37 was formerly used to regulate commercial fisheries in the Northwestern Hawaiian Islands by license and permit. Section 188-53, HRS, gives DLNR authority to establish such areas as the Northwestern Hawaiian Islands Marine Refuge (under Chapter 60.5, Hawaii Administrative Rules) for the purposes of managing, preserving, protecting, and conserving marine life. Criminal violations of this chapter are petty misdemeanors, with certain exceptions prosecuted as felonies.

**HRS Chapter 190 – Marine Life Conservation Program.** By this chapter, all marine waters of the State are marine life conservation areas administered by the State. Authorizes rules governing the take of marine resources such as fish, invertebrates, and algae. Violations of this chapter are petty misdemeanors.

**HRS Chapter 195D – Conservation of Aquatic Life, Wildlife, and Land Plants.** The Hawai'i State counterpart to the Endangered Species Act of 1973, but affords additional safeguards through determinations that certain indigenous species believed to need protection, may be additionally listed as threatened or endangered. Provides for separate state administrative enforcement and criminal misdemeanor penalty proceedings for violations.

**HRS Chapter 200 – Ocean Recreation and Coastal Areas Program.** Allows certain derelict, abandoned, or vessels aground to be immediately removed from state waters under certain conditions such as when posing an imminent danger to life or property. In addition to administrative penalties, certain violations of this chapter may be prosecuted as a misdemeanor.

**HRS Chapter 205A – Coastal Zone Management.** Creates a comprehensive and coordinated approach to regulation of development in coastal special management areas; including shoreline setback; and managing marine and coastal resource issues including recreation, historic preservation, scenic and open space preservation, protection of ocean ecosystems, reduction of coastal hazards, and beach protection. Civil fines may be available for violations of this chapter.

**HRS Chapter 339 – Litter Control.** Prohibits the disposal of refuse or waste material into the waters of the State. Infractions of this chapter may be prosecuted as violations.

**HRS Chapter 342D – Water Pollution. Prohibits discharge of a water pollutant into state waters.** Violations of this chapter may result in imposition of fines. Knowing violations may be criminally prosecuted as a Class C felony.

**HRS Chapter 343 – Environmental Impact Statements.** Provides for a state environmental review process, including proposed land uses within the conservation district or shoreline area defined by section 205A-41, HRS, or for certain uses of state funds.

**31. Hawaii Administrative Rules (HAR): Title 11 - Chapters 54, 55, 60.1, 200; Title 13 - Chapters 5, 60.5, 75, 76, 124, 125, 221, 275, 277, 280, and 300**

**HAR Chapter 54 – Water Quality Standards.** Creates state water quality standards including the policy mandate that where high quality waters constitute an outstanding national resource, such as waters of national and state parks and wildlife refuges and waters of exceptional or ecological significance, that water quality shall be maintained and protected. Section 11-54-7, HAR, classifies all beaches of the Northwestern Hawaiian Islands to be protected as “Class I” water areas.

**HAR Chapter 55 – Water Pollution Control.** Further elaborates water pollution discharge prohibitions defined under § 342D-50, HRS, and under NPDES permit criteria issued under this chapter.

**HAR Chapter 60.1 – Air Pollution Control.** Creates air quality emission standards; prohibitions against activities by any person causing air pollution also apply to any public body

**HAR Chapter 200 – Environmental Impact Statement Rules.** Provides agencies and persons with procedures, specifications of contents of environmental assessments and environmental impact statements, and criteria and definitions of statewide application.

**HAR Chapter 5 – Conservation District.** Regulates land uses in the conservation district (submerged lands are zoned in the conservation district) for the purpose of conserving, protecting, and preserving important natural resources of the State through appropriate management and use to promote their long-term sustainability. Any placement or erection of any solid material on land is a land use if that material remains on the land more than 14 days, or causes a permanent change in the land area on which it occurs.

**HAR Chapter 60.5 – Northwestern Hawaiian Islands Marine Refuge.** Creates the State of Hawai'i's Northwestern Hawaiian Islands Marine Refuge; requires a permit for access, and creates a fully protected zone to the extent of the State's jurisdiction.

**HAR Chapter 75 – Rules Regulating the Possession and Use of Certain Fishing Gear.** Regulates the use of certain fishing gear and methods, including a prohibition of use of poisonous substances, explosives, electrofishing devices, and firearms.

**HAR Chapter 76 – Non-indigenous Aquatic Species.** Protects against introduction of non-indigenous aquatic species by requiring ballast water management practices for shipping vessels

**HAR Chapter 124 – Indigenous Wildlife, Endangered and Threatened Wildlife, and Introduced Wild Birds.** Promotes conservation, management, protection, and enhancement of indigenous wildlife; and management of introduced wild birds.

**HAR Chapter 125 – Rules Regulating Wildlife Sanctuaries.** Establishes a Hawai'i State Seabird Sanctuary on various offshore islands in the main Hawaiian Islands as well as at Kure Atoll, to conserve, manage, and protect indigenous wildlife in sanctuaries.

**HAR Chapter 221 – Unencumbered Public Lands.** Regulates public activities on unencumbered public lands.

**HAR Chapter 275 – Rules Governing Procedures for Historic Preservation Review for Governmental Projects Covered Under Sections 6E-7 and 6E-8, HRS.** Requires historic properties to be evaluated and classified for potential impacts, mitigation, and conservation through a review process.

**HAR Chapter 277 – Rules Governing Requirements for Archaeological Site Preservation and Development.** Creates standards for preservation of historic property or cultural sites.

**HAR Chapter 280 – Rules Governing General Procedures for Inadvertent Discoveries of Historic Properties During a Project Covered by the Historic Preservation Review Process.** Provides rules for inventory, assessment, and potential mitigation upon inadvertent discovery of historical property.

**HAR Chapter 300 – Rules of Practice and Procedure Relating to Burial Sites and Human Remains.** Is the Hawai'i counterpart to the federal Native American Graves Protection and Repatriation Act, and it sets out the rules relating to burial sites and human remains.

#### *Traditional Customs that Safeguard the Property*

Under the Proclamation, the implementing regulations, and Monument Management Board policy, cultural and historic resources receive the same stringent protection as do the natural resources within Papahānaumokuākea. To Native Hawaiians, natural resources are cultural resources, and they are genealogically linked to those natural resources, including all of the Hawaiian Islands in the archipelago. Thus, the area must be treated with appropriate reverence and honor.

Under Section 106 of the National Historic Preservation Act (NHPA), 16 U.S.C. § 470f, the Co-Trustees must consult with the State Historic Preservation Division, the Office of Hawaiian Affairs (OHA) and other Native Hawaiian organizations and individuals to avoid or minimize adverse impacts to historic properties that may arise from permitted and management activities. In addition, the Co-Trustees, OHA and other Native Hawaiian organizations and individuals will help ensure that Native Hawaiians have appropriate access to natural and cultural Papahānaumokuākea resources to continue practices that are important for the preservation and perpetuation of Native Hawaiian culture.

The Office of Hawaiian Affairs facilitates the Native Hawaiian Cultural Working Group, which provides input into Papahānaumokuākea management, permits and activities. Within the Monument Management Plan, two action plans are devoted to Native Hawaiian participation in management and access to the resources of Papahānaumokuākea.

# Cultural Research Cruise

From the Blog: Papahānaumokuākea Marine Educators and Cultural Practitioners Cruise, July 23rd, 2008  
by Andy Collins

In celebration of International Year of the Reef, Papahānumokuākea Marine National Monument took ten educators from across Oceania to the Northwestern Hawaiian Islands. Along with Oceania's educators, several Native Hawaiian cultural practitioners were offered berths on the cruise to conduct cultural research. Below are blog entries written by cruise participants that were published *Honolulu Advertiser*, and online at <http://hawaiianatolls.org>.

## The Waters of the NWHI Prove Very Refreshing

By expedition member  
Craig McGrogan (Australia)

[On] an expedition to Papahānaumokuākea Marine National Monument (PMNM)... a stimulating mix of marine educators, from throughout Oceania, coupled with the expansive waters of PMNM are ideal conditions in which to take a step back and reflect on my position and responsibilities as a Marine Educator.

I'm reminded that no matter how far apart the different islands we represent may be throughout Oceania, we have in common the same concerns and issues facing us in our field of marine education. From overfishing to declining water quality, these are challenges all coral reef managers are facing, and we as educators are tasked with communicating to others as we raise awareness and hopefully stimulate positive behavioral changes.

It is enriching for all to learn how different regions of our Pacific community are responding to these challenges, allowing us all to compare our own approach and the sort of messages (themes) we are communicating through our education and conservation work. Take, for instance, subsistence agriculture in Palau using composting techniques passed down from one generation to the next, not only to nourish crops, but to retain water and reduce soil erosion at times of high rainfall. A simple, yet effective means of improving crop production, whilst reducing nutrient and sediment run-off into coastal waters.

The use of fish ponds, a form of traditional aquaculture in Hawai'i, is yet another example of how coastal communities are able to enhance subsistence food production

in an environmentally sustainable way. By introducing such cross-cultural awareness and appreciation into our individual educational activities, we will in turn be able to offer a far richer learning experience.

We are all linked by the very ocean that separates us, no matter how far apart our countries may be. Strengthening these connections within the group that we are, on this expedition to the NWHI, will prove a valuable first step towards developing a collaborative network of marine educators throughout Oceania.

Practitioners hoped relationships built across Oceania would better enable management of the Pacific's fragile ecosystems.

Nai'a Watson, expedition member and Monument staff, and Uncle Mervin Dudoit from Moloka'i

## My Treasured of Memories of the National Monument

*By expedition member  
Fatima Saua'fea-Le'au*

The purpose of the expedition is “to build a network of marine educators across Oceania committed to forwarding the goals of marine conservation and in inspiring future generations to be better stewards of their natural resources”. The expedition to the national monument... reached its purpose. The most inspiring moments that I have witnessed in the national monument are the snorkeling activities... I swam around looking at live corals in Shark Island and saw a huge green turtle sitting on the sand looking at me as if she is saying “I got here first...find your own spot”. It is just so amazing to swim in the water with fish that come up close to your face. I will always remember too the hiking up Nihoa. When our group reached the top of the plateau.... It was such a beautiful site to watch the birds flying all over.

This expedition has been an exciting and once in a lifetime opportunity for me. I have learned so much from the expedition and I have also built a network of friends that, I hope, we will continue on our journey in sharing and exchange of our knowledge and ideas to conserve, protect and manage our resources for the future generations of the Pacific Islands.

## Our Kupuna Islands

*By expedition member  
Legario “Hank” Eharis*

The Northwestern Hawaiian Islands is definitely remote, yet still a part of the Hawaiian people; they signify connections to the beliefs and cultural ties to the land and seas. When I first set foot upon the island of Nihoa, there came an overwhelming feeling of peacefulness. It was like being away from home for a very long time and suddenly you’re home and everyone is sad but yet happy to see you again. Awesome feeling! You look around and fish rise to the surface of the water; monk seals come up to greet you; birds hover in your presence.

My most memorable moments will be the diving at the many off-shore reefs, in the coral lagoons, and to see the abundance of fish species still in a natural, pristine habitats, diving in the blue waters off of Mokumanamana and Mokupāpapa Atolls. I’m at a loss for words of the vast open blue planet I am just beginning to experience and see.

I have learned a lot from the different teachers and educators from throughout Oceania. There are similarities we encounter in the fight to better our land and ocean resources and in how to take care and promote malama ka aina, malama i ke kai (caring for the land, caring for the ocean). Hopefully this expedition will allow the doors to be open for more practitioners, educators and maka’ainana (people of the land–Hawaiians) to see and experience our Kupuna Islands.

## 5.c Implementation of Protective Measures

### Permitting System

One of the means by which the integrity of this property is upheld is through the restriction of access to only those who can demonstrate a convincing need to enter. Access to Papahānaumokuākea Marine National Monument is regulated through a rigorous permitting system, and permits are limited to activities that fall under the following permit types:

- **Research:** for activities designed to enhance the understanding of Papahānaumokuākea's resources and activities and improve resource management decision-making.
- **Conservation and Management:** for activities that make up the general management of Papahānaumokuākea, such as field station operations and marine debris removal.
- **Education:** for activities that further the educational value of Papahānaumokuākea.
- **Native Hawaiian Practices:** for activities that constitute Native Hawaiian cultural practices.
- **Special Ocean Use:** for activities related to commercial ocean uses that generate revenue or profits, including ecotourism and documentary filmmaking, which have a net benefit to Papahānaumokuākea.
- **Recreation (Midway only):** for all recreational activities.

Review of all permit applications is thorough, conducted by members of all State and Federal agencies involved. The Co-Trustees are required to determine that issuing the requested permit is compatible with the findings of Presidential Proclamation 8031 to ensure the conservation and management of the natural, historic and cultural resources of Papahānaumokuākea. To be granted a permit for access to the site, the proposed activities must be found by the Co-Trustees to be compatible with the stringent requirements codifying Presidential Proclamation 8031 and the federal and state regulations for Papahānaumokuākea Marine National Monument (referred to below as the Monument, as taken from the Proclamation):

- a. The activity can be conducted with adequate safeguards for the resources and ecological integrity of the Monument;
- b. The activity will be conducted in a manner compatible with the management direction of Presidential Proclamation 8031, considering the extent to which the conduct of the activity may diminish or enhance Monument resources, qualities, and ecological integrity, any indirect, secondary, or cumulative effects of the activity, and the duration of such effects;
- c. There is no practicable alternative to conducting the activity within the Monument;
- d. The end value of the activity outweighs its adverse impacts on Monument resources, qualities, and ecological integrity;

Establishing reef monitoring sites (Photo: James Watt)

- e. The duration of the activity is no longer than necessary to achieve its stated purpose;
- f. The applicant is qualified to conduct and complete the activity and mitigate any potential impacts resulting from its conduct;
- g. The applicant has adequate financial resources available to conduct and complete the activity and mitigate any potential impacts resulting from its conduct;
- h. The methods and procedures proposed by the applicant are appropriate to achieve the proposed activity's goals in relation to their impacts to Monument resources, qualities, and ecological integrity;
- i. The applicant's vessel has been outfitted with a mobile transceiver unit approved by OLE and complies with the requirements of Presidential Proclamation 8031; and
- j. There are no other factors that would make the issuance of a permit for the activity inappropriate.

In addition to meeting the findings of the Proclamation, each activity is reviewed to ensure that it is both biologically sound and culturally appropriate,

As a matter of policy, permit applications are sent to a select group of Native Hawaiian cultural experts and are also reviewed by the Office of Hawaiian Affairs (OHA) to determine if the activity will have any detrimental impacts to the culture. In addition, under Section 106 of the National Historic Preservation Act (NHPA), the Co-Trustees coordinate and consult with the State Historic Preservation Division, and seek input from OHA and other representatives of Native Hawaiian organizations to avoid or minimize the adverse impacts to historic properties that may arise from permitted activities.

Before the designation of Papahānaumokuākea, separate permits were issued by each agency; currently, all Papahānaumokuākea

permits are jointly issued as single unified permits and are signed by all three Co-Trustee agency designees. Each agency, as laid out in the Proclamation establishing Papahānaumokuākea, retains its sphere of jurisdiction, responsibility and expertise. Each brings different knowledge and strengths to this process. They work together on many aspects of the management process. Throughout this process however, each partner agency continues to carry out its statutory and enforcement responsibilities. Even where one of the MMB member agencies has primary responsibility, input from the other agencies is presumed as part of overall management.

#### **Permit requirements and protocols**

In addition to the required review of each activity to ensure that it meets the findings of the Proclamation and is both biologically sound and culturally appropriate, there are several permit requirements and protocols that must be complied with.

**Cultural:** All permittees are required to participate in a Native Hawaiian cultural briefing prior to departure for Papahānaumokuākea. They are also encouraged to provide opportunities for cultural monitors and practitioners to accompany them in the property.

**Vessels:** All permitted vessels must undergo a hull inspection, and hull cleaning if necessary, prior to entering Papahānaumokuākea. In addition, all vessels must be certified as rat-free. All vessels must also be equipped with an approved Vessel Monitoring System (VMS) for tracking purposes.

**Gear and Supplies:** All tenders, dive gear, clothes, and even food that will be eaten ashore must undergo additional quarantine requirements before entering all areas except Midway Atoll and French Frigate Shoals. The protocols are intended both for activities at a single site and for moving between sites within Papahānaumokuākea. See Appendix F for the full protocols regarding the special conditions and rules for moving between islands and atolls and packing for field camps, as well as for disease and introduced species prevention for permitted activities in the marine environment.

# Day 3: Images from the Nihoa Expedition

From the Blog of the Marine Educators and Cultural Practitioners Cruise to PMNM, July 2008. Published online and in the newspaper, The Honolulu Advertiser.

Nihoa's sea cliffs are hundreds of feet high, with the highest point approaching 900 feet.

Frontal view of Nihoa just prior to access as the crew of the NOAA ship *Hi'ialakai* prepares to take the

educators ashore. Expedition members are first loaded into safe boats, then lowered into the water and finally driven to meet an even smaller zodiac boat that will take them to shore at Nihoa.

Once on Nihoa, the group is lead by Kekuewa Kikiloi, a Ph.D. candidate in archaeology who has done the most recent research and study of the archaeological sites on both Nihoa and Mokumanamana. Kikiloi prepped the group with detailed instructions and then asked the ancestors for permission to enter with an *oli*, or chant.

The groups accessed the island in two small groups to minimize disturbance to the birds and cultural sites. Each group hiked in single file, again to minimize disturbance. The initial part of the trail was very steep; the group had to work as a team to ensure everyone's safety.

About half-way up the Middle Valley trail, Kikiloi spoke to the group

**Biological Samples:** Commonly collected samples (coral, fish, invertebrates, etc.) are subject to protocols developed to ensure the proper handling, storage, and transport of biological samples within Papahānaumokuākea. See Appendix F for the full protocol regarding general storage and transport for scientific collection in Papahānaumokuākea.

A major factor in the development of these requirements and protocols is the fact that the islands and atolls of Papahānaumokuākea provide habitat for many rare, endemic plants and animals. Many of these species are formally listed as endangered under the Endangered Species Act and/or by the IUCN. Endemic plants and insects, and the predators they support, are especially vulnerable to the introduction of competing or consuming species. Such introductions may cause the extinction of island endemics or even the destruction of entire island ecological communities. The protocols listed above detail the rigorous policies and procedures that must be strictly adhered to when access to particular islands and atolls is given. Restrictions are included on the movement of not only personnel, but all materials, vessels, dive and monitoring equipment, camping and terrestrial supplies, and food to these islands and atolls. For example, all cloth items (clothes, camera straps, hats, shoes, under garments, etc.) must be purchased new and frozen for 48 hours prior to going ashore at any of the islands and atolls, except Midway. All dive gear must be soaked in an approved solution at the end of each day. Transport protocols include the collection of samples and their disposition.

## Enforcement and Resources

NOAA and FWS both have law enforcement officials who investigate violations of Papahānaumokuākea resources or quality. Both these agencies work in partnership cooperatively with the State of Hawai'i Division of Conservation and Resources Enforcement within the Department of Land and Natural Resources to investigate and cite parties who have violated Papahānaumokuākea regulations. Systems to monitor both domestic and international

maritime traffic have been implemented. NOAA works in concert with the U.S. Coast Guard (USCG) to monitor all vessel activity in Papahānaumokuākea and to track movement via the required VMS. The USCG regularly sends ships and planes to patrol and monitor activity in the area.

Staff are in Papahānaumokuākea year-round at three sites: Midway Atoll, French Frigate Shoals, and at a field camp at Laysan Island. In addition, field camps are staffed for at least six months of the year at other locations such as Kure Atoll. This presence also ensures that any unauthorized vessel or activity near these islands will be observed promptly and reported, as each of these islands are equipped with communications technology.

Additional innovative enforcement technology and programs are being considered in the Monument Management Plan. In the past two years, the USCG and NOAA-Fisheries OLE have taken swift action on alleged fishing violations, resulting in over \$100,000 in combined fines.

Adequate resources are available to ensure the property is protected. Resources are available from both the Federal government of the United States and the government of the State of Hawai'i. In addition, myriad government agencies can and do provide additional resources, both in financial terms and in-kind services.

## 5.d Existing Plans

All plans related to the conservation and management of Papahānaumokuākea Marine National Monument are developed by the Co-Trustees. The islands of Papahānaumokuākea that are part of the State of Hawai'i remain under the jurisdiction of the City and County of Honolulu; however, no current municipal plans address the property.

Please refer to Section 5.e "Monument Management Plan" regarding preparation of the management plan for the property.

The following list provides an overview of some of the existing plans for resource

about the many agricultural terraces located on this particular side of the island. As a group, they have not yet been mapped in detail.

The group continues to hike in single file to the top of the ridge crest above Middle Valley.

This picture does not fully convey the feeling of thousands of birds flying overhead, but it provides an opportunity to understand just how many birds call this small rocky island home.

An immature great frigate bird rests in its nest amongst the thick 'ilima bushes that cover the entire island.

In the foreground is an agricultural terrace. In the background is "Dogs Head Peak" a name given by the Tanninger expedition (1923-1924); atop this peak sits the largest *heiau*, or ceremonial temple, on the island. Kikilo'i said that as many as 40 coral heads often a key feature of ceremonial sites—were found there.

A group shot of the first access group.

After two-hours on-island the group headed back to the landing area for pick up by the zodiac.

management in Papahānaumokuākea that demonstrate the breadth and depth of protective plans already in operation (see Appendix L for full documents). As discussed in Section 5.b “Protective Designations”, a range of applicable protective laws and current management strategies already provide comprehensive and long lasting protective measures for the property. These plans were in existence prior to designation of Papahānaumokuākea; many are site- or species-specific. The Monument Management Plan is a comprehensive, overarching approach to management which incorporates, by reference or action plan, all of these plans. For example, the actions and strategies of the Threatened and Endangered Species Action Plan incorporate many of the activities outlined in each of the stand-alone species recovery plans listed below.

#### **Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve Operations Plan**

This plan was written to guide the operations within the NWHI Coral Reef Ecosystem Reserve. It was the basis for the day-to-day management decisions during the first five years of reserve operation. All components of this plan that were not already implemented were incorporated into the Monument Management Plan. The NOAA Office of National Marine Sanctuaries was the lead agency for this plan.

#### **Visitor Services Plan for Midway Atoll**

This plan documents approved recreational activities at Midway Atoll and identifies the structure of the visitor services program managed by the U.S. Fish and Wildlife Service, the lead Co-Trustee agency. The plan also addresses activities that honor and interpret World War II history as recognized by the Battle of Midway National Memorial. It discusses operational limitations, biological constraints and partnership opportunities beyond Midway Atoll. A key feature of the plan is that it limits the total number of overnight visitors to 50 people per night for 2009 and beyond.

#### **Hawaiian Islands National Wildlife Refuge Master Plan**

Since its approval in 1986, this plan has guided the management of the Hawaiian

Islands National Wildlife Refuge. It places primary emphasis on protecting and enhancing refuge wildlife resources, particularly threatened and endangered species. It also includes a strategy to evaluate and nominate, if appropriate, lands and waters of the refuge for status as a World Heritage site. Primary responsibility for implementation of the plan is with the FWS as the lead agency.

#### **Fish and Wildlife Service Draft Laysan Island Ecosystem Restoration Plan**

In 1998, the draft Laysan Restoration Plan was developed in response to a need for coordinated ecosystem restoration that takes an integrated approach to managing the island’s entire biota rather than a species-by-species approach. It includes recommendations that are helping FWS attain the following objectives:

- (1) Stabilize the present ecosystem by preventing any new introductions.
- (2) Recreate as nearly as possible the Laysan Island ecosystem that was present prior to major human caused habitat modification during the 1890s and early 1900s.
- (3) Whenever possible, eliminate nonnative species, prioritizing those that cause obvious or significant ecosystem alterations.
- (4) Replant or reintroduce native species that are were extirpated from Laysan.
- (5) Establish regular comprehensive ecosystem monitoring, so that any nonnative introductions or declines in native species will be detected early enough for management to react in a cost-effective manner.

#### **Fish and Wildlife Service Regional Seabird Conservation Plan, Pacific Region**

The purpose of the Pacific Region’s Regional Seabird Conservation Plan is to identify the Fish and Wildlife Service’s priorities for seabird management, monitoring, research, outreach, planning and coordination. The plan includes a review of seabird resources and habitats, a description of issues and

threats, and a summary of current management, monitoring and outreach efforts. All species are prioritized by conservation concern at the regional scale, and recommendations for conservation actions are identified and prioritized. Papahānaumokuākea populations of five species discussed in the plan are considered globally significant, including two listed as vulnerable by the IUCN.

*From the tiniest flatworm to grandest coral-scape, the colors of Papahānaumokuākea are unforgettable*  
(Photo: James Watt)

**Fish and Wildlife Service Contingency Plans for Disasters – Covering the Pacific Remote Island National Wildlife Refuge Complex**

The purpose of this document is to establish communications procedures and delegation of authority procedures for emergency situations that may affect the safety of the staff or operation of the Pacific Remote Islands National Wildlife Refuge Complex.

**National Marine Fisheries Service - Final Environmental Impact Statement: Bottomfish and Seamount Groundfish Fisheries of the Western Pacific Region**

NOAA first implemented a federal bottomfish fishery management plan in the early 1980s, and has since added several amendments to the plan. The management regime for the waters around the property have been divided into the Ho'omalulu zone (area west of 165° 00' W longitude) and the Mau zone (area between 161° 20' W longitude and 165° 00' W longitude); a limited-entry fishery has been established to carefully manage and control fishing effort. Additional restrictions, including limits on vessel size, have also limited fishing pressure within the property. A total of 17 fishery permits were authorized under the limited-entry program for the two management zones, but only eight of these fishery permits were still in effect when the Proclamation was issued on June 15, 2006. No additional permits will be issued before the fishery is phased out in 2011.

**Fish and Wildlife Service - Prehistoric Cultural Resources and Management Plan for Nihoa and Necker Islands, Hawai'i**

This plan outlines management strategies for the cultural resources of the islands of Nihoa and Mokumanamana.

**Hawai'i's Comprehensive Wildlife Conservation Strategy (CWCS)**

Hawai'i's CWCS is a comprehensive review on the status of the full range of the State's native species, both terrestrial and aquatic. In addition to identifying major threats, it also presents strategies for long-term conservation of these species and their habitats. The mission of this strategy is to guide conservation efforts across the State, including the Northwestern Hawaiian Islands, to ensure protection of Hawai'i's wide range of native wildlife and the diverse habitats that support them. Congress requires states to develop such strategies as an eligibility condition for state wildlife grants.

**State of Hawai'i Aquatic Invasive Species Management Plan**

The goal of this plan is to minimize the harmful ecological, economic and human health impacts of aquatic invasive species through the prevention and management of their introduction, expansion, and dispersal into, within, and from Hawai'i. To accomplish this goal, the plan identifies seven objectives (ranging from collaboration and prevention, to research and policy) as well as associated strategies for each.

### Various Species Recovery Plans

Pursuant to the Endangered Species Act, recovery plans for numerous species within the property have been developed by FWS and the National Marine Fisheries Service. A recovery plan develops goals, objectives, criteria, and actions needed for protecting and enhancing rare and endangered species populations. The plans provide for the conservation of species at risk of extinction throughout all or a significant portion of their range, and the conservation of the ecosystems on which they depend. Summaries of the various recovery plans are outlined below (see Appendix M for full recovery plans).

**Hawaiian Monk Seal:** As a species, the Hawaiian Monk Seal is in crisis. The population remains in a grave decline that has lasted 20 years; only about 1,200 monk seals remain. Modeling predicts that the total monk seal population will fall below 1,000 animals by the year 2012. Actions to date have not been sufficient to result in a recovering population. Most of the total world population of Hawaiian Monk Seals breeds and forages inside Papahānaumokuākea. A recent revision of the recovery plan for the Hawaiian Monk Seal provides guidance for the lead agency in this recovery program, NOAA Fisheries. The Hawaiian Monk Seal Recovery Plan details the ways in which the MMB can facilitate and support those efforts (NOAA Fisheries 2007).

**Cetaceans:** In the NWHI, sighting and acoustic recordings of baleen whales as well as toothed whales and dolphins have been documented. Five species of baleen whales listed as “endangered” under the Endangered Species Act of 1973, and as “depleted” under the Marine Mammal Protection Act of 1972, have been sighted or heard in Papahānaumokuākea. In addition to these five, the endangered sperm whale and at least 18 other non-ESA listed species are found in Papahānaumokuākea. It has now been documented that humpback whales are calving in the eastern portion of the property (Johnston et al. 2007). Recovery actions for this listed species are summarized in the final recovery plan for the humpback whale,

*Megaptera novaeangliae* (NOAA Fisheries 1991). Draft recovery plans are available for the fin whale and sperm whale (NOAA Fisheries 2006a, 2006b), and a final plan is available for the recovery of the blue whale (NOAA Fisheries 1998).

**Marine Turtles:** The marine turtles known to occur in Papahānaumokuākea are the Hawaiian population of the Green, Hawksbill, Loggerhead, and Leatherback turtles. While there are no records of the endangered Olive Ridley Turtle within Papahānaumokuākea waters, their wide distribution throughout the tropical Pacific makes it likely that they do also occur there. Green and Loggerhead turtles are listed as threatened species; the Hawksbill and Leatherback turtles are classified as endangered species. Recovery plans are in place for each of these species in the Pacific and five-year reviews were jointly published in 2007 (NOAA Fisheries and FWS 1998a; 1998b; 1998c; 1998d; 1998e; 2007). Nesting habitat loss, the harvesting of eggs and turtles for commercial and subsistence purposes, and fishery interactions have caused sea turtle populations to decline across the Pacific. About 90% of the Green Turtles in the Hawaiian Islands are known to nest in the NWHI, the majority on a few islets at French Frigate Shoals (Balazs and Chaloupka 2003).

**Birds:** Five bird species in Papahānaumokuākea are afforded protection under the Endangered Species Act. Three species are passerines: the Laysan Finch, found on Laysan Island and Pearl and Hermes Atoll, and the Nihoa Finch and the Nihoa Millerbird, which are endemic to Nihoa. Research, recovery, and management for these species takes into consideration the recommendations of the Northwestern Hawaiian Islands Passerines Recovery Plan (FWS 1984) and ongoing input from species experts. Numerous sites were evaluated and ranked for translocation of these species to establish additional populations; this information and some recommendations for proceeding with translocation were provided recently by Morin and Conant

(2007). This plan is implemented by FWS.

The Laysan Duck has the most restricted range of any duck species and is especially vulnerable to extinction because of its small population size (fewer than 800 individuals) and extremely limited range. In 2004 and 2005, 42 Laysan Ducks were translocated to Midway Atoll NWR, where their population has grown to 200 birds (Reynolds et al. 2007).

The Short-tailed Albatross was first observed at Midway Atoll between 1936 and 1941. Since then, between one and three individuals have been observed every year in Papahānaumokuākea. While the Short-tailed Albatross primarily breeds on Torishima, an island owned and administered by Japan, the *Short-tailed Albatross Draft Recovery Plan* (FWS 2005) provides suggestions for ways in which Monument staff can facilitate recovery of this species.

**Plants:** Six plant species known historically from the NWHI are listed as endangered. Three plant taxa have probably always been rare and restricted to Nihoa, although one species, the loulou or fan palm, also occurred on Laysan Island. *Mariscus pennatiformis* ssp. *bryanii* is known only from Laysan Island. *Cenchrus agrimonioides* var. *laysanensis* was historically known from Laysan Island and Midway and Kure Atolls, but has not been seen there since about 1980 (O'Connor 1999; HBMP database 2007). A recovery plan for three species found only at Nihoa (the Nihoa fan palm, *Schiedea verticillata*, and *Amaranthus brownii*) was finalized in 1998 (FWS 1998). Recovery actions for the other three species (*Cenchrus agrimonioides*, *Mariscus pennatiformis*, and *Sesbania tomentosa* or 'ohai) are described in the *Recovery Plan for the Multi-Island Plants* (FWS 1999).

### 5.e Monument Management Plan

The Co-Trustees have developed a joint agency Monument Management Plan to serve as the guiding document for coordinated conservation and management actions in Papahānaumokuākea over the next 15 years. The final plan will be released in late 2008. The Monument Management Plan focuses on coordinated management across Co-Trustee agencies and addresses issues such as conservation, research, monitoring, enforcement, education, Native Hawaiian practices, cultural resources, permitting and field operations. As it was developed, the Monument Management Plan incorporated many of the plans that had been previously developed to guide current management actions within the NWHI. These plans are listed in Section 5.d.

The Monument Management Plan is organized into three sections:

Section 1, the introduction, describes Papahānaumokuākea’s setting and the current status and condition of the ecosystem and cultural resources based on existing scientific and historic knowledge. It also describes known anthropogenic stressors that affect Papahānaumokuākea’s resources or may do so in the future.

Section 2, the management framework, includes key elements to move toward an ecosystem approach to management. The framework comprises the following elements:

- The legal and policy basis leading to the establishment of Papahānaumokuākea
- Vision, mission and guiding principles that provide an overarching policy direction for Papahānaumokuākea
- Goals to guide the implementation of specific action plans to address priority management needs
- Institutional arrangements for management among the Co-Trustees and other stakeholders
- Regulations and zoning to manage human activities and threats
- Concepts and direction to move toward a coordinated ecosystem approach to management

Section 3 presents action plans to address six priority management needs over a 15-year planning horizon. These priority management needs are:

- Understanding and interpreting NWHI resources
- Conserving wildlife and their habitats
- Reducing threats to Papahānaumokuākea’s resources
- Managing human activities
- Facilitating coordination
- Achieving effective operations

Each action plan consists of multiple strategies and activities to address one or more priority management needs and achieve a desired outcome. Performance measures will be developed to evaluate implementation of the Monument Management Plan. Papahānaumokuākea regulations and other policy and operating instruments are provided in the Appendices, along with references.

*The Vision, Mission, Guiding Principles, and Goals for Managing Papahānaumokuākea Marine National Monument*

The Papahānaumokuākea Marine National Monument vision, mission and guiding principles establish the overarching policy direction and guidance for Papahānaumokuākea’s management (see Table 5.2). The vision describes the long-term management desire of the Co-Trustees to maintain the ecosystem health and diversity and Native Hawaiian cultural significance of Papahānaumokuākea in perpetuity. The mission establishes the need for integrated management in order to ensure ecological integrity and achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian culture, and heritage resources for current and future generations. The guiding principles provide direction for making informed decisions about human activities consistent with the vision and mission for Papahānaumokuākea. The goals are the unifying elements of successful property management. They identify and focus management priorities, resolve issues, and link to the public interest in preserving and caring for the historic and scientific objects within Papahānaumokuākea.

(Photo: James Watt)

*Table 5.2: Monument vision, mission, guiding principles, and goals*

Vision
To forever protect and perpetuate ecosystem health and diversity and Native Hawaiian cultural significance of Papahānaumokuākea.
Mission
Carry out seamless integrated management to ensure ecological integrity and achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian culture, and heritage resources for current and future generations.
Guiding Principles
<p>Papahānaumokuākea shall be managed in a manner that—</p> <ul style="list-style-type: none"> <li>• Is consistent with the Vision and Mission;</li> <li>• Recognizes that the resources of the NWHI are administrated by the Co-Trustees for the benefit of present and future generations;</li> <li>• Affirms that the NWHI and its wildlife are important, unique, and irreplaceable;</li> <li>• Honors the significance of the region for Native Hawaiians;</li> <li>• Honors the historic importance of the region;</li> <li>• Incorporates best practices, scientific principles, traditional knowledge, and an adaptive management approach;</li> <li>• Errs on the side of resource protection when there is uncertainty in available information on the impacts of an activity;</li> <li>• Enhances public appreciation of the unique character and environment of the NWHI;</li> <li>• Authorizes only uses consistent with Presidential Proclamation 8031 and applicable laws;</li> <li>• Coordinates with federal, state, and local governments, Native Hawaiians, relevant organizations, and the public; and</li> <li>• Carries out effective outreach, monitoring, and enforcement to promote compliance.</li> </ul>
Goals
<b>Goal 1:</b> Protect, preserve, maintain, and where appropriate restore the physical environment and the natural biological communities and their associated biodiversity, habitats, populations, native species, and ecological integrity.
<b>Goal 2:</b> Support, promote, and coordinate research, ecosystem characterization, and monitoring that increases understanding of the NWHI, improves management decision-making, and is consistent with conservation and protection..
<b>Goal 3:</b> Manage and only allow human activities consistent with Proclamation 8031 to maintain ecological integrity and prevent or minimize negative impacts for long-term protection.
<b>Goal 4:</b> Provide for cooperative conservation including community involvement that achieves effective property operations and ecosystem-based management.
<b>Goal 5:</b> Enhance public understanding, appreciation, and support for protection of the natural, cultural, and historic resources.
<b>Goal 6:</b> Support Native Hawaiian practices consistent with long-term conservation and protection.
<b>Goal 7:</b> Identify, interpret, and protect Papahānaumokuākea’s historic and cultural resources.
<b>Goal 8:</b> Offer visitors opportunities at Midway Atoll to discover and appreciate the wildlife and beauty of the NWHI, enhance conservation, and honor its unique human history.

**Toward ecosystem-based management**

An ecosystem approach to management for Papahānaumokuākea requires that multiple steps be implemented in a comprehensive and coordinated way. The Papahānaumokuākea Marine National Monument approach is unique in that it includes:

- Ecosystem level planning;
- Cross-jurisdictional management goals;
- Co-management;
- Adaptive management;
- Marine zoning;
- Habitat restoration;
- Incorporation of traditional knowledge; and
- Long-term ocean and coastal observing, monitoring and research.

**Effective management plan implementation**

The Monument Management Plan has recently been finalized. A key component of overall management effectiveness will be a review and updating of the plan every five years, as described below. In addition, an entire action plan is devoted specifically to developing measures of effectiveness across all Papahānaumokuākea activities. Additional activities to assess the health of the resources of Papahānaumokuākea are outlined in Section 6 “Monitoring”.

**Monument Management Plan development and review**

The management plan will be reviewed every five years. The review represents an essential element of the adaptive management process and includes public involvement, characterization of issues, and review and evaluation of action plans.

The Monument Management Plan was developed based on the current state of knowledge regarding the most appropriate management measures. These management measures consist of regulations and action plans to govern the first five years of Papahānaumokuākea management, and project activities over a 15-year time frame where appropriate. Action plans will be implemented, and where regulations apply, enforced, through interagency collaborative

mechanisms based on the jurisdiction of each government agency. After five years, the Monument Management Plan will be reviewed, incorporating lessons learned and new data and information from monitoring, ecosystem science, and traditional knowledge, along with a comprehensive evaluation to develop or refine management strategies and actions.

**Achieving effective property operations**

A key priority management need in the management plan focuses on property operations, including central and field operations, information management, and overall program evaluation. Central and field operations are essential to support action plans to address all other priority management needs. Monument staff and facilities provide essential operational capacity for effective collaboration between the MMB and other stakeholders. Operational effectiveness will be evaluated and improved through an adaptive management process that captures lessons learned and transforms them into action.

The Co-Trustees are committed to developing management plan performance measures, which fall into three categories: annual benchmarking, management capacity assessment and outcome assessment.

Annual benchmarking measures will be used to determine whether activities have occurred as planned. Management capacity assessment measures will be used every two to three years to determine the adequacy of implementation mechanisms and processes, including interagency coordination and stakeholder and community participation. Outcome assessment measures will be used every four to five years to evaluate the impacts of management actions on the resources and ecosystem status.

**5.f Sources and Levels of Finance**

The primary sources of funding for the property come from the Co-Trustee agencies. Budgets are appropriated annually from the U.S. Congress or the State of Hawai‘i Legislature to the federal

and state administrations. NOAA's Office of National Marine Sanctuaries annual operating budget for the Monument is approximately \$7.1 million. FWS has an annual Monument budget of approximately \$6.8 million, including operations and deferred maintenance funds, roughly half of which administers contracts (including a portion of airport operations) at Midway Atoll. The Federal Aviation Administration also finances a portion of the airport management at Midway Atoll. While the State of Hawai'i does not have a budget that is solely devoted to the Monument, they allocate nearly \$462,000 of staff and resources annually with in-kind services. NOAA-Fisheries also does not have a budget that is solely devoted to the Monument, but allocates considerable funds to protected species restoration, monitoring and protection through the Hawaiian Monk Seal programs, programs for turtles, marine debris removal, and coral reef monitoring. The combined funding for these NOAA-Fisheries programs is \$11 million annually.

In addition to the Co-Trustee agencies, numerous other agencies provide added resources to support the management of Papahānaumokuākea. NOAA's Office of Law Enforcement and FWS' refuge law enforcement staff both support enforcement actions in Papahānaumokuākea. The USCG regularly patrols the area with ships and planes; these assets cost on average \$5,600/hour for patrols and/or emergency response. The Hawai'i Undersea Research Lab of the University of Hawai'i has a deep diving submersible and remotely operated vehicles that are used to assess deep ocean resources in Papahānaumokuākea. Funding for these efforts comes from numerous sources, including National Science Foundation grants, NOAA's Ocean Exploration Program and NOAA's Undersea Research Center. The Hawai'i Institute of Marine Biology of the University of Hawai'i has received an annual appropriation in the last four years, ranging from \$1.2–\$2.5 million to assist in characterizing, understanding and assessing connectivity between islands and throughout the Hawaiian Archipelago. Additional resources have been allocated by various entities to document and find many of the maritime heritage resources within

Papahānaumokuākea. These funds come from both government and private sources. The total financial allocation to manage, restore and enforce the property's resources is difficult to quantify exactly, but ranges from about \$34 million to more than \$50 million annually.

While the funding to manage Papahānaumokuākea is adequate, recent cuts have diminished the Co-Trustees' ability to address the threat of marine debris. In addition, funding for the restoration and annual population assessments of an iconic Papahānaumokuākea species, the Hawaiian Monk Seal, has decreased in the past few years, raising additional concerns about the ability of the management agencies to halt the decline of this critically endangered species.

### 5.g Expertise and Training

Staff expertise and training in conservation and management is extensive and often complex. The FWS and NOAA establish strict eligibility requirements for their scientific and management positions. Current staff have extensive experience in wildlife biology and fish and wildlife management, or policy; some are recognized worldwide as experts in their field. In addition to this expertise, the FWS operates the National Conservation Training Center in Shepherdstown, West Virginia, where training courses in a wide range of sciences, technologies and management are offered. NOAA has laboratories and training programs around the country. Many staff are members of professional organizations and have close contact with their peers in other agencies and organizations, often far beyond the boundaries of the United States. All are highly educated; most possess at least a bachelor's degree from an accredited University.

Coordination with other agencies for training is ongoing and undertaken frequently, depending on the discipline. All field staff from the agencies are trained together in wilderness first aid, small vessel operations, and other emergency response protocols. NOAA ship operations are on par with military efficiency levels, and all officers are part of a quasi-military corps. Emergency response

for oil and vessel events is coordinated via the USCG area command, and all agencies participate in these exercises.

The USCG has developed area contingency plans for response to oil spills and vessel groundings throughout Papahānaumokuākea. Because of the extensive infrastructure found at Midway Atoll National Wildlife Refuge, FWS has also developed several Midway-specific contingency plans, including an Emergency Spill Response Plan, Spill Prevention and Control Countermeasure Plan, and an Airport Emergency Action Plan. A team made up of staff from each Co-Trustee agency works together to train and develop response plans for both anticipated and unanticipated events. This includes evacuation protocols for emergencies and weather, as well as for response to natural events such as disease outbreaks. While not all response plans have been developed, many are called for and outlined in the Monument Management Plan.

Education and outreach staff are trained in communications techniques; many of the education staff are former teachers. Papahānaumokuākea Marine National Monument staff are also reaching out to colleagues in other marine protected areas, such as the Great Barrier Reef Marine Park Authority in Australia, to gain knowledge from their management experiences. Conferences such as Our Sea of Islands, held in November 2006, allow for sharing of experiences across the Pacific.

Monument staff have contributed resources as well as logistical and technical support to projects that have helped to bring the majesty of this coral reef and Pacific island area to a broad audience. Films such as Ocean Futures' "Voyage to Kure," BBC and National Geographic features, and Susan Middleton and David Liittschwager's photographic works in *National Geographic* and their book *Archipelago* are several examples. Monument managers, research and education staff, and field support personnel were instrumental in assisting

in the production of these visual journeys, and continue to support projects like these, that reach a broad audience.

Multiple staff have expertise in Native Hawaiian cultural resource management and practices. Within NOAA, there is a team that works explicitly on Native Hawaiian traditional knowledge and management as it pertains to Papahānaumokuākea. Several staff work exclusively with Native Hawaiian cultural research and constituency relations, and multiple staff are Native Hawaiian practitioners themselves. Additionally, the December 2006 Memorandum of Agreement for Promoting Coordinated Management of the Northwestern Hawaiian Islands Marine National Monument (agreement) provided for the inclusion of the Office of Hawaiian Affairs into the Monument management process to provide a voice for Native Hawaiians and their cultural rights and practices. Through this Agreement and as described in the MMP, the Co-Trustees will undertake coordinated, integrated management to achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian traditional and customary cultural and religious practices, and heritage resources for current and future generations.

## 5.h Visitor Facilities and Statistics

One of the management principles of Papahānaumokuākea Marine National Monument is to bring the place to the people rather than the people to the place. As provided in the Presidential Proclamation establishing Papahānaumokuākea, Midway Atoll is the only place where the public is welcomed to learn about and experience this remote island ecosystem, and hopefully to return home with a newfound knowledge of how their actions far from these shores can affect Papahānaumokuākea's resources.

Visitation at Midway Atoll is managed under a Visitor Services Plan incorporated into the overall Monument Management Plan. It provides for a very small-scale

program, with no more than 50 overnight visitors present at any one time. Currently, that number is much lower based on limited transportation availability to the atoll (see Table 5.3).

Visitors are housed in a converted U.S. Navy Bachelor Officers' Quarters; 24 rooms are currently available. In the future, one of the historic officers' houses may also be converted to accommodate visitors. All meals are served in the Clipper House restaurant. A small food and supply store and a separate gift shop are available. Transportation is almost entirely by bicycle or on foot, although a limited number of golf carts are available to visitors.

In addition to overnight visitors, Midway occasionally hosts larger groups for less than a day, generally to commemorate the Battle of Midway. These visitors are offered guided walking tours along existing roadways with interpretive programs at specific historic or wildlife stops. The management plan and Midway Visitor Services Plan limit such larger day visits to three per year.

At Midway Atoll, a small visitor center interprets natural and historic resources, and visitors participate in a mandatory orientation session that furthers their knowledge about Papahānaumokuākea resources and their importance to Native Hawaiian culture. Several guided tours are offered by FWS staff. Guided tours focus on refuge management, historic resources, restoration activities, and biological resources. Other visitor facilities include a road/trail system throughout Sand Island, a "trail" along the historic runways of Eastern Island, a theater, library, gymnasium, bowling alley and small community center. In the future, a new museum and expanded interpretive programs are planned. Many of the current visitors come to Midway with a guided tour operator, providing additional programs and information for guests.

The Midway visitor services plan and all proposed visitor experiences meet all seven criteria for sustainable tourism proposed by the World Heritage Alliance.

Visitation at Midway Atoll over the past several years is as follows:

*Table 5.3: Visitation at Midway Atoll, 2005 - present*

Fiscal Year	Visitor Count
2005	610
2006	250
2007	1,861*
2008 (to date)	310

\*This number is due largely to a 1-day event to commemorate the 65th anniversary of the Battle of Midway.

Other than Midway Atoll, Papahānaumokuākea is closed to public visitation, although occasionally small groups of educators, documentary filmmakers, or government officials visit some of the islands under permit.

### 5.i Property Promotion and Presentation

As outlined in the Monument Management Plan, the Co-Trustees plan to continue and strengthen their outreach, interpretation and educational efforts in the coming years. Educational programs such as Navigating Change focus not just on Papahānaumokuākea's natural, cultural and historic resources, but on raising awareness and motivating students to change their attitudes and behaviors to better care for all of Hawai'i's land and ocean resources. Workshops on Midway Atoll for teachers and other community leaders and educators offer participants the opportunity to experience Papahānaumokuākea and bring it back to their students and lifetime learners. Colleges, universities and private organizations also have the opportunity to conduct college-level classes or informal educational camps on Midway Atoll to bring Papahānaumokuākea to life for students.

As stated earlier, to limit impact on the property's resources, among other goals, promotion and presentation of Papahānaumokuākea largely brings the place to the people rather than the people to the place.

# Our Sea of Islands:

## A Regional Forum for Oceania on Marine Managed Areas and World Heritage

29 January – 2 February, 2007  
Honolulu, Hawai'i

The forum, organized by Papahānaumokuākea Marine National Monument and the United Nations Educational, Scientific and Cultural Organization (UNESCO) World Heritage Centre, together with their partners, provided an opportunity for Pacific island leaders to work together for better marine and heritage conservation.

More than 100 delegates from over 20 Pacific nations, including the United States, Solomon Islands, Cook Islands, Fiji, Sāmoa and the Federated States of Micronesia came together to enhance natural and cultural heritage and management of marine managed areas (MMAs). The Our Sea of Islands Forum was the first opportunity in over a decade for people across Oceania to meet and discuss the diversity of types, scales, approaches and status of MMA development and management across the region. Participants valued this opportunity for dialogue as an interconnected Oceania and recognized the need to work together to protect our ocean home.

The Pacific Ocean spans more than one-third of the Earth's surface and is known for its vast marine resources, high biological diversity and diverse cultural heritage. The islands of Oceania are connected by common history, culture and ancestry: indigenous Oceanic cultures and traditions, their proud history of distant ocean navigators who utilized the wind, sea and stars to maintain regional connections over centuries, and their rich heritage in natural resource stewardship, management practices and knowledge.

Oceania has demonstrated global leadership in their commitment to marine conservation and the sustainable use of marine resources. Approximately 25% of the world's marine protected areas are located in Oceania, and all the jurisdictions in Oceania have established MMAs, particularly using community-based and traditional approaches. The three largest MMAs in the world are in Oceania: Australia's well-known Great Barrier Reef Marine Park, the Phoenix Islands Protected Area (PIPA) in Kiribati, and NWHI Papahānaumokuākea Marine National Monument.

Participants at the Forum identified and recognized critical needs, gaps and opportunities that must be addressed to sustain Oceania's people and environment. Outcomes focused in six key areas of marine area management - progress and status in MMA development, customary practices, surveillance and enforcement, science to inform management, conservation finance, and the application of the World Heritage Convention.

The participants affirmed that traditional knowledge and management practices are integral to the maintenance, development and management of MMAs in Oceania. This principle underpins all of the commendations, proposed participant actions and recommendations to governments and organizations by the Our Sea of Islands Forum.

Our Sea of Islands participants came from over 20 Pacific nations (Photo: Papahānaumokuākea Marine National Monument)

### *Telepresence*

As technologies develop, telepresence is one way to vividly bring the place to the people. Underwater video cameras, real-time video transmission, virtual field trips, formal distance learning, Web site interfaces, etc., offer many promising options for the creation of educational programs about this remote area.

### *Mokupāpapa: Discovery Center*

In the main Hawaiian Islands, Hilo's Mokupāpapa: Discovery Center for Hawai'i's Remote Coral Reefs interprets the natural science, culture and history of the Northwestern Hawaiian Islands and surrounding marine environment. More than 200,000 people have learned about the wonders of Papahānaumokuākea through the Center, including thousands of students and community groups. Since opening, the Center has hosted at least 60,000 visitors and 3,500 schoolchildren per year. In addition to school visitations during the school year, Mokupāpapa: Discovery Center offers a week-long summer course to more than 7,000 students each summer. Monument staff also participate in community events and forums to share their knowledge of the region's resources.

### *Information Kiosks*

Cooperative arrangements have been made with other facilities to host displays about the reefs and resources of the Papahānaumokuākea Marine National Monument. These include an aquarium display at the Waikīkī Aquarium on coral reef resources, as well as displays at the Hawai'i Maritime Center depicting life on a field camp and on a research vessel in Papahānaumokuākea. Additional interpretive displays are planned in concert with the new Visitor and Interpretive Center on Maui at the Hawaiian Islands Humpback Whale National Marine Sanctuary offices. Additional collaborative interpretive projects are being considered at other sites around the state.

### *Film and Internet*

The Co-Trustees also work with commercial and nonprofit filmmakers to develop documentaries and news programs that reach audiences around the world. A new Papahānaumokuākea Web site ([papahanaumokuakea.gov](http://papahanaumokuakea.gov)) has been developed to provide a virtual visit to the region. Additional informative materials are prepared and distributed as needed.

### *Teacher at Sea Program*

Since 2001, the Papahānaumokuākea Co-Trustees, along with a host of educational partners, have facilitated field-based educational experiences for teachers and other educators within the Northwestern Hawaiian Islands. These experiences have ranged from educator-at-sea voyages aboard NOAA research vessels to island- and atoll-based field trips. From 2001 to 2008, more than 70 educators have experienced Papahānaumokuākea's relatively pristine environments and cultural treasures, from flourishing coral reefs to sacred Native Hawaiian archaeological sites. Through blogging and online journaling to video podcasting and teleconferencing with classrooms, Papahānaumokuākea has provided mechanisms for these individuals to share their personal experiences with the world. Every year, a new cadre of ambassadors returns home with personal experience of Papahānaumokuākea and the skills to share this knowledge widely with those who can benefit from it most.

### *School Curriculum: Navigating Change*

In addition to the interpretive programs and documentaries, one of the key programs of Papahānaumokuākea is Navigating Change, an educational program offered to schoolchildren throughout the state, which predates the inception of the property. At this program's core is *Hōkūle'a*, a modern-day reincarnation of a double-hulled sailing vessel that has been instrumental in the accomplishment of superlative modern-day feats of navigation, using science built upon a foundation of ancestral knowledge. In 2001, *Hōkūle'a's* navigator, Nainoa

Thompson, envisioned sailing *Hōkūleʻa*, a replica of an ancient Polynesian voyaging canoe, among the wild and protected Northwestern Hawaiian Islands. Calling his idea “Navigating Change,” he wrote that he wanted to “bring the beauty of the Earth’s rare wildlife to living rooms and classrooms to create an awareness of the difference between where nature is protected and what happens when it is not.”

Navigating Change is currently made possible by a partnership of private and government organizations called the Navigating Change Educational Partnership (NCEP). Through environmental education that utilizes place-based stewardship components, it continues to focus on influencing attitudes and behaviors to understand, protect and care for all our islands and ocean resources. The NCEP includes: the Polynesian Voyaging Society, the Hawaiʻi Department of Land and Natural Resources, the U.S. Fish and Wildlife Service, NOAA, Bishop Museum, University of Hawaiʻi at Manoa, and the Pacific American Foundation. This group partners with many others, including the Hawaiʻi Department of Education, to bring the curriculum to the teachers and into the classrooms.

208

Beginning in 2001, pre-voyage preparation for this program involved a statewide “warm-up” sail and a week-long summer workshop that engaged over 200 teachers in workshops throughout the state on the basic principles of Navigating Change. During the 18-day voyage in May 2004 to the NWHI, NCEP acted as “mission control,” connecting 1,800 students and 80 classrooms across America and the Pacific with the vessel’s crew for an hour-long satellite link-up. Through these teleconferences, students participated in the excitement of voyaging. Teachers could extend that experience into the everyday classroom using a Teacher’s Guide to Navigating Change curriculum, with carefully designed interfacing DVD modules and video clips.

More than 300 teachers, principals, and administrators (including participation by family members) have attended full-day workshops—reaching an estimated 4,000

students in the State of Hawaiʻi. Workshops often interface with cultural components (for instance, an opportunity to sail on a voyaging canoe). In addition, over 50 teachers have provided feedback and encouragement by continuing to contact the NCEP through e-mails and by sharing their project work and examples of how their students have been positively influenced by the program.

In August 2005, seven teachers who were previously involved in developing and field testing the Navigating Change Teacher’s Guide were chosen to sail on a NOAA ship to explore and produce lessons about the Northwestern Hawaiian Islands.

The current focus for Navigating Change is the Ahupuaʻa Alliance Program, a year long strategy to help students, teachers, nonprofit organizations, private businesses and government agencies focus on specific place-based learning sites. A field site that safely provides rich learning activities (including an opportunity to conduct stewardship activities) will be developed or enhanced in each *ahupuaʻa* (a traditional Hawaiian land division, which usually runs from the deep sea to the mountaintops) with members of the local community.

#### Participation at Conferences and Events

An important part of promotion of the property is the participation of Monument staff at various conference, workshops, and events. A sample of recent events attended includes:

**Our Sea of Islands: A Regional Forum for Oceania on Marine Managed Areas and World Heritage, January 29–February 2, 2007.** Our Sea of Islands brought together participants from over 20 countries, states and territories around the Pacific and was co-sponsored by NOAA, the Department of Interior, and UNESCO World Heritage Programme. Its purpose was to highlight current efforts to protect important marine areas in Oceania, to share and expand technical expertise, and to develop balanced management practices by incorporating science and customary marine management techniques. The forum was also an

opportunity to build upon and collaborate with ongoing marine managed area networks across Oceania. Of the forum's multiple specific outcomes and recommended actions, the one most significant and relevant to this section is the need to integrate customary resource management into national and regional marine management policies.

**Traditional Ecological Knowledge Workshop, Kona, Hawai'i Island, August 21–24, 2008 (Prior to the 2008 U.S. Coral Reef Task Force Meeting).** Addressing concerns about the erosion of traditional ecological knowledge (TEK) and its transfer to younger generations, Monument staff hosted a Traditional Ecological Knowledge Workshop prior to the 2008 U.S. Coral Reef Task Force Meeting. This inter-agency and cross-cultural learning exchange hosted participants from six countries, including 30 traditional practitioners and youth from their communities across the Pacific. Responding directly to the forum's recommended actions, the TEK workshop aimed to promote and strengthen traditional knowledge and customary practices in Oceania, foster the intergenerational transfer of traditional knowledge and customary marine management practices, and share lessons about the importance of incorporating traditional knowledge into modern management at the 2008 U.S. Coral Reef Task Force Meeting in Kona, Hawai'i Island. Additionally, each community represented at the TEK Workshop received a "TEK Toolkit," including digital cameras and voice recorders, and instruction on how to (1) collect oral histories relevant to traditional marine management, and (2) instructions on the incorporation of TEK into marine management.

**U.S. Coral Reef Task Force Meeting, 2008.** At the 2008 U.S. Coral Reef Task Force Meeting, Monument staff worked to foster broader engagement between coral reef management and TEK. In particular, a Native Hawaiian practitioner presented a video of outcomes from the TEK Workshop (which had been held the week before). The objective was to inspire marine managers from across the United States and partner nations to more fully

*Pristine Papahānaumokuākea reef with numerous Acropora coral colonies, a species extremely rare in the main Hawaiian Islands (Photo: James Watt)*

incorporate TEK into marine management policies and regulations.

**Response to Climate Change Workshop, Kāne'ohe, Hawai'i September 2–5, 2008.** The Co-Trustees hosted the fourth-ever Response to Climate Change (RtCC) workshop in September 2008. It discussed implications for climate change on coral reefs and practical steps reef managers can undertake to build resiliency and reduce the threat of global climate change. The curriculum was customized to provide information specifically relevant to Pacific reefs, including the vital role traditional ecological knowledge can play in managing Hawai'i's reefs. The workshop sought to build a bridge between Western science and traditional management approaches, as well as supporting resiliency and management efforts. RtCC participants included cultural practitioners, marine managers, scientists and academics.

**National Institute of Water and Atmosphere (New Zealand) and National Oceanic and Atmospheric Administration (U.S.A.) exchange, July 2008.** Aiming to foster direct relationships with other indigenous peoples of the Pacific, the National Oceanic and Atmospheric Administration hosted an information exchange with indigenous representatives from the National Institute of Water and Atmosphere (New Zealand) in July 2008. During this exchange, managers focused on indigenous management framework tools for managing marine resources.

### *Presentation of Research to the Public*

As is discussed in Sections 2 and 4, research in Papahānaumokuākea has been ongoing for a number of years. Since the 1970s, one of the key aspects of this research has been to provide data to inform management decisions. In the mid 1970s through the mid 1980s, the Tripartite NWHI Fishery Expeditions resulted in significant new findings and the hosting of two major scientific symposia where results were presented to researchers, representatives of management agencies, and the general public. In addition, two publications from these symposia were produced, which collectively presented the results of more than 50 peer-reviewed papers documenting the scientific findings to date. The documents were the 1980 and 1984 Proceedings of the Symposium on Status of Resource Investigations in the Northwestern Hawaiian Islands, both published by the University of Hawai'i (UH) Sea Grant College Program.

Patterned after the first two successful symposia held in the 1980s, a third symposium was held in Honolulu, Hawai'i during November 2004, under the joint sponsorship of NOAA's Pacific Islands Fisheries Science Center, NOAA's National Ocean Service, the U.S. Fish and Wildlife Service, the Western Pacific Fishery Management Council, and the State of Hawai'i's Department of Land and Natural Resources. The Symposium covered a range of scientific themes, including the history

of research and management in the NWHI; protected species; fish, shellfish, and fisheries; oceanography and mapping; and ecology and environmental impacts. The symposium was attended by more than 300 representatives from research institutions, agencies and the public at large. The proceedings of the Northwestern Hawaiian Islands Third Scientific Symposium are published in the Atoll Research Bulletin No. 543, issued by the Smithsonian Institution's National Museum of Natural History.

Additional emerging findings from studies undertaken by the University of Hawai'i's Hawai'i Institute of Marine Biology, NOAA and others have been presented each year since 2006 at an annual mini-symposium held in conjunction with the Hawai'i Conservation Conference, which is attended by up to 300 participants. In addition, NOAA's Pacific Islands Fisheries Science Center (PIFSC), the Hawai'i Institute of Marine Biology (HIMB), and Papahānaumokuākea Marine National Monument host a Semi-Annual Northwestern Hawaiian Islands Joint Symposium and have been doing so for the past few years. Overall, significant efforts have been undertaken to bring the science to the managers and to inform the general public on the state of conservation and the health of the resources in Papahānaumokuākea.

### *Programs and Events Engaging the Native Hawaiian Community*

Engaging the Native Hawaiian community in Papahānaumokuākea management is a priority for the Co-Trustees. Success in this effort will promote long-term support and greater understanding from the host culture of the Hawaiian Archipelago. In addition to seeking input from the Native Hawaiian Cultural Working Group, some of the ways in which Papahānaumokuākea engages with the Native Hawaiian Community include:

**Aloha 'Āina: Cultural resilience and cultural connectivity.** An array of research and outreach activities with Native Hawaiian communities, the Aloha 'Āina

210

*Reef Assessment and Monitoring Program Team preparing for Rapid Ecological Assessments*  
(Photo: James Watt)

(Love of the Place) programs involve Monument staff working to assess the needs of, and to facilitate, a Native Hawaiian Research Plan looking at questions common to all. “It’s simple, really,” says Mahina Paishon-Duarte, cultural practitioner and Monument liaison to Native Hawaiian communities. “It’s helping people to remember their love for the place.” This series of programs engages in multiple activities, which include securing research berths for cultural practitioners; facilitating collaborations between Native Hawaiian practitioners and scientists at the University of Hawai‘i’s Hawai‘i Institute of Marine Biology; ensuring that communities from each of the main Hawaiian Islands are involved in the discussion; and that lessons learned are shared throughout communities. Program directions stem from roundtable discussions in Native Hawaiian communities on Moloka‘i, Maui, Hawai‘i Island, O‘ahu, and Kaua‘i, which were facilitated by Monument staff and help to ensure that major Papahānaumokuākea program areas (e.g., the Native Hawaiian Research Plan) address questions and concerns shared with Native Hawaiian communities across the state.

**Native Hawaiian Cultural Research Plan.** Preliminary development of the Native Hawaiian Cultural Research Plan (NHCRP) is being fostered by Native Hawaiian community roundtable discussions and initial results from the Native Hawaiian Cultural Research programs (2008). The vision for the NHCRP is stated in the Monument Management Plan. A formal workshop to begin the NHCRP’s development is planned for the fall/winter of 2008.

**Ongoing information exchange between Native Hawaiian program leaders and academia, governmental and/or marine management agencies, the public and others.** For several years, Native Hawaiian practitioners working for the Monument (e.g., in the position of Native Hawaiian programs and outreach) have been engaged in a wide variety of collaborations with governmental, academic, non-governmental, and community organizations, and other entities in Hawai‘i. Other collaborative

exchanges include giving presentations about TEK and social-ecological resilience. Future plans include expanding the existing partnership with the Hawai‘i Institute of Marine Biology to establish a traditional knowledge internship program, in which Native Hawaiian youth (e.g., college students) apply for paid internships to spend time in traditional communities and learn traditional ecological knowledge and practices from elders.

## 5.j Staffing Levels

The level of training and staff expertise required is significant, complex, and difficult to adequately describe. Each of the Co-Trustees and many of the partner agencies, such as the law enforcement offices or USCG, have their own training programs, many that span multiple years. A basic description of the primary agency roles is outlined here and many of the specific tasks are further described in the Monument Management Plan (Appendix K).

For the National Oceanic and Atmospheric Administration (NOAA), day-to-day management of Papahānaumokuākea at the field level is through the Office of the National Marine Sanctuaries (ONMS) and the National Marine Fisheries Service Pacific Islands Regional Office (PIRO). The NOAA-ONMS Papahānaumokuākea Superintendent operates out of the central office in Honolulu, with support from 25 additional staff to implement programs in policy, research, permits, education and outreach, and information management. NOAA-ONMS also has four full-time staff in the office on the Island of Hawai‘i in the main Hawaiian Islands to manage the Mokupāpapa Discovery Center. PIRO staff include a full-time Management Officer and a policy specialist, both based in Honolulu. NOAA-ONMS have four full-time contractors dedicated to the development of the centralized Monument Information Management System, which will standardize and make available data necessary for the effective management of Papahānaumokuākea.

For the U.S. Fish and Wildlife Service, Papahānaumokuākea is managed both from Honolulu, Hawai'i, and onsite at Tern Island in French Frigate Shoals, Laysan Island, and Midway Atoll.

The FWS Papahānaumokuākea Superintendent is based in Honolulu, along with a permits manager, logistics coordinator, and administrative staff. Midway Atoll staffing includes a Refuge Manager, Deputy Refuge Manager, wildlife biologists, a visitor services manager, interpretive ranger, law enforcement ranger, and equipment operator. In addition, FWS contracts with a private entity to operate the infrastructure of the island, including airport operation, medical facilities, food preparation, electrical generation and distribution, water system, sewage system, etc. This company has approximately 50 workers on Midway, fully trained in their particular skill. In addition, upon first arriving on Midway, they receive a full orientation about working on a National Wildlife Refuge and within Papahānaumokuākea Marine National Monument.

Staffing at French Frigate Shoals consists of a Refuge Manager and Assistant Refuge Manager. Biological science technicians and volunteers are also stationed at French Frigate Shoals and Laysan Island.

The State of Hawai'i staff is mainly located in Honolulu, however, field staff are on site at Kure Atoll each summer for an extended period of time (up to six months). The State

Papahānaumokuākea Superintendent is based in Honolulu, along with a permits coordinator, a research coordinator, policy specialists and administrative staff. The Kure Atoll Field Manager is based part of the year in Honolulu and part of the year on site at Kure Atoll. A team of two to three volunteers works alongside the Kure Atoll Manager during the field season to manage activities at the site.

As previously indicated, all field staff from each agency undergo rigorous training in wilderness first aid, small vessel operations and other safety procedures to ensure that they are well equipped to handle emergencies in remote field sites. All researchers and crew on all agency vessels must engage in emergency response training on every voyage into Papahānaumokuākea. Coordination of oil and other hazardous material response procedures and simulated response activities are scheduled regularly by the USCG. All agencies are required to follow standard operating procedures for diving, operation of heavy equipment, food handling, hazardous materials handling and disposition, and the like as required by national and state occupational health and safety regulations. All persons entering Papahānaumokuākea are also required to attend a briefing in which the important cultural significance and consideration of protocols is discussed. Similarly, any activities that occur on the most sensitive sites usually require accompaniment by a staff member from one of the agencies who is trained in both the biological and cultural considerations of the site.

# 6. Monitoring

## 6.a Key Indicators for Measuring State of Conservation

As detailed in previous sections, Papahānaumokuākea is unrivaled in its combination of high levels of endemism, overall intact ecosystems, and cultural significance. As a result, the conservation of Papahānaumokuākea’s natural and cultural resources is paramount and a guiding principle of its vision: to forever protect and perpetuate the ecosystem health and diversity and Native Hawaiian cultural significance of Papahānaumokuākea.

Within Papahānaumokuākea’s spacious boundaries, there is phenomenal variation in both landscapes and associated biota. Both the region’s wide latitudinal span and the long geologic succession of islands and atolls create diverse terrestrial habitats and result in a multitude of ecological niches. This geologic succession has also

(Photo: James Watt)

given rise to abundant and diverse marine habitats, from shallow atoll lagoons to submerged seamounts. A central priority of Papahānaumokuākea Marine National Monument is to protect, maintain and preserve this rare ecological integrity as well as ecosystem health and function.

Another management priority of the Monument is to support Native Hawaiian practices and protect cultural resources. The monitoring efforts listed in Table 6.1 strive to deduce key components of the environmental conservation goals while also ensuring the long-term mission of supporting Native Hawaiian cultural practices and resources.

Table 6.1a: Indicators of Conservation for Natural Resources

Indicator	Parameter Group	Parameters	Periodicity	Location of Records
Marine Ecosystem Monitoring	Algae	Endemism Community composition Abundance and diversity Alien, invasive species	Annual	DLNR, NOAA, FWS
	Corals	Endemism Community composition Abundance and diversity Disease	Annual	DLNR, NOAA, FWS, HIMB
	Deepwater Corals	Abundance and diversity	Annual	NOAA, HURL
	Shallow Water Invertebrates	Endemism Community composition Abundance and diversity Alien, invasive species Lobster monitoring	Annual	NOAA, FWS
	Fish	Endemism Community composition Abundance and diversity Biomass Alien, invasive species Movement patterns	Annual	DLNR, NOAA, FWS, HIMB

Table 6.1a (continued): Indicators of Conservation for Natural Resources

Indicator	Parameter Group	Parameters	Periodicity	Location of Records
Marine Ecosystem Monitoring	Oceanography	Water quality Rainfall Wave height Chlorophyll a, b Dissolved oxygen Sea level change	Annual	NOAA, FWS, UH
		Temperature (water and air) Salinity Wind velocity	Real-time	NOAA
		Ambient sounds	Continuous	NOAA
Threatened, Endangered and Protected Species Monitoring	Reptiles	Turtle nesting	Seasonal (May-October)	FWS, NOAA
	Monk Seals	Population assessments Reproductive success Survivorship	Seasonal (May-October)	FWS, NOAA
	Seabirds	Survivorship Reproductive success Abundance Breeding pairs Movement patterns	Seasonal (May-October)	FWS, NOAA, DLNR
	Cetaceans	Population assessments Acoustic recordings	Seasonal Continuous	FWS, NOAA, DLNR
Terrestrial Ecosystem Monitoring	Terrestrial Birds	Abundance Survivorship	Seasonal (May-October)	FWS
	Terrestrial Plants	Endemism Species composition Abundance and distribution Alien, invasive species	Seasonal (May-October)	FWS
	Terrestrial Invertebrates	Endemism Species composition Distribution and abundance of ants Distribution and abundance of Grey Bird Locust	Annual	FWS
Threat Assessment Monitoring	Marine Debris	Accumulation rates Composition Alien, invasive species	Annual	FWS, DLNR, NOAA, UH, USGS
	Alien Species	Distribution and abundance	Annual	FWS, DLNR, NOAA, UH, USGS
	Disease	Distribution and abundance Prevalence Lethality	Annual	FWS, DLNR, NOAA, UH, USGS
	Human Impacts	Restrict access Review permitted activities Cumulative impacts	Continuous	PMNM Office
	Climate Change	Sea level change Water chemistry Sea surface temperature	Annual	NOAA, FWS, UH

Table 6.1b: Indicators of Conservation for Cultural Resources

Indicator	Parameter Group	Parameters	Periodicity	Location of Records
Public understanding of Native Hawaiian cultural significance to Papahānaumokuākea is increasing	Appreciation and understanding of local values and beliefs about the site	Perceptions of the intrinsic and/or non-market value of Papahānaumokuākea to the continuity of the Native Hawaiian culture	Annual	PMNM Office
		Appreciation of Native Hawaiian cultural, historical and cosmological relationship to Papahānaumokuākea by (1) Native Hawaiian community and (2) broader community	Annual	PMNM Office
	Outreach and education about the importance of natural integrity to cultural protection	Number of permittees educated	Annual	PMNM Office
		Trends in broader community's values about natural and cultural importance of the site	Annual	PMNM Office
	Distribution of formal knowledge about cultural research in PMNM to the community, including (a) the Native Hawaiian community, and (b) where culturally appropriate, the broader community	Measuring the degree of community's awareness about activities of, and information generated by, Native Hawaiian cultural practitioners in PMNM	Annual	PMNM Office
		Facilitating interactions between Native Hawaiian practitioners, Western scientists, resource managers (including Monument staff) and broader community	Annual	PMNM Office
Outreach & education about Native Hawaiian sea-uses in Papahānaumokuākea	Visitor numbers to Mokupāpapa Interpretive Center; Number of classrooms utilizing Navigating Change curriculum and/or other curricula relating to PMNM's natural and cultural resources	Annual	PMNM Office	
Native Hawaiian stakeholder engagement with Papahānaumokuākea	Cultural practitioners' access to the site	Number of berths provided to cultural practitioners by PMNM to access and practice in Papahānaumokuākea; When appropriate, type of cultural access to the PMNM and demographics of individuals participating in cultural access in PMNM (e.g., gender, age, island of origin)	Annual	PMNM Office, OHA Office
		PMNM's commitment to fostering cultural research and practices in Papahānaumokuākea	Annual	PMNM Office, OHA Office
		Native Hawaiian cultural research needs identified and prioritized	Annual	PMNM Office, OHA Office

Table 6.1b (continued): Indicators of Conservation for Cultural Resources

Indicator	Parameter Group	Parameters	Periodicity	Location of Records
Native Hawaiian stakeholder engagement with Papahānaumokuākea	Engagement of Native Hawaiian traditional knowledge and practices in the management of Papahānaumokuākea	Degree and type of integration of Native Hawaiian management practices with Western scientific practices in PMNM	Annual	PMNM Office
		Interactions between Monument staff and Native Hawaiian Cultural Working Group	Annual	PMNM Office
		Interactions between Monument staff and broader Native Hawaiian community regarding integrated traditional-Western scientific management of the site	Annual	PMNM Office
		Continued review of all PMNM use permits by Native Hawaiian cultural practitioners	Annual	PMNM Office
		Number of PMNM permits reviewed by Native Hawaiian practitioners	Annual	PMNM Office
		Protections enacted by Native Hawaiian review of permits	Annual	PMNM Office
	Access to site by Hawaiian wayfinders	Number of wayfinding trips allowed in Papahānaumokuākea	Annual	PMNM Office
		If applicable, number and reason for restrictions of wayfinding in Papahānaumokuākea	Annual	PMNM Office
Review of human impacts on the cultural resources.	Integrity of archaeological sites on Nihoa and Mokumanamana	Tracking and evaluating Section 106 consultations (consultation process required under National Historic Preservation act, in the event of use of Nihoa or Mokumanamana)	Annual	PMNM Office, OHA Office

While the natural and cultural resources in Papahānaumokuākea exist in a nearly pristine environment, and are thus removed from major pressures of extensive human population, they are not entirely threat-free. As a result, it is just as important to monitor the threats to Papahānaumokuākea as it is to monitor the state of its natural and cultural resources. Detailed in Section 4.b, the most worrisome threats to resources originate outside the boundaries of Papahānaumokuākea. Marine debris consistently washes up on the reefs and shores of these islands and atolls. On par with these external threats are the imposing effects of climate change, namely sea-level rise, ocean acidification and sea surface temperature increases. It is therefore imperative to monitor both the natural and cultural resources as well as the threats facing these resources on a frequent basis.

## 6.b Administrative Arrangements for Monitoring Property

Prior to the inception of Papahānaumokuākea, the State of Hawai‘i, U.S. Fish and Wildlife and NOAA managed separate jurisdictions in the waters and lands of the NWHI and were responsible for their respective monitoring programs. Since Papahānaumokuākea’s designation, the Co-Trustees collectively have administered Papahānaumokuākea Marine National Monument. Each Co-Trustee has maintained their respective monitoring and research regimes but now works in a coordinated fashion to facilitate overall management efforts. The comprehensive Monument Management Plan (MMP), which directs and guides all monitoring efforts in

Table 6.2: Relationship Between Management and Monitoring

Monument Management Goals	Indicators	Criterion
Protect, preserve, maintain, and where appropriate, restore the physical environment and natural biological communities and their associated biodiversity, habitats, populations, native species, and ecological integrity.	Marine Ecosystem Monitoring	ix, x
	Threatened and Endangered Species Monitoring	x
	Terrestrial Ecosystem Monitoring	ix, x
	Threat Assessment Monitoring	viii, ix, x
Support, promote, and coordinate research, ecosystem characterization, and monitoring that increases understanding of the NWHI, improves management decisionmaking, and is consistent with conservation and protection.	Marine Ecosystem Monitoring	ix, x
	Threatened and Endangered Species Monitoring	x
	Terrestrial Ecosystem Monitoring	ix, x
	Threat Assessment Monitoring	viii, ix, x
Manage and only allow human activities consistent with Proclamation 8031 to maintain ecological integrity and prevent or minimize negative impacts for long-term protection.	Threat Assessment Monitoring	viii, ix, x
Provide for cooperative conservation including community involvement that achieves effective Monument operations and ecosystem-based management.	Marine Ecosystem Monitoring	ix, x
	Threatened and Endangered Species Monitoring	x
	Terrestrial Ecosystem Monitoring	ix, x
	Threat Assessment Monitoring	viii, ix, x
Enhance public understanding, appreciation, and support for protection of the natural, cultural and historic resources.	Increased public understanding of Papahānaumokuākea’s cultural significance to Hawaiians	iii, vi
Support Native Hawaiian practices consistent with long-term conservation and protection.	Maintain or increase Native Hawaiian engagement	iii, vi
Identify, interpret, and protect Monument historic and cultural resources.	Review of human impacts on cultural resources	iii, vi

218

Papahānaumokuākea, encompasses all of the respective agencies’ goals to manage and conserve Papahānaumokuākea resources. Table 6.2 illustrates how the MMP will facilitate World Heritage monitoring efforts to ensure a responsible and lasting monitoring program.

Examples of enhanced management facilitation include the establishment of a unified permitting process to restrict access and ensure sound research and activities in Papahānaumokuākea. In addition, plans are underway for the creation of a centralized Monument Information Management System which will standardize all monitoring data for managers to evaluate Papahānaumokuākea’s resources in a true ecosystem-based fashion. Proprietary cultural information, however, will be housed in the Office of Hawaiian Affairs’ Wahi Pana Database to offer additional protections that federal and state executive branch agencies are unable to provide.

The overall management and protection of Papahānaumokuākea is under the administrative authority of the following three agencies:

United States Fish and Wildlife Service  
300 Ala Moana Blvd., Room 5-231  
Honolulu, HI 96850  
USA

National Oceanic and Atmospheric Administration  
6600 Kalaniana’ole Hwy, Suite 300  
Honolulu, HI 96825  
USA

State of Hawai’i, Department of Land and Natural Resources  
1151 Punchbowl St, Room 130  
Honolulu, HI 96813  
USA

These three agencies, both independently and on a collaborative basis, have had management responsibility for monitoring resources in Papahānaumokuākea for decades (and in two cases, nearly a century). Much of the monitoring effort has been carried out by these agencies' various subsidiaries and partners, and credit must be given to the following organizations and institutions for their contributions to the enhancement of knowledge of natural and cultural resources found in Papahānaumokuākea:

- Bishop Museum
- Joint Institute for Marine and Atmospheric Research
- Hawai'i Institute of Marine Biology
- Hawai'i Undersea Research Laboratory
- NOAA National Marine Fisheries Service
- NOAA Coral Reef Conservation Program
- NOAA/National Marine Fisheries Science/Pacific Islands Fishery Science Center
- NOAA National Ocean Service/National Center for Coastal Ocean Science
- The Oceanic Institute
- Office of Hawaiian Affairs
- Smithsonian Institution
- State of Hawai'i Division of Aquatic Resources
- United States Geological Survey
- University of Hawai'i

### 6.c Results of Previous Reporting Exercises

The following list, arranged in reverse chronological order, represents a compilation of status reports for the NWHI derived from monitoring data. In the past century, hundreds of scientific papers have been published incorporating data collected in the NWHI, but this list has been restricted to only those published documents that clearly depict the status and trends of monitoring data in the NWHI.

## 7.b Texts Relating to Protective Designation, Copies of Property Management Plans and Extracts of Other Plans Relevant to the Property

The property is protected under a myriad of designations, including international, national and state legal measures. All of these protective measures are outlined as excerpts or links and can be found in Section 5 and the Appendices. Copies of the National Historic Register applications and links to or summaries of management plans and conservation polices to manage the site are also found in the Appendices.

### List of Appendices

**Appendix A.** NOAA Chart of Papahānaumokuākea

**Appendix B.** Selected Text from the Kumulipo: A Hawaiian Creation Chant (Beckwith ed. 1951)

**Appendix C.** National Historic Registers for Nihoa and Necker (Mokumanamana) Islands in Papahānaumokuākea

- *Necker Island Archaeological District.* National Register of Historic Places Inventory - Nomination Form for Federal Properties
- *Nihoa Island Archaeological District.* National Register of Historic Places Inventory - Nomination Form for Federal Properties

**Appendix D.** U.S. Congress Apology to Native Hawaiians on behalf of the United States for the overthrow of the Kingdom of Hawaii (U.S. Public Law 103-150. 103rd Congress Joint Resolution 19, 1993)

**Appendix E.** Summary of Submerged Historic Resources of Papahānaumokuākea

**Appendix F.** Operational Protocols and Best Management Practices for Papahānaumokuākea

- Papahānaumokuākea Marine National Monument Special Conditions & Rules for Moving Between Islands & Atolls and Packing for Field Camps
- Disease and Introduced Species Prevention Protocol for Permitted Activities in the Marine Environment
- Remote Islands Special Conditions and Rules for Marine Quarantine in Papahānaumokuākea Marine National Monument
- Precautions for Minimizing Human Impacts on Endangered Land Birds in Papahānaumokuākea Marine National Monument
- General Storage and Transport Protocol for Scientific Collection in Papahānaumokuākea Marine National Monument
- Papahānaumokuākea Marine National Monument National Marine Fisheries Service Best Management Practices
- Best Practices for Minimizing the Impact of Artificial Light on Sea Turtles
- Special Conditions & Rules for Small Boat Operations at Tern Island

**Appendix G.** International Legal Measures for Papahānaumokuākea

- Designation as a Particularly Sensitive Sea Area by the International Maritime Organization (adopted April 3, 2008)
- Areas to be Avoided “In the Region of the North-West Hawaiian Islands”
- Ship Reporting System for the Papahānaumokuākea Marine National Monument Particularly Sensitive Sea Area (PSSA)

**Appendix H.** Federal Legal Measures Specific to Papahānaumokuākea and the Northwestern Hawaiian Islands

- Executive Order 1019 – Hawaiian Islands Reservation (February 3, 1909)
- Executive Order 13022 – Administration of the Midway Islands, 61 FR 56875 (October 31, 1996)

- Department of the Interior Secretary's Order 3217 – Battle of Midway National Memorial, (September 13, 2000)
- Executive Order 13178 – Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, 65 FR 76903 (December 4, 2000)
- Executive Order 13196 – Final Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, 66 FR 7395 (January 18, 2001)
- Presidential Proclamation 8031 of June 15, 2006 establishing the Northwestern Hawaiian Islands Marine National Monument, by regulations at 71 FR 36443 (June 26, 2006); as amended by Presidential Proclamation 8112) (codified at 50 CFR Part 404)
- Northwestern Hawaiian Islands Marine National Monument codifying regulations, 50 CFR Part 404 (2006). Federal regulations codifying the provisions of Proclamation 8031 were published on August 29, 2006 (50 CFR Part 404)
- Domestic implementation of mandatory ship reporting measures associated with international PSSA designation including regulations and management plan amending the Areas to be Avoided “In the Region of the North-West Hawaiian Islands” initially established in 1981. Federal Register: December 3, 2008 (Vol. 73, No. 233 [Pages 73592-73605])
- National Wildlife Refuge System Administration Act of 1966, as amended, 16 U.S.C. §§ 668dd-ee
- Refuge Recreation Act, 16 U.S.C. § 460k-3
- Coastal Zone Management Act, 16 U.S.C. § 1451, *et seq.*
- Marine Mammal Protection Act of 1972, 16 U.S.C. § 1361, *et seq.*
- Endangered Species Act of 1973, as amended, 16 U.S.C. § 1531, *et seq.*
- Magnuson-Stevens Fishery Conservation and Management Act, 16 U.S.C. § 1801, *et seq.*
- Fish and Wildlife Improvement Act of 1978, 16 U.S.C. § 742I
- National Wildlife Refuge System Improvement Act of 1997, 16 U.S.C. §§ 668dd-ee
- Archaeological Resources Protection Act (ARPA) of 1979, 16 U.S.C. § 470aa-mm
- Abandoned Shipwreck Act (ASA) of 1988, 43 U.S.C. § 2101-2100
- Native American Graves Protection and Repatriation Act (NAGPRA) of 1990, 25 U.S.C. 3001 *et seq.*
- Sunken Military Craft Act (SMCA) of 2004, Public Law 108-375

#### **Appendix J.** State of Hawai'i Legal Measures Applicable to Papahānaumokuākea and Resources

#### **Appendix I.** General Federal Legal Measures Applicable to Papahānaumokuākea Resources

- Antiquities Act of 1906, 16 U.S.C. § 431, *et seq.*
- Migratory Bird Treaty Act of 1918, as amended, 16 U.S.C. 703-712
- Historic Sites, Buildings and Antiquities Act, 16 U.S.C. §461-462. 464-467
- Fish and Wildlife Act of 1956, 16 U.S.C. § 742f
- National Historic Preservation Act (NHPA) of 1966, 16 U.S.C. § 470-470b, 470c-470n
- Hawaii Organic Act of April 30, 1900, c339, 31 Stat. 141 Section 2
- Hawaii Admission Act of March 18, 1959, Pub. L. 86-3, 73 Stat. 4 Section 2
- Constitution of the State of Hawai'i, Article XI, Sections 1, 2, 6, and 9; and Article XII, Section 7
- Hawaii Revised Statutes Title 1 – Chapter 6E, Sections 6E-1 and 6E-7; Title 12, Chapter 171, Section 171-3, Chapter 183D, Section 183D-4, Chapter 187A, Section 187A-8, Chapter 188, Sections 188-37 and 188-53
- Hawaii Administrative Rules Title 13, Chapter 60.5, Chapter 125, Chapters 275-284, and Chapter 300

**Appendix K.** Papahānaumokuākea Monument Management Plan. U.S. Fish and Wildlife Service, National Oceanic and Atmospheric Administration and Hawai'i Department of Land and Natural Resources. December, 2008

- Vol. 1. Papahānaumokuākea Monument Management Action Plans
- Vol. 2. Papahānaumokuākea Environmental Assessment
- Vol. 3. Appendices. Supporting Documents and References
- Vol. 4. Midway Atoll Conceptual Site Plan
- Vol. 5. Response to Comments

**Appendix L.** Existing Property Management Plans

- Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve Operations Plan
- Visitor Services Plan for Midway Atoll National Wildlife Refuge and the Battle of Midway National Memorial and the Papahānaumokuākea Marine National Monument's Midway Atoll Special Management Area
- Hawaiian Islands National Wildlife Refuge Master Plan
- Fish and Wildlife Service Draft Laysan Island Ecosystem Restoration Plan
- Fish and Wildlife Service Regional Seabird Conservation Plan, Pacific Region
- Final Environmental Impact Analysis on the Bottomfish and Seamount Groundfish Fisheries of the Western Pacific Region
- Prehistoric Cultural Resources and Management Plan for Nihoa and Necker Islands, Hawai'i
- Hawai'i's Comprehensive Wildlife Conservation Strategy
- Hawai'i Aquatic Invasive Species Management Plan

**Appendix M.** Species Recovery Plans for United States Federally Endangered and Threatened Species Applicable to Papahānaumokuākea

- Recovery Plans for the Hawaiian Monk Seal, the Humpback Whale and Blue Whale

- Recovery Plans for the Green and Loggerhead Sea Turtles, Hawksbill and Leatherback Turtles
- Recovery Plan for the Northwestern Hawaiian Islands Passerines
- Draft Revised Recovery Plan for the Laysan Duck
- Draft Recovery Plan for the Short-Tailed Albatross
- Hawaiian Dark-Rumped Petrel/Newell's Manx Shearwater Recovery Plan
- Recovery Plan for Three Plant Species on Nihoa Island
- Recovery Plan for the Multi-Island Plants

**Appendix N.** Emergency Response and Contingency Plans for Papahānaumokuākea

- US Fish and Wildlife Service Continuity of Operations Plan
- US Fish and Wildlife Service Tsunami Warning/Watch Preparedness Protocol
- National Marine Fisheries Communications – Emergencies
- Contingency Plan for Hawaiian Monk Seal Unusual Mortality Events

**Appendix O.** Assessment of Staffing Levels and Field Requirements for Management of Papahānaumokuākea

- Requirements Document. Report to Office National Marine Sanctuaries–NOAA. Honolulu, Hawai'i. Choi, F. and Associates, 2007

**Appendix P.** Property Promotion and Presentation Materials for Papahānaumokuākea

- A Citizens' Guide to the Monument
- Cultural Significance and Historical Background. Handout for visitors to Midway Island NWR
- Northwestern Hawaiian Islands Coral Reef Ecosystem: A National Treasure. Fact Sheet
- Northwestern Hawaiian Islands: A Resource Guide

- A Whale of a Journey – Poster of Whaling Shipwrecks of the Papahānaumokuākea Marine National Monument

### 7.c Form and Date of Most Recent Records or Inventory of Property

Recent records include results from a wide array of research and monitoring studies, surveys and inventories of bathymetrical, ecological, archaeological and cultural resources in Papahānaumokuākea. These are available in the form of published scientific articles, management plans, reports, databases and maps. Many are referenced below in the Reference List, or are included in the Appendices.

The most recent scientific literature, data sets and key management documents for Papahānaumokuākea are accessible through NOAA's extensive CoRIS (Coral Reef Information System) online library (<http://coris.noaa.gov/data/portals/nwhi.html#7>); mapping products are available through NOAA's nautical charts service (<http://www.nauticalcharts.noaa.gov/> and [http://www.oceangrafix.com/o.g/Charts/HI\\_PI/NOAA-Nautical-Charts.html](http://www.oceangrafix.com/o.g/Charts/HI_PI/NOAA-Nautical-Charts.html)); summaries of coral reef monitoring data are available through the NOAA Biogeography Branch (<http://ccma.nos.noaa.gov/stateofthereefs>). Updated information on management of Papahānaumokuākea is made available on the Monument web site ([www.papahanaumokuakea.gov](http://www.papahanaumokuakea.gov)).

### 7.d Locations of Inventory, Records and Archives are Held

#### Papahānaumokuākea Co-trustee Agencies:

- 1) United States Fish and Wildlife Service,  
300 Ala Moana Blvd., Room 5-231  
Honolulu, Hawaii 96850.  
USA
- 2) National Oceanic and Atmospheric Administration  
6600 Kalaniana'ole Highway, Suite 300  
Honolulu, HI 96825.  
USA
- 3) Hawai'i Department of Land and Natural Resources  
1151 Punchbowl Street, Room 330,  
Honolulu, HI 96813.  
USA

## 8. Contact Information of Responsible Authorities

### 8.a Preparers

#### Overall Project Coordinator

**Name:** Athline M. Clark  
**Title:** State Co-Manager, Papahānaumokuākea Marine National Monument (PMNM)  
**Address:** 6600 Kalanianaʻole Highway Suite 300 Honolulu, Hawaiʻi USA 96825  
**Telephone:** 001-808-397-2660  
 Fax: 001-808-397-2662  
 E-mail: Athline@hawaii.rr.com

#### Application Co-Leads

Wayne Haight, State Office PMNM  
 Janna Shackeroff, Ph.D., NOAA ONMS PMNM

#### Team Members

##### State of Hawaiʻi

Dan Polhemus, Ph.D., Administrator, Hawaiʻi Division of Aquatic Resources  
 Corinne Kane, Research Coordinator, State Office PMNM  
 Danielle Carter, Permits Coordinator, State Office PMNM  
 Doug Runde, Ph.D., Policy Specialist, State Office PMNM  
 Kerry Irish, former Project Co-Coordinator

##### Office Of Hawaiian Affairs

Heidi Guth, Esq., Lead Advocate – Native Rights, Office of Hawaiian Affairs  
 Sterling Wong, Policy Advocate – Native Rights, Office of Hawaiian Affairs

*Crosshatch Triggerfish or humuhumu*

(Photo: Susan Middleton & David Liittschwager)

##### NOAA Office of National Marine Sanctuaries PMNM

T. ʻAulani Wilhelm, NOAA Superintendent  
 Malia Chow, Ph.D., Special Projects Coordinator  
 Kaylene Keller, Ph.D., Data Information Coordinator  
 Ann Mooney, Research Logistics Coordinator  
 Naiʻa Watson, Constituency Advocate  
 Kelly Gleason, Ph.D., Maritime Archaeologist

##### NOAA Office of National Marine Sanctuaries, Regional Office

Hans Van Tilburg, Ph.D., Regional Maritime Archaeologist

##### NOAA Office of General Council

Ole Varmer, International Programs Office  
 Ted Beuttler, Esq, Office of National Marine Sanctuaries

##### U.S. Fish and Wildlife Service

Barbara Maxfield, Chief, External Affairs  
 Jim Maragos, Ph.D., Biologist, Refuges Program  
 Beth Flint, Ph.D., Biologist, Refuges Program  
 Anan Raymond, Ph.D., Archaeologist, Pacific Regional Office  
 John Klavitter, Biologist Midway Atoll NWR

### ***Bishop Museum***

Dr. Jennifer Kahn, Archaeologist  
and Anthropologist

## GLOSSARY

**Abiotic:** Pertaining to the non-living components of the environment.

**Abysal (zone):** Relating to the bottom waters of oceans, usually below 1000 m.

**Adaptive management:** The process of adjusting management actions and/or directions as new and better information emerges about the ecosystem

**Adaptive reuse:** A process that changes a disused or ineffective item into a new item that can be used for a different purpose.

**Alien species (exotic, nonnative):** With respect to a particular ecosystem, any species, including its seeds, eggs, spores, or other biological material capable of propagating that species, that is not native to that ecosystem.

**Anthropogenic:** Caused by humans.

**Apex predator:** A species (e.g., fish) at the top of the food chain.

**Appropriate Use (NWR):** A proposed or existing use on a refuge that meets the criteria in 603 FW 1.

**Aquaculture:** Cultivation of aquatic organisms under controlled or semi-controlled conditions.

**Archipelago:** A group or cluster of islands.

**Ballast water:** Any water and associated sediments used to manipulate the trim and stability of a vessel

**Bathymetry:** Study and mapping (benthic mapping) of seafloor elevations and the variations of water depth; the topography of the seafloor.

**Battle of Midway:** A naval battle in the Pacific Theater of World War II. It took place from June 4, 1942 to June 7, 1942, approximately one month after the Battle of the Coral Sea, about five months after the Japanese capture of Wake Island, and six

months after the Empire of Japan's attack on Pearl Harbor that had led to a formal state of war between the United States and Japan.

**Benthic habitat:** Of the seafloor, or pertaining to organisms living on or in the seafloor.

**Biodiversity:** Defined as the number of different organisms or species that inhabit a given ecosystem or the earth overall. It can also refer to the variability within species and among species living on the earth or in a particular community. Many ecologists also include the interaction of species the environment when describing biodiversity. All biodiversity has its origins in the different combinations of genetic material (DNA) and how this is expressed in different organisms.

**Biogeographical:** Of relating to or involved with biogeography, a branch of biology that deals with the geographical distribution of animals and plants.

**Biological community:** A naturally occurring assemblage of plants and animals that live in the same environment and are mutually sustaining and interdependent.

**Biological inventory or Biodiversity inventory:** Catalog of all biota in a given area. Inventories of large clades (a clade is a related group with a common ancestor) of organisms that are likely to contain many undescribed species or otherwise require major revision to complete their taxonomy.

**Biomass:** The total weight of all the living organisms, or some designated group of living organisms, in a given area.

**Bioprospecting:** Search for new chemicals compounds, genes and their products in living things that will have some value to people.

**Biota:** All the organisms, including animals, plants, fungi and microorganisms, living components of an ecosystem.

**Biotic:** Pertaining to any aspect of life, especially to characteristics of entire populations or ecosystems.

**Bishop Museum:** Founded in 1889, the Bishop Museum is the largest museum in Hawai'i and the premier natural and cultural history institution in the Pacific, recognized throughout the world for its cultural collections, research projects, consulting services and public educational programs. It also has one of the largest natural history specimen collections in the world.

**Board of Land and Natural Resources:** An appointed Board of the State of Hawai'i composed of seven members, one from each land district and two at large, and the Chairperson, the executive head of the Department. Members are nominated and, with the consent of the Senate, appointed by the Governor for a 4-year term. The BLNR convenes twice monthly to review and take action on department submittals, including Monument permits.

**Bottomfish species:** means bottomfish management unit species as defined at 50 CFR 660.12.

**Bottomfishing:** Fishing for bottomfish species using hook-and-line method of fishing where weighted and baited lines are lowered and raised with electric, hydraulic, or hand-powered reels.

**Calderas:** A crater whose diameter is many times that of the volcanic vent because of the collapse or subsidence of the central part of a volcano or because of explosions of extraordinary violence.

**Catch-per-unit-effort (CPUE):** The average number of fish caught in a discrete amount of time.

**Categorical Exclusion:** A category of actions that the agency has determined does not individually or cumulatively have a significant effect on the quality of the human environment.

**Ciguatera toxin:** Toxins produced by a marine microalgae called *Gambierdiscus toxicus*. These toxins become progressively concentrated as they move up the food chain from small fish to large fish that eat them, and reach particularly high concentrations in large predatory tropical reef fish.

**Co-Trustees:** U.S. Department of Commerce, through the National Oceanic and Atmospheric Administration, the Department of the Interior through the Fish and Wildlife Service, and the State of Hawai'i.

**Commercial Fishing:** Fishing in which the fish harvested, either in whole or in part, and are intended to enter commerce through sale, barter or trade.

**Compatible use:** A proposed or existing wildlife-dependent recreational use or any other use of a national wildlife refuge that, based on sound professional judgment, will not materially interfere with or detract from the fulfillment of the National Wildlife Refuge System mission or the purposes of the national wildlife refuge.

**Comprehensive Conservation Plan:** A document that describes the desired future conditions of the refuge, and provides long-range guidance and management direction for the refuge manager to accomplish the purposes of the refuge, contribute to the mission of the System, and to meet other relevant mandates.

**Coral bleaching:** When zooxanthellae, symbiotic algae that live in coral tissue, leave the coral as a result of thermal and other types of stress.

**Crustacean:** A member of the phylum Crustacea, such as a crab, shrimp, or lobster.

**Cultural literacy:** The art and understanding of the intangible meanings and emotions conveyed through a particular written cultural language.

**Cultural resources:** Any resources whether they are tangible or intangible such as stories, people, structures, or artifacts that identifies a certain native people's culture inherent in the way they live and practice their traditions.

**Cumulative effects (NEPA):** Cumulative impact of the direct and indirect effects of the proposed action and its alternatives when added to the aggregate effects of past, present, and reasonably foreseeable future actions.

**Customary rights:** Rights customarily and traditionally exercised for subsistence, cultural, and religious purposes and possessed by ahupua'a tenants who are descendants of Native Hawaiians who inhabited the Hawaiian Islands prior to 1778.

**Derelict:** Abandoned, especially by the owner or occupant; forgotten unused.

**Direct effects (NEPA):** Effects caused by the action and occurring at the same time and place.

**Distance-learning:** Education initiated on-site at a remote location offered to others often times providing two way communication through audio and/or video technology links.

**Ecological:** Of, or having to do with, the environments of living things or with the pattern of relations between living things and their environments.

**Ecological impacts:** The effect that a human-caused or natural activity has on living organisms and their environment.

**Ecological Reserve:** An area of the Monument consisting of contiguous, diverse habitats that provide natural spawning, nursery, and permanent residence areas for the replenishment and genetic protection of marine life, and also to protect and preserve natural assemblages of habitats and species within areas representing a broad diversity of resources and habitats found within the monument.

**Ecosystem:** A geographically specified system of organisms (including humans), the environment, and the processes that control its dynamics.

**Ecosystem Health:** A condition in which structure and functions allow the desired maintenance over time of biological diversity, biotic integrity, and ecological processes.

**Ecosystem Integrity:** A condition determined to be characteristic of an ecosystem that has the ability to maintain its function, structure, and abundance of natural biological communities, including rates of change in response to natural environmental variation.

**Ecosystem Services:** the natural processes by which the environment produces resources. Common examples are water, timber, and habitat for fisheries, and pollination of native and agricultural plants.

**Ecosystem-based management approach:** Management that carefully considers impacts to all species and trophic interactions, including maintenance of biological communities and the protection of natural habitats, populations and ecological processes. The approach emphasizes the inherent value of ecosystems and recognizes the importance of species interactions and conservation of habitats, and only permits resource utilization in a manner that is consistent with the Monument's primary goal of resource protection.

**Ecotourism:** Travel to natural areas to foster environmental and cultural understanding, and appreciation and conservation. The Proclamation defines Ocean-Based Ecotourism as a class of fee-for-service activities that involves visiting the Monument for study, enjoyment, or volunteer assistance for purposes of conservation and management.

**Effects (Impacts):** As defined by NEPA (direct, indirect, cumulative): Effects include ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative. Effects may also include those resulting from actions that may have both beneficial and detrimental effects, even if on balance the agency believes that the effect will be beneficial.

**El Niño:** A climatic phenomenon characterized by a large scale weakening of the trade winds and warming of the surface layers in the eastern and central equatorial Pacific Ocean. El Niño events occur irregularly at intervals of 2-7 years, although the average is about once every 3-4 years. and typically last 12-18 months. During El Niño, unusually high atmospheric sea level pressures develop in the western tropical Pacific and Indian Ocean regions, and unusually low sea level pressures

develop in the southeastern tropical Pacific. Southern Oscillation tendencies for unusually low pressures west of the date line and high pressures east of the date line have also been linked to periods of anomalously cold equatorial Pacific sea surface temperatures sometimes referred to as **La Niña**.

**Endangered species:** An animal or plant species in danger of extinction throughout all or a significant portion of its range.

**Endemic:** Referring to species native to and confined to a particular region, thus often having a comparatively restricted distribution.

**Environmental Assessment (EA):** A concise public document, prepared in compliance with the National Environmental Policy Act, that briefly discusses the purpose and need for an action, alternatives to such action, and provides sufficient evidence and analysis of impacts to determine whether to prepare an environmental impact statement or finding of no significant impact.

**Environmental Impact Statement (EIS):** Documentation that assesses the impacts of major Federal actions significantly affecting the quality of the human environment as required by section 102(2)(C) of NEPA.

**Exclusive Economic Zone (EEZ):** A zone contiguous to the territorial sea, including zones contiguous to the territorial sea of the United States, the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands (to the extent consistent with the Covenant and the United Nations Trusteeship Agreement), and United States overseas Territories and possessions extending to a distance of 200 nautical miles from the baseline from which the breadth of the territorial sea is measured.

**Fathom:** A unit of length equal to 1.8m (6ft) used to measure water depth.

**Field camp (camp):** In this document refers to both seasonal camps that are placed on Lisianski, Pearl and Hermes, Kure, and Nihoa; and one permanent camp at Laysan Island. Seasonal camps are established for specific activities such as monk seal

research. The Laysan Island camp is staffed year-round to work on restoration of the island. Camps depend on tents, import all water, and have very limited communications and physical access.

**Field station:** In this document is used to refer to permanent infrastructures on Tern Island or Midway Atoll. These stations have buildings, water-making abilities, greater power sources, advanced communication, and regular access by boat and aircraft.

**Fishery:** The act, process, or season of taking fish or other sea products for sale or consumption.

**Friends of Midway Atoll NWR:** Association whose mission is “[t]o support the Midway Atoll National Wildlife Refuge in its efforts to preserve, protect and restore the biological diversity and historic resources of Midway Atoll, while providing opportunity for wildlife-dependent recreation, education and scientific research.”

**Geographic Information System (GIS):** A system of spatially referenced information, including computer programs that acquire, store, manipulate, analyze, and display spatial data.

**Geomorphologic:** Relating to geomorphology, a science that deals with land and submarine relief features of the earth’s surface.

**Hazardous material:** A substance or material that is capable of posing an unreasonable risk to health and safety or property when transported in commerce and has been designated as hazardous under the federal Hazardous Materials Transportation Law (49 USC 5103).

**Hazardous Waste:** The Resource Conservation and Recovery Act (RCRA) specifically defines a hazardous waste as a solid waste (or combination of wastes) that, due to its quantity, concentration, physical, chemical, or infectious characteristics, can cause or significantly contribute to an increase in mortality. RCRA further defines a hazardous waste as one that can increase serious,

irreversible, or incapacitating reversible illness or pose a hazard to human health or the environment when improperly treated, stored, disposed of, or otherwise managed.

**Hi'ialakai:** NOAA research vessel. Hi'ialakai means embracing pathways to the sea in the Hawaiian language.

**Hökūle'a:** a traditional Hawaiian double hulled voyaging canoe recreated by the Polynesian Voyaging Society in the 1970s which signified a rebirth of ancient voyaging and navigation and a new cultural renaissance period in Hawaiian history. [Hökūle'a is Hawaiian for star of gladness].

**Hypersaline:** Salinity well in excess of that of seawater; found in enclosed water bodies.

**Impacts:** See **Effects**

**Indirect effects (NEPA):** Those are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems.

**In situ** [Latin]: In place

**In-reach:** Purposefully communicating to personnel working within your agency, or Co-Trustees.

**Indigenous (species):** Existing within a historical ecological range, usually within a balanced system of coevolved organisms.

**Infrastructure:** In this document refers to physical buildings and structures, roads, and utility and communications systems.

**Interagency:** Involving two or more public or government agencies.

**Introduced Species:**

1. A species (including, but not limited to, any of its biological matter capable of propagation) that is nonnative to the ecosystem(s) protected by the Monument; or

2. Any organism into which genetic matter from another species has been transferred in order that the host organism acquires the genetic traits of the transferred genes.

“Introduction” means the intentional or unintentional escape, release, dissemination, or placement of a species into an ecosystem as a result of human activity.

**Invasive species:** A nonindigenous species that may threaten the diversity or abundance of native species or the ecological stability and or uses of infested waters and the introduction of which into an ecosystem may cause harm to the economy, environment, human health, recreation, or public welfare.

**Invertebrates:** Any animal that is not a vertebrate, that is, whose nerve cord is not enclosed in a backbone of bony segments.

**Island-specific:** Pertains to a specific island of the Monument and may not be translated to other islands.

**Knowledge-base:** Information and ideas acquired through pre-existing experiences and cumulative education.

**La Niña:** see **El Niño**

**Larval:** An immature stage of any invertebrate animal that differs dramatically in appearance from the adult.

**Lead-based paint:** paint that contains high levels of lead, generally found in houses and apartments built before 1978, when the federal government banned it from housing.

**Longline Protected Species Zone:** The area in the Northwestern Hawaiian Islands where longline fishing is prohibited, described as within a 50 nm radius from the geographic centers of Nihoa Island, Mokumanamana, French Frigate Shoals, Gardner Pinnacles, Maro Reef, Laysan Island, Lisianski Island, Pearl and Hermes Atoll, Midway Atoll, and Kure Atoll.

**Management Zones:** Special Preservation Areas, Ecological Reserves, and the Midway Atoll Special Management Area (SMA) as defined in Monument regulations (50 CFR 404).

**Marine debris:** Any persistent solid material and contents that is manufactured or processed and directly or indirectly, intentionally or unintentionally, disposed of or abandoned into the marine environment.

**Maritime:** Of or relating to navigation or commerce on the sea.

**Memorandum of Agreement or Understanding (MOA/U):** A nonbinding agreement between state or federal agencies, or divisions within an agency, that delineates tasks, jurisdiction, standard operating procedures or other matters which the agencies or units are duly authorized and directed to conduct.

**Meta-population:** A subdivided population of a single species.

**Midway Atoll Special Management Area:** The area of the monument surrounding Midway Atoll out to a distance of 12 nautical miles, established for the enhanced management, protection, and preservation of Monument wildlife and historical resources.

**Migratory bird:** Birds that are listed in Title 50 of the Code of Federal Regulations, Section 10.13.

**Mitigate (mitigation):** To make less severe. An action or series of actions that offset the environmental impact, or reduce the severity or consequences. Usually done by sequestering or reducing contact thereby reducing risk or by compensating, enhancing, or restoring areas adversely affected.

**Mobile transceiver unit:** A vessel monitoring system or VMS device installed on board a vessel that is used for vessel monitoring and transmitting the vessel's position as required by Presidential Proclamation 8031.

**Monument Management Board (MMB):** The MOA established a locally based Monument Management Board (MMB) to guide field level coordination. The seven-member MMB includes representation of the Co-Trustee agencies and the Office of Hawaiian Affairs.

**Monument Regulations:** Initial regulations prescribed by the Presidential Proclamation 8031 completed jointly by the FWS and NOAA on August 29, 2006 (71 FR 51134). Monument regulations, codified under 50 CFR Part 404, establish the scope and purpose, boundary, definitions, prohibitions, marine zones, and regulated activities for managing the Monument.

**National Historic Landmark:** Nationally significant historic places designated by the Secretary of the Interior possessing exceptional value or quality in illustrating or interpreting the heritage of the United States.

**National Historic Properties:** Properties listed in, or eligible for listing in the National Register of Historic Places (National Historic Preservation Act of 1966, as amended; implementing regulation for evaluation and determination of eligibility are in 36 CFR 60). "National Register of Historic Places."

**National Marine Sanctuary Foundation:** A private, nonprofit, 501(c)(3) tax-exempt organization created to assist the federally managed National Marine Sanctuary Program with education and outreach programs designed to preserve, protect, and promote meaningful opportunities for public interaction with the nation's marine sanctuaries.

**National Monument:** An area on lands owned or controlled by the Government of the United States designated by the President of the United States under the Antiquities Act of 1906, to recognize historic landmarks, historic and prehistoric structures, and other objects of historic or scientific interest.

**National Register of Historic Places:** The Nation's official list of cultural resources worthy of preservation. Authorized under the National Historic Preservation Act of 1966, the National Register is part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect our historic and archeological resources.

**National Wildlife Refuge System:** All lands, waters, and interests therein administered by the U.S. Fish and Wildlife Service as wildlife

refuges, wildlife ranges, wildlife management areas, waterfowl production areas, and other areas for the protection and conservation of fish, wildlife, and plant resources.

**Native Hawaiian:** Any individual who is a descendent of the aboriginal people who, prior to 1778, occupied and exercised sovereignty in the area that now constitutes the State of Hawai'i.

**Native Hawaiian practices:** Cultural activities conducted for the purposes of perpetuating traditional knowledge, caring for and protecting the environment, and strengthening cultural and spiritual connections to the Northwestern Hawaiian Islands that have demonstrable benefits to the Native Hawaiian community. This may include, but is not limited to, the noncommercial use of monument resources for direct personal consumption while in the Monument.

**Native species:** A species (plant or animal) within its natural range or natural zone of dispersal without human aid.

**Natural variability:** Uncertainties that stem from inherent or assumed randomness and unpredictability in the natural world.

**Northwestern Hawaiian Islands (NWHI):** Beginning 155 miles (249.4 kilometers) from the main Hawaiian Island of Kaua'i, the 10 islands and atolls of this chain that extend for 1,200 miles (1,931 kilometers) to Kure Atoll. In past decades, also known as the Leeward or Kūpuna Islands, and now as Papahānaumokuākea.

**NOWRAMP or NWHIRAMP:** The Northwestern Hawaiian Islands Coral Reef Assessment and Monitoring Program, which began in 2000, to rapidly evaluate and map the shallow water reef habitats in the NWHI.

**Oceania:** Collective name for the islands scattered throughout most of the Pacific Ocean.

**Oceanographic:** Of or relating to oceanography, a science that deals with the ocean and its phenomena.

**Outreach:** The act of communicating activities and conceptual ideas to public audiences outside the administering agency/agencies and actively involving them in Monument activities.

**Pacific Rim:** includes the countries that lie along the Pacific Ocean, plus the island countries of the Pacific.

**Passage without interruption:** A vessel passing through waters within the Monument boundary without stopping anywhere within the boundary of the Monument.

**Pelagic:** Referring to the open ocean.

**Pelagic species:** From the Proclamation: Pelagic Species means Pacific Pelagic Management Unit Species as defined at 50 CFR 660.12.

**Permit:** As used in the Monument Management Plan, authorization by the Co-Trustees to conduct an activity within the Monument that: (i) is research designed to further understanding of monument resources and qualities; (ii) will further the educational value of the monument; (iii) will assist in the conservation and management of the monument; (iv) will allow Native Hawaiian practices; (v) will allow a special ocean use; or (vi) will allow recreational activities.

**Petrels:** Any of numerous seabirds constituting the families Procellariidae and Hydrobatidae.

**Polynesian Voyaging Society (PVS):** A society founded in 1973 to research how Polynesian seafarers discovered and settled on the islands in the Pacific Ocean before European explorers arrived in the 16th century.

**Pono:** [Hawaiian] Appropriate, correct, and deemed necessary by traditional standards in the Hawaiian culture.

**Precautionary approach:** In the decision-making process, if there is a reasonable suspicion of harm, this approach urges a full evaluation of available alternatives for the purpose of preventing or minimizing harm. When consequences are uncertain, managers

err on the side of caution thereby giving the benefit of the doubt to nature, public health, and community well-being.

**Predator-dominated marine ecosystem:** Reef ecosystems that have relatively greater abundance of large fish, such as sharks and jacks and fewer smaller fish that graze on the coral and algae.

**Presidential Proclamation 8031:** Establishment of the Northwestern Hawaiian Islands Marine National Monument, A Proclamation by the President of the United States of America, June 15, 2006. (also **Proclamation, Presidential Proclamation and Proclamation 8031**)

**Productivity:** Rate of energy fixation or storage per unit time; not to be confused with production.

**Prohibitions:** Actions prohibited by authority of law.

**Recreational Activity:** For the purposes of the Monument, an activity conducted for personal enjoyment that does not result in the extraction of Monument resources and that does not involve a fee-for-service transaction. This includes, but is not limited to, wildlife viewing, SCUBA diving, snorkeling, and boating.

**Remediation:** Rehabilitation of a section of the environment that has been polluted or degraded from a sustainable (self-repairing) state.

**Repatriation:** The transfer of legal interest in and physical custody of Native American cultural items to lineal descendants, culturally affiliated Indian tribes, and Native Hawaiian organizations.

**Resiliency:** The ability of an ecosystem to recover from, or adjust to, stress or change.

**SCUBA:** A self-contained underwater breathing apparatus and includes, but is not limited to, open circuit and rebreather technology.

**Seamount:** Submerged volcanic mountain rising above the deep-seafloor.

**Secretaries:** For the Monument, collectively refers to the Secretary of Commerce and the Secretary of the Interior

**Sessile invertebrates:** Organism being attached to a substrate.

**Shoal:** Elevation of the sea bottom comprising any material except rock or coral (in which case it is a reef) and which may endanger surface navigation.

**Socioeconomic:** Relating to or involving a combination of social and economic factors.

**Spawning:** The direct release of sex cells into the water for reproduction.

**Special Ocean Use:** An activity or use of the Monument that is engaged in to generate revenue or profits for one or more of the persons associated with the activity or use, and does not destroy, cause the loss of, or injure monument resources. This includes ocean-based ecotourism and other activities such as educational and research activities that are engaged in to generate revenue, but does not include commercial fishing for bottomfish or pelagic species conducted pursuant to a valid permit issued by NOAA.

**Special Preservation Area (SPA):** Discrete, biologically important areas of the Monument within which uses are subject to conditions, restrictions, and prohibitions, including but not limited to access restrictions. SPAs are used to avoid concentrations of uses that could result in declines in species populations or habitat, to reduce conflicts between uses, to protect areas that are critical for sustaining important marine species or habitats, or to provide opportunities for scientific research.

**Stakeholder:** Any and all interested parties; an organization, governmental entity, or individual that has a stake in, or may be impacted by, a given approach to environmental regulation or other agency action.

**Submersible:** A research submarine, designed for manned or remote operation at great depths.

**Substrate:** The material making up the base on which an organism lives or to which it is attached.

**Substratum:** The bottom of the bay, the soils of the bay bottom. May also refer to any surface that allows for the colonization of marine life.

**Sustenance Fishing:** For the Monument, sustenance fishing means fishing for bottomfish or pelagic species in which all catch is consumed within the Monument, and that is incidental to an activity permitted.

**Symbiotic:** Situation in which two dissimilar organisms live together in close association.

**Temporary Structure (Non Permanent):** A structure with no permanent foundation that is easy to assemble, dismantle, and transport and is removed from a site between periods of actual use except as specifically permitted otherwise.

**Terrestrial species:** Plants and animals living on land.

**Threatened species:** Any species that is likely to become endangered within the foreseeable future throughout all or a significant portion of its range.

**Topographic:** General elevation pattern of the land surface or the ocean bottom.

**Traditional knowledge:** A way of knowing and learning that is acquired through expressions of dance or other forms of art, orally, or thru actual hands-on experiences passed down from generation to generation.

**Trolling:** Fishing using one or more lines with hooks or lures attached and drawn through the water behind a moving vessel.

**Trophic:** Relating to nutrition; the position of an organism in a food chain or food pyramid.

**Unexploded Ordnance (UXO):** Munitions that contain explosive components. In the Monument, refers to lost or abandoned military items.

**Unified Ocean Governance:** An integrated ecosystem-based management approach using an overall governance framework of shared principles and authority, clear communications and protocols.

**Unusual Mortality Events:** Criteria used to determine if mortalities seen in the Hawaiian Monk Seal are significantly abnormal to indicate an underlying vector. Criteria include: a marked increase in the magnitude of strandings is occurring when compared with prior records; animals are stranding at a time of the year when strandings are unusual; an increase in strandings is occurring in a very localized area; the species, age, or sex composition of the stranded animals is different; stranded animals exhibit similar or unusual pathologic findings, or the general physical condition; mortality is accompanied by unusual behavior patterns; and critically endangered species are stranding.

**Vessel Monitoring System (VMS):** Means a vessel monitoring system or mobile transceiver unit approved by the NOAA Office for Law Enforcement for use on vessels permitted to access the Monument in accordance with the Proclamation and 50 CFR 404. The hardware and software used by vessels to track and transmit their positions to a receiver in a remote location.

**Wayfinding:** Noninstrument navigation. Wayfinding involves navigating on the open ocean without sextant, compass, clock, radio reports, or satellites reports. The wayfinder depends on observations of the stars, the sun, the ocean swells, and other signs of nature for clues to direction and location of a vessel at sea.

**Zooxanthellae:** A group of dinoflagellates living symbiotically in association with one of a variety of invertebrate groups and found in corals and other marine organisms.

## LINE ART GLOSSARY

**Hawaiian Green Turtle (*Chelonia mydas*), or honu.** The islands and atolls of Papahānaumokuākea encompass over 90% of the total nesting area for the Hawaiian population of the Green Turtle.

**Makau, or the Hawaiian fishhook,** has been used by expert Hawaiian fishers since ancient times. A wide range of fishing activities occurred in the Hawaiian Islands in antiquity, as evidenced by the presence of one-, two-, and multiple piece fishhooks.

**Ulua, or the Giant Trevally (*Caranx ignobilis*),** represents one of the abundant and wide-ranging apex predators of Papahānaumokuākea's coral reef ecosystems. These predator-dominated systems are characteristic of reefs prior to human exploitation, a concept embodied in the Hawaiian term *'āina momona* (place of abundance).

**Galapagos sharks (*Carcharhinus galapagenesis*),** are significant both ecologically and culturally. Sharks, *manō*, are the most common *'aumakua* (family guardian spirits) of fishing families, and represent the physical form of such highly revered gods as Kamohoali'i, who guided his sister Pele through Papahānaumokuākea (Beckwith 1970).

Representation of Papahānaumokuākea's several species of **terns** Papahānaumokuākea protects colonies of global significance for 14 million seabirds, representing 21 species. It is the largest tropical seabird rookery in the world.

Representation of the **traditional Hawaiian voyaging canoe, Hōkūle'a.** As in generations past, the contemporary apprentice wayfinder's first open-ocean training ground takes them into Papahānaumokuākea.

Native Hawaiian practitioners utilize **conch shells** in cultural protocol. For instance, by blowing a conch shell and chanting, Native Hawaiian practitioners greet their ancestors (*kūpuna*), give thanks, and ask their permission to land on Nihoa and Mokumanamana.

**Crab, or pāpa'i,** represent the benthic shallow-water invertebrates of Papahānaumokuākea, many of which are just being identified and dozens are species new to science. Many invertebrates, such as *pāpa'i*, are important for subsistence and cultural activities, and today, in bridging traditional and Western practices in the management of Papahānaumokuākea.

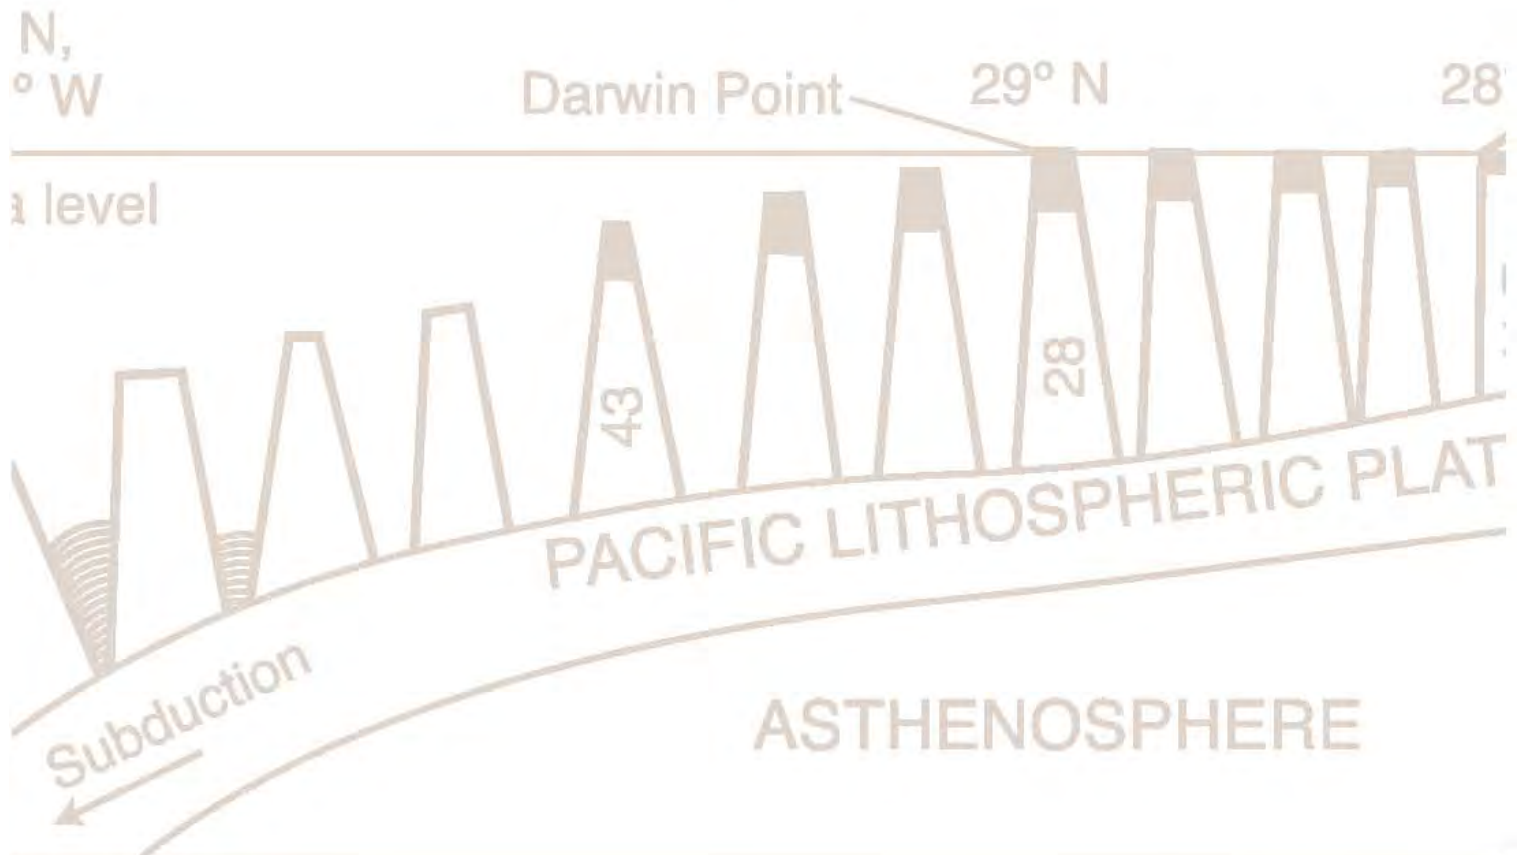

*Red Algae*

## **Note to Reviewers:**

The December 2006 Memorandum of Agreement for Promoting Coordinated Management of the Northwestern Hawaiian Islands Marine National Monument identified the Secretaries of Commerce and the Interior, and Governor of Hawai‘i as Co-Trustees for the Papahānaumokuākea Marine National Monument. The agreement provided for the inclusion of the Office of Hawaiian Affairs into the Monument management process to assure the perpetuation of Hawaiian cultural resources in the Monument, including the customary and traditional rights and practices of Native Hawaiians exercised for subsistence, cultural, and religious purposes under the Constitution of the State of Hawai‘i, Article XII, Section 7.

The Co-Trustees will work together in a coordinated fashion to cooperatively manage areas where joint or adjacent jurisdiction exists, while continuing to honor the policies and statutory mandates of the various management agencies. Therefore, it is important to remember as you read this document that there are both coordinated agency activities and specific Co-Trustee responsibilities. Of course even where one agency has primary responsibility, input from another Co-Trustee can often be helpful, and this continuing coordination is presumed throughout the Monument Management Plan.

The authors of the Monument Management Plan identified these important pieces of information as you read this document:

### 1) Cooperative and Individual Co-Trustee Responsibilities

Prior to its designation, several Federal conservation areas existed within the Monument, namely the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, managed by the National Oceanic and Atmospheric Administration (NOAA) within the U.S. Department of Commerce, and the Hawaiian Islands and Midway Atoll National Wildlife Refuges, managed by the U.S. Fish and Wildlife Service (FWS) within the U.S. Department of the Interior. Nothing in the Monument Management Plan will diminish the responsibilities and requirements by the Federal agencies to continue to manage these areas.

Furthermore, the Proclamation issued by President Bush on June 15, 2006, establishing the Monument expressly stated it did not diminish or enlarge the jurisdiction of the State of Hawai‘i. In 2005 the State designated all of its waters in the NWHI as a Marine Refuge, and it has jurisdiction over the State Seabird Sanctuary at Kure Atoll, the northwesternmost emergent feature in the NWHI. To provide for the most effective conservation and management of the natural, cultural, and historic resources of the NWHI, Governor Lingle on December 8, 2006, entered into the agreement with the two Secretaries to have State lands and waters in the NWHI managed as part of the Monument, with the three parties serving as Co-Trustees.

### 2) Specific Agency Requirements

FWS is required to develop Comprehensive Conservation Plans (CCPs) for all National Wildlife Refuges by October 2012 (National Wildlife Refuge System Improvement Act of 1997). So that there would be a single management plan for the Monument, FWS moved its planning effort forward to have this Monument Management Plan also serve as, and meet the requirements of, the CCPs for the two refuges within the Monument.

Because this Monument Management Plan is a mixture of the existing Reserve Operations Plan, the subsequent draft national marine sanctuary management plan, the refuge CCPs, and State plans, as fully described in Section 2.2 of the plan, it does not resemble typical sanctuary management plans, typical refuge CCPs, or typical State of Hawai'i management plans. However, this plan and the accompanying environmental analysis meet all applicable Federal and State requirements.

### 3) Funding Estimates

This Monument Management Plan provides long-term guidance for management decisions over a 15-year horizon and sets forth desired outcomes, with strategies and activities to reach those outcomes, including the agencies' best estimate of future needs. These are sometimes substantially above current budget allocations and are included primarily for agency strategic planning and program prioritization purposes. This management plan does not constitute a commitment of funds, or a commitment to request funds, by Federal or State agencies. All funding for current and possible future Monument activities is subject to the budgeting and appropriations processes of the Federal and State governments.

## **EXECUTIVE SUMMARY**

Papahānaumokuākea Marine National Monument (Monument) in the Northwestern Hawaiian Islands comprises one of the largest protected areas in the world. The Monument, a vast, remote, and largely uninhabited marine region, encompasses an area of approximately 139,793 square miles (362,061 square kilometers) of Pacific Ocean in the northwestern extent of the Hawaiian Archipelago. Covering a distance of 1,200 miles, the 100-mile wide Monument is dotted with small islands, islets, and atolls and a complex array of marine and terrestrial ecosystems. This region and its natural and historic resources hold great cultural and religious significance to Native Hawaiians. It is also home to a variety of post-Western-contact historic resources, such as those associated with the Battle of Midway. As such, the Monument has been identified as a national priority for permanent protection as a Monument for its unique and significant confluence of conservation, ecological, historical, scientific, educational, and Native Hawaiian cultural qualities.

On June 15, 2006, President George W. Bush issued Presidential Proclamation 8031 establishing the Northwestern Hawaiian Islands Marine National Monument under the authority of the Antiquities Act of 1906 (16 U.S.C. 431). The Monument includes a number of existing federal conservation areas: the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, managed by the U.S. Department of Commerce through the National Oceanographic and Atmospheric Administration (NOAA); and Midway Atoll National Wildlife Refuge, Hawaiian Islands National Wildlife Refuge, and Battle of Midway National Memorial, managed by the U.S. Department of the Interior through the U.S. Fish and Wildlife Service (FWS). These areas remain in place within the Monument, subject to their applicable laws and regulations in addition to the provisions of the Proclamation.

The Northwestern Hawaiian Islands also include State of Hawai‘i lands and waters, managed by the State through the Department of Land and Natural Resources as the Northwestern Hawaiian Islands Marine Refuge and the State Seabird Sanctuary at Kure Atoll. These areas also remain in place and are subject to their applicable laws and regulations.

The President accordingly assigned management responsibilities to the Secretaries of Commerce and the Interior, acting through NOAA and FWS. The President also directed the Secretary of Commerce, in consultation with the Secretary of the Interior and the State of Hawaii, to modify, as appropriate, the plan developed by NOAA through the public national marine sanctuary designation process and for the two federal agencies to promulgate additional regulations.

The joint implementing regulations for the Monument were promulgated on August 29, 2006 (71 FR 51134, 50 CFR Part 404). These regulations codify the scope and purpose, boundary, definitions, prohibitions, and regulated activities for managing the Monument. Proclamation 8031 was later amended on March 6, 2007, to establish the Native Hawaiian name of the Monument, Papahānaumokuākea Marine National Monument, and clarify some definitions.

To provide the most effective management of the area, Governor Linda Lingle, Secretary of Commerce Carlos M. Gutierrez, and Secretary of the Interior Dirk Kempthorne signed a Memorandum of Agreement (MOA) on December 8, 2006, which provided for coordinated

administration of all the federal and state lands and waters within the boundaries of the Monument. The MOA provided that management of the Monument is the responsibility of the three parties acting as Co-Trustees: the State of Hawai‘i, Department of Land and Natural Resources; the U.S. Department of the Interior, FWS; and the U.S. Department of Commerce, NOAA. It also established the institutional arrangements for managing the Monument, including representation of Native Hawaiian interests by the Office of Hawaiian Affairs on the Monument Management Board.

The organizational structure for the Monument consists of:

- A Senior Executive Board composed of a designated senior policy official for each party that is directly responsible for carrying out the agreement and for providing policy direction for the Monument;
- A Monument Management Board (that reports to the Senior Executive Board) composed of representatives from the federal and state agency offices that carry out the day-to-day management and coordination of Monument activities; and
- An Interagency Coordinating Committee representing other state and federal agencies as appropriate to assist in the implementation of Monument management activities.

This Monument Management Plan (Plan) describes a comprehensive and coordinated management regime to achieve the vision, mission, and guiding principles of the Monument and to address priority management needs over the next 15 years. The Plan is organized into three main sections; introduction, management framework, and action plans that address specific issues related to priority management needs.

The introduction provides the vision and mission of the Monument. It also provides the background, setting, environmental and anthropologic stressors, as well as the status and condition of natural, cultural, and historic resources of the Monument.

The management framework for the Monument includes key elements to move toward an ecosystem approach to management. An ecosystem approach to management requires the implementation and coordination of multiple steps in a comprehensive and coordinated way. These key management framework elements include:

- The legal and policy basis for establishment of the Monument;
- The vision, mission, and guiding principles that provide the overarching policy direction for the Monument;
- Institutional arrangements between Co-Trustees and other stakeholders;
- Regulations and zoning to manage human activities and threats;
- Goals to guide the implementation of action plans and priority management needs; and
- Concepts and direction for moving toward a coordinated ecosystem approach to management.

The third section of the plan consists of 22 action plans that address six priority management needs and provide an organizational structure for implementing management strategies. These priority management needs are to understand and interpret Monument resources, conserve wildlife and their habitats, reduce threats to Monument resources, manage human activities, facilitate coordination, and achieve effective operations. Together, the priority management

needs, action plans, and strategies are aimed at achieving long-term ecosystem protection for the Monument.

The action plans contain strategies and activities that are aimed at achieving a desired outcome. Each action plan describes the issue or management need, the context and history of the action plan's particular issue or management need, and the strategies and activities planned for the Monument over the next 15 years. Ongoing evaluation and monitoring of these management actions will be conducted to provide informed decision-making and to provide feedback to management on the success of meeting the stated desired outcomes of each action plan.

The six priority management needs, action plans, and corresponding desired outcomes are as follows:

### **Understanding and Interpreting the Northwestern Hawaiian Islands**

- Marine Conservation Science Action Plan
  - ❖ Protect the ecological integrity of natural resources by increasing the understanding of the distributions, abundances, and functional linkages of marine organisms and their habitats in space and time to improve ecosystem-based management decisions in the Papahānaumokuākea Marine National Monument.
- Native Hawaiian Culture and History Action Plan
  - ❖ Increase understanding and appreciation of Native Hawaiian histories and cultural practices related to Papahānaumokuākea Marine National Monument and effectively manage cultural resources for their cultural, educational, and scientific values.
- Historic Resources Action Plan
  - ❖ Identify, document, preserve, protect, stabilize, and where appropriate, reuse, recover, and interpret historic resources associated with Midway Atoll and other historic resources within the Monument.
- Maritime Heritage Action Plan
  - ❖ Identify, interpret, and protect maritime heritage resources in Papahānaumokuākea Marine National Monument.

### **Conserving Wildlife and Habitats**

- Threatened and Endangered Species Action Plan
  - ❖ Safeguard and recover threatened and endangered plants and animals and other protected species within Papahānaumokuākea Marine National Monument.
- Migratory Birds Action Plan
  - ❖ Conserve migratory bird populations and habitats within Papahānaumokuākea Marine National Monument.
- Habitat Management and Conservation Action Plan
  - ❖ Protect, maintain, and where appropriate, restore the native ecosystems and biological diversity of Papahānaumokuākea Marine National Monument.

### **Reducing Threats to Monument Resources**

- Marine Debris Action Plan
  - ❖ Reduce the adverse effects of marine debris to Papahānaumokuākea Marine National Monument resources and reduce the amount of debris entering the North Pacific Ocean.
- Alien Species Action Plan
  - ❖ Detect, control, eradicate where possible, and prevent the introduction of alien species into Papahānaumokuākea Marine National Monument.
- Maritime Transportation and Aviation Action Plan
  - ❖ Investigate, identify, and reduce potential threats to Papahānaumokuākea Marine National Monument from maritime and aviation traffic.
- Emergency Response and Natural Resource Damage Assessment Action Plan
  - ❖ Minimize damage to Papahānaumokuākea Marine National Monument resources through coordinated emergency response and assessment.

### **Managing Human Uses**

- Permitting Action Plan
  - ❖ Implement an effective and integrated permit program for Papahānaumokuākea Marine National Monument that manages, minimizes, and prevents negative human impacts by limiting access only for those activities consistent with Presidential Proclamation 8031 and other applicable laws, regulations and executive orders.
- Enforcement Action Plan
  - ❖ Achieve compliance with all regulations within Papahānaumokuākea Marine National Monument.
- Midway Atoll Visitor Services Action Plan
  - ❖ Offer visitors opportunities to discover, enjoy, appreciate, protect, and honor the unique natural, cultural, and historic resources of Papahānaumokuākea Marine National Monument.

### **Coordinating Conservation and Management Activities**

- Agency Coordination Action Plan
  - ❖ Successfully collaborate with government partners to achieve publicly supported, coordinated management in Papahānaumokuākea Marine National Monument.
- Constituency Building and Outreach Action Plan
  - ❖ Cultivate an informed, involved constituency that supports and enhances conservation of the natural, cultural, and historic resources of Papahānaumokuākea Marine National Monument.
- Native Hawaiian Community Involvement Action Plan
  - ❖ Engage the Native Hawaiian community in active and meaningful involvement in Papahānaumokuākea Marine National Monument management.
- Ocean Ecosystems Literacy Action Plan
  - ❖ Cultivate an ocean ecosystems stewardship ethic, contribute to the nation's science and cultural literacy, and create a new generation of conservation leaders through formal environmental education.

### **Achieving Effective Monument Operations**

- Central Operations Action Plan
  - ❖ Conduct effective and well-planned operations with appropriate human resources and adequate physical infrastructure in the main Hawaiian Islands to support management of Papahānaumokuākea Marine National Monument.
- Information Management Action Plan
  - ❖ Consolidate and make accessible relevant information to meet educational, management, and research needs for Papahānaumokuākea Marine National Monument.
- Coordinated Field Operations Action Plan
  - ❖ Coordinate field activities and provide adequate infrastructure to ensure safe and efficient operations while avoiding impacts to the ecosystems in Papahānaumokuākea Marine National Monument.
- Evaluation Action Plan
  - ❖ Determine the degree to which management actions are achieving the vision, mission, and goals of Papahānaumokuākea Marine National Monument.

Finally, the appendices (Volume III) include supporting documents such as the unified permit policy, application, and instructions; Midway Atoll Visitor Services Plan; Presidential Proclamations 8031 and 8112; Monument regulations (50 CFR Part 404); the Memorandum of Agreement for Promoting Coordinated Management of the Northwestern Hawaiian Islands Marine National Monument; operational protocols and best management practices; and the International Maritime Organization Particularly Sensitive Sea Area Designation and Associated Protective Measures. Volume IV contains the Midway Atoll Conceptual Site Plan. Volume V is the Response to Comments, including comments on all components of the management plan, including the environmental assessment, and Cultural Impact Assessment.

## 1.0 Introduction

Presidential Proclamation 8031, issued by President George W. Bush on June 15, 2006, set aside the Northwestern Hawaiian Islands (NWHI) as the Papahānaumokuākea Marine National Monument (Monument), creating one of the world’s largest marine protected areas, managed to protect ecological integrity. This Monument designation adds to the mo‘okū‘auhau, or the genealogy, of the NWHI, as a place of deep significance to Native Hawaiians, and now, to the nation and the world.

In the Pacific, the NWHI have played a significant role in the culture and traditions of Native Hawaiians. Significant archaeological finds, as well as oral and written histories, confirm a deep relationship between the Hawaiian people and the NWHI. The region was also considered a sacred place, as evidenced by the many wahi kūpuna (ancestral sites) on the islands of Nihoa and Mokumanamana.

Monument Vision and Mission
<p><b>Vision</b></p> <p>To forever protect and perpetuate ecosystem health and diversity and Native Hawaiian cultural significance of Papahānaumokuākea.</p>
<p><b>Mission</b></p> <p>Carry out seamless integrated management to ensure ecological integrity and achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian culture, and heritage resources for current and future generations.</p>

The NWHI have been the focus of various conservation efforts by the United States, beginning in 1903, when President Theodore Roosevelt sent in Marines to stop the slaughter of seabirds at Midway Atoll. Over the next 100 years, and through the efforts of six U.S. Presidents and one Hawai‘i Governor, the region received increasing protection, with the culmination being Proclamation 8031 that created the Monument.

Globally, the NWHI are a natural and cultural treasure of outstanding scientific, conservation, and aesthetic value. The establishment of the Monument builds on the long-standing efforts of state and federal agencies, nongovernmental organizations, stakeholders, and the public to provide for long-term protection of the marine and terrestrial ecosystems of the NWHI and the preservation of cultural and historic resources.

Management of the Monument is the responsibility of three Co-Trustees: the State of Hawai‘i, through the Department of Land and Natural Resources; the U.S. Department of the Interior (DOI), through the Fish and Wildlife Service (FWS); and the U.S. Department of Commerce (DOC), through the National Oceanic and Atmospheric Administration (NOAA). The Co-Trustees are committed to preserving the ecological integrity of the Monument and perpetuation of the NWHI ecosystems, Native Hawaiian culture, and historic resources. NOAA and FWS promulgated final regulations for the Monument under Title 50 Code of Federal Regulations (CFR) Part 404 on August 29, 2006. These regulations codify the scope and purpose, boundary, definitions, prohibitions, and regulated activities for managing the Monument. In addition, the Co-Trustees developed and signed a Memorandum of Agreement (MOA) on December 8, 2006, to establish roles and responsibilities of coordinating bodies and mechanisms for managing the Monument.

Proclamation 8031 states that the Secretary of Commerce, through NOAA, has primary responsibility regarding the management of the marine areas of the Monument, in consultation with the Secretary of the Interior. The Secretary of the Interior, through FWS, has sole responsibility for the areas of the Monument that overlay the Midway Atoll National Wildlife Refuge (NWR), the Battle of Midway National Memorial, and the Hawaiian Islands National Wildlife Refuge, in consultation with the Secretary of Commerce. Nothing in the Proclamation diminishes or enlarges the jurisdiction of the State of Hawai‘i. The State of Hawai‘i, through the Department of Land and Natural Resources, has primary responsibility for the Northwestern Hawaiian Islands Marine Refuge and State Seabird Sanctuary at Kure Atoll.

The MOA also requires the Co-Trustees to develop a Monument Management Plan for ensuring the coordinated management of coral reef ecosystems and related marine environments, terrestrial resources, and cultural and historic resources of the Monument. To develop the Monument Management Plan, the Co-Trustees began with the final “draft” of NOAA’s Office of National Marine Sanctuaries (ONMS, formerly the National Marine Sanctuary Program) proposal. This document provided a good basis and background information from which to start. Requirements for the FWS National Wildlife Refuge System Comprehensive Conservation Planning process were added. Alternative plans and management approaches were developed and reviewed in an Environmental Assessment (see Volume II, Final Environmental Assessment). Finally, through a process of review and synthesis, the final plan was developed.

The Monument is situated in the northwestern portion of the Hawaiian Archipelago, located northwest of the Island of Kaua‘i and the other main Hawaiian Islands (Figure 1.1). A vast, remote, and largely uninhabited region, the Monument encompasses an area of approximately 139,797 square miles (362,075 square kilometers) of the Pacific Ocean. Spanning a distance of approximately 1,200 miles (1,043 nautical miles/1,931 kilometers), the 115-mile-wide (100 nautical mile/185.2 kilometer) Monument is dotted with small islands, islets, reefs, shoals, submerged banks, and atolls that extend from subtropical latitudes to near the northern limit of coral reef development.

The Monument includes a complex array of terrestrial and marine ecosystems. The NWHI are intimately connected to Native Hawaiians on genealogical, cultural, and spiritual levels (Beckwith 1951; DOI 2008). The region’s natural resources, together with its rich Native Hawaiian cultural and other historic resources, give this Monument a unique stature as one of the most significant protected areas in the world.

This Monument Management Plan describes a comprehensive and coordinated management regime to achieve the vision, mission, and guiding principles of the Monument and to address priority management needs over the next 15 years. The plan is organized into three sections. This Introduction, Section 1, describes the Monument’s setting and the current status and condition of the ecosystem and cultural resources based on existing scientific and historic knowledge. It also describes known anthropogenic stressors that affect Monument resources or may do so in the future.

The management framework for the Monument is described in Section 2 and includes key elements to move toward an ecosystem approach to management. This framework comprises the following elements:

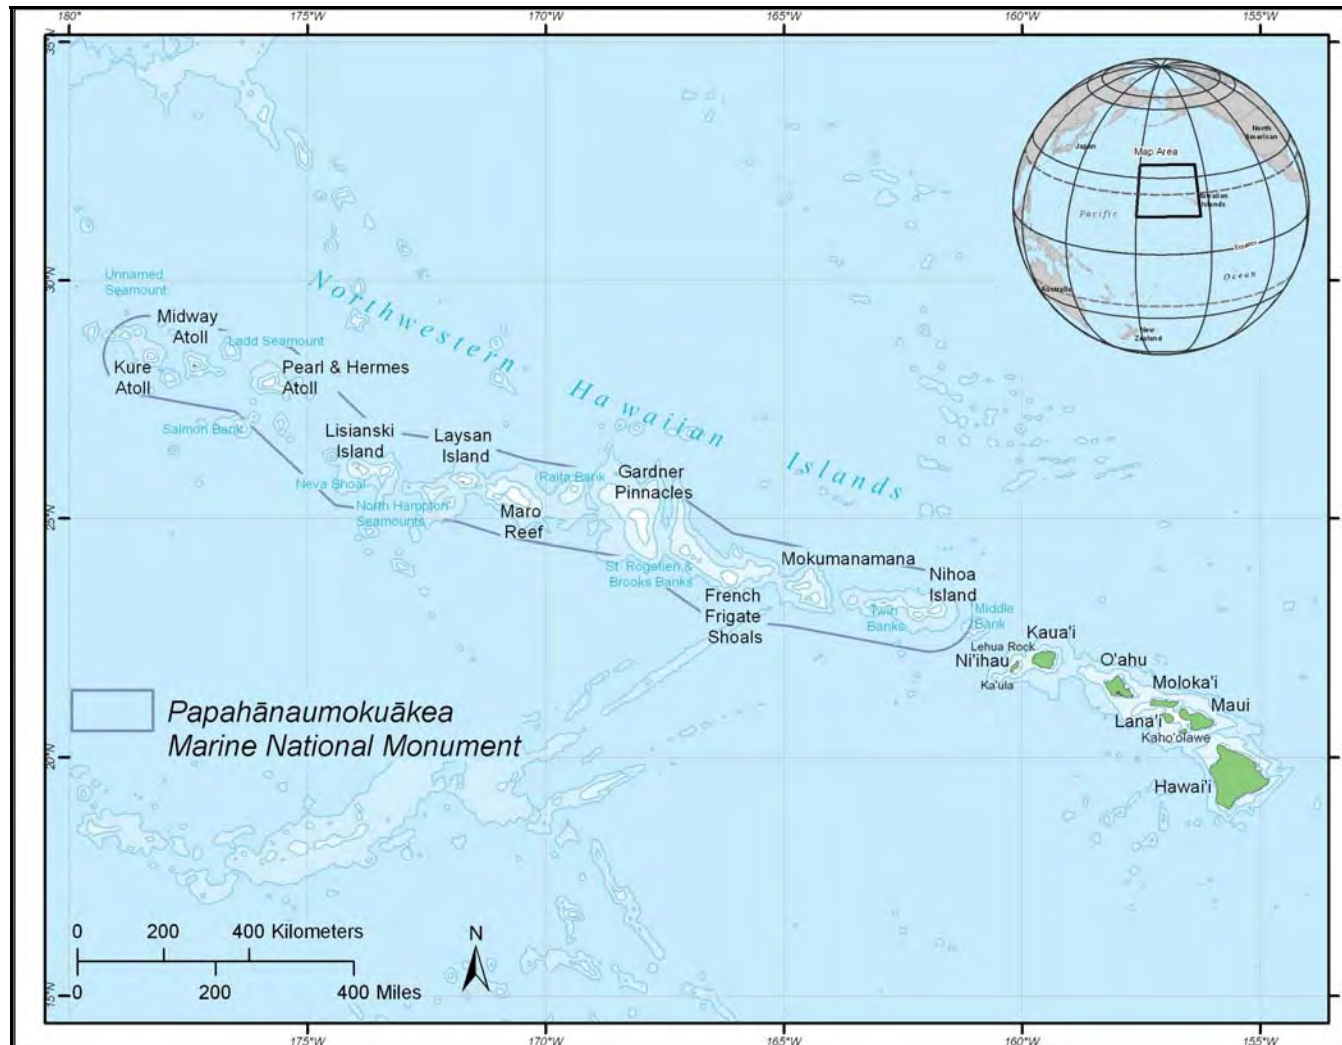

- The legal and policy basis leading to the establishment of the Monument
- Vision, mission, and guiding principles that provide an overarching policy direction for the Monument
- Goals to guide the implementation of specific action plans to address priority management needs
- Institutional arrangements for management among the Co-Trustees and other stakeholders
- Regulations and zoning to manage human activities and threats
- Concepts and direction to move toward a coordinated ecosystem approach to management

Section 3 presents action plans to address six priority management needs over a 15-year planning horizon. These priority management needs are:

- Understanding and interpreting the NWHI
- Conserving wildlife and habitats
- Reducing threats to Monument resources
- Managing human uses
- Coordinating conservation and management activities
- Achieving effective Monument operations

Each action plan consists of multiple strategies and activities to address one or more priority management needs and achieve a desired outcome. Performance measures will be developed to evaluate implementation of the Monument Management Plan. Monument regulations and other policy and operating instruments are provided in the appendices, along with references.

Figure 1.1 Hawaiian Archipelago Including the Northwestern Hawaiian Islands (Nihoa to Kure Atoll) and Main Hawaiian Islands (Hawai'i to Kaua'i). Inset shows the Hawaiian Archipelago in the Pacific Ocean.

## 1.1 Monument Setting

### Hānau Moku—The Birth of Islands

Birth is a core theme in Native Hawaiian culture. Pō, the primordial darkness from which all life springs and returns to after death (Kikiloi 2006), is seen as birthing the world and all of the Hawaiian gods. The union of her progeny, Kumulipo and Pō‘ele, births all the creatures of the world, beginning in the oceans with the coral polyp—a genealogy that starts with the simplest life form and moves to the more complex.

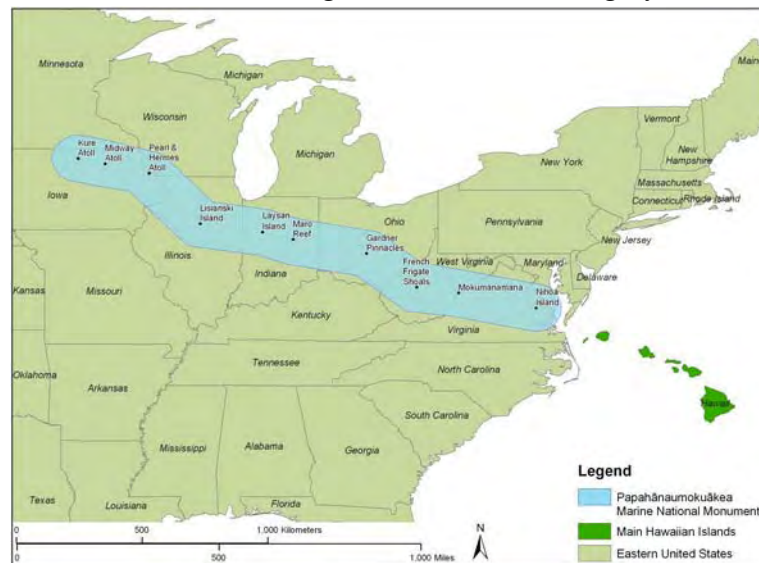

In keeping with the symbolism of birth, Native Hawaiians view the rising of magma from deep within the earth as birthing of the islands—the physical manifestation of the union between the earth mother, Papahānaumoku, and sky father, Wākea. The symbolism of this union is also the foundation for the name of the Monument: Papahānaumokuākea.

From a Native Hawaiian perspective, the NWHI are the kūpuna (elders or grandparents) of Native Hawaiians. As a kupuna, each island is our teacher; each island has its own unique message. As the younger generation, humans are tasked to mālama (care for) our kūpuna. It is our kuleana (responsibility) to take the time to listen to their wisdom.

### Overview – Geographic, Geological and Ecosystem Setting

As one of the world’s largest marine protected areas, the Papahānaumokuākea Marine National Monument encompasses a vast area of the Pacific. Extending for a distance of roughly 1,200 statute miles (1,043 nautical miles, 1,931 kilometers) by 115 statute miles (100 nautical miles, 185 kilometers), the Monument covers an area of approximately 140,000 square miles (362,100 square kilometers) and includes a rich, varied, and unique natural, cultural, and historic legacy. The Monument is located approximately between latitudes 22° N. and 30° N. and longitudes 161° W. and 180° W. within the north-central Pacific Ocean.

Overlaid on a map of the continental United States, the Monument would cover a distance from the Midwest to the eastern U.S. coastline (figure 1.2).

**Figure 1.2 Papahānaumokuākea Marine National Monument Overlaid on Eastern North America.**

The islands and atolls of the Monument constitute the northwestern three-quarters of the world's longest and most remote island chain. Formed millions of years ago, the islands were created by a sequential series of underwater shield volcanoes which, in combination with the main Hawaiian Islands, form the Hawaiian Archipelago. These once lofty islands have been transported northwest, as if on a conveyor belt, by the movements of the Pacific Plate to their current locations (Dalrymple et al. 1974). Because of the pervasive and unrelenting forces of subsidence and erosion, all that remains today are small patches of ancient land, and shoals and reefs now lie where magnificent mountains once loomed. Northwest of Kaua'i and Ni'ihau, the rocky islands, atolls, and reefs become progressively older and smaller.

**Figure 1.3 Atoll Formation.**

Beginning 155 miles (249.4 kilometers) from the main Hawaiian Island of Kaua'i, the 10 islands and atolls of this chain extend for 1,200 miles (1,931 kilometers) and are referred to as the NWHI, in past decades as the Leeward or Kūpuna Islands, and now as Papahānaumokuākea. None of these islands is more than 2 square miles (5 square kilometers) in size, and all but four have an average mean height less than 32 feet (10 meters). As a group, they represent a classic geomorphological sequence, consisting of highly eroded high islands, near-atolls with volcanic pinnacles jutting from surrounding lagoons, true ring-shaped atolls with roughly circular rims and central lagoons, and secondarily raised atolls, one of which has an interior hypersaline lake. These islands are also surrounded by more than 30 submerged ancillary banks and seamounts. This geological progression along the Hawaiian Ridge continues northwestward beyond the last emergent island, Kure Atoll, as a chain of submerged platforms that makes a sudden northward bend to become the Emperor Seamounts, which extend across the entire North Pacific to the base of the Kamchatka Peninsula in Russia. This unbroken chain of progressively more senescent volcanic structures essentially tracks the movement of the Pacific tectonic plate over the past 80 million years and has provided some of the most compelling evidence that form the basis for current theories of hot-spot-mediated island formation and global plate tectonic movements.

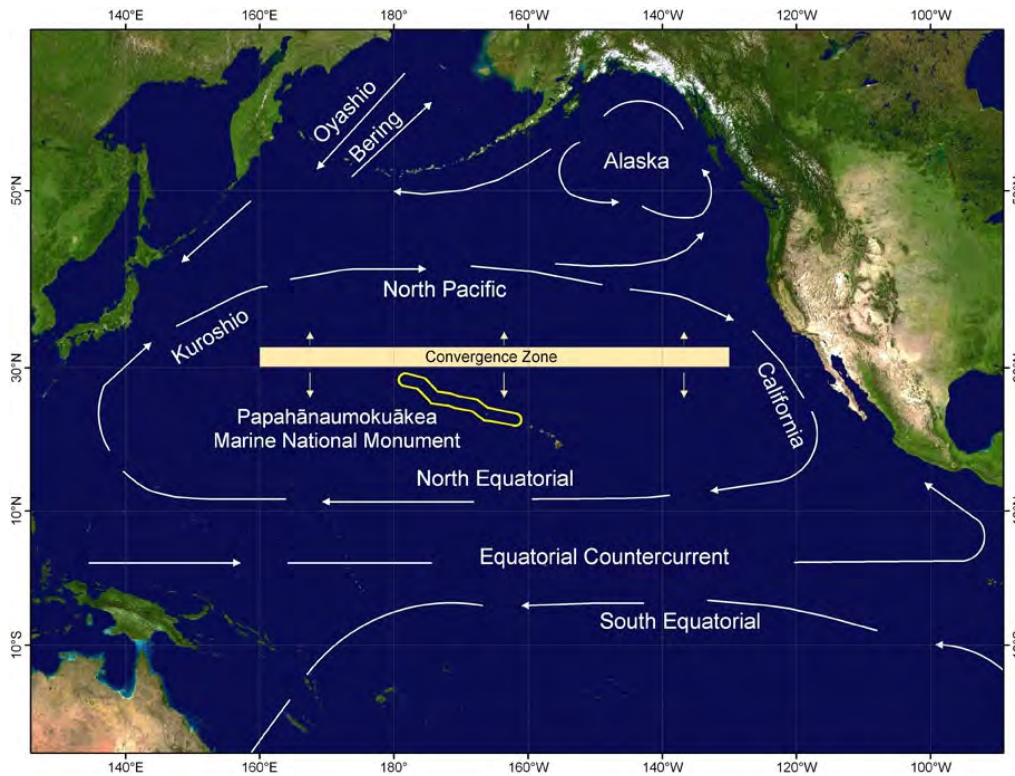

The Monument supports a diverse and unique array of both marine and terrestrial flora and fauna. With a spectrum of bathymetry and topography ranging from abyssal basins at depths greater than 15,000 feet (4,572 meters) below sea level to rugged hillslopes and cliff tops on Nihoa and Mokumanamana (Necker Island) at up to 903 feet (275.2 meters) above sea level, the Monument represents a complete cross section of a Pacific archipelagic ecosystem. Habitats contained within the Monument include deep pelagic basins, abyssal plains, submarine escarpments, deep and shallow coral reefs, shallow lagoons, littoral shores, dunes, and dry

coastal grasslands and shrublands. Relatively high percentages of most taxonomic groups in the NWHI are found nowhere else on earth.

Nutrient conditions in the NWHI may be influenced by local and regional factors. Upwelling may occur in response to localized wind and bathymetric features. The Monument is located at the northern edge of the oligotrophic tropical Pacific, in the North Pacific central gyre ecosystem (see Figure 1.4). Regional factors are largely influenced by the position of the subtropical front and associated high chlorophyll content of waters north of the front. High-chlorophyll waters intersect the northern portions of the NWHI during southward winter migrations of the subtropical front. The influx of nutrients to the NWHI from these migrations is considered a significant factor influencing different trophic levels in the NWHI (Polovina et al. 1995). It is near the 18°C sea surface isotherm, a major ecological transition zone in the northern Pacific. This boundary, also known as the “chlorophyll front,” varies in position both seasonally and annually, occasionally transgressing the Monument boundary and surrounding the northern atolls of Kure and Midway. The movement of the front influences overall ocean productivity, and resultant recruitment of certain faunal elements such as Hawaiian monk seals and Laysan and black-footed albatrosses (Polovina et al. 1994). The northernmost atolls also are occasionally affected by an episodic eastward extension of the Western Pacific warm pool, which can lead to higher summer ocean temperatures at Kure than are found in the more “tropical” waters of the main Hawaiian Islands farther south. This interplay of oceanography and climate is still incompletely understood, but is a dynamic not seen in most other tropical atoll ecosystems, and it provides a useful natural laboratory for understanding phenomena such as periodic coral bleaching and the effects of El Niño and La Niña ocean circulation patterns.

Ocean currents, waves, temperature, nutrients, and other oceanographic parameters and conditions influence ecosystem composition, structure, and function in the NWHI. The archipelago is influenced by a wide range of oceanographic conditions that vary on spatial and temporal scales. Spatial variability in oceanographic conditions ranges from a localized temperature regime that may affect a small portion of a reef to a temperature regime that influences the entire Monument. Temporal variability in ocean conditions may range from hourly and daily changes to seasonal, annual, or decadal cycles in nutrient inputs, sea level heights, current patterns, and other large-scale oceanographic processes (Polovina et al. 1994). Currents play an important role in the dispersal and recruitment of marine life in the NWHI. Surface currents in the NWHI are highly variable in both speed and direction (Firing and Brainard 2006), with long-term average surface flow being from east to west in response to the prevailing northeast trade wind conditions. The highly variable nature of the surface currents is a result in large part of eddies created by local island effects on large-scale circulation. The distribution of corals and other shallow-water organisms is also influenced by exposure to ocean waves. The size and strength of ocean wave events have annual, interannual, and decadal time scales. Annual extratropical storms (storms that originate outside of tropical latitudes) create high waves during the winter. Decadal variability in wave power is possibly related to the Pacific Decadal Oscillation events (Mantua et al. 1997). A number of extreme wave events were recorded during the periods 1985 to 1989 and 1998 to 2002, and anomalously low numbers of extreme wave events occurred during the early 1980s and from 1990 to 1996. Marine debris accumulation in shallow water areas of the NWHI is also influenced by large- and small-scale ocean circulation patterns and El Niño and La Niña events (Morishige et al. 2007).

**Figure 1.4 Diagram of Central Pacific Gyre. The North Pacific, California, North Equatorial, and Kuroshio currents along with atmospheric winds generate the North Pacific Subtropical Gyre. The Subtropical Convergence Zone, an area where marine debris is known to accumulate, shifts seasonally between 23° N and 37° N latitude.**

The physical isolation of the Hawaiian Archipelago explains the relatively low species diversity and high endemism levels of its biota (DeMartini and Friedlander 2004). The direction of flow of surface waters explains biogeographic relationships between the NWHI and other sites, such as Johnston Atoll to the south (Grigg 1981), as well as patterns of endemism, population structure, and density of reef fish within the archipelago (DeMartini and Friedlander 2006).

The shallow marine component of the Monument is nearly pristine and has been described as a “predator-dominated ecosystem,” an increasingly rare phenomenon in the world’s oceans (Friedlander and DeMartini 2002). Large, predatory fish—such as sharks, giant trevally, and Hawaiian grouper—that are rarely seen and heavily overfished in populated areas of the world are extremely abundant in the waters of the Monument. For instance, such species comprise only 3 percent of fish biomass in the heavily used main Hawaiian Islands, but by contrast represent 54 percent of fish biomass in the waters of the Monument. The NWHI are also characterized by a high degree of endemism in reef fish species, particularly at the northern end of the chain, with endemics comprising more than 50 percent of the population in terms of numerical abundance (DeMartini and Friedlander 2004).

Live coral cover is highest in the middle of the chain, with Lisianski Island and Maro Reef having 59.3 percent and 64.1 percent of their respective available substrate covered with living corals (Maragos et al. 2004). Coral species richness is also highest in the middle of the chain,

reaching a maximum of 41 reported coral species at French Frigate Shoals (Maragos et al. 2004). The coral reefs of the Monument are undisturbed by fishing or tourism, with excellent health and high species richness; preliminary faunal inventories indicate that many of their constituent species remain undocumented, and new coral species are still being discovered in this area.

The majority of the Monument consists of deep pelagic waters that surround the island platforms. At least 15 banks lie at depths between 100 and 1,300 feet (30 and 400 meters) within the Monument, providing important habitat for bottomfish and lobster species, although only a few of these banks have been studied in any detail (Kelley and Ikehara 2006). These waters represent critical deepwater foraging grounds for Hawaiian monk seals (Parrish et al. 2002) as well as a spatial refugium for pelagic fishes such as tunas and their allies.

Scientists using deep-diving submersibles have established the presence of deepwater precious coral beds at depths of 1,200 to 1,330 feet (365 to 406 meters); these include ancient gold corals whose growth rate is now estimated to be only a few centimeters every hundred years and whose ages may exceed 2,500 years (Roark et al. 2006). At depths below 1,640 feet (500 meters), a diverse community of octocorals and sponges flourish. These deepwater sessile animals prefer hard substrates devoid of sediments (Baco-Taylor et al. 2006). Even deeper yet, the abyssal depths of the Monument harbor low densities of organisms, and yet the total biomass of the abyssal community is quite large because of the large area of this habitat type within the Monument. Occupying this habitat are odd and poorly documented fishes and invertebrates, many with remarkable adaptations to this extreme environment.

The deep waters are also important insofar as they support an offshore mesopelagic boundary community (Benoit-Bird et al. 2002), a thick layer of pelagic organisms that rests in the deep ocean (1,300 to 2,300 feet, or 400 to 700 meters) during the day, then migrates up to shallower depths (from near zero to 1,300 feet or 400 meters) at night, providing a critical source of nutrition for open-ocean fishes, seabirds, and marine mammals. Overall, the fauna of the Monument's waters below standard SCUBA diving depths remains poorly surveyed and documented, representing an enormous opportunity for future scientific research in a system largely undisturbed by trawling or other forms of resource extraction.

Rates of marine endemism in the NWHI are among the highest in the world. In addition, the sheer mass of apex predators in the marine system is simply not seen in areas subject to higher levels of human impact (DeMartini and Friedlander 2004). The Monument represents one of the last remaining unspoiled protected areas on the planet, and virtually every scientific exploration to the area is a voyage of discovery. In the course of just one 3-week research cruise in the fall of 2006, conducted as part of the global Census of Marine Life project, more than 100 potentially new species were discovered at French Frigate Shoals alone.

In contrast to its marine systems, the terrestrial area of the Monument is comparatively small but supports significant endemic biodiversity. Six species of plants, including a fan palm, and four species of endemic birds, including remarkably isolated species such as the Nihoa finch, Nihoa millerbird, Laysan finch, and Laysan duck, one of the world's rarest ducks, are found only in the NWHI. Of these, the Laysan finch and Laysan duck occurred elsewhere in the archipelago in prehistory (Morin and Conant 2002). In addition, more than 14 million seabirds nest on the tiny

islets in the chain, including 99 percent of the world's Laysan albatrosses and 98 percent of the world's black-footed albatrosses. Although still poorly documented, the terrestrial invertebrate fauna also shows significant patterns of precinctive speciation, with endemic species present on Nihoa, Mokumanamana, French Frigate Shoals, Laysan, Lisianski, Pearl and Hermes, and Kure.

### **Climate**

The climate of the entire Hawaiian archipelago features mild temperatures year-round, moderate humidities, persistent northeasterly trade winds, and infrequent severe storms. Hawai'i's climate is notable for its low day-to-day and month-to-month variability (Giambelluca and Schroeder 1998). The climate is influenced by the marine tropical or marine Pacific air masses, depending on the season. During the summer, the Pacific High Pressure System becomes dominant with the ridge line extending across the Pacific north of Kure and Midway. This system places the region under the influence of easterly winds, with marine tropical and trade winds prevailing. During the winter, especially from November through January, the Aleutian Low moves southward over the North Pacific, displacing the Pacific High before it. The Kure-Midway region is then affected by either marine Pacific or marine tropical air, depending on the intensity of the Aleutian Low or the Pacific High Pressure System (Amerson et al. 1974). The surrounding ocean has a dominant effect on the weather of the entire archipelago.

Sea surface temperature is an important physical factor influencing coral reefs and other marine ecosystems. Maximum monthly climatological mean sea-surface temperature measured over the last 20 years at Kure is 80.6 °F (27 °C) in August and September (NOAA Pathfinder SST time series; Hoeke et al. 2006), with monthly minimums in February at 66.2 °F (19 °C). The large seasonal temperature fluctuations at the northern end of the archipelago result in the coldest and sometimes the warmest sea surface temperatures in the entire Hawaiian chain (Brainard et al. 2004). At the southern end of the Monument, the annual variation in sea surface temperature is much less, with French Frigate Shoals varying only between 74 and 81.5° F (23.3 and 27.5° C) throughout the year. During the period between July and September 2002, sea surface temperatures along the entire Hawaiian Archipelago were anomalously warm, resulting in widespread mass coral bleaching, particularly in the three northern atolls.

Air temperature at the northern end of the archipelago (Kure and Midway atolls) varies between 51 and 92 °F (11 and 33 °C). Air temperature measurements made at six sites on Nihoa (23° N. latitude) from March 2006 to March 2007 ranged between 61 and 94 °F (16 and 34 °C). Annual rainfall amounts at Tern Island, French Frigate Shoals are shown in Figure 1.5. Annual rainfall over the last 26 years has been 28.85 inches (73.28 centimeters) on average, ranging between 15.99 and 41.04 inches (40.61 and 104.24 centimeters) per year.

Figure 1.5 Annual Rainfall (inches) Tern Island, French Frigate Shoals.

On average, between four and five tropical typhoons or hurricanes are observed annually in the Central Pacific. Most of these storms develop in the eastern tropical Pacific, but some form in the central tropical Pacific, and occasionally typhoons approach the Monument from the Western Pacific. The strongest hurricane ever recorded in the Monument area was Patsy in 1959, which passed between Midway and Kure with wind speeds of greater than 115 mph (100 knots) (Friedlander et al. 2005). Only two hurricanes nearing the NWHI since 1979 were classified as Category 2 or weaker. No significant tropical storms have been observed in the NWHI since Hurricane Nele passed near Gardner Pinnacles in 1985.

Much more common, and perhaps more significant as a natural process affecting the geology and ecology of the Monument, are the extratropical storms and significant wave events that regularly move across the North Pacific in the boreal winter. These large wave events (larger than 33-foot or 10-meter waves) influence the growth forms and distribution of coral reef organisms (Dollar 1982; Dollar and Grigg 2004; Friedlander et al. 2005) and affect the reproductive performance of winter-breeding seabirds nesting on low islets in the Monument. Most large (16 to 33 feet+ or 5 to 10+ meters) wave events approach the NWHI from the west, northwest, north, and northeast, with the highest energy generally occurring from the northwest sector. The southern sides of most of the islands and atolls of the NWHI are exposed to fewer and weaker wave events. Annually, wave energy and wave power (energy transferred across a given area per unit time) are highest (~1.3 W/m) between November and March and lowest (~0.3 W/m) between May and September. Extreme wave events (33+ feet or 10+ meter waves) affect shallow water coral reef communities with at least an order of magnitude more energy than the typical winter waves (Friedlander et al. 2005).

## Islands and Marine Habitats of Papahānaumokuākea

The following section contains brief descriptions of the individual islands and marine habitats within the Papahānaumokuākea Marine National Monument, and their salient physical and biological characteristics. The most commonly used name for each island is given first, with alternative names, if any, provided in parentheses. It should be noted that for the islands northwest of Mokumanamana, the Hawaiian names provided are not yet in use on many modern maps. In addition, multiple Hawaiian names have been given to these islands, with the most ancient still being researched through the study of chants, stories, song, and documents written in the Hawaiian language.

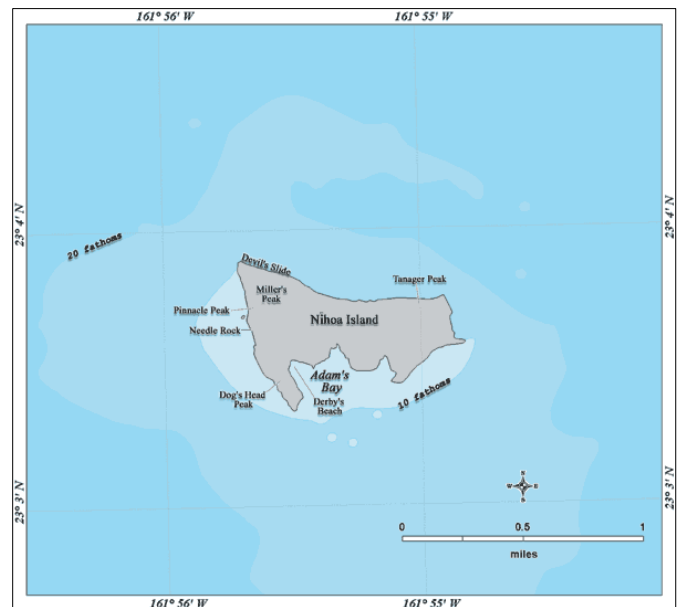

### Nihoa

**23°03' N., 161°56' W.**

“He pu‘u kolo i Nihoa.” (“Crawling up the cliffs of Nihoa.”) This traditional Hawaiian saying is a compliment to one who perseveres. (Pukui 1997). Nihoa has many craggy cliffs, and the rough surf in the winter makes landing there even more difficult than during the summer. “Nihoa” literally means “firmly set,” which could refer to the people who frequented such rugged conditions, and to the pounding that the island takes from the sea and wind. Nihoa has also been known as Moku Manu (bird island).

Nihoa is located approximately 155 miles (249.4 kilometers) northwest of Kaua‘i, the closest of the main Hawaiian Islands.

Measuring roughly 170 acres (0.68 square kilometers), this island is the largest emergent volcanic island within the Monument and the tallest, reaching an elevation of 903 feet (275.2 meters) at Miller Peak. It is also the geologically youngest island within the Monument, with an age calculated at 7.3 million years (Clague 1996). Nihoa is a deeply eroded remnant of a once-large volcano, and the large basaltic shelf of which it is a part stretches 18 miles (28.9 kilometers) in a northeast-southwest direction and averages between 112 to 217 feet (34.1 and 66.1 meters) deep (NOAA 2003b). The island’s two prominent peaks and steep sea cliffs are clearly visible from a distance, rising like a fortress above the sea. The island’s northern face is composed of a sheer cliff made up of successive layers of basaltic lava, within which numerous volcanic dikes are visible. The surface of the island slopes southward with an average slope of 23° (Johnson 2004). The island’s surrounding submerged reef habitat totals approximately 142,000 acres (574.6 square kilometers) and is a combination of uncolonized hard bottom, macroalgae, pavement with sand channels and live coral, and uncolonized volcanic rock (NOAA 2003b), supporting at least 127 species of reef fish and 17 species of corals.

**Figure 1.6 Nihoa.**

Nihoa’s seabird colony boasts one of the largest populations of Tristram’s storm-petrel, Bulwer’s petrel, and blue noddies in the Hawaiian Islands, and very possibly the world. The island is a unique example of a lowland native community, resembling those lowland communities that once occurred on the main Hawaiian Islands but are now almost completely gone (Wagner et al. 1990). The island’s vegetation can be classified as part coastal mixed community (*Sida* mixed shrub and grassland) and coastal dry shrubland dominated by ‘ilima (*Sida fallax*), ‘āweoweo (*Chenopodium oahuense*), and ‘ōhai (*Sesbania tomentosa*). The island supports 21 native plant species, including three endemics: a palm or loulu (*Pritchardia remota*), an amaranth (*Amaranthus brownii*), and an herb (*Schiedea verticillata*) (Wagner et al. 1999). The avifauna of the island includes two endemic passerine birds, the Nihoa finch (*Telespiza ultima*) and the Nihoa millerbird (*Acrocephalus familiaris kingi*), both listed as endangered under the federal Endangered Species Act (ESA) and HRS 195D. The arthropod fauna of the island includes 33 species of mites, three species of spiders, and 182 species of insects, 17 of which are endemic, including a katydid (*Banza nihoa*), a giant tree cricket (*Thaumatoeryllus conantae*), two species of endemic seed bugs (*Nysius nihoae* and *Nysius suffusus*), and an endemic trapdoor spider (*Nihoa mahina*) (Evenhuis and Eldredge 2004). Nihoa also has a rich cultural heritage, with at least 88 known wahi kupuna (ancestral sites) constructed by the precontact Hawaiians who inhabited the island for 700 years (until 1700 A.D.), and is listed on the National Register of Historic Places.

### **Mokumanamana (Necker Island)** **23°35' N., 164°42' W.**

Mokumanamana is translated as a branching or pinnacled island, which aptly describes it, but many people who have studied its many religious and cultural sites suggest that the repetition of the word “mana” (spiritual power) after the Hawaiian word for “island” probably holds even more relevance. The facts that most of the 33 shrines on the island follow the kua (spine) of the island, the solar solstice hits the upright stones at a particular angle, navigational sites have been noted here, and the Hawaiian axes of life and death cross directly over Mokumanamana all potentially explain the reasoning behind the double mana in the name, and the concept of branching.

**Figure 1.7 Mokumanamana (Necker Island)**

Mokumanamana is a dry volcanic island shaped like a fishhook and includes approximately 45 acres (0.18 square kilometers) of land. Geologists believe the island, with an estimated age of 10.6 million years, was once the size of O‘ahu in the main Hawaiian Islands, with a maximum paleo-elevation of 3,400 feet (1,036 meters) (Clague 1996), but due to centuries of erosion its

highest point, at Summit Hill, is now only 276 feet (84.1 meters) above sea level. Wave action has eroded the remainder of the original island into a submerged shelf approximately 40 miles (64 kilometers) long and 15 miles (24 kilometers) wide. Although this shelf holds more than 380,000 acres (1,538 square kilometers) of coral reef habitat supporting 125 reef fish species and 18 coral species, severe wave action and currents in the exposed areas tend to inhibit coral growth. The bank provides excellent habitat for spiny lobsters (*Panulirus marginatus*) and slipper lobsters (*Scyllarides squammosus*), especially in areas of less than 90 feet (27.4 meters) depth and high benthic relief (Parrish and Polovina 1994). Because of its limited size, Mokumanamana supports only five indigenous plant species and no land birds, but does harbor three species of mites, two species of spiders, and 70 species of insects, of which 11 are endemic, including a large weevil (*Rhycogonus biformis*), two species of seed bugs (*Nysius neckerensis* and *Nysius chenopodii*), and a trapdoor spider (*Nihoa hawaiiensis*) (Evenhuis and Eldredge 2004). Sixteen species of seabirds breed here, including the black noddy (*Anous minutus*), which historically was called the Necker Island tern.

Mokumanamana is also significant in Native Hawaiian culture. It bears 33 heiau (ceremonial sites) with standing stones that stretch the length of the island's central spine, suggesting that it was visited by Native Hawaiians for spiritual and possibly navigational purposes.

### **French Frigate Shoals (Kānemiloha'i)** **23°145' N., 66°10' W.**

The first atoll to the northwest of the main Hawaiian Islands, Kānemiloha'i (flat, sand island) is also the midpoint of the archipelago and the largest coral reef area in Hawai'i. This low, flat area is where Pele is said to have left one of her older brothers, Kānemiloha'i, as a guardian during her first journey to Hawai'i from Kahiki (Tahiti). Pele continued down the archipelago until finally settling in Kīlauea, Hawai'i Island, where she is said to reside today.

French Frigate Shoals is the largest atoll in the chain, taking the form of an 18-mile (28.9 kilometers) long crescent. It is estimated to be 12.3 million years old (Clague 1996). The shoals consist of 67 acres (0.27 square kilometers) of total emergent land surrounded by approximately 230,000 acres (931 square kilometers) of coral reef habitat, with a combination of sand, rubble, uncolonized hard bottom, and crustose coralline algae in the windward and exposed lagoon areas, and patch and linear coral reefs in more sheltered areas (NOAA 2003b). Tern Island in the atoll is the site of a FWS field station, which occupies a former U.S. Coast Guard Long-Range Aids to Navigation (LORAN) station that closed in 1979. Within the NWHI, French Frigate Shoals is the center of diversity for corals (more than 41 species, including the

**Figure 1.8 French Frigate Shoals.**

genus *Acropora*, which is all but absent elsewhere in Hawai‘i) and reef fishes (178 species). A relatively deep (82 to 98 feet or 24.9 to 29.8 meters) coral reef at this atoll has been recently discovered to function as a spawning site for the giant trevally, *Caranx ignobilis* (Meyer et al. 2007); a rare discovery of spawning sites for top predators.

The lagoon is also unusual in that it contains two exposed volcanic pinnacles representing the last vestiges of the high island from which the atoll was derived, as well as nine low, sandy islets. The sand islets are small, shift position, and disappear and reappear. In 1923, the Tanager Expedition mapped 16 islets (Amerson 1971). In 1963, Whaleskate was a 16.8-acre (0.068 square kilometers), vegetated island (Amerson 1971); by 1998, it had completely disappeared (Antonelis et al. 2006). These islets provide highly important habitat for the world’s largest breeding colony of the imperiled Hawaiian monk seal, which is listed as endangered under the ESA and HRS 195D, and is internationally recognized as critically endangered by the World Conservation Union. The atoll’s sandy islets also provide nesting sites for 90 percent of the threatened green turtle population breeding in the Hawaiian Archipelago. In addition, 19 of Hawai‘i’s 22 seabird species are found on the island, giving it the highest species richness of breeding seabirds within the Monument. The dry coastal shrublands of the larger islets within the atoll also support an endemic seed bug (*Nysius frigateensis*), moth (*Agrotis kerri*), and mite (*Phauloppia bryani*) (Usinger 1942; Nishida 2002).

### **Gardner Pinnacles (Pūhāhonu)** **25°02' N., 168°05' W.**

“He pūko‘a kū no ka moana.” (“A large rock standing in the sea.”) This traditional Hawaiian saying is used to describe someone who is stubborn, unchangeable, and very determined. This is a suitable description for Pūhāhonu (surfacing of a sea turtle for air/breath), which looks a bit like a turtle’s beak coming up for air and consists of two rocks, with the tallest of them 170 feet tall and 200 yards long.

Gardner Pinnacles consists of two emergent basaltic volcanic peaks estimated to be 15.8 million years in age (Clague 1996), which represent the oldest high islands in the Hawaiian chain. In scale, these pinnacles are small, the largest reaching only 180 feet (54.8 meters) high and having a diameter of approximately 590 feet (179.8 meters). Because of their limited size, they support only a single species of land plant (*Portulaca lutea*) and a few terrestrial arthropod species, but they are by contrast excellent habitat for seabirds (Clapp 1972). Guano from such seabirds gives the peaks a “frosted” appearance, indicating their importance as roosting and breeding sites for at least 12 subtropical species. Landings and terrestrial surveys

**Figure 1.9 Gardner Pinnacles.**

rarely take place because of the difficulty of getting ashore under all but the most calm ocean conditions.

These remnant volcanic pinnacles are surrounded by approximately 600,000 acres (2,428 square kilometers) of coral reef habitat, most of which is in waters 60 feet (18.3 meters) or deeper, harboring 124 reef fish species and 27 species of corals. The intertidal bases of the pinnacles are studded with large populations of ‘opihi, endemic Hawaiian limpets that have been seriously depleted by overharvesting elsewhere in the main Hawaiian Islands.

**Maro Reef (Ko‘anako‘a, Nalukākala)  
25°22' N., 170°35' W.**

The name Ko‘anako‘a literally means the settling of coral, referring to Maro’s expansive coral reefs. Another name for Maro, Nalukākala, describes surf that arrives in combers, such as the surf that froths over shallow reefs.

Maro Reef is a largely submerged open atoll 19.7 million years old (Clague 1996), with less than one acre (4,046.8 square meters) of periodically emergent land. At very low tide, only a small coral rubble outcrop of a former island is believed to break above the surface; as a result, Maro supports no terrestrial biota.

In contrast, the shallow water reef system is extensive, covering nearly a half-million acres (2,023 square kilometers), and is the largest coral reef in the Monument. It is also one of the chain’s most ecologically rich shallow water marine ecosystems, with 64.1 percent coral cover over the entire area, among the highest percentage observed in the Monument (Maragos et al. 2004). The documented marine biota at Maro Reef includes 37 species of corals and 142 species of reef fish. Fish species endemic to the Hawaiian Archipelago make up half of all fish recorded here. Maro’s reefs are intricate and reticulated, forming a complex network of reef crests, patch reefs, and lagoons. Deepwater channels with irregular bottoms cut between these shallow reef structures, but navigation through them is difficult and hazardous. Cover types range from unconsolidated with 10 percent or less macroalgae cover to areas with greater than 10 percent coral or crustose coralline algae (NOAA 2003b). Because the outermost reefs absorb the majority of the energy from the open ocean swells, the innermost reticulated reefs and aggregated patch reefs are sheltered and have the characteristics of a true lagoon. Given the structural complexity of this platform, its shallow reefs are poorly charted and largely unexplored.

**Figure 1.10 Maro Reef.**

## Laysan Island (Kauō) 25°46' N., 171°45' W.

Kauō (egg) describes both the shape of this island and, perhaps, the abundant seabirds that nest here.

Laysan is a raised atoll, estimated to be 20.7 million years old (Clague 1996), with a maximum elevation of approximately 50 feet (15 meters) above sea level. It represents the second largest island in the Monument, with a land area of approximately 1,023 acres (4.14 square kilometers), surrounded by close to 100,000 acres (405 square kilometers) of coral reef. Most of the reef area at Laysan lies in deeper waters, with a small, shallow-water reef area in a bay off the southwest side of the island. The reef system as a whole supports 131 species of reef fishes and 27 species of corals. Laysan is home to a semi-permanent FWS field camp to support wildlife monitoring and habitat restoration.

The island's ring of sandy dunes surrounds a shallow depression of about 200 acres (0.8 square kilometers). This basin is a mix of hypersaline water and mud flats, a feature unique within the Hawaiian Archipelago and rare within the Pacific as a whole, that changes in size seasonally and annually depending on variations in rainfall. Because of its elevation of about 40 feet (12 meters), Laysan is well vegetated, supporting at least 30 species of flowering plants, including five endemic subspecies prior to human contact (Athens et al. 2007), many of which were driven to extinction by the misguided introduction of rabbits in 1902 during the guano mining era (Ely and Clapp 1973). The plant community is divided into five different associations arrayed in concentric rings around the interior hypersaline lake: (1) coastal shrubs, (2) interior bunchgrass, (3) vines, (4) interior shrubs, and (5) wetland vegetation (Newman 1988). The island also previously harbored five Hawaiian endemic land birds, of which two, the endangered Laysan finch (*Telespiza cantans*) and the endangered Laysan duck (*Anas laysanensis*), still survive (Pratt et al. 1987). In addition, approximately two million seabirds nest here, including boobies, frigatebirds, terns, shearwaters, noddies, and the world's second-largest black-footed and Laysan albatross colonies. The island also supports a relatively rich arthropod fauna, including a large endemic weevil (*Rhyncogonus bryani*), four endemic moths, an endemic wasp, and three endemic mites. A successful 12-year eradication project to remove the sandbur *Cenchrus echinatus*, a plant that had displaced native vegetation over 30 percent of the island, has been completed, and an active ecological restoration project is under way to bring back a number of other plants and animals that were lost after the introduction of rabbits (Morin and Conant 1998).

Figure 1.11 Laysan Island.

### Lisianski Island (Papa‘āpoho) and Neva Shoal 26°04' N., 173°58' W.

Papa‘āpoho describes a flat area with a depression or hollow, which is exactly how the island of Papa‘āpoho is shaped. Its highest point is a 40-foot-high sand dune, and its lowest point is a depression to the south that runs as a channel toward the ocean.

Lisianski Island is another raised atoll, rising to 40 feet (12.1 meters) above sea level, and with approximately 400 acres (1.6 square kilometers) of emergent land is the third largest island within the Monument. This 23.4-million-year-old island (Clague 1996) is over 1.2 miles (1.9 kilometers) across, consisting of an elevated rim surrounding a broad central depression, although unlike Laysan it does not enclose an interior saline lake. The coral cover on the platform around the island, called Neva Shoal, is extensive, totaling more than 290,000 acres (1,174 square kilometers) with an average of almost 60 percent cover of the substrate. There are 24 coral species at Lisianski and 124 species of reef fish. Fish species endemic to the Hawaiian Archipelago compose 58 percent of all fish recorded here.

Lisianski suffered ecological perturbations similar to those on Laysan because of the introduction of mice (Olsen and Ziegler 1996), guano mining, and the release of rabbits in 1903 (Tomich 1986). Lisianski lost a breeding population of land birds, the Laysan ducks historically known from about 150 years ago. It currently supports no endemic land plant or bird species, although it does harbor an endemic seed bug (*Nysius fullawayi flavus*) and an endemic moth (*Helicoverpa minuta*) (Usinger 1942; Nishida 2002). The island also hosts large Bonin petrel and sooty tern colonies, as well as a variety of other seabirds. Lisianski also has the only grove of *Pisonia grandis* trees in the entire Hawaiian Archipelago; this tree is dispersed by seabirds and is favored as a nesting site for many tree-nesting seabird species.

Figure 1.12 Lisianski Island and Neva Shoal.

### Pearl and Hermes Atoll (Holoikauaua) 27°50' N., 175°50' W.

The name Holoikauaua celebrates the Hawaiian monk seals that haul out and rest here. Pearl and Hermes Atoll is a large atoll with several small islets, forming 96 acres (0.38 square kilometers) of land surrounded by more than 300,000 acres (1,214 square kilometers) of coral reef habitat. The atoll has an estimated age of 26.8 million years (Clague 1996) and is 20 miles (32 kilometers) across and 12 miles (19.3 kilometers) wide, with dunes rising above sea level. Unlike Lisianski and Laysan to the southeast, Pearl and Hermes Atoll is a true atoll, fringed with shoals, permanent emergent islands, and ephemeral sandy islets.

These features provide vital dry land for monk seals, green turtles, and a multitude of seabirds, with 16 species breeding here. The islets are periodically washed over when winter storms pass through the area. The atoll boasts the highest rate of reef fish endemism in the Hawaiian Archipelago, with 62 percent of fish species recorded endemic to the Hawaiian Archipelago out of 174 species overall. Coral species richness is high as well, with 33 species present. The permanent islands with higher dunes also support an endemic subspecies of native seed bug (*Nysius fullawayi infuscatus*) (Usinger 1942). Pearl and Hermes also hosts a small population of endangered Laysan finches that were translocated here in the 1960s.

Figure 1.13 Pearl and Hermes Atoll.

### Midway Atoll (Pihemanu) 28°15' N., 177°20' W.

Pihemanu is aptly named for the loud din of birds that one hears on this atoll. Midway Atoll consists of three sandy islets (Sand [1,128 acres, 4.56 square kilometers], Eastern [337 acres, 1.36 square kilometers], and Spit [13 acres, 0.05 square kilometers]), for a total of 1,464 acres (5.9 square kilometers) in terrestrial area, lying within a large, elliptical barrier reef measuring approximately 5 miles (8 kilometers) in diameter. The atoll, which is 28.7 million years old (Clague 1996), is surrounded by more than 88,500 acres (356 square kilometers) of coral reefs. In 1965, the U.S. Geological Survey took core

Figure 1.14 Midway Atoll.

samples and hit solid basaltic rock 180 feet (54.8 meters) beneath Sand Island and 1,240 feet (377.9 meters) beneath the northern reef. Numerous patch reefs dot the sandy-bottomed lagoon. These reefs support 163 species of reef fishes and 16 species of corals.

Although Midway’s native vegetation and entomofauna have been greatly altered by more than a century of human occupation, the island boasts the largest nesting colonies of Laysan and black-footed albatrosses in the world, forming the largest colony of albatrosses in the world. The Navy, FWS, and U.S. Department of Agriculture-Wildlife Services (USDA Wildlife Services) successfully eradicated rats from Midway, a small forest of mature ironwood trees (an alien invasive species) has been removed from Eastern Island, and new ironwood seedlings from the remaining seedbank are removed as they are detected. Currently, the cover on all of the islands at Midway is approximately 30 percent paved or structures, 23 percent grass and forbs, 18 percent woodland, 7 percent sand and bare ground, 22 percent shrublands, and less than 0.23 percent wetland. Midway Atoll also supports the first successful reintroduced population of endangered Laysan ducks, translocated from Laysan Island in 2004 and 2005. Laysan ducks use both the largely introduced vegetation of Midway Atoll and the restored patches of native vegetation. This reintroduction is significant because island ducks are globally threatened taxa, and because the Laysan duck is the most endangered waterfowl in the Northern Hemisphere and the U.S. Introduced canaries breed among historic buildings that mark the beginning of cable communication across the Pacific near the beginning of the 20<sup>th</sup> century. The atoll and surrounding seas were also the site of a pivotal battle of World War II, and Midway was an active Navy installation during the Cold War.

### **Kure Atoll (Mokupāpapa)** **28°25' N., 178°20' W.**

Mokupāpapa literally means flat island, and the name was ascribed to Kure Atoll by officials of the Hawaiian Kingdom in the 19th century. Under the reign of King David Kalākaua, the Hawaiian Kingdom disbursed an official envoy to Kure Atoll to take ‘formal possession’ of the atoll. At the time, Kure was known in the kingdom as Ocean Island, but Hawaiian Kingdom officials indicated that Kure was “known to ancient Hawaiians, named by them Moku Pāpapa and recognized as part of the Hawaiian Domain.”

**Figure 1.15 Kure Atoll**

Kure Atoll is the most northwestern island in the Hawaiian chain and occupies a singular position at the “Darwin Point:” the northern extent of coral reef development, beyond which coral growth cannot keep pace with the rate of geological subsidence. Kure’s coral is still growing slightly faster than the island is subsiding. North of Kure, where growth rates are even slower, the drowned Emperor Seamounts foretell the

future of Kure and all of the Hawaiian Archipelago. As Kure Atoll continues its slow migration atop the Pacific Plate, it too will eventually slip below the surface.

This 29.8-million-year-old atoll (Clague 1996) is nearly circular, with a reef 6 miles (9.6 kilometers) in diameter enclosing a lagoon with two islets comprising over 200 acres (0.81 square kilometers) of emergent land, flanked by almost 80,000 acres (324 square kilometers) of coral reef habitat. The outer reef forms a nearly complete circular barrier around the lagoon, with the exception of passages to the southwest, and the associated marine habitats support 155 species of reef fishes. Fish species endemic to the Hawaiian Archipelago compose 56 percent of all fish recorded here. There are 27 species of coral found at the atoll. Of the two enclosed islets, the only permanent land is found on crescent-shaped Green Island, which rises to 20 feet (6.1 meters) above sea level and is located near the fringing reef in the southeastern quadrant of the lagoon. The atoll is an important breeding site for black-footed and Laysan albatrosses, Christmas shearwaters, and 14 other breeding seabirds. A resident population of spinner dolphins inhabits the lagoon during the day. There are 11 arthropods on Kure that are endemic to the Hawaiian Archipelago, one of which is a mite (*Hemicheyletia granula*) that is apparently endemic to Kure (Nishida 2001).

The U.S. Coast Guard established a LORAN station at Kure in 1960 (Woodward 1972) and occupied it until 1993. This land use had far-reaching effects on all the plants and animals at Kure Atoll, resulting in elevated invasive species problems and contaminants left behind when the base closed. As early as 1870, explorers documented the presence of Polynesian rats (*Rattus exulans*) here. These rodents influenced the species composition of the seabird community and the reproductive performance of the species that were there. In 1993, the State Department of Land and Natural Resources and USDA Wildlife Services eradicated rats from Kure Atoll.

### Banks and Seamounts

Approximately 30 submerged banks are within the Monument (Miller et al. 2004). Deepwater banks, seamounts, and the abyssal plain are among the least studied environments of the NWHI. Recent use of shipboard mapping technologies, submersibles, and remotely operated vehicles, however, has provided valuable information to characterize the physical and biological components of these ecosystems. Multibeam mapping expeditions have revealed dramatic geologic features, including knife-edge rift zones, seafloor calderas, sea-level terraces, submarine canyons, underwater landslide scars and debris fields, and previously unmapped seamounts (Smith et al. 2003; Smith et al. 2004).

Figure 1.16 Banks and Shoals near French Frigate Shoals.

Submersible surveys on South Pioneer Ridge (Pioneer Bank) and two unnamed seamounts, one east of Laysan Island and the other east of Mokumanamana, have revealed the presence of various substrate types, deposited when these geologic features were at sea level (Smith et al. 2004). In some areas, dense communities of corals (ahermatypic) and sponges at depths approaching 1,000 fathoms (1,830 meters) obscured the underlying substratum. The deepwater marine plants of the area are a mixture of tropical species, species with cold-temperature affinities, and species with disjunctive distributions, suggesting alternative biogeographical patterns and dispersal routes from the main Hawaiian Islands (McDermid and Abbott 2006).

Mega- to macro-scale descriptions of bottomfish habitats made on Raita Bank, West St. Rogatien Bank, Brooks Bank, and Bank 66 indicate the distribution and abundance of bottomfish are patchy and appear to be associated with high relief and topographic features, including crevices and caves (Kelley et al. 2006). Nihoa sits on a broad double platform, with a large bank immediately to the west, and two smaller banks farther to the northwest. Surrounding French Frigate Shoals is a series of submerged banks, including Southeast Brooks Bank, St. Rogatien Bank, and two other smaller banks to the west, plus another unnamed bank immediately to the east. Raita Bank lies nearly equidistant between Gardner Pinnacles and Maro Reef. Laysan has a small seamount to the southeast and the large Northampton Seamounts to the southwest. In the vicinity of Lisianski, Pioneer Bank is only 22 nautical miles (25.3 miles or 40.7 kilometers) from Neva Shoals, and these features combine to form a major coral reef ecosystem with a variety of intermingled marine habitats, rich in biodiversity. Telemetry studies of Hawaiian monk seals unexpectedly have revealed that these animals spend considerable foraging time at subphotic depths on these banks, particularly in areas that have high levels of relief, such as pinnacles and walls (Parrish and Abernathy 2006).

All of these banks provide prime habitats for bottomfish-associated fish species that are important food sources for Hawaiian monk seals. Such banks also support populations of spiny and slipper lobsters, and colonies of precious gold, pink, and black corals that have been heavily disturbed in much of the remainder of the Pacific by the use of physically damaging harvest methods, such as trawling. These deep-living corals, below the depth where enough light penetrates for photosynthesis, rely on the capture of plankton from the water column with their tentacles rather than deriving energy from symbiotic dinoflagellate algae, known as zooxanthellae, that virtually all shallow-water reef-building corals harbor in their cells. Submersible surveys conducted at depths of 656 to 1,148 feet (199.9 to 349.9 meters) on Raita, West St. Rogatien, and Brooks Banks found little evidence of physical disturbances by bottomfishing from anchors and fishing gear (Kelley and Ikehara 2006).

### **Pelagic and Deep-water Habitats**

The pelagic marine ecosystem is the largest ecosystem on earth. Biological productivity in the pelagic zone is highly dynamic; for example, in the equatorial Pacific Ocean, upwelling extends westward along the equator in a cold tongue of water from the coast of South America, eventually encountering a large pool of warmer water in the western Pacific (the cold tongue-warm pool system). The eastern cold-tongue system is characterized by high levels of primary production, and the western warm pool by lower levels of primary production.

Most of the Monument's area can be considered pelagic habitat. The estimated area of all parts of the Monument with depths greater than 1,000 fathoms (6,000 feet or 1.8 kilometers) is 117,375 square miles (304,000 square kilometers), or about 84 percent of the entire Monument (Miller et al. 2006). Pelagic habitat can be separated into the following five zones relative to the amount of sunlight that penetrates through seawater: (a) epipelagic, (b) mesopelagic, (c) bathypelagic, (d) abyssopelagic, and (e) hadalpelagic. Sunlight is the principal factor of primary production (phytoplankton) in marine ecosystems, and because sunlight diminishes with ocean depth, the amount of sunlight penetrating seawater and its effect on the occurrence and distribution of marine organisms are important. The epipelagic zone extends to nearly 656 feet (200 meters) and is the near extent of visible light in the ocean. The mesopelagic zone occurs between 656 feet (200 meters) and 3,281 feet (1,000 meters) and is sometimes referred to as the "twilight zone." Although the light that penetrates to the mesopelagic zone is extremely faint, this zone is home to wide variety of marine species. The bathypelagic zone occurs from 3,281 feet (1,000 meters) to 13,123 feet (4,000 meters), and the only visible light seen is the product of marine organisms producing their own light, which is called "bioluminescence." The next zone is the abyssopelagic zone (13,123 to 19,685 feet, 4,000 to 6,000 meters), where there is extreme pressure and the water temperature is near freezing. This zone does not provide habitat for very many creatures, except small invertebrates such as squid. The last zone is the hadalpelagic (19,685 feet [6,000 meters] and below) and occurs in trenches and canyons. Surprisingly, marine life, such as tubeworms and seastars, is found in this zone, often near hydrothermal vents.

Pelagic species are closely associated with their physical and chemical environments. Suitable physical environment for these species depends on gradients in temperature, oxygen, or salinity, all of which are influenced by oceanic conditions on various scales. In the pelagic environment, physical conditions such as isotherm and isohaline boundaries often determine whether the surrounding water mass is suitable for pelagic fish, and many of the species are associated with specific isothermic regions. Additionally, fronts and eddies that become areas of congregation for different trophic levels are important habitat for foraging, migration, and reproduction for many species (Bakun 1996).

At least 15 banks lie at depths between 100 and 1,300 feet (30 and 400 meters) within the Monument, providing important habitat for bottomfish and lobster species, although only a few of these banks have been studied in any detail (Kelley and Ikehara 2006). These waters represent critical deepwater foraging grounds for Hawaiian monk seals (Parrish et al. 2002) as well as a spatial refugium for pelagic fishes such as tunas and their allies.

The deep waters are also important insofar as they support an offshore mesopelagic boundary community (Benoit-Bird et al. 2002), a thick layer of pelagic organisms that rest in the deep ocean (1,300 to 2,300 feet, or 400 to 700 meters) during the day, then migrates up to shallower depths (from near zero to 1,300 feet or 400 meters) at night, providing a critical source of nutrition for open-ocean fishes, seabirds, and marine mammals. This community of organisms that inhabit the upper layers of the mesopelagic zone has been surveyed at French Frigate Shoals, Lisianski, Pearl and Hermes, Midway, and Kure using echosounding technology (Lammers et al. 2006). Their work confirmed the presence of a community of vertical migrators, consisting of fish, squid, and shrimp. This temporal variability in the structure of the biotic community is important to understand as the spatial patterns are studied. Mesopelagic fishes, in particular, are

important prey for bigeye tuna, which tend to live at greater depths than the other tuna species. Overall, the fauna of the Monument's waters below acceptable SCUBA diving depths (100 to 130 feet or 30 to 40 meters) remains poorly surveyed and documented, representing an enormous opportunity for future scientific research in a system largely undisturbed by trawling or other forms of resource extraction.

Phytoplankton comprise more than 95 percent of primary productivity in the marine environment (Valiela 1995). These represent several different types of microscopic organisms requiring sunlight for photosynthesis living primarily in the upper 100 meters of the euphotic zone of the water column. Phytoplankton include organisms such as diatoms, dinoflagellates, coccolithophores, silicoflagellates, and cyanobacteria. Although some phytoplankton have structures (e.g., flagella) that allow them some movement, their general distribution is primarily controlled by current movements and water turbulence. Diatoms can be either single celled or can form chains with other diatoms. They are mostly found in areas with high nutrient levels, such as coastal temperate and polar regions. Diatoms are one of the major contributors to primary production in coastal waters and occur everywhere in the ocean. Dinoflagellates are unicellular (one-celled) organisms that are often observed in high abundance in subtropical and tropical regions. Coccolithophores, which are also unicellular, are mostly observed in tropical pelagic regions (Levington 1995). Cyanobacteria, or blue-green algae, are often found in warm nutrient-poor waters of tropical ocean regions.

Oceanic pelagic fish including skipjack, yellowfin tuna, and blue marlin prefer warm surface layers, where the water is well mixed by surface winds and is relatively uniform in temperature and salinity. Other pelagic species—albacore, bigeye tuna, striped marlin, and swordfish—prefer cooler, more temperate waters, often meaning higher latitudes or greater depths. In fact, the largest proportion of the tuna catch in the Pacific Ocean originates from the warm pool, even though paradoxically it is a region of low primary productivity. Tuna movement to upwelling zones at the fringe of the warm pool may be key in resolving this apparent discrepancy between algal and tuna production. Preferred water temperature often varies with the size and maturity of pelagic fish, and adults usually have a wider temperature tolerance than subadults. Thus, during spawning, adults of many pelagic species usually move to warmer waters, the preferred habitat of their larval and juvenile stages.

Large-scale oceanographic events (such as El Niño) change the characteristics of water temperature and productivity across the Pacific, and these events have a significant effect on the habitat range and movements of pelagic species. Tuna are commonly most concentrated near islands and seamounts that create divergences and convergences, which concentrate forage species, and also near upwelling zones along ocean current boundaries and along gradients in temperature, oxygen, and salinity. Swordfish and numerous other pelagic species tend to concentrate along food-rich temperature fronts between cold upwelled water and warmer oceanic water masses (NMFS 2001). These frontal zones also function as migratory pathways across the Pacific for loggerhead turtles (Polovina et al. 2000). Loggerhead turtles are opportunistic omnivores that feed on floating prey such as the pelagic cnidarian, *Vellela vellela* (“by the wind sailor”) and the pelagic gastropod *Janthina* spp., both of which are likely to be concentrated by the weak downwelling associated with frontal zones (Polovina et al. 2000).

The estimated hundreds of thousands of seabirds breeding in the Monument are primarily pelagic feeders that obtain the fish and squid they consume by associating with schools of large predatory fish such as tuna and billfish (Fefer et al. 1984; Au and Pitman 1986). These fish—yellowfin tuna (*Thunnus albacares*), skipjack tuna (*Katsuwonus pelamis*), mahimahi (*Coryphaena hippurus*), wahoo (*Acanthocybium solandri*), rainbow runner (*Elagatis bipinnulatus*), and broadbilled swordfish (*Xiphias gladius*)—are apex predators of a food web existing primarily in the epipelagic zone. Although both the predatory fish and the birds are capable of foraging throughout their pelagic ranges (which encompass the entire Monument and tropical Pacific Ocean), the birds are most successful at feeding their young when they can find schools of predatory fish within easy commuting range of the breeding colonies (Ashmole 1963, Feare 1976, Flint 1991). Recently fledged birds, inexperienced in this complex and demanding style of foraging, rely on abundant and local food resources to survive while they learn to locate and capture prey. Some evidence from tagging studies done by Itano and Holland (2000) suggests both yellowfin and bigeye tuna aggregate around island reef ledges, seamounts, and fish aggregating devices and are caught at a higher rate here than in open-water areas. Yellowfin tuna in Hawai‘i exhibit a summer island-related inshore-spawning run (Itano 2001).

Ashmole and Ashmole (1967) and Boehlert (1993) suggest that the circulation cells and wake eddies found downstream of oceanic islands may concentrate plankton and therefore enhance productivity near islands. Higher productivity, in turn, results in greater abundance of baitfish, thus allowing higher tuna populations locally. Johannes (1981) describes the daily migrations of skipjack tuna and yellowfin tuna to and from the waters near islands and banks. The presence of natural densities of these tunas within the foraging radius of seabird colonies enhances the ability of birds to provide adequate food for their offspring (Ashmole and Ashmole 1967; Au and Pitman 1986; Diamond 1978; Fefer et al. 1984). Wake eddies also concentrate the larvae of many reef fishes and other reef organisms and serve to keep them close to reefs, enhancing survivorship of larvae and recruitment of juveniles and adults back to the reefs. For at least three of the seabird species breeding in the NWHI (brown noddies, white terns, and brown boobies), large proportions (33 to 56 percent) of their diets originate from the surrounding coral reef ecosystem in other areas where their diet has been studied (Ashmole and Ashmole 1967; Harrison et al. 1983; King 1970; Diamond 1978).

## 1.2 Status and Condition of Natural Resources

The NWHI can be characterized as a large marine ecosystem exposed to a wide range of oceanographic conditions and environmental and anthropogenic stressors. Submerged geomorphologic features, including reef, slope, bank, submarine canyon, and abyssal plain habitats, support a diverse range of shallow and deepwater marine life. Small islands and islets provide critical breeding grounds and nesting sites for endangered, threatened, and rare species, which forage on land and throughout the coral reef, deepwater, and pelagic marine ecosystems encompassing the NWHI.

These natural systems hold important cultural value, as all archipelagic wildlife are regarded as ancestors to Native Hawaiians (Malo 1951). The life forms defined in this section are inhabitants of the NWHI and referred to in the Kumulipo, a genealogical oli (chant) that frames the evolution of life from the simplest of creatures to the most complex. In the Native Hawaiian worldview, the interface between natural and cultural resources is seamless.

### Algae

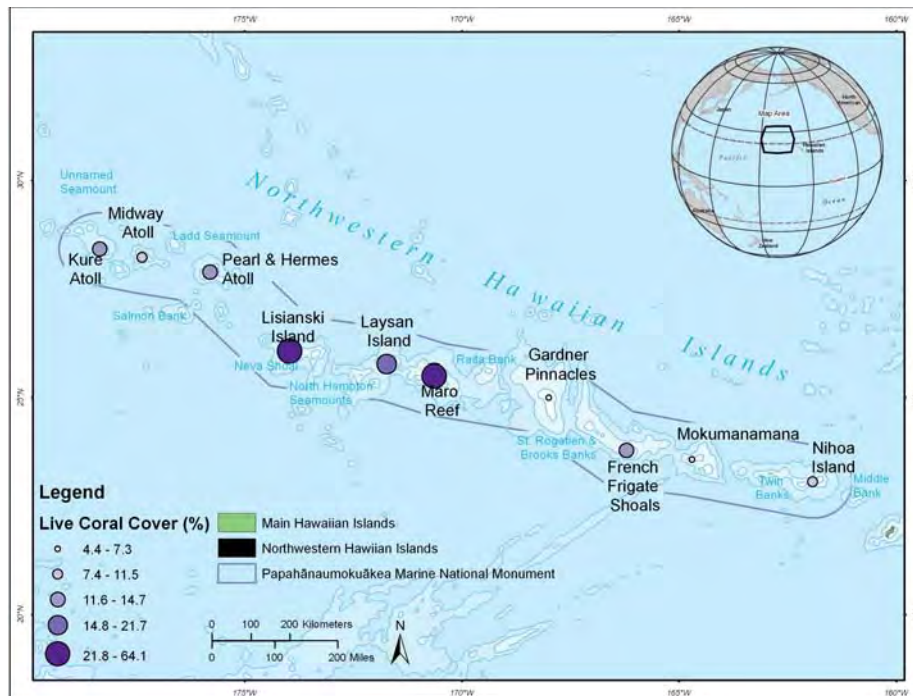

The marine algal flora in the Monument are diverse and abundant. There are 353 species of macroalgae and two seagrass species known from the NWHI (McDermid and Abbott 2006). The species composition of the macroalgae community is relatively similar throughout the NWHI. Representatives of the Chlorophyta, Rhodophyta, Phaeophyta, branched coralline, crustose coralline, Cyanophyta, and turf algae occur in varying combinations, with green algae having the largest biomass and area coverage (Vroom and Page 2006). Green algae in the genus *Halimeda* was found in more than 70 percent of all quadrats during Monumentwide surveys in 2004. This calcified algae contributes greatly to sand formation (Vroom and Page 2006). An island-specific checklist of the nonvascular plants of the NWHI can be found in Eldredge (2002). The NWHI contain a large number of Indo-Pacific algal species not found in the main Hawaiian Islands, such as the green calcareous alga (*Halimeda velasquezii*). Unlike in the main Hawaiian Islands, where alien species and invasive algae have overgrown many coral reefs, the reefs of the NWHI are largely free of alien algae, and the high natural herbivory results in a natural algal assemblage.

### Corals

Fifty-seven species of stony corals are known in the shallow subtropical waters of the NWHI (at depths of less than 100 feet [33 meters]), which cover an area of 911,077 acres (3,687 square kilometers) (Miller et al. 2004; 2006) in the Monument. Endemism of this group is high, with 17 of those species (30 percent) found only in the Hawaiian Archipelago. These endemics also account for 37 to 53 percent of visible stony corals in all shallow reef areas surveyed (Friedlander et al. 2005). Fifteen of the 17 endemic species are in the genera *Montipora*, *Porites*, or *Pocillopora*.

Deepwater corals in the Monument are even more diverse than those in shallow water. To date, 137 gorgonian octocorals and 63 species of azooxanthellate scleractinians have been documented to occur in the Monument (Parrish and Baco 2007). In November 2007, two new potential genera of deepwater bamboo corals were collected by submersible at a single site off Twin Banks (Watling, pers comm).

Live coral cover is highest in the middle of the chain, with Lisianski Island and Maro Reef having 59.3 and 64.1 percent of their respective available substrate covered with living corals (Maragos et al. 2004). Coral cover varies significantly across the NWHI from these high rates at Maro and at Lisianski to very minimal coverage at most of the other reef sites (Figure 1.17). Despite their high latitudes, a similar number of species of coral have been reported for the NWHI (57) as the main Hawaiian Islands (59) (Friedlander et al. 2005). Coral species richness is also highest in the middle of the chain, reaching a maximum of 41 reported coral species at French Frigate Shoals (Maragos et al. 2004). Stony corals are less abundant and diverse at the northern end (Kure, Midway, and Pearl and Hermes) of the archipelago and off the exposed basalt islands to the southeast (Nihoa, Mokumanamana, La Prouse, and Gardner). At these sites, soft corals such as *Simularia* and *Palythoa* are more abundant. Table coral in the genus *Acropora* is not found in the main Hawaiian Islands, but seven species are recorded for Mokumanamana, Gardner, Pearl and Hermes, Neva, French Frigate Shoals, Maro, and Laysan, with the highest number of species and colonies at French Frigate Shoals. These colonies of coral may have been established from larvae traveling in currents or eddies from Johnston Atoll, 450 miles (724.2 kilometers) to the south (Grigg 1981; Maragos and Jokiel 1986). The Monument's coral reefs are relatively undisturbed by the impacts of fishing or tourism, with excellent health and high species richness. Preliminary faunal inventories indicate that many of their constituent species remain undocumented; even new coral species are still being discovered.

**Figure 1.17 Differences in Coral Cover Among Regions within the NWHI.**

REA surveys were conducted at 173 sites in 2002. Coral cover was calculated from size frequency data of colony counts within transects. Data are mean and standard error. Based on unpublished data from PIFSC-CRED. Map by Friedlander and Wedding of the NCCOS/CCMA/Biogeography Team.

**Benthic Shallow Water Invertebrates**

With the exception of coral and lobster species, the marine invertebrates of the NWHI are very poorly known. Only two comprehensive collections of these groups of animals were conducted prior to 2000: the 1902 Albatross Expedition, in which the collected organisms were deposited at the Smithsonian Institution, and the 1923 Tanager Expedition, in which the collection was deposited at the Bishop Museum. In 2000, the NWHI Reef Assessment and Monitoring Program was established, and it continues to the present to assess the biota of all 10 emergent reef areas and shallow waters (less than 65 feet [20 meters]) in the Monument (Friedlander et al. 2005). While this work is ongoing, a number of new species already have been recorded for Hawai‘i, and some of these species may turn out to be endemic to the NWHI (DeFelice et al. 2002). By 2005, a total of 838 species from 12 orders had been identified, and many species are being worked on by taxonomic experts around the world and have yet to be identified (Friedlander et al. 2005).

One species of marine invertebrate for which some population data are available is the black-lipped pearl oyster (*Pinctada margaritifera*). This oyster was discovered in 1927 and was heavily harvested at Pearl and Hermes Atoll until 1929, when the practice was prohibited by law. An estimated 150,000 oysters were harvested before a 1930 expedition estimated the remaining population at 100,000 oysters. More recent surveys in 1969, 1996, and 2000 found only a few oysters, indicating that the population had not recovered since the last harvest. Recent surveys conducted in 2003 at Pearl and Hermes Atoll mapped and measured more than 1,000 individuals (Keenan et al. 2004). The average size of pearl oysters in the 2003 surveys was larger than the 1930 surveys (Figure 1.18). It is unclear whether the number and size structure reflect a potential recovery of the species 70 years later or a more thorough sampling effort relative to the previous survey. However, the slow recovery of this species demonstrates the fragility of some of the Monument resources.

## Crustaceans

The NWHI lobster trap fishery, which commenced in the mid-1970s, primarily targeted the Hawaiian spiny lobster (*Panulirus marginatus*) and slipper lobster (*Scyllarides squammosus*). Three other species, green spiny lobster (*P. penicillatus*), ridgeback slipper lobster (*S. haanii*), and sculptured slipper lobster (*Parribacus antarcticus*), were caught in low abundance (DiNardo and Marshall 2001).

Fishery statistics during the early developmental phase of the fishery (1976 to 1982) are scant. The total reported catch and landings of lobsters peaked in 1985 and generally declined from 1986 to 1995. Fishing effort peaked in 1986 and declined in 1988 before increasing in 1990. After 1990, fishing effort generally declined. The fishery initially targeted spiny lobster, but by 1985 gear modifications and improved markets led to an increase in slipper lobster landings. Catches of slipper lobster remained high from 1985 to 1987, fell into a general decline from 1988 to 1996, and increased significantly from 1997 to 1999. The fishery was closed in 2000 because of the uncertainty in the population models used to assess the stocks (DeMartini et al. 2003).

The National Marine Fisheries Service (NMFS), a line office of NOAA, has conducted annual fishery-independent trap surveys through its Pacific Islands Fisheries Science Center (PIFSC) since 1984, with the exception of 1990, to (1) evaluate the performance of commercial and research survey gear, (2) calibrate gear types, and (3) monitor the relative abundance of local populations of lobster in the NWHI. The survey has also been used as a platform for short-term experiments (e.g., studies of handling mortality) and the collection of biological and oceanographic data. Since 1990, the abundance of spiny lobsters at Mokumanamana has generally decreased. Significant drops in abundance were observed in 1992, 1994, and 1998. The abundance of slipper lobsters has remained at relatively low levels at Mokumanamana between 1988 and 2006. Spiny lobster abundance at Maro Reef declined significantly after 1988 and remained low through 1999. An increasing trend in spiny lobster abundance has been detected at Maro Reef since 2000. Slipper lobster abundance at Maro Reef has generally been increasing, with significant increases occurring after 1991. These changes suggest a switch in species dominance at Maro Reef in 1990 (spiny to slipper lobster), and the initial phases of a spiny lobster population recovery in 2000.

Numerous hypotheses have been advanced to explain population fluctuations of lobsters in the NWHI, including environmental (Polovina and Mitchum 1992), biotic (e.g., habitat and competition) (Parrish and Polovina 1994), and anthropogenic (e.g., fishing) (Polovina et al. 1995; Moffitt et al. 2006). Each hypothesis by itself offers a plausible, however simplistic, explanation of events that in fact result from several processes acting together. It is likely that population fluctuations of lobsters in the NWHI can be more accurately described by a mix of the hypotheses presented, each describing a different set of mechanisms (DiNardo and Marshall 2001).

## Reef Fish

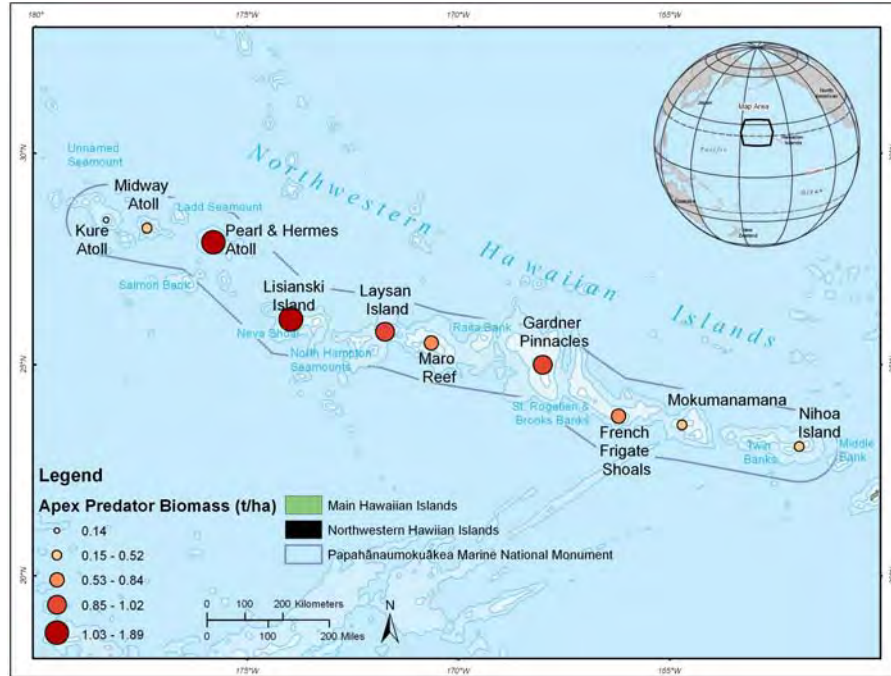

The extreme isolation of the NWHI chain and its distance from the diverse fish population centers of the Western Pacific contribute to a lower fish species diversity relative to other sites to

the west (Mac et al. 1998). The long-term protection from fishing pressure that has been afforded the NWHI has resulted in high standing stocks of fish more than 260 percent greater than the main Hawaiian Islands. The fish community of the coral reef ecosystem of the NWHI also shows a very different structure than the main Hawaiian Islands and most other places in the world. The shallow-reef fish community is remarkable in the abundance and size of fish in the highest trophic levels. In this large-scale, intact, predator-dominated system, more than 54 percent of the total fish biomass on forereef habitats in the NWHI consists of apex predators. In contrast, the total fish biomass in the main Hawaiian Islands is dominated by herbivorous fish species (55 percent), with only 3 percent composed of apex predators (Friedlander and DeMartini 2002). Apex predator biomass on forereef habitats in the NWHI is 1.3 metric tons per hectare, compared with less than 0.05 metric tons per hectare on forereef habitats in the main Hawaiian Islands (Figure 1.19).

**Figure 1.19 Comparison of Biomass in Major Trophic Guilds between the Northwestern Hawaiian Islands and the Main Hawaiian Islands. Source: Friedlander and DeMartini 2002.**

Areas with the highest apex predator biomass include Pearl and Hermes Atoll, followed by Lisianski and Laysan Islands (Figure 1.20). Large, predatory fish such as sharks, giant trevally, and Hawaiian grouper that are rarely seen and heavily overfished in populated areas of the world are extremely abundant in the waters of the Monument.

**Figure 1.20 Geographic Pattern of Apex Predator Biomass Density (t/ha) at the 10 Emergent Northwestern Hawaiian Islands (NWHI) Reefs Surveyed during September/October 2000, 2001, and 2002. Based on data from DeMartini and Friedlander 2004. Map by Friedlander and Wedding of the NCCOS/CCMA/ Biogeography Team.**

The NWHI are also characterized by a high degree of endemism in reef fish species, particularly at the northern end of the chain, with endemism rates well over 50 percent, making it one of the most unique fish faunas on earth (DeMartini and Friedlander 2004). Because of the decline in global marine biodiversity, endemic “hot spots” like Hawai‘i are important areas for global biodiversity conservation. Overall fish endemism is higher in the NWHI compared with the main Hawaiian Islands (Friedlander et al. 2005; DeMartini and Friedlander 2004). Within the NWHI, endemism increases up the chain and is highest at the three northernmost atolls and Lisianski (Figure 1.21). Another feature of the shallow-water reef fish community noticed by divers is that some species found only at much greater depths in the main Hawaiian Islands inhabit shallower water in the NWHI. This might be explained by water temperature preferences or by disturbance levels that vary between the two ends of the archipelago.

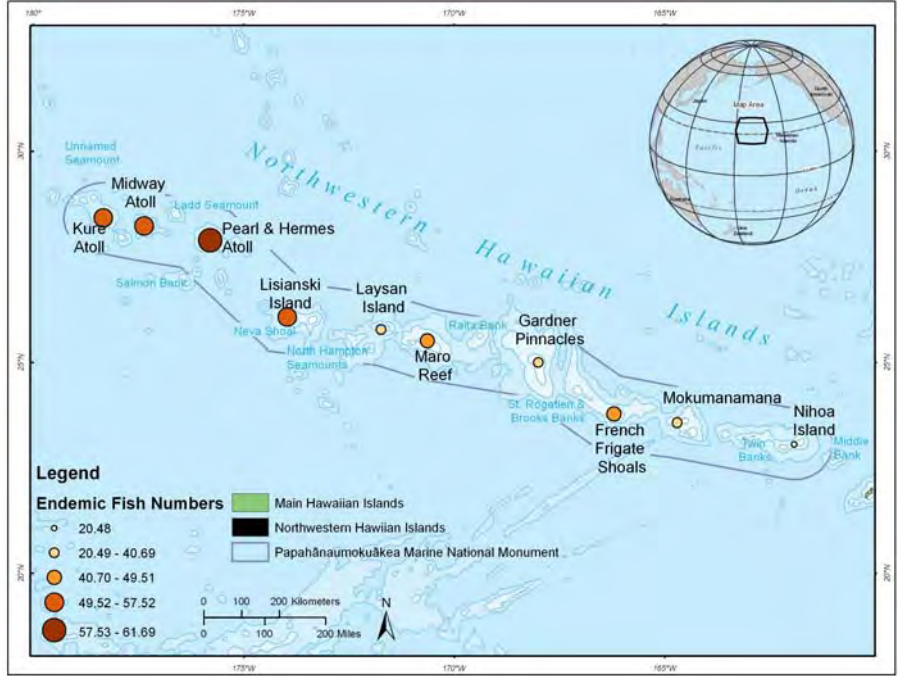

Figure 1.21 Percent Endemism (Based on Numerical Densities) at Each of 10 Emergent NWHI Reefs, Surveyed during September/October 2000, 2001, and 2002. Note patterns of endemism with latitude. Based on data from DeMartini and Friedlander 2004. Map by Friedlander and Wedding of the NCCOS/CCMA/Biogeography Team.

**Bottomfish**

The bottomfish species in the NWHI are in the taxonomic groups *Lutjanidae* (snappers), *Serranidae* (groupers), *Carangidae* (jacks), and *Lethrinidae* (emperors). The bottomfish stocks in the NWHI Mau and Ho‘omalulu zones have not been determined to be overfished, but in 1990, the stocks in the Mau Zone were considered to be near the overfishing threshold. Since then, however, bottomfish harvest rates in the Mau Zone, including the Ho‘omalulu Zone, have resulted in a bottomfish stock complex that currently is considered “healthy and lightly exploited,” particularly in comparison to the main Hawaiian Islands (Brodziak 2007).

### **Pelagic Marine Life**

The oceanic Scombroid fish (billfish, tuna, and wahoo) have zoogeographies much more like that of plankton than of benthic fish. Most are cosmopolitan and occur in all oceans within the tropical and subtropical zones but may have very specific water temperature preferences (Longhurst and Pauly 1987). The yellowfin tuna, for instance, prefers water no cooler than 18 to 21 °C, which coincides with the northern boundary of the Monument. All species undertake seasonal and age-related migrations, traveling between spawning grounds and feeding grounds appropriate for their sizes. They prey on medium-sized pelagic fish, crustaceans, and cephalopods. Tagging studies of yellowfin tuna and bigeye tuna have demonstrated that, while these species have enormous capacity to travel huge distances, they show very specific attraction to fish aggregating devices, island reef ledges, seamounts, and other elements of structure (Itano and Holland 2000). Lowe et al. (2006) similarly found that while two species of large sharks, tiger sharks (*Galeocerdo cuvier*) and Galapagos sharks (*Carcharhinus galapagensis*), are capable of long-distance travel, they showed more site fidelity than expected throughout the year, with 70 percent of tiger sharks exhibiting year-round residence at French Frigate Shoals. Some of the study subjects did make long-distance movements, with sharks marked at French Frigate Shoals showing up at Midway and on the Kona coast of the Island of Hawai‘i. The tremendous economic value of these fishes has resulted in serious declines of most populations because of industrialized fishing. Myers and Worm (2003) calculated that large predatory fish biomass today is only about ten percent of pre-industrial levels worldwide. Large predatory fish populations remain healthy and robust in the Monument (Friedlander et al. 2005).

### **Reptiles**

The five species of sea turtles that occur in the NWHI are the loggerhead (*Caretta caretta*), the green (*Chelonia mydas*), the olive ridley (*Lepidochelys olivacea*), the leatherback (*Dermochelys coriacea*), and the hawksbill (*Eretmochelys imbricata*). All of these species are protected by the ESA and by HRS 195D. Of these species, only the green turtle comes ashore to bask and breed in the NWHI. French Frigate Shoals is the site of the principal rookery for the entire Hawaiian green turtle stock, with more than 90 percent of the population nesting there (Balazs and Chaloupka 2004a). As adults, most of these turtles travel to foraging grounds in the main Hawaiian Islands or in Midway or Johnston atolls, where they graze on benthic macroalgae. They periodically swim back to the nesting grounds at French Frigate Shoals (or, in smaller numbers, to Lisianski and Pearl and Hermes Atoll) to lay eggs. Breeding adults remain extremely faithful to the colony where they were hatched for their own reproductive activities (Bowen et al. 1992). Hatchling turtles may spend several years in pelagic habitats foraging in the neritic zone before switching to a benthic algae diet as adults.

The Hawaiian population of green turtles has been monitored for more than 30 years, following the cessation of harvesting in the 1970s, and has shown a steady recovery from its depleted state (Balazs and Chaloupka 2004a, see Figure 1.22.) The transition zone chlorophyll front, located north of Monument waters most years, occasionally moves southward along with one of the species tightly associated with it, the loggerhead turtle. The North Pacific population breeds in Japan but feed on buoyant organisms concentrated at the convergent front in these high-chlorophyll waters, which support a complex food web including cephalopods, fishes, and crustaceans, also fed upon by albacore tuna (*Thunnus alalunga*) and a variety of billfish (Polovina et al. 2001).

The terrestrial herpetofauna of the NWHI is made up of introduced species of lizards, including four gecko species and two skinks, and a tiny blind snake (*Ramphotyphlops braminus*) that was imported to Midway, most likely in soil. The greatest diversity of these introduced reptiles is found at Midway and Kure atolls.

Figure 1.22 Long-Term Trend in the Abundance of Nesting Hawaiian Green Sea Turtles (dash lines represent Bayesian 95 percent credible region). Source: Balazs and Chaloupka 2004a.

### Land Birds

Four endangered land bird species in the NWHI are protected under the ESA and HRS 195D. Three species are passerines: the Laysan finch, currently found on Laysan Island and Pearl and Hermes Atoll; and the Nihoa finch and Nihoa millerbird, which are endemic to Nihoa. The fourth species is the Laysan duck, which once was found on many Hawaiian Islands but is now restricted to Laysan Island and Midway Atoll.

The Nihoa millerbird population is very small, and total population estimates fluctuate widely between years. The most recent population estimate (2007) is 814 birds (MacDonald 2008), but results have ranged between 23 and 814 birds in these sporadic and irregularly timed surveys (with broad confidence intervals), and these results are insufficient to adequately monitor trends in the population. Based on monitoring surveys, the Nihoa finch population has fluctuated widely since 1968 from a low of 5,200 individuals to a high of 20,802 (Morin and Conant 2002), but the population and its habitat are considered to be relatively stable. However, the Pearl and Hermes Atoll population is likely declining as a result of habitat alteration by the invasive alien plant *Verbesina encelioides*.

Planning is under way for habitat restoration and possible translocation of the Nihoa species to establish additional populations, but these efforts have not progressed sufficiently to affect the status of the species. An evaluation and structured ranking of potential translocation sites

yielded Laysan Island as the top choice for a first translocation of Nihoa millerbirds. Research to gather information pertinent to translocation planning is ongoing.

The total estimated Laysan duck population on Laysan Island has fluctuated from seven to more than 600 adult birds in the last century. The most recent (2005) population estimate of adult birds is 600 birds (Reynolds et al. 2006). The population at Midway was founded with a total of 42 wild birds translocated from Laysan in 2004 and 2005. Of this original total, 25 or 26 birds are believed to have bred. After successful breeding seasons in 2005 through 2007, the number of ducks at Midway had increased to nearly 200 animals (Reynolds et al. 2007). Another successful breeding season at Midway in 2008 added significantly to the population, but an outbreak of avian botulism in August 2008 caused the death of more than 130 ducks and a temporary setback to this new population.

### **Shorebirds**

Forty-seven species of shorebirds have been recorded in the Monument. Most of these are classified as infrequent visitors or vagrants, but the Monument does support regionally significant populations of four migrants: Pacific golden plovers (*Pluvialis fulva*), bristle-thighed curlews (*Numenius tahitiensis*), wandering tattlers (*Tringa incana*), and ruddy turnstones (*Arenaria interpres*). Most of these birds arrive in July and August and return to the Arctic to breed in May, but some of the younger individuals may skip breeding their first summer and remain in the Monument. While in the NWHI, these species use all the habitats available for foraging and sometimes concentrate in large numbers in the hypersaline lake at Laysan and in the artificial water catchment pond on Sand Island at Midway Atoll. The rat-free islands of the Monument provide important wintering sites for the rare bristle-thighed curlew because they are flightless during molt and require predator-free sites. This species and Pacific golden plovers are listed as species of high conservation concern in the National and Regional Shorebird Conservation Plans (Engilis and Naughton 2004) and are designated Birds of Conservation Concern by the FWS at the regional and national scale (FWS 2002).

### **Seabirds**

The importance of seabirds in the NWHI was recognized in 1909 with the establishment of the Hawaiian Islands NWR. Early protection and active management have resulted in large, diverse, and relatively intact seabird populations. Seabird colonies in the NWHI constitute one of the largest and most important assemblages of tropical seabirds in the world, with approximately 14 million birds (5.5 million breeding annually), representing 21 species (Naughton and Flint 2004) (See Table 1.1). Greater than 98 percent of the world's Laysan and black-footed albatrosses nest here. For several other species, such as Bonin petrel, Christmas shearwater, Tristram's storm-petrel, and the gray-backed tern, the Monument supports colonies of global significance. The last complete inventory of NWHI breeding populations was done between 1979 and 1984 (Fefer et al. 1984). Population trends since then have been derived from more intensive monitoring at three islands. Population trends in the NWHI are stable or increasing for most species, but there is concern for a few, especially the albatrosses.

The conservation status of seabirds in Hawai'i was assessed as part of the North American Waterbird Conservation Plan. Eleven of the 21 species were classified as highly imperiled or of high conservation concern at the broad scale of the plan (eastern north Pacific, western north

Atlantic, and Caribbean) (See Table 1.1.) At the regional scale (Pacific Islands), 6 species were included in these highest concern categories: Laysan, black-footed, and short-tailed albatrosses; Christmas shearwater; Tristram's storm-petrel; and blue noddy.

**Table 1.1 Seabird Species Known to Breed in Papahānaumokuākea Marine National Monument (FWS data)<sup>1</sup>**

Common Name	Species	Estimated Number of Breeding Birds
Black-Footed Albatross	<i>Phoebastria nigripes</i>	111,800
Laysan Albatross	<i>Phoebastria immutabilis</i>	1,234,000
Bonin Petrel	<i>Pterodroma hypoleuca</i>	630,000
Bulwer's Petrel	<i>Bulweria bulwerii</i>	180,000
Wedge-Tailed Shearwater	<i>Puffinus pacificus</i>	450,000
Christmas Shearwater	<i>Puffinus nativitatis</i>	5,400
Tristram's Storm-Petrel	<i>Oceanodroma tristrami</i>	11,000
Red-Tailed Tropicbird	<i>Phaethon rubricauda</i>	18,400
White-Tailed Tropicbird	<i>Phaethon lepturus</i>	8
Masked Bobby	<i>Sula lepturus</i>	3,400
Red-Footed Booby	<i>Sula sula</i>	15,800
Brown Booby	<i>Sula leucogaster</i>	800
Great Frigatebird	<i>Fregata minor</i>	19,800
Little Tern	<i>Sternula albifrons</i>	20
Gray-Backed Tern	<i>Onychoprion lunatus</i>	86,000
Sooty Tern	<i>Onychoprion fuscatus</i>	3,000,000
Blue Noddy	<i>Procelsterna cerulean</i>	7,000
Brown Noddy	<i>Anous stolidus</i>	150,000
Black Noddy	<i>Anous minutus</i>	26,000
White Tern	<i>Gygis alba</i>	22,000
Total		5,971,428

<sup>1</sup> - Laysan and black footed albatrosses, Christmas shearwater, Tristram's storm-petrel, and blue-gray noddy are on the Birds of Conservation Concern list for the Hawaiian Bird Conservation Region, and black-footed albatrosses are on the national list (FWS 2002).

Distribution, population status and trends, ecology, and conservation concerns for each of these species are contained in the Regional Seabird Conservation Plan, Pacific Region (FWS 2005). The greatest threats to seabirds that reside in the NWHI are both local and global. These threats include introduced mammals and other invasive species, fishery interactions, contaminants, oil pollution, marine debris, and climate change. Over the past 20 years, active management in the NWRs and State Seabird Sanctuary has included the eradication of black rats (*Rattus rattus*) at Midway Atoll and Polynesian rats (*Rattus exulans*) at Kure Atoll; eradication or control of invasive plants; cleanup of contaminants and hazards at former military sites; and coordination with NMFS and the Regional Fishery Management Councils, as well as industry and conservation organizations, to reduce fishing impacts.

### Marine Mammals

The marine and littoral ecosystems of the Monument provide essential habitat for the Hawaiian monk seal (*Monachus schauinslandi*), one of the world's most endangered marine mammals. The Hawaiian monk seal was listed as an endangered species under the ESA in 1976 (41 FR 51611) and is protected by the State under HRS 195D. About 1,200 individuals exist (Antonelis

et al. 2006; NMFS 2003; NMFS 2004a), and models predict that the population will fall below 1,000 individuals within the next five years. While 80 to 100 Hawaiian monk seals coexist with humans in the main Hawaiian Islands (D. Schofield, pers. comm.), the great majority of the population lives among the remote islands and atolls of the Monument. Their range generally consists of the islands, banks, and corridors within the Monument, although individual animals may be found beyond this extensive area on occasion, sometimes farther than 50 nautical miles (92.6 kilometers) from shore.

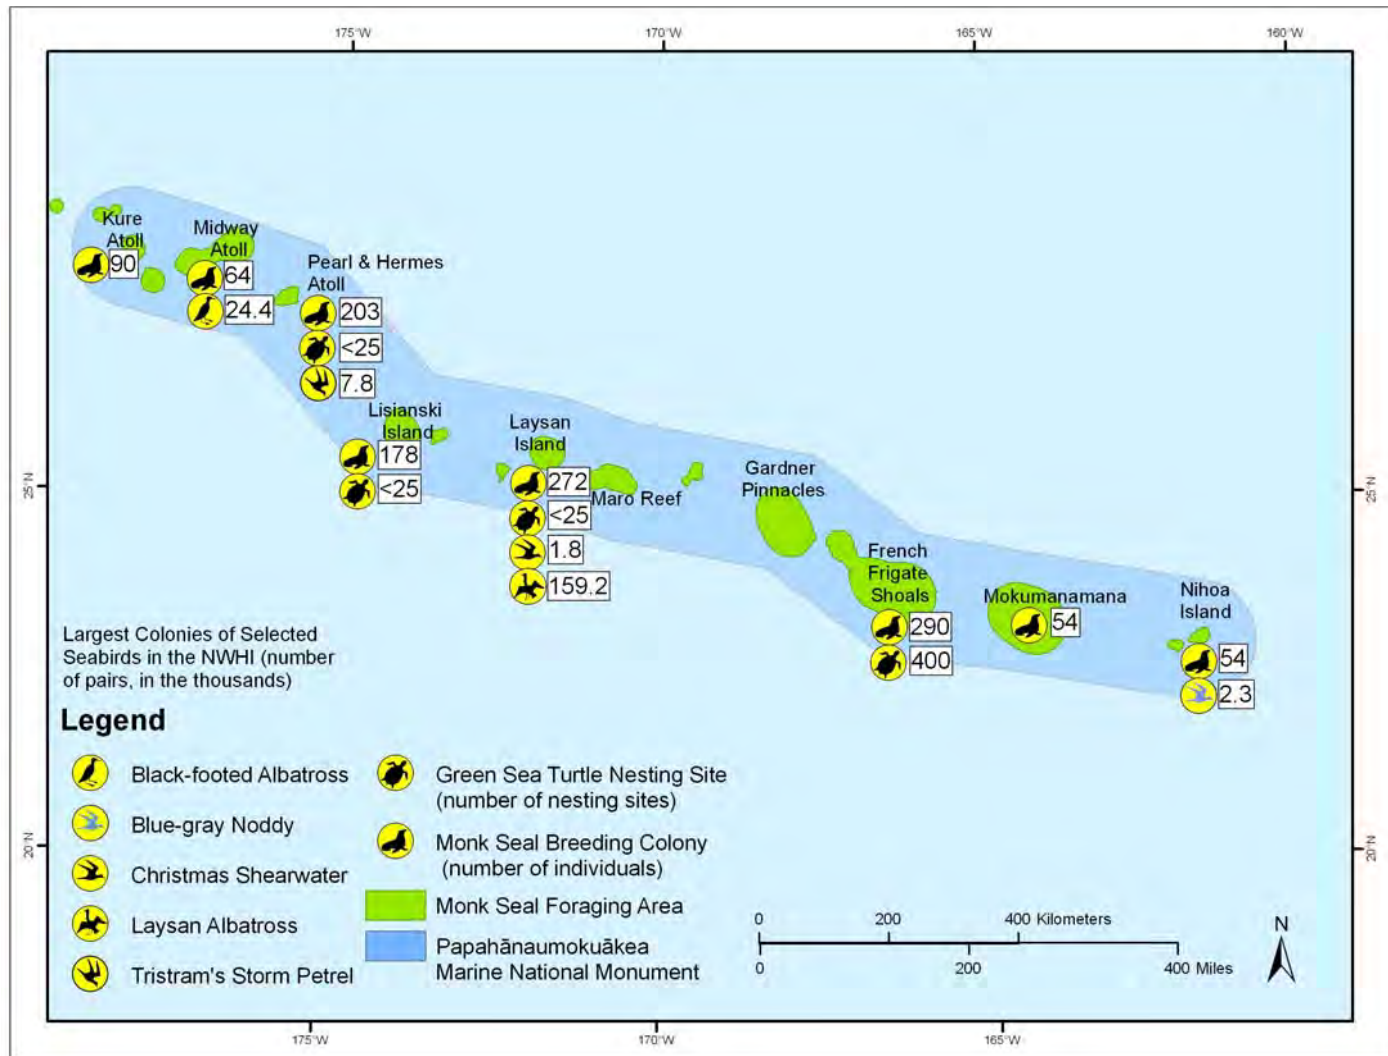

In May 1988, NMFS designated critical habitat under the ESA for the Hawaiian monk seal from shore to 20 fathoms in ten areas of the NWHI. Critical habitat for this species includes all beach areas, sand spits and islets, including all beach crest vegetation to its deepest extent inland, lagoon waters, inner reef waters, and ocean waters out to a depth of 20 fathoms around the following: Pearl and Hermes Atoll; Kure Atoll; Midway Atoll, except Sand Island and its harbor; Lisianski Island; Laysan Island; Maro Reef; Gardner Pinnacles; French Frigate Shoals; Mokumanamana; and Nihoa (50 CFR §226.201). Critical habitat was designated to enhance the protection of habitat used by monk seals for pupping and nursing, areas where pups learn to swim and forage, and major haulout areas where population growth occurs.

Reproductive success of the Hawaiian monk seal population has declined, with the total mean nonpup beach counts at the main reproductive NWHI subpopulations in 2001 being approximately 60 percent lower than in 1958 (NMFS 2003). French Frigate Shoals has the largest Hawaiian monk seal breeding site and breeding subpopulation, followed by Laysan Island, Pearl and Hermes Atoll, and Lisianski Island (Figure 1.23).

The foraging biogeography of the Hawaiian monk seal has been described in a number of recent reports (Stewart 2004a, b, and c; Stewart and Yochem 2004a, b, and c) and is illustrated in Figure 1.23. Between 1996 and 2002, the movements and diving patterns of 147 Hawaiian monk seals in the NWHI (consisting of 41 adult males, 35 adult females, 29 juvenile males, 15 juvenile females, 12 weaned male pups, and 15 weaned female pups) were monitored with satellite-linked depth recorders. Overall findings of these studies include the following:

- Monk seal foraging range covers an area of approximately 18,593 square miles (48,156 square kilometers), or almost 14 percent of the total area of the Monument.

**Figure 1.23 Hawaiian Monk Seal Breeding Sites and Subpopulation Sizes and Foraging Area (Stewart 2004a); Green Turtle Nesting Sites (Balazs and Ellis 2000); and Largest Nesting Sites for Seabird Species of Highest Concern for the Pacific Island Region in the Northwestern Hawaiian Islands (Kushlan et al. 2002; Fefer et al. 1984 for seabird colony size).**

- Seals foraged extensively at or near their breeding sites and breeding subpopulations and haulout sites (95 percent within 20 miles of these sites), except at French Frigate Shoals, where foraging distances were demonstrated to be greater.
- The highest concentration of monk seal activity in the NWHI is focused on French Frigate Shoals and surrounding banks.
- Seals moved along specific corridors to travel between breeding sites and haulout sites. These corridors were closely associated with the NWHI submarine ridge. Seals likely forage along these corridors around subsurface features like reefs, banks, and seamounts.

Several banks located northwest of Kure Atoll represent the northern extent of the monk seal foraging range (Stewart 2004a). These areas have also been identified as important precious coral habitat as a result of recent research conducted with submersibles and remotely operated vehicles by NOAA's Office of Ocean Exploration (NOAA 2003c). The main terrestrial habitat requirements include haulout areas for pupping, nursing, molting, and resting. These are primarily sandy beaches, but virtually all substrates are used at various islands. The loss of terrestrial habitat is a priority issue of concern in the NWHI, especially habitat loss caused by environmental factors such as storms and sea level rise that could further exacerbate this problem in the future. While some habitat loss (e.g., the subsidence of Whaleskate Island at French Frigate Shoals) has already been observed, sea level rise over the longer term may threaten a large portion of the resting and pupping habitat in the NWHI. Habitat loss has decreased available haulout and pupping beaches.

Past and present impacts to the monk seal population in the NWHI include hunting in the 1880s; disturbance from military uses of the area; entanglement in marine debris (Henderson 2001; 1990; 1984a; 1984b); direct fishery interaction, including recreational fishing (Kure Atoll) and commercial fishing prior to the establishment of the 50-mile Protected Species Zone around the NWHI in 1991 (NMFS 2003); predation by sharks (Nolan 1981); aggression by adult male monk seals; and reduction of habitat and prey caused by environmental change (Antonelis et al. 2006).

The waters of the Monument are also home to more than 20 cetacean species, six of them federally recognized as endangered under the ESA and HRS 195D, and "depleted" under the Marine Mammal Protection Act (see Table 1.4), but comparatively little is known about the distributions and ecologies of these whales and dolphins (Barlow 2006). Recent research by Johnston et al. (2007) reveals that the Monument also hosts many more humpback whales than originally thought. The most well-studied cetacean species in the Monument is the Hawaiian spinner dolphin (*Stenella longirostris*). This geographically isolated subgroup of the spinner dolphin is genetically distinct from those of the eastern tropical Pacific (Galver 2000). They occur off all of the main Hawaiian Islands and only four of the NWHI (Kure, Midway Atoll, Pearl and Hermes Atoll, and French Frigate Shoals) (Karczmarski et al. 2005). Andrews et al. (2006) found that the animals at the three northern sites were a genetically homogeneous population that was distinct from the group at French Frigate Shoals, which had some exchange with dolphins in the main Hawaiian Islands. Genetic isolation, together with an apparent low genetic diversity, suggests that spinner dolphins could be highly vulnerable to anthropogenic and environmental stressors (Andrews et al. 2004).

## Terrestrial Invertebrates

Native terrestrial arthropods and land snail communities of the NWHI are the least well studied of the animal groups, but perhaps the most seriously affected by human activities and introductions. In particular, the many species of ants that have accidentally reached all the islands of the archipelago except Gardner Pinnacles have had enormous effects on these native terrestrial invertebrates.

The entomofauna of the Monument includes some groups of insects that demonstrate dramatic adaptive radiations. One such group is the seedbugs, specifically the genus *Nysius*, which shows the complete range of feeding types: from host-specific plant feeders, to diverse plant hosts, to omnivorous feeding, and finally to predator/scavengers. It is a rare occurrence to find herbivory and carnivory occurring within the same genus. Nowhere else in the world is there a lineage like the Hawaiian *Nysius* in which to explore the evolution of carnivory in Heteroptera. Some of these species are single-island endemics and of particular conservation concern because of their limited ranges.

**Table 1.2 Number of Terrestrial Arthropod Species in the NWHI Summarized by Order and Island (Nishida 1998; Nishida 2001)**

Terrestrial Arthropod Species	Number of Terrestrial Arthropod Species by Island

### Terrestrial Plants

The land plants of the NWHI are typically salt-tolerant and drought-resistant species of the beach strand and coastal scrub. The number of native species found at each site is positively correlated with island size but is negatively influenced by the number of alien species occurring at the site. The three sites with airstrips and a longer history of year-round human habitation have much larger populations of alien species of land plants (See Table 1.3). At least three species of NWHI endemic plants (*Achyranthes atollensis*, *Phyllostegia variabilis*, and *Pritchardia* species of Laysan) are believed to have gone extinct since European contact. Some other native species and genera have found refuge in areas of the NWHI where rats were never introduced, and now occur at much greater densities than they do in the main Hawaiian Islands (e.g., *Pritchardia remota* and *Sesbania tomentosa*, commonly known as ‘ohai).

At least six species of terrestrial plants found only in the region are listed under the ESA and HRS 195D, some so rare that because of the limited surveys on these remote islands, they may have already vanished from the planet. The World Conservation Network lists *Cenchrus agrimonioides* var. *laysanensis* as extinct, though biologists still hold hope that it may exist. *Amaranthus brownii*, endemic to Nihoa, is deemed critically endangered by the World Conservation Network, while *Pritchardia remota* is considered endangered.

**Table 1.3 Biogeographic Description of Land Plants of Papahānaumokuākea Marine National Monument (number of species that have been observed at each site in previous 20 years) (Bruegmann, M.M. 1995; Starr, F., and K. Martz 1999; Starr, F., K. Martz, and L. Loope 2001; Morin, M., and S. Conant 1998; Wagner, W.L., D.R. Herbst, and S.H. Sohmer 1999).**

Island	Emergent land area (acres)	Island endemic	Indigenous to Hawai‘i and other Pacific Islands	Alien	Total no. of Species
Nihoa	171	3	14	3	20
Mokumanamana	46	0	5	0	5

<sup>1</sup> - Sites where an airfield and permanent human habitation has influenced immigration of novel species.

## Endangered and Threatened Species

Twenty-three species of plants and animals known to occur in the NWHI are listed under the ESA and by the State of Hawai‘i under HRS 195D (Table 1.4). Specific threats and recovery actions related to these species are discussed in section 1.4, and in individual action plans presented in Section 3.

**Table 1.4 Species Occurring in the NWHI Listed as Threatened or Endangered Under the Endangered Species Act and by the State of Hawai‘i (HRS 195D)<sup>1</sup>**

<b>Marine Mammals</b>		
Hawaiian monk seal	<i>Monachus schauinslandi</i>	E
Humpback whale	<i>Megaptera novaeangliae</i>	E
Sperm whale	<i>Physeter macrocephalus</i>	E
Blue whale	<i>Balaenoptera musculus</i>	E
Fin whale	<i>B. physalus</i>	E
Sei whale	<i>B. borealis</i>	E
North Pacific right whale	<i>Eubalaena japonica</i>	E
<b>Marine Turtles</b>		
Olive Ridley turtle	<i>Lepidochelys olivacea</i>	T/E
Leatherback turtle	<i>Dermochelys coriacea</i>	E
Loggerhead turtle	<i>Caretta caretta</i>	T
Hawksbill turtle	<i>Eretmochelys imbricata</i>	E
Green turtle	<i>Chelonia mydas</i>	T
<b>Terrestrial Birds</b>		
Laysan duck	<i>Anas laysanensis</i>	E
Laysan finch	<i>Telespyza cantans</i>	E
Nihoa millerbird	<i>Acrocephalus familiaris kingi</i>	E
Nihoa finch	<i>Telespyza ultima</i>	E
<b>Seabirds</b>		
Short-tailed albatross	<i>Phoebastria albatrus</i>	E
<b>Plants</b>		
No common name	<i>Amaranthus brownii</i>	E
Kamanomano	<i>Cenchrus agrimoniodes var laysanensis</i>	E
No common name	<i>Mariscus pennatififormis ssp bryanii</i>	E
Loulu	<i>Pritchardia remota</i>	E
No common name	<i>Schiedea verticillata</i>	E
‘Ōhai	<i>Sesbania tomentosa</i>	E

<sup>1</sup> - Under the Endangered Species Act of 1973 and the State of Hawai‘i (HRS 195D), endangered species are those in danger of extinction. Threatened species are those likely to become an endangered species within the foreseeable future. E = endangered; T = threatened.

### 1.3 Status and Condition of Cultural and Historic Resources

The Monument was established for its unique combination of natural and cultural resources, including Native Hawaiian and post-Western-contact historic resources. It is composed of terrestrial and marine areas that have special national and international significance in terms of conservation, ecology, history, science, education, culture, archaeology, and aesthetics. The establishment of the Monument also provides the framework for coordinated and comprehensive management of the area.

#### Native Hawaiian Cultural Foundation and Significance

*Kū pākū ka pali o Nihoa i ka makani*

*The cliff of Nihoa stands as resistance against the wind*

—Said of one who stands bravely in the face of misfortune (Pukui 1983: 1924)

Polynesian navigators began voyaging across the vast Pacific Ocean, unaided by Western instrumentations, about 300 B.C. or earlier (Howe 2006). Over the next 1,300 years, these skilled and visionary wayfinders would leave their mark on a more than 10-million-square-mile area of the Pacific that has become known as the Polynesian triangle, its defining points being made by settlements on Aotearoa (New Zealand) in the West, on Rapa Nui (Easter Island) in the East, and on the Hawaiian archipelago in the North (Polynesian Voyaging Society 2007). A unique spirituality binds the multitude of Polynesian societies that today inhabit the hundreds of islands contained within this region. These Polynesian societies share many of the same cosmologies, genealogies, and oral histories, the origins of which can be traced either back to the wayfinders who first ventured through the Pacific or from subsequent voyagers who traveled across this massive water continent.

Canoes filled with those who would become Native Hawaiians first arrived in the waters of the remote Hawaiian Archipelago, most likely from Hiva or the Marquesas Islands, around 1,600 years ago or earlier (PVS 2007). Upon finding abundant natural resources, they decided to remain, living in harmony with nature to survive on such a remote island chain. They developed complex resource management systems and specialized skill sets to ensure the fertile soils and rich reef environments they found could be sustained for future generations. These included agricultural terraces; extensive water paddies for their staple food, kalo (taro); and incredibly productive fishponds, many of them acres in size that sprawled over shallow coastal waters.

The ocean serves as a central source of physical and spiritual sustenance for Native Hawaiians on a daily basis. Poetically referred to as Ke kai pōpolohua mea a Kāne (the deep dark ocean of Kāne), the ocean was divided into numerous smaller divisions and categories, from the nearshore to the deeper pelagic waters (Malo 1951). Likewise, channels between islands were also given names and served as connections between islands, as well as a reminder of their larger oceanic history and identity.

Today, Native Hawaiians continue to maintain their strong cultural ties to the land and sea. This concept of interconnectedness transcends geography. Native Hawaiians understand the importance of managing the islands and waters as one, as they are inextricably connected to one

another (Beckwith 1951; Lili‘uokalani 1978). Despite the fact that the NWHI were not used and experienced on a daily basis by most Hawaiians, they have always been seen as an integral part of the Hawaiian Archipelago and have been honored as a deeply spiritual location, as evidenced by the many wahi kūpuna, or sacred sites, on Nihoa and Mokumanamana.

Much of the information about the NWHI has been passed down in oral and written histories, genealogies, songs, dance, and archaeological resources. Through these cultural resources of knowledge, Native Hawaiians have been able to recount the travels of seafaring ancestors between the NWHI and the main Hawaiian Islands. Hawaiian language archival resources have also played an important role in providing key documentation; a large body of information was published in local newspapers, some of it more than a hundred years ago (e.g., Kaunamano 1862; Manu 1899; Wise 1924).

More recent ethnological studies (Maly 2003) support the continuity of Native Hawaiian traditional practices and histories in the NWHI, and it is important to note that only a fraction of these have been recorded—many more exist in the memories and life histories of kūpuna. Nevertheless, the relationship of Native Hawaiians to the NWHI is marked by some irregularity, notably on the arrival of Europeans to the Hawaiian Archipelago in the late 18th century. At the point of contact between the West and Hawai‘i, Native Hawaiians were thriving in the islands, with a population estimated between 300,000 and one million. (For discussion on pre-contact Native Hawaiian population, see Stannard 1989.) However, foreign diseases introduced into Hawai‘i over the next century would cause the Native Hawaiian population to fall into a steep decline. Thus, the sacred path traveled to the islands northwest of Kaua‘i saw few Native Hawaiians for a period of time, and this trend lasted through the early 19th century.

A renewed interest in the NWHI grew as successive Hawaiian monarchs focused on reuniting the entire Hawaiian Archipelago by formally incorporating the NWHI into the territory of the Kingdom of Hawai‘i. Throughout the 1800s, title to the islands and waters of the region was vested in the Kingdom of Hawai‘i (Mackenzie and Kaiama 2003). This title came to pass because of the actions of Hawaiian monarchs, which included the following highlights:

- In 1822, Queen Ka‘ahumanu organized and participated in an expedition to locate and claim Nihoa under the Kamehameha Monarchy.
- Nihoa was reaffirmed as part of the existing territory of Hawai‘i in 1856 by authority of Alexander Liholiho, Kamehameha IV (March 16, 1856, Circular of the Kingdom of Hawai‘i).
- King Kamehameha IV made a round trip voyage between Honolulu and Nihoa in 1857 and instructed Captain John Paty of the *Manuokawai* to annex any lands discovered during further exploration of the region. In 1857, the islands of Laysan and Lisianski were declared new lands to be included into the domain of the Kingdom (Kingdom of Hawai‘i 1857).
- Lydia Lili‘uokalani, prior to becoming queen, visited Nihoa with a 200-person party aboard the *Iwalani*.
- King David Kalākaua annexed Kure Atoll (Ocean Island) and announced formal possession of the island in 1886, through Special Commissioner Colonel James Harbottel (Harbottel-Boyd 1886).

In 1893, Queen Lydia Lili‘uokalani was overthrown by the self-proclaimed Provisional Government of Hawai‘i, with the assistance of U.S. Minister John L. Stevens. Five years later, in 1898, the archipelago, inclusive of the NWHI, was collectively acquired by the United States through a domestic resolution, called the “New Lands Resolution.”

The ea (sovereignty and life), as well as the kuleana (responsibility), for the entire Hawaiian Archipelago continues to exist in the hearts and minds of many present-day Native Hawaiians—a perspective recognized in law by the Apology Resolution (U.S. Public Law 103-150), which is a joint resolution of Congress signed by President Clinton in 1993. The Apology Resolution states, in part, that “The Congress...apologizes to Native Hawaiians on behalf of the people of the United States for the overthrow of the Kingdom of Hawaii on January 17, 1893 with the participation of agents and citizens of the United States, and the deprivation of the rights of Native Hawaiians to self determination;...” It also recognizes that “the health and well-being of the Native Hawaiian people is intrinsically tied to their deep feelings and attachment to the land.”

The stage was set for a reawakened relationship between Native Hawaiians and the NWHI in 2000, when President Clinton signed the Executive Orders creating the NWHI Coral Reef Ecosystem Reserve. With new channels of access possible, the cultural protocol group, Nā Kupu‘eu Paemoku, traveled to Nihoa on the traditional double-hulled voyaging canoe *Hōkūle‘a* in 2003 to conduct traditional ceremonies. The following year, in 2004, *Hōkūle‘a* sailed more than 1,200 miles (1,931 kilometers) to the most distant end of the island chain, visiting Kure Atoll as part of a statewide educational initiative called “Navigating Change.” Concurrently, officials of the Polynesian Voyaging Society saw that the ancient sailing route between Kaua‘i and Nihoa was an appropriate training course for the next generation of Native Hawaiians interested in reestablishing the traditional system of wayfinding practiced by their ancestors. In 2005, Nā Kupu‘eu Paemoku again sailed to the NWHI, this time to Mokumanamana, where they conducted protocol ceremonies on the Summer Solstice—the longest day of the year, June 21. On June 21, 2007, as a follow-up to the 2005 access, the Edith Kanaka‘ole Foundation ventured to Nihoa and Mokumanamana to conduct its own cultural research initiatives and to better understand the relationship between the wahi kūpuna (ancestral places) and the northern pathway-of-the-sun.

Native Hawaiians’ longstanding and deeply spiritual relationship with the NWHI over millennia reaffirms the importance of positioning the Hawaiian culture as the lens through which the significance of the region, as well as the Hawaiian Archipelago as a whole, is viewed.

### **Native Hawaiian Cultural Resources**

Most family genealogies of Native Hawaiians begin with the Kumulipo, or creation chant (Malo 1951). The Kumulipo depicts the history of creation, beginning with the simplest of organisms and gradually reaching higher levels of complexity in the natural world, eventually completing the cycle of life with humans. As with most oral traditions, different families had variations of the creation chant, and different stories evolved as the chant moved closer to the evolution and naming of humans. It is through the perpetuation of chants like the Kumulipo—and other ancient traditions, practices, and protocols—that Native Hawaiians have passed on their spiritual

belief that the people are deeply related to the natural environment, and in fact, all of the natural resources are also cultural resources.

Physical remnants of wahi kūpuna (ancestral places), Hawaiian language archival and oral resources, and historical accounts provide evidence of the various past uses of the NWHI and the surrounding ocean by Native Hawaiians (Kaunamano 1862, in Hoku a ka Pakipika; Manu 1899, in Ka Loea Kalaiaina; Wise 1924, in Nupepa Kuokoa). Evidence indicates that the area served as a home and a place of worship for centuries. It is posited that the first Native Hawaiians to inhabit the archipelago frequented Nihoa and Mokumanamana for at least a 500- to 700-year period (Emory 1928; Cleghorn 1988; Irwin 1992). They brought many of the skills necessary to survive with them from their voyaging journeys throughout Polynesia. Over time, they developed complex resource management systems and additional specialized skill sets to survive on these remote islands with limited resources (Cleghorn 1988).

The impressions left by ancient Hawaiians can be seen through the distinctive archaeology of Nihoa and Mokumanamana. The ceremonial terraces and platform foundations with upright stones found on both Nihoa and Mokumanamana are not only amazing examples of unique traditional Hawaiian architectural forms of stone masonry work, but they also show similarities to samples from inland Tahiti (Emory 1928). The structures are some of the best preserved early temple designs in Hawai‘i and have played a critical role in understanding Hawai‘i’s strong cultural affiliation with the rest of Polynesia, and the significant role of Native Hawaiians in the migratory history and human colonization of the Pacific (Cleghorn 1988).

It is believed that Mokumanamana played a central role in Hawaiian ceremonial rites and practices a thousand years ago because it is directly in line (23° 34.5’ N latitude) with the rising and setting of the equinoctial sun along the Tropic of Cancer. In Hawaiian, this path is called “ke ala polohiwa a Kāne,” or the “way of the dark clouds of Kāne,” which has been translated to mean death or the westward pathway of the ancestral spirits. Because Mokumanamana sits on the northernmost limit of the path the sun makes throughout the year, it sits centrally on an axis between two spatial and cultural dimensions: pō (darkness, creation, and afterlife) and ao (light, existence). On the summer solstice (the longest day of the year), the sun travels slowest across the sky on this northern passage, going directly over Mokumanamana. The island has the highest concentration of ceremonial sites anywhere in the Hawaiian archipelago. All of these sites are strategically placed and act as physical reminders of the important spiritual role these sites play in Hawaiian culture. The sites and structures are channels for the creation of new life, and facilitate Native Hawaiians’ return to source after death (Liller 2000).

Nihoa and Mokumanamana are listed on the National Register of Historic Places, and there are more than 140 documented archaeological sites on these two islands. Though they are quite barren and seemingly inhospitable to humans, the number of cultural sites is testimony to the pre-Western-contact occupation and use of these islands. On Nihoa, a total of 89 archaeological sites are known, including residential features, agricultural terraces, ceremonial structures, shelters, cairns, and burials. This island also has significant soil development for agriculture along with constructed terraces, which suggest investment in agricultural food production. On Mokumanamana, a total of 52 archaeological sites have been documented, including 33

ceremonial features, which makes it the highest concentration of religious sites found anywhere in the Hawaiian archipelago.

While Nihoa and Mokumanamana are thought to have been frequented until about 700 years ago, voyages to these islands and others in Papahānaumokuākea for the gathering of turtles, fish, bird feathers, and eggs continued into the 20<sup>th</sup> century, particularly from Kaua‘i and Ni‘ihau (Tava and Keale 1989; Maly 2003). Cultural practices like these continue to remind and teach Native Hawaiians of the connections and relationships their ancestors have passed down from generation to generation.

### Maritime Heritage Resources

*“I had just put my hand upon my coat when the ship struck with a fearful crash...I sprang upon deck... to find ourselves surrounded with breakers apparently mountain high, and our ship careening over upon her broadside...”*

—Thomas Nickerson, on the loss of the ship *Two Brothers* at French Frigates Shoals, 1823 (Nantucket Historical Association MS 106 folder 3.5)

The Monument enjoys a rich maritime history, with ocean vessels from around the world having traveled into the NWHI—although not all that came in made it back out.

Long before Western ships sighted the NWHI, Native Hawaiians and other Polynesians journeyed in large double-hulled canoes to these resource-rich islands and atolls as they explored the vast Pacific Ocean without aid of western instrumentation. Guided by the stars, currents, and weather patterns, Native Hawaiians set the stage for the intrepid ships and crews who would enter the waters of the NWHI beginning in the early part of the 19th century. It is believed that Native Hawaiians frequently sailed along the ancient voyaging routes that connect Kaua‘i to the settlements on Nihoa and Mokumanamana.

In addition to the rich Native Hawaiian cultural setting, maritime activities following Western contact with the Hawaiian Islands have left behind the historical and archaeological traces of a unique past. Currently, more than 60 ship losses are known among the NWHI, the earliest loss dating back to 1818. These, combined with 67 known aircraft crashes, amount to more than 120 potential maritime and military heritage resources. Many of these resources reflect the distinct phases of historical activities in the remote atolls (Van Tilberg 2002).

As American and British whalers first made passage from Hawai‘i to the seas near Japan in 1820, they encountered the low and uncharted atolls of the NWHI. Some of these early voyages gave rise to the Western names of the islands and atolls as we know them today. Pearl and Hermes Atoll is named for the twin wrecks of the British whalers *Pearl* and *Hermes*, lost in 1822. Midway was originally sighted by Captain Daggett of the New Bedford whaler *Oscar* in 1839. Laysan was reportedly discovered by the

Anchor from an unidentified 19th century whaling ship at Kure Atoll. Photo courtesy of James Watt.

American whaleship *Lyra* prior to 1828. Gardner Pinnacles was named by Captain Allen on the Nantucket whaler *Maro* in 1820, the same year the ship encountered, and gave its name to, Maro Reef.

The history of American whaling is a significant part of our national maritime heritage and is a topic that encompasses historic voyages and seafaring traditions set on a global stage, as these voyages had political, economic, and cultural impacts. The United States was intimately involved in the whaling industry in important and complex ways. Ten whaling shipwrecks are known in the NWHI. Five of these have been located (the American whaler *Parker*, the British whalers *Pearl*, *Hermes*, and the *Gledstanes*, as well as an unidentified whaler at French Frigate Shoals), and their archaeological assessment is under way (Van Tilberg and Gleason, in prep). Whaling vessel wreck sites from the early 19th century are quite rare, and the study and preservation of heritage resources provide a unique glimpse into our maritime past.

Despite being slowly integrated into navigational charts, the NWHI remained an area of low and inconspicuous reefs and atolls for many years, frequented by shipwrecks and castaways. Crews were often stranded for many months while they constructed smaller vessels from salvaged timbers and set out for rescue. Some vessels were lost with all hands. Russian and French ships of discovery transited the NWHI, and sometimes found themselves upon the sharp coral reefs. Nineteenth-century Japanese junks of the Tokugawa Shogunate period, drifting away from their home islands and into the Pacific, were reportedly washed onto the sands of the atolls. Hawaiian schooners and local fishing sampans voyaged into the archipelago, many not to return. Marine salvage expeditions based out of the main Hawaiian Islands profited from the area, although existing records of their cruising activities are scarce. These types of sites have the potential to tell us about early-historic-period voyages in the Pacific and about the seafaring traditions of many cultures.

The strategic geographical location of the NWHI proved early on to be a valuable “commodity.” The opening of China and Japan to commerce in the mid-19<sup>th</sup> century and the transition to steam propulsion brought with it the need for Pacific coaling stations. In August 1869, Captain William Reynolds of the USS *Lackawanna* took formal possession of Midway Atoll for the United States. Soon after, the USS *Saginaw*, a Civil-War-era side-wheel gunboat, was assigned to support improvement efforts at Midway. However, work to open a channel into the lagoon remained incomplete, and the *Saginaw*, on a return voyage from Midway with the contracting party, wrecked on the reef at nearby Kure Atoll on October 29, 1870. The wreck site was discovered in 2003, allowing research into the early technology of the “Old Steam Navy” (Van Tilberg 2003a).

From this inauspicious beginning, the strategic location of Midway and the NWHI continued to grow in importance for commercial and military planners. The Spanish-American War in 1898 led to the American colonization of Guam and the Philippines, as well as annexation of the Hawaiian Islands. This greatly expanded American colonial presence made transpacific communication a priority. By 1903, the first transpacific cable and station were in operation, and employees of the Commercial Pacific Cable Company settled at Midway. In the 1930s, Pan American Airways’ “flying clippers” (seaplanes) were crossing the ocean, arriving at Midway from Honolulu on their 5-day transpacific passages (Cohen 1985). In 1939, the U.S. Navy

expanded its interest in Midway, and millions of dollars were awarded to the Pacific Naval Air Base Consortium. Construction of the naval air facility at Midway was begun the following year.

Naval activities increased during World War II. French Frigate Shoals was the temporary staging site for Japanese seaplanes, as well as a U.S. naval air facility at a later time. The Navy built an important submarine advance base at Midway Atoll, dredging the reef to form a channel and harbor for submarine refit and repair. The wreck of the USS *Macaw*, a Navy submarine salvage vessel lost in 1944 during the rescue of the submarine *Flier*, testifies to the dangerous nature of Pacific operations at Midway (Van Tilberg 2003a; Van Tilberg 2003b). Eastern Island at Midway possessed the main airfield in the early days of the war, while submarine and seaplane support operations were concentrated on Sand Island. Together, these areas constituted a vital center for undersea, surface fleet, and naval aviation operations. In fact, the Hawaiian Sea Frontier forces stationed patrol vessels at most of the islands and atolls. Tern Island, in French Frigate Shoals, was expanded after the Battle of Midway through dredging to create a naval air facility for staging aircraft from the main Hawaiian Islands and to provide faster resupply of Midway.

In June 1942, the Battle of Midway took place in seas north of Midway Atoll. Four Japanese aircraft carriers and one American carrier were sunk, and the Japanese military was forced to withdraw from a planned invasion. Although most of the battle took place 100 to 200 miles to the north, an intense air fight was waged directly over and around the atoll. Training exercises before and after the battle also took their toll. At least 30 naval aircraft, both American and Japanese, crashed or were ditched into the nearshore waters of Midway and Kure Atolls, many of them combat losses for both American and Japanese navies. Many of these crash sites are war graves. This battle proved to be the most decisive U.S. victory and was the turning point of World War II in the Pacific (Prange 1982).

All of these maritime activities have left a scattered material legacy around and on the islands: whaling ships, Japanese junks, Navy steamers, Hawaiian fishing sampans, Pacific colliers, salvage vessels, and Navy aircraft (Rauzon 2001). Many of these sites, as defined by state and federal preservation laws (the National Historic Preservation Act, the Archaeological Resources Protection Act, and the Abandoned Shipwreck Act), are of national and international historical significance. Programmatic mandates have been established to ensure their preservation and protection. NOAA's Maritime Heritage Program focuses on the discovery and investigation of these heritage resources for the benefit of present and future generations. These sites are the physical record of past activities in the NWHI and embody unique aspects of island and Pacific maritime history.

### **Heritage Resources of Midway Atoll**

*"They had no right to win. Yet they did, and in doing so they changed the course of a war...Even against the greatest of odds, there is something in the human spirit – a magic blend of skill, faith and valor – that can lift men from certain defeat to incredible victory."*

—Walter Lord

Designated as a National Memorial, Midway Atoll preserves the physical remains of the rich historic past in the Monument. With its defensive structures and military architecture, both residential and industrial, the atoll serves as a memorial to the pivotal Battle of Midway. While its role in that battle has earned Midway a prominent place in history, it was the atoll's strategic location that first drew the attention of the world nearly 100 years earlier. Called the "Middlebrook Islands" by Captain N.C. Brooks when he landed there in 1859 (Helber Hastert & Fee 1995; *Paradise of the Pacific* 1936), Midway's location soon proved attractive to transpacific commercial traders, triggering a century of development and manipulation of the landscape to meet the needs of commerce and the military, as well as occasional shipwreck survivors.

Physical improvements started almost immediately after the United States took possession in 1869, with a Congressional appropriation for development of the Sand Island entrance channel. Though the crew of the USS *Saginaw* worked on the channel during their 6½-month stay, the project stalled when the underlying solid limestone reef was encountered and the estimated costs to complete it proved prohibitive.

Interest in the atoll waned for a period, with its only sporadic inhabitants being the survivors of two notable shipwrecks that occurred in the late 1880s. The *General Seigel*, a schooner on a shark-hunting expedition with a crew of eight, wrecked in November 1886. Three crewmen died and one, Adolfe Jorgenson, was marooned by the remaining four members when they sailed from Midway on June 28, 1887. Seven months later, on February 3, 1888, the *Wandering Minstrel* was wrecked on the coral reef during a similar quest for sharks. The crew of 40, which included Captain F.D. Walker and his wife and sons, were surprised to find Adolfe Jorgensen still alive on Sand Island. After spending 14 months stranded on Midway, the Walker family and remaining crew were finally rescued in April 1889. Though none of the structures from this era remains, the stories of the survivors, including tales of murders, mutiny, escapes, buried treasure, and rescue, inspired Robert Louis Stevenson's novel "The Wrecker."

Interest in Midway was renewed in 1903, when the Commercial Pacific Cable Company chose Sand Island for a relay station on its route across the Pacific from San Francisco to the Far East. Armed with plans drafted by San Francisco architect Henry Meyers, Superintendent Ben W. Colley arrived in April 1903 with a staff and several carpenters to construct the station. The innovative reinforced concrete and steel buildings were plumbed and wired for electricity supplied by an acetylene generator. The graceful, two-story design offered shaded verandahs, a library, and billiard room along with kitchens and bedrooms. An ice-making plant, cold storage house, and windmills were also constructed. Superintendent Colley adapted the stark landscape to meet the needs of the cable company by importing soil from Honolulu to make a garden for growing fresh vegetables and by planting vegetation such as naupaka (*Scaevola*), grasses, ironwood trees, and coconuts to control the white sand that drifted everywhere (Colley n.d.). The first round-the-world telegram was issued by President Theodore Roosevelt on July 4, 1903. The remains of the cable station and its landscape can still be observed on the atoll.

In 1935, Pan American Airways began constructing a refueling base at Midway, which consisted of a wooden dock and a mooring barge in the lagoon where the seaplanes landed and discharged cargo and passengers (Yoklavich 1993). The facilities included a prefabricated hotel with a

solar-heated hot water system, lounge, dining room, and 40 guest rooms, as well as tennis courts, baseball fields, and even a sandy nine-hole golf course that required the use of black golf balls. None of these structures survives today, though historical photographs and film footage remain to tell the story.

Military interest in Midway accelerated as World War II started in Europe and war in the Pacific appeared inevitable. The strategic importance of an air base at Midway was considered second only to Pearl Harbor (Yoklavich 1993), and construction of the Naval Air Base was authorized in 1939. Architect Albert Kahn of Detroit, Michigan, one of the country's foremost industrial designers, prepared plans for the buildings in 1940 (Woodbury 1946:76 in Yoklavich 1993:24). Development of the military station changed the civilian character of Midway, creating a base landscape that replaced the individual units or "towns" that had defined the cable station and Pan American Airways' presence. The new base design clearly demonstrated the Navy's authority by placing the officer's housing in the center of Sand Island and developing a road system that linked the military's buildings. The architectural style of the buildings enhanced the perception of military control because of its uniform, simple, and efficient design.

On December 7, 1941, two Japanese destroyers shelled Sand Island for almost 2 hours (Hazelwood n.d., in Yoklavich 1993:26). Marine guns returned fire, but the Japanese ships caused extensive damage to several buildings, including the seaplane hangar and power plant. First Lieutenant George H. Cannon was fatally wounded in the shelling and posthumously became the first Marine to receive the Medal of Honor in World War II (Heinl 1948:13, in Yoklavich 1993:26).

The capture of Wake Island and Guam by the Japanese, along with their aggressive offensive operation in the Pacific, caused military strategists to look more closely at Midway as the key to retaining any hope of U.S. success in the Pacific Theater. If Midway fell, it would be a short hop from there to Honolulu and other West Coast cities.

The historical events of the Battle of Midway have been explored in great detail in numerous reports, books, and articles, so only a brief synopsis is included here. In spring 1942, Midway Atoll was thought to be the target of an imminent Japanese attack. To learn their plans, Fleet Admiral Chester William Nimitz sent a command over the secure cable for Midway to broadcast a false distress message. The intelligence trap proved successful when a Japanese message was decoded two days later stating that the target "AF was having trouble with its fresh water distillation system" (Cressman et al. 1990). With the Japanese target clearly identified, Admiral Nimitz focused on planning for the impending battle.

Nimitz inspected the islands on May 2, 1942, to spur every effort to fortify the island with men and equipment. Nearly every inch of Sand and Eastern islands was covered with men and equipment. While most of the new equipment was sent to the European Theater, Nimitz tried to find resources for Midway sufficient to repel a Japanese landing. Several groups of Marine and Navy air detachments as well as Navy PT (patrol torpedo) boats were sent to the atoll to support existing forces.

PBY (patrol bomber-Y) Catalina seaplanes, the famous “flying boats” of World War II, were housed in the seaplane hangar and used the seaplane ramp in Sand Island harbor to make regular patrols. On the morning of June 4, 1942, a Navy PBY pilot radioed a contact report of “the main body” at approximately 700 miles away, headed northeast (Cressman et al. 1990). Though the pilot had actually seen part of the occupation force rather than the attacking force, the report immediately put the U.S. forces on alert.

All aircraft were already prepared to launch when the radar on Sand Island began picking up the incoming enemy flight at about 0630. As 108 Japanese planes zoomed toward Midway, 25 defending U.S. Marine fighters tried valiantly to slow their progress. Eastern Island’s airfield was eerily quiet for the few minutes prior to attack, with all but a few airplanes safely launched. Meanwhile, torpedo bombers flew to attack the enemy aircraft carriers. The Japanese military strategy was simple—destroy the air base at Midway and clear the way for occupation.

The attack lasted only 17 minutes, but left the installations on both Sand and Eastern Islands in shambles. The seaplane hangar was hit and set ablaze. The fuel oil tanks 500 yards north of the seaplane hangar were also hit, sending a thick black column of smoke that could be seen for miles. The men on Midway were unable to effectively return fire on such advanced aircraft, which could drop bombs well out of reach of the anti-aircraft guns.

Meanwhile, an epic air battle was unfolding at sea. Against all odds and despite devastating losses of aircraft and pilots as well as the sinking of the USS *Yorktown*, the U.S. forces dealt a fatal blow to the Imperial Japanese Navy. Japanese naval commander Admiral Yamamoto had lost his entire fast carrier group, with its complement of some 250 planes, most of the pilots, and about 2,200 officers and men. On the morning of June 5, he gave the surprising order for a general retirement of his fleet, even though he still maintained overwhelming gunfire and torpedo superiority. In all its long history, the Japanese Navy had never known defeat (Morison 1963). This was America’s greatest victory in the Pacific Theater and changed the course of history.

Midway as a military base was closed after World War II, was reactivated during the Korean War, closed again, and was reactivated in 1953. Crucial to the new radar technology tracking system during the Cold War, Midway served as a primary base for the “Pacific Barrier” operation, providing a radar line from Midway Atoll to Adak Island, some 1,300 miles to the north (NAS Barbers Point 1962). Continuous coverage for each 14-hour run necessitated a staggered flight schedule, with the radar planes, called “Willy Victors,” leaving Midway every four hours (Sheen pers. com. 1998).

During the Vietnam War, Midway was selected as the site for the June 8, 1969, meeting of President Thieu of the Republic of Vietnam and U.S. President Richard Nixon. President Thieu, fearful of riots if he came to the United States, asked for a remote and safe location for a meeting. The base commander’s home (Building 414) at Midway was the site of this momentous meeting (Denfeld, in Yoklavich et al. 1994).

Since its designation in 2000, FWS has managed Midway Atoll as the National Memorial to the Battle of Midway, ensuring that those who fought and died in that battle will always be

remembered for their sacrifice. Among Midway's 63 existing National Register-eligible historic properties are six defensive structures related to the Battle of Midway that were listed together as a National Historic Landmark in 1986. These structures, together with the cable station buildings, the Albert Kahn-designed naval base, and war memorials, provide a tangible link to the past and the historic events that have transpired on this small speck of land in the middle of the Pacific.

## **1.4 Environmental and Anthropogenic Stressors**

Despite their remote location and largely uninhabited condition, the NWHI are subject to a wide range of environmental and anthropogenic stressors. Marine pollution, dredging, invasive species, fishing, climate change, and vessel groundings are some of the factors that have affected or may cause harm to the resources of the NWHI. An understanding of past and present stressors and potential future threats provides a backdrop for identifying priority management needs and informing an ecosystem-based management approach. In recent years, increased efforts have focused on documenting terrestrial and coral reef ecosystem health and the effects of priority environmental and anthropogenic stressors. Future research and monitoring efforts will focus on investigating the direct and indirect effects of climate change, such as increases in water temperature, acidification, productivity, sea level rise, changes in precipitation, and other factors on terrestrial and marine habitats and species. Given the Monument's status as a relatively pristine control site for the Hawaiian Archipelago and the greater Pacific, information gained here on the effects of climate change and factors contributing to ecosystem resilience will have management applicability for resource managers worldwide. This section describes the environmental and anthropogenic stressors in the NWHI.

### **Coastal Development**

A century ago, coastal development in the NWHI consisted of guano mining at Laysan Island and the establishment of the Commercial Pacific Cable Company on Midway. Then, in 1938, Congress authorized the Hepburn Board, a fact-finding group in the Navy, to make a strategic study of the need for additional U.S. naval bases. This study resulted in the construction of base facilities, airfields, and seadromes during 1939 and 1940 (Hepburn Board Report 1939, Time 1939). One of these facilities was Midway Naval Air Station. Facility construction included dredging a channel and building a seaplane basin and a turning basin. All of this work was accomplished through the dynamiting of coral heads by "skindivers" and by draglines and dredges mounted on land and barges. Approximately 3 million cubic yards (2.29 million cubic meters) of coral and material was removed. An estimated 2,800 feet (853 meters) of sheetpiling bulkhead was installed on Sand Island. Dredged material was pumped behind this bulkhead, creating new land for a seaplane parking-mat (U.S. Navy Bureau of Yards and Docks 1947).

After the Battle of Midway, the Navy recognized the need to be able to resupply Midway within hours, not the days or weeks required for ships to travel there. In less than five months, the Navy SeaBees and contractors dredged 660,000 cubic yards (504,600 cubic meters) of coral, enlarging Tern Island (at French Frigate Shoals) threefold to create a refueling stop for aircraft between O'ahu and Midway (U.S. Navy Bureau of Yards and Docks 1947).

The Navy occupied Midway, French Frigate Shoals, and Pearl and Hermes during the first half of the 20<sup>th</sup> century. The U.S. Coast Guard constructed LORAN stations after World War II at Kure and French Frigate Shoals and operated them for several decades (USCG 1994a). Several Cold War operations were conducted at French Frigate Shoals, such as the recently declassified "Corona Project," the first operational space photo reconnaissance satellite system. French Frigate Shoals served as a tracking and recovery station for this project in the early 1960s.

During the Cold War, French Frigate Shoals housed up to 300 personnel at a time in support of the various classified and unclassified missions (Bill Wood pers. com. 2001). An additional 100 people were stationed at French Frigate Shoals to monitor the aboveground nuclear testing at Johnston Atoll. The Midway Naval Air Station supported several hundred to several thousand soldiers and dependents during the pre- to post-World War II era, before the atoll was transferred to FWS in 1996. Various islands of French Frigate Shoals, Midway, Kure, and Pearl and Hermes Atolls were used in military training exercises that included the use of landing craft, helicopters, and boats.

These types of coastal development activities alter current flow, temperature regimes, and shoreline configuration, and as a result, may significantly alter coastal erosion patterns. Reef disturbances due to storm or human activities are believed to create favorable environments for the formation of ciguatera toxin in marine life (Lehane and Lewis 2000, Van Dolah 2000, Ruff 1989, Kaly and Jones 1994). Operation of housing and other facilities on some islands and the creation of dumps contribute to point and nonpoint sources of pollution to the terrestrial and marine environments.

Since the closure of Navy and Coast Guard facilities, coastal development activities have been limited to small-scale conversion of abandoned Coast Guard buildings on Tern Island at French Frigate Shoals and Green Island at Kure to biological field stations. The only recent coastal construction has been the repair of the seawall protecting Tern Island's small runway and buildings, and construction of a small boat ramp at French Frigate Shoals in 2004. This construction was needed to halt the erosion of the island and to eliminate the risk of injury and death to endangered monk seals, threatened green turtles, and migratory seabirds previously trapped in eroding seawall sheet piling that has now been removed from the island.

Current human population levels are limited to a few agency staff and volunteers at French Frigate Shoals, Laysan Island, Lisianski Island, and Pearl and Hermes and Kure atolls. In addition to a small number of agency staff and volunteers at Midway Atoll, approximately 50 contract employees operate the infrastructure required to maintain Henderson Airfield as an emergency landing site for commercial transpacific airliners.

### **Marine Pollution**

Marine pollution can be defined as the introduction by humans, whether directly or indirectly, of substances or energy to the marine environment, resulting in deleterious effects such as hazards to the health of marine life and humans, hindrance of marine activities, and impaired water quality. Marine pollution may originate from land-based or sea-based human activities in the form of point-source discharges, groundwater discharges, or nonpoint-source runoff. Studies conducted by the FWS, Coast Guard, Navy, and the University of Hawai'i have documented contamination in soil, sediment, and biota at French Frigate Shoals, Kure, and Midway. Direct impacts to black-footed albatrosses, in the form of reduced hatching success, have been linked to high organochlorine levels (Ludwig et al. 1997). Finkelstein et al. (2007) found a correlation between levels of organochlorines and elevated levels of mercury and impaired immune function in black-footed albatrosses.

Marine debris, such as derelict fishing gear and discarded plastics, is a global problem. The increase in reliance on plastic materials that float and are persistent in the environment, as well as improper disposal, has led to an abundance of these materials in our oceans. Marine debris degrades the aesthetic value of the coastal environment, creates navigational hazards, and has negative ecological impacts. There are documented cases of maritime disasters resulting in loss of human life because of vessel entanglement with marine debris (Cho 2004), and loss of marine animals through entanglement and drowning in derelict fishing gear (Henderson 1990, 2001). In addition, hazardous waste has washed ashore; for example, at Laysan Island a diverse complement of hazardous materials has been found, including compressed gas cylinders, phosphorus flakes, petroleum, and a 55-gallon drum marked “Toluene Diisocyanate.” A container of the pesticide carbofuran is suspected to have washed ashore at Laysan Island, and the area dubbed “The Dead Zone” remained a hazard on the island from 1987 until it was remediated by FWS in 2002.

Impacts of marine debris on the ecological health of the NWHI have not been fully documented due to the large size and remoteness of the region, as well as the historical and ongoing nature of the problem. It is known that fishing and cargo nets lost at sea are carried by currents to shallow water environments of the NWHI, causing physical damage to corals and creating entanglement hazards for monk seals, sea turtles, and other marine organisms. Mortality caused by entanglement in derelict fishing gear, primarily nets, has been documented for several mobile marine species in the NWHI, with impact on the Hawaiian monk seal being of greatest concern because of the endangered status of this animal (Boland and Donohue 2003). Mean annual entanglement rates for monk seals are in a range that is higher than that shown to be detrimental to other pinniped populations, and documentation of entanglements is available only for those seals that return to shore; thus, it is highly probable that the actual impact is underestimated. From 1982 and 2003, 238 Hawaiian monk seal entanglements were documented in the NWHI, of which 162 were disentangled and freed, 61 escaped or had freed themselves, 8 were found dead, and 7 met an unknown fate (Henderson 2006 pers. com.). Other threatened or endangered marine animals, such as sea turtles, have been found entangled in marine debris, and often the only evidence of their drowning is the remains of their bones or shells still caught in the debris. In 2004, the skeleton of a subadult loggerhead sea turtle and the carcass of a small whale were found in a large floating net (NMFS 2004b).

Derelict fishing gear also degrades reef health by abrading, smothering, and dislodging corals and other benthic organisms, as well as by preventing recruitment on reef surfaces (Donohue and Brainard 2001). Estimates of the overall impact of debris on shallow water habitats are difficult to quantify and are complicated by the likelihood that debris acts as a vector for alien species and introduction and spread of disease.

In the NWHI, much of the marine debris is in the form of derelict fishing nets, mostly trawl nets, from North Pacific fisheries. No trawl net fisheries are active in Hawaiian waters, but active domestic and international fisheries use this type of gear in Pacific Rim fisheries. Other types of debris include gill nets, seine nets, lobster traps, fishing floats, Fish Aggregation Devices (FADs), hazardous materials (e.g., barrels, gas cylinders), and plastics. Because much of the debris comes from international fisheries, U.S. activities aimed at prevention are complicated. Debris produced from illegal activities, such as the unauthorized deployment of FADs, unlicensed fishing

throughout the Pacific, or dumping of debris at sea, makes the problem even more complex and harder to quantify.

Since 1996, regular marine debris removal efforts have been conducted through a multi-agency effort led by NOAA, in collaboration with FWS, the State of Hawai‘i, City and County of Honolulu, Honolulu Waste Disposal, U.S. Coast Guard, U.S. Navy, University of Hawai‘i Sea Grant College Fund, Schnitzer Steel Hawai‘i Corporation (formerly Hawai‘i Metals Recycling Company), The Ocean Conservancy, and other local agencies, businesses, and nongovernmental partners. Since then, this effort has resulted in the removal of more than 563 tons (502 metric tons) of derelict fishing gear and other marine debris from the coral reef ecosystems of the NWHI (Figure 1.24). Marine debris survey and collection activities have been conducted at Kure Atoll, Midway Atoll, Pearl and Hermes Atoll, Lisianski Island, Laysan Island, and French Frigate Shoals. Removal operations have targeted areas where marine debris has accumulated over the past several decades. It is estimated that the accumulation rate is 57 tons (52 metric tons) per year. Until substantial efforts are made to significantly reduce the sources of debris and until debris can be effectively removed at sea, similar amounts are expected to continue accumulating indefinitely in the reef ecosystems of the NWHI.

Smaller types of marine debris made of plastic, such as disposable lighters, bottle caps, and other fragments, are ingested at sea by adult albatrosses, wedge-tailed shearwaters, and other seabirds when they feed at sea (Fry et al. 1987). These objects are subsequently fed to chicks in Monument colonies. It has been estimated that approximately five tons of plastic are fed to albatross chicks at Midway Atoll each year (Klavitter 2005). The foreign objects may reduce their survival by causing direct injury to the gut, accumulating and reducing the chicks’ ability to swallow full-sized meals, and placing them at greater risk of dehydration, a common cause of death in young albatrosses (Sileo et al. 1990; Sievert et al. 1993; Fry et al. 1987; Auman et al. 1997). Additionally, this debris may increase the birds’ exposure to and ingestion of organochlorine contaminants from plastic surfaces (Carpenter and Smith 1972).

## Terrestrial Pollution

Past uses have left a legacy of modification and contamination throughout NWHI, especially at French Frigate Shoals, Midway Atoll, and Kure Atoll. The NWHI have hosted an array of polluting human activities, including guano mining, fishing camps, Coast Guard LORAN stations, U.S. Navy airfields and bases, and various military missions. Contamination at all these sites includes offshore and onshore contaminated debris such as batteries (lead and mercury), transformers with polychlorinated biphenyls (PCBs), capacitors, and barrels. Debris washing ashore is another source of contamination on the islands. Birds, such as shorebirds, may ingest soil while foraging. Studies have shown that soil can constitute up to 30 percent of the material a bird consumes (Hui and Beyer 1998, Beyer et al. 1994). If the consumed soil is contaminated, it can result in direct intake of toxic substances by foraging birds. Direct ingestion of sand contaminated by carbofuran, a pesticide that washed ashore with marine debris on Laysan Island, caused the deaths of endangered Laysan finches until the source was identified and removed by the FWS (Campbell et al. 2004; David et al. 2001).

Uncharacterized, unlined landfills remain on some of these islands. Kure Atoll and French Frigate Shoals both have point sources of PCBs from former LORAN stations. While the Coast Guard has mounted cleanup actions at both sites, elevated levels of contamination remain in island soils, nearshore sediment, and biota.

During Coast Guard residency at Tern Island (French Frigate Shoals), an area on the north side of the island across from the barracks was used as a general dump and for burning garbage and trash. Waves, rust, and erosion slowly destroyed the northern seawall, and it was breached in late 1980, exposing the dump. Further erosion revealed a great deal of scrap metal, cable, wire, batteries, and electronic equipment such as capacitors and transformers. Coast Guard investigations removed exposed debris over the course of several years. PCB concentrations in the soil ranged from nondetect (<0.033) to 2,300 milligrams/kilogram. In an agreement forged by the Coast Guard and signed by the FWS, EPA, and Coast Guard, a cleanup level for soil was set at two milligrams/kilogram. In 2001, the Coast Guard excavated the landfill (U.S. Coast Guard 2002). Despite the removal of a large amount of material, the Coast Guard left intact an area of approximately 95 by 60 feet (29 by 18.3 meters) that is a jumble of concrete blocks and metal debris from which numerous capacitors, batteries, and transformers have been removed over the years. PCB concentrations in ten soil samples collected from this debris pile ranged from 0.14 to 54 milligrams/kilogram PCBs, with results for five of the ten samples exceeding the cleanup level of two milligrams/kilogram (U.S. Coast Guard 2003). The most highly contaminated sample (54 milligrams/kilogram PCB) is considered hazardous waste. Unfortunately, this area is open to the lagoon, so it is washed by tides and storms. It is also frequented by monk seals and turtles.

During Coast Guard residency at Kure, garbage and scrap metal were disposed of and burned at a dump site located at the southwestern edge of the island. Included in the pit were hazardous materials such as batteries and PCB-containing capacitors. The Coast Guard reported PCBs in the eroding dump to range from nondetect to 393 milligrams/kilogram (U.S. Coast Guard 1994b). In 1994, the Coast Guard remediated the landfill on Kure, excavating and putting into containers soil from the landfill that exhibited a concentration equal to or greater than 25 milligrams/kilogram. A total of 36 cubic yards (27.5 cubic meters) of soil was removed from

the landfill. Scrap metal, cable, nonliquid-containing drums, and remaining soil in the landfill (metal debris and soils with PCB concentrations below 25 milligrams/kilogram) were removed from the landfill and re-interred in the “reburial pit.” The depth of the reburial pit was set 15 feet below ground surface, which was estimated to be two feet above the groundwater (U.S. Coast Guard 1994b). Confirmation sampling by the Coast Guard found concentrations of PCBs exceeding the cleanup goal and in excess of 100 milligrams/kilogram.

French Frigate Shoals and Pearl and Hermes Atoll were used for World War II seaplane refueling operations. Leaking underground fuel storage tanks at French Frigate Shoals resulted in petroleum contamination of soil.

Midway Atoll was the site of a U.S. Navy airfield. Before control of the atoll was transferred to the DOI in 1996, numerous contaminated sites throughout the atoll were identified and cleaned up under the U.S. Department of Defense’s (DOD) Base Realignment and Closure (BRAC) process. Contamination identified and remediated included petroleum in the groundwater and nearshore waters; pesticides (e.g., DDT) in the soil; PCBs in soil, groundwater, and nearshore sediments and biota; metals, such as lead and arsenic, in soil and nearshore waters; and unlined, uncharacterized landfills. While most of the known areas were remediated, several areas warrant continued monitoring for potential releases. Since the airfield’s closure, the Navy has returned on several occasions to conduct further remediation.

Midway has several landfills left behind by the Navy. Some of these landfills were created during base closure for the disposal of construction rubble and asbestos. Other landfills were created during Navy occupancy for disposal of materials associated with operations. One area that needs continued monitoring and potentially further remediation is known as the Old Bulky Waste Landfill. This site is an uncharacterized landfill that was created by the disposal of scrap metal, used equipment, and unconsolidated waste off the south shore of Sand Island to create a

Erosion of the Bulky Waste Landfill on Sand Island, Midway Atoll.

peninsula approximately 1,200 feet long by 450 feet (average) wide by nine feet high (366 meters long by 137 meters wide by 2.7 meters high)(Navy 1995). It is bordered on the three seaward sides by an approximately 10-foot-thick (3-meter-thick) band of concrete and stone rip-rap. Wastes known to have been deposited in the landfill are metals (lead, cadmium, chromium, and nickel), gasoline, battery acid, batteries, mercury, lead-based paint, solvents, waste oil, PCBs, dioxins, furans, transmission and brake fluids, vehicles, equipment, tires, and miscellaneous debris (U.S. Navy 1996). The Old Bulky Waste Landfill is subjected to groundwater infiltration from the north and seawater infiltration from the other three sides.

The Technical Memorandum for Evaluation of Remedial Alternatives (U.S. Navy 1995) stated that all remedial alternatives considered for the Old Bulky Waste Landfill would require groundwater monitoring. Alternatives considered were (1) containment, by constructing a

multilayer cap in place and providing a lateral barrier extending below the lagoon floor along the landfill periphery; (2) removal, by excavating the landfill and disposing of nonhazardous wastes farther inland; (3) covering, by constructing a multilayer cap in place; and (4) no action. Ultimately, the Old Bulky Waste Landfill was covered in approximately 2 to 2.5 feet (0.6 to 0.8 meters) of soil. Currently, the landfill is eroding, and the soil placed on top is sifting into the debris, causing large holes to open up around the edge and in the center of the landfill. Additionally, burrowing birds are bringing up buried soil and nesting below the cover. More than 500 bird burrows have been counted in the landfill.

Pollution generated by past and present human activities, from sea-based and land-based sources, continues to stress the NWHI ecosystem. Emergency response mechanisms and ongoing cleanup and restoration activities will be maintained and enhanced to address these issues. In the case of marine debris, the NWHI is the recipient, not the source, of this type of marine pollution. This provides the Monument with an important opportunity, as well as a challenge, to facilitate global and Pacific regional cooperation to help solve this problem.

### Climate Change

Recent decades have brought increased awareness of the changing global environment and the implications this change may have on ecological processes. The increase in average global temperatures, sea level rise, and change in chemical compositions of the world's oceans are typically cited as the results of global climate change. Changes in the global climate are being brought about by three factors: increasing concentrations of carbon dioxide and other gasses in the atmosphere; alterations in the biogeochemistry of the global nitrogen cycle; and ongoing land use and land cover change. Changes in land use associated with industrialization are causing atmospheric concentrations of carbon dioxide to rise and are considered to be the most important component of global change (Vitousek 1994, Kleypas *et al.* 2006). While there is some debate regarding the extent of the impact these changes will have on Earth's environment, several trends have been well documented. Areas of impact linked to global climate change that may have the greatest potential effect on the Monument are weather changes, coral bleaching, sea level rise inundating important habitat, and oceanic chemical composition change.

According to the findings of the Intergovernmental Panel on Climate Change (IPCC), warming of the climate system is unequivocal, as is now evident from observations of increases in global average air and ocean temperatures, widespread melting of snow and ice, and rising global average sea level. The international scientific consensus of the IPCC is that most of the recent warming observed has been caused by human activities and that it is "very likely" due to increased concentrations in anthropogenic greenhouse gases (IPCC 2007).

Regional predictions for the North Central Pacific Gyre area within the life of the Monument Management Plan are for surface temperature increases of 0.9 to 1.8° F (0.5 to 1.0 °C), which is a smaller increase than that predicted for the Arctic and Northern hemisphere continental areas. Projected precipitation maps indicate a decrease of 10 to 20 percent of average precipitation by 2090 in the Monument area. The past 30 years have seen increases in the frequency of higher intensity storms and it is likely that this trend will continue as sea surface temperatures continues to rise (Emanuel 2005). Extratropical storm tracks will likely move poleward and be associated with changes in wind, precipitation, and temperature patterns. Projection of the magnitude of sea level rise by 2090 from thermal expansion of water and the melting of land-based ice sheets is less certain, but the estimate ranges from 0.6 to 1.9 feet (0.18 to 0.59 meters) (IPCC 2007). A rise of that magnitude (1.6 feet or 0.48 meters) is predicted to cause the loss of 3 to 65 percent of the terrestrial habitat in the Monument (Baker et al. 2006). Evidence also suggests that the world's oceans are regionally divisible with regard to historical fluctuations in sea level. Localized variations in subsidence and emergence of the sea floor and plate-tectonics activity prevent extrapolations in sea level fluctuations and trends between different regions. Thus, it may not be possible to discuss uniform changes in sea level on a global scale, nor the magnitude of greenhouse-gas-forced changes, as these changes may vary regionally (Michener et al. 1997). As an example, tide gauge records on the Atlantic coast indicate a sea level rise of 0.06 to 0.16 inches/year (0.89 to 0.99 centimeters/year) over the past century, whereas they have indicated a 0.35 to 0.39 inches/year (0.15 to 0.4 centimeters/year) increase along the Gulf Coast of the United States (Michener et al. 1997). More recent modeling indicates that melting could occur faster than the IPCC has predicted (Overpeck et al. 2006). Increases in sea level may also affect low-lying equatorial islands and atolls. Shoreline erosion and saltwater intrusion into subsurface freshwater aquifers have been noted throughout the Pacific (Shea et al. 2001).

### ***Weather Changes***

Weather changes, such as reductions in the amount of precipitation and changes in soil moisture and temperature, will affect vegetation communities by changing species compositions, seasonalities, and biomass. These changes in turn may affect the reproductive capabilities of insects and land birds that depend on this vegetation. Increased storm frequency and intensity will have impacts on coral health by direct damage caused by breakage and smothering as sand moves around, and on terrestrial systems through overwashing of islands.

### ***Coral Bleaching***

Many corals live in symbiosis with tiny symbiotic algae that live inside their tissues and provide energy. Bleaching occurs when a coral is stressed by temperature, changes in salinity or turbidity as well as other factors. The coral may then evacuate their symbionts leaving themselves energy-depleted and more susceptible to disease and overgrowth by faster growing turf algae. Above-normal mean sea-surface temperatures have been shown to cause bleaching and mortality in corals, both in nature and in the laboratory, with bleaching generally occurring in shallower waters (Floros et al. 2004). Other variables have also been implicated in bleaching and mortality events, including extended periods of high temperatures, low wind velocity, clear skies, calm seas, low rainfall, high rainfall, salinity changes, high turbidity, or acute pollution. Smith and Buddemeier (1992) state, "Reef damage from anthropogenic environmental degradation (nutrient runoff, siltation, overexploitation) is widespread, represents a much greater threat than climate change in the near future, and can reinforce the negative effects of climate

change.” Floros et al. (2004) goes on to note, “The causes of coral bleaching are debatable, but widely thought to be the result of a variety of stresses, both natural and human-induced, that cause the degeneration and the loss of the colored zooxanthellae from the coral tissues.”

Sea surface temperature anomalies resulting from regional and global-scale climatic phenomenon are believed to cause bleaching in the NWHI. Mass coral bleaching in the NWHI occurred during late summer 2002 (Aeby et al. 2003; Kenyon and Brainard 2006), the first time it was recorded or known to exist in the NWHI. Coral bleaching occurred again at high levels in 2004, but was detected at only low rates in 2006 (Kenyon et al. 2006). Furthermore, the NWHI were believed to be less susceptible to bleaching because of their high latitude location. Bleaching was most severe, however, at the three northernmost atolls (Pearl and Hermes, Midway, and Kure), which experience both higher and lower sea water temperatures than the other reef areas of the NWHI. Bleaching occurred but was less severe at Lisianski Island and farther south in the NWHI.

### ***Oceanic Chemical Concentration Change***

Glacial and interglacial periods in the Earth’s history cycle have been associated, respectively, with low and high concentrations of carbon dioxide, as measured from deep Antarctic ice cores. However, recent increases fall outside the range of peak prehistoric carbon dioxide levels. The rate of increase is also five to ten times more rapid than any of the sustained changes in the ice-core record (Vitousek 1994). Carbon dioxide levels have increased from 280 to 355 microliters per liter ( $\mu\text{L/L}$ ) since 1800, a level of increase otherwise never reported during the past 160,000 years. Data suggest this increase is linked to fossil fuel combustion and not deforestation (Vitousek 1994). Increasing amounts of  $\text{CO}_2$  in the atmosphere have a direct effect on the amount of  $\text{CO}_2$  in the ocean. In a process commonly referred to as ‘ocean acidification,’  $\text{CO}_2$  in the atmosphere reacts with surface waters, resulting in a chain of chemical reactions that serve to increase the acidity of seawater. Anthropogenic release of  $\text{CO}_2$  to the atmosphere has already increased the acidity of the ocean since levels from the year 1750 (Royal Society 2005; IPCC 2007). Calcifying marine organisms, such as reef-building corals, plankton and calcareous algae, among others, require an oversaturation of the form of calcium carbonate called aragonite to remain in solid form. This saturation state is a function of depth and pressure, and as the oceans become more acidic, under saturation with respect to aragonite becomes a distinct threat which could facilitate the dissolution of formed reef structures as well as inhibit the growth and accretion of new structure (Vitousek 1994; Royal Society 2005; Kleypas 2006; Fine and Tchernov 2007; Hoegh-Guldberg 2007). Ocean acidification of deep ocean waters will cause metabolic disruptions for deep-living animals as well (Seibal and Walsh 2001).

The full extent as to how alterations to seawater chemistry may affect the oceans and associated ecosystems is as yet unknown. However, current research suggests that ocean acidification may drastically reduce a coral reef’s ability to overcome the balance of erosion and depositional forces leaving them and their associated ecosystems (including carbonate-based island atolls) susceptible to the additional threats of sea level rise and increased storm activity.

Chemical concentration changes in the atmosphere may also affect terrestrial ecosystems. For instance, the quantity of nitrogen available to organisms affects species composition and productivity. Increase in nitrogen can alter species composition by favoring those plant species

that respond to nitrogen increases (Vitousek 1994). Increased carbon dioxide can also influence photosynthetic rates in plants, change plant species composition, lower nutrient levels, and lower weight gain by herbivores.

**Diseases**

The incidence of diseases affecting marine organisms is increasing globally; however, the factors contributing to disease outbreaks are poorly known and hampered due to a lack of information on normal disease levels in the ocean (Harvell et al. 1999). The incidence of coral disease is lower in the NWHI (Aeby 2006). The NWHI provide unique opportunities to document baseline levels of disease in coral reefs in the absence of a resident human population (Aeby 2006).

Recent studies in the NWHI have begun to document baseline levels of coral disease (Work et al. 2004; Aeby 2006). Tumors, as well as lesions associated with parasites, ciliates, bacteria, and fungi, have been found on a number of coral species. The overall average prevalence of disease (number of diseased colonies/total number of colonies) was found to be very low in the NWHI, estimated at 0.5 percent (ranging from 0 to 7.1 percent) (Aeby 2006), compared with the average prevalence of disease of 0.95 percent in the main Hawaiian Islands (Friedlander et al. 2005). The prevalence of disease varies among different genera of coral (Figure 1.25), with the highest prevalence in species of the genera *Acropora* and *Montipora*. A protocol for characterizing coral disease has now been incorporated into regular coral surveys and monitoring of the NWHI.

**Figure 1.25 Overall Prevalence of Disease in the Four Major Coral Genera in the NWHI.** Seventy-three sites were surveyed in July 2003. Prevalence (all surveys combined) is calculated as the number of diseased colonies per genera/total number of colonies per genera x 100. Source: Aeby 2006.

The threatened Hawai'i population of the green turtle is affected by fibropapillomatosis (FP), a disease that causes tumors in turtles. The prevalence of FP in the Hawaiian green turtle population was estimated at 40 to 60 percent, with the majority of cases found among juvenile turtles (Balazs and Pooley 1991). The herpes virus has been suggested as the possible cause or as a cofactor of FP (Herbst 1995). The majority of recent turtle strandings are by juvenile turtles

with FP (Work et al. 2004). As a result, FP may pose a major threat to the long-term survival of the species (Quackenbush et al. 2001).

### Marine Alien Species

Marine alien species can be defined as aquatic organisms that have been intentionally or unintentionally introduced into new ecosystems, resulting in negative ecological, economic, or human health impacts. A total of 13 marine alien invertebrate, fish, and algal species have been recorded in the NWHI (Table 1.5). Alien species may be introduced unintentionally by vessels, marine debris, or aquaculture, or intentionally, as in the case of some species of groupers and snappers and algal species.

**Table 1.5 Marine Alien Species in the Northwestern Hawaiian Islands<sup>1</sup>**

Species	Taxa	Native Range	Present Status in NWHI <sup>2</sup>	Mechanism of Introduction
<i>Hypnea musciformis</i>	Algae	Unknown; Cosmopolitan	Not Established; in drift only (MAR)	Intentional introduction to Main Hawaiian Islands (documented)
<i>Diadumene lineata</i>	Anemone	Asia	Unknown; on derelict net only (PHR)	Derelict fishing net debris (documented)
<i>Pennaria disticha</i>	Hydroid	Unknown; Cosmopolitan	Established (PHR, LAY, LIS, KUR, MID)	Fouling on ship hulls (hypothesized)
<i>Balanus reticulatus</i>	Barnacle	Atlantic	Established (FFS)	Fouling on ship hulls (hypothesized)
<i>Balanus venustus</i>	Barnacle	Atlantic and Caribbean	Not Established; on vessel hull only (MID)	Fouling on ship hulls (documented)
<i>Chthamalus proteus</i>	Barnacle	Caribbean	Established (MID)	Fouling on ship hulls (hypothesized)
<i>Amathia distans</i>	Bryozoan	Unknown; Cosmopolitan	Established (MID)	Fouling on ship hulls (hypothesized)
<i>Schizoporella errata</i>	Bryozoan	Unknown; Cosmopolitan	Established (MID)	Fouling on ship hulls (hypothesized)
<i>Lutjanus kasmira</i>	Fish	Indo-Pacific	Established (NIH, MOK, FFS, MAR, LAY, and MID)	Intentional introduction to Main Hawaiian Islands (documented)
<i>Cephalopholis argus</i>	Fish	Indo-Pacific	Established (NIH, MOK, FFS)	Intentional introduction to Main Hawaiian Islands (documented)
<i>Lutjanus fulvus</i>	Fish	Indo-Pacific	Established (NIH and FFS)	Intentional introduction to Main Hawaiian Islands (documented)
<i>Cnemidocarpa irene</i>	Tunicate	Indo-Pacific	Established (FFS)	Fouling on ship hulls (hypothesized)
<i>Polycarpa aurita</i>	Tunicate	Indo-Pacific and Western Atlantic	Established (FFS)	Fouling on ship hulls (hypothesized)

Recent compilations of marine alien species in Hawai‘i (Eldredge and Carlton 2002) include some 343 species: 287 invertebrates, 24 algae, 20 fish, and 12 flowering plants. Information concerning marine aquatic invasive species in the NWHI is more recent, and judgments as to whether organisms are invasive or native are based on knowledge of marine aquatic alien species that has been gained in the main Hawaiian Islands over the last decade. This is due both to the lack of taxonomic information for many invertebrate groups and the minimal historical sampling

effort in the NWHI. The status of the taxonomy of many non-coral marine invertebrate groups and algae is not fully developed for the NWHI, and comprehensive species inventories have yet to be produced, although efforts to correct this situation are presently under way (Godwin et al. 2006).

The known data concerning marine aquatic alien species in the NWHI were collected from a single focused marine invasive species survey by the Bishop Museum at Midway Atoll in 2000 and subsequent multi-agency RAMP cruises in 2002 and 2003. The results of these efforts have recorded a total of 13 aquatic invasive marine fish, invertebrate, and algae species in the NWHI. Table 1.5 shows the species, the native range of each, their present status in the NWHI, and the hypothesized or documented mechanism of introduction.

Eleven species of shallow-water snappers (*Lutjanidae*) and groupers (*Serranidae*) were purposely introduced to one or more of the main islands of the Hawaiian Archipelago in the late 1950s and early 1960s. Two snappers, the bluestripe snapper (taape, *Lutjanus kasmira*) and the blacktail snapper (*Lutjanus fulvus*), and one grouper, the peacock grouper (*Cephalopholis argus*), are well established and have histories of colonization along the island chain that are reasonably well documented (Randall 1987). Bluestripe snappers have been by far the most successful fish introduction to the Hawaiian coral reef ecosystem. Approximately 3,200 individuals were introduced on the island of O‘ahu in the 1950s. The population has expanded its range by 1,491 miles (2,400 kilometers), until it has now been reported as far north as Midway in the NWHI (Figure 1.26). These records suggest a dispersal rate of about 18-70 nautical miles (33-130 kilometers) per year. The other two species have only been recorded as far north as French Frigate Shoals and are present in much lower numbers than bluestripe snappers.

**Figure 1.26 Spread of Bluestripe Snapper throughout the Hawaiian Archipelago after Introduction to O‘ahu in 1958. Source: Friedlander et al. 2005.**

The magnitude of the problem of aquatic alien species is far greater in the main Hawaiian Islands than in the NWHI. Efforts to control the accelerated introduction of alien species in the NWHI will focus on transport mechanisms, such as marine debris, ship hulls, and discharge of bilge water from vessels originating from Hawaiian Island and other ports, to effectively reduce new

introductions. Existing Monument regulations and permitting requirements greatly reduce the chance of new introductions. Monitoring is needed as an early warning system for response actions to be effective. Natural transport mechanisms, such as larval transport in currents, also play a role in the spread of aquatic invasive species.

### Terrestrial Alien Species

Human occupation at Midway Atoll has continued uninterrupted since the Commercial Pacific Cable Company took up residence there in 1903. The cable company attempted to make the settlement as self-sufficient as possible through the cultivation of gardens and small livestock. Initial garden attempts failed because of the lack of organic soil on the islands. To remedy this lack, barge loads of soil were brought from O‘ahu and Guam, and contained not only the organic matter that made gardening possible, but also all the associated soil organisms such as ants, centipedes, and fungi. In addition to the introduction of vegetables, trees and ornamentals were also planted, such as ironwoods, eucalyptus, and acacia. So successful were these introductions that, by 1922, an estimated two-thirds of Sand Island was covered with imported vegetation. Livestock and poultry were also raised. While the black rat (*Rattus rattus*) was successfully exterminated on Midway in 1997, mice (*Mus musculus*), along with various species of ants, wasps, ticks, and mosquitoes, continue to plague wildlife and humans. Mosquitoes are of special concern as they are potential vectors for diseases such as West Nile virus, avian malaria, and avian pox.

Laysan Island was the site of another attempt at colonization. In 1890, Captains Freeth and Spencer initiated the mining of guano, resulting in the removal of thousands of tons of guano and the disturbance of hundreds of acres of habitat. The most devastating action on Laysan was the introduction of domestic rabbits, Belgium and European hares, and guinea pigs by Max Schlemmer in 1903. Schlemmer, known as the “King of Laysan,” introduced these animals partly to amuse his many children and as potential livestock for a meat-canning business. Schlemmer’s activities, which included feather exporting, were outlawed with the establishment of the Hawaiian Islands Reservation; however, by then, the rapidly reproducing rabbits had extirpated most of the vegetation on Laysan. The U.S. Bureau of Biological Survey sent an expedition on the *Thetis* in the winter of 1912 and 1913 to exterminate them but ran out of ammunition after 5,000 rabbits were killed; thus, several thousand remained, which continued to destroy the vegetation (Ely and Clapp 1973, Rauzon 2001). The rabbits were finally exterminated in 1923 by the Tanager Expedition, which was a joint expedition by the U.S. Bureau of Biological Survey, the Bishop Museum, and the U.S. Navy (Rauzon 2001). In only a few years, the rabbits destroyed almost all of the vegetation and associated insects of the island, causing the extinction of three species of birds: the Laysan honeycreeper (*Himantione sanguinea freethii*), the Laysan rail (*Porzana palmeri*), and the Laysan millerbird (*Acrocephalus familiaris familiaris*).

The number of alien land plants in the NWHI varies from only three introduced at Nihoa to 249 introduced at Midway Atoll. The level of threat from introduced plants also varies between species. For example, the invasive plant golden crownbeard (*Verbesina encelioides*) displaces almost all native vegetation in some nesting areas. This plant causes entanglement of albatross adults and chicks and increases chick mortality as a result of heat stress by reducing the birds’ ability to use convective cooling for thermoregulation. At Southeast Island, Pearl and Hermes

Atoll, *Verbesina* has displaced almost all native vegetation. When it dies back each year, the endangered Laysan finches (*Telespiza cantans*) suffer severe food and cover restrictions. This plant has quickly covered nesting habitat on Sand, Eastern, and Spit islands of Midway Atoll, Green Island of Kure Atoll, and Southeast Island of Pearl and Hermes Reef.

Sandbur (*Cenchrus echinatus*) is an aggressive invasive grass currently occurring at Kure and Midway Atolls, Pearl and Hermes Reef, Lisianski Island, and French Frigate Shoals. An intensive *Cenchrus* eradication effort at Laysan Island that took 12 years to complete has been a major contribution to the restoration of Laysan's seabird nesting habitat and has facilitated restoration of the island's native vegetation. Laysan Island has also been invaded by Indian Pluche (*Pluchea indica*), *Sporobolus pyramidatus*, and swine cress (*Coronopus didymus*). Invasive ant species have been detected at all of the islands in the Monument and pose threats to many components of the terrestrial ecosystem, most notably to native terrestrial invertebrates (e.g., the endemic Lepidopteran larvae) and native plants. They also have been observed preying on the eggs and chicks of seabirds in the Monument.

The invasive gray bird locust (*Schistocerca nitens*) was first detected at Nihoa in 1984, and by 2000 was periodically reaching large population levels that were causing damage to the native plant community, including three endemic species listed as endangered. This grasshopper species has now also spread to Mokumanamana, French Frigate Shoals, and Lisianski Island. A workshop was convened in 2005 to identify research and mitigation measures to respond to this invasive insect (Gilmartin 2005). The meeting produced a variety of recommendations that shall be incorporated into the alien species management program of the Monument.

Mandatory quarantine protocols are enforced for any visitors to the NWHI to prevent further importation of invasive organisms. At all of the islands and atolls except Midway and French Frigate Shoals, these protocols include requiring the use of brand new or island-specific gear at each site and treatments such as cleaning, using insecticide, and freezing to minimize the transport of potentially invasive species to the islands. Protocols at Midway and French Frigate Shoals are modified as necessary to accommodate the greater volumes of material coming in, but all possible procedures are still employed to minimize additional introductions at these two sites.

### **Fishing**

Fishing and other resource extractive uses have occurred in varying degrees in the NWHI. Native Hawaiians traveled to these areas as early as 500 A.D. During the western exploration period (1750 to 1920s), explorers and whalers from France, Russia, Japan, Britain, and the United States harvested Hawaiian monk seals, whales, fish, seabirds, and guano from various parts of the NWHI. In more recent history (1920s to 1970s), fishing and other resource extractive uses were punctuated by the overexploitation of the endemic black-lipped pearl oyster (1928 to 1931), the beginning of a Hawai'i-based fishing fleet (1930s to 1940s), a cessation of commercial uses during World War II, a resumption of commercial fishing (1945 to 1960) (during which Tern Island was used as a transshipment point for fresh fish flown to Honolulu), and a proliferation of foreign fishing vessels from Japan and Russia (1965 to 1977).

Commercial fishing in the NWHI has, in recent decades, been managed according to federal fishery management plans developed for fisheries for precious corals, bottomfish and seamount

groundfish, and pelagic, crustacean, and coral reef fisheries. According to the management scheme, no precious coral or coral reef species fisheries have been permitted in the NWHI. Pelagic longline fishing within 50 nautical miles (92.6 kilometers) of the NWHI has been prohibited since 1991, the year the Longline Protected Species Zone was designated to prevent interactions with endangered species (50 CFR 665.806 [2008] Subpart F). No crustacean (lobster-trap) fishery has operated in the NWHI since 1999. Between 2000 and 2005, NMFS has set an annual harvest guideline of zero lobsters for this fishery. Proclamation No. 8031 directed the Secretaries to ensure that NWHI commercial lobster fishing permits be subject to a zero annual harvest limit.

Proclamation 8031 allows commercial fishing by federally permitted bottomfish fishery participants who have valid permits until mid-2011 (71 FR 36443, June 26, 2006). This amounts to a maximum of eight permitted bottomfish vessels that fish within the Monument.

The only commercial fishery occurring in the Monument is the federal bottomfish fishery. This fishery operates according to the management regime specified in the Fishery Management Plan for Bottomfish and Seamount Groundfish Fisheries in the Western Pacific Region. In the NWHI, the bottomfish fishery is a hook-and-line fishery that targets a range of snappers, jacks, emperors, and groupers that live on the outer reef slopes, seamounts, and banks at depths of approximately 50 to 400 fathoms (91 to 731 meters). The management regime includes several precautionary measures that minimize potential effects of this fishery. For instance, the bottomfish fishery participants do not operate in the presence of the monk seals so as to avoid any direct or indirect effects of the fishery on the species (50 CFR 665.207 [2008] Subpart C). In addition, it is known that the vessels operations do not negatively impact habitat (Kelley and Ikehara 2006). Finally, the annual catch limit in the NWHI is set by regulation at 300,000 lbs. of bottomfish and 180,000 lbs. of pelagic species (50 CFR Part 404), and, to date, annual harvest has fallen below these limits.

### **Transportation Hazards and Groundings**

Hazards to shipping and other forms of maritime traffic, such as shallow submerged reefs and shoals, are inherent in the NWHI's 1,200 miles (1,931 kilometers) of islands and islets. The region is exposed to open ocean weather and sea conditions year-round, punctuated by winter severe storm and wave events. Vessel groundings and the release of fuel, cargo, and other items pose real threats to the NWHI. Likewise, aircraft landing at Midway Atoll or Tern Island pose certain risks to wildlife and other resources, including bird strikes, introduction of alien species, aircraft crashes, and fuel spills. Certain management practices, such as requiring night landings and runway sweeps during albatross season at Midway and alien species inspections, can minimize these risks.

The many types of vessels operating in and transiting through the NWHI pose different threats to the marine environment based on their size, age, draft, port of origin, frequency of visits, activities conducted, navigational protocols, and operations that could disturb or injure wildlife or coral reef ecosystems, as well as the volume, type, and location of discharges. The range of vessel types include 20- to 60-foot fishing and recreational vessels, 150- to 250-foot research vessels, 500- to 700-foot passenger cruise ships and freighters, 700- to 1,000-foot tankers, as well as Coast Guard, military, and international ships of all sizes and types.

### ***Vessel Groundings, Oil and Fuel Spills, and Loss of Cargo Overboard***

In the NWHI, a number of factors have contributed to vessel groundings and cargo loss over the years. These factors include human error, lack of appropriate navigational practices, inaccurate nautical charts, and treacherous conditions posed by the low-lying islands, atolls, and shallow pinnacles and banks. All vessels pose a risk to the environment. Periodically, accidental loss of cargo overboard causes marine debris or hazardous materials to enter sensitive shallow-water ecosystems.

Twelve of the 60 ship losses known to have occurred in the region have been located and include whaling vessels, Navy frigates, tankers, and modern fishing boats. Additionally, 67 planes are known to have been lost in the region, mainly naval aircraft (many from World War II), but only two have been located. Some of these ship and aircraft wreck sites fall into the category of war graves associated with major historic events.

Unexploded ordnance, debris, and modern shipwrecks, such as the fishing vessels *Houei Maru #5* and *Paradise Queen II* at Kure Atoll or the tanker *Mission San Miguel* lost at Maro Reef, are not protected as heritage resources and represent a more immediate concern as threats to reef ecosystems. Mechanical damage from the initial grounding, subsequent redeposition of wreck material by storm surge, fishing gear damage to reef and species, and release of fuel or hazardous substances are all issues to be considered in protecting the integrity of the environment. Dissolved iron serves as a limiting nutrient in many tropical marine areas and tends to fuel cyanobacteria (blue-green algae) growth when the iron begins to dissolve (corrode). This is especially a problem on atolls and low coral islands where basalt or volcanic rock is absent in the photic zone and natural dissolved sources of iron in seawater are even lower. Therefore, any ships left in place would be an iron source that could contribute to potential cyanobacterial blooms. It has been demonstrated that not removing non-historic steel vessels can have long-term detrimental effects that, in most cases, can be worse than any short-term damage to the environment caused by the removal action.

In 1998, the *Paradise Queen II* ran aground at Kure Atoll, spilling 11,000 gallons of diesel fuel and 500 gallons of hydraulic fluids and oil. The vessel also lost 3,000 pounds of frozen lobster tails, 4,000 pounds of bait, 11 miles of lobster pot mainline, and 1,040 lead-weighted plastic lobster traps. Traps rolling around in the surf broke coral and coralline algal structures. Two years later, researchers found broken coral and 600 lobster traps among piles of nets surrounding the decaying wheelhouse (Maragos and Gulko 2002).

When the 85-foot longliner *Swordman I*, carrying more than 6,000 gallons of diesel fuel and hydraulic oil, ran aground at Pearl and Hermes Reef in 2000, vessel monitoring system technology allowed agents to track the disaster and quickly send out equipment for a cleanup that cost upward of \$300,000, a cost that the government had to sue to recover.

By comparison, the grounded chartered marine debris cleanup vessel *Casitas* caused less environmental damage. Following the removal of 33,000 gallons of fuel and oil, the 145-foot motor vessel *Casitas* was successfully extracted from the reef at Pearl and Hermes Atoll and entombed northwest of the atoll in approximately 7,200 feet (2,195 meters) of water. However,

the crew fleeing the sinking vessel was forced to camp on a quarantine island without “clean gear.” It has yet to be determined whether any invasive species came ashore with the shipwrecked crew. The ship was conducting marine debris cleanup operations under a NOAA charter when it ran aground on July 2, 2005. Unified Command representatives from the Coast Guard, State of Hawai‘i, and Northwind Inc. (owner of the *Casitas*), in cooperation with the federal trustees FWS and NOAA, oversaw the operation to prevent further damage to the coral reef ecosystem and islands.

On June 1, 2007, a grounded vessel named *Grendel* was discovered inside Kure Atoll’s lagoon on the northeast reef. Metal debris from the vessel was found on the reef extending along a 500-foot path from the vessel northeast to the emergent reef, indicating that the vessel entered the lagoon over the northeast reef. The level of fouling on the steel hulled sloop suggested that the vessel wrecked approximately three to four months earlier, in February or March. The vessel’s sails, sheets, and lines were tangled around the mast, stays, and railings, creating a wildlife entanglement hazard. Approximately 275 pounds of entanglement hazards were removed using snorkeling gear. A battery, 300 pounds of chain, three anchors, and several broken pieces of metal were also removed from the site.

### ***Waste Discharge***

The International Convention for the Prevention of Pollution from Ships (MARPOL 1973/78) is the main international convention covering prevention of pollution of the marine environment by ships from operational or accidental causes. It addresses potential sources of pollution, such as oil, chemicals, harmful substances in packaged form, garbage, sewage, and air pollution. (The United States is not a signatory to those parts of the Convention addressing the last two sources.) The Convention’s regulations are aimed at preventing and minimizing pollution from both accidental events and routine operations.

Vessel waste generally consists of solid waste, sewage, gray water, and bilge water. Solid waste may consist of food, cans, glass, wood, cardboard, paper, and plastic. Sewage discharge can contain bacteria or viruses or medical wastes that can cause disease in humans and wildlife or affect the ecosystem by increasing nutrient load. Gray water is wastewater from sinks, showers, laundry, and galleys. It may contain a number of pollutants such as suspended solids, ammonia, nitrogen, phosphates, heavy metals, and detergents. Bilge water can contain fuel, oil, and wastewater from engines and machinery that collects in the bottom of the ship’s hull as a result of routine operations, spills, and leaks. Discharge in the Monument is tightly regulated by the Proclamation and permit requirements. Monument staff are investigating the potential impacts of various types of discharges and will continue to update permit requirements as need to safeguard the marine resources.

### ***Ballast Water Exchange***

Ballast water discharged from ships is one of the primary pathways for the introduction and spread of aquatic nuisance species. In response to national concern regarding these species, the National Invasive Species Act of 1996 was enacted, which reauthorized and amended the Nonindigenous Aquatic Nuisance Prevention and Control Act of 1990. In addition to the Monument discharge regulations, ballast water exchange in the Monument is regulated by Coast Guard regulations establishing a national mandatory ballast water management program for all

vessels equipped with ballast water tanks that enter or operate within U.S. waters. These regulations also require vessels to maintain a ballast water management plan that is specific for that vessel and that assigns responsibility to the master or an appropriate official to understand and execute the ballast water management strategy for that vessel.

### ***Introduction of Alien Species***

Introduction of marine alien species, including pathogens, is of great concern. The prohibitions on ballast discharge in the Proclamation and the actions outlined in the Alien Species Action Plan (Section 3.3.2) aim to prevent the introduction of alien species to the marine environment. The Alien Species Action Plan addresses prevention, monitoring of alien species, and education of Monument users and the public about the need to prevent alien species introductions.

### ***Anchor Damage to Reefs***

Vessel anchoring has the potential to affect the ecosystem depending on many factors, such as the size of the ship and anchor system, weather conditions, and the location and vicinity of the anchorage relative to sensitive ecosystems, such as coral reefs. Because of the potential for impacts to the ecosystem, anchoring on or having a vessel anchored on any living or dead coral with an anchor, anchor chain, or anchor rope is prohibited. Anchoring on all other substrates is strictly regulated.

Anchors and chains can destroy coral and live rock, directly affecting fishes and benthic organisms and their habitat. To prevent this type of damage, mooring buoys are sometimes used in places where frequent or extended anchoring is necessary. Depending on site conditions and mooring type, such buoys can reduce impacts to the ecosystem. The Office of National Marine Sanctuaries has successfully used mooring buoys to mitigate ecosystem damage in high-use areas in the Florida Keys National Marine Sanctuary. Similarly, in Hawai‘i, the State Department of Land and Natural Resources minimized coral reef and benthic habitat damage at Molokini Islet’s popular anchorage with mooring buoys. Data are available to study potential mooring buoy locations using anchor logs from ships that currently operate, or have done so historically, in the Monument.

### ***Light and Sound Impacts***

Light and sound generated by people in the marine environment have been the subject of attention in recent years because of concerns that they may negatively affect a variety of species. In the NWHI, seabirds are attracted to and become disoriented by ship lights at night. With emergent land areas in the NWHI providing breeding and nesting area for millions of seabirds, ships’ nightlights attract birds, which can strike the vessel and become injured. The extent of the impact of lights on the seabirds is affected by many factors, including the amount of light, the size of the vessel, the vessel location relative to nesting areas, the season, and the type of birds in the vicinity. Shearwaters, petrels, and juvenile birds are especially vulnerable to nightlights and deck injuries. Lights from vessels can also attract green turtle hatchlings, making them more vulnerable to predators. Lights and lighted structures on land contribute to seabird mortality by causing collisions and disorientation. Light sources in the vicinity of turtle nest-sites may disorient hatching marine turtles so they travel inland and perish.

Anthropogenic sound may also affect some species in the NWHI environment. Sound is a common element of the marine and terrestrial environment, originating from a variety of natural sources such as wind, waves, earthquakes, and marine organisms. Humans introduce sound incidentally into the environment through activities such as low-flying aircraft, shipping, fishing, and other vessel use. People also introduce sound intentionally using sonar for research or military applications, seismic arrays, fish finders, and other tools that help people “see” underwater, and to better understand or exploit the marine environment. The amount and intensity of sound in the ocean are increasing as human activities expand.

Underwater sounds of both human and natural origin may affect the behavior and, in some cases, the survival and productivity of individual marine mammals. The nature and significance of effects depend on a number of factors involving the intensity, duration, and frequency of the sound, as well as particular aspects of the habitat and the animal it may affect. Of particular concern is midfrequency tactical sonar used by military vessels. This type of sonar has been implicated as the cause of several recent marine mammal stranding events (Marine Mammal Commission 2005). Deep-diving species, such as beaked whales, appear to be particularly at risk from these sound sources. Beaked whales occur throughout the Hawaiian Archipelago, including within the Monument (Barlow 2003).

Little is currently known about sound levels and sources in the Monument. Future assessment of the anthropogenic sound in the NWHI will be conducted in close coordination with the Marine Mammal Commission, NMFS, and other partners. The Marine Mammal Commission maintains a Sound Program and Advisory Committee on Acoustic Impacts on Marine Mammals to address the effects of anthropogenic sound on marine mammals.

The following information summarizes the main types of vessels operating in the Monument. All vessels carry with them some degree of risk associated with groundings, discharge, alien species introductions, and wildlife interactions and other potential threats, which are addressed in different sections throughout this plan or directly through prohibitions or permit requirements.

### ***Fishing Vessels***

Eight commercial fishing permits are eligible for use in the Monument until June 2011. The fishermen average two to ten trips per year per vessel, with duration ranging from 3 to 22 days per trip. For the most part, these vessels bottomfish around the atolls and banks at the 100-fathom depth and troll in deep water and across banks as they transit between islands. Annual catch limit is set by the Proclamation and codified by regulation (50 CFR Part 404). Crew size ranges from one to four people. The Proclamation prohibits further commercial bottomfish and associated pelagic fishing after June 15, 2011.

### ***Vessels Conducting Research and Management Activities***

Several vessels are engaged in research or management activities in the Monument. These vessels include NOAA’s *Oscar Elton Sette*, *Hi‘ialakai*, *Ka‘imimoana*, and the University of Hawai‘i’s R/V *Kilo Moana* and R/V *Kaimikai-O-Kanaloa*, as well as chartered vessels for marine debris removal and for FWS management activities. These vessels are most active in the NWHI during April through November. They average 200 feet in length; weigh 2,300 tons; and carry 50 crew, researchers, and other staff. The Coast Guard sends a buoy tender to the NWHI

once a year. This mission also serves as a law enforcement patrol. In addition, the Coast Guard may occasionally send other ships to the area as needed (Havlik 2005 pers. com.).

### ***Cruise Ships***

A small number of cruise ships visit the Midway Atoll Special Management Area each year. The *Seven Seas Voyager* visited Midway once, and the *Pacific Princess* visited twice in 2004. In 2005, 2006, and 2007, one cruise ship visited the atoll each year (Maxfield 2005 pers. com.). Because of their size and the narrow width of the entrance channel at Midway, as well as port security requirements, cruise ships offload passengers three to four miles outside the lagoon and transport them ashore in small boats.

Worldwide, cruise ships constitute a large and growing industry, and like other ships, present a potential environmental threat to the Monument. Large cruise ships can carry thousands of passengers and crew, producing hundreds of thousands of gallons of wastewater and tons of garbage each day. The cruise industry has attracted a lot of attention regarding the treatment of waste at sea, and the Monument closely monitors scientific and regulatory developments that may influence management decisions associated with these ships.

### ***Merchant Vessels***

U.S. flag and international merchant vessels, including container ships, bulk carriers, and tankers, transit the waters surrounding the NWHI regularly. Data on routes and volume of shipping traffic are in the process of being compiled. Vessel traffic passes to the north of the island chain, following great circle routes to and from ports on the west coast of North America and East Asia. Vessels also pass through the Monument. Vessels have been observed using the pass between Pearl and Hermes Atoll and Lisianski Island because it allows vessels to maintain an east-west heading while transiting through the island chain (Tosatto 2005 pers. com.). Periodically, accidental loss of cargo overboard causes marine debris or hazardous materials to enter sensitive shallow water ecosystems.

### ***Native Hawaiian Practices and Education***

Between 2003 and 2007, several trips for Native Hawaiian cultural practices, education, and documentary film and photography projects were conducted on vessels in the Monument. Vessel size varied, as did anchoring and waste discharge practices. Some of the trips, such as the *Hōkūle‘a* voyage to Kure in 2004 as part of the “Navigating Change” program, included both FWS and NOAA personnel.

### ***Armed Forces Actions within the Monument***

In addition to Midway Atoll, the U.S. military has historically utilized ranges, operating areas, and facilities that today are partially overlaid by the Monument. Beginning well before World War II training and research, development, test, and evaluation (RDT&E) have occurred in the Hawai‘i area.

Military use of the area known as the Pacific Missile Range Facility (PMRF) began in 1940 when the U.S. Army acquired a pre-existing grass airstrip. As described in both the PMRF Enhanced Capability EIS completed in 1998 and the Hawaii Range Complex (HRC) Final

EIS/Overseas EIS completed in 2008, the Department of Defense has utilized areas within the Monument for training and RDT&E.

When the President proclaimed the creation of the Monument, an exemption for military activities was included. Presidential Proclamation 8031 creating the Monument states that its prohibitions “shall not apply to activities and exercises of the Armed Forces that are consistent with applicable laws” and that “All activities and exercises of the Armed Forces shall be carried out in a manner that avoids, to the extent practicable and consistent with operational requirements, adverse impacts on monument resources and qualities.” Proclamation 8031 also requires, “In the event of threatened or actual destruction of, loss of, or injury to a monument resource or quality resulting from an incident, including but not limited to spills and groundings, caused by a component of the Department of Defense or the USCG, the cognizant component shall promptly coordinate with the Secretaries for the purpose of taking appropriate actions to respond to and mitigate the harm and, if possible, restore or replace the monument resource or quality.”

The Final EIS/Overseas EIS for the HRC is the most comprehensive source for information on the current activities of the U.S. Navy and other military users within those portions of the Monument and HRC that overlap. In addition, the Missile Defense Agency’s Final Ground-Based Midcourse Defense Extended Test Range EIS provides information on long-range missile defense tests in the Pacific region, some of which occur above or near the Monument.

U.S. Armed Forces activities within the Monument include RDT&E actions, training events such as unit level training, anti-submarine warfare exercises and major exercises such as RIMPAC, as well as assistance to the Monument when such activities can also serve as training consistent with federal fiscal law requirements. The U.S. Navy has provided assistance within the Monument areas in the past. Examples include assistance with hand-cutting of heavy fishing nets from coral areas as training for Navy Reserve divers and assistance with removal of grounded vessels as training in harbor clearance techniques.

As described more fully in the HRC EIS/OEIS, the easternmost portion of the Monument extends into the Hawai‘i operating area (OPAREA). The Monument overlays a small portion of a long-existing military warning area known as W-188 where training occurs. W-188 extends from the Navy’s PMRF at Barking Sands, Kauai. At its closest point to Nihoa, W-188’s boundary is more than 10 miles away, but given the Monument’s extension 50 miles from each island, the Monument overlays approximately 40 miles of W-188. The overlap involves less than 2 percent of the entire Monument – approximately 4,300 square nautical miles of the Monument’s approximately 140,000 square nautical miles. Navy training activities, such as sonar use, are generally limited to the OPAREA. Armed Forces training, including live-fire training, can take place anywhere within W-188.

The Temporary Operating Area (TOA), an area of airspace north and west of Kauai within the HRC, includes the Monument within its boundaries. The TOA is an area used for RDT&E, primarily missile defense testing and evaluation, which typically occurs high in the atmosphere. The TOA is normally used less than a dozen times per year for missile testing and evaluation for short periods of time – usually a few hours. Some of the missile tests include intercepts of target

missiles above or near the Monument and result in intercept debris landing in the Monument. Most intercept scenarios are planned so that debris will land in open ocean areas, far from land. A few tests could result in small amounts of debris on land areas.

### ***U.S. Armed Forces Precautions within the Monument***

Presidential Proclamation 8031 states “all activities and exercises of the Armed Forces shall be carried out in a manner that avoids, to the extent practicable and consistent with operational requirements, adverse impacts on monument resources and qualities.” The Armed Forces have demonstrated that they understand and respect the value and importance of the Monument. They also recognize that the primary management philosophy for the Monument is protection and preservation.

To ensure achievement of the Proclamation’s objectives, the Armed Forces must comply with an extensive list of environmental laws and Executive Orders that apply to their activities. Some of these laws require the Armed Forces to work with, seek input from, or enter into consultation with the agencies represented by the Monument’s Co-Trustees: Department of the Interior’s FWS; Department of Commerce through NOAA and NMFS; and the State of Hawai‘i, through the DLNR and its Coastal Zone Management office.

These laws include, but are not limited to:

National Environmental Policy Act, National Historic Preservation Act, Endangered Species Act, Marine Mammal Protection Act, Migratory Bird Treaty Act, National Wildlife Refuge System Administration Act, Magnuson-Stevens Fishery Conservation and Management Act, National Marine Sanctuaries Act, Coastal Zone Management Act, Rivers and Harbors Act, Clean Air Act, Federal Water Pollution Control Act, Executive Order 13089 - Coral Reef Protection, and Executive Order 13352 - Cooperative Conservation.

For activities described in the Hawaii Range Complex EIS/OEIS that could take place within the Monument, protective measures as well as mitigation measures were developed with input from the Co-Trustees’ agencies, namely NMFS and FWS, through the Section 7 process of the ESA and the authorization or permitting process of the MMPA. These measures include mandatory NMFS approved lookout training and mandatory safety and shut down zones for use of mid-frequency active sonar in the presence of marine mammals among numerous other requirements. These measures will further reduce the possibility of any adverse impacts on the Monument. The Navy has committed to conduct its activities in accordance with these measures.

For missile testing above or near the Monument, numerous measures are taken to limit possible effects from any missile debris. The probability of any debris hitting birds, seals, other wildlife, or historic and cultural resources would be extremely low. Any quantities of falling debris would also be very low and widely scattered so as not to present a toxicity issue. Any debris as it falls through the atmosphere would have cooled sufficiently so as not to present a fire hazard for vegetation and habitat within the Monument.

## 1.5 Global Significance

The Monument is important both nationally and globally, as it contains one of the world's most significant marine and terrestrial ecosystems, includes many areas of cultural significance, is managed to protect ecological integrity, and is one of the world's largest marine protected areas. It serves as an example of ongoing geological processes, biological evolution, and the effects of humans on the natural environment. These volcanic rocks, large atolls of sand and coral, and islets surrounded by reefs and waters provide unique habitats for endemic and rare species of animals and plants, with outstanding and universal value from scientific, conservation, and aesthetic perspectives. This relatively pristine region contrasts sharply with most insular and marine ecosystems, which are more severely affected by human activities and populations around the world.

More recently, the recognition of the uniqueness of the NWHI has led the State of Hawai'i, on behalf of the Co-Trustees, to work toward nomination of the Monument as a United Nations Educational, Scientific, and Cultural Organization (UNESCO) World Heritage Site for its natural and cultural values, and as part of the world heritage of mankind. The National Park Service Office of International Programs is the lead for the U.S. in coordinating nominations through the UNESCO World Heritage Centre. The U.S. submitted a new World Heritage tentative list to UNESCO's World Heritage Centre in January 2008, which included the Monument as one of the top sites for consideration. The Monument is proposed as a mixed site for both its outstanding cultural and natural values for the following reasons:

- The islands are an outstanding example representing a major stage of the earth's evolutionary history;
- The Monument's natural resources are an outstanding example representing significant ongoing geological processes, biological evolution, and man's interaction with his natural environment;
- The islands and atolls provide habitats where populations of rare and endangered species of plants and animals still survive;
- It bears a unique or at least exceptional testimony to a cultural tradition or to a civilization, which is living or which has disappeared, and;
- It is directly or tangibly associated with events or living traditions, with ideas, or with beliefs, with artistic and literary works of outstanding universal significance.

UNESCO rules require a minimum 1-year delay between the time a Nation submits its tentative list and brings forward an application for consideration of a World Heritage Site. The U.S. submitted its new Tentative List to UNESCO on January 24, 2008. In April 2008, the National Park Service Office of International Programs announced that the Monument had been selected as one of the first two sites to be submitted for nomination by the U.S. to the UNESCO World Heritage Centre in over 15 years. Once the application is submitted, it will take a minimum of 18 months for the site to be considered by the UNESCO World Heritage Committee as a new site for inscription. Applications are submitted once each year in February.

Conserving the NWHI contributes to international community efforts aimed at conserving biodiversity and ecological integrity around the world. These efforts include work by organizations such as the World Conservation Union, the world's largest environmental

knowledge network; the Convention on Biological Diversity; the South Pacific Regional Environment Program; and UNESCO. Conservation and management of Monument resources contribute to the reduction in the current rate of loss of biological diversity at the global, national, and regional levels, for the benefit of all life on earth.

Remote, uninhabited, and relatively pristine in comparison to other marine ecosystems in the world, the Monument serves as one of the few modern sentinels for monitoring and deciphering short-term and long-term responses to local, regional, and global environmental and anthropogenic stressors. The Monument is one of the few regions on Earth where monitoring and research activities can be conducted in virtual absence of local human habitation. In comparison, most reef systems in the coastal regions of the world are adjacent to human population centers, where vessel traffic, overharvesting, sedimentation, habitat destruction, and other human actions have altered the terrestrial and adjacent marine environments. At a time when global climate change impacts, such as sea level rise and ocean acidification are emerging as significant threats to our oceans, ongoing research, monitoring, habitat restoration, and conservation management of the insular and marine ecosystems in the NWHI will continue to provide significant insights that will benefit potential management interventions not only for the NWHI, but for insular and marine ecosystems around the world.

On April 3, 2008, the International Maritime Organization (IMO) designated the Monument as a Particularly Sensitive Sea Area (PSSA). As part of the PSSA designation process, the IMO adopted U.S. proposals for associated protective measures consisting of (1) expanding and consolidating the six existing recommendatory Areas To Be Avoided (ATBA's) in the Monument into four larger areas and enlarging the class of vessels to which they apply; and (2) establishing a ship reporting system for vessels transiting the Monument, which is mandatory for ships 300 gross tons or greater that are entering or departing a U.S. port or place and recommended for other ships. The vessel reporting system requires that ships notify the U.S. shore-based authority (i.e., the U.S. Coast Guard; NOAA will be receiving all messages associated with this program on behalf of the Coast Guard) at the time they begin transiting the reporting area and again when they exit. Notification is made by e-mail through the Inmarsat-C system or other satellite communication system. It is estimated that almost all commercial vessel traffic will be able to report via Inmarsat-C. The Armed Forces are not subject to the access restrictions and reporting requirements in the Monument when they are conducting activities and exercises. Sovereign immune vessels also are not subject to the reporting requirement but all vessels are encouraged to participate.

The PSSA and associated protective measures were adopted to provide additional protection to the exceptional natural, cultural and historic resources in the Monument. Requiring vessels to notify NOAA upon entering the reporting area will help make the operators of these vessels aware that they are traveling through a fragile area with potential navigational hazards such as the extensive coral reefs found in many shallow areas of the Monument. The PSSA and associated protective measures are now in effect.

Nevertheless, the Monument is not immune from local, regional, and global-scale influences. The millions of pounds of marine debris that have accumulated in the NWHI illustrate the impact

people have on faraway, uninhabited ecosystems at an international scale. In addition, human activities taking place outside of the Monument may have devastating effects on the cultural, historic and natural resources of the Monument. Therefore, in light of the national and global significance of the unique ecosystems of the NWHI, and the fact that two of the most significant threats facing the Monument, marine debris and climate change, originate outside of the Monument, the MMB is committed to continue to work with and promote further collaborations at an international level to preserve and protect the cultural, historical and natural resources of Papāhanaumokuākea.

# **Management Framework**

---

- 2.1 Legal Framework for the Monument**
  - 2.2 Policy Framework**
  - 2.3 Initial Management**
  - 2.4 Monument Management: The Vision, Mission, Guiding Principles, and Goals**
  - 2.5 Management Action Plans**
-

## 2.0 Management Framework

Management of the Monument is carried out by the Co-Trustees in accordance with legal mandates, authorities, and policies of several federal and state agencies, and Monument-specific policies and implementing regulations. In their day-to-day management, the Co-Trustees through the Monument Management Board will ensure the coordinated planning and execution of activities so that they are consistent with the legal and policy structure of the Monument.

Management of the Monument focuses on managing activities for the benefit of the ecosystem's health. In establishing the Monument, President George W. Bush recognized the importance of an ecosystem approach to management. This approach is mindful of the interconnectedness of the Monument resources and requires a holistic approach to managing activities so as to preserve ecosystem structure, function, and key processes and recover resources where necessary.

The management framework supporting an ecosystem approach to management of the Monument includes the following key elements:

- (1) A legal and policy foundation for cooperative ecosystem-based management;
- (2) Institutional arrangements to promote and enhance collaboration with jurisdictional partner agencies and other stakeholders;
- (3) Monument regulations that incorporate multiple management tools including prohibitions, zoning, and regulated activities;
- (4) Established Monument vision, mission, guiding principles, and goals;
- (5) Operational goals;
- (6) Desired outcomes, strategies, and activities that implement the Monumentwide goals and are set forth in action plans specific to management subject areas; and
- (7) An iterative and adaptive approach.

Together, these elements provide the framework for managing the Monument ecosystem.

## 2.1 Legal Framework for the Monument

President George W. Bush issued Presidential Proclamation 8031 (Establishment of the Northwestern Hawaiian Islands Marine National Monument, June 15, 2006), which created the Monument under the authority of the Antiquities Act of 1906, as amended (16 U.S.C. 431-433). Federal partners—NOAA and FWS—promulgated joint implementing regulations on August 29, 2006 (Northwestern Hawaiian Islands Marine National Monument, 50 CFR Part 404). Specifically, these regulations codify the scope and purpose, boundary, definitions, prohibitions, and regulated activities of the Monument. Furthermore, Proclamation 8031 was amended on February 28, 2007, to declare the Native Hawaiian name for the Monument, Papahānaumokuākea, and clarify some definitions (Presidential Proclamation 8112, Establishment of the Papahānaumokuākea Marine National Monument, February 28, 2007).

The Monument includes areas and management authorities that are under the jurisdiction of one or multiple federal agencies or the State of Hawai‘i. For example, the Monument, an area of approximately 139,793 square miles (362,062 square kilometers), includes the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, managed by NOAA’s National Ocean Service (NOS) through the Office of National Marine Sanctuaries; Midway Atoll National Wildlife Refuge/Battle of Midway National Memorial, both managed by FWS; Hawaiian Islands National Wildlife Refuge, managed by FWS; Northwestern Hawaiian Islands Marine Refuge and the State Seabird Sanctuary at Kure Atoll, managed by the State of Hawai‘i, Department of Land and Natural Resources (DLNR). Additionally, NOAA’s National Marine Fisheries Service (NMFS) continues its management of fishing and specific protected species conservation programs, FWS oversees activities under its Endangered Species Act and Migratory Bird Treat Act authorities, and the State of Hawai‘i Historic Preservation Division, with the assistance of the Office of Hawaiian Affairs (OHA), ensures preservation of Native Hawaiian cultural and historic sites, while OHA also assures the perpetuation of Hawaiian cultural resources in the Monument, including the customary and traditional rights and practices of Native Hawaiians exercised for subsistence, cultural, and religious purposes under the Constitution of the State of Hawai‘i, Article XII, Section 7. The legal relationships among the three Co-Trustees and others (including the DOD) have a long history with respect to natural resource management of the NWHI, beginning in 1903 and continuing to modern-day directives that promote the comprehensive and coordinated ecosystem-based management of resources by NOAA, FWS, and the State of Hawai‘i.

Each agency, as laid out in the Proclamation establishing the Monument, retains its spheres of jurisdiction, responsibility, and expertise. They bring different knowledge and strengths to this process. They work together on many aspects of the management process, which can benefit from the synergies of cooperative action. Throughout this process however, each partner will continue carrying out its statutory responsibilities. Even where one of the MMB members has primary responsibility, input from the other board members can often be helpful and is presumed as part of the plan.

## 2.2 Policy Framework

To achieve a coordinated management scheme, the Proclamation ordered a new level of collaboration that would result in coordinated management of the entire Monument. To that end, the Co-Trustees developed and agreed to operate according to terms and institutional relationships set in a memorandum of agreement (MOA), which includes a provision for an annual MOA review by the Co-Trustees (State of Hawai‘i et al. 2006). The signatories of that MOA are the Co-Trustees, who operate with personnel devoted to the development and implementation of coordinated management. The three Co-Trustees are the State of Hawai‘i, the U.S. Department of the Interior (DOI), and the U.S. Department of Commerce (DOC). To provide context for the current management framework, this section briefly summarizes the involvement of each Co-Trustee in the pre-Monument institutional arrangement, which influences, and in some instances, carries over to the collaborative Co-Trustee management.

### *Institutional Arrangements for Management*

The MOA established the institutional arrangements for management of the Monument. The approach demands coordination by the Co-Trustees as well as collaboration with stakeholders to effectively manage under an ecosystem approach. The institutional arrangements for Monument management are described below. These consist of a Senior Executive Board (SEB) providing policy guidance, and a Monument Management Board (MMB), which consists of field staff who conduct the day-to-day management activities of the Monument.

#### *Senior Executive Board*

Pursuant to the MOA, a SEB provides policy guidance to their respective agency staff assigned to carry out Monument management activities. The SEB is comprised of a senior-level designee from the DOI, the DOC, and the State of Hawai‘i Department of Land and Natural Resources (DLNR). The SEB oversees the implementation of the following management actions by the MMB:

- Develop a management plan;
- Provide support for enforcement purposes;
- Coordinate resource and monitoring efforts;
- Develop a mechanism to access scientific and resource data;
- Provide support to identify locations of cultural and religious significance;
- Manage recreational, educational, and commercial activities;
- Identify and facilitate coordination and partnership opportunities with stakeholders;
- Facilitate opportunities to participate and collaborate on education activities;
- Develop interagency agreements, grants, and other instruments;
- Ensure appropriate monitoring of activities within the Monument; and
- Enhance coordination by jointly issuing permits.

#### *Monument Management Board*

Pursuant to the MOA, the MMB promotes coordinated management of the Monument at the field level. The MMB includes a broader range of representatives from the Co-Trustees, specifically:

- State of Hawai‘i, Department of Land and Natural Resources, Division of Aquatic Resources;

- State of Hawai‘i, Department of Land and Natural Resources, Division of Forestry and Wildlife;
- U.S. Fish and Wildlife Service, Hawaiian and Pacific Islands National Wildlife Refuge Complex;
- U.S. Fish and Wildlife Service, Pacific Islands Fish and Wildlife Office;
- National Oceanic and Atmospheric Administration, Office of National Marine Sanctuaries;
- National Oceanic and Atmospheric Administration, National Marine Fisheries Service; and the
- Office of Hawaiian Affairs.

This group meets on a regular basis to implement the day-to-day management of the Monument. The MMB will operate under an interagency charter, providing details on its roles, responsibilities, and activities. The charter will be regularly reviewed and updated as necessary.

#### *Papahānaumokuākea Interagency Coordinating Committee*

The Co-Trustees authorized the MMB to establish the Papahānaumokuākea Interagency Coordinating Committee (ICC) to assist in implementation of Monument management activities. The ICC includes representatives from the Co-Trustees and other agencies, including, but not limited to, the U.S. Environmental Protection Agency, U.S. Coast Guard 14<sup>th</sup> District Prevention and Response, U.S. Geological Survey, and the DOD. This group is not fixed, meets periodically or as specific topics require, and federal and state agency partners may participate according to the relevancy of their activities and/or mandates related to the Monument.

#### ***The Co-Trustees***

##### *The U.S. Department of Commerce: National Oceanic and Atmospheric Administration*

Two NOAA line offices have mandates that apply to activities in the Monument –NOS and NMFS. In 2000, the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve (Reserve) was established via Executive Order 13178 (as amended by Executive Order 13196) to preserve and protect coral reef ecosystems of the NWHI. Responsibility for managing the Reserve was assigned to NOS through the National Marine Sanctuary Program (NMSP) under the authority of the National Marine Sanctuaries Act (16 U.S.C 1431 et seq.) and the National Marine Sanctuaries Amendments Act of 2000, Public Law 106-513, and other applicable statutes. Executive Order 13178 directed NOAA, in consultation with federal and state partners, to initiate a process to designate the Reserve as a national marine sanctuary pursuant to sections 303 and 304 of the National Marine Sanctuaries Act of 2000.

In January 2001, NOAA declared the Reserve an active candidate for sanctuary designation (5509 FR 66). A Reserve Advisory Council (RAC) was established to provide advice and recommendations on the designation and management of any sanctuary and to develop a Reserve Operations Plan for managing the Reserve. Throughout this process, the public and other stakeholders were engaged to seek input and gather information toward developing a unified plan for Reserve operations and the proposed sanctuary. A series of ten public scoping meetings were hosted in Hawai‘i and Washington, D C., with more than 13,000 comments received during the initial scoping period. Throughout the designation process, additional input was collected from the public, stakeholder groups, and interagency partners via science workshops (Gittings et

al. 2004), focus group discussions (SRG 2004b), and RAC and associated subcommittees meetings. In total, more than 100 meetings were held and close to 52,000 public comments were received that guided the direction and development of a draft sanctuary management plan to direct management of the anticipated sanctuary upon its designation. Simultaneously, a Reserve Operations Plan (ROP) was drafted and finalized with extensive consultation with partner agencies and the RAC (NOAA 2005a). The ROP guides the management of the Reserve and served as the primary foundation from which the draft sanctuary management plan was developed. In addition, a State of the Reserve Report was developed to provide a comprehensive summary of 5 years of Reserve operations (NOAA 2006).

The draft sanctuary management plan has several companion documents packaged into the draft designation proposal, including a draft environmental impact statement and draft implementing regulations. When the Monument was designated in 2006 by Presidential Proclamation, the processing of these documents was halted. However, the Proclamation recognized the extensive public input and the relevancy of the NMSP public processes and resulting draft sanctuary documents, and directed the Co-Trustees to modify, as appropriate, the draft sanctuary management plan in developing a plan to manage the Monument (Presidential Proclamation 8031, 36443 FR 71).

NMFS executes mandates and exercises authority under several statutes that are relevant to natural resource management in the Monument. Among others, these statutes include the Magnuson-Stevens Fishery Conservation and Management Act, the Endangered Species Act, the Marine Mammal Protection Act, the Fish and Wildlife Coordination Act, the Coral Reef Conservation Act, the Global Change Research Act, the Lacey Act Amendments, and the Fish and Wildlife Improvement Act of 1978, as well as various executive orders and proclamations. Since the 1970s, the national and regional management by NMFS (under NMFS' Southwest Region) has included management activities such as conservation, research, and emergency response, and fisheries management in the NWHI. Since its establishment in 2003, the Pacific Islands Regional Office and the Pacific Islands Fisheries Science Center have worked together to build on these programs and fulfill NMFS' functions in the Pacific Region, including the area that is within the Monument. All NMFS programs, Habitat Conservation, Sustainable Fisheries, and Protected Resources are relevant to NMFS' contribution to the Monument complement of programs.

NOAA's line offices collaborate to fulfill NOAA's Co-Trustee responsibilities under the Monument management arrangement. The Monument office of NOAA's Office of National Marine Sanctuaries (ONMS) and NMFS Pacific Islands Region, both headquartered in Honolulu, Hawai'i, represent NOAA at the field level and coordinate with the NOAA headquarters to ensure unified representation in the Co-Trustee arrangement.

*The U.S. Department of the Interior: U.S. Fish and Wildlife Service*

The U.S. Fish and Wildlife Service is a bureau of the U.S. Department of the Interior that works with others to conserve, protect, and enhance fish, wildlife, and plants and their habitats for the continuing benefit of the American people. Two program offices of FWS, Endangered Species and the National Wildlife Refuge System, have statutory authority for Monument resources and

program representatives are members on the MMB. Both coordinate with FWS and DOI headquarters to ensure unified representation in the Co-Trustee arrangement.

The FWS Pacific Islands Fish and Wildlife Office shares the responsibility for administration of the ESA with NMFS and has conservation oversight for all terrestrial species including seabirds. This office also administers coastal conservation and conservation partnerships programs through its habitat conservation division, and provides assistance with invasive species issues and emergency response throughout the Pacific islands.

The FWS also administers the 97-million acre National Wildlife Refuge System, including 548 refuges throughout the United States and its territories. The Hawaiian Islands and Midway Atoll NWRs, located within the Monument, are managed from Honolulu through the FWS Hawaiian and Pacific Islands NWR Complex. This Complex of refuges is in turn administered through the Pacific Regional Office, Regional Refuge Chief, headquartered in Portland, Oregon.

The overarching legislation and guidance for managing the Hawaiian Islands and Midway NWRs are derived from the National Wildlife Refuge System Administration Act of 1966, as amended (16 U.S.C. 668dd-668ee); the Refuge Recreation Act of 1962 (16 U.S.C. 460k-460k-4), as amended; 50 CFR (Wildlife and Fisheries); and the Fish and Wildlife Service Manual (administrative policy). Of all the laws governing the activities on NWRs, the National Wildlife Refuge System Improvement Act (Improvement Act) (Public Law 105-57, October 9, 1997) exerts the greatest influence. The Improvement Act amended the National Wildlife Refuge System Administration Act of 1966 by including a unifying mission for all NWRs to be managed as a system, a new process for determining compatible uses on refuges, and requiring that each refuge will be managed under a Comprehensive Conservation Plan, developed in an open public process.

The Improvement Act states that the Secretary of the Interior shall provide for the conservation of fish, wildlife, and plants, and their habitats within the Refuge System as well as ensure that the biological integrity, diversity, and environmental health of the Refuge System are maintained. House Report 105-106, accompanying the Improvement Act, states, “the fundamental mission of our System is wildlife conservation: wildlife and wildlife conservation must come first.” Biological integrity, diversity, and environmental health are critical components of fish and wildlife conservation. The FWS Biological Integrity, Diversity, and Environmental Health Policy states that “the highest measure of biological integrity, diversity, and environmental health is viewed as those intact and self-sustaining habitats and wildlife populations that existed during historic conditions (601 FW 310).”

The purpose for which a refuge was established or acquired is of key importance to refuge planning. Refuge purposes and the Refuge System’s mission form the foundation for management decisions. The purposes of a refuge are specified or derived from the law, proclamation, executive order, agreement, public land order, donation document, or administrative memorandum that establishes, authorizes, or expands a refuge.

The legal authority that established the area now known as the Hawaiian Islands National Wildlife Refuge (HINWR)—Executive Order 1019, signed by President Theodore Roosevelt on

February 3, 1909—set aside the islets and reefs extending from Nihoa to Kure, excepting Midway Atoll, as the Hawaiian Islands Reservation “...for use...as a preserve and breeding ground for native birds.” President Roosevelt took this action to provide additional protections for the seabirds after reports that hundreds of thousands of Laysan albatross were being slaughtered for the millinery trade in violation of the Lacey Act of 1900. In 1940, President Franklin Roosevelt signed Presidential Proclamation 2416, renaming the area the HINWR. The authorities, mandates, and policies that govern the activities of the FWS have resulted in the conservation of island, atoll, and nearshore habitats within the HINWR.

The HINWR has been closed to the public since its establishment and will remain closed to the public under the Monument Management Plan. Access to HINWR prior to Monument establishment was regulated by FWS Refuge Special Use Permit regulations. These permits were issued only to conduct research, education, or to film documentaries to promote public understanding of refuge resources and improve refuge management. In addition, the Secretary of the Interior and the President of the United States in 1974 considered all of the refuge’s emergent lands except Tern Island to be ecologically appropriate for inclusion into the National Wilderness Preservation System, as outlined in the Wilderness Act of 1964 (16 U.S.C 1132-1136). Congress, however, has not acted to designate this area within the wilderness system.

The FWS has also been assisting the U.S. Navy with wildlife management issues for almost 50 years at Midway Atoll. A cooperative management plan developed by the Navy and FWS in the early 1980s further defined responsibilities and led to the establishment of an “overlay” NWR on Midway in 1988. On October 31, 1996, President William Clinton signed Executive Order 13022, directing the Secretary of the Interior, through FWS, to administer Midway Atoll NWR. The purposes of the refuge, as defined in the Executive Order, are to maintain natural biological diversity; conserve fish and wildlife and their habitats; fulfill international wildlife treaty obligations; provide for research, education, and compatible wildlife-dependent recreation; and recognize and maintain the atoll’s historic significance. In addition, in accordance with language in the Fiscal Year 2000 Interior Appropriations Act, Secretary of the Interior Bruce Babbitt signed Secretary’s Order 3217, designating the lands and waters of Midway Atoll NWR as the Battle of Midway National Memorial.

### *The State of Hawai‘i*

In 1893, the Kingdom of Hawai‘i, which included most of the Northwestern Hawaiian Islands, was overthrown with the involvement of certain United States officials and others. Some involved in the overthrow and others went on to create a provisional government and then the Republic of Hawai‘i, which assumed control of approximately 1.8 million acres of crown, government, and public lands of the Kingdom of Hawai‘i, including certain submerged and fast lands of the Northwestern Hawaiian Islands. Upon its annexation, the Republic ceded these lands to the United States in 1900. A majority of these lands were again ceded, this time to the State of Hawai‘i, upon statehood in 1959.

Under the terms of the statute admitting Hawai‘i as a state in 1959, the federal government granted title to Hawai‘i to most of the previously ceded lands and mandated that these ceded lands be held by Hawai‘i in public trust. In accordance with the Hawaii Organic Act of April 30, 1900, c 339, 31 Stat 141, and the Hawaii Admission Act of March 18, 1959, Pub L 86-3, 73 Stat

4, most of the islands of the Hawaiian Archipelago that were part of the Territory of Hawai‘i became part of the State of Hawai‘i as part of the public land trust. Hawai‘i’s lands continue to hold a considerable amount of legal, historical, and sentimental significance to Native Hawaiians. Pursuant to Section 5(f) of the Hawaii Admission Act, one purpose for which the ceded lands are held in trust by the State is “for the betterment of the conditions of native Hawaiians.” Proclamation 8031, designating the Monument, specifically states, “Nothing in this proclamation shall be deemed to diminish or enlarge the jurisdiction of the State of Hawai‘i.”

The State of Hawai‘i DLNR has stewardship responsibility for managing, administering, and exercising control over the public trust and submerged lands (most of which are ceded lands), ocean waters, and marine resources, around each of the Northwestern Hawaiian Islands, except at Midway Atoll, Section 171-3 Hawaii Revised Statutes. In 2005, Hawai‘i Governor Linda Lingle established the Northwestern Hawaiian Islands Marine Refuge (0 to 3 nautical miles around all emergent lands, except Midway Atoll) under Sections 187A-5 and 188-53(a), Hawaii Revised Statutes (established as ch. 60.5, Hawaii Administrative Rules). Unless otherwise authorized by law, it is unlawful for any person to enter the refuge without a permit except for freedom of navigation, innocent passage, interstate commerce, and activities related to national defense or enforcement, foreign affairs, and in response to emergencies.

The State of Hawai‘i, DLNR’s Division of Forestry and Wildlife manages the emergent lands of the State Seabird Sanctuary at Kure Atoll. The State Historic Preservation Division and the State Historic Preservation Officer oversee cultural and historic resources statewide. DLNR’s Division of Conservation and Resource Enforcement maintains full police powers, including the power of arrest, within all lands and waters within the State’s jurisdiction. The State is represented on the MMB by DLNR’s Division of Aquatic Resources and Division of Forestry and Wildlife.

#### *Office of Hawaiian Affairs*

Established by a 1978 amendment to the Constitution of the State of Hawai‘i, Office of Hawaiian Affairs (OHA) serves as the principal agency working for Native Hawaiians. OHA was created for various purposes including bettering the conditions of Native Hawaiians. OHA manages a property and monetary trust, creating its fiduciary duty to Native Hawaiians. The OHA trust is funded in part by a pro rata share of income derived from the ceded lands portion of the public land trust.

Under the direction of nine publicly elected trustees, OHA fulfills its constitutional and statutory mandates. Section 10-1(a), Hawaii Revised Statutes, states: “The people of the State of Hawaii and the United States of America as set forth and approved in the Admission Act, established a public trust which includes among other responsibilities, betterment for conditions of Native Hawaiians. The people of the State of Hawaii reaffirmed their solemn trust obligation and responsibility declared in the state constitution that there be an office of Hawaiian affairs to address the needs of the aboriginal class of people of Hawaii.” OHA serves as a member of the MMB and, along with the Native Hawaiian Cultural Working Group, represents a voice of the Native Hawaiian community on Monument matters (see Native Hawaiian Community Involvement Action Plan, Section 3.5.3).

***Public Involvement***

Stakeholder and community involvement is an integral component to achieving the goals of the Monument. Engaging an informed constituency will further the successful protection of the ecosystems of the NWHI. Monument staff currently conduct diverse constituency building and outreach activities related to the Monument. Staff will continue to cultivate an informed, involved constituency that supports and enhances conservation of the natural, cultural, and historic resources of the Monument. Strategies and activities to further public involvement in Monument management activities are found throughout the Monument Management Plan.

## 2.3 Initial Management

### *Regulations Implementing the Proclamation*

The initial Monument regulations were issued to implement the provisions in Presidential Proclamation 8031, and rulemaking was completed jointly by the FWS and NOAA on August 29, 2006 (71 FR 51134). Monument regulations, codified under 50 CFR Part 404, establish the scope and purpose, boundary, definitions, prohibitions, marine zones, and regulated activities for managing the Monument. These regulations can be evaluated and updated as necessary.

Monument regulations: (For a full text, see Appendix D.)

- Prohibit unauthorized access to the Monument;
- Provide for carefully regulated educational and scientific activities;
- Preserve access for Native Hawaiian cultural activities;
- Establish marine zones to manage human activities;
- Provide for visitation in a special area around Midway Atoll;
- Phase out commercial fishing over a 5-year period;
- Ban exploring for, developing, or producing oil, gas, or minerals and using or attempting to use poisons, electrical charges, or explosives in the collection or harvest of Monument resources;
- Prohibit introducing alien species from within or into the Monument; and
- Prohibit anchoring on corals.

The prohibitions required by the Proclamation do not apply to the activities and exercises of the Armed Forces (including those carried out by the Coast Guard) that are consistent with applicable laws. However, it requires them to conduct activities and exercises in a manner that avoids, to the extent practicable and consistent with operational requirements, adverse impacts on Monument resources and qualities. Proclamation 8031 also requires that “in the event of threatened or actual destruction of, loss of, or injury to a monument resource or quality resulting from an incident, including but not limited to spills and groundings, caused by a component of the Department of Defense or the USCG, the cognizant component shall promptly coordinate with the Secretaries for the purpose of taking appropriate actions to respond to and mitigate the harm and, if possible, restore or replace the monument resource or quality.”

As the prohibitions of the Proclamation were effective upon issuance, there was a pressing need to resolve the permitting scheme as directed by the Proclamation. Thus, the Co-Trustees have collaborated to develop a joint permit system, essentially streamlining all discrete permitting processes into one Monument permit according to the six permit categories iterated in the Proclamation:

1. Research
2. Education
3. Conservation and management
4. Native Hawaiian practices
5. Special ocean use
6. Recreational activities within Midway Atoll

### ***Management Zones***

Monument regulations define three types of marine zones to manage activities. The zones are: Special Preservation Areas, Ecological Reserves, and the Midway Atoll Special Management Area (SMA) (Figure 2.1). Each zone addresses protection of habitat and foraging areas of threatened and endangered species; inclusion of a representative range of the diverse array of marine habitats, including shallow coral reef environments, as well as deepwater slopes, banks, and seamounts; and minimization of risks associated with specific activities such as fishing and recreational activities. Zones also protect the ecological linkages between habitats. The location and description of activities prohibited and allowed in each zone are defined in the Monument regulations (see Appendix D).

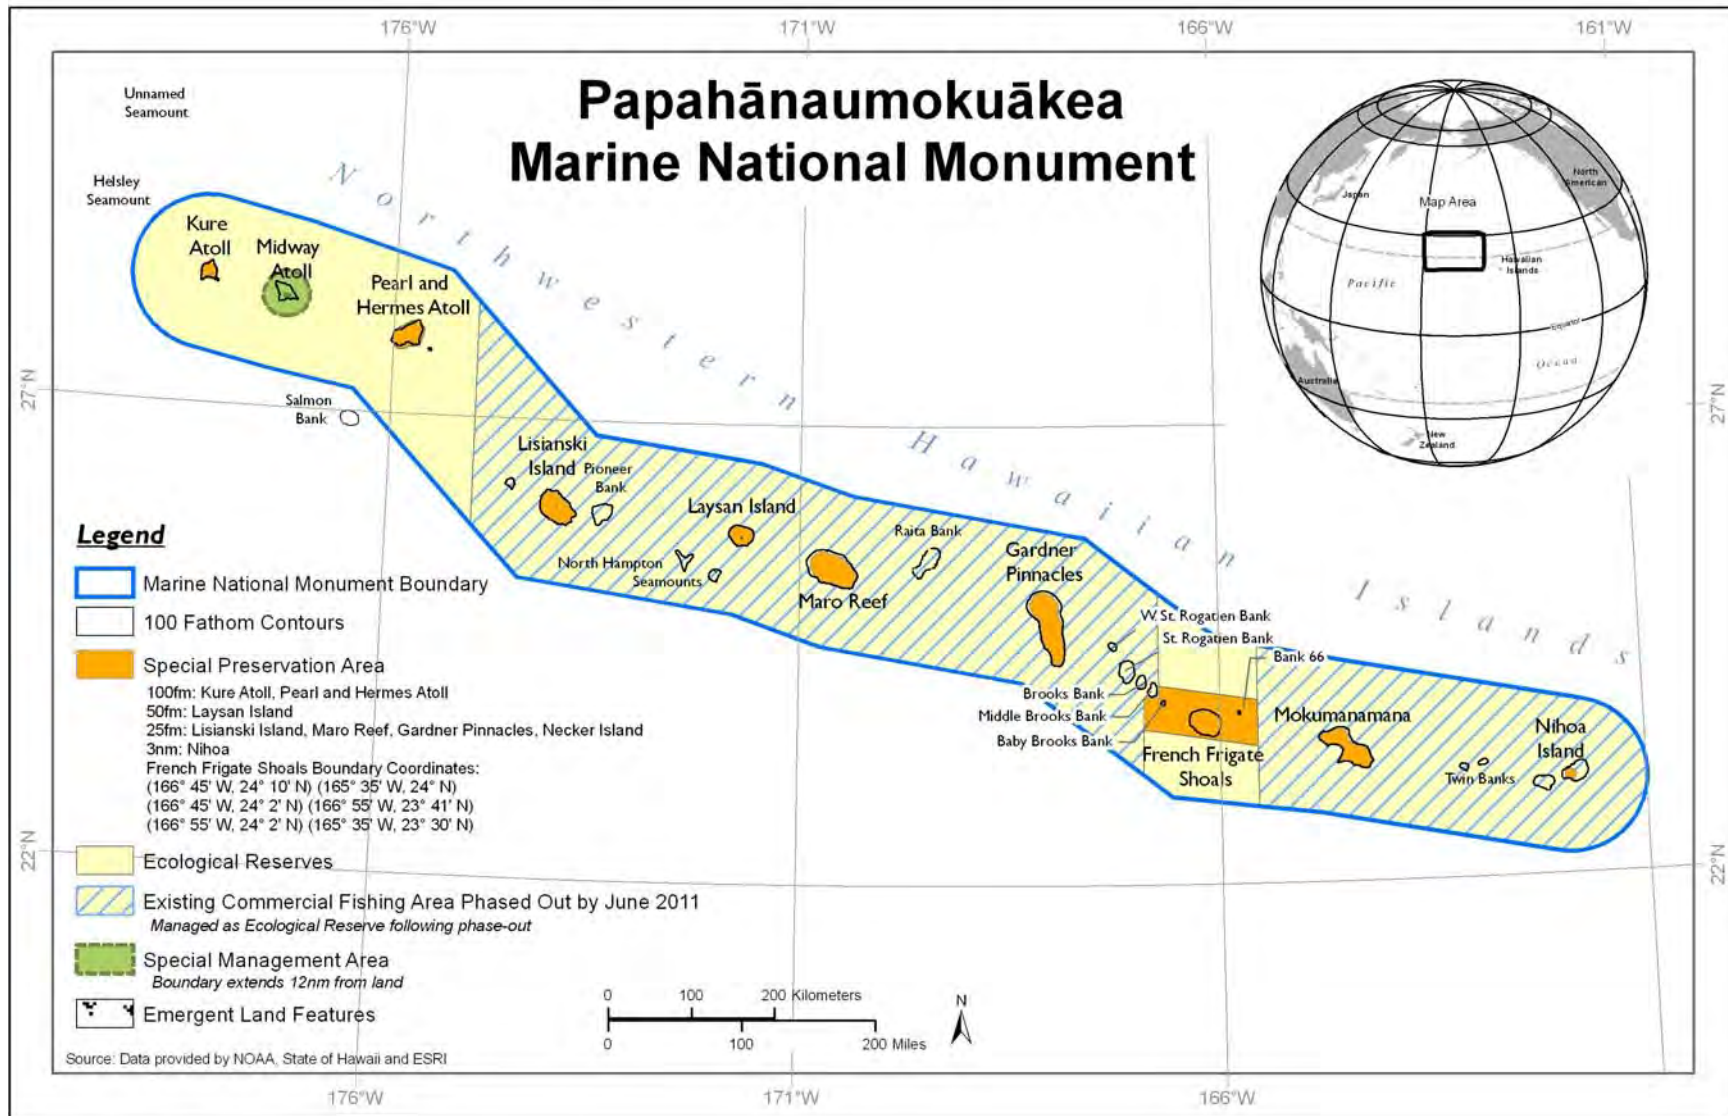

Figure 2.1 Map of the Papahānaumokuākea Marine National Monument and Zones.

Zoning provides protection to highly sensitive habitats, particularly shallow coral reefs. Discrete, biologically important areas of the Monument are designated as Special Preservation Areas, and resource harvest and almost all forms of discharge are prohibited. Other areas designated as Ecological Reserves consist of contiguous, diverse habitats that provide natural spawning, nursery, and permanent residence areas. Resource extraction is highly restricted within the Ecological Reserves. In the Midway Atoll SMA and other NWR areas, proposed activities are subject to findings of appropriateness (603 FW 1) and compatibility determinations (16 U.S.C. 668dd-668ee and 603 FW 2) by the FWS to ensure the activities meet the purposes for establishing the Hawaiian Islands and Midway Atoll NWRs and the mission of the National Wildlife Refuge System. Recreational activities in the Monument are restricted to the Midway Atoll SMA. Due to the vast size of the Monument, the existing zones extend over large areas and include a variety of habitat types and an extensive diversity of species. As new information becomes available, additional zones may be created to further the protection and conservation of the natural and cultural resources of the NWHI.

#### *Toward Ecosystem-Based Management*

An ecosystem approach to management for the NWHI requires that multiple steps be implemented in a comprehensive and coordinated way. The Monument approach is unique in that it includes:

- Ecosystem level planning
- Cross-jurisdictional management goals
- Co-management
- Adaptive management
- Marine zoning
- Habitat restoration
- Long-term ocean and coastal observing, monitoring, and research.

#### *Ecosystems, Ecosystem-Based Management, and Ecological Integrity*

Over the last decade, considerable scientific discussion and debate have been devoted to developing an understanding of concepts and terms used to describe an ecosystem, ecosystem-based management, and ecological integrity. For the purposes of this plan, an ecosystem is defined as a dynamic and interrelating complex of plant and animal communities and their associated nonliving environment with humans as an integral part of the system. Ecosystems are organized structurally into populations, species, and communities of organisms that interact with each other and with abiotic features of the environment and, functionally, into production and consumption components that process energy and materials (Limburg et al. 1986). Ecosystems vary in size, often with smaller systems embedded within larger ones. Ecosystems have been described as moving targets, with multiple potential futures that are uncertain and unpredictable (Walters 1986). The scale of ecosystems depends on the spatial extent of the system dynamics that are to be studied and influenced by management (Sissenwine and Murawski 2004).

Ecosystem-based management is an approach that recognizes the relationships and interconnectedness among living and nonliving ecosystem components that are affected by a number of natural and anthropogenic factors that vary over space and time. The goal of ecosystem-based management is to maintain ecosystems in a healthy, productive, and resilient

condition for their intrinsic value as well as to provide for needed ecosystem services.

Ecosystem-based management:

- Provides protection of marine and terrestrial ecosystem structure and function
- Is place-based, focusing on a specific ecosystem and the range of activities affecting it
- Explicitly accounts for the interconnectedness within systems, recognizing the importance of interactions between key species or services
- Integrates ecological, social, economic, and institutional perspectives, recognizing their strong interdependencies.

This approach requires managers to have access to extensive information and data including baseline conditions, the interactions among the components of the ecosystem, and the consequences of natural influences and individual and cumulative human activities. Ecosystem-based management also recognizes that humans are inseparable from and co-evolved with ecosystems. Surrounding any ecosystem are a multiplicity of perspectives and knowledge systems. Attention to the human dimensions assumes that humans affect, and are affected by, the oceans in both positive and negative ways and that these complex relationships between people and the ocean are dynamic, diverse and may differ among the various perspectives. The availability of scientific information, together with Native Hawaiian traditional knowledge, is essential for ecosystem-based management of the Monument.

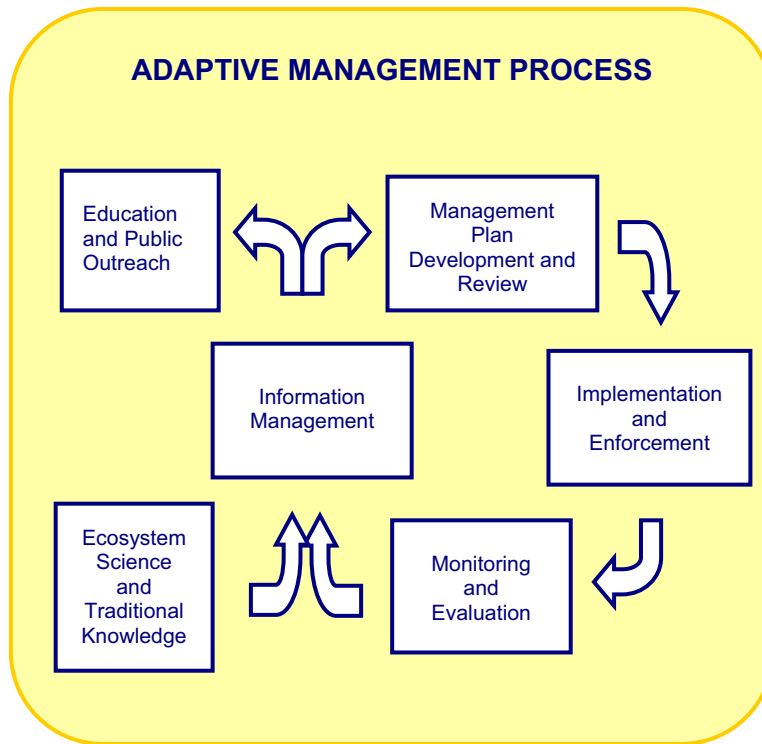

Maintaining ecological integrity is often cited as the primary goal of ecosystem-based management. Ecological integrity is the capability to support and maintain a balanced, integrated, adaptive community of organisms having species composition, diversity, and functional organization comparable to that of natural habitats of the region (Karr and Dudley 1981). A system will retain its integrity if it preserves all its components, as well as the functional relationships among those components (De Leo and Levin 1997). Kay (1991) described ecological integrity as the ability to maintain ecosystem function and structure in the face of changing environmental conditions, where “environment” refers to the biotic and external abiotic components that affect it, including humans. Considering the dynamic nature of ecosystems, the goal of ecosystem-based management should not be to eliminate all forms of disturbance, but rather to maintain processes within limits or ranges of variation that may be considered natural, historical, or acceptable (Noss 1995). Such an approach must be flexible, adaptive, and experimental at scales compatible with the scales of critical ecosystem functions (Walters 1986).

Ecological integrity is defined for the Monument as “a condition determined to be characteristic of an ecosystem that has the ability to maintain the function, structure, and abundance of natural biological communities, including rates of change in response to natural environmental variation” (50 CFR 404.3). This definition builds on this extensive body of research on ecosystem form and function and the Co-Trustee agencies’ experience and mandates.

### *Adaptive Management*

The Monument offers an unprecedented opportunity to take incremental and informed steps toward ecosystem-based management at a large scale. To progress consistently toward an ecosystem approach to management, new information and data will be used to inform and refine management strategies and activities, consistent with Monument goals and desired outcomes.

**Figure 2.2 Adaptive Management Cycle to Inform Management and Decisionmaking.**

Adaptive management is a continuous learning cycle designed to inform management actions and decisionmaking based on implementation of management strategies and actions, conducting monitoring and evaluation, and providing feedback to management on the success of meeting the desired outcomes and strategies (Figure 2.2). The Monument’s adaptive management process includes the following elements: management plan development and review, implementation and enforcement, monitoring and evaluation, integration of ecosystem science and traditional knowledge, scientific research, information management, and education and public outreach. Ecosystem science and traditional knowledge are inputs to the learning process, together with the results of monitoring and evaluation. A comprehensive information management system facilitates the compilation of information and data from research, monitoring, plan review, education, and public outreach and also helps to inform research and management priorities. An effective adaptive management process provides managers with timely feedback and information. If the desired outcomes and goals are achieved, then this approach confirms the management strategies and activities are on the right course. If the results are not achieved, then feedback into the management framework can help identify whether it is a specific action or group of strategies or activities that may need to change. Periodic updates of the Monument Management Plan will incorporate feedback from our adaptive management process and result in refined and sometimes new management strategies and activities to meet our overall Monument goals and desired outcomes.

### *Human dimensions*

Humans are integral to ecosystems, and the human dimensions of ecosystems are an integral focus of the science needed to achieve ecosystem-based management. Understanding the impact of humans on the ocean, the impact of the ocean on humans, and the human aspects of ocean governance provides the scientific basis for ensuring ocean health and quality of life for this and future generations (Joint Subcommittee on Ocean Science and Technology, 2007). The relationships between humans and ocean ecosystems are complex, dynamic, and coupled, and recognizing the importance of human-ocean relationships in the management of the NWHI assumes that human “impacts” on oceans are not necessarily negative, but also may restore and foster human and ocean well-being. In the planning, management, and evaluation of the Monument, human dimensions are critical for long-term success.

Marine science and policy institutions in the United States and worldwide recognize that a deeper understanding of the human dimensions of ecosystems—human causes, consequences, and responses to ecosystem stress—is needed to foster improved support for coastal and ocean decisionmaking. Examples include statements by the Joint Subcommittee on Ocean Science and Technology (2007), United States Commission on Ocean Policy (2004), Pew Oceans Commission (2003), International Human Dimensions Programme on Global Environmental Change, and NOAA’s External Ecosystem Task Team (2006).

The resilience of ecosystems is integrally connected to that of human systems. According to resilience thinking, a multiplicity of perspectives surrounds a given ecosystem. In the highly diverse Hawaiian archipelago, the idea of a “multiplicity of perspectives” captures the notion that within the community are a variety of perspectives and values about the oceans that vary depending upon people’s historical, cultural, social, political, economic, spiritual, or other contexts. These and other human dimensions insights are important considerations in providing a more integrative ecosystem understanding, promoting ecosystem resilience, and ensuring a holistic ecosystem-based management approach.

### *Incorporation of Traditional Knowledge*

*Ua lehulehu a manomano ka ‘ikena a ka Hawai‘i.  
Great and numerous is the knowledge of the Hawaiians.  
—Pukui (1983)*

There are many similarities between an ecosystem-based management approach for the NWHI and the traditional knowledge and practices implemented by Native Hawaiians to manage their natural resources. Both approaches share the view of nature as a holistic and dynamic system of interrelated parts and emphasize the need for long-term sustainability and health of our natural resources.

The Native Hawaiian traditional knowledge and worldview is valued for its rich base of empirical knowledge and practical methods of resource management, developed over hundreds of years of living and interacting with the lands and ocean waters of Hawai‘i (Titcomb and Pukui 1952; Kikuchi 1976; Titcomb et. al. 1978; Poepoe et. al 2003; Kikiloï 2003). Traditional management practices take advantage of understanding seasonal patterns in weather, patterns of biological species, and the designation of ecological zones (Handy et al. 1972; Kelly 1989; Gon 2003; Department of Land and Natural Resources 2003b).

Through detailed observations of the oceanic environment, its interrelation to the terrestrial environment, seasonal and lunar patterns, and species life cycles, species of the ocean and land realms were taxonomically partnered, and systems for resource management developed (Kamakau 1976; Malo 1951; Beckwith 1951). Kapu, or restrictions, on resource extraction were implemented based on these ecological understandings (Pukui and Handy 1950; Handy et al. 1972). Other traditional strategies were set up to naturally enhance marine resources through increased protection, growth, and reproduction (Kikiloi 2003). Understanding the Native Hawaiian worldview of ecosystems and relationships, along with traditional approaches to resource management, aids in moving toward an ecosystem-based management approach for the NWHI. These core principles include viewing ecosystems holistically, recognizing variations in space and time, and continuously building a knowledge base to inform management and successfully care for the environment. The perspective that Native Hawaiian traditional knowledge and resource management approaches bring to the Monument can provide insight into ecosystems and relationships.

## 2.4 Monument Management Policy Framework: The Vision, Mission, Guiding Principles, and Goals for Managing Papahānaumokuākea Marine National Monument

The Monument vision, mission, and guiding principles establish the overarching policy direction and guidance for Monument management (Figure 2.3 and Table 2.1). The vision describes the long-term management desire of the Monument to maintain the health and diversity of the NWHI ecosystem in perpetuity. The mission establishes the need for integrated management in order to achieve the long-term protection of NWHI ecosystems and the perpetuation of Native Hawaiian practices and heritage resources. The guiding principles provide direction for making informed decisions about human activities consistent with the vision and mission for the Monument. The Monument goals are the unifying elements of successful monument management. They identify and focus management priorities, resolve issues, and link to the public interest in preserving and caring for the historic and scientific objects within the Monument.

**Figure 2.3 Monument Management Policy Framework.**

**Table 2.1 Monument Vision, Mission, Guiding Principles, and Goals**

<b>Vision</b>
To forever protect and perpetuate ecosystem health and diversity and Native Hawaiian cultural significance of Papahānaumokuākea.
<b>Mission</b>
Carry out seamless integrated management to ensure ecological integrity and achieve strong, long-term protection and perpetuation of NWHI ecosystems, Native Hawaiian culture, and heritage resources for current and future generations.
<b>Guiding Principles</b>
<p>The Monument shall be managed in a manner that—</p> <ul style="list-style-type: none"> <li>• Is consistent with the Vision and Mission;</li> <li>• Recognizes that the resources of the NWHI are administered by the Co-Trustees for the benefit of present and future generations;</li> <li>• Affirms that the NWHI and its wildlife are important, unique, and irreplaceable;</li> <li>• Honors the significance of the region for Native Hawaiians;</li> <li>• Honors the historic importance of the region;</li> <li>• Incorporates best practices, scientific principles, traditional knowledge, and an adaptive management approach;</li> <li>• Errs on the side of resource protection when there is uncertainty in available information on the impacts of an activity;</li> <li>• Enhances public appreciation of the unique character and environment of the NWHI;</li> <li>• Authorizes only uses consistent with Presidential Proclamation 8031 and applicable laws;</li> <li>• Coordinates with federal, state, and local governments, Native Hawaiians, relevant organizations, and the public; and</li> <li>• Carries out effective outreach, monitoring, and enforcement to promote compliance.</li> </ul>
<b>Monument Goals</b>
<b>Goal 1:</b> Protect, preserve, maintain, and where appropriate restore the physical environment and the natural biological communities and their associated biodiversity, habitats, populations, native species, and ecological integrity.
<b>Goal 2:</b> Support, promote, and coordinate research, ecosystem characterization, and monitoring that increases understanding of the NWHI, improves management decisionmaking, and is consistent with conservation and protection.
<b>Goal 3:</b> Manage and only allow human activities consistent with Proclamation 8031 to maintain ecological integrity and prevent or minimize negative impacts for long-term protection.
<b>Goal 4:</b> Provide for cooperative conservation including community involvement that achieves effective Monument operations and ecosystem-based management.
<b>Goal 5:</b> Enhance public understanding, appreciation, and support for protection of the natural, cultural, and historic resources.
<b>Goal 6:</b> Support Native Hawaiian practices consistent with long-term conservation and protection.
<b>Goal 7:</b> Identify, interpret, and protect Monument historic and cultural resources.
<b>Goal 8:</b> Offer visitor opportunities at Midway Atoll to discover and appreciate the wildlife and beauty of the NWHI, enhance conservation, and honor its unique human history.

## 2.5 Management Action Plans

Action plans are composed of specific strategies to address six priority management needs. Each action plan is guided by a desired outcome, a specific need for action, and strategies and associated activities designed to achieve that need. Strategies and activities implement Monument regulations, research and educational partnerships, habitat management and restoration conservation targets, threatened and endangered species recovery, historic preservation, Native Hawaiian cultural practices, and appropriate public uses programmed over a 15-year period, with 5-year reviews.

### ***Monument Management Plan Development and Review***

The management plan will be reviewed every five years. The review represents an essential element of the adaptive management process and includes public involvement, characterization of issues, and review and evaluation of action plans.

This Monument Management Plan was developed based on the current state of knowledge on the most appropriate management measures. These management measures consist of regulations and action plans to govern the first five years of Monument management and project activities over a 15-year timeframe, where appropriate. Action plans will be implemented, and where regulations apply, enforced, through interagency collaborative mechanisms based on the jurisdiction of each government agency. After five years, the Monument Management Plan will be reviewed, incorporating lessons learned and new data and information from monitoring, ecosystem science, and traditional knowledge, and a comprehensive evaluation to develop or refine management strategies and actions.

### ***Six Priority Action Plan Groupings***

The core of the Monument Management Plan is contained in 22 action plans, organized under six priority management needs. Priority management needs were identified considering legal mandates and inputs from numerous public scoping meetings and workshops, as well as the status of Monument resources based on the multiple temporal and spatial scales of management issues, and meetings conducted with managers, scientists, and other stakeholders. Priority management needs address multiple Monument goals by defining specific areas for focused action, including improving our understanding of the NWHI, conserving wildlife and habitats, reducing threats to the ecosystem, managing human uses, facilitating collaboration and partnerships, and achieving effective Monument operations.

Action plans describe specific strategies to address the six priority management needs for the Monument. Each action plan is guided by a desired outcome and provides the context and history of the particular issue or management activity. Action plans also highlight a specific need for action

#### **Note to Readers Regarding Terminology and FWS Refuge Comprehensive Conservation Program Requirements**

The Proclamation stated that, "to manage the Monument, the Secretary of Commerce, in consultation with the Secretary of the Interior and the State of Hawaii, shall modify, as appropriate, the plan developed by NOAA's National Marine Sanctuary Program through the public sanctuary designation process, and will provide for public review of that plan." Sanctuary management plans are structured differently than NWR management plans. As a result, this plan includes desired outcome statements, strategies, and activities as a part of the action plans that direct Monument management actions. For those familiar with refuge management plans, these statements, strategies, and activities are equivalent to goals, objectives, and strategies respectively.

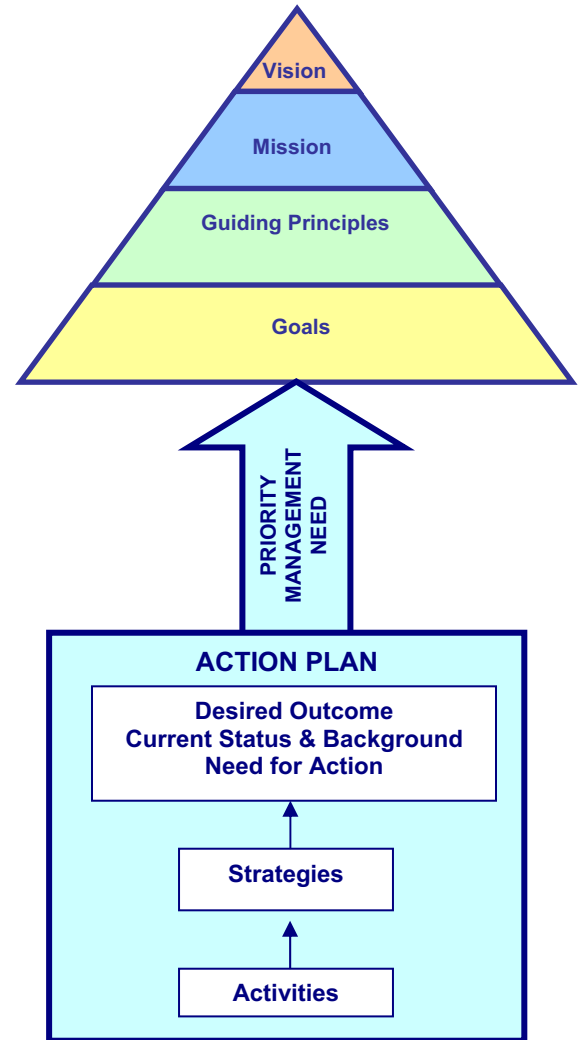

and identify strategies and associated activities designed to address that need. Ultimately, all strategies and activities are designed to help achieve the desired outcome of the action plan (Figure 2.4).

#### *Understanding and Interpreting the NWHI*

The NWHI represent a unique opportunity to advance our understanding of ecosystem science through research, monitoring, and the incorporation of traditional knowledge. In turn, coordinated research and long-term monitoring is needed to deepen our understanding of the composition, structure, and function of NWHI ecosystems and to provide the predictive tools to make informed management decisions consistent with the conservation and protection of the region. The continued development of a long-term monitoring program is needed to provide vital data and information necessary to monitor changes in ecosystem status over time and to evaluate the effectiveness of management measures in protecting and restoring ecological integrity. The integration of human dimensions with ecological ones in both research and management will further ecosystem-based management of the Monument. Additionally, the incorporation of indigenous knowledge into management practices will enrich and inform the MMB's approach to long-term planning. The further characterization of Native Hawaiian cultural relationships to the NWHI through the study of oral histories, place names, and practices associated with the region will enhance the physical record of activities in the NWHI. The unique aspects of island and Pacific maritime history, as well as historical and archaeological resources, collectively can provide a basis for developing effective management of resources.

#### *Conserving Wildlife and Habitats*

The Presidential Proclamation establishing the Monument highlights that it is in the public interest to preserve marine and terrestrial areas in the NWHI through active conservation and management of wildlife and their habitats. “This diverse ecosystem is home to many species of coral, fish, birds, marine mammals, and other flora and fauna including the endangered Hawaiian monk seal, the threatened green sea turtle, and the endangered leatherback and hawksbill sea turtles” (Presidential Proclamation 8031, 2006). Action plans to address this priority management need contain strategies to maintain the biological integrity, diversity, and environmental health of the Monument and identify activities to assist in the recovery of threatened and endangered species; manage migratory bird populations; and conserve, manage, and, where appropriate, restore the habitats of the Monument's native flora and fauna.

**Figure 2.4 Organization of Action Plan by Priority Management Need.**

### *Reducing Threats to the Ecosystem*

Despite their remote location, marine and terrestrial ecosystems of the NWHI are at risk from a range of threats from human activities within and outside the Monument. Natural and anthropogenic threats to the Monument include habitat alteration or damage from marine debris, the changing climate including increased storm intensity and frequency, rising sea level and ocean temperature, introduction of alien species, potential vessel and aircraft impacts, release of hazardous materials from landfills, vessel grounding, and past human impacts. Development and implementation of threat reduction protocols and monitoring are needed to protect, preserve, maintain and, where appropriate, restore natural communities, including habitats, populations, native species, and ecological processes, and function as a public trust for current and future generations. In addition to threat reduction, emergency response in the Monument will be coordinated under a series of plans and systems.

### *Managing Human Activities*

The NWHI has experienced a long history of human use, with periods of overexploitation, that have contributed to the current endangered status of some species, including land birds, several plants, sea turtles, and the Hawaiian monk seal. Although the extent of resource exploitation has been limited in recent years, human activities and the use of Monument resources will be carefully managed considering historical uses and new threats. Action plans for managing human activities address the need for permitting, enforcement, and managing specific human uses, including Native Hawaiian cultural practices and visitors at Midway Atoll.

### *Coordinating Conservation and Management Efforts*

Comprehensive and coordinated conservation and management of the Monument can be achieved only through effective interagency coordination and partnerships with a broad range of stakeholders. Coordination between the MMB members and other stakeholders is needed to maintain existing resource protection measures, increase the efficiency and effectiveness of management and enforcement, and reduce conflicts and duplication of Monument management activities. Education and outreach efforts will require coordination among government agencies, nongovernmental organizations, and other stakeholder groups. Coordination with stakeholders and the public will provide a forum for advice and input on Monument management and improve awareness and understanding of the ecological, Native Hawaiian cultural significance, and historic significance of the NWHI. Coordination with international initiatives is needed to address Pacific regional and global management issues affecting the Monument.

### *Achieving Effective Monument Operations*

Monument operations include central and field operations, information management, and overall program evaluation. Central and field operations are essential to support action plans to address all other priority management needs. Central operations are located in the main Hawaiian Islands and include support offices, interpretive facilities, and information management facilities. Field operations include shipboard and research diving operations, as well as land-based operations in the NWHI. Monument staff and facilities provide essential operational capacity for effective collaboration between the MMB and other stakeholders. Operational effectiveness will be evaluated and improved through an adaptive management process that captures lessons learned and transforms them into action.

### 3.0 Action Plans to Address Priority Management Needs

The Monument Management Plan contains 22 action plans organized under six priority management needs. Each action plan is guided by a desired outcome, a specific need for action, and strategies and associated activities designed to achieve that need over a 15-year period with 5-year reviews. A projected timeline for completion is provided with most strategies in the action plans. These projected timelines begin once the Management Plan becomes final.

The strategies and activities described in each action plan were developed based on the current state of knowledge on the most appropriate management measures. Estimated costs to implement the Monument Management Plan are provided in Table 3.1 by action plan. The cost of administration and planning, field, and infrastructure development activities was estimated and combined for all agencies responsible for management of the Monument.

At the end of each Action Plan, a summary table lists which MMB agency has the lead for coordinating each activity. Lead agency designation does not necessarily relate to actual statutory, jurisdictional, or regulatory authority. However, lead agency does mean that agency will take the lead in providing much of the staff and other resources (such as, funding, volunteers, infrastructure, vessels, aircraft, etc.) to implement the activity and is responsible for coordinating with other agencies to monitor and report the progress of the project(s). It should be emphasized that other MMB agencies are encouraged to participate in shared decision-making and implementation of the activity.

The total estimated cost to implement the Monument Management Plan over the next 15 years is \$358,573,974. Roughly one-quarter of this amount are costs identified in Section 3.6.3, Coordinated Field Operations. Most of the coordinated field operations costs would be allocated to one-time infrastructure development activities designed to replace or enhance supporting infrastructure at existing field stations, rehabilitation of historic buildings at Midway, and increase transportation and enforcement assets Monument-wide.

This Monument Management Plan provides long-term guidance for management decisions over a 15-year horizon and sets forth desired outcomes, with strategies and activities to reach those outcomes, including the agencies' best estimate of future needs. These estimates are sometimes substantially above current budget allocations and are included primarily for agency strategic planning and program prioritization purposes. Neither this draft nor the subsequent final plan constitutes a commitment of funds, or a commitment to request funds, by federal or state agencies. All funding for current and possible future Monument activities is subject to the budgeting and appropriations processes of the federal and state governments.

Prioritization of activities in the management plan is not a linear process nor necessarily measured by the amount of funds allocated. Several factors apply when setting the implementation schedule and allocating funds; these include, but are not limited to, natural, cultural, and historic resource needs; funding; agency capacity; completion of necessary planning and environmental review; and community input and support. Each MMB and partner ICC agency develops annual budget projections and priorities and allocates funds based on its own

programmatic, legal and policy requirements. The cycle and timelines for funding and planning vary.

After five years, the Monument Management Plan will be reviewed, incorporating lessons learned and new data and information from monitoring, ecosystem science, and traditional knowledge, and a comprehensive evaluation to develop or refine management strategies and actions.

**Table 3.1 Total Estimated Cost to Fully Implement Actions Plan by Year**

Priority Management Need	Action Plan	Estimated Annual Cost							PMN Total	% of Total
		Yr 1	Yr 2	Yr 3	Yr 4	Yr 5	Yrs 6-10	Yr 11-15		
<b>Understanding and Interpreting the NWHI</b>	3.1.1 - Marine Conservation Science	\$12,212,725	\$7,176,000	\$7,571,102	\$7,715,012	\$8,037,820	\$9,085,989	\$10,221,737	\$79,954,250	22%

### **3.1.3 Historic Resources Action Plan**

### **3.1.4 Maritime Heritage Action Plan**

---

### 3.1 Understanding and Interpreting the NWHI

Protecting the health and integrity of the resources in the Monument is a key priority for resource managers. “Ecological Integrity” is defined by Monument regulations as a “condition determined to be characteristic of an ecosystem that has the ability to maintain the function, structure, and abundance of natural biological communities, including rates of change in response to natural environmental variation.” Protecting the integrity of cultural and historic resources is also a critical component of management. Management actions and decisions need to be informed by a solid understanding of Monument resources. Monitoring, research, and restoration are integral components that provide the data and analysis needed to take the appropriate management actions.

Resource managers and policymakers need comprehensive information about the ocean, and islands and atolls, and their natural and social environments to make wise decisions. The U.S. Commission on Ocean Policy (2005) and the President’s Ocean Action Plan have identified a number of areas of scientific inquiry fundamental to management. These topics include coral reefs, marine biodiversity, regional ecosystem dynamics, climate change, and social and economic research. Many of these apply directly to the NWHI. Baseline monitoring data and characterization are essential to identify natural and human-induced temporal changes and provide the basis for evaluating whether management activities are effective or need to be modified based on changing conditions. The Monument Management Plan reflects these nationally recognized natural and social science needs for ecosystem-based management.

The NWHI consist of a complex assemblage of ecological, cultural, and historic resources in relatively undisturbed condition compared with the main Hawaiian Islands and many other marine-based ecosystems in the world (Freidlander et al. 2005). The Monument represents a unique opportunity to improve management decision making, to advance management-driven ecosystem science through research on ecosystem components and processes, and to develop models and other tools to predict ecosystem responses to natural and anthropogenic perturbations, such as climate variability and change. In addition to the Native Hawaiian cultural significance of the region, submerged maritime heritage resources, such as shipwrecks and sunken aircraft, and other historic and archaeological sites provide insight into the NWHI’s rich past.

Agencies responsible for caring for this extraordinary place include the State of Hawai‘i, FWS, and NOAA. Establishment of the Monument provides a management framework that encourages, facilitates, and directs coordinated management, preservation, research, education, and planning with other partners. Universities and other research organizations are also integral to building knowledge about the NWHI. As our understanding of the NWHI’s ecological, cultural, and historic resources improves, so will our capacity to achieve effective and long-term protection of this special place. A more complete understanding of the NWHI will provide insights for improved management throughout the Hawaiian Archipelago.

Action plans to understand and interpret the NWHI focus on characterizing and monitoring the region from multiple perspectives. They also emphasize sharing information with partners and the public in relevant ways.

Each action plan consists of a set of strategies to address a desired outcome. Over the next 15 years, these desired outcomes are:

- **Marine Conservation Science:** Protect the ecological integrity of natural resources by increasing the understanding of the distributions, abundances, and functional linkages of marine organisms and their habitats in space and time to improve ecosystem-based management decisions in the Papahānaumokuākea Marine National Monument.
- **Native Hawaiian Culture and History:** Increase understanding and appreciation of Native Hawaiian histories and cultural practices related to Papahānaumokuākea Marine National Monument and effectively manage cultural resources for their cultural, educational, and scientific values.
- **Historic Resources:** Identify, document, preserve, protect, stabilize, and, where appropriate, reuse, recover, and interpret historic resources associated with Midway Atoll and other historic resources within Papahānaumokuākea Marine National Monument.
- **Maritime Heritage:** Identify, interpret, and protect maritime heritage resources in Papahānaumokuākea Marine National Monument.

Action plans described in this section will be implemented in close coordination with other partners and in conjunction with other priority management needs.

### 3.1.1 Marine Conservation Science Action Plan

#### Desired Outcome

Protect the ecological integrity of natural resources by increasing the understanding of the distributions, abundances and functional linkages of marine organisms and their habitats in space and time to improve ecosystem-based management decisions in the Papahānaumokuākea Marine National Monument.

3.3.2	Alien Species
3.5.1	Agency Coordination
3.6.2	Information Management
3.6.3	Coordinated Field Operations

#### Current Status and Background

Scientific endeavors in the NWHI were motivated in part by conservation goals as early as 1920, when the Tanager Expedition included people engaged in not only collection of specimens but eradication of invasive species and restoration of habitats damaged by introduced herbivores at Laysan Island. The Pacific Ocean Biological Survey Program carried out by the Smithsonian Institution, while not explicitly designed for conservation purposes, laid the foundation of our knowledge of seabird populations and movements at sea. The Tripartite agreement among the State of Hawai‘i, FWS, and NOAA Fisheries provided a framework for extensive ecological research in the NWHI beginning in 1976. Interwoven with these large institutional efforts are numerous independent research projects that continue to contribute to the body of knowledge available for science-based resource conservation.

Links to goals
Goal 2
Goal 4
Goal 6
Goal 7

Multiagency efforts continued when the Northwestern Hawaiian Islands Reef Assessment and Monitoring Program (NWHIRAMP, historically known as NOWRAMP), was initiated in 2000 to characterize and monitor the coral reefs of the NWHI using a consistent set of sampling protocols. The Reef Assessment and Monitoring Program establishes a baseline for future data gathering and monitoring change over time. NWHIRAMP is a collaborative partnership of agencies and institutions consisting of quantitative diver surveys of fish, coral, algae, and invertebrate communities, supplemented by towed diver surveys of large fish and substrate type, oceanographic data collection, and sediment contaminant studies (Maragos and Gulko 2002).

Other annual multi-agency efforts are supported by a variety of agencies and institutions, including the University of Hawai‘i’s Hawai‘i Institute of Marine Biology (HIMB). This research partnership focuses on conservation science and has produced many key findings that have management implications, not just within the Hawaiian archipelago, but also for the maintenance of healthy coral reef ecosystems around the world. HIMB’s ongoing research on genetic connectivity, tagging studies, disease outbreaks, coral health, threat assessments, and climate change will be used to inform managers’ understanding of the NWHI and help to create a holistic view of ecological structure and function to ensure the best protection of the Monument’s valuable resources. The Monument acts as an ideal site to understand ecosystem function and responses to natural and anthropogenic events in a site largely free from direct human impacts. This provides a unique opportunity to understand how healthy ecosystems

respond to change and compare these natural responses with other sites with greater human impact. This understanding will be important for evaluating the effects and ecological implications of climate change in the Monument, as compared with other sites particularly around the Pacific.

In another multi-agency project, NOAA led a significant mapping effort using satellite imagery, multi-beam sonar, and other remote sensing methods to provide detailed maps of the shallow-water seabed features of the Northwestern Hawaiian Islands, including the *Draft Atlas of the Shallow-Water Benthic Habitats of the NWHI* (NOAA 2003b) and the *Bathymetric Atlas of the NWHI* (Miller et al. 2004). These documents begin to describe the marine habitats and bathymetry of the NWHI and establish important baseline information for resource managers. Efforts are under way to expand the coverage of the bathymetry data, interpret the multi-beam backscatter imagery, develop a ground-truthing database, and verify remotely sensed information to further refine and complete these characterizations. The expanded habitat mapping efforts will provide managers with a greater understanding of the available resources as well as provide fundamental data for a variety of modeling efforts such as modeling the effects of climate change.

In May 2003, NOAA, through a multiagency partnership, convened a workshop with NWHI resource managers and researchers from the scientific community to identify information and science needs and resources for effective conservation and management of the NWHI. The results from this workshop were analyzed and summarized in a report titled *Information Needs for Conservation Science and Management of the Northwestern Hawaiian Islands* (Gittings et al. 2004). Workshop results are incorporated into planning and coordination efforts of science and management activities in the NWHI, and research gaps identified by the workshop informed the drafting of the archipelago wide, multiagency Hawaiian Archipelago Marine Ecosystem Research Plan (HAMER). In November 2004, the NWHI Third Scientific Symposium was held in Honolulu, Hawai‘i, and provided further syntheses of the current state of knowledge and management of the NWHI (Macintyre 2006).

Building on these earlier planning efforts, and in light of the complexity and depth of conservation science needs in the Monument, the MMB expanded the development of a stand-alone Natural Resources Science Plan to further identify management priorities, assess and identify standard protocols, formalize collaborative monitoring, and increase effectiveness of protection and management efforts. A scoping meeting for the draft Natural Resources Science Plan was held in November 2007 to solicit input on five broad thematic research categories. The five thematic areas adapted from the HAMER Plan and identified in the draft Natural Resources Science Plan are:

- Research on ecological processes and connectivity
- Research on biodiversity and habitats
- Research on human impacts
- Research on ecosystem change, indicators, and monitoring
- Modeling and forecasting ecosystem change

Biologists survey algae and coral species throughout the NWHI to monitor ecosystem health. Photo: Jean Kenyon

### **Need for Action**

Effective stewardship of the Monument should be based on reliable information on the biological characteristics of the organisms, their ecological relationships, an understanding of the natural temporal variations, and anthropogenic impacts that affect their ecosystems.

It is important to continue and further enhance monitoring efforts to protect and conserve the Monument's flora and fauna. Conducting annual monitoring will provide for an assessment of the continued health of the NWHI. Akin to monitoring vital signs such as heartbeat and blood pressure in humans, monitoring the abundance and diversity of marine organisms allows managers to track health and establish baselines and the range of natural variability throughout the year and between years. These baselines help to identify change over time and can be used in many ways; from assessing the status of groups of organisms, to assessing the effects of management and restoration efforts, to studying the impact of larger-scale phenomena, such as climate change on ecosystems. Monitoring can also be used as a broad-scale warning system, to assess changes, or to identify when management actions need to be modified based on changing conditions. Changing resource conditions may also prompt managers to request more specific research and seek actionable results to best protect and preserve the Monument.

Although monitoring and research are deemed an integral part of the Monument Management Plan, great care will be taken to ensure that the research conducted in the Monument is necessary for the continuation and enhancement of resource protection. The permitting process and future Natural Resource Science Plan (NRSP) will continue to specify that the benefits of data acquisition will outweigh the impacts of conducting these activities.

Recognizing the value of and need for greater understanding of marine habitats, continued characterization and monitoring of marine habitats and species are described within this Action Plan. Because of the connection between marine and terrestrial species, communities and ecosystems, additional management-related surveys, research, and monitoring priorities that span marine and terrestrial habitats are also found in separate action plans within this Monument Management Plan, in particular Threatened and Endangered Species, Migratory Bird, Habitat Management and Conservation, Marine Debris, and Alien Species Action Plans. With coral reefs, seabird colonies, and tropical ecosystems in decline in general around the world, the NWHI present a unique opportunity to characterize an intact ecosystem and begin to understand the degree of natural variability in an ecosystem relatively free of local anthropogenic influences. Studying these remote areas may also make an important contribution toward understanding the impacts of global climate change on coral reef ecosystems. The NWHI are still relatively unexplored, and fundamental information on the species, habitats, and their status is needed to best protect these resources in perpetuity. Functional relationships among the species, habitats, ecosystems, and oceanographic and other physical processes of the NWHI marine environments are also not well understood. Evaluation tools, such as models, are needed to describe complex ecosystem functions and provide resource managers with the capability to assess both the benefits and risks of management decisions.

### **Strategies to Achieve the Desired Outcome**

There are three strategies designed to achieve the desired outcome of protecting ecological integrity by increasing the understanding of the distributions, abundances, and functional linkages of marine organisms and their habitats in space and time to improve ecosystem-based management decisions in the Monument. Systematic characterization, monitoring, and research are means to acquire this information. Strategy MCS-1 and its associated activities are specific to the marine environment, while strategies MCS-2 and MCS-3 apply to all research and monitoring activities in the Monument. The strategies and activities are coded by the acronym for the action plan title, Marine Conservation Science (MCS). A summary of strategies and activities is provided in Table 3.1.1 at the end of this action plan.

- MCS-1: Continue and enhance research, characterization, and monitoring of marine ecosystems for the life of the plan, as appropriate.
- MCS-2: Assess and prioritize research and monitoring activities over the life of the plan.
- MCS-3: Communicate results of research and monitoring over the life of the plan.

#### **Strategy MCS-1: Continue and enhance research, characterization and monitoring of marine ecosystems for the life of the plan, as appropriate.**

This strategy is focused on continuing marine research, characterization, and monitoring designed to support an ecosystem-based approach to protection and management. These activities are implemented through a variety of partnerships and collaborations, including those with the University of Hawai‘i’s HIMB, Hawai‘i Undersea Research Lab (HURL), School of Ocean and Earth Science Technology, and others. Findings will be synthesized and made available for managers to inform decision making, as well as to the general public. Additional marine research and monitoring activities are found in the Threatened and Endangered Species, Migratory Bird, Habitat Management and Conservation, Marine Debris, and Alien Species Action Plans.

As ecosystem characterization assessments are moving ahead, analysis of data from regular monitoring surveys can be used to evaluate change over time in a given ecosystem. Monitoring data can help scientists understand the causes of change and be used to build ecosystem models. Producing high-level ecosystem functional models can be achieved only through broad-based collaborations among agencies and institutions with varying capacities. It is critical that monitoring protocols be established in collaboration with partner agencies so that they may yield reliable, useful information over time. To the extent possible, relevant datasets will be integrated with the national Integrated Ocean Observing System efforts.

#### ***Activity MCS-1.1: Continue to characterize types and spatial distributions of shallow-water marine habitats to inform protection and management efforts.***

The MMB will continue working with partners to conduct field work to validate and update existing habitat maps and bathymetry. This work will build on remote sensing data originally collected in the development of the *Draft Atlas of the Shallow-Water Benthic Habitats of the NWHI* and the *Bathymetric Atlas of the NWHI*, Draft. The updated dataset, maps, and images will provide a framework for the biogeographic assessment in Activity MCS-2.3, described below. The results of these activities will better define resource baselines to inform protection

and management efforts. Shallow-water habitats are defined as those less than 16 fathoms (30 meters).

***Activity MCS-1.2: Continue monitoring of shallow-water coral reef ecosystems to protect ecological integrity.***

Monitor shallow water habitats using sampling protocols developed through interagency collaborative efforts. Sites selected should be representative of broad habitat types. Quantitative surveys of coral, algae, fish, and invertebrates will be conducted annually using methods comparable to or intercalibrated with those of existing historical data sets. This monitoring will be conducted in collaboration with partners. The suitability of these methods, data sets, and analyses to meet management needs will be periodically assessed with partners as described in Activity MCS-2.2, and are subject to change based on the outcomes of that activity. The results of these activities will better define resource baselines for comparisons in protection and management efforts.

***Activity MCS-1.3: Map and characterize deep-water habitat.***

As resources in this habitat are virtually unknown in the NWHI, it is imperative to understand the dynamics of deep-water habitat to protect and manage them in the future. Working with partners, the MMB will use data collected with the multibeam sonar systems to acquire both bathymetric and backscatter data and produce deep-water benthic habitat maps. Habitat maps will be ground-truthed using remote cameras, submersibles, and other technology, as appropriate. This work will continue to develop baseline inventory of the biological resources and biodiversity of deep reefs, seamounts, banks, and abyssal plains using all available technologies, including submersibles, remotely operated vehicles (ROV), autonomous underwater vehicles (AUV), and technical diving. Deep-water habitats are defined as those greater than 16 fathoms (30 meters). Research investigations will be continued on the deep coral reef, deep slope, seamount, pelagic, and abyssal ecosystems of the NWHI.

***Activity MCS-1.4: Establish and implement monitoring program for deep-water ecosystems, as appropriate.***

Using the shallow-water ecosystem monitoring protocols as a model, protocols will also be developed for deep-water ecosystems. In collaboration with research partners, the Monument will determine management information needs and establish data collection protocols, statistical sampling design, and site selection criteria for monitoring of deep-water ecosystems, as well as implement monitoring of deep-water reefs, banks, and associated communities to meet these management information needs. All appropriate technologies and methods will be utilized, including submersibles, ROVs, AUVs, bait station drop cameras, and technical diving. Monitoring of key indicator species will be implemented if determined to be a key monitoring tool.

***Activity MCS-1.5: Measure connectivity and genetic diversity of key species to enhance management decisions.***

Genetic studies can provide data to compare the similarity or differences of populations at different locations across the NWHI. Understanding the genetic diversity of species, and the ways in which an area's populations change, helps managers forecast, prepare for, and mediate potential threats to populations. Identifying the genetic makeup of populations can help

managers understand more about the effective size of a population, its history of immigration from other populations, and the level of genetic diversity inherent in the population. This information is helpful in understanding the various fish stocks, as well as whether the NWHI serve as a source for recruits to the MHI. Comparisons of the population genetics at different sites in the Monument may indicate whether those populations are distinct and must be managed separately or whether the population in question can be considered as the same throughout the archipelago. Population connectivity can be assessed using genetic assays across a broad range of coral reef invertebrates and fishes with widely varying life history characteristics. Understanding the genetic diversity of species provides important information into how anthropogenic influences, such as debris accumulation, pollution, and climate change, can be evaluated Monument-wide. Population connectivity can be assessed using genetic assays across a broad range of coral reef invertebrates and fishes with widely varying life history characteristics.

***Activity MCS-1.6: Collect, analyze, and input research, monitoring, and bathymetric data into appropriate databases to inform management decisions.***

Information management is critical for organizing and storing large numbers of published and unpublished manuscripts and research findings, as well as for analyzing and summarizing large amounts of data and other research products. Because of the complexity of information management from multiple sources, it is imperative that such an endeavor be conducted in close collaboration with interagency and research partners (see Section 3.6.2 Information Management Action Plan, Activity IM-1.2). Such collaborations necessitate the flow of information to and from other established agency databases, such as NOAA's Coral Reef Watch Program, NOAA's Coral Reef Information System (CoRIS), DLNR's seabird and dolphin database, and the multiagency online Oceanographic Atlas of the Pacific. The Monument Information Management System, as well as other databases, will be updated on a regular basis to manage, analyze, summarize, and interpret research data collected from the NWHI to best protect Monument resources. Products, such as maps and reports on the status and trends of important resources in the NWHI, will be generated from these databases for researchers and managers.

**Strategy MCS-2: Assess and prioritize research and monitoring activities over the life of the plan.**

A management-driven Natural Resources Science Plan will be developed and assessed on a regular basis to ensure that marine and terrestrial research and monitoring conducted in the NWHI are appropriate, relevant, and necessary to ensure ecological integrity is maintained, enhance effective management, improve management decision making, advance ecosystem science, include traditional knowledge, and begin to understand the impacts of climate change. The plan will build on existing regional science and research planning efforts. Consistency with HAMER and links to similar research in the main Hawaiian Islands will be maintained so that science conducted in this portion of the archipelago can be used across the archipelago. An interdisciplinary range of investigations designed to protect resources and inform management actions will be included in the plan.

***Activity MCS-2.1: Develop a prioritized Natural Resources Science Plan to support protection and management activities within 1 year.***

Working collaboratively, the MMB will develop a prioritized, interdisciplinary NWHI Monument NRSP. The NRSP will serve as a more detailed implementation plan that supports protection, management and research strategies contained within this action plan, as well as specific management-related surveys, research, and monitoring priorities found in other Action Plans, in particular the Threatened and Endangered Species, Migratory Bird, Habitat Management and Conservation, Marine Debris, Alien Species, and Native Hawaiian Culture and History Action Plans. It will align management priorities among agencies to facilitate resource and information sharing and will address both baseline information needs and management-driven needs, with the ultimate goal of ensuring that the health and ecological integrity of the Monuments resources are protected. The NRSP will be a stand-alone document separate from that of the Monument Management Plan, with its own federal and state environmental review. Each agency or research partner will use the plan as a guide for conducting and authorizing research activities. Information needs and gaps will be reevaluated on a regular basis with input from the MMB, ICC, technical groups, research partners, Native Hawaiians, and the public. The NRSP will also address monitoring requirements to understand the direct and indirect impacts of climate change on species, populations and ecosystems.

Examples of activities to be included in the NRSP under the five thematic areas are:

*Research on ecological processes and connectivity*

Understanding the mechanisms that link NWHI populations (and where applicable to the main Hawaiian Islands) at various scales, such as oceanographic processes, recruitment variability, larval and adult behavior, bird migratory and foraging patterns and drivers, the effect of isolation on the genetic structure of terrestrial flora and fauna, and other life history characteristics, will reveal the connectivity and interrelationships of the ecosystems within the NWHI.

*Research on biodiversity and habitats*

Documenting, maintaining, and restoring diversity includes the discovery and description of new species, identifying the spatial distributions of habitats critical for the survival of native species, determining habitat changes important for the survival of native species, and maintaining diversity by affecting the recovery of protected species. This activity may include the study of methods for the restoration of native habitats, plants, and animals; research on terrestrial arthropods and avian components of the biological community; research on circulation patterns, residence times of water, wave climatology, and other physical drivers that structure habitats and result in biological zonation of the marine and terrestrial environments.

*Research on human impacts*

Understanding the impacts of human activities on the ecosystems of the NWHI may include research on the cumulative impacts of both local (e.g., research, other permitted activities) and distant (marine debris, fishing, climate change) activities, as well as the impact of invasive species on the marine and terrestrial biodiversity of the NWHI. Comparative studies between the main Hawaiian Islands and NWHI provide a unique opportunity to examine the effects of anthropogenic activities on coral reef ecosystems.

*Research on ecosystem change, indicators, and monitoring*

Establishing baselines on the abundance and health of Monument biota is the first step toward understanding the range of natural variability that characterizes these ecosystems. Research will address marine and terrestrial biodiversity and communities. Coral bleaching follow-up surveys and assessments will be continued with regional research partners to assess the impacts of major bleaching events in 2002 and 2004. Research to define and understand factors contributing to resilience and recovery from these perturbations will assist managers in responding to future bleaching events. The use of indicator species as a monitoring tool will be evaluated.

*Modeling and forecasting ecosystem change*

Developing functional ecosystem models that reflect the complexity and dynamic nature of the ecosystems of the NWHI is a long-term goal of the Monument's research program. A related goal is to design models that reflect ecological connectivity of the NWHI to the main Hawaiian Islands and other regions of the Pacific. Descriptive and predictive models will be used by managers to better understand ecosystem function, and to evaluate the impacts of proposed activities.

***Activity MCS-2.2: Assess monitoring program protocols.***

Consistency in data collection protocols over time is of primary importance in any monitoring program in order to enable statistically valid comparisons between time periods. As management needs evolve and our understanding of ecosystem variability improves, monitoring protocols, sampling design, and sampling intervals will be evaluated for their effectiveness in meeting management needs and accurately reflecting change in the environment. An overall goal of these periodic assessments will be to ensure that the sampling and site selection protocols adequately represent the range of habitats in the NWHI, and that the methods provide adequate statistical power to detect differences between sites or changes between time periods and that the data are useful to and informs management decisionmaking. These evaluations will be conducted on a cycle consistent with 5-year management plan reviews with the interagency technical group on research.

***Activity MCS-2.3: Formalize collaborative regional monitoring programs for the NWHI.***

Several independent monitoring initiatives are being conducted in the NWHI and new initiatives are planned, such as monitoring for invasive species, seabird colonies, the effectiveness of Monument management zones, water chemistry, and water quality. Monitoring programs will need to include data on the organisms in the NWHI in a wide range of habitats as well as oceanographic and climatological parameters. Monument zones, which are spread across a broad distance and include a range of habitats, will require the design of an efficient yet effective monitoring program to maximize protection and management efforts. The Monument will facilitate the development of formal monitoring programs that are closely linked to the needs of NWHI resource managers. Partnerships with collaborating agencies and organizations will be established in which responsibilities, obligations, deliverables, and timelines for a regional monitoring program are clearly articulated.

***Activity MCS-2.4: Implement management-driven research priorities identified in the Monument Natural Resources Science Plan.***

Once the Monument Natural Resources Science Plan is finalized, priorities identified in the plan will guide research and monitoring activities for both marine and terrestrial environments that will in turn provide the necessary information for effective management actions. These priorities will be reassessed on a regular basis based on the outcome of research and monitoring activities, outcome of evaluation assessments, the 5-year reviews of the Monument Management Plan and regular reviews of the Science Plan. Research and monitoring priorities will be implemented through a variety of partnerships and collaborations.

***Activity MCS-2.5: Coordinate research update meetings.***

Regular meetings among managers, staff, and researchers will be conducted to facilitate the exchange of information and ensure the management-driven Monument research objectives identified in the NRSP are being met.

**Strategy MCS-3: Communicate results of research and monitoring over the life of the plan.**

Research is an exciting way to promote ecosystem literacy and caring for the NWHI. Ecosystem research-related education and outreach present an ideal opportunity to “bring the place to the people and not the people to the place.” This strategy serves a dual purpose of presenting the science to a general audience and promoting the research necessary to manage the Monument. In addition, research and modeling discoveries can be shared with the public and incorporated into classroom curricula. Activities contained within this strategy apply to terrestrial and marine research and monitoring activities in the Monument.

***Activity MCS-3.1: Coordinate an annual meeting to present current research in the NWHI.***

Annual meetings provide an important forum for the NWHI multidisciplinary research community, managers, and interested public to keep abreast of current research initiatives and recent findings. This meeting will seek to incorporate recent findings from research, including but not limited to, ecosystem, Native Hawaiian, maritime heritage, and socioeconomic studies.

***Activity MCS-3.2: Identify and prioritize research, monitoring, and modeling projects for education and outreach.***

Translating NWHI research findings to the public and incorporating it into classroom curricula is a high priority for the Monument. Working with partner agencies, research, monitoring, and modeling projects will be identified and prioritized for dissemination.

***Activity MCS-3.3: Include an educational component in marine research expeditions.***

Past NOWRAMP/NWHIRAMP expeditions have included educational components that have been highly successful for education and outreach. Components included live web sites with updates from the research vessel, imagery, and video. Using this model and other innovative ideas, marine research and monitoring expeditions aboard NOAA research vessels will include educational and outreach components.

***Activity MCS-3.4: Use materials gathered and created through research to develop or enhance education and outreach products.***

Many of the materials developed during previous marine research expeditions have been incorporated into other outreach products, specifically displays at the Mokuāpāpapa Discovery

Center, slideshows, and educational curricula. Similarly, educational materials have been associated with satellite tracking of albatross and migration of golden plovers. Education and outreach products will continue to be developed based on research conducted in the Monument. (See Section 3.5.4, Ocean Ecosystems Literacy Action Plan).

**Table 3.1.1 Summary of Strategies, Activities, and Agency Leads for Marine Conservation Science**

Strategies and Activities	Agency Lead
<b>Strategy MCS-1: Continue and enhance research, characterization and monitoring of marine ecosystems for the life of the plan, as appropriate.</b>	
Activity MCS-1.1: Continue to characterize types and spatial distributions of shallow-water marine habitats to inform protection and management efforts.	NOAA
Activity MCS-1.2: Continue monitoring of shallow-water coral reef ecosystems to protect ecological integrity.	NOAA
Activity MCS-1.3: Map and characterize deep-water habitat.	NOAA
Activity MCS-1.4: Establish and implement monitoring program for deep-water ecosystems, as appropriate.	NOAA
Activity MCS-1.5: Measure connectivity and genetic diversity of key species to enhance management decisions.	NOAA
Activity MCS-1.6: Collect, analyze, and input research, monitoring, and bathymetric data into appropriate databases to inform management decisions.	NOAA
<b>Strategy MCS-2: Assess and prioritize research and monitoring activities over the life of the plan.</b>	
Activity MCS-2.1: Develop a prioritized Natural Resources Science Plan to support protection and management within 1 year.	NOAA
Activity MCS-2.2: Assess monitoring program protocols.	NOAA
Activity MCS-2.3: Formalize collaborative regional monitoring programs for the NWHI.	NOAA
Activity MCS-2.4: Implement management-driven research priorities identified in the Monument Natural Resources Science Plan.	NOAA FWS
Activity MCS-2.5: Coordinate research update meetings.	NOAA
<b>Strategy MCS-3: Communicate results of research and monitoring over the life of the plan.</b>	
Activity MCS-3.1: Coordinate an annual meeting to present current research in the NWHI.	NOAA
Activity MCS-3.2: Identify and prioritize research, monitoring, and modeling projects for education and outreach.	NOAA
Activity MCS-3.3: Include an educational component in marine research expeditions.	NOAA
Activity MCS-3.4: Use materials gathered and created through research to develop or enhance education and outreach products.	NOAA

### 3.1.2 Native Hawaiian Culture and History Action Plan

#### Desired Outcome

Increase understanding and appreciation of Native Hawaiian histories and cultural practices related to Papahānaumokuākea Marine National Monument and effectively manage cultural resources for their cultural, educational, and scientific values.

Links to other Action Plans	
3.1.1	Marine Conservation Science
3.1.3	Historic Resources
3.5.2	Constituency Building and Outreach
3.1.4	Maritime Heritage
3.5.3	Native Hawaiian Community Involvement
3.5.4	Ocean Ecosystems Literacy
3.6.2	Information Management

#### Current Status and Background

Since the early visioning process in 2000 on how best to protect the NWHI, the need to understand and document the cultural significance of the Monument and its integral relationship with the rest of the archipelago has been growing, leading to an increased effort to research and compile known cultural information about this important region. This research effort has produced a substantial amount of cultural information and theories pertaining to the traditions and practices of Native Hawaiians in the NWHI (Kikiloi in prep.). This work includes archival research (Tava and Keale 1989; Mackenzie and Kaiama 2003), ethnographic studies (Maly 2003), and archaeological research (Emory 1928; Cleghorn 1988; Liller 2000; Graves and Kikiloi in prep).

Links to goals
Goal 4
Goal 5
Goal 6
Goal 7

While more cultural research needs to be conducted, several steps have been taken toward integrating this cultural information into educational and outreach efforts. One of these efforts is “Navigating Change,” an education and outreach partnership created in 2001 among NOAA, FWS, the State of Hawai‘i, the Polynesian Voyaging Society, Bishop Museum, and many other groups. This initiative, which includes classroom curricula and multimedia materials, utilizes Native Hawaiian voyaging traditions and cultural values to engage students and the public in learning about and caring for the NWHI as well as the main Hawaiian Islands. Together, the Polynesian Voyaging Society, FWS, NOAA, and the State coordinated voyages by *Hōkūle‘a*, a traditional Hawaiian double-hulled voyaging canoe, to and through the NWHI, as well as the associated educational outreach efforts for the voyages.

Cultural sites at Mokumanamana indicate the use of the NWHI and surrounding oceans by Native Hawaiians in precontact Hawai‘i. Photo: Andy Collins

To effectively engage both English and ‘ōlelo Hawai‘i (Hawaiian language) speakers, and to explicitly recognize the Native Hawaiian history and continued relationship with Papahānaumokuākea, all interpretive signs at Mokupāpapa Discovery Center in Hilo and similar education centers are in both English and ‘ōlelo Hawai‘i. Native Hawaiian values and histories are integrated into the displays, and Hawaiian-speaking volunteers have been recruited to act as docents at Mokupāpapa.

The Reserve, in collaboration with the Kamakakūokalani Center for Hawaiian Studies at the University of Hawai‘i, conducted cultural research on the NWHI. This research and synthesis have yielded a university-level course on the NWHI and an informational video that portrays the NWHI from an indigenous perspective. In August 2004, the Kamakakūokalani Center held a 2-day workshop to discuss Native Hawaiian issues and concerns about the NWHI (see also Section 3.5.3, the Native Hawaiian Community Involvement Action Plan).

Also under contract with the Reserve, the Bernice Pauahi Bishop Museum developed an online “Annotated Bibliography of Cultural Resources for the Northwestern Hawaiian Islands.” The database contents primarily include holdings available in the Bishop Museum’s Library and Archives, the libraries at the University of Hawai‘i at Mānoa, and the State of Hawai‘i Archives that may be valuable to researchers and others learning about the NWHI. The database is accessible to the public on the Internet ([www2.bishopmuseum.org/noaanwhi/index.asp](http://www2.bishopmuseum.org/noaanwhi/index.asp)).

To strengthen the agencies’ cultural resource management capability, internal capacity and a liaison program will be developed. Under such a program, liaisons with the Hawaiian community would conduct projects and initiatives to support cultural education, research, and access. The liaisons would work with the Native Hawaiian community, plan and organize cultural working group meetings, and coordinate cultural research and outreach for the Monument (see also Section 3.4.3, the Native Hawaiian Community Involvement Action Plan). Through a Native Hawaiian cultural perspective, we can learn more about the NWHI’s ecosystems and histories and develop better ways of managing the area.

### **Need for Action**

Both the executive order that established the Reserve and Proclamation 8031, which established the Monument, recognize and address the significance of the NWHI to Native Hawaiians. Understanding the NWHI from a Native Hawaiian perspective benefits the Monument in many ways. Native Hawaiians’ resource management practices were and are mainly guided by their traditional beliefs and familial connections to their natural environment and the imperative to manage the islands and oceans as inextricably linked. As a result, Native Hawaiian research contributes to an ecosystem-based approach to management and complements other types of research. Education of and by, and outreach to, the Native Hawaiian community can elicit greater involvement by Native Hawaiians in Monument management. Utilizing cultural information in education and outreach will engage the broader public in learning about and caring for the Monument and Native Hawaiian culture. This action plan presents strategies and activities for research, education, and outreach aimed at accomplishing that desired outcome.

More research and documentation about Native Hawaiian traditions, practices, and histories of the NWHI need to be done, particularly before the histories held only in the oral tradition are lost with the kūpuna who hold that knowledge. Some of this work can be accomplished through literature searches and other historical, Hawaiian language, and archival research. Other information will require access to the NWHI to conduct new cultural research by both academics and practitioners. As information is gathered and compiled information regarding the location, character, or ownership of certain cultural resources may be withheld from public disclosure, consistent with applicable law such as the National Historic Preservation Act.

The Monument offers a vast, sacred, and protected classroom, which cannot be recreated or modeled anywhere else, for Native Hawaiians or the rest of the world. For example, the experiential learning of traditional wayfinding and cultural protocols by crewmembers of the *Hōkūle‘a* and other Polynesian voyaging wa‘a (canoes) cannot be learned in a museum or from books. Equally, the historic sites of Nihoa and Mokumanamana represent the most pristine and extensive collection of cultural sites within the Hawaiian archipelago and are being used as a training ground for cultural practitioners who wish to continue to practice such cultural protocols as can only be rediscovered in Papahānaumokuākea. Native Hawaiian cultural tradition is primarily transmitted orally, and current educational studies have shown that Native Hawaiian learning continues to be most productive when done experientially (Tibbetts 2006).

As a result, and as allowed by applicable laws, cultural accesses to promote and expand traditional knowledge may include a component that allows for observational learning and experiences, which help translate in part to building relationships with both the place and the people of the place. These interpersonal relationships with fellow researchers may be as important as ancestral connections that are also related to Papahānaumokuākea. Experiences gained in Papahānaumokuākea are absorbed over time, with information and knowledge earned that potentially may be understood or implemented after the actual experience. Only if relationships with the place, spirits, and people of the place are maintained can the experiential knowledge be appropriately shared and used at the right time. Western scientific terms such as “baseline” and “assessment” are not necessarily used the same way in Hawaiian traditional knowledge, and as such cultural research should not be limited in scope or manner by any such terminology.

### **Strategies to Achieve the Desired Outcome**

Five strategies have been identified to increase understanding and documentation of Native Hawaiian culture and history related to the Monument. The strategies and activities are coded by the acronym for the action plan title, “Native Hawaiian Culture and History” (NHCH). A summary of strategies and activities is provided in Table 3.1.2 at the end of this action plan.

- NHCH-1: Identify and prioritize scientific and Native Hawaiian cultural research needs within 18 months.
- NHCH-2: Conduct, support, and facilitate Native Hawaiian cultural access and research of the NWHI over the life of the plan.
- NHCH-3: Increase cultural resource management capacity across MMB agencies over the life of the plan.
- NHCH-4: Plan, develop, and implement a Monument Cultural Resources Program over the life of the plan.
- NHCH-5: Provide cultural outreach and educational opportunities to serve the Native Hawaiian community and the general public over the life of the plan.

### **Strategy NHCH-1: Identify and prioritize scientific and Native Hawaiian cultural research needs within 18 months.**

Identification and prioritization of research needs will be achieved through consultation with the Native Hawaiian Cultural Working Group and other Native Hawaiian institutions and organizations, and by assessing and identifying gaps in the information assembled in the past in consultation with what was then the Reserve Advisory Council's Native Hawaiian Cultural Working Group and other cultural experts. Potential research topics include (1) understanding the historical relationship Native Hawaiians have had with the NWHI; (2) understanding cultural practices of this region, such as navigation and voyaging, traditional religious worship, place names and geography, mele (song) and hula (dance), mo'olelo (legendary histories, mythologies, and stories), and fishing techniques; (3) determining culturally and ecologically appropriate methods of following the Hawaiian protocol of giving ho'okupu (offerings); (4) acquiring and implementing traditional Hawaiian knowledge; (5) increasing research to support and identify sites for protective status; and (6) clarifying how Hawaiian concepts of restoration and preservation of natural and cultural resources fit into current regulatory constraints. Research on these topics will give insight into the appropriateness of certain activities and practices that occur in the area.

***Activity NHCH-1.1: Identify research needs that can be accomplished through anthropological, archaeological, historical, and Hawaiian cultural methods.***

Such research could be conducted through ethnographic interviews, researching oral traditions and archival historical information written in the English and Hawaiian languages, archaeological survey and analyses, and cultural field experience. Potential topics include further study into the history of Nihoa and Mokumanamana's previous inhabitants, the human-made structures on those islands, and cultural links throughout the archipelago—especially for residents of Ni'ihau and Kaua'i with the NWHI. Research needs will be developed within 18 months and consistently updated via such venues as the annual cultural resources research conference (see Section 3.4.3, the Native Hawaiian Community Involvement Action Plan).

***Activity NHCH-1.2: Develop cultural research priorities alongside associated management challenges and opportunities.***

Once research needs have been identified, priorities will be established by the MMB in consultation with the Native Hawaiian Cultural Working Group that are directly linked to key management challenges and available opportunities to conduct such research. These needs and priorities will be assembled in a report that will be completed within 18 months.

**Strategy NHCH-2: Conduct, support, and facilitate Native Hawaiian cultural access and research of the NWHI over the life of the plan.**

Ongoing research and documentation about Native Hawaiian traditions, practices, and histories of Papahānaumokuākea are as important as ongoing scientific research in helping us ensure successful management of the Monument. Thus, working closely with partners, we will continue to conduct and support cultural and historical research and seek ways to facilitate access to the NWHI for such purposes. The MMB will also work to support complementary Western science and traditional knowledge investigations, management, and outreach strategies. This work will be done in cooperation with partners, both organizations and individual researchers. Additionally, research findings may help clarify appropriate cultural activities for an area and aid in gaining appropriate additional protections for cultural resources.

Cultural accesses will incorporate opportunities for the perpetuation and expansion of traditional knowledge, including natural resources conservation and management. Such accesses may emphasize the interconnectivity of the entire Hawaiian archipelago and assist Native Hawaiian practitioners in reconnecting to the natural resources knowledge and experience of their ancestors, which will further assist them in teaching and practicing traditional resource management in the main Hawaiian Islands as well as assist managers of Papahānaumokuākea. Native Hawaiian mele (songs), oli (chants) and mo‘olelo (stories) that refer both to the NWHI and to natural resource abundance are best understood when observed and experienced first-hand. The NWHI provide a unique opportunity to continually experience and view a sizeable portion of the Hawaiian archipelago much as Native Hawaiian ancestors once did. As Native Hawaiian practitioners connect with and experience the natural and cultural resources through the eyes of their ancestors, they also become aware of an inherent kuleana (responsibility and privilege) to foster the possibility of ‘ōuli (ancestral signs or omens expressed through nature) and biophysical and spiritual understandings of the environment.

All of these types of cultural research findings would be integrated and presented as part of an annual meeting to present current research being conducted in the NWHI (see Section 3.1.1, the Marine Conservation Science Action Plan). This annual meeting provides an important forum for the NWHI multidisciplinary research community, managers, and interested public to keep abreast of current research initiatives and recent findings.

***Activity NHCH-2.1: Continue to compile information and conduct new cultural and historical research about the NWHI.***

Limited cultural and historical research about the NWHI has already been directly conducted by NOAA and FWS in conjunction with partner organizations such as OHA and the Bishop Museum. Monument staff will continue to compile existing information about the region and initiate new research based on the priorities developed under strategy NHCH-1.

***Activity NHCH-2.2: Support Native Hawaiian cultural research needs.***

Once priorities have been developed, access needs to meet these priority requirements will be considered and established as opportunities arise to create additional partnership contracts, grants, or formal agreements with Native Hawaiian organizations and individuals. Research on the issues identified through the process described in strategy NHCH-1 may also be supported by the MMB through grants, logistical support, berthing space aboard research vessels (see Section 3.6.3, the Coordinated Field Operations Action Plan), and other in-kind resources. Such support has already begun prior to Monument establishment and will be continued.

***Activity NHCH-2.3: Facilitate cultural field research and cultural education opportunities annually.***

Consistent with activities that have already begun in the Monument, the MMB will continue to facilitate research and education opportunities in the field for students, teachers, and cultural specialists during every field season. Such support includes providing berthing space aboard research vessels, logistical support, and putting researchers and educators in touch with others doing similar work.

***Activity NHCH-2.4: Convene a Native Hawaiian nomenclature working group.***

Within a year, the Monument will convene a variety of experts, including the Native Hawaiian Cultural Working Group, on the history and meaning of Hawaiian names for known and yet-to-be-discovered regions, islands, geographical and oceanic features, sites, and plant and animal species. These names and their histories and meanings will be included and updated regularly in the forthcoming Monument Information Management System (see below) to ensure that such names continue to reflect Hawaiian knowledge and experience, and processes will be established to ensure that the Native Hawaiian names are imbued with appropriate cultural authority and officially recognized in government records.

***Activity NHCH-2.5: Incorporate cultural resources information into the Monument Information Management System.***

As cultural information is compiled and generated, in collaboration and cooperation with Native Hawaiian organizations and institutions that are also creating databases of such information (such as OHA's *Wahi Pana* Database), it will be incorporated into the Monument Information Management System (see Section 3.6.2, the Information Management Action Plan). This system will incorporate a security layer for the protection of proprietary cultural information.

***Activity NHCH-2.6: Continue to facilitate Native Hawaiian cultural access.***

Such access needs may include, but not be limited to (1) access to the NWHI by cultural practitioners for Hawaiian religious practices and ceremonial purposes; (2) regular access for Polynesian voyaging canoes for wayfinding, navigational, and cultural protocol training; (3) gathering specific types of plants, shells, and feathers for cultural implements and ceremonies; (4) repatriating iwi kūpuna (ancestral bones) and monitoring burial sites; (5) honoring ancestral homelands and their associated deities; (6) restoring native species; and (7) observing and reconnecting with natural and spiritual resources. These types of access allow for lessons to be learned at specific sites for specific purposes and to determine significant astronomical relationships, and provide for voyaging training in a voyaging route of Native Hawaiians' kūpuna. Voyaging training provides for traditional navigational apprenticeship in an ancient art, which Hawaiians conceive as learning to pull an island out of the sea from beyond the horizon using only observation and knowledge of the natural environment.

***Activity NHCH-2.7: Establish agreements with local universities and museums to address possible curation, research, use, return, and repatriation of collections.***

To provide proper stewardship of cultural resources and artifacts, necessary agreements will be established in concert with the Cultural Resources Program Plan (see strategy NHCH-4). Other agreements will be developed as the need arises, including, but not limited to, negotiation for agreements to be initiated within 18 months with the Bishop Museum and University of Hawai'i about inventories, curation, and access of existing cultural resources currently in their control.

**Strategy NHCH 3: Increase cultural resource management capacity across MMB agencies over the life of the plan.**

To effectively carry out the strategies and activities outlined within this action plan, the MMB agencies will increase their collective capacity to effectively understand, manage, and protect the

Native Hawaiian cultural resources of the Monument and fulfill federal and state mandates and requirements.

***Activity NHCH-3.1: Assess Monument cultural resource capacity.***

Limited staff capacity currently exists among the Monument management agencies in the area of cultural resource management. Agencies will identify staff needs and work toward building staff capacity to carry out the strategies and activities contained within this plan. Staffing needs will be identified and included in the development of the Monument Cultural Resources Program Plan (see Activity NHCH-4.1).

***Activity NHCH-3.2: Engage Native Hawaiian practitioners and cultural experts and the Native Hawaiian Cultural Working Group in the development and implementation of the Monument's management activities.***

The Native Hawaiian Cultural Working Group and other Native Hawaiian cultural practitioners and experts will be consistently consulted and integrated into the creation and implementation of programs (see Section 3.5.3, the Native Hawaiian Community Involvement Action Plan). Examples of their participation may include the following: (1) providing cultural briefings to every person preparing to enter the Monument, as a condition of being permitted access; (2) when feasible, accompanying permittees accessing the Monument to experience, practice, and learn from the Monument resources while educating others; and (3) including Native Hawaiians, particularly the younger generations, as part of cultural and scientific research teams when feasible.

***Activity NHCH-3.3: Increase knowledge base of Native Hawaiian values and cultural information through "in-reach" programs for resource managers.***

Efforts will be made to increase the knowledge base of Native Hawaiian cultural significance by Monument resource managers. This knowledge base will be increased by having Monument resource managers and staff and MMB members, as appropriate, participate in informal and formal briefings, cultural workshops, and cultural exchanges in cooperation with other marine protected area sites that integrate traditional knowledge into their management.

***Activity NHCH-3.4: Identify and integrate Native Hawaiian traditional knowledge and management concepts into Monument management.***

In the past, traditional resource management involved recognizing local variations, observing patterns, periodically applying kapu (restrictions on resource extraction and other activities) by konohiki (local managers), and maintaining a deep respect for, and intimate knowledge of, the environment. The MMB will work with the Native Hawaiian community and other cultural experts to identify how traditional knowledge and associated practices may be integrated into Monument management and research activities. A report on traditional knowledge and management practices, including recommendations for integrating these perspectives into management of the NWHI, will be developed to guide implementation.

**Strategy NHCH-4: Plan, develop, and implement a Monument Cultural Resources Program over the life of the plan.**

All cultural resources in the NWHI are under the jurisdiction of the Monument, and therefore the MMB will support efforts to protect these important elements, including archaeological sites and the sacred resources of the NWHI, according to the parameters and conditions included within Sections 106 and 110 of the National Historic Preservation Act. This strategy may include documenting and evaluating the NWHI as a Traditional Cultural Property and development of a Cultural Resources Program to fully integrate cultural resource protection into Monument management (see Activity HR-3.2 in Section 3.1.3, Historic Resources Action Plan).

***Activity NHCH-4.1: Prepare a Cultural Resources Program Plan.***

Within 18 months, the MMB will initiate the development of a Cultural Resources Program Plan, in partnership with the Native Hawaiian Cultural Working Group, cultural practitioners and experts, and others. As part of the plan development, the program partners will identify cultural resources, sites, and other locations within the Monument that are appropriate for use in contemporary Native Hawaiian protocols. In addition, the plan will include policies and procedures on the collection, curation, and disposition of archaeological materials, other artifacts, and human remains. The MMB and partners will complete the plan within two years of initiation.

***Activity NHCH-4.2: Develop and implement specific preservation and access plans, as appropriate, to protect cultural sites at Nihoa and Mokumanamana.***

Both Nihoa and Mokumanamana are recognized as culturally significant, are listed on the National Register of Historic Places, and are protected by the FWS in accordance with the National Wildlife Refuge System Administration Act of 1966, as amended, and the National Historic Preservation Act of 1966. To further protect these sites, preservation plans for both islands will be developed and implemented, as will access plans for other cultural elements and yet-to-be discovered sites within the Monument. These preservation plans will address the monitoring and stabilization of cultural sites and return/repatriation agreements with museums and institutions that house the artifact collections. These preservation plans will be initiated within 18 months.

***Activity NHCH-4.3: Initiate implementation of the Monument Cultural Resources Program.***

Within six months of completion of the Cultural Resources Program Plan, the MMB will initiate the strategies and activities contained within the plan.

**Strategy NHCH-5: Provide cultural outreach and educational opportunities to serve the Native Hawaiian community and the general public over the life of the plan.**

Native Hawaiian values and cultural information will be used to guide outreach and education programs to serve both Native Hawaiians and the general public. Native Hawaiian values and resource management practices can be relevant to multiple audiences and help to provide a more complete understanding of the NWHI and the need to protect its ecosystems and other cultural resources. Permittee education and outreach programs will target Monument users.

As requested by the Native Hawaiian Cultural Working Group, staff will strive to provide more outreach to the Native Hawaiian community so that the cultural information compiled and incorporated into Monument materials reaches Native Hawaiians, many of whom otherwise may

not have access to such information. Developing culturally relevant materials can also make information more accessible and engaging to Native Hawaiians. For example, making Hawaiian language tours available at Mokupāpapa Discovery Center would increase the center's value and accessibility to Hawaiian language immersion school groups as a culturally relevant learning tool. The Native Hawaiian Cultural Working Group, Native Hawaiian community leaders, cultural experts, and others will be consulted for cultural accuracy and appropriateness and for input on how information is used and shared.

***Activity NHCH-5.1: Integrate Native Hawaiian values and cultural information into general outreach and education programs.***

Cultural information and traditional Native Hawaiian values will be infused into education and outreach materials aimed at the general public. The “Navigating Change” program, school curricula, promotion of Hawaiian place names in Monument materials, videos, articles, and the lecture series at Mokupāpapa are some of the ways the MMB will accomplish this activity (see Sections 3.5.2 and 3.5.4, Constituency Building and Outreach and Ocean Ecosystems Literacy Action Plans).

***Activity NHCH-5.2: Develop a culturally based strategy for education and outreach within the Native Hawaiian community.***

This strategy, to be developed within three years, includes making information relevant, attractive, and accessible to Native Hawaiians. Outreach and education designed with and for Native Hawaiians will be accomplished through special events, cultural groups, schools (K-12), and colleges. Products that may be developed include videos and public television programs, publications, and school curricula. Traditional products will be encouraged, such as hula, mele, and oli. The MMB will continue to utilize ‘Ōlelo Hawai‘i in outreach and education materials and programs as appropriate (see Sections 3.5.2 and 3.5.4, Constituency Building and Outreach and Ocean Ecosystems Literacy Action Plans).

***Activity NHCH-5.3: Integrate Native Hawaiian values and cultural information into the Monument permittee education and outreach program.***

Within two years, the MMB will provide appropriate cultural information and guidelines to all Monument users and will help in fostering a deeper respect for the NWHI through better understanding of, and respect for, Hawaiian values and the cultural significance of the place (see Section 3.4.1, Permitting Action Plan). This activity includes, but is not limited to, the cultural briefing required prior to any permitted access to the Monument; the creation of a course for permit applicants that would engage in experiential approaches to maximize learning through various modalities; the development of a cultural observer program; and the creation of comprehensive research sources, such as willing cultural experts, libraries, and electronic databases of cultural and historical information with security layers for confidential information, which will assist applicants in appropriately completing permit applications.

**Table 3.1.2 Summary of Strategies, Activities, and Agency Leads for Native Hawaiian Culture and History**

<b>Strategies and Activities</b>	<b>Agency Lead</b>
<b>Strategy NHCH-1: Identify and prioritize scientific and Native Hawaiian cultural research needs within 18 months.</b>	
Activity NHCH-1.1: Identify research needs that can be accomplished through anthropological, archaeological, historical, and Hawaiian cultural methods.	OHA
Activity NHCH-1.2: Develop cultural research priorities alongside associated management challenges and opportunities.	OHA
<b>Strategy NHCH-2: Conduct, support, and facilitate Native Hawaiian cultural access and research of the NWHI over the life of the plan.</b>	
Activity NHCH-2.1: Continue to compile information and conduct new cultural and historical research about the NWHI.	OHA
Activity NHCH-2.2: Support Native Hawaiian cultural research needs.	NOAA OHA State of Hawai‘i FWS
Activity NHCH-2.3: Facilitate cultural field research and cultural education opportunities annually.	NOAA OHA
Activity NHCH-2.4: Convene a Native Hawaiian nomenclature working group.	OHA
Activity NHCH-2.5: Incorporate cultural resources information into the Monument Information Management System.	NOAA
Activity NHCH-2.6: Continue to facilitate Native Hawaiian cultural access.	OHA
Activity NHCH-2.7: Establish agreements with local universities and museums to address possible curation, research, use, return, and repatriation of collections.	FWS
<b>Strategy NHCH-3: Increase cultural resource management capacity across MMB agencies over the life of the plan.</b>	
Activity NHCH-3.1: Assess Monument cultural resource capacity.	OHA
Activity NHCH-3.2: Engage Native Hawaiian practitioners and cultural experts and the Native Hawaiian Cultural Working Group in the development and implementation of the Monument’s management activities.	OHA
Activity NHCH-3.3: Increase knowledge base of Native Hawaiian values and cultural information through “in-reach” programs for resource managers.	OHA NOAA
Activity NHCH-3.4: Identify and integrate Native Hawaiian traditional knowledge and management concepts into Monument management.	OHA
<b>Strategy NHCH-4: Plan, develop, and implement a Monument Cultural Resources Program over the life of the plan.</b>	
Activity NHCH-4.1: Prepare a Cultural Resources Program Plan.	FWS
Activity NHCH-4.2: Develop and implement specific preservation and access plans, as appropriate, to protect cultural sites at Nihoa and Mokumanamana.	FWS
Activity NHCH-4.3: Initiate implementation of the Monument Cultural Resources Program.	FWS

Strategies and Activities	Agency Lead
<b>Strategy NHCH-5: Provide cultural outreach and educational opportunities to serve the Native Hawaiian community and the general public over the life of the plan.</b>	
Activity NHCH-5.1: Integrate Native Hawaiian values and cultural information into general outreach and education programs.	NOAA
Activity NHCH-5.2: Develop a culturally based strategy for education and outreach within the Native Hawaiian community.	NOAA
Activity NHCH-5.3: Integrate Native Hawaiian values and cultural information into the Monument permittee education and outreach program.	OHA

### 3.1.3 Historic Resources Action Plan

#### Desired Outcome

Identify, document, preserve, protect, stabilize, and where appropriate, reuse, recover, and interpret historic resources associated with Midway Atoll and other historic resources within Papahānaumokuākea Marine National Monument.

Links to other Action Plans	
3.1.2	Native Hawaiian Culture and History
3.1.4	Maritime Heritage
3.6.3	Coordinated Field Operations

#### Current Status and Background

NOAA and FWS comply with the Federal Archaeological Program, a collection of laws and regulations that pertain to the protection of historical and archaeological properties on federal and federally managed lands. The National Historic Preservation Act directs all federal agencies to develop programs to protect historical and archaeological resources. Section 106 requires agencies to consider the potential impacts of their actions. Section 110 requires agencies to actively search for archaeological resources and to assess them for their significance and eligibility for inclusion in the National Register of Historic Places. The locations of cultural and historic resources are considered sensitive data and are not openly released even through the Freedom of Information Act. State agencies comply with similar state laws for protection of historic and cultural resources.

Links to goals
Goal 5
Goal 7
Goal 8

For the purposes of the Monument Management Plan, historic resources are the non-marine sites, structures, artifacts, in the Monument associated with the historic period (after first Western contact with Native Hawaiians in 1778). Historic resources in the Monument fall into two broad categories: Midway Atoll historic period resources, and those elsewhere in the Monument.

At Midway Atoll, historic period cultural resources include 63 structures and buildings eligible for inclusion in the National Register of Historic Places. These historic properties are mostly associated with World War II, the Battle of Midway National Historic Landmark and Memorial, and the early 20<sup>th</sup>-century Commercial Pacific Cable Company. Section 1.3 describes the history and context of the historic properties that remain on Midway Atoll. FWS currently manages the historic properties at Midway Atoll according to a Programmatic Agreement (Programmatic Agreement 1996) and Historic Preservation Plan (Speulda et al. 1999).

Jurisdiction and control of Midway Atoll were transferred from the Navy to the FWS in 1996 by Executive Order 13022. In preparation for the transfer, the Navy identified, evaluated, and mitigated effects on the 63 historic properties. The Navy conducted this effort in consultation with the Pacific Division of the Naval Facilities Engineering Command, FWS, Advisory Council on Historic Preservation, National Park Service, State Historic Preservation Officer of the State of Hawai‘i, Sixth Defense Battalion of the U.S. Marine Corps, Defenders of Midway Islands Reunion Association, and International Midway Memorial Foundation. The consultation resulted in a Programmatic Agreement for the treatment of the 63 historic properties (Programmatic Agreement 1996). One of the stipulations in the Programmatic Agreement directed the FWS to prepare a Historic Preservation Plan for long-term management of the 63 historic properties. FWS completed the plan in 1999 (Speulda et al. 1999).

The Midway Atoll Historic Preservation Plan focuses on long-term management and treatment for each of the 63 historic properties. It also identifies procedures for treating new discoveries and caring for museum collections, and includes recommendations for interpretation, education, and public outreach.

The Programmatic Agreement and Historic Preservation Plan prescribe one of six different treatment categories to each of the 63 historic properties. The treatment categories are (1) reuse, (2) secure, (3) leave as-is, (4) fill in, (5) demolish, or (6) relocate. Many factors were used to assign the treatment category for a historic property, including historic importance, interpretive value, overall setting, association with key historic themes, and structural integrity. The determinations were made in consideration of recommendations from interest groups, specialists, and the Advisory Council on Historic Preservation.

In the treatment category assignments, 23 buildings and structures were identified for reuse, including the Officers' housing; carpentry, machine, and transportation shop buildings; the refrigeration plant; the recreation facility; the seaplane hangar and ramp; and water reservoirs. Thirteen buildings were slated for securing and stabilization in place, including the command post, radar buildings, power plant, and the cable station buildings. Twenty structures were placed in the "leave as-is" category and will deteriorate in place under natural environmental conditions. These properties include the Eastern Island gun, runways, and revetments, and the Sand Island cemetery, Japanese gravestones, two 5-inch guns, and gun batteries. Four properties were filled with sand, including a pillbox and an underground bunker. Fifteen properties were slated for demolition, including the N.O.B. armory, the submarine base buildings, the general storehouse and air terminal building, two barracks, and the blackout hangar and associated shops. Three objects were identified for removal to a secure location, including a torpedo, a pillbox turret, and submarine netting.

Beyond the abundant, significant, and dramatic historic resources at Midway Atoll, few other significant historic resources within the Monument are presently known. As outlined in Section 1.3, the post-contact history of the Monument archipelago beyond Midway is rich and varied. However, the present record of tangible non-marine sites that relate to this history is small. This is because historians and archaeologists simply have not spent much time researching locations on the islands and atolls of the Monument for evidence of post-contact historical events such as shipwreck survivor camps, bird and other resource extraction camps, or World War II facilities.

### **Need for Action**

Although the Midway Atoll Programmatic Agreement and Historic Preservation Plan are still in force, they need to be updated. Since the time the plan was written, in 1999, a visitor services plan has been adopted, lead-based paint abatement has become an important priority, and the Monument has been created. Furthermore, the Sixth Defense Battalion of the U.S. Marine Corps and Defenders of Midway Islands Reunion Association and the International Midway Memorial Foundation continue to maintain strong interest in the preservation and interpretation of historic resources at Midway Atoll. The historic properties require continual repair and maintenance according to the terms of the Historic Preservation Plan and the Secretary of the Interior's Standards for the Treatment of Historic Properties. The effects of weathering and erosion by salt water, salt spray, salty soils, precipitation, plant growth, solar radiation, and wind continue to threaten the integrity of the historic properties at Midway Atoll.

Among the islands that compose the Monument beyond Midway Atoll, surveys are needed to identify and evaluate historic resources that relate to shipwreck survivor camps, bird and other resource extraction camps, and World War II facilities. Beyond the historic resources of Midway Atoll, the other atolls and islands of the Monument have histories and associated historic resources that relate to the post-contact history of exploration, commerce, war, and conservation of the Monument.

### **Strategies to Achieve the Desired Outcome**

The strategies and associated activities in this action plan constitute a historic resource program of identification, documentation, protection, preservation, reuse, and interpretation of the varied historic resources in the Monument. The Monument Management Plan calls for the implementation of a range of activities that preserve, stabilize, reuse, rehabilitate, and interpret the historic structures and the stories and artifacts associated with them.

Seven strategies have been developed for achieving the desired outcome of identifying, interpreting, and protecting historic resources in the NWHI. The strategies and activities are coded by the acronym for the action plan title, “Historic Resources” (HR). A summary of strategies and activities is provided in Table 3.1.3 at the end of this action plan.

- HR-1: Update the Midway Atoll Historic Preservation Plan to meet the present needs of the Refuge and Monument within one year.
- HR-2: Implement, supervise, and monitor the historic preservation treatments identified in the Midway Atoll Historic Preservation Plan at two historic properties each year.
- HR-3: Prepare an updated Battle of Midway National Historic Landmark nomination within four years.
- HR-4: Improve the function and capacity of the Midway museum within eight years.
- HR-5: Document and inventory historic resources beyond Midway Atoll NWR within 15 years.
- HR-6: Conduct archaeological and historical research on the historical events and structures at Midway Atoll NWR within 15 years.

### **Strategy HR-1: Update the Midway Atoll Historic Preservation Plan to meet the present needs of the Refuge and Monument within one year.**

The Midway Historic Preservation Plan was written in 1999. Since then, a visitor services plan has been adopted, lead-based paint abatement has become an important priority, and the Monument has been designated. The historic properties require continuous repair and maintenance according to the terms of the Historic Preservation Plan and the Secretary of the Interior’s Standards for the Treatment of Historic Properties. The effects of weathering and erosion by salt water, salt spray, salty soils, precipitation, plant growth, solar radiation, and wind continue to threaten the integrity of the historic properties at Midway Atoll NWR. Within one year of Monument Management Plan approval, the Monument partners will update the Historic Preservation Plan and reconcile it with the existing Midway Visitor Services Plan and the lead-based paint removal plan.

***Activity HR-1.1: Reconcile the Historic Preservation Plan with the Midway Visitor Service Plan, lead-based paint abatement plan, and other facilities maintenance and use plans.***

This activity will require consultation and coordination among refuge program specialists and the MMB to align priorities and needs among these plans. The needs of the Historic Preservation Plan will be balanced with the priorities of lead-based paint removal, visitor services, habitat management, and management infrastructure.

***Activity HR-1.2: Submit the updated Historic Preservation Plan for approval to the Advisory Council on Historic Preservation and Monument partners.***

The updated Historic Preservation Plan may lead to the preparation of additional documents to support its implementation.

**Strategy HR-2: Implement, supervise, and monitor the historic preservation treatments identified in the Midway Atoll Historic Preservation Plan at two historic properties each year.**

The Midway Atoll Historic Preservation Plan (Speulda et al. 1999) and its enabling authorities (National Historic Preservation Act of 1966 and the Programmatic Agreement for Treatment of Historic Properties at Midway) have prescribed specific historic preservation treatments for the 63 historic properties at Midway Atoll NWR. Implementing this prescription requires a program that identifies needs and procedures and supervises the conduct of preservation treatments at the properties. This strategy will be coordinated with the facilities operation plan and the lead-based paint abatement priorities. An important activity in this strategy is to adaptively reuse historic buildings and structures at Midway Atoll NWR. Many of Midway's historic properties can serve the need for administrative and public space as Monument activities grow.

***Activity HR-2.1: Within three years, create dedicated capacity to implement the updated Historic Preservation Plan.***

Limited staff and funds currently exist at the Midway Atoll NWR or among the Monument management agencies for historic preservation and cultural and historic resources management. Agencies will identify staff needs and work toward building staff capacity to carry out the strategies and activities contained within this and related action plans. Staffing needs will be identified and included in the development of the Monument Cultural Resources Program plan (see Section 3.1.2, the Native Hawaiian Culture and History Action Plan).

***Activity HR-2.2: Annually train Monument staff and the Midway contractors on the content of the Historic Preservation Plan and implementation of appropriate treatments.***

All Midway personnel who are involved in maintaining Midway Atoll infrastructure need to be aware of the historic preservation responsibilities and procedures on the atoll. This will ensure that the use and maintenance of the historic properties occurs according to the treatment identified in the Historic Preservation Plan. Training media will be produced so that all new and visiting personnel and all regular permanent personnel stay current on historic preservation priorities on an annual basis.

***Activity HR-2.3: Incorporate into the Midway Atoll visitor services program semiannual opportunities and events for visitors or volunteers to implement historic preservation treatments.***

This activity will resurrect and refine the previous refuge program to recruit volunteers to help maintain historic properties, including painting, window restoration, and landscape maintenance.

**Strategy HR-3: HR-3: Prepare an updated Battle of Midway National Historic Landmark nomination within four years.**

The American victory at the Battle of Midway changed the course of World War II in the Pacific. The Battle of Midway National Historic Landmark was created in 1986 to honor this great achievement and the sacrifices of those involved. The National Historic Landmark focuses on the remains of nine defensive positions on Midway's Sand Island that are directly associated with this historic battle. These include six magazines, a pillbox, a 3-inch gun emplacement at Battery D, and 5-inch gun emplacements at Battery C. We now have a better understanding of historic features at Midway that played an important role in the battle. As a result, it is appropriate to update this important ensemble of National Historic Landmark features. Additional structures to consider for inclusion in the National Historic Landmark include Battery A, which had not been located when the National Historic Landmark was drafted; the underground bunker on south beach; and the south beach pillbox (S-6). The Eastern Island runways will also be considered for inclusion in the National Historic Landmark.

***Activity HR-3.1: Identify, collect, and review publications, data sets, and documents on the National Historic Landmark within two years of Monument Management Plan adoption.***

Archival research is the first step to identify resources that may be appropriate to include in the National Historic Landmark.

***Activity HR-3.2: Plan and conduct a field survey and documentation of selected National Historic Landmark sites and features within two years.***

Standard historical archaeological practice will be exercised in this activity.

***Activity HR-3.3: Consult with interested parties and update the National Historic Landmark nomination within four years.***

This activity includes evaluation of the findings, preparation of a report, an updated National Historic Landmark nomination, and consultation with the Advisory Council on Historic Preservation, the National Park Service National Historic Landmark staff, the Hawai'i State Historic Preservation Office, and interested and knowledgeable parties such as the Sixth Defense Battalion of the U.S. Marine Corps and Defenders of Midway Islands Reunion Association, and the International Midway Memorial Foundation.

***Activity HR-3.4: Implement repair and maintenance treatments at National Historic Landmark features within six years.***

The National Historic Landmark features require periodic repair and maintenance. Depending on the treatment, some of the repair and maintenance can be accomplished by volunteers or other unskilled labor, while other repair work will require the involvement of specially trained historic preservation architects and engineers.

**Strategy HR-4: Improve the function and capacity of the Midway museum within eight years.**

The Midway museum should be a general repository containing written material, photographs, artifacts, oral histories, and personal memorabilia relating to Midway's history. The museum should include a climate-controlled storage area, as well as research desks and tape recording and listening booths. The Midway museum should be a unique repository for records and materials useful for interpreting the history and natural history of Midway Atoll.

***Activity HR-4.1: Prepare a Scope of Collections Statement within five years.***

The Scope of Collections Statement document will help define the scope and types of documents, artifacts, and other historic materials that may be donated, or otherwise acquired by Monument staff for proper museum curation.

***Activity HR-4.2: Remodel the Midway museum space within seven years.***

This activity will remodel the Midway museum space to meet the needs of the Scope of Collections Statement and the visiting public and to preserve the artifacts and historical materials according to the museum curation standards set forth by the U.S. Department of the Interior Manual 411 DM (U.S. Department of the Interior 1997).

***Activity HR-4.3: Organize and curate collections within eight years.***

Organize and curate Midway Museum collections according to the museum curation standards set forth by the DOI (411 DM).

**Strategy HR-5: Document and inventory historic resources beyond Midway Atoll NWR within 15 years.**

Studying and protecting historic resources beyond Midway Atoll begins with basic documentary research and field site surveys. These activities are similar to those involved with ecosystem research. Both involve consolidation of past research and archival data and field inventory of non-marine areas within the Monument. Historic resource surveys are compatible with planned multitasking missions, interagency cooperation, and operational efficiency.

***Activity HR-5.1: Identify, collect, and review publications, data sets, and documents within 12 years.***

Archival research is the first step to identify historic resources that may occur on other islands and atolls in the archipelago beyond Midway.

***Activity HR-5.2: Plan, conduct, and report on field surveys and documentation of selected sites within 15 years.***

Standard historical archaeological practice will be exercised in this activity.

**Strategy HR-6: Conduct archaeological and historical research on the historical events and structures at Midway Atoll NWR within 15 years.**

Much has been written and documented about the history and historic properties at Midway Atoll, particularly with respect to its role in World War II. However, Midway's history is rich and varied. Many nontraditional perspectives and sources of information have yet to be investigated. A healthy and responsible historic preservation program at Midway will conduct new research.

***Activity HR-6.1: Begin a long-term annual program to compile, collect, curate, and publish oral histories of life on Midway Atoll within 3 years.***

From the Commercial Pacific Cable Station era to World War II and through the Cold War, many people have lived on or visited Midway Atoll. Their stories provide a perspective on Midway, commerce, and war that is rarely captured in standard histories and official documents. Some of these personal oral histories have been recorded; many others need to be collected. This activity will ensure that alternative perspectives on the unique history of Midway Atoll will not be lost to the passing of the ages.

***Activity HR-6.2: Conduct archaeological investigation of the Commercial Pacific Cable Station site within ten years.***

The Commercial Pacific Cable Station era was a unique chapter in the history of Midway Atoll. Archaeological and historical research, including excavation, will shed light on the lifestyle and struggles of Midway's earliest permanent residents.

**Table 3.1.3 Summary of Strategies, Activities, and Agency Leads for Historic Resources**

### 3.1.4 Maritime Heritage Action Plan

**Desired Outcome**

Identify, interpret, and protect maritime heritage resources in Papahānaumokuākea Marine National Monument.

**Current Status and Background**

The maritime heritage of the NWHI began hundreds, if not thousands, of years ago with Polynesian and Native Hawaiian voyages across the Hawaiian archipelago and beyond. This history, the lessons this history provides, and the need to further the understanding of this heritage are critical and are dealt with in other areas of this Monument Management Plan (see Section 3.1.2, the Native Hawaiian Culture and History Action Plan, and Section 3.5.3, the Native Hawaiian Community Involvement Action Plan).

Links to other Action Plans	
3.1.2	Native Hawaiian Culture and History
3.1.3	Historic Resources Action Plan
3.3.4	Emergency Response and Natural Resource Damage Assessment
3.4.1	Permitting
3.5.3	Native Hawaiian Community Involvement

Links to goals
Goal 3
Goal 4
Goal 5
Goal 7

A preliminary survey of the maritime heritage resource base began during the Northwestern Hawaiian Islands Reef Assessment and Monitoring Program research expedition in 2002 and continued in 2003, with annual surveys beginning in 2005. Initial investigations in the NWHI led to the discovery of the naval steamer USS *Saginaw*, wrecked in 1870, the submarine rescue vessel USS *Macaw*, lost in 1944, the sailing ship *Carrollton*, lost in 1906, and the whale ship *Parker*, lost in 1842. In 2004, NOAA divers located the remains of the British whaling ships *Pearl* and *Hermes*, lost in 1822. These two archaeological sites provide a unique material record of historic activities, being the oldest wrecks yet found in the Hawaiian Islands and the only known whalers of the British South Seas Company in the world. Annual surveys provide for continued documentation and discovery of new maritime heritage sites. Applying heritage practices to maritime resources challenges society to value what has only too often been considered out of sight and out of mind.

Best practices in the maritime heritage field, at both the national and international levels, highlight similarities between heritage preservation and natural resources conservation. These best practices aim to value maritime heritage resources in a manner that complements, rather than conflicts with, ecosystem management. While excavation may be appropriate in certain circumstances, in situ management is considered the first or preferred alternative in the overall research design. In situ management does not preclude recovery, but does set forth a “precautionary” approach in terms of the artifacts and their environment. Proposed heritage work in the NWHI region emphasizes a low-impact approach, to an extent consistent with the Monument’s conservation goals and guiding principles. The coordinated management of heritage and natural resources is achieved through a unified permitting process.

**Need for Action**

For the purposes of this Monument Management Plan, the definition of maritime heritage resources includes submerged and beached shipwrecks, aircraft, and other sites of historical, cultural, and archaeological significance. These resources have not been adequately inventoried or protected within the NWHI. The main Hawaiian Islands have experienced the illegal removal of historic artifacts, as well as the potential destruction of historic material from nearshore

construction and dredging projects. By comparison, NWHI maritime heritage resources are relatively intact and undisturbed. NOAA, the State of Hawai‘i, and FWS have the statutory responsibility to inventory, evaluate, and interpret these heritage resources, and together increase maritime heritage preservation in the Monument and awareness of these unique resources throughout the State.

NOAA, the State of Hawai‘i, and FWS share similar goals of heritage resource preservation in the Monument. Protection and management of sites that meet established heritage criteria are mandated by state and federal preservation laws.

Maritime heritage resources, when properly studied and interpreted, add an important dimension to our understanding and appreciation of our nation’s rich maritime legacy, and make us more aware of the critical need to be wise stewards of our ocean planet.

NOAA and FWS comply with the Federal Archaeological Program, a collection of laws and regulations that pertain to the protection of historical and archaeological properties on federal and federally managed lands. The National Historic Preservation Act directs all federal agencies to develop programs to protect historical and archaeological resources. Section 106 requires agencies to consider the potential impacts of their actions, including the review of permit applications for projects that may allow the disturbance of the seabed, where archaeological remains may lie. Section 110 requires agencies to actively search for archaeological resources and to assess them for their significance and eligibility for inclusion in the National Register of Historic Places. This action plan presents strategies and activities for addressing maritime

heritage resource management and protection needs in the Monument. To this end, each program or agency may contribute its own particular expertise: the Maritime Heritage Program, under NOAA’s Office of National Marine Sanctuaries (ONMS), features field survey skills in underwater archaeology; FWS manages its comprehensive cultural resources program; and the State of Hawai‘i Department of Land and Natural Resources provides the context of the state inventory.

### **Strategies to Achieve the Desired Outcome**

The strategies and associated activities in this action plan are designed to increase our understanding of maritime heritage resources and foster effective and protective management in the Monument. These strategies will be carried out in collaboration with maritime heritage staff of ONMS, Pacific Islands Region; the Historic Preservation Division of the State Department of Land and Natural Resources; and the FWS Cultural Resources Team.

NOAA diver surveys the USS *Macaw* remains off Midway Atoll. Photo: James Watt

Three strategies have been developed for achieving the desired outcome of identifying, interpreting, and protecting maritime heritage resources in the NWHI. The strategies and activities are coded by the acronym for the action plan title, “Maritime Heritage” (MH). A summary of strategies and activities is provided in Table 3.1.4 at the end of this action plan.

- MH-1: Document and inventory maritime heritage resources throughout the life of the plan.
- MH-2: Incorporate maritime heritage into public education and outreach throughout the life of the plan.
- MH-3: Coordinate interagency efforts to protect maritime heritage resources for the life of the plan.

**Strategy MH-1: Document and inventory maritime heritage resources throughout the life of the plan.**

Studying and protecting maritime heritage resources begin with basic documentary research and field site surveys. These activities are similar to those involved with ecosystem research. Both involve consolidation of past research and archival data, scientific SCUBA diving operations, and bathymetric mapping and remote sensing surveys. Maritime heritage surveys are compatible with planned multitasking missions, interagency cooperation, and operational efficiency.

***Activity MH-1.1: Identify, collect, and review publications, data sets, and documents annually.***

Archival research and review of existing documents are the first steps in creating and confirming the maritime heritage resource inventory in the NWHI, as well as in formulating an effective field survey plan. Documents from at least two maritime heritage sites will be added to the site database per year.

***Activity MH-1.2: Plan and carry out coordinated field mapping surveys of selected sites annually.***

Conducting field mapping surveys is the next step in understanding and interpreting heritage sites. Techniques can include shoreline terrestrial survey and inventory; marine remote sensing using magnetometer and side-scan sonar to locate potential heritage targets; and noninvasive diving surveys to assess and inventory sites (Dean 1992). These phases generally take place during multidisciplinary research cruises and are the result of coordinated interagency planning. Results are incorporated into a comprehensive Monument maritime heritage resource inventory maintained by ONMS. As an ongoing annual activity, maritime heritage field surveys will be conducted and progress reports will be completed annually.

***Activity MH-1.3: Complete a status report on potential environmental hazards within 1 year, and update it annually.***

Wreck sites and other debris can represent potential environmental hazards that may be identified through field survey work. The MMB will be informed of any discovered potential hazards in order to assess the need for response or remediation (see Section 3.3.4, Emergency Response and Natural Resource Damage Assessment Action Plan). A status report on potential environmental hazards from wreck sites, disposal, etc. will be compiled by year 1 and updated annually.

***Activity MH-1.4: Develop status report on maritime heritage artifact recovery operations within two years, and recover and conserve maritime heritage artifacts as appropriate.***

When excavation and analysis of material remains are appropriate for site interpretation, and when these tasks can be done in a manner that respects the integrity of the ecosystem and the environmental goals of the Monument, recovery of selected artifacts is a way of bringing the data to the public, rather than taking more visitors to the NWHI site. Such recovery will be carried out through the established permitting processes of the Monument (see Section 3.4.1, Permitting Action Plan, and Appendix A). A status report on potential and completed maritime heritage recovery operations will be completed by year 2 and updated annually.

***Activity MH-1.5: Develop and implement an internal maritime heritage resource database within 5 years.***

An internal database of known maritime heritage resources will be established and maintained by the Monument maritime archaeologist for the prioritization of targets, to be completed by year 5.

**Strategy MH-2: Incorporate maritime heritage into public education and outreach throughout the life of the plan.**

Raising public awareness of the maritime heritage field is essential to better valuing and protecting the resource. Protection comes through understanding the nature of heritage resources and what we can learn from them, as well as familiarity with established preservation laws. Education and outreach efforts for maritime sites emphasize “bringing the place to the people, not the people to the place” in a responsible manner.

***Activity MH-2.1: Incorporate maritime heritage materials into Monument education and outreach projects annually.***

Resources and opportunities for collaboration for education and outreach are available through the MMB agencies and other entities. Monument maritime archaeologists will coordinate and participate in public outreach regarding Monument heritage resources and maritime history. Outreach efforts may include presentations, displays, still and video projects, and website materials. This activity includes potential support for the promotion of Native Hawaiian cultural outreach and education via Section 3.1.2, the Native Hawaiian Culture and History Action Plan.

***Activity MH-2.2: Develop and deliver public maritime heritage educational materials at selected presentations, conferences, and events.***

Shipwreck topics often appeal to large audiences at local, national, and international levels, and offer a chance to not only highlight the relatively new field of maritime heritage, but also to emphasize the unique nature of the NWHI, the need for conservation and ecosystem management, and the overall stewardship of all ocean resources. A minimum of two maritime heritage presentations will be given at professional conferences or public events each year.

**Strategy MH-3: Coordinate interagency efforts to protect maritime heritage resources for the life of the plan.**

Because of NOAA's previous maritime heritage work in the region, efforts to inventory, evaluate, interpret, and preserve maritime heritage resources in the NWHI will be coordinated by a staff maritime archaeologist through ONMS, and conducted in close collaboration and coordination with the MMB. Each program or agency provides expertise in related fields: maritime archaeology field survey (NOAA); museum program, terrestrial archaeology, and National Historic Preservation Act (NHPA) implementation (FWS); and state survey, inventory, and preservation (Department of Land and Natural Resources).

***Activity MH-3.1: Coordinate interagency maritime heritage resources management annually.***

Communication by the MMB with heritage preservation efforts on a larger scale is essential. Communication involves sharing research and preservation efforts in the Monument with the related professional fields of archaeology and cultural resource management, among others. Coordination of field activities is also necessary for the more effective use of facilities and equipment. Efforts to collaborate and coordinate will occur annually for the duration of the plan.

***Activity MH-3.2: Enhance protective measures for selected sites within the NWHI through the National Register nomination process within 2 years.***

Protection of specific heritage sites will be enhanced by federal recognition under the National Heritage Preservation Act and the National Register of Historic Places (Delgado 1985). Additionally, preservation measures of the Department of Land and Natural Resources will be implemented for resources on state submerged lands (up to 3 nautical miles from emergent lands) via the State Historic Preservation Division. Protective status for specific sites will be sought as needed using measures described above. This activity includes potential support for the protection and preservation of Native Hawaiian cultural resources discussed in the Native Hawaiian Culture and History Action Plan (Section 3.1.2). The National Register nomination process for maritime heritage sites will begin by year 2.

***Activity MH-3.3: Develop and implement a Monument Maritime Heritage Research Plan within 2 years.***

The Monument Maritime Heritage Resource Research Plan will be completed within 2 years. Working collaboratively with partner and local agencies, universities, and experts in the field, the MMB will develop a research plan that outlines maritime heritage priorities for the NWHI. This effort will be coordinated by the Monument maritime archaeologist.

**Table 3.1.4 Summary of Strategies, Activities, and Agency Leads for Maritime Heritage**

<b>Strategies and Activities</b>	<b>Agency Lead</b>
<b>Strategy MH-1: Document and inventory maritime heritage resources throughout the life of the plan.</b>	
Activity MH-1.1: Identify, collect, and review publications, data sets, and documents annually.	NOAA
Activity MH-1.2: Plan and carry out coordinated field mapping surveys of selected sites annually.	NOAA
Activity MH-1.3: Complete a status report on potential environmental hazards within one year, and update it annually.	NOAA
Activity MH-1.4: Develop status report on maritime heritage artifact recovery operations within 2 years, and recover and conserve maritime heritage artifacts as appropriate.	NOAA
Activity MH-1.5: Develop and implement an internal maritime heritage resource database within 5 years.	NOAA
<b>Strategy MH-2: Incorporate maritime heritage into public education and outreach throughout the life of the plan.</b>	
Activity MH-2.1: Incorporate maritime heritage materials into Monument education and outreach projects annually.	NOAA
Activity MH-2.2: Develop and deliver public maritime heritage educational materials at selected presentations, conferences, and events.	NOAA
<b>Strategy MH-3: Coordinate interagency efforts to protect maritime heritage resources for the life of the plan.</b>	
Activity MH-3.1: Coordinate interagency maritime heritage resources management annually.	NOAA
Activity MH-3.2: Enhance protective measures for selected sites within the NWHI through the National Register nomination process within 2 years.	NOAA
Activity MH-3.3: Develop and implement a Monument Maritime Heritage Research Plan within 2 years.	NOAA

## 3.2 Conserving Wildlife and Habitats

Coastal development in the main Hawaiian Islands has resulted in the destruction of natural habitats for many protected species, giving rise to the NWHI's function as a wildlife haven relatively undisturbed by human presence. A significant number of species found in the NWHI are at risk of extinction and depend upon the unique habitat found there for their survival. Ninety percent of the Hawaiian population of green turtles nests in the NWHI, and the majority of Hawaiian monk seals pup there. The NWHI also host one of the largest and most important assemblages of seabirds in the world.

Past human activities in the NWHI have left lasting habitat impacts in the form of sunken and grounded vessels, dilapidated buildings and structures, military sites, and introduced species that have become invasive. The remnants of these activities can sometimes pose a threat to wildlife and their natural habitat. Other impacts resulting from climate change pose significant threats to NWHI habitats and endangered species. To address these impacts, the FWS maintains a full-time presence at French Frigate Shoals, Laysan Island, and Midway Atoll to monitor wildlife, eliminate noxious weeds, restore native vegetation, prevent the extinction of native species, and clean up contaminated sites. NOAA maintains seasonal field camps at several islands to monitor Hawaiian monk seal populations and works with FWS at seasonal field camps at French Frigate Shoals. The State also maintains a part-time presence at Kure Atoll to undertake similar activities.

Action plans to take care of threatened and endangered species, migratory birds, and the habitats upon which they depend focus on undertaking on-the-ground conservation and management strategies. These strategies and activities focus on population enhancement through the maintenance and improvement of key ecosystem components. Many of the strategies and activities reflect information contained in the Hawai'i Comprehensive Wildlife Conservation Strategy developed by the Hawai'i Department of Land and Natural Resources (Mitchell et al. 2005) and were considered in the development of the Monument Management Plan.

Each action plan consists of a set of strategies to address a desired outcome. Over the next 15 years, these desired outcomes are:

- **Threatened and Endangered Species:** Safeguard and recover threatened and endangered plants and animals and other protected species within Papahānaumokuākea Marine National Monument.
- **Migratory Birds:** Conserve migratory bird populations and habitats within Papahānaumokuākea Marine National Monument.
- **Habitat Management and Conservation:** Protect, maintain, and where appropriate, restore the native ecosystems and biological diversity of Papahānaumokuākea Marine National Monument.

Action plans described in this section will be implemented in close coordination with agency partners and in conjunction with other priority management needs.

### 3.2.1 Threatened and Endangered Species Action Plan

#### Desired Outcome

Safeguard and recover threatened and endangered plants and animals and other protected species within Papahānaumokuākea Marine National Monument.

#### Current Status and Background

Two federal acts, as well as multiple state statutes, protect specific species in the NWHI. The federal acts are the Endangered Species Act of 1973 (ESA) and the Marine Mammal Protection Act of 1972 (MMPA). The ESA provides for the conservation of species at risk of extinction throughout all or a significant portion of their range and the protection of critical habitats on which they depend. The ESA also gives individual states the option to assist in managing endangered species recovery programs. The MMPA provides for the protection and conservation of all marine mammals and their ecosystems, whether or not they are listed under the ESA. Because of the overlap of protections, this action plan’s activities are directed at both ESA listed and non-ESA listed marine mammals. The State of Hawai‘i has additional protections for endangered species in its wildlife laws, which also affords other indigenous species treatment as threatened or endangered if criteria are met (HRS 195D, HRS 183D, HRS 125, and Hawai‘i Administrative Rules Title 13). The recovery plans issued pursuant to the ESA guide conservation efforts of threatened and endangered species. The most recent iterations of these plans were used to guide the strategies and activities under this action plan. Specific recovery activities for listed species are included in recovery plans, which may be accessed at: <http://www.nmfs.noaa.gov/pr/recovery/plans.htm> and <http://www.fws.gov/endangered/recovery/index.html#plans>. In addition, many of the strategies and activities are informed by Hawaii’s Comprehensive Wildlife Conservation Strategy (Mitchell et al. 2005).

Goal 1
Goal 3
Goal 4

**Hawaiian Monk Seal:** The Hawaiian monk seal is in crisis. The population is in a decline that has lasted 20 years, and as of 2008, there were about 1,200 monk seals. Modeling predicts that the species’ population will fall below 1,000 animals by the year 2012. Actions to date have not been sufficient to result in a recovering population. Most of the entire world population of Hawaiian monk seals breeds and forages inside the Monument. The recovery plan for the Hawaiian monk seal (NMFS 2007) provides a detailed description of actions that should be taken by NMFS and its collaborators to recover the species. This action plan details the ways the MMB can facilitate and support those efforts.

**Cetaceans:** In the NWHI, sighting and acoustic recordings of baleen whales as well as toothed whales and dolphins have been documented. Five species of baleen whales listed as “endangered” under the ESA and HRS 195D, and as “depleted” under the MMPA have been sighted or heard in the Monument area. In addition to these five, the endangered sperm whale and at least 18 other non-ESA listed species are found in the Monument (Barlow 2006). It has now been documented that groups of humpback whales are overwintering in the waters of the Monument, including whales with small calves and some that exhibit breeding behavior

(Johnston et al. 2007). Recovery actions for this listed species are summarized in the final recovery plan for the humpback whale, *Megaptera novaeangliae* (NMFS 1991). Draft recovery plans are available for the fin whale and sperm whale (NMFS 2006a, 2006b), and a final recovery plan is available for the blue whale (NMFS 1998).

**Marine Turtles:** Marine turtles that are known to occur in the Monument are the Hawaiian population of the green turtle and hawksbill, loggerhead, and leatherback turtles. While there are no records of the threatened olive ridley within Monument waters, their wide distribution throughout the tropical Pacific makes it likely that they do sometimes occur there. Green and loggerhead sea turtles are listed as threatened species; the hawksbill and leatherback turtles are listed as endangered species. Recovery plans are in place for each of these species in the Pacific and 5-year reviews were jointly published in 2007 (NMFS and FWS 1998a; 1998b; 1998c; 1998d; 1998e, 2007). Sea turtle population declines have occurred across the Pacific because of nesting habitat loss, harvesting of eggs and turtles for commercial and subsistence purposes, and fishery interactions. About 90 percent of nesting activity for the Hawaiian population of green turtles occurs in the NWHI at islets of French Frigate Shoals (Balazs and Chaloupka 2004a).

**Birds:** Five endangered bird species in the NWHI are afforded protection under the ESA and HRS 195D. Three species are passerines: the Laysan finch, found on Laysan Island and Pearl and Hermes Atoll, and the Nihoa finch and the Nihoa millerbird, which are endemic to Nihoa. Research, recovery, and management of these species take into consideration the recommendations of the Northwestern Hawaiian Islands Passerines Recovery Plan (FWS 1984), Hawaii's Comprehensive Wildlife Conservation Strategy for the Northwestern Hawaiian Islands (Mitchell et al. 2005) and ongoing input from species experts. Numerous sites were evaluated and ranked for translocation of these species to establish additional populations; this information and some recommendations for proceeding with translocation were provided recently by Morin and Conant (2007).

The Laysan duck has the most restricted range of any duck species and is especially vulnerable to extinction because of its small population size (fewer than 800 individuals) and extremely limited range. In 2004 and 2005, a total of 42 Laysan ducks were translocated to Midway Atoll NWR. Not all of these birds have reproduced, but the newly established population has grown since 2005 from 42 to a preliminary estimate of 192 birds in 2007 (Reynolds and Citta 2007). Additional activities are described in the Draft Revised Recovery Plan for the Laysan Duck (*Anas laysanensis*) (FWS 2004).

The short-tailed albatross breeds on Torishima, an island owned and administered by Japan. The short-tailed albatross was first observed at Midway Atoll between 1936 and 1941. Since then, one to four individuals have been observed every year in the NWHI. The Short-tailed Albatross Draft Recovery Plan (FWS 2005) provides suggestions for ways in which Monument staff can facilitate recovery of this species.

**Plants:** Six plant species known historically from the NWHI are listed as endangered. Three plant taxa have probably always been rare and restricted to Nihoa, although one species, the loulou or fan palm, also occurred on Laysan Island. *Mariscus pennatiformis* ssp. *bryanii* is known only from Laysan Island. *Cenchrus agrimonioides* var. *laysanensis* was historically known from

Laysan Island and Midway and Kure Atolls, but has not been seen there since about 1980 (O'Connor 1999; HBMP database 2007). A recovery plan for three species found only at Nihoa (Nihoa fan palm, *Schiedea verticillata*, and *Amaranthus brownii*) was finalized in 1998 (FWS 1998). Recovery actions for the other three species (*Cenchrus agrimonioides*, *Mariscus pennatiformis*, and *Sesbania tomentosa* or 'ohai) are described in the Recovery Plan for the Multi-Island Plants (FWS 1999).

### **Need for Action**

A coordinated and comprehensive approach is required to understand and address specific threats (e.g., climate change, habitat loss) in order to protect and recover these 23 endangered or threatened species. Cooperation among the MMB agencies is crucial to ensure that management actions conducted in the Monument are effective in protecting and enhancing populations of these endangered species and marine mammals because the entire world population of many of these species occurs only, or almost entirely, within the Monument.

### **Strategies to Achieve the Desired Outcome**

The strategies and associated activities in this action plan are designed to increase populations of threatened and endangered species and foster effective and protective management in the Monument. These strategies will be carried out in collaboration with and coordination by the Co-Trustees and other entities. The proposed activities in this Action Plan are characterized by more urgency, and perhaps in some cases more controversy, than those in some of the other action plans. Extra consideration is needed during prioritization of activities and in permitting in light of the high cost of failure to act. A great effort to coordinate with key stakeholder groups and the Native Hawaiian community will ensure that all interests have been identified. In addition to these management strategies for threatened and endangered species, additional and more detailed research and monitoring activities will be incorporated into the Natural Resources Science Plan.

Eight strategies have been developed for achieving the desired outcome of protecting marine mammals and aiding in the recovery of threatened and endangered plants and animals in the Monument. The strategies and activities are coded by the acronym for the action plan title, "Threatened and Endangered Species" (TES). A summary of strategies and activities is provided in Table 3.2.1 at the end of this action plan.

- TES-1: Support activities that advance recovery of the Hawaiian monk seal for the life of the plan.
- TES-2: Determine the status of cetacean populations and verify and manage potential threats over the life of the plan.
- TES-3: Ensure that nesting populations of green turtles at source beaches are stable or increasing for the life of the plan.
- TES-4: Work with the international recovery team for short-tailed albatrosses to facilitate an increase in the total breeding population of this species to at least 25 breeding pairs occurring on sites other than Torishima and Senkaku islands for the life of the plan.
- TES-5: Conduct activities to increase Laysan duck populations in the Monument over the life of the plan.

- TES-6: Maintain stable or increasing populations of the Laysan finch, Nihoa finch, and Nihoa millerbird in the Monument over the life of the plan.
- TES-7: Establish populations of each listed plant species on one to three additional Monument islands and ensure genetic material is also protected in approved repositories for the life of the plan.
- TES-8: Ensure protection of threatened and endangered species by facilitating Endangered Species Act consultations for Monument activities throughout the life of the plan.

**Strategy TES-1: Support activities that advance recovery of the Hawaiian monk seal for the life of the plan.**

For nearly 3 decades, a concerted effort has been made to save the Hawaiian monk seal. The U.S. Government, the State of Hawai‘i, nongovernment organizations, private-sector entities, and countless individuals in local communities across Hawai‘i have worked to recover the species. These efforts have not been sufficient to prevent a continued decline in the species. However, without these efforts, the situation would likely be much worse.

As recommended by the 2007 Recovery Plan for the Hawaiian Monk Seal, several key actions are required to address current and potential threats to the monk seal in attempts to alter the trajectory of the Hawaiian monk seal population and to move the species toward recovery. The most critical activities described in the plan that are applicable to the monk seal population in the Monument are to (1) investigate food limitations and take actions to increase female juvenile survival, (2) prevent entanglement of seals in marine debris, (3) reduce shark predation on seals, (4) reduce exposure to and spread of infectious disease, (5) continue population monitoring and research, (6) reduce impacts from grounded vessels, (7) reduce the impact of human interactions, and (8) conserve monk seal habitat.

To advance efforts on these key actions to address threats to monk seal survival and recovery, the MMB will pursue several key strategies in support of monk seal recovery efforts. These efforts will advance the objective of reversing the population decline of monk seal populations in the Monument and achieving a positive growth rate during the life of this plan.

***Activity TES-1.1: Support marine debris removal activities to promote recovery.***

Hawaiian monk seals have one of the highest documented entanglement rates of any pinniped species, and marine debris, such as derelict fishing gear, are chronic forms of pollution affecting the NWHI. The incidence of entangled monk seals at the breeding sites of the NWHI has been well documented and field staff actively disentangle seals. Cetaceans, sea turtles, and sea birds are also subjected to the detrimental effects of derelict fishing gear and other marine debris. Monument staff will support efforts to reduce marine debris as detailed in the strategies and activities in the Marine Debris Action Plan. These efforts, particularly in key monk seal habitat, will decrease the number of injuries and mortalities caused by entanglement (see Section 3.3.1, Marine Debris Action Plan).

***Activity TES-1.2: Support and facilitate emergency response for monk seals.***

The ability to respond to situations in the Monument that threaten monk seals, such as ship groundings, oil spills, and disease outbreak, requires a well-coordinated interagency effort and is constrained by limited transportation and logistical capabilities. Several agencies have response protocols, but further coordination and collaboration among the agencies will help minimize the effects during these events. Agreed-upon and standardized protocols will be put into place to ensure that a rapid and well-organized response, including assessment, proper collection of evidence, and continued monitoring, occurs during and after an event. The Monument can facilitate these types of responses through coordination, permitting, and transportation and logistical support.

***Activity TES-1.3: Conserve Hawaiian monk seal habitat.***

Consideration should be given to evaluating the loss of habitat caused by erosion and other factors (e.g., sea level rise) that have contributed to the loss of critical habitat for seals. Predicted increases in sea level this century and beyond may severely reduce the amount of habitat for seals to rest, breed, and rear their pups. Feasibility of restoration will be evaluated to consider rebuilding habitat essential for the reproduction of monk seals and other protected species (e.g., turtles and sea birds) at several alternative sites that could lead to rebuilding preferred, stable pupping habitat (i.e., accessibility, long shoreline, and stable beach).

***Activity TES-1.4: Reduce the likelihood and impact of human interactions on monk seals.***

Efforts will be made to ensure that all users of the NWHI are aware of the impacts of disturbing monk seals on breeding beaches and in nearshore waters. Any proposed activity in the Monument that may increase seal disturbance or threaten survival (such as nearshore ship traffic, beach use, noise, research, or any other impact that could negatively affect the marine or terrestrial habitat of the monk seal) should be scrutinized carefully during the permit review process to ensure recovery of the monk seal population is not hampered by the activity.

***Activity TES-1.5: Support outreach and education on Hawaiian monk seals.***

Increased outreach and education activities focused on the Hawaiian monk seal are now being conducted. Continuation of these activities will provide the public and interest groups with information to understand the critical status of the Hawaiian monk seal population and the urgent action that is needed to prevent extinction.

***Activity TES-1.6 Reduce shark predation on monk seals.***

More than two decades of monk seal studies indicate that predation by Galapagos sharks on pre-weaned pups is an unusual behavior, occurring primarily at French Frigate Shoals. These sharks are known to kill and injure Hawaiian monk seals, and more needs to be understood about shark abundance, prey preferences, and seasonal movement patterns. The problem should continue to be monitored. Site-specific mitigation plans and methods should be developed and implemented, as appropriate.

**Strategy TES-2: Determine the status of cetacean populations and verify and manage potential threats over the life of the plan.**

Management actions and efforts to reduce the impacts to cetaceans in the NWHI have been limited, largely because of sparse information on the distribution, abundance, and ecology of

species using the Monument. Initial efforts should address this lack of information, which should then lead to the identification and management of threats.

***Activity TES-2.1: Census cetacean populations.***

In order to best develop management strategies for cetaceans in the Monument, surveys and observations will be pursued to gain information on species distribution and abundance estimates. This information will allow managers to better define humpback whale breeding and calving areas in the NWHI.

***Activity TES-2.2: Conduct annual spinner dolphin mark and recapture photo identification surveys.***

Annual spinner dolphin mark/recapture photo identification surveys will be continued at Midway, Kure, and Pearl and Hermes Atolls in order to maintain the only long-term data set (1998-2007) in the NWHI. The census may be expanded to other locales in the future.

***Activity TES-2.3: Monitor, characterize, and address the effects of marine debris on cetaceans in the Monument.***

Monument staff will reduce the potential for cetaceans to be adversely affected by marine debris. The long-term solution is ultimately a decrease in the amount of debris entering the ocean; strategies are included in Section 3.3.1, the Marine Debris Action Plan.

***Activity TES-2.4: Respond to any suspected disease and unusual mortality incidents affecting cetaceans.***

To date, no cases of a NWHI cetacean with an infectious disease have been documented. Should an ill cetacean be sighted, when feasible, the animal will be examined and sampled for a broad spectrum of possible diseases, treated appropriately, and monitored for recovery. Performing timely and complete necropsies with cetaceans will facilitate disease surveillance and monitoring in the NWHI. Contingency response plans will be developed to respond to disease outbreaks, mass strandings, and necessary human and material resources will be identified to initiate an appropriate response.

***Activity TES-2.5: Prevent human interactions with cetaceans.***

Efforts will be made to prevent negative human-cetacean interactions that may occur as a result of visitor programs or research activities through design controls on both. The controls will aim to prevent disturbance to cetaceans resting in Monument lagoons or nearshore areas and restrict geological research using sound levels known to be dangerous to marine mammals.

**Strategy TES-3: Ensure that nesting populations of green turtles at source beaches are stable or increasing over the life of the plan.**

The Hawaiian population of the green turtle is a discrete genetic stock of *Chelonia mydas* that is endemic to the Hawaiian Archipelago. This population of threatened green turtles has been monitored since the 1970s and is one of the few populations in the Pacific that is increasing in numbers. The principal rookery for the Hawaiian population of the green turtle is located on sand islands at French Frigate Shoals. More than 90 percent of all green turtle nesting in the Hawaiian Archipelago occurs here. The main rookery island at French Frigate Shoals is East

Island, where at least 50 percent of the nesting occurs, and approximately 200 to 500 females nest each year. Other atolls within the NWHI that support green turtle nesting include Laysan Island, Lisianski Island, and Pearl and Hermes Atoll. Individual nests have been documented for the first time at Midway Atoll in 2006 and 2007.

Green turtles were listed under the ESA in 1978 because of overexploitation for commercial and other purposes, the lack of adequate regulatory mechanisms and effective enforcement, evidence of declining numbers, and habitat loss and degradation. The protections of the ESA and HRS 195D have been effective at restoring Hawaiian green turtle population abundance, as evidenced by a long-term, steady increase in the number of nesting females at the principal green turtle rookery at French Frigate Shoals.

***Activity TES-3.1: Collect biological information on nesting turtle populations.***

Research has been conducted on the green turtle nesting population in the NWHI since 1973 and comprises one of the longest time series of nesting abundance data for any sea turtle population around the globe. Information on abundance of nesting turtles is critical for making intelligent management decisions, understanding the status of the Hawaiian population of the green turtle, and evaluating the success of management programs. Maintenance of standardized and consistent monitoring protocols is crucial to understanding population trends, leading to effective management (See Section 3.1.1, Marine Conservation Science Action Plan). In addition to maintaining current nesting monitoring at East Island, distribution of nesting activity throughout the Monument will be periodically reassessed. As the population increases, or nesting sites are degraded as a result of sea level rise, new sites may be used for nesting.

***Activity TES-3.2: Protect and manage nesting and basking habitat.***

Green turtle nesting habitat, including basking beaches, will be protected by use of best management practices to prevent the introduction of mammalian predators on eggs and hatchlings, reduce artificial lighting near nesting beaches, prohibit undesirable habitat alteration, and control human access. Limited entry policies will be continued, and human activities will be strictly regulated at islands and reefs used by green turtles.

Rises in sea level as a result of climate change are predicted to reduce the availability of green turtle nesting habitat at French Frigate Shoals, and changes in nest-site temperature regimes may affect population ecology by modifying sex ratios of hatchling populations. Management actions may need to be undertaken to delay habitat loss as a result of rising sea level. Awareness of these impacts will improve our ability to reduce impacts and manage habitat for sea turtle populations.

***Activity TES-3.3: Protect and manage marine habitat, including foraging areas and migration routes.***

Areas of high turtle foraging activity in the Monument will be identified and mapped, along with high-use corridors used by turtles migrating between their breeding sites and foraging areas outside the Monument. Activities in the Monument, such as anchoring and vessel transit, will be managed to minimize disturbance to foraging areas; reduce discharge and introduction of contaminants, silt, and oil; and minimize vessel hazards to turtles transiting the open water areas of the Monument.

**Strategy TES-4: Work with the international recovery team for short-tailed albatrosses to facilitate an increase in the total breeding population of this species to at least 25 breeding pairs occurring on sites other than Torishima and Senkaku islands.**

The short-tailed albatross was listed as federally endangered in the United States in 2000. The foraging range of the short-tailed albatross overlaps with that of the black-footed and Laysan albatrosses and covers most of the northwestern and northeastern Pacific Ocean. The short-tailed population dropped dramatically as a result of feather hunters in the late nineteenth century. The world population of short-tailed albatross is currently estimated at fewer than 2,000 birds, with 85 percent of individuals breeding at a single colony on Torishima Island in Japan, and the remaining individuals breeding on Senkaku Island, just southwest of Torishima.

***Activity TES-4.1: Work cooperatively with the Japanese government to establish one or more breeding populations on islands free from threats such as active volcanoes and introduced mammals.***

While most of the recovery actions for short-tailed albatrosses will necessarily be carried out by the Japanese government, activities such as providing use of surrogate species for development of translocation techniques and technical assistance will contribute to the recovery of this species. In 2006, ten Laysan albatross chicks from Midway Atoll were translocated to Kīlauea Point National Wildlife Refuge on Kaua‘i, where Japanese ornithologists raised them to learn appropriate nurturing techniques. With this knowledge, it may be possible to translocate short-tailed albatross from Torishima to safer habitats. FWS staff also help Japanese biologists with satellite tagging projects studying feeding patterns, how weather systems and winds influence short-tailed albatross movements, and how ocean productivity and seafloor bathymetry affect their distribution.

This activity also includes attempts to attract birds to Midway Atoll using decoys and recorded colony sounds and monitoring and maintaining any new breeding colony sites established at Midway Atoll. In recent years, one to four short-tailed albatross have been attracted to Midway, and two birds were practicing their mating dance on Eastern Island at Midway in 2008.

***Activity TES-4.2: Conduct studies to examine the correlation between reproductive success and contaminant loads.***

Analysis of the feathers, eggs, and dead chicks of black-footed albatrosses at Midway Atoll will determine the levels of persistent environmental contaminants. These data will be used as a surrogate for estimating contaminant body-burdens in short-tailed albatrosses.

***Activity TES-4.3: Create and disseminate information on fisheries bycatch and bycatch reduction to all fisheries occurring outside the Monument.***

Materials will be created for public outreach and attendance at domestic and international meetings to carry out government-to-government communication on fisheries mitigation measures that can reduce bycatch during commercial fishing operations.

**Strategy TES-5: Conduct activities to increase Laysan duck populations in the Monument over the life of the plan.**

The Laysan duck, endemic to the Hawaiian Islands, was federally listed as endangered in 1967. Prior to 2004, only a single population of the species remained, on Laysan Island. Since 2004, a second population of Laysan ducks has been established at Midway Atoll, through two translocations of subadults from Laysan Island. Current population estimates at both Midway and Laysan indicate a population size of fewer than 800 individuals. Within 15 years, the target, based on interim downlisting criteria in the Draft Revised Recovery Plan for the Laysan Duck (FWS 2004), is to ensure that at least five stable populations occur in predator-free or predator-controlled sites throughout the Monument and main Hawaiian Islands, and that the population at Laysan is stable or increasing. The plan also calls for island-specific management plans for each population that identify habitat improvement, predator control, and population supplementation as needed.

***Activity TES-5.1: Continue population monitoring on Laysan Island and Midway Atoll.***

Activities include population size estimation through mark-recapture and monitoring of reproductive success and survival for population modeling; disease screening and prevention to avoid translocation of unhealthy individuals; and genetics research to prevent loss of genetic diversity during population translocations. Monitoring Laysan duck populations for potential human disturbance, especially during molt (when the birds are flightless) and during the nesting season, is necessary when disturbance may result in nest abandonment and brood fragmentation.

***Activity TES-5.2: Carry out translocations to other sites in the Monument.***

Required activities include restoring or creating habitat necessary to support Laysan duck populations; transporting juveniles from established populations to additional islands; and conducting post-release monitoring to assess foraging behavior, body condition, survival, habitat suitability, and reproductive success of translocated birds, as identified in the Draft Revised Recovery Plan for the Laysan Duck (FWS 2004).

**Strategy TES-6: Maintain stable populations of the Laysan finch, Nihoa finch and Nihoa millerbird in the Monument over the life of the plan.**

The Laysan finch, Nihoa finch, and Nihoa millerbird are endemic passerines in the NWHI that have extremely limited distributions within relatively sensitive biological systems. Because of the inherently small population sizes of these species as a result of the extremely limited habitat availability, all three of these passerine species in the Monument have been listed as federally endangered. The most recent population estimates indicate a total population size of approximately 10,000 Laysan finches, which occur only on Laysan Island and at Pearl and Hermes Atoll (a result of translocations conducted in 1967); fewer than 5,000 Nihoa finches, which occur only on Nihoa; and fewer than 600 Nihoa millerbirds, also endemic to Nihoa.

***Activity TES-6.1: Continue to conduct annual censuses of populations of each passerine species and monitor their food and habitat requirements.***

In particular, these monitoring activities allow for detection of changes in population and habitat availability by monitoring the status of native plant and terrestrial invertebrate populations. Monitoring methods will be assessed and altered as necessary to improve trend detection and develop knowledge of habitat requirements for these species.

**Activity TES-6.2: Implement translocations of each species and site restoration as needed by developing appropriate techniques for capture, translocation, release, and monitoring.**

Capture, translocation, and restoration are critical steps in establishing additional populations. These potential translocations will provide a buffer against catastrophic declines of current natural populations.

**Strategy TES-7: Establish populations of each listed plant species on one to three additional Monument islands and ensure genetic material is also protected in approved repositories.**

*Amaranthus brownii*, *Schiedea verticillata*, and *Pritchardia remota* are believed to be endemic to Nihoa. *A. brownii*, an herbaceous annual, is the rarest native plant species on Nihoa; when last seen in 1983, only 35 plants were located. *S. verticillata*, a perennial herbaceous species, is confined to approximately 10 colonies totaling fewer than 400 individuals on Nihoa. *P. remota*, a long-lived perennial fan palm, has fewer than 1,500 individuals and occurs in four valleys on Nihoa. Because of the small number of existing individuals and their extremely limited distributions, these species are subject to an increased likelihood of extinction from random events. *Cenchrus agrimonioides* var. *laysanensis* was known historically only from the NWHI at Laysan Island, Kure Atoll, and Midway Atoll. Although *C. agrimonioides* var. *agrimonioides* currently occurs on O‘ahu and Maui, the *laysanensis* variety has not been observed since 1973. *Mariscus pennatiformis* spp. *bryanii*, a member of the sedge family, is known only from Laysan Island, and comprises only one to 200 individuals annually.

**Activity TES-7.1: Ensure all endangered plant species from Nihoa and Laysan Island are fully represented in an ex situ collection such as a nursery or arboretum.**

For these extremely rare taxa, it is critical to ensure that these plants are maintained in off-site locations to protect them from extinction should these in situ populations or their critical habitat experience a catastrophic event. Using guidelines for collection described in an authorized Endangered Species Permit, seeds of all listed plants will be collected and sent to seed banks such as the Lyon Arboretum and National Tropical Botanical Garden.

**Activity TES-7.2: Increase numbers and locations of *Amaranthus brownii* and *Schiedea verticillata* on Nihoa by 2018.**

Existing colonies will be augmented via outplanting, and factors restricting colony expansion (e.g., competition from alien species) will be eliminated. Attempts will be made to establish new colonies within the historical range of these species by identifying key environmental factors associated with plant growth and reproduction, preparing the sites, propagation, outplanting, and post-planting maintenance.

**Activity TES-7.3: Establish a self-sustaining *Pritchardia remota* population on Laysan Island by 2012.**

In accordance with the Draft Laysan Island Restoration Plan (Morin and Conant 1998), sites will continue to be prepared for planting and elimination of immediate threats, such as alien plants. Purity of seed stocks will be ensured by using standard operating procedures for maintaining the plants in the field. Frequent monitoring will be conducted to improve outplanting methods

and protect the site from alien species invasion, and plant vigor data will be collected to guide future outplanting strategies and techniques.

***Activity TES-7.4: Continue greenhouse operations on Laysan Island to propagate and outplant rare plant taxa.***

The plant propagation facility at Laysan Island is described in the Draft Laysan Island Restoration Plan (Morin and Conant 1998). *Pritchardia remota* seeds are collected at Nihoa and *Mariscus pennatiformis* seeds are collected following collection guidelines, including taking no more than 15 percent of seeds from any source plant. For *Pritchardia remota*, the surface of the seeds is sterilized before transporting them to Laysan Island to ensure that they are free of pests, diseases, and pathogens. The plants are germinated in shade houses and outplanted after they reach the optimal size for subsequent survival in the wild. A plant restoration database for Laysan is maintained to document variations in handling and treatment protocols and success after outplanting. All monitoring, collection, propagation, and outplanting follow guidelines from the Hawai'i Rare Plant Restoration Group, including Instructions and Methods, Collecting and Handling Protocols, and General Reintroduction/Outplanting Guidelines.

***Activity TES-7.5: Evaluate the potential to establish one to three colonies of *Amaranthus brownii*, *Schiedea verticillata*, and *Pritchardia remota* outside of their historical ranges.***

To protect the taxa from catastrophic events and achieve recovery objectives, it may be necessary to establish colonies of each taxa on other islands outside their historical range. Impacts on native flora and fauna at transplant sites will need to be assessed and evaluated to prevent the risk of hybridization with closely related species. Factors to consider include avoiding impacts to native species at establishment sites, finding suitable habitat, and choosing areas accessible enough to allow for planting and monitoring of introduced populations. Mokumanamana, Laysan Island, Kure Atoll, and Eastern and Sand Islands at Midway Atoll should be considered as potential sites.

***Strategy TES-8: Ensure protection of threatened and endangered species by facilitating Endangered Species Act consultations for Monument activities throughout the life of the plan.***

Since threatened and endangered species occur within the Monument, actions proposed by Federal agencies frequently require consultation with NMFS or FWS. Section 7(a)(2) of the ESA requires that federal agencies consult with NMFS for listed species under its jurisdiction and with the FWS for listed species under its jurisdiction (jurisdiction for sea turtles is shared by the two agencies) on actions that the federal agencies conclude may affect listed species or designated critical habitat.

This strategy undertakes the activities required to increase the capacity of the consultation actions under the ESA, promote timely and effective coordination among the action agencies and consulting agencies, and produce current baseline assessments of key species and designated critical habitat. These activities will help to improve the consultation process for all involved and result in protection and recovery of listed species and habitat.

***Activity TES-8.1: Increase the capacity of NMFS and FWS to address ESA consultations for activities within the Monument.***

This activity will seek to build the capacity of the consulting agencies to conduct consultations and coordinate with the action agencies and Monument staff. This activity will implement programs to improve the consulting personnel's knowledge about the species, habitat, and agency consultation procedures and laws. Such a program will include, among other elements, appropriate education, training, and regular interaction with species and habitat experts who can provide valuable input and review.

Additional staffing will most likely be needed by the agencies to carry out federal consultation requirements; staff will have expertise in ESA regulatory requirements, work to complete consultations in a timely fashion, coordinate between agencies and the Monument staff, appropriately integrate relevant biological information on the subject listed species or critical habitat, and develop and deliver Section 7 workshops for action agencies.

***Activity TES-8.2: Develop baseline assessments for listed species and critical habitat and streamline the Monument consultation process to facilitate ESA consultations.***

This activity will assist Monument managers, consulting agencies, and action agencies by producing ecological baselines of listed species and critical habitat, description of sensitive areas, and other information that can be considered early in any planning process relevant to the Monument. This information will be made available to action agencies to assist them in determining whether their activities may affect listed species and, if so, improve their biological assessments for consultations. It also will assist NMFS and FWS staff in evaluating proposed actions and developing their biological opinions. Also, ESA and other consultation procedures will be reviewed and streamlined and benefit from the preparation of current descriptions.

***Activity TES-8.3: Work with federal agencies proposing activities in the Monument to increase their knowledge about the ESA and listed species and critical habitat in the Monument.***

An action agency must be knowledgeable about the species, habitat, and laws directing consultation. When an action agency makes a determination regarding whether to consult and how to consult, the determination should be based on sound science and according to the criteria set forth in the regulatory regime implementing the ESA. To help action agencies recognize when their activities may affect listed species or critical habitat and the character of the effects, NMFS and the FWS will coordinate with its partners to build capacity within the action agencies.

Capacity building activities in this activity include the development and delivery by NMFS and FWS of targeted workshops that provide information on the requirements for ESA consultations and on the Monument listed species and critical habitat and working with partners to develop a cache of "best practices" and other operations protocols to avoid any impacts to listed species and habitat. These workshops and other like information exchanges will help to reduce and avoid any detrimental effects to listed species and critical habitat, improve the overall relationship with action agencies, and facilitate timely and effective consultations.

**Table 3.2.1 Summary of Strategies, Activities, and Agency Leads for Threatened and Endangered Species**

<b>Strategies and Activities</b>	<b>Agency Lead</b>
<b>Strategy TES-1: Support activities that advance recovery of the Hawaiian monk seal for the life of the plan.</b>	
Activity TES-1.1: Support marine debris removal activities to promote recovery.	NOAA
Activity TES-1.2: Support and facilitate emergency response for monk seals.	NOAA
Activity TES-1.3: Conserve Hawaiian monk seal habitat.	NOAA
Activity TES-1.4: Reduce the likelihood and impact of human interactions on monk seals.	NOAA
Activity TES-1.5: Support outreach and education on Hawaiian monk seals.	NOAA
Activity TES-1.6: Reduce shark predation on monk seals	NOAA
<b>Strategy TES-2: Determine the status of cetacean populations and verify and manage potential threats over the life of the plan.</b>	
Activity TES-2.1: Census cetacean populations.	NOAA
Activity TES-2.2: Conduct annual spinner dolphin mark and recapture photo identification surveys.	State of Hawai'i
Activity TES-2.3: Monitor, characterize, and address the effects of marine debris on cetaceans in the Monument.	NOAA
Activity TES-2.4: Respond to any suspected disease and unusual mortality incidents affecting cetaceans.	NOAA
Activity TES-2.5 Prevent human interactions with cetaceans.	NOAA
<b>Strategy TES-3: Ensure that nesting populations of green turtles at source beaches are stable or increasing over the life of the plan.</b>	
Activity TES-3.1: Collect biological information on nesting turtle populations.	FWS
Activity TES-3.2: Protect and manage nesting and basking habitat.	FWS
Activity TES-3.3: Protect and manage marine habitat, including foraging areas and migration routes.	NOAA
<b>Strategy TES-4: Work with the international recovery team for short-tailed albatrosses to facilitate an increase in the total breeding population of this species to at least 25 breeding pairs occurring on sites other than Torishima and Senkaku islands.</b>	
Activity TES-4.1: Work cooperatively with the Japanese government to establish one or more breeding populations on islands free from threats such as active volcanoes and introduced mammals.	FWS
Activity TES-4.2: Conduct studies to examine the correlation between reproductive success and contaminant loads.	FWS
Activity TES-4.3: Create and disseminate information on fisheries bycatch and bycatch reduction to all fisheries occurring outside the Monument.	NOAA
<b>Strategy TES-5: Conduct activities to increase Laysan duck populations in the Monument over the life of the plan.</b>	
Activity TES-5.1: Continue population monitoring on Laysan Island and Midway Atoll.	FWS
Activity TES-5.2: Carry out translocations to other sites in the Monument.	FWS

Strategies and Activities	Agency Lead
<b>Strategy TES-6: Maintain stable populations of the Laysan finch, Nihoa finch, and Nihoa millerbird in the Monument over the life of this plan.</b>	
Activity TES-6.1: Continue to conduct annual censuses of populations of each passerine species and monitor their food and habitat requirements.	FWS
Activity TES-6.2: Implement translocations of each species and site restoration as needed by developing appropriate techniques for capture, translocation, release, and monitoring.	FWS
<b>Strategy TES-7: Establish populations of each listed plant species on one to three additional Monument islands and ensure genetic material is also protected in approved repositories.</b>	
Activity TES-7.1: Ensure all endangered plant species from Nihoa and Laysan Island are fully represented in an ex situ collection such as a nursery or arboretum.	FWS
Activity TES-7.2: Increase numbers and locations of <i>Amaranthus brownii</i> and <i>Schiedea verticillata</i> on Nihoa by 2018.	FWS
Activity TES-7.3: Establish a self-sustaining <i>Pritchardia remota</i> population on Laysan Island by 2012.	FWS
Activity TES-7.4: Continue greenhouse operations on Laysan Island to propagate and outplant rare plant taxa.	FWS
Activity TES-7.5: Evaluate the potential to establish one to three colonies of <i>Amaranthus brownii</i> , <i>Schiedea verticillata</i> , and <i>Pritchardia remota</i> outside of their historical ranges.	FWS
<b>Strategy TES-8: Ensure protection of threatened and endangered species by facilitating Endangered Species Act consultations for Monument activities throughout the life of the plan.</b>	
Activity TES-8.1: Increase the capacity of NMFS and FWS to address ESA consultations for activities within the Monument.	FWS NOAA
Activity TES-8.2: Develop baseline assessments for listed species and critical habitat and streamline the Monument consultation process to facilitate ESA consultations.	NOAA FWS
Activity TES-8.3: Work with federal agencies proposing activities in the Monument to increase their knowledge about the ESA and listed species and critical habitat in the Monument.	NOAA FWS

### 3.2.2 Migratory Birds Action Plan

#### Desired Outcome

Conserve migratory bird populations and habitats within Papahānaumokuākea Marine National Monument.

Links to other Action Plans	
3.2.3	Habitat Management and Conservation
3.3.2	Alien Species
3.3.4	Emergency Response
3.5.4	Ocean Ecosystems Literacy
3.6.3	Coordinated Field Operations

#### Current Status and Background

In 1903, President Theodore Roosevelt placed Midway under the jurisdiction and control of the Navy to stop the “wanton destruction of birds that breed on Midway.” In 1909, he ordered that “the following islets and reefs, namely: Cure Island, Pearl and Hermes Reef, Laysianki or Pell Island, Laysan Island, Mary Reef, Dowsetts Reef, Gardiner Island, Two Brothers Reef, French Frigate Shoal, Necker Island, Frost Shoal and Bird Island ...are hereby reserved and set apart, subject to valid existing rights, for the use of the U.S. Department of Agriculture as a preserve and breeding ground for native birds.” Thus, native birds were the first wildlife species for which the Monument area was managed for conservation purposes by the U.S. Government. Early protection was important in ensuring the large, diverse seabird and shorebird populations present today in the Monument. Seabird colonies in the NWHI constitute one of the largest and most important assemblages of tropical seabirds in the world, with approximately 14 million birds (6 million breeding annually), representing 22 species. Greater than 95 percent of the world’s Laysan and black-footed albatrosses nest here. For several other species, such as the Bonin petrel, Christmas shearwater, Tristram’s storm-petrel, and gray-backed tern, the NWHI supports colonies of global significance. For the species of boreally breeding shorebirds that overwinter in the tropical Central Pacific, the NWHI are an essential stopover or wintering site. In particular, the bristle-thighed curlew relies on the mammal-free islands of the Monument because it goes through a flightless period during molt and is very vulnerable to predation.

Goal 1
Goal 2
Goal 3
Goal 4
Goal 5

#### Need for Action

The majority of all tropical seabirds in Hawai‘i nest in the Monument, and those breeders plus an equal number of species of nonbreeding seabirds transit through or forage in the waters of the Monument. While the breeding colonies are secure from future development and disturbance, a variety of threats still faces seabirds in the Monument, including contaminants left from former activities in the area and contaminants, such as oil, arriving from the sea; habitat loss to sea level rise; changes in food availability resulting from climate change; marine debris, which causes both ingestion and entanglement hazards; invasive species; fisheries interactions outside the Monument boundary; and wildlife diseases. Breeding seabirds and migratory shorebirds rely on terrestrial areas of the Monument for valuable wintering habitat, free of mammalian predators.

Statute and policy at several levels mandate the protection and management of migratory bird populations in the Monument. The primary federal protective measure for these species is the Migratory Bird Treaty Act of 1918, which prohibits hunting, taking, capturing, killing, or selling of seabird species, and also fully protects eggs, nests, and feathers from collection or destruction. Additional directives from international treaties, domestic legislation, executive orders, state law, and FWS policy require the protection, monitoring, and assessment of migratory nongame birds;

determination of the effects of environmental changes and human activities on migratory birds; and active protection of colonies, roosts, loafing sites, and adjacent waters for seabirds.

### **Strategies to Achieve the Desired Outcome**

Four strategies have been identified for achieving the desired outcomes of protecting and enhancing migratory bird populations in the Monument. The strategies and activities are coded by the acronym for the action plan title, “Migratory Birds” (MB). A summary of strategies and activities is provided in Table 3.2.2 at the end of this action plan.

- MB-1: Protect and enhance habitats for terrestrial and marine migratory birds throughout the life of the plan.
- MB-2: Minimize the impact of threats to migratory birds such as habitat destruction by invasive species, disease, contaminants (including oil), and fisheries interactions for the life of the plan.
- MB-3: Monitor populations and habitats of migratory birds at a level sufficient to ascertain natural variation and then to detect changes in excess of that variation that might be attributed to human activities, including anthropogenic climate change.
- MB-4: As threats are removed, restore seabird species at sites where they have been extirpated.

### **Strategy MB-1: Protect and enhance habitats for terrestrial and marine migratory birds for the life of the plan.**

Safe habitats for breeding and foraging are essential for all of the migratory birds using the Monument. While most seabirds and shorebirds exhibit some flexibility in their habitat requirements, features of the plant community (species and structural characteristics) favor or limit populations.

#### ***Activity MB-1.1: Control or eradicate nonnative species at all sites where they have a negative impact on the survivorship or reproductive performance of migratory birds.***

Invasive species affect survival and reproduction of migratory birds by causing direct mortality through predation or parasitism, or by modifying the habitat to make it less suitable for survival or reproduction. Invasive species that have been shown to diminish the quality of migratory bird habitat in the Monument include several plants such as sandbur (*Cenchrus echinatus*), ironwood (*Casuarina equisetifolia*), and golden crownbeard (*Verbesina encelioides*), and introduced scale insects and associated ants that damage vegetation providing appropriate habitat for migratory birds. (See Section 3.3.2, Alien Species Action Plan.)

#### ***Activity MB-1.2: Restore components of the native plant communities that are important to seabird nesting.***

Opportunities for restoring native habitats for seabirds exist wherever nonnative species have been eradicated or controlled or human activities limiting migratory bird species have ceased. Translocation, propagation, and outplanting of native plants (*Eragrostis variabilis*, *Sesbania tomentosa*, *Sida fallax*, *Scaevola sericea*, etc.) to improve habitat for migratory bird nesting and foraging are ongoing at Laysan Island and Midway and Kure Atolls and are planned for other sites in the Monument (Rehkemper et al. 2005).

**Strategy MB-2: Minimize the impact of threats to migratory birds such as habitat destruction by invasive species, disease, contaminants (including oil), and fisheries interactions for the life of the plan.**

The original motivation for the protection of the area by the federal government was to eliminate illegal harvest of breeding seabirds. Minimizing threats to migratory bird populations remains a primary concern.

***Activity MB-2.1: Conduct surveillance for evidence of avian disease outbreaks, and follow existing response plan if disease is detected.***

The MMB participates with other National Wildlife Refuges and agencies as partners in the Hawai'i–Pacific Islands Working Group on Avian Influenza Surveillance to guard against wildlife diseases such as Asian H5N1 Avian Influenza. Staff report all instances of unusual mortality and collect samples using approved safety protocols and protective gear. If avian influenza is detected, Monument staff will use the Highly Pathogenic Avian Influenza Disease Contingency Plans in place for the Midway Atoll NWR and Hawaiian Islands NWR.

***Activity MB-2.2: Monitor contaminant levels in birds and their habitats, and respond if the potential exists to cause immediately lethal or sublethal effects.***

Bird health and contaminant levels in areas of contamination that have already been identified will be monitored, and unexplained health problems in other areas will be evaluated for possible links to contaminants.

***Activity MB-2.3: Ensure that all spill response plans have adequate coverage of actions necessary to minimize mortality to migratory birds.***

Monument staff will coordinate with and provide technical contributions regarding migratory birds to multiagency spill prevention and pre-spill activities, as well as actual response actions and Natural Resource Damage Assessments. (Also see Section 3.3.4, Emergency Response Plan.) Staff will contribute to keeping seabird and shorebird information current for the area contingency plan and maintain a list of restoration activities for the Co-Trustees.

***Activity MB-2.4: Maintain rigorous quarantine protocols to prevent the introduction of alien species that may prove hazardous specifically to migratory birds.***

Alien species are one of the greatest threats to migratory birds, either directly in the case of pathogens or predators, or indirectly in the case of invasive plants or animals that damage habitat. Rigorous quarantine protocols must be maintained to ensure new alien species are not introduced or transmitted from one island to another. (See Section 3.3.2, Alien Species Action Plan.)

***Activity MB-2.5: Work with partners to reduce the impact of commercial and sport fisheries outside the Monument on migratory bird populations.***

Sport and commercial fishing was eliminated, or is being phased out, within the Monument. However, such activities outside the Monument can adversely impact Monument resources. FWS established national policy in 2001 that identified the bycatch of migratory birds in fisheries as a serious conservation problem and may be inconsistent with of the underlying tenets

of the Migratory Bird Treaty Act. FWS and the U.S. Department of State worked with NMFS to draft a National Plan of Action for addressing the problem of seabird bycatch to comply with the Code of Conduct for Responsible Fisheries developed by the Food and Agriculture Organization of the United Nations. This group of agencies and representatives of the Regional Fisheries Management Councils work with industry and conservation organizations to guide implementation of the National Plan of Action to reduce fishing impacts. Laysan albatrosses and black-footed albatrosses, two of the species most affected by bycatch mortality in the northern hemisphere, nest almost exclusively in the Monument, so the responsibility to provide data on seabird population status and biological expertise regarding the problem falls to Monument staff. Staff provide additional assistance by teaching seabird identification skills to fishers and fisheries observers and by assisting with the development of mitigation techniques. Implementation of many of the actions identified in the FWS Migratory Bird Draft Conservation Action Plan for Black-footed Albatross (*Phoebastria nigripes*) and Laysan Albatross (*P. immutabilis*) will involve Monument staff.

***Activity MB-2.6: Research mite impacts on black-footed albatross chicks on Kure Atoll.***

Mites (including the native mite *Womersia midwayensis*) causing mortality and morbidity on black-footed albatross (*P. nigripes*) chicks on Kure Atoll should be investigated. This activity is necessary to determine the preferred habitat of mites and assess the potential to alter habitat or discourage albatross nesting.

**Strategy MB-3: Monitor populations and habitats of migratory birds to ascertain natural variation and to detect changes in excess of that variation that might be attributed to human activities, including anthropogenic climate change.**

Monitoring migratory bird populations and habitats is necessary to detect changes in excess of natural variation that might be attributed to human activities. Monitoring must include statistically valid sample sizes and must provide time series long enough for credible evaluations of population responses to threats and management actions.

***Activity MB-3.1: Using standard methods devised for tropical seabirds, monitor a suite of 15 focal seabird species at specific sites in the Monument to track changes in population size and understand underlying causes of that change.***

A coordinated program to assess the status and trends of seabird populations is essential to provide scientific information necessary to make management decisions and to evaluate the efficacy of management actions. The Regional Seabird Conservation Plan (FWS Pacific Region 2005) recommends inventories of all seabird colonies at long-term intervals, such as every ten years, and intensive quantitative monitoring of specific parameters, such as survival or population size of a select group of species at selected localities, on an annual basis. The 15 focal species were identified during a review of seabird monitoring in the NWHI by the U.S. Geological Survey and FWS and were chosen because they are Birds of Conservation Concern, stewardship species of the NWHI, or representative of specific foraging or breeding guilds. A recently completed assessment of seabird monitoring for Hawai'i and the Pacific (Citta, Reynolds, and Seavy 2006) will be used to develop a standardized seabird monitoring plan for the Monument as well as other areas in the U.S. Central Tropical Pacific. As part of the plan, the monitoring data will be maintained in the PIMS.

***Activity MB-3.2: Monitor changes in habitat quality by measuring reproductive performance and diet composition in selected seabird species.***

Parameters such as hatching success, fledging success, and diet composition provide a more immediate indication of ocean conditions and prey abundance and availability than does long-term population monitoring. This is because seabirds take many years to mature to recruitment into the breeding population, and actual fluctuations in the number of breeders may reflect conditions that occurred five to ten years previously. As a result, quantification of population parameters such as reproductive success and survival, and subsequent modeling of population trends, provides a better understanding of the status of these seabird populations.

***Activity MB-3.3: Develop and use standardized methods to accurately assess the population size and trends of over-wintering and migrating Pacific golden plovers, bristle-thighed curlews, wandering tattlers, and ruddy turnstones.***

Repeatable surveys at reference sites where we can predict continuity of measurement in the future will allow us to evaluate long-term changes in transient and winter resident shorebirds in the Monument and contribute to international monitoring of these wide-ranging species.

**Strategy MB-4: As threats are removed, restore seabird species at sites where they have been extirpated.**

Many examples of extremely successful conservation programs are based on the principle that populations can be restored to an area if a limiting threat is removed. Seabird populations that formerly occurred at various sites in the Monument have the potential to be restored by using behavioral manipulation techniques such as colony attraction through sound and visual stimuli or the provision of artificial nest structures.

***Activity MB-4.1: Use social attraction techniques to encourage recolonization at Midway and Kure Atolls by Bulwer's petrels and Tristram's storm-petrels.***

The introduction of Polynesian rats to Kure sometime before 1912 and of black rats to Midway in 1943 resulted in the extirpation of these two small seabird species at these two atolls. Both rat species have now been eradicated. Petrel species are typically very conservative about dispersing and starting new colonies, but successful restoration of petrels using social attractants such as playing recorded calls has been documented in several studies (Podolsky and Kress 1987), and the provision of nest boxes has been shown to enhance reproductive success and thus accelerate the recolonization process (Bolton et al. 2004).

**Table 3.2.2 Summary of Strategies, Activities, and Agency Leads for Migratory Birds**

<b>Strategies and Activities</b>	<b>Agency Lead</b>
<b>Strategy MB-1: Protect and enhance habitats for terrestrial and marine migratory birds throughout the life of the plan.</b>

### 3.2.3 Habitat Management and Conservation Action Plan

#### Desired Outcome

Protect, maintain, and where appropriate, restore the native ecosystems and biological diversity of Papahānaumokuākea Marine National Monument.

Links to Other Action Plans	
3.2.1	Threatened and Endangered Species
3.2.2	Migratory Birds
3.3.2	Alien Species
3.5.1	Agency Coordination
3.5.4	Ocean Ecosystems Literacy
3.6.3	Coordinated Field Operations

#### Current Status and Background

Presidential Proclamation 8031 prescribes ecosystem-based management for the Northwestern Hawaiian

Islands, and the National Wildlife Refuge System Administration Act of 1966, as amended, also requires such management for all NWRs. They require protections of ecosystem structure and function; conservation of fish, wildlife, plants, and their habitats; and ensuring the biological integrity, diversity, and environmental health of the Monument. Section 1.1 of this Monument

Links to Goals
Goal 1
Goal 2
Goal 3
Goal 4

Management Plan describes habitats in the NWHI, ranging from abyssal benthic areas to the high cliff faces of Nihoa and Mokumanamana (Necker), and Section 1.2 elaborates on the historical and current status of those habitats as well as describing resources of concern in the Monument. The Environmental and Anthropogenic Stressors section (1.3) describes known threats to biological integrity, diversity, and environmental health of the Monument. Habitat management activities included in this action plan include inventory of Monument resources, characterizing habitat health, investigating problems, changing plant communities to meet ecosystem goals, removing contaminants, preserving wilderness character, and engaging in ecological restoration of native habitats.

#### Need for Action

While the Monument remains one of the most remote and undisturbed archipelagos in the world, it still requires active habitat management on the part of managers to fulfill the mandate of protecting, maintaining, and restoring its wide range of native habitats. Furthermore, FWS has a mandate to conserve and restore, where appropriate, wildlife and habitats on NWRs. In accordance with refuge system laws and policies, management must “maintain existing levels of biological integrity, diversity, and environmental health at the Refuge scale. Following that, [managers] will restore lost or degraded elements of biological integrity, diversity, and environmental health at all landscape scales where it is feasible and supports fulfillment of refuge purposes” (601 FW 3). Restoration, when and where appropriate, will be undertaken using best available information about pre-disturbance conditions. This action plan will provide guidance for management of Monument lands and waters, rationale for the activities listed, and a framework for continuity and consistency in habitat management decisions for the life of the plan.

### Strategies to Achieve the Desired Outcome

Strategies for conservation and management in the varied habitats of the Monument have been identified to achieve the desired outcome of protecting native ecosystems and biological diversity. The strategies and activities are coded by the acronym for the action plan title, “Habitat Management and Conservation” (HMC). A summary of strategies and activities is provided in Table 3.2.3 at the end of this action plan.

- HMC-1: Within 15 years, develop and implement a strategy for restoring the health and biological diversity of the shallow reefs and shoals where anthropogenic disturbances are known to have changed the ecosystem, using best available information about pre-disturbance conditions.
- HMC-2: Within 10 years, investigate and inventory sources of known contamination from historical human uses of the NWHI and, where appropriate, coordinate with responsible parties to develop plans and complete cleanup actions.
- HMC-3: Protect and restore beach strand and crest habitats over the life of the plan.
- HMC-4: Within 10 years, restore and maintain coastal mixed grasses and shrubs on all the coralline islands and atolls of the Monument using best available historical information about the original indigenous ecosystem.
- HMC-5: Within 10 years, restore and maintain coastal mixed grasses and shrublands on basalt islands in the Monument.
- HMC-6: Maintain and better understand the Monument’s wetland and mudflat habitats to benefit migratory shorebirds and waterfowl for the life of the plan.
- HMC-7: Maintain, enhance, and, where appropriate, develop freshwater seeps, intermittent streams, and freshwater ponds as necessary for the benefit of native species for the life of the plan.
- HMC-8: Maintain no more than 150 acres of ironwood woodlands on Sand Island, Midway Atoll, to provide seabird nesting and roosting habitat for the life of the plan.
- HMC-9: Protect and maintain 120 acres of vertical rocky cliff-face habitat at Nihoa and Mokumanamana for nesting seabirds for the life of the plan.

**Strategy HMC-1: Within 15 years, develop and implement a strategy for restoring the health and biological diversity of the shallow reefs and shoals where anthropogenic disturbances are known to have changed the ecosystem, using best available information about pre-disturbance conditions.**

The shallow reef (less than 16 fathoms, 30 meters) areas of the Monument have been affected by a variety of human activities through the years, including overharvesting of some species, dredging and filling, and anchor damage from vessels stopping in the area. The extent and relative severity of these impacts are poorly understood.

***Activity HMC-1.1: Identify and prioritize restoration needs in shallow water reef habitats impacted by anthropogenic disturbances within 5 years.***

For more than 100 years, human activities in the NWHI have created disturbance in natural systems. Many such actions affecting marine and terrestrial wildlife are known, but the impacts of disturbance in the marine environment in particular, opportunities for restoration, and priorities for undertaking restoration actions are not thoroughly analyzed. One example of a

shallow-reef marine organism that has been negatively impacted by human activities is the black-lipped pearl oyster (*Pinctada margaritifera*), which has not recovered at Pearl and Hermes atoll since it was intensely harvested in the 1920s (Galtsoff 1933; Keenan et al. 2006). Where appropriate, and using the best available information about pre-disturbance conditions, opportunities for restoring species will be identified and prioritized.

***Activity HMC-1.2: Analyze historical and present impacts on reef growth at Midway Atoll and determine factors limiting nearshore patch reef growth to facilitate restoration of natural reef building.***

Midway Atoll has been the site of the most dramatic modification of reef circulation and the most prolific source of anthropogenic inputs to nearshore reefs in the NWHI. Evaluating these pressures and their effects on reefs will provide useful information to help replace lost ecosystem function and integrity of reefs at Midway and potentially at other sites with similar threats to nearshore reef habitats.

***Activity HMC-1.3: Where feasible, implement appropriate restoration activities.***

As follow-up to identifying restoration priorities (HMC-1.1), appropriate restoration activities will be assessed (HMC-1.2), actions developed and, where feasible, implemented.

**Strategy HMC-2: Within 10 years, investigate, inventory, and map sources of known contamination from historical human uses of the NWHI and, where appropriate, coordinate with responsible parties to develop plans and complete cleanup actions.**

Human occupation and activity in the NWHI have resulted in numerous impacts, some of which can be categorized as contaminants that disrupt native ecosystems in various ways. These contaminants are found in both terrestrial and marine environments of the Monument and include, but are not limited to, heavy metals, iron, PCBs, and other organochlorines. Other materials that have come into the Monument by way of the ocean include pesticides, oil from undocumented spills at sea, and plastic marine debris (see Section 3.3.1, Marine Debris Action Plan). These contaminants occur both in known dumping sites and in areas less well characterized or not yet discovered.

***Activity HMC-2.1: Evaluate effects of contamination in terrestrial and nearshore areas from shoreline dumps at French Frigate Shoals and at Kure, Midway, and Pearl and Hermes atolls and prioritize cleanup action based on risk assessments.***

Various dumps left behind from military activities during World War II and the Cold War are disintegrating quickly. Runoff, erosion, and seepage from all of these dumps have contaminated nearshore habitats. The extent of the effects of this contamination to birds nesting on the dumps and marine organisms in adjacent waters will be investigated.

***Activity HMC-2.2: Work with partners and responsible parties to verify the integrity of known landfills and dumps and to conduct additional remediation if necessary.***

Landfills and dumping sites at Midway Atoll, such as the Old Bulky Waste Landfill, which was designated as a contaminated site during the Navy's Base Realignment and Closure (BRAC) program assessment at Midway, and "Rusty Bucket" on Sand Island at Midway, which was not designated contaminated in the BRAC assessment, need to be evaluated every five years for integrity, containment effectiveness, and hazard potential. Monument staff will work with the

U.S. Environmental Protection Agency (EPA) and the Navy to ensure best practices for preventing the contained contaminants at these sites from migrating out of the dump areas at Midway. In collaboration with the Coast Guard, EPA, and Hawai'i Department of Health, the Co-Trustees will work to investigate washing and leaching of PCBs from known dumps at Kure Atoll and to finish the removal of the dump at Tern Island, French Frigate Shoals, to achieve agreed-upon levels of PCBs there.

***Activity HMC-2.3: Locate historic disposal sites at French Frigate Shoals and at Kure, Midway, and Pearl and Hermes atolls, and investigate them for contamination.***

There is a need to search for documented but not yet located landfills at Tern and East Islands, French Frigate Shoals, and Southeast Island, Pearl and Hermes Atoll, and for underground storage tanks at Eastern Island, Midway Atoll. It is also important to investigate the 1993 unlined landfill created by the Coast Guard on Green Island, Kure Atoll, during remediation of the LORAN station to confirm that the PCBs placed in the unlined landfill are not leaching to groundwater and that the documented surface hot spots have been removed. In addition, the 25 milligram/kilogram cleanup level for PCBs should be evaluated to ensure that it is adequately protective of wildlife.

***Activity HMC-2.4: Evaluate costs to ecosystem function and benefits of removing anthropogenic iron sources such as metal from shipwrecks and discarded debris from reefs throughout the Monument.***

Increasing the available iron in tropical oceanic waters often results in an overgrowth of certain cyanobacteria that are naturally rare in the iron-limited environments of the tropical Pacific away from volcanic islands. The MMB will develop a catalog of all anthropogenic iron sources and the factors associated with each site that would enable prioritization for removal and a cost-benefit analysis.

***Activity HMC-2.5: Continue collection and fingerprinting of oil found washed ashore and on wildlife from mystery spills to determine its provenance, and build an oil sample archive for possible use as evidence in liability assignment.***

The occurrence of oil on nesting seabirds and washed up on beaches in the Monument that cannot be attributed to a known spill is a regularly recorded event at all the staffed sites in the NWHI. Because of the enormous foraging range of subtropical seabirds and the large number of vessels transiting the North Pacific, these spills are rarely attributed to any responsible party. Samples collected in the Monument can be used to compare with banks of petroleum signatures and may help in understanding more about the primary sources of this pollution.

***Activity HMC-2.6: Continue monitoring the area at Laysan Island that was contaminated by the insecticide carbofuran.***

In 1988, biologists first detected unexplained mortality of carrion flies and ghost crabs at a beach crest site on Laysan Island. These scavengers were coming in to feed on dead albatross chicks, commonly seen in summer months at Laysan. Upon entering the area later referred to as the "Dead Zone," they would abruptly die. The cause was finally identified by FWS as the pesticide carbofuran, and the area was cleaned by removing and treating on-site contaminated sand in 2002. Continued vigilance is needed to make sure that such effects do not flare up again in that area because of an overlooked hot spot.

***Activity HMC-2.7: Conduct ecological risk assessment to determine allowable lead levels in soils at Midway and remove lead from buildings and soils to nonrisk levels.***

Lead in the soils around many of the buildings at Midway is adversely affecting the birds nesting and burrowing in these areas by causing droop-wing and other lethal and sublethal effects. Before the lead can be effectively removed from the soil, an ecological risk assessment will be performed to determine the cleanup level necessary to ensure the protection of human and wildlife health. The lead-based paint flaking from the buildings at Midway will be removed to eliminate this contamination.

**Strategy HMC-3: Protect and restore beach strand and crest habitats over the life of the plan.**

Beach strand and beach crest habitats on French Frigate Shoals, Laysan Island, Lisianski Island, Pearl and Hermes Atoll, Midway Atoll, and Kure Atoll provide important habitat for a variety of native organisms, several of them listed as threatened or endangered. Anthropogenic threats, including previous manipulation of shorelines and additions of structures and the suite of effects to shoreline habitats associated with global climate change, make it necessary to actively manage these habitats in the Monument.

***Activity HMC-3.1: Evaluate loss of beach strand and crest due to erosion and sea level rise to aid in formulating a restoration plan that will stop as much net loss of beach strand and beach crest habitat as is possible.***

Projected sea level rise, increased storm frequency, changes in current patterns, and large wave events pose a particular danger to the low-lying terrestrial habitats of the Monument. In addition to sea level rise, invasive species threaten the dune stability, particularly golden crownbeard (*Verbesina enceliodes*) and ironwood (*Casuarina equisetifolia*) on Kure and Midway Atolls. Monument staff will evaluate the loss of beach strand and crest in order to formulate a restoration plan.

***Activity HMC-3.2: Inventory and map manmade structures and changes in natural beach and reef state that may influence erosion and depositional processes at all of the beach strand units of the Monument.***

Human modification of shorelines and channels may be affecting ecosystem function in the NWHI. These features will be evaluated, their effects analyzed, and their restoration considered.

**Strategy HMC-4: Within 10 years, restore and maintain coastal mixed grasses and shrubs on all the coralline islands and atolls of the Monument using best available historical information about the original indigenous ecosystem.**

Coastal mixed grass and shrub habitats cover the majority of the Monument's terrestrial area and are important habitat for seabirds, shorebirds, landbirds, and terrestrial invertebrates. Careful review of historical botanical accounts and studies of pollen preserved in the anaerobic sediments of Laysan Lake (Athens, et al. 2007) provide a template for restoration of the plant communities of the coastal grass and shrublands.

***Activity HMC-4.1: Propagate and outplant native species chosen on the basis of historical records at Midway and historical and pollen records from Laysan Island in 250 acres of***

**vegetated area at Midway Atoll, focusing on the original footprint of the island and then moving to the dredge spoils section.**

Using seed sources deemed most appropriate by botanical experts, including bunchgrass (*Eragrostis variabilis*), naupaka (*Scaevola sericea*), morning glory (*Ipomoea pes caprae*, *I. indica*), *Solanum nelsonii*, *Capparus sandwichiana*, *Chenopodium oahuense*, and *Lepidium bidentatum*, and treated to maintain quarantine standards, Monument staff will propagate seeds in the greenhouse on Sand Island and outplant them in selected areas of the entire atoll.

**Activity HMC-4.2: Implement the Draft Laysan Island Restoration Plan by removing invasive plants, and propagating and outplanting all extant species identified in the pollen record or historical documents as formerly having occurred at Laysan.**

The Draft Laysan Island Restoration Plan (Morin and Conant 1998) details the biological history of the island's habitats and lays out a plan for ecological restoration of habitat structure and function. This document includes plans for restoration of plants, terrestrial arthropods, and avian components of the biological community that occurred at Laysan Island prior to human contact and the resultant loss of many of the island's species.

**Activity HMC-4.3: At Laysan Island, replace 60 acres of the introduced shrub *Indian pluchea* with native species.**

The need to provide appropriate nesting habitat and maintain elements of ecosystem function while restoring native species requires management of the timing of vegetation replacement. Reestablishment of the native shrub community (including *Sida fallax*, *Chenopodium oahuense*, and *Capparis sandwicensis*) will precede the removal of the alien plant *Pluchea indica* in order to maintain the ecosystem function of providing nesting substrate for red-footed boobies, great frigatebirds, and black noddies.

**Activity HMC-4.4: Formulate and implement a restoration plan for Lisianski Island using guidelines established for neighboring Laysan Island.**

Our current and historical knowledge of the vegetation community at Lisianski Island is less well developed than that of its neighbor, Laysan Island. Lisianski Island may provide good opportunities for ecological restoration following appropriate investigation of its botanical history. Sediments at the lowest part of the island will be sampled for ancient pollen to aid in reconstructing the composition and structure of the plant community prior to human visitation. Fossil pollen scientists believe that the soil of Lisianski Island may have characteristics amenable to the preservation of ancient pollen in the low-lying center of the island.

**Activity HMC-4.5: Propagate and outplant native vegetation on 34-acre Southeast Island at Pearl and Hermes Atoll to replace native plant community extirpated by invasion of the alien plant golden crownbeard.**

As golden crownbeard (*Verbesina encelioides*) is removed, native habitats will be restored on Southeast Island at Pearl and Hermes Atoll. This restoration is of great importance for the survival of several native plant populations, especially *Eragrostis variabilis*, *Solanum nelsonii*, *Tribulus cistoides*, *Lepidium bidentatum*, and *Boerhavia repens* at the northern end of the archipelago, and for a small translocated population of the endangered Laysan finch (*Telespyza cantans*). Propagules from the same native species still extant on several of the other islets in the atoll will be used.

***Activity HMC- 4.6: Implement coordinated ecosystem restoration activities on Kure Atoll.***

In 2007, the State of Hawai‘i began drafting a management plan for Kure Atoll. This plan includes prioritizing and eliminating ecosystem threats caused by past anthropogenic disturbances. Ongoing efforts to restore ecosystem function include removing invasive species and increasing the range of and the reintroduction of native plant species. These activities are designed to improve nesting, foraging, and resting habitat for migratory birds. Kure Atoll has been identified as a site for potential translocation of the endangered Laysan finch and Laysan duck. Assessment of the feasibility of these activities has begun.

***Activity HMC-4.7: Monitor changes in the species composition and structure of mixed grass and shrub plant communities at each site.***

An understanding of the range of natural variability caused by weather in these simple but dynamic vegetation communities allows managers to better evaluate the effectiveness of various management actions.

**Strategy HMC-5: Within 10 years, restore and maintain coastal mixed grasses and shrublands on basalt islands in the Monument.**

The coastal mixed grass and shrubland habitat of the basalt islands in the Monument (Nihoa and Mokumanamana, La Perouse Pinnacle, and Gardner Pinnacles) are remarkably intact with respect to their species composition and vegetation structure. They represent a window to the past in that they probably closely resemble the dryland coastal plant communities that have been lost in the main Hawaiian Islands.

***Activity HMC-5.1: Inventory and document life histories of endemic terrestrial invertebrates at Nihoa and Mokumanamana.***

The vegetation communities of Nihoa and Mokumanamana are the most intact native coastal plant assemblages in the State. They do suffer from the introduction of a number of alien insect species. Understanding the ecology of these new terrestrial arthropods will aid in identifying which species pose the greatest threat to the native coastal mixed grass and shrubland habitat, including the five endangered plant species there, and the endemic and native terrestrial invertebrates of these basalt islands.

***Activity HMC-5.2: Monitor changes in species composition and structure of the coastal shrub and mixed grass communities on basalt islands throughout the life of the plan.***

Surveys and mapping of the plant community will help document losses of native species and provide a template for restoration of any that are lost through invasive species competition, herbivory, or other means.

**Strategy HMC-6: Maintain and better understand the Monument’s wetland and mudflat habitats to benefit migratory shorebirds and waterfowl for the life of the plan.**

The vast oceanic areas that many boreal shorebirds and waterfowl must cross during their annual migration provide few resting places other than these small natural wetlands at Midway Atoll, Kure Atoll, Pearl and Hermes Atoll, and most importantly Laysan Island. While they are a small part of the total Monument area, they may provide a temporary habitat for migrant birds that determines their survival.

***Activity HMC-6.1: Monitor water level, salinity, and other water quality parameters of Laysan Lake, and document any loss of lake area.***

The hypersaline lake and associated mudflats at Laysan Island, and to a lesser extent, the ‘ākulikuli (*Sesuvium portulacastrum*) flats at Southeast Island, Pearl and Hermes Atoll, and Spit Island in Midway Atoll, serve as an important habitat for migratory waterfowl and shorebirds. Historically, during times of low vegetative cover caused by overbrowsing by rabbits or long periods of drought, the dunes have drifted into the lake.

***Activity HMC-6.2: As needed, restore dune habitat on Laysan Island to stabilize movement if lake loss starts to occur.***

Dune habitat can be effectively restored through vegetation protection or drift fences to minimize sand movement. Measures to slow sand movement may protect the wetland habitat at these sites.

**Strategy HMC-7: Maintain, enhance, and, where appropriate, develop freshwater seeps, intermittent streams, and freshwater ponds as necessary for the benefit of native species for the life of the plan.**

The vast majority of all the species of animals in the Monument can survive without access to any fresh water, but a few invertebrates, landbirds, and waterbirds at certain life stages (particularly the Laysan duck) require water with low salinity, and periodic access to these sources is essential. Freshwater sources are found at Nihoa, Mokumanamana, and Laysan Islands, and Midway and Kure Atolls.

***Activity HMC-7.1: Monitor salinity, parasites, contaminants, and native arthropods associated with freshwater seeps, ponds, and streams.***

The endemic passerines (particularly Nihoa finch and Laysan finch), the Laysan duck, and certainly a number of the native invertebrates, freshwater algae, and terrestrial arthropods rely on fresh water, particularly during their reproductive seasons. Water quality and abundance are important factors in the reproduction of many of these species.

***Activity HMC-7.2: Evaluate potential for development and create as needed additional freshwater sources at potential translocation sites of the Laysan duck, Nihoa finch, Laysan finch, and Nihoa millerbird.***

Some potential translocation sites for endangered endemic birds in the NWHI may contain all important habitat features for survival except for fresh water. Evaluation of the potential for water development at these locations will allow evaluation of overall translocation site suitability.

**Strategy HMC-8: Maintain no more than 150 acres of ironwood woodlands on Sand Island, Midway Atoll, to provide seabird nesting and roosting habitat for the life of the plan.**

The ironwood (*Casuarina*) forests at Sand Island provide nesting and roosting habitat for very large populations of white terns and the only breeding population of black noddies in the northern end of the Monument. While this species is an invasive nonnative, it does support these

large seabird populations and will be replaced with adequate native alternatives before removing it completely.

***Activity HMC-8.1: Remove ironwood on Sand Island from 50 acres outside designated woodland and control young ironwood in areas managed for grass and shrubs.***

Ironwood is a fast-spreading species that will displace other vegetation types if not restrained. Forested infestations can be treated with heavy machinery or cutting and application of Garlon®. Young *Casuarina* can be controlled by hand-pulling and cutting and herbicide treatment.

***Activity HMC-8.2: Devise and implement methods for monitoring population size and reproductive success in tree-nesting seabird species.***

Better census techniques for tree-nesting seabirds such as white terns and black noddies are needed to assist decisionmaking about vegetation management and ultimate replacement of introduced species with natives. These studies will enable evaluation of whether certain age classes or forest types are more productive than others for these seabirds.

**Strategy HMC-9: Protect and maintain 120 acres of vertical rocky cliff-face habitat at Nihoa and Mokumanamana for nesting seabirds for the life of the plan.**

Throughout Hawai‘i, vertical cliff habitats provide a safe haven for native birds, insects, and plants that can survive in the exposed inaccessible sites. Nihoa and Mokumanamana support colonies of cliff-nesting seabirds (white terns, black noddies, brown boobies, and white-tailed and red-tailed tropicbirds) and an unknown suite of plant and insect species on their dramatic rocky faces.

***Activity HMC-9.1: Educate other federal and state agencies about overflight rules and promote compliance regarding overflights and close approaches.***

Overflight restrictions are indicated on flight sectional charts, and the Federal Aviation Administration encourages pilots to maintain a minimum altitude of 2,000 feet above national wildlife refuges and national monuments. The Navy requires a minimum altitude of 3,000 feet over noise-sensitive areas such as national monuments. In addition, 50 CFR 27.34 prohibits the operation of aircraft at altitudes resulting in the harassment of wildlife. Aircraft approaches to the cliff habitats cause disturbance and possible loss of seabird eggs and chicks. Rapid turnover of personnel engaging in flights over the Monument has resulted in periodic overflights at too low an altitude. New staff (e.g., Coast Guard and DOD) will be made aware of the implications for wildlife disturbance.

***Activity HMC-9.2: Develop and implement techniques for monitoring plant and animal populations on cliff habitats in the Monument within 10 years.***

The cliff habitats of Nihoa and Mokumanamana are virtually inaccessible because of their height (up to 900 feet), windward location, and fragile rock type, which preclude safe climbing or rappelling. These cliffs provide habitat for significant proportions of seabirds, including white terns, black noddies, gray-backed terns, brown boobies, and red-tailed tropicbirds that nest on these islands. Monument staff will investigate culturally appropriate and innovative remote and direct methods as possible options for monitoring cliff habitats.

**Table 3.2.3 Summary of Strategies, Activities, and Agency Leads for Habitat Management and Conservation**

Strategies and Activities	Agency Lead
<b>Strategy HMC-1: Within 15 years, develop and implement a strategy for restoring the health and biological diversity of the shallow reefs and shoals where anthropogenic disturbances are known to have changed the ecosystem, using best available information about pre-disturbance conditions.</b>	
Activity HMC-1.1: Identify and prioritize restoration needs in shallow water reef habitats impacted by anthropogenic disturbances within 5 years.	NOAA
Activity HMC-1.2: Analyze historical and present impacts on reef growth at Midway Atoll and determine factors limiting nearshore patch reef growth to facilitate restoration of natural reef building.	NOAA FWS
Activity HMC-1.3: Where feasible, implement appropriate restoration activities.	NOAA FWS
<b>Strategy HMC-2: Within 10 years, investigate, inventory and map sources of known contamination from historic human uses of the NWHI and, where appropriate, coordinate with responsible parties to develop plans and complete cleanup actions.</b>	
Activity HMC-2.1: Evaluate effects of contamination in terrestrial and nearshore areas from shoreline dumps at French Frigate Shoals and at Kure, Midway, and Pearl and Hermes atolls and prioritize cleanup action based on risk assessments.	FWS
Activity HMC-2.2: Work with partners and responsible parties to verify the integrity of known landfills and dumps and to conduct additional remediation if necessary.	FWS
Activity HMC-2.3: Locate historic disposal sites at French Frigate Shoals and at Kure, Midway, and Pearl and Hermes atolls, and investigate them for contamination.	FWS
Activity HMC-2.4: Evaluate costs to ecosystem function and benefits of removing anthropogenic iron sources such as metal from shipwrecks and discarded debris from reefs throughout the Monument.	FWS
Activity HMC-2.5: Continue collection and fingerprinting of oil found washed ashore and on wildlife from mystery spills to determine its provenance, and build an oil sample archive for possible use as evidence in liability assignment.	FWS
Activity HMC-2.6: Continue monitoring the area at Laysan Island that was contaminated by the insecticide carbofuran.	FWS
Activity HMC-2.7: Conduct ecological risk assessment to determine allowable lead levels in soils at Midway and remove lead from buildings and soils to nonrisk levels.	FWS
<b>Strategy HMC-3: Protect and restore beach strand and crest habitats over the life of the plan.</b>	
Activity HMC-3.1: Evaluate loss of beach strand and crest due to erosion and sea level rise to aid in formulating a restoration plan that will stop as much net loss of beach strand and beach crest habitat as is possible.	FWS
Activity HMC-3.2: Inventory and map manmade structures and changes in natural beach and reef state that may influence erosion and depositional processes at all of the beach strand units of the Monument.	FWS

Strategies and Activities	Agency Lead
<b>Strategy HMC-4: Within 10 years, restore and maintain coastal mixed grasses and shrubs on all the coralline islands and atolls of the Monument using best available historical information about the original indigenous ecosystem.</b>	
Activity HMC-4.1: Propagate and outplant native species chosen on the basis of historical records at Midway and historical and pollen records from Laysan Island in 250 acres of vegetated area at Midway Atoll, focusing on the original footprint of the island and then moving to the dredge spoils section.	FWS
Activity HMC-4.2: Implement the Draft Laysan Island Restoration Plan by removing invasive plants, and propagating and outplanting all extant species identified in the pollen record or historical documents as formerly having occurred at Laysan.	FWS
Activity HMC-4.3: At Laysan Island, replace 60 acres of the introduced shrub Indian pluchea with native species.	FWS
Activity HMC-4.4: Formulate and implement a restoration plan for Lisianski Island using guidelines established for neighboring Laysan Island.	FWS
Activity HMC-4.5: Propagate and outplant native vegetation on 34-acre Southeast Island at Pearl and Hermes Atoll to replace native plant community extirpated by invasion of the alien plant golden crownbeard.	FWS
Activity HMC- 4.6: Implement coordinated ecosystem restoration activities on Kure Atoll.	State of Hawai'i
Activity HMC-4.7: Monitor changes in the species composition and structure of mixed grass and shrub plant communities at each site.	FWS
<b>Strategy HMC-5: Within 10 years, restore and maintain coastal mixed grasses and shrublands on basalt islands in the Monument.</b>	
Activity HMC-5.1: Inventory and document life histories of endemic terrestrial invertebrates at Nihoa and Mokumanamana.	FWS
Activity HMC-5.2: Monitor changes in species composition and structure of the coastal shrub and mixed grass communities on basalt islands throughout the life of the plan.	FWS
<b>Strategy HMC-6: Maintain and better understand the Monument's wetland and mudflat habitats to benefit migratory shorebirds and waterfowl for the life of the plan.</b>	
Activity HMC-6.1: Monitor water level, salinity, and other water quality parameters of Laysan Lake, and document any loss of lake area.	FWS
Activity HMC-6.2: As needed, restore dune habitat on Laysan Island to stabilize movement if lake loss starts to occur.	FWS
<b>Strategy HMC-7: Maintain, enhance, and, where appropriate, develop freshwater seeps, intermittent streams, and freshwater ponds as necessary for the benefit of native species for the life of the plan.</b>	
Activity HMC-7.1: Monitor salinity, parasites, contaminants, and native arthropods associated with freshwater seeps, ponds, and streams.	FWS
Activity HMC-7.2 Evaluate potential for development and create as needed additional freshwater sources at potential translocation sites of the Laysan duck, Nihoa finch, Laysan finch, and Nihoa millerbird.	FWS

Strategies and Activities	Agency Lead
<b>Strategy HMC-8: Maintain no more than 150 acres of ironwood woodlands on Sand Island, Midway Atoll, to provide seabird nesting and roosting habitat for the life of the plan.</b>	
Activity HMC-8.1: Remove ironwood on Sand Island from 50 acres outside designated woodland and control young ironwood in areas managed for grass and shrubs.	FWS
Activity HMC-8.2: Devise and implement methods for monitoring population size and reproductive success in tree-nesting seabird species.	FWS
<b>Strategy HMC-9: Protect and maintain 120 acres of vertical rocky cliff-face habitat at Nihoa and Mokumanamana for nesting seabirds for the life of the plan.</b>	
Activity HMC-9.1: Educate other federal and state agencies about overflight rules and promote compliance regarding overflights and close approaches.	FWS
Activity HMC-9.2: Develop and implement techniques for monitoring plant and animal populations on cliff habitats in the Monument within 10 years.	FWS

#### **3.3.1 Marine Debris Action Plan**

#### **3.3.2 Alien Species Action Plan**

#### **3.3.3 Maritime Transportation and Aviation Action Plan**

#### **3.3.4 Emergency Response and Natural Resource Damage Assessment Action Plan**

---

### 3.3 Reducing Threats to Monument Resources

Situated in the middle of the Pacific Ocean at the fulcrum of the North Pacific gyre and the mid-point between the economic giants of the east and west, the NWHI are subject to the full range of environmental and anthropogenic stressors despite their remote location and the absence of human population. Many threats originate far outside the NWHI. Marine debris, largely consisting of discarded or lost fishing nets from distant fleets and plastic trash, threatens and damages coral reef and coastal habitats, entangles and chokes marine life, and aids in the transport of contaminants.

The introduction of alien species to the islands has led to the establishment of invasive species that crowd out native species, altering habitat and food webs. Alien species may arrive on vessels or debris of any kind from ports around the world. Discharges from vessels operating in or transiting the NWHI can introduce pathogens that contribute to coral disease and could threaten marine mammal populations.

Vessel groundings and cargo spills occur somewhat infrequently in this remote archipelago, and response to such emergencies has required exceptional collaborative interagency effort and resources to minimize effects to the fragile coral reef and terrestrial ecosystems.

Through an ecosystem-based approach to management, of which interagency coordination and cooperation are central, reducing threats to the ecosystem is achieved through an effective regulatory framework, education and outreach, preventative measures to minimize risk, emergency response, and natural resource damage assessment and restoration when unforeseen events cause injury to natural resources.

Action plans to reduce existing and potential threats and prevent impacts to the ecosystem focus on developing and implementing risk reduction assessment and protocols, emergency response plans, and alien species prevention and eradication, where feasible. Each action plan consists of a set of strategies to address a desired outcome. The desired outcomes of these action plans over the 15-year planning horizon are:

- **Marine Debris:** Reduce the adverse effects of marine debris to Papahānaumokuākea Marine National Monument resources and reduce the amount of debris entering the North Pacific Ocean.
- **Alien Species:** Detect, control, eradicate where possible, and prevent the introduction of alien species into Papahānaumokuākea Marine National Monument.
- **Maritime Transportation and Aviation:** Investigate, identify, and reduce potential threats to Papahānaumokuākea Marine National Monument from maritime and aviation traffic.
- **Emergency Response and Natural Resource Damage Assessment:** Minimize damage to Papahānaumokuākea Marine National Monument resources through coordinated emergency response and assessment.

Action plans described in this section will be implemented in close coordination with agency partners and in conjunction with other priority management needs.

### 3.3.1 Marine Debris Action Plan

#### Desired Outcome

Reduce the adverse effects of marine debris to Papahānaumokuākea Marine National Monument resources and reduce the amount of debris entering the North Pacific Ocean.

Links to other Action Plans

3.5.4	Ocean Ecosystems Literacy
3.6.3	Coordinated Field Operations

#### Current Status and Background

In 1982 annual net and line removal began along NWHI beaches. A multiagency effort launched in 1996 strengthened and expanded efforts to address the problem of marine debris, a problem that was much larger than any agency alone might resolve. An estimated 750 to 1,000 tons of marine debris were on reefs and beaches in the NWHI. NOAA, in collaboration with 14 other partners, including the Coast Guard, Schnitzer Steel Hawai‘i Corporation (formerly Hawai‘i Metals Recycling Company), the Sea Grant College Program, the U.S. Navy, FWS, the City and County of Honolulu, the State of Hawai‘i, The Ocean Conservancy, Hawai‘i Wildlife Fund, Matson Navigation Company, and others removed 66 tons of marine debris and derelict fishing gear from 1996 to 2000.

Links to Goals
Goal 1
Goal 2
Goal 3

In 2001, the multiagency cleanup effort was extended, and yields grew from approximately 25 tons per year in 1999 and 2000 to 68 tons in 2001, 107 tons in 2002, 118 tons in 2003, 126 tons in 2004, 57 tons in 2005, 21 tons in 2006, and 19 tons in 2007. The total amount of marine debris removed from 1996 to 2007 was 582 tons. The 2006 field season marked the first year of the maintenance mode effort, in which specific study areas called “High Entanglement Risk Zones” for Hawaiian monk seals are cleaned and designated accumulation rate zones are studied. Based on a recent study, the accumulation of new debris in the NWHI is now estimated to be 57 tons (or 52 metric tons) annually (Dameron et al. 2007). Even if all new input of debris were stopped, existing debris in the ocean would continue to accumulate in the NWHI for years to come.

Pacific Island Fisheries Science Center, Coral Reef Ecosystem Division's marine debris removal team at work in the NWHI. Photo: Jake Asher

In 2005, with guidance from Congress, a Marine Debris Program was established under NOAA’s Office of Response and Restoration. This program is undertaking a national and international effort focused on identifying, removing, reducing, and preventing debris in the marine environment. This program is a significant step toward addressing the marine debris issue and

providing much-needed support to projects that address the issue. As one example, a project funded in 2005 established a port reception facility and derelict net recycling program in Honolulu for proper disposal of derelict fishing gear. Also in 2005, the Marine Debris Program joined the multiagency cleanup effort through funding for debris removal field operations.

On December 22, 2006, the Marine Debris Research, Prevention, and Reduction Act was signed into law. The Act makes the Marine Debris Program permanent and directs NOAA to work in conjunction with federal agencies such as EPA and the Coast Guard to identify the origin, location, and projected movement of marine debris within navigable waters of the United States and the U.S. exclusive economic zone. The Act specifically targets fishing gear as a threat to the marine environment and navigation safety, authorizes the research and development of alternative types of fishing gear, and allows the use of voluntary incentives to promote recovery of lost or discarded gear. The Act also authorizes NOAA to offer grants to academia, nonprofit organizations, commercial organizations, and state, local, or tribal governments to identify, assess, reduce, and prevent marine debris.

In recognition of the magnitude of the marine debris problem, NOAA has contributed to mitigating the effects of marine debris by providing funding for debris removal efforts and participating in the NWHI multiagency partnership. This work will now continue through the establishment of the Monument, and the MMB is already working to increase awareness of this very serious threat to coral reef ecosystems through national and international documentaries and publications, public outreach displays at Mokupāpapa Discovery Center, development of lesson plans about marine debris in the Navigating Change Teacher's Guide, and community presentations.

### **Need for Action**

Marine debris, especially derelict fishing gear, is a severe chronic threat to the shallow-water ecosystems of the NWHI and hinders the recovery of the endangered Hawaiian monk seal and threatened sea turtles through ingestion of debris and entanglement, which can lead to drowning and suffocation (see Section 3.2.1, the Threatened and Endangered Species Action Plan). Ocean currents carry marine debris, including derelict fishing nets and other gear from North Pacific fisheries, plastics, hazardous materials and hazardous waste lost or discarded from ships during transit, authorized and unauthorized fish aggregation devices (Donohue 2005), and other shore-based debris from Pacific Rim countries, across the greater Pacific Ocean. The North Pacific Subtropical Convergence Zone, located just north of the Hawaiian Archipelago, concentrates some of these materials. Under certain conditions, such as during an El Niño event, this convergence zone dips southward and straddles the Hawaiian Archipelago, depositing much higher volumes of debris on the island chain than in years when these conditions are not in effect (Harrison and Craig 1993; Matsumura and Nasu 1997; Ingraham and Ebbesmeyer 2001; Donohue and Foley 2007; Morishige et al. 2007).

Large conglomerations of derelict fishing nets that are carried into shallow waters degrade reef health by shading, abrading, smothering, and dislodging fragile corals and other benthic organisms and by preventing recruitment on reef surfaces (Donahue and Brainard 2001). Nets and line pose deadly entanglement hazards for all marine life. Smaller marine debris, such as disposable lighters and plastic bottle caps, are ingested by albatrosses while foraging for food

and affect survival rates of these birds. Marine debris washes ashore in the NWHI, degrading habitat and the health of the Monument's ecosystems. Debris in the form of hazardous materials, unknown substances, and unexploded ordnance endangers wildlife as well as Monument field staff. Marine debris also acts as a vector for the accelerated introduction of alien species into the region and poses a navigational hazard to maritime vessels (see Sections 3.3.2 and 3.3.4, the Alien Species and Emergency Response and Natural Resource Damage Assessment action plans). This action plan presents strategies and activities for addressing marine debris issues in the Monument as well as the North Pacific region.

### **Strategies to Achieve the Desired Outcome**

Ultimately, the Monument's desired outcome is the elimination of marine debris, including derelict fishing gear, from the NWHI. Complete elimination of marine debris in the near future is virtually impossible because of the financial cost, the size of the area, and the continuous influx of new debris. However, removal of existing debris, detection and prevention of incoming debris, and education to prevent future generations of debris are the achievable strategies to reduce the overall impact of debris. Three strategies have been developed to achieve the desired outcome. The strategies and activities are coded by the acronym for the action plan title, "Marine Debris" (MD). A summary of strategies and activities is provided in Table 3.3.1 at the end of this action plan.

- MD-1: Remove and prevent marine debris throughout the life of the plan.
- MD-2: Investigate the sources, types, and accumulation rates of marine debris within 5 years.
- MD-3: Develop outreach materials regarding marine debris within 2 years.

### **Strategy MD-1: Remove and prevent marine debris throughout the life of the plan.**

Continued support of existing debris removal programs, including the Marine Debris Program, is essential. Existing debris, particularly large fishing nets, poses an acute entanglement threat to endangered and threatened species. The only way to decrease entanglement rates from existing debris is to remove the nets from beaches and the nearshore areas, including those around French Frigate Shoals, Maro Reef, Lisianski Island, Laysan Island, Pearl and Hermes Atoll, Midway Atoll, and Kure Atoll. Nets and other debris also combine into large masses that are moved around by wave energy. These masses scour the bottom, abrading and breaking coral colonies, preventing colonization, and damaging other benthic resources. Removal of debris, particularly large nets that have come into shallow waters, is expensive and dangerous. Programs to identify, track, and remove nets both within and outside the Monument, combined with incentive programs for fishermen to pick up these nets and bring them back to shore for disposal, may be more cost effective and would prevent damage to fragile reef ecosystems. The MMB will work in partnership with the Coast Guard and other marine debris partners to provide incentives for fishing vessels to participate in disposal programs and still comply with Coast Guard policies regarding the transport of debris as "cargo-for-hire."

***Activity MD-1.1: Continue working with partners to remove marine debris in the Monument and reduce additional debris entering the Monument.***

The MMB will continue to support and participate in the multiagency cleanup effort that has been highly effective in removing marine debris from shallow-water areas and beaches. With existing infrastructure, protocols, and experience in executing this demanding and logistically intensive task, it is beneficial to all parties to continue participating in the existing effort. Data collected and analyzed as part of the multiagency effort will be entered into the Papahānaumokuākea Information Management System (PIMS), once it is developed.

Although cleanup efforts have removed the majority of accumulated large nets in NWHI waters less than 30 feet (9 meters) deep, additional debris keeps coming in. NOAA estimates that, each year, 57 tons (52 metric tons) of derelict fishing gear and other netting originating from outside the U.S. accumulates on coral reefs and beaches in the NWHI (Dameron et al. 2007). Two ways to prevent debris from entering the shallow-water reef ecosystem are to retrieve the existing debris at sea and to change existing fishing gear disposal practices. Potential changes include designing gear modifications, implementing gear loss reporting requirements, requiring permanent identification of fishing gear, requiring dockside gear accountability inspections of vessels prior to their departure on fishing trips and upon their return, working with the fishery management councils in the United States and similar agencies in foreign countries to reduce illegal fishing and destructive fishing practices, and pursuing technological means to detect and retrieve gear lost at sea.

***Activity MD-1.2: Catalog, secure, contain, and properly remove hazardous materials that wash ashore in the NWHI.***

Unidentified chemical containers, unexploded ordnance, oceanographic instruments, loose fish aggregating devices, and other unidentified objects regularly wash up on beaches in the Monument. The items will be documented, identified, and then secured until appropriate removal and disposal by approved contractors can occur.

***Activity MD-1.3: Develop and implement a 5-year marine debris removal and prevention strategy for the Monument.***

Using recommendations from national and international marine debris conferences and data from ongoing marine debris removal efforts, and in coordination with partner agencies and organizations, a coordinated strategy for marine debris removal and prevention will be developed for the NWHI. Data and information on the types, sources, locations, and impacts of debris obtained from ongoing removal efforts and additional studies will be used to develop focused, short-term and long-term initiatives geared to achieve the greatest return on investment in terms of ecological protection. The MMB will continue to pursue activities that identify, track, and collect large debris at sea, along with development of incentive programs for fishing vessels to collect debris at sea and bring it to dockside collection facilities. A dockside collection program has been implemented on O‘ahu for fishermen to offload derelict fishing gear retrieved at sea. This program illustrates the type of coordination among multiple government agencies, community groups, and the private sector needed to address this issue. The marine debris removal and prevention strategy will investigate this mechanism to provide additional incentive for debris prevention.

***Activity MD-1.4: Work with the U.S. Department of State to gain international cooperation and involvement for marine debris issues.***

The MMB will work through the Interagency Marine Debris Coordinating Committee, the U.S. Department of State, and other appropriate U.S. agencies to call international attention to marine debris problems in the NWHI and to identify approaches to reducing foreign debris sources. Approaches may include, but are not limited to, permanent identification of fishing gear, incentive programs for recovered debris, and dockside gear accountability inspections of vessels prior to their departure on fishing trips and on their return.

***Activity MD-1.5: Work with the fishery management councils to address marine debris prevention with U.S. fishing fleets.***

The MMB will work with the Western Pacific and North Pacific Fishery Management Councils to assess and address fishing practices or domestic fishing gear that contribute to the marine debris problem. The MMB will coordinate with the Councils to initiate an accountability requirement for all vessels that use the type of gear that is contributing to marine debris in the NWHI. This requirement could include permanent identification of fishing gear, incentive programs for recovered debris, disposal and recycling programs, dockside gear accountability inspections of vessels prior to their departure on fishing trips and on their return, and other approaches.

**Strategy MD-2: Investigate the sources, types, and accumulation rates of marine debris within 5 years.**

The MMB, in partnership with other governmental and nongovernmental entities, will conduct research into mechanisms to locate, track, and remove debris at sea before it reaches fragile Monument ecosystems. This program will attempt to use unmanned aircraft systems to locate the debris at sea and may also take advantage of remote sensing systems being researched for Monument enforcement purposes to detect large debris conglomerates. Once an area of high concentration of debris is located, unmanned aircraft can be launched from vessels to find individual conglomerations of debris and target removal efforts. These initiatives will help direct the cleanup effort to where it will have the greatest effect, with limited resources. Using satellite imagery, NMFS is also working with partners to design a statistical survey to census marine debris in the north Pacific. This information will provide us with an estimate of the magnitude of the marine debris problem in the Pacific. In addition, NMFS and its partners are working to track debris movement in the Pacific Ocean, including areas within the Monument, through the use of satellite-tracked drifter buoys.

Another project is to address the small plastic debris being fed to young albatrosses. Much of the debris being fed to young albatross is picked up at sea by the adults. Monitoring the debris that washes up onto the beaches at Midway Atoll will provide a snapshot of what is in the waters surrounding the Monument islands, the most economical approach to such identification. This study will also allow us to begin to identify sources of the debris and then to develop a strategy for use of this information for prevention through education and outreach targeting key stakeholders and user-groups that are associated with the behaviors that produce these forms of marine debris.

***Activity MD-2.1: Work with partners on marine debris studies.***

The MMB will work with the Marine Debris Program to support studies on the marine debris issue, including research to quantify resource impacts and to determine marine debris accumulation rates, biological and ecological impacts, efforts to track sources and types of debris, and documentation of the cost estimates of damage. One such study, implemented in August 2008, will assess resource impacts from nets found on corals and the recovery of net-scars over time at Midway Atoll reefs.

***Activity MD-2.2: Develop and standardize marine debris monitoring protocols for marine and terrestrial habitats.***

Currently, marine debris data are collected by numerous entities using a variety of data collection methods. Synthesizing, quantifying, and interpreting marine debris data are therefore difficult. The MMB will work with all federal and state partners to standardize protocols to maximize the use and utility of data collected by the various programs. Development of a statistically sound and biologically relevant marine debris monitoring protocol for Midway Atoll has begun. This protocol may serve as the basis for a long-term monitoring program within the Monument. Since 1984, 22 international marine debris conferences have recommended standardization of data collection as one of their top two priorities. This unique project at Midway Atoll, in partnership with the Dow Chemical Company and with additional funding from a National Fish and Wildlife Foundation grant, hopes to lay the foundation for a greater understanding of debris sources.

**Strategy MD-3: Develop outreach materials regarding marine debris within 2 years.**

To better explain the scope and impacts of marine debris in the NWHI, an outreach strategy will be developed with the multiagency partnership to reach both local and international audiences and specific fishing communities.

***Activity MD-3.1: Work with partners to continue to develop and implement an outreach strategy for marine debris.***

To better explain the scope and impacts of marine debris in the NWHI, an outreach strategy will be developed with the multiagency partnership to reach a broad audience and specific fishing communities. Such outreach will be coordinated with other efforts as described in the Constituency Building and Outreach Action Plan (Section 3.5.2) as well as with broader efforts of the Marine Debris Program.

Awareness of the impact of marine debris must be increased. Most people are not aware that much of the shore-based marine debris comes from the careless disposal of garbage, such as cigarette lighters and other plastics, and that much of the derelict fishing gear comes from losses at sea caused by bad weather, gear failure, and improper disposal. Educating the public about the impacts of this debris in the ocean environment aims to change behaviors and ultimately reduce the volume of debris in the ocean. Documentaries and feature stories regarding this issue already have led to significant actions by several nations aimed at reducing marine debris. Such educational activities will be encouraged by the MMB. In addition, outreach products will be developed to reach specific fishing communities and industries. These materials will target recreational fishermen and commercial fishing sectors on proper disposal and reporting of gear lost at sea. The outreach materials will highlight lost gear to better explain the scope and impacts of this type of marine debris.

**Table 3.3.1 Summary of Strategies, Activities, and Agency Leads for Marine Debris**

<b>Strategies and Activities</b>	<b>Agency Lead</b>
<b>Strategy MD-1: Remove and prevent marine debris throughout the life of the plan.</b>	
Activity MD-1.1: Continue working with partners to remove marine debris in the Monument and reduce additional debris entering the Monument.	NOAA
Activity MD-1.2: Catalog, secure, contain, and properly remove hazardous materials that wash ashore in the NWHI.	FWS

Activity MD-3.1: Work with partners to continue to develop and implement an outreach strategy for marine debris.	NOAA

### 3.3.2 Alien Species Action Plan

#### Desired Outcome

Detect, control, eradicate where possible, and prevent the introduction of alien species into Papahānaumokuākea Marine National Monument.

#### Current Status and Background

Despite the extreme remoteness of the Monument, the relatively low rate of visitation, and the high amount of administrative control over the conditions of any visits, alien species have left their mark on natural communities in the Monument. Insular ecosystems are often more vulnerable to the effects of introduced species than continental areas due to smaller total population sizes, higher endemism, and species that have evolved longer in the absence of predators and thus are less likely to have developed defenses against them (Blackburn et al. 2004). An invasive species is defined as a species (1) that is nonnative (or alien) to the ecosystem under consideration, and (2) whose introduction causes or is likely to cause economic or environmental harm or harm to human health (Executive Order 13112). Invasive species can affect native species by competitive exclusion, niche displacement, hybridization, introgression, predation, and ultimately extinction (Mooney and Cleland 2001). The known incidence and distribution of alien species in the NWHI is described in Section 1.4, Environmental and Anthropogenic Stressors.

The ecosystems of Hawai‘i have changed profoundly and at an accelerating pace since humans arrived, accompanied by an array of alien species. The NWHI now have terrestrial invaders in most taxa, some of which have caused great disruption to the native ecosystems. In the main Hawaiian Islands, alien algae have altered native habitat and in some areas have overgrown and completely smothered extensive areas of coral reef (DLNR 2003a). Other alien species have caused serious economic effects. Each year, Maui County spends thousands of dollars to remove more than a million pounds of the alien algae *Hypnea* from its beaches (Coloma-Agaran 2003). Snowflake coral (*Carijoa riisei*) has covered significant portions of black coral beds in the main Hawaiian Islands in depths greater than 250 feet (75 meters) and is now considered one of the most invasive invertebrates on deep-water coral reefs (DLNR 2003a). Hawai‘i’s harbors and bays are the most common sites for alien species introductions (Godwin et al. 2006).

In 2003, the State of Hawai‘i DLNR and various federal, state, industry, and nonprofit organizations released the State of Hawai‘i Aquatic Invasive Species Management Plan (DLNR 2003a). Many of the strategies outlined in that plan complement those outlined in this action plan but are much broader in scope, as they concern the entire archipelago, including the complexities of the highly populated and commercially active main Hawaiian Islands. An assessment of the potential threats of nonindigenous marine species in the NWHI was completed by Eldredge (2005). A 2006 report by HIMB addresses issues specific to reducing the potential impacts of invasive marine species in the NWHI (Godwin et al. 2006).

Goal 1
Goal 2
Goal 3
Goal 4
Goal 5

Early attempts to establish human settlements in the NWHI in the late 1800s and early 1900s, especially at Laysan Island and Midway Atoll, resulted in the introduction of many alien terrestrial species, including plants, insects, and mammals. The number of alien land plants in the NWHI varies from only three introduced at Nihoa to 249 introduced at Midway Atoll. The level of threat from introduced plants also varies between species. For example, the invasive plant golden crownbeard (*Verbesina encelioides*) displaces all native vegetation in nesting areas, causing entanglement and heat prostration and killing hundreds of albatrosses each year. The invasive gray bird locust (*Schistocerca nitens*) was first detected at Nihoa in 1984 and by 2000 was periodically reaching population levels large enough to cause damage to the native plant community, including three endemic species listed as endangered. This grasshopper species has now also spread to Mokumanamana, French Frigate Shoals, and Lisianski Island. To prevent further importation of invasive plants, animals, or insects, mandatory quarantine protocols are enforced for any visitors to all the islands in the NWHI (with the exception of Midway Atoll and French Frigate Shoals). These protocols require the use of brand new or island-specific gear at each site and treatments such as cleaning, using insecticide, and freezing to minimize the transport of potentially invasive species to the island.

Of the 343 marine alien species found in the Main Hawaiian Islands, a total of 13 alien marine invertebrate, fish, and algal species have been recorded in the NWHI, with the highest concentrations occurring at Midway Atoll (see Table 1.1, and also Eldredge and Carlton 2002; Godwin et al 2006). The location, source, and year of each confirmed sighting are contained in the Monument's geodatabase. Several patterns have emerged through analyses of these data: (1) of the three alien fish species in the Monument, ta'ape (*Lutjanus kasmira*) has spread significantly farther and is more abundant than either to'au (*Lutjanus fulvus*) or roi (*Cephalopholis argus*); (2) aside from the Christmas tree hydroid (*Pennaria disticha*), invasive invertebrates are concentrated in the harbors of Midway Atoll and Tern Island in French Frigate Shoals. Invasive invertebrates commonly thrive in harbors, benefiting from anthropogenic structures, such as pier pilings and seawalls, as well as protection from wave action; (3) alien algae have not yet spread far into the Monument. *Hypnea musciformis* has been found only on lobster traps retrieved near Mokumanamana (Godwin et al. 2006).

*Hypnea musciformis*, an alien algae species which is invasive in the main Hawaiian Islands, has been documented in the waters surrounding Mokumanamana. Photo W.H. Magruder (Bishop Museum)

Although the remoteness and relative inaccessibility of the NWHI have helped to prevent the introduction of some alien species to the area, these islands are vulnerable to introductions through a variety of human activities. Maritime vessels are recognized as the primary vector for transporting marine alien species through contaminated vessel equipment, hull fouling, ballast water, and ballast sediment. Additional vectors include deliberate and accidental release and transport by artificial substrates such as fish attractant devices and marine debris (See Section

3.3.1, the Marine Debris Action Plan, and also Godwin et al. 2006.). Analyses are currently being conducted of the algal and invertebrate communities living on derelict nets collected during the 2007 marine debris removal effort. This information will provide needed insight on the quantity and diversity of alien biota living on the nets and facilitate the assessment of this threat to the ecosystems of the NWHI.

### **Existing Laws, Regulations, and Protocols**

Vessel hull fouling and ballast water discharge have been identified as two major vectors for transporting alien species in marine environments (International Maritime Organization 1997, 2001). Therefore, Monument regulations and permit requirements specifically target these pathways. Best management practices for Monument access will continue to use the latest information to address both marine and terrestrial alien species introductions and support the requirements developed by FWS to prevent alien species introductions to the Hawaiian Islands NWR (see Section 3.4.1, the Permitting Action Plan, and Appendix A).

In 2000, the State of Hawai'i Legislature designated DLNR as the lead agency for preventing the introduction of alien aquatic organisms through ballast water and hull fouling. DLNR reestablished an interagency task force to discuss and make recommendations to address concerns about alien aquatic organism issues related to ballast water and hull fouling, including adopting administrative rules and penalties. DLNR has hired a project coordinator to address issues relating to aquatic invasive species through hull fouling and ballast water. The State of Hawai'i has also been working on developing a comprehensive ballast water and hull fouling program since September 2002, with NOAA funds administered by the State Office of Planning, Coastal Zone Management Program.

Federal laws that apply in addressing alien species and invasive species in the NWHI include the Lacey Act of 1900, as amended (18 U.S.C. 42, 16 U.S.C. 3371), the Endangered Species Act of 1973, the Nonindigenous Aquatic Nuisance Prevention and Control Act of 1990 (16 U.S.C. 4701), and the National Invasive Species Act of 1996 (Public Law 104-332); Executive Order 13112 on Invasive Species (1999) also applies. Executive Order 13112 established the National Invasive Species Council and requires development of a National Management Plan for Invasive Species. Under the Nonindigenous Aquatic Nuisance Prevention and Control Act, NOAA and FWS have responsibility for control and management of invasive aquatic species.

The Coast Guard has developed the Mandatory Ballast Water Management Program for U.S. Waters. The Coast Guard published regulations on July 28, 2004, establishing a national mandatory ballast water management program for all vessels equipped with ballast water tanks that enter or operate within U.S. waters. These regulations also require each vessel to maintain a ballast water management plan that is specific to that vessel and assigns responsibility to the master or another appropriate official to understand and execute the ballast water management strategy for that vessel. The International Maritime Organization (1997) has developed ballast water exchange guidelines. In Hawai'i, the Alien Aquatic Organisms Task Force is also developing strategies to address the transport of alien species by vessels. DLNR promulgated Title 13, Chapter 76, Hawaii Administrative Rules (Non-indigenous Aquatic Species) on October 12, 2007, to manage ballast water discharge from vessels operating in Hawai'i waters (Appendix F). They are consistent with and complement the federal regulations and coincide

with the national focus to protect U.S. water in which many states have adopted their own rules.

The MMB incorporated FWS policies aimed primarily at preventing the introduction of terrestrial alien species to the islands in the Hawaiian Islands NWR (Appendix F). These policies include requiring personnel and other visitors to use new, island-specific clothing, shoes, and other gear, such as tents and bedding, that have been frozen for at least 48 hours and carefully packed to prevent contamination at all islands with the exception of Midway Atoll and French Frigate Shoals. In addition, considerable resources and staff time are devoted to controlling and eradicating invasive species on the islands. The eradication of the introduced grass *Cenchrus echinatus* at Laysan Island is an example of the success the FWS has had in its prevention and eradication programs (Rehkemper and Flint 2002). The MMB has also taken steps toward preventing marine alien species introductions through the development of protocols for reducing the risk of transmission from vessel hulls, discharge, and equipment used throughout the Monument (Appendix F).

### **Monument Regulations and Permit Requirements**

Preventing alien species from entering the NWHI ecosystem is the most important action to take in protecting the ecosystem from the impacts of invasive species. It is difficult, if not impossible, to predict whether an alien species will become invasive in a given environment. The probability of a successful eradication of an alien species in the marine environment is low. Therefore, efforts will be made to prevent all alien species from entering NWHI ecosystems. Monument regulations and permit requirements (based on best management practices) related to alien species target key vectors known for transporting alien species. Monument regulations related to preventing alien species introductions include a prohibition of the release or introduction of alien species into the Monument, and the State regulates any kind of vessel discharge (see Appendix F; HAR Title 13 Chapter 76). Mandatory hull inspections and cleaning, if needed, are a Monument permit requirement for all ships authorized to enter the Monument. In addition, aircraft landing within the Monument are subject to inspection, as are all visitors and their luggage.

In addition to regulations and permit conditions, outreach programs offer tools for enlisting the support of Monument permittees in protecting ecological integrity. (See also the action plans for Permitting, Section 3.4.1; Ocean Ecosystems Literacy, Section 3.5.4; Constituency Building and Outreach, Section 3.5.2; and Marine Transportation and Aviation, Section 3.3.3.)

### **Need for Action**

Worldwide, invasive species are causing negative ecological and economic impacts. While not all alien species will become invasive in a given environment, it is difficult, if not impossible, to determine which will have harmful impacts. Therefore, a precautionary approach treats all alien species as potentially invasive other than a select few that have been cleared for human consumption. The need to prevent introductions of both marine and terrestrial alien species to the NWHI was raised as an issue of concern during public scoping meetings in 2002 and consistently during public scoping and comment periods since that time. Protecting the lands and waters of the NWHI from the impacts of alien species is critical to achieving the Monument's primary goal of resource protection.

While few alien species are established in the waters of the NWHI, global trends suggest that others could be introduced to this relatively pristine ecosystem. For example, marine debris serves as a vector for invasive species by providing a ride for sessile aliens and a microhabitat for other species that may arrive unattached but associated with the debris. By causing mechanical damage to reef structures, it may also create favorable habitat for settling out and recruitment of nonnative species. Once established, invasive species can be extremely costly to control and would likely be impossible to eradicate. The remoteness of this area compounds the challenge. If appropriate prevention and control measures are not taken, alien species could continue to spread and may cause substantial damage to the health and integrity of marine ecosystems across the Hawaiian Archipelago. This action plan presents strategies and activities for addressing alien species needs in the Monument, as well as the NWHI region.

### **Strategies to Achieve the Desired Outcome**

Strategies identified for achieving the desired outcomes range from preventing alien species introductions to monitoring, controlling, and eradicating existing alien species in the Monument, to detecting new invasive species threats. The strategies and activities are coded by the acronym for the action plan title, “Alien Species” (AS). A summary of strategies and activities is provided in Table 3.3.2 at the end of this action plan.

- AS-1: Conduct planning to prioritize by threat level, invasiveness, and practicality of eradication or control all nonnative organisms in the Monument over the life of the plan.
- AS-2: Engage in active surveillance to monitor existing infestations and to detect new infestations of alien species over the life of the plan.
- AS-3: Establish and enforce quarantine procedures appropriate for each site and habitat (terrestrial and aquatic) in the Monument to prevent the invasion or reinfestation of nonindigenous species over the life of the plan.
- AS-4: Eradicate the house mouse population on Sand Island, Midway Atoll, within 15 years.
- AS-5: Prioritize infestations of alien terrestrial arthropods by species and locations and, within 5 years, develop and subsequently implement plans to control and if possible eradicate the highest-priority species.
- AS-6: Control and eventually eradicate the highest-priority invasive plants in the terrestrial parts of the Monument within 15 years.
- AS-7: Investigate methods to eventually eradicate aquatic invasive organisms already known to be present in the Monument, and conduct regular surveillance for new invasions.
- AS-8: Conduct and facilitate research designed to answer questions regarding invasive species detection; effects on ecosystem; and alien species prevention, control, and eradication over the life of the plan.
- AS-9: Engage Monument users and the public in preventing the introduction and spread of alien species.
- AS-10: Participate in statewide and Pacific regional alien species efforts.

**Strategy AS-1: Conduct planning to prioritize by threat level, invasiveness, and practicality of eradication or control all nonnative organisms in the Monument over the life of the plan.**

The consolidation of efforts and information and the standardization of methods for approaching invasive species problems will enable managers to prioritize invasive species projects, maintain better readiness to respond to new invasions, and prevent or reduce the probability of additional invasions.

***Activity AS-1.1: Complete an Integrated Alien Species Management plan.***

An Integrated Alien Species Management Plan (IASMP) for the Monument will be developed based on review of the effectiveness of existing protocols and a critical geospatial threat analysis of alien species found within the NWHI and risks associated with new introductions from maritime traffic from the main Hawaiian Islands and interisland travel by aircraft or vessel. The plan will be based on a comprehensive risk assessment and enable prioritization of alien species management actions. Any necessary pesticide use proposals and Section 7 consultations will address terrestrial alien species control, eradication, and response to outbreaks within two years. The IASMP and associated compliance requirements will be updated every 5 years and will include proactive components such as completing pesticide use proposals and Section 7 consultations before they are needed to facilitate rapid response.

***Activity AS-1.2: Develop best management practices to prevent, control, and eradicate alien species.***

The integrated alien species management plan will include a definition of specific protocols and requirements for preventing, controlling the spread of, and eradicating alien species, such as hull inspections and island quarantine protocols, a description of each partner's role in alien species control, best management practices to prevent the spread of species within the NWHI, and priority areas. Species of concern will be identified. One concern the plan will address is the need to prevent the spread of alien species within the NWHI, especially from Midway Atoll.

The plan will incorporate individual Co-Trustee guidelines, as appropriate, for the most effective and collaborative efforts possible. Memoranda of agreement will be developed as necessary to adopt and implement agency guidelines. Planning may also include development of a formal inter-agency rapid-response field team modeled after similar efforts for brown tree snakes, the state terrestrial and aquatic alien invasive species (AIS) response teams, oil-spill response teams, and the Federal Incident Command System. A rapid response plan that details complete areas of responsibilities for each managing partner on the discovery of a new introduction needs to be a part of the plan.

This plan will include strategies for a rapid risk assessment, possible methods for containment and eradication, and a provision for quickly accessing funding needed for the control or eradication attempt. Additionally, measures to reduce the chances that ships are transporting deleterious species should be encouraged even if no ballast water is intentionally discharged in the Monument. These measures may include exchange; pre-intake treatments such as filtration, ultraviolet treatment, or sonic treatment; post-intake extermination of organisms; and regular cleaning of ballast tanks. Coordination with existing groups already working on some of these alien species issues will be a high priority to build on the plans already drafted. Examples of these are the State of Hawai'i Aquatic Invasive Species Management Plan (DLNR 2003a), the report on Reducing Potential Impact of Invasive Marine Species in the NWHI CRER (Godwin et

al. 2006), the Assessment of the Potential Threat of Marine Nonindigenous Species in the NWHI (Eldredge 2005), the Draft Pacific Islands Rat Spill Contingency Plan (FWS in prep.), and the Draft Laysan Island Restoration Plan (Morin and Conant 1998). This activity will be closely linked with the field protocols developed in the Coordinated Field Operation Action Plan (Section 3.6.3) and in the Maritime Transportation and Aviation Action Plan (Section 3.3.3).

**Strategy AS-2: Engage in active surveillance to monitor existing infestations and to detect new infestations of alien species over the life of the plan.**

The two pressing needs in managing areas affected by invasive species are to identify what new species have recently arrived and become established and which alien species exhibit invasive characteristics and are, therefore, the most dangerous. Maintaining careful records of the distribution of known alien species and actively searching for new arrivals are essential to correctly prioritize response and restoration activities.

***Activity AS-2.1: Survey distributions and populations of known alien species at regular intervals.***

Existing invasions should be closely monitored to determine their rate of spread and distribution relative to sensitive native species in the Monument. This will assist managers in prioritizing response actions. Monument staff will incorporate alien species data collection into existing annual ecosystem monitoring activities (see Section 3.1.1, Marine Conservation Science Action Plan).

***Activity AS-2.2: Maintain a GIS database of marine and terrestrial alien species.***

Data collected during alien species monitoring will be added to the Monument's geographic information system (GIS) database for tracking and analysis purposes (see Section 3.6.2, Information Management Action Plan). These data will help track the spread of invasive species and the success of control measures instituted by Monument managers.

***Activity AS-2.3: Develop and implement monitoring protocols for early detection and characterization of new infestations.***

In accordance with the Monument's integrated alien species management plan, protocols will be developed and refined as necessary to monitor selected areas for possible alien species introduction. Discoveries of new alien species will be immediately reported to managers for appropriate response and incorporated into the Monument's GIS database.

**Strategy AS-3: Establish and enforce quarantine procedures appropriate for each site and habitat (terrestrial and aquatic) in the Monument to prevent the invasion or reinfestation of nonindigenous species over the life of the plan.**

The benefits of preventing the introduction of a new species far outweigh its cost. Reducing the probability of alien species being transported to the Monument by developing effective quarantine protocols and enforcing them is tremendously important to maintain the biological integrity, diversity, and environmental health of the system.

***Activity AS-3.1: Enforce the use of existing quarantine protocols to prevent the introduction of invasive terrestrial species to the Monument.***

Strict enforcement of existing policies (see Appendix F) requiring the use of island-specific soft gear that is brand new and has been frozen for 48 hours has resulted in a very low incidence of new invasive species being reported in the NWHI since the inception of the current program in 1991 at all high-quarantine sites (Nihoa, Mokumanamana, Gardner Pinnacles, Laysan Island, Lisianski Island, and Pearl and Hermes Atoll).

***Activity AS-3.2: Continue to require hull inspection and cleaning of all vessels, SCUBA gear, marine construction material, and instruments deployed in the Monument.***

A majority of recent marine invasive species to Hawai'i are directly attributed to sessile and mobile biofouling organisms associated with hull fouling (Godwin et al. 2006). Therefore, prevention efforts will focus on introductions by vessel dispersal. These modes of dispersal include hulls and propellers, outboard motors, anchors and chains, fishing equipment, scientific dive gear, research floating platforms, and drydocks (Godwin et al. 2005). Inspections are mandatory for all permitted vessels prior to entering the Monument. A hull cleaning may be required prior to access.

**Strategy AS-4: Eradicate the house mouse population on Sand Island, Midway Atoll, within 15 years.**

Subsequent to the eradication of the black rat (*Rattus rattus*) at Midway Atoll and the Polynesian rat (*Rattus exulans*) at Kure Atoll, the house mouse (*Mus musculus*) on Sand Island, Midway, remains the only nonnative mammal left in the NWHI. Mice can cause high mortality in seabirds as large as albatrosses (Wanless et al. 2007.) In addition, Midway now hosts a translocated population of endangered Laysan ducks that are likely to be negatively affected by high mouse populations. Mice are also a major threat to native plants and terrestrial invertebrates.

***Activity AS-4.1: Produce a house mouse eradication plan within 5 years and procure appropriate permits for chosen eradication techniques.***

The eradication of introduced rodents from islands is routine, and the successful removal of black rats at Midway Atoll in recent years has provided a model for mouse eradication. Mice present additional challenges, however, such as much smaller home range sizes and different foraging and reproductive ecology. A careful planning effort that emphasizes the minimization of effects to nontarget organisms at the site and the other biological differences that may affect the operation is necessary.

***Activity AS-4.2: Implement and complete house mouse eradication.***

All of Sand Island (1,128 acres) will be treated with rodenticide, with active management to prevent nontarget impacts to native wildlife. Surveys of the affected ecosystem components before and after the operation will provide a valuable demonstration of the effects of introduced mice on biological communities.

**Strategy AS-5: Prioritize infestations of alien terrestrial arthropods by species and locations and, within 5 years, develop and subsequently implement plans to control and if possible eradicate the highest-priority species.**

Introduced insects can have devastating effects on native plant and animal communities, but our state of knowledge of the ecology of native terrestrial invertebrates in the Monument and our understanding of technologies for controlling and eradicating introduced arthropod species are minimal. Planning and prioritization will improve our chances of successfully managing this group of invasive species while minimizing negative effects to native species (terrestrial and aquatic).

***Activity AS-5.1: Within 5 years, formulate a priority list of locations and species and a treatment plan to control and eventually eradicate all social Hymenopterans, such as ants and wasps, at all islands in the Monument.***

Nineteen different species of ants have been recorded in the NWHI through the years (Nishida 1998, 2000). All of these are alien, and some have the potential to be exceedingly invasive and damaging to native plants and animals. Some species are more dangerous to native species than others, and different species of ant may require different approaches to eradication or control in terms of toxicant delivery and effectiveness, seasonality, habitat choices, and differences in accessibility of the infested islands. Other Hymenopterans such as wasps also threaten indigenous species, particularly insects.

***Activity AS-5.2: Conduct toxicant trials to evaluate their efficacy and document ecological effects at selected islands on highest-priority invasive species of ants and wasps.***

Specific toxicants for killing target species of ants and wasps and baits most palatable to the target species will be tested for efficacy and attractiveness before full-scale eradication efforts begin.

***Activity AS-5.3: Control and if possible eradicate the two introduced mosquito species at Midway Atoll within 10 years using methods prescribed in the Integrated Alien Species Management Plan.***

Reduction or elimination of mosquitoes (*Aedes albopictus* and *Culex quinquefasciatus*) at Midway will benefit humans, nesting seabirds, and the endangered Laysan duck, as well as other endangered bird species that might be translocated to Midway in the future (see the Threatened and Endangered Species Action Plan, Section 3.2.1) by eliminating the vector for avian pox, which already occurs there, and other arthropod-borne diseases that may arrive in the future. Monument staff will continue to kill mosquito larvae in freshwater ponds and manage mosquito reproduction while avoiding harm to endangered Laysan ducks and other species of migratory waterbirds and shorebirds, using either mosquito fish (*Gambusia affinis*) or bacterial control (*Bacillus thuringiensis israelensis*), depending on the wildlife species using each site. We will also eliminate mosquito breeding habitat by getting rid of standing water sources, where possible and appropriate, and by limiting access to standing water in pipes and cisterns.

***Activity AS-5.4: Develop and implement a plan to control and if possible eradicate the invasive gray bird locust wherever it occurs.***

Gray bird locusts (*Schistocerca nitens*) have been found on Nihoa, Mokumanamana, French Frigate Shoals, and Lisianski Island. To better respond to the invasive grasshopper *Schistocerca nitens*, a workshop was held in 2005 to address this threat species. Addressing one of the recommendations, Monument staff will continue to collect climate data, along with grasshopper abundance measures, to develop and continue improving a model for predicting outbreaks. Locust outbreaks are triggered by specific combinations of rainfall and drought, with egg laying favored by warm and dry conditions and survival of young grasshoppers favored by a flush of vegetation caused by rains at the appropriate time. Looking for correlations between grasshopper abundance and moisture and temperature conditions will allow better predictions of high locust populations.

***Activity AS-5.5: Protect endangered plants threatened by gray bird locust outbreaks at Nihoa by developing appropriate baits for localized application of toxicants to protect specific high-priority plant sites.***

Control of grasshoppers on islands such as Nihoa, with its many endemic species of arthropods, requires very careful choices of agents. Lower toxicity to nontarget organisms or specificity of delivery to just grasshoppers will be ensured.

**Strategy AS-6: Control and eventually eradicate the highest-priority invasive plants in the terrestrial parts of the Monument within 15 years.**

Invasive plants brought to the Northwestern Hawaiian Islands in the course of human activity have caused extensive damage through the years by displacing native plants and by changing the structure and composition of the vegetation community to make it less useful as habitat for other native organisms.

***Activity AS-6.1: Control and eventually eradicate golden crownbeard and co-occurring weedy shrubs in all areas where they occur.***

Golden crownbeard (*Verbesina encelioides*) is an invasive annual plant that is a prolific seed producer and grows in extremely dense monotypic stands, in which most other plant species are excluded. The species is currently found at Kure, Midway, and Pearl and Hermes Atolls. Control and eventual eradication will require breaking the cycle of the plant setting seed and then depleting the soil seed bank. This task is made much more difficult because of the high density of nesting seabirds, which precludes many mechanized forms of control. Areas to be treated by hand-pulling, mowing when appropriate, and treatment with glyphosate to prevent plants from setting seed and to exhaust the seed bank include 1,098 acres on Midway Atoll, 75 acres on Kure Atoll, and 34 acres on Pearl and Hermes Atoll. Several other invasive weeds are associated with *Verbesina* at Midway Atoll and will respond to the same treatments described above. These weeds include Spanish needle or beggartick (*Bidens alba* and *B. pilosa*), spiny pigweed (*Amaranthus spinosus*), haole koa (*Leucaena leucocephala*), castor bean (*Ricinus communis*), and hairy abutilon (*Abutilon grandifolium*).

***Activity AS 6.2: Control and eventually eradicate the invasive grass sandbur from all areas of the Monument where it currently occurs.***

The invasive grass sandbur (*Cenchrus echinatus*) has been successfully eradicated at Laysan Island and French Frigate Shoals, but currently exists at Kure, Midway, and Pearl and Hermes

Atolls, and Lisianski Island, so replicating the techniques described in Rehkemper and Flint (2002) will prevent the habitat degradation and loss of native plants and breeding seabirds at other sites in the NWHI where *Cenchrus echinatus* occurs. It can be eliminated by maintaining a year-round program of hand-pulling and limited spraying of glyphosate, to be scheduled so that no plant is ever allowed to go to seed; thus, the seed bank is eventually depleted.

***Activity AS-6.3: Control and eventually eradicate Indian pluchea, Sporobolus pyramidatus, and swine cress from Laysan Island.***

The introduced shrub *Pluchea indica* will be eradicated by cutting and painting stumps with Garlon® in a gradual manner to make sure seabird nesting habitat provided now by *Pluchea* is replaced with other shrubs being used in the ecological restoration at Laysan Island, such as ‘ilima (*Sida fallax*). Replacing this invasive shrub with native plants providing the same structure used by many nesting birds at Laysan Island is prescribed by the Draft Laysan Restoration Plan (Morin and Conant 1998). Athens, Ward, and Blinn (2007) discovered the pollen of the native shrub *Sida fallax*, previously unknown to Laysan Island, in the 7,000-year pollen core they studied from Laysan Lake. ‘Ilima has a similar growth form to the *Pluchea* now favored by nesting red-footed boobies and great frigatebirds at Laysan Island. The introduced grass *Sporobolus pyramidatus* and the herbaceous plant swine cress (*Coronopus didymus*) are vulnerable to hand-pulling and glyphosate treatments and also will be treated often enough to prevent any plant from setting seed.

***Activity AS-6.4: Control and eventually eradicate prioritized alien plant species from Kure Atoll.***

A preliminary Draft Kure Atoll Management Plan (2007) prioritizes alien species that need to be eradicated. Ironwood (*Casuarina equisetifolia*) will be eradicated by cutting down trees and painting the stumps with Garlon 4®. Beach heliotrope (*Tournefortia argentea*) will be controlled in beach dune areas by selectively removing young trees that have not attained the size that seabirds utilize for nesting. Chemical (probably glyphosate) and mechanical methods will be used to control and in some cases eradicate *Flaveria trinervia*, *Setaria verticillata*, *Chenopodium murale*, *Cynodon dactylon*, *Portulaca oleracea*, and *Boerhavia coccinea*. Native plants propagated in Kure Atoll’s nursery will be used to replace the nonnative plants that are removed.

**Strategy AS-7: Investigate methods to eventually eradicate aquatic invasive organisms already known to be present in the Monument, and conduct regular surveillance for new invasions.**

Aquatic invasive species present difficulties to resource managers because the technology for detection and subsequent control and eradication is not well established in marine environments. The spread of these alien species is harder to contain than are pests located on islands. These factors make locating, characterizing, and eliminating infestations of aquatic invasive species a high priority.

***Activity AS-7.1: Map, control, and eventually eradicate invasive red algae where it occurs.***

Monument staff will map current distributions by using SCUBA, technical mixed gas diving, or remotely operated vehicles and concentrate searches in areas where lobster trapping (commercial

or research) occurred. Searching for the extent of the infestation of *Hypnea musciformis* should start in areas in the NWHI where commercial and research trapping for lobsters has occurred, because it is thought that the original transport of the invasive algae may have been made by traps previously deployed in the main Hawaiian Islands.

***Activity AS-7.2: Conduct surveillance at appropriate sites for snowflake coral and other incipient marine invasives.***

Based on preferred sites already infested by snowflake coral (*Carijoa riisei*) in other areas and on understanding of the species life history and dispersion methods, the MMB will devise a plan for surveying sites with the highest probability of invasion by this damaging species.

**Strategy AS-8: Conduct and facilitate research designed to answer questions regarding invasive species detection, effects on ecosystem, and alien species prevention, control, and eradication over the life of the plan.**

Some of the invasive species problems facing Monument managers are without precedent because of the kinds and sizes of habitats being managed, the species involved, and the logistical and technical difficulties of working there. Research designed to assist in adapting methods to the Monument situation is essential for managing this unique National Monument.

***Activity AS-8.1: Support and conduct research on alien species detection and the effects of invasive species on native ecosystems.***

Monument staff, working with subject experts, will determine which methodologies for alien species detection and control will be appropriate for use in the NWHI. As appropriate, staff will initiate or support research on alien species detection and documentation of their ecological effects. Some of this work will be based on previous research done in other places and methodologies that have already been developed. Research priorities will be identified through updates to the Monument Research and Monitoring Plan (see the Marine Conservation Science Action Plan, Section 3.1.1). Research results on ecosystem effects will aid in prioritization of control and eradication efforts.

***Activity AS-8.2: Support and conduct research on invasive species prevention, control methods, and eradication techniques.***

The high level of protection afforded the Monument enables managers to exercise unprecedented levels of influence over practices that may prevent movement of invasive species into the area. Research to document the effectiveness of these measures will aid those managing other wildlands in choosing quarantine methods. Successful invasive species control and eradication programs require systematic investigations into the efficacy of techniques chosen and the ecological impacts of any methods used. Such an investigation has been outlined for the grasshopper invasion on Nihoa (Gilmartin 2005).

**Strategy AS-9: Engage Monument users and the public in preventing the introduction and spread of alien species.**

The organisms that have caused the greatest ecological disruption in the Monument all arrived as accidental introductions by humans. Educating all visitors to the area will go a long way toward

preventing future harmful species from reaching Papahānaumokuākea and will be knowledge that applies wherever they travel.

***Activity AS-9.1: Integrate alien species information into the overall outreach program for Monument permittees.***

As part of the outreach to all Monument permittees, Monument staff will develop outreach materials that include information on regulations, permit requirements, and best management practices related to alien species. The outreach program will help people identify alien species and understand the importance of, and methods for, preventing alien species introductions. A guide to marine and terrestrial alien species with photographs, modes of transport, reporting protocols, and best management practices will be used as part of the outreach program. Outreach may consist of printed materials and videos, as well as presentations that are part of the permit application process and as taxonomy training for staff and volunteers. Such a program could be developed in partnership with the University of Hawai‘i HIMB to develop staff, partners, and volunteers with expertise in field identification of various marine taxa. This program could include a certification program that demonstrates identification skill sets. (See the action plans for Permitting, Section 3.4.1; Enforcement, Section 3.4.2; Ocean Ecosystems Literacy, Section 3.5.4; and Constituency Building and Outreach, Section 3.5.2), and the Midway Atoll Visitor Services Plan (Appendix B).)

***Activity AS-9.2: Integrate alien species information into general Monument outreach materials.***

Monument staff will integrate messages on alien species into general education and outreach materials when appropriate opportunities arise. For example, the “Navigating Change” curriculum and video series developed in 2004 contained information on the threat of invasive species to native ecosystems (see the Ocean Ecosystems Literacy Action Plan, Section 3.5.4).

**Strategy AS-10: Participate in statewide and Pacific regional alien species efforts.**

Invasive species management is a challenge shared by resource managers worldwide. Exchange of technologies, strategies, and case histories of successes and failures are invaluable for all ecosystem stewards.

***Activity AS-10.1: Build relationships with other resource managers and invasive species experts in the State, nation, and other countries based on shared challenges concerning invasive species.***

Information exchange will maximize the effectiveness of collective resources and keep the MMB current on invasive species research, management, and outreach efforts throughout Hawai‘i and the Pacific. Because most vessels bound for the NWHI come from the main Hawaiian Islands, it is particularly important to support efforts there. Groups addressing invasive species in Hawai‘i include the Hawai‘i Invasive Species Council, the Alien Aquatic Organism Task Force, and the Coordinating Group on Alien Pest Species, among several others. The Pacific Invasives Network is addressing invasive species issues in Pacific islands. The State of Hawai‘i has hired an AIS coordinator with funds from the National Aquatic Nuisance Task Force and has obtained Hawai‘i Invasive Species Council funds to support the Aquatic Alien Species Response Team. Communication with these groups will provide opportunities for information and resource

sharing and implementation of standardized protocols for alien species reporting and monitoring species, including support for hull inspections, vessel monitorings, and other joint MMB activities.

Monument staff will participate in public and professional conferences, working group meetings, and activities focused on reducing the impacts of alien species statewide and in the Pacific region.

**Table 3.3.2 Summary of Strategies, Activities, and Agency Leads for Alien Species**

<b>Strategies and Activities</b>	<b>Agency Lead</b>
<b>Strategy AS-1: Conduct planning to prioritize by threat level, invasiveness, and practicality of eradication or control all nonnative organisms in the Monument over the life of the plan.</b>	
Activity AS-1.1: Complete an Integrated Alien Species Management Plan.	FWS
Activity AS-1.2: Develop best management practices to prevent, control, and eradicate alien species.	FWS
<b>Strategy AS-2: Engage in active surveillance to monitor existing infestations and to detect new infestations of alien species over the life of the plan.</b>	
Activity AS-2.1: Survey distributions and populations of known alien species at regular intervals.	FWS NOAA
Activity AS-2.2: Maintain a GIS database of marine and terrestrial alien species.	NOAA

Activity AS-10.1: Build relationships with other resource managers and invasive species experts in the State, nation, and other countries based on shared challenges concerning invasive species.	FWS

### 3.3.3 Maritime Transportation and Aviation Action Plan

#### Desired Outcome

Investigate, identify, and reduce potential threats to Papahānaumokuākea Marine National Monument from maritime and aviation traffic.

#### Current Status and Background

With the exception of a few small boats at Midway Atoll, French Frigate Shoals, and Kure Atoll, no vessels have home ports in the NWHI. Therefore, almost all marine traffic in the waters surrounding the NWHI is from transiting merchant vessels, research ships, and fishing vessels; with cruise ships, U.S. Coast Guard ships, and recreational vessels visiting less frequently. An estimated 50 vessels pass through the U.S. Exclusive Economic Zone surrounding the NWHI each day (Mathers 2005, pers. com.). Navy ships and vessels conduct training and participate in testing activities in the Hawaii Range Complex, which encompasses the Monument, and vessels that support missile defense tests occasionally operate in Monument waters. Vessels in shallow waters are at higher risk of impacting resources.

Links to other Action Plans	
3.2.1	Threatened and Endangered Species
3.3.2	Alien Species
3.3.4	Emergency Response
3.4.1	Permitting
3.4.2	Enforcement
3.5.2	Constituency Building and Outreach
3.5.4	Ocean Ecosystems Literacy
3.6.3	Coordinated Field Operations

Links to Goals
Goal 1
Goal 2
Goal 3
Goal 4
Goal 8

A relatively small number of flights are conducted in the Monument. The MMB agencies charter on average 27 flights to French Frigate Shoals and 45 flights to Midway Atoll each year to transport supplies and personnel. The Coast Guard conducts regular enforcement overflights, often landing at Midway Atoll for refueling. A few research and management activities associated with remote sensing, mapping, wildlife survey, and marine debris detection may be conducted by aircraft each year. The planning associated with ship, small boat, and aircraft activities is discussed in the Coordinated Field Operations Action Plan, Section 3.6.3.

#### Need for Action

All activities conducted in the Monument must meet the requirements articulated in Presidential Proclamation 8031, which established the Monument. Consistent with the spirit of the Proclamation, the MMB will investigate, identify, and reduce threats to the NWHI ecosystems. This work includes regularly evaluating the effects ships and aircraft may have on the environment during the course of normal operations and identifying ways in which they can be reduced. The MMB will periodically review vessel and aircraft activities,

recognizing that future increase in access to and use of the Monument could result in increased risks associated with transportation. The MMB is committed to minimizing the environmental footprint generated through maritime and aviation traffic.

Ships and aircraft allow human access and make activities possible in the vast and remote NWHI. However, they also bring with them the possibility of threats or environmental hazards. Some of these hazards are critical in nature and demand immediate response, such as groundings and fuel, chemical, or oil spills (see the Emergency Response and Natural Resource Damage Assessment Action Plan, Section 3.3.4). Others are biological in nature, such as the threat of alien species introductions through vessel hull fouling or ballast water discharge (see the Alien Species Action Plan, Section 3.3.2), or interactions with protected marine species (see the Threatened and Endangered Species Action Plan, Section 3.2.1). This action plan establishes a framework to evaluate various activities conducted by ships and aircraft.

### **Strategies to Achieve the Desired Outcome**

Two strategies have been identified for achieving the desired outcome of preventing and reducing impacts of vessels and aircraft operating in and transiting the NWHI. Strategies and activities are coded by the acronym for the action plan title, “Maritime Transportation and Aviation” (MTA). A summary of strategies and activities is provided in Table 3.3.3 at the end of this action plan.

- MTA-1: Increase awareness of navigational hazards and ecological sensitivity of the Monument.
- MTA-2: Conduct studies to identify potential aircraft and vessel hazards and adopt measures to prevent adverse impacts.

#### **Strategy MTA-1: Increase awareness of navigational hazards and ecological sensitivity of the Monument.**

The banks, atolls, and other reefs of the NWHI support a diverse array of species assemblages forming a system that is unique in the world (Friedlander et al. 2005), which could experience catastrophic losses in the event of a major ship grounding or oil spill. The MMB continues to analyze threats to the ecosystem from vessel traffic (see activity MTA-2.1, below). The establishment of internationally recognized shipping designations will raise awareness about the sensitivity and dangers of operating in the Monument, as well as provide information about the incidence of unreported international vessels transiting the area.

##### ***Activity MTA-1.1: Coordinate implementation of domestic and international shipping designations with appropriate entities.***

Potential impacts to Monument resources from ship traffic, including habitat damage from groundings, hazardous materials spills, and sewage and ballast water discharges, have been identified as some of the primary anthropogenic threats to the vulnerable and valuable natural and cultural resources of the area. PSSA designation will augment domestic protective measures by alerting international mariners to exercise extreme caution when navigating through the area.

On April 3, 2008, the IMO designated the Monument as a PSSA. As part of the PSSA designation process, the IMO adopted U.S. proposals for associated protective measures consisting of (1) expanding and consolidating the six existing recommendatory Areas To Be

Avoided (ATBAs) in the Monument into four larger areas and enlarging the class of vessels to which they apply; and (2) establishing a ship reporting system for vessels transiting the Monument, which is mandatory for ships 300 gross tons or larger that are entering or departing a U.S. port or place and recommended for other ships. The IMO protective measures do not apply to the activities and exercises of the Armed Forces (including the U.S. Coast Guard) that are consistent with applicable laws. Sovereign immune vessels also are not subject to the reporting requirement but all vessels are encouraged to participate.

The vessel reporting system requires that ships notify the U.S. shore-based authority (the U.S. Coast Guard; NOAA will be receiving all messages associated with this program on behalf of the Coast Guard) at the time they begin transiting the reporting area and again when they exit. Notification is made by e-mail through the Inmarsat-C system or other satellite communication system. It is estimated that almost all commercial vessel traffic will be able to report via Inmarsat-C. The Armed Forces are not subject to the access restrictions and reporting requirements in the Monument when they are conducting activities and exercises.

The PSSA and associated protective measures were adopted to provide additional protection to the exceptional natural, cultural, and historic resources in the Monument. Requiring vessels to notify NOAA upon entering the reporting area will help make the operators of these vessels aware that they are traveling through a fragile area with potential navigational hazards such as the extensive coral reefs found in many shallow areas of the Monument. The PSSA and associated protective measures are now in effect.

NOAA and FWS are establishing the infrastructure that will be required to maintain an international ship reporting system and to ensure that information regarding PSSA designation will be incorporated into nautical charts and other information sources. Appendix G of Volume III contains the relevant documents for the IMO designated PSSA around the Monument.

***Activity MTA-1.2: Develop boundary and zoning informational tools.***

Information on the PSSA designation, zones, boundaries, and regulations will be made available to Monument users to help them comply with all maritime transportation requirements. Global positioning system coordinates will be provided along with nonnavigational reference maps in the appropriate public documents. The MMB will work with NOAA's Office of Coast Survey to update NOAA navigational charts as well as to provide appropriate information to mariners in the United States Coast Pilot®, a series of nautical reference books.

***Activity MTA-1.3: Provide necessary updates to nautical charts and the Notice to Mariners.***

The MMB will work with the appropriate NOAA and Coast Guard offices to update the nautical charts and Notice to Mariners to reflect Monument boundaries, zones, and other pertinent designations. The U.S. Notice to Mariners announces updates to National Geospatial-Intelligence Agency and National Ocean Service charts using information collected from many sources, among them the Coast Guard Local Notices. The U.S. Notice to Mariners will contain only those chart corrections of interest to ocean-going vessels.

Bathymetric data collected as part of research and monitoring in the NWHI may be used to update nautical charts. However, standards for data used for benthic habitat mapping are less rigorous than are applied to hydrographic survey, so most of the data collected to date in the NWHI are unlikely to be used for updating charts Monument-wide. Nautical charts can be updated only using bathymetric surveys that meet the standards of the International Hydrographic Organization (IHO). Therefore, when a survey is to be conducted in an area where chart updates would be useful, the survey planners will work with the Hydrographic Surveys division of the Office of Coast Survey to determine whether the minimum requirements for IHO standards for chart updates are compatible with the mandated research objectives. Often, these standards are greater than the scientific survey needs, so if collaborative dual-purpose surveying is undertaken, cost-sharing agreements will be sought with the Office of Coast Survey during survey planning. Nautical charts are updated based on national prioritized needs, and even if data are collected to IHO standards, many years could pass between survey completion and the incorporation of updates to the associated charts. As such, updating all NWHI nautical charts is a long-term goal.

**Strategy MTA-2: Conduct studies to identify potential aircraft and vessel hazards and adopt measures to prevent adverse impacts.**

While many aircraft and vessel hazards are known and can be reduced through regulations and permit requirements, more information needs to be gained about potential hazards to minimize human impacts and maximize resource protection. Specific information gained through small-scale studies can strengthen or add specificity to regulations and permit requirements should they be needed.

***Activity MTA-2.1: Conduct studies on potential aircraft and vessel hazards and impacts.***

Various studies on potential aircraft and vessel hazards may be conducted based on priority threats identified in the comprehensive threat assessment discussed in the Enforcement Action Plan (Section 3.4.2). These studies may include, but are not limited to, the following: an anchoring/mooring location feasibility study; a long-term study on mandatory hull inspections and cleaning for all vessels accessing the Monument; studies on alien species introductions via aircraft; an assessment of permit reporting requirements for interactions with federally protected species and other wildlife; a light and sound study; and a discharge study.

***Activity MTA-2.2: Develop protocols and practices as needed and integrate with existing protocols for safe aircraft and vessel operations.***

The MMB will work with the ICC to convene a group of experienced aircraft and vessel operators to discuss safety for humans and wildlife during flight and boating operations. Existing protocols will be evaluated and other recommendations sought to reduce risks to personnel and the environment through pre-trip training and standard procedures. New protocols and practices will be developed as needed.

***Activity MTA-2.3: Improve existing pre-access information for inclusion on the Monument website and in permit application instructions.***

The following information will be incorporated into pre-trip training for Monument users and vessel operators: information on regulations and compliance; navigation hazards; emergency

response protocols and contacts; zoning designations, including waste discharge location and types; preventing the introduction of alien species; preventing and reporting interactions with protected species and other wildlife; preventing light and sound pollution; and preventing anchor damage to coral reefs and other benthic habitats and organisms. The information will be conveyed as appropriate to all vessel operators, captains, crews, and trip participants. The MMB will also incorporate this information into written materials to be distributed to potential visitors. (See the action plans for Permitting, Section 3.4.1; Enforcement, Section 3.4.2; Ocean Ecosystems Literacy, Section 3.5.4; and Constituency Building and Outreach, Section 3.5.2.)

***Activity MTA-2.4: Conduct activities to improve energy and water conservation measures on all vessels operating in the Monument.***

The NOAA ship *Hi'ialakai* sets an example for the fleet by increasing shipboard conservation measures each year. In 2006, the ship began a recycling program and began installing water-saving devices to reduce impacts to the Monument as well as other parts of the ocean where the ship operates. In 2008, NOAA plans to test the use of biofuels and nonpetroleum-based hydraulic fluid on the *Hi'ialakai*. The MMB will continue to work with ship managers on these measures and encourage similar practices for all vessels that operate in the Monument.

**Table 3.3.3 Summary of Strategies, Activities, and Agency Leads for Maritime Transportation and Aviation**

Strategies and Activities	Agency Lead
<b>Strategy MTA-1: Increase awareness of navigational hazards and ecological sensitivity of the Monument.</b>	
Activity MTA-1.1: Coordinate implementation of domestic and international shipping designations with appropriate entities.	NOAA
Activity MTA-1.2: Develop boundary and zoning informational tools.	NOAA
Activity MTA-1.3: Provide necessary updates to nautical charts and the Notice to Mariners.	NOAA
<b>Strategy MTA-2: Conduct studies to identify potential aircraft and vessel hazards and adopt measures to prevent adverse impacts.</b>	
Activity MTA-2.1: Conduct studies on potential aircraft and vessel hazards and impacts.	NOAA
Activity MTA-2.2: Develop protocols and practices as needed and integrate with existing protocols for safe aircraft and vessel operations.	NOAA
Activity MTA-2.3: Improve existing pre-access information for inclusion on the Monument website and in permit application instructions.	NOAA
Activity MTA-2.4: Conduct activities to improve energy and water conservation measures on all vessels operating in the Monument.	NOAA

### 3.3.4 Emergency Response and Natural Resource Damage Assessment Action Plan

#### Desired Outcome

Minimize damage to Papahānaumokuākea Marine National Monument resources through coordinated emergency response and assessment.

#### Current Status and Background

The history of shipwrecks and groundings is as old as the history of ships in the NWHI. Many islands and atolls are named for ships that went aground. This history continues, with four recent vessel groundings. The *Paradise Queen* and *Grendel* went aground at Kure Atoll in 1998 and 2007, respectively, and the *Swordman II* and *Casitas* went aground at Pearl and Hermes Atoll in 2000 and 2005, respectively. Natural disasters such as tropical cyclones and tsunamis, while rare, also threaten Monument natural, cultural, and historic resources. The remote locations in the Monument have logistically and financially challenged effective response and remediation efforts to date and will continue to be a primary factor in future emergency response efforts.

Links to Goals
Goal 1
Goal 2
Goal 3
Goal 4

Emergency response in the NWHI will be coordinated under a series of plans and systems, including the National Response Plan and the National Incident Management System. The National Response Plan establishes a comprehensive all-hazards approach to enhance the ability of the United States to manage domestic incidents, including oil and hazardous chemical spills. This plan incorporates the National Contingency Plan and its regulations governing how oil pollution response is conducted by the Coast Guard, EPA, the affected state, and resource trustees, including NOAA and FWS. The NWHI are covered specifically by the Hawai‘i Area Contingency Plan (Version 5.0 - May 02, 2005; <http://homeport.uscg.mil/mycg/portal/ep/portDirectory.do?tabId=1&cotpId=27>). This Area Contingency Plan describes the strategy for a coordinated industry, federal, state, and local response to a discharge or substantial threat of discharge of oil or a release of a hazardous substance. The Area of Responsibility of U.S. Coast Guard Sector Honolulu Captain of the Port Zone includes the Northwestern Hawaiian Islands.

Houei Maru #5 bow section. Wrecked in 1976 at Kure Atoll. Photo: Dan Suthers

FWS and NOAA have designated representatives who are federal members of the Regional Response Team, which makes response recommendations to the federal on-scene coordinator.

The Hawai'i DLNR and the Hawai'i Department of Health are the designated state representatives for all marine injury events. The Department of Health is the state on-scene coordinator. These representatives work closely with all parts of FWS, NOAA, the State, and the MMB in making recommendations on the use of alternative response technologies, such as dispersants. Unlike the State, NOAA and DOI can make only consultative recommendations; they do not have a formal vote in that process.

While the Monument and state regulations regulate access, they also provide a general exemption for activities necessary to respond to emergencies. The general exemption for emergencies allows for individuals responding to emergencies threatening life, property, or the environment to conduct necessary activities without the need for a permit. The general exemption applies only to the emergency response activity itself and not to ancillary activities, such as training for emergency response, salvage operations, remediation, or restoration. These ancillary actions also require timely response and would be covered under the appropriate agency's conservation and management permit.

Monument staff have access to resources-at-risk information that is of interest during contingency planning and spill response through the Sanctuaries Hazardous Incident Emergency Logistics Database System, a web-based decision support tool commonly referred to as "SHIELDS." This tool includes regulatory information, contact lists, GIS maps, environmental sensitivity indexes, information on resources at risk, and significant terrestrial and submerged historic and cultural resource and hazards data. Environmental Sensitivity Indices were last produced by NOAA for this area in 2001. Environmental Sensitivity Indices identify resources at risk on a seasonal and location basis and facilitate decisions about response options given threats to specific resources at risk.

In addition, the Monument's own GIS database of spatial resource data and the FWS Asset Maintenance Management System will be used to document this information. As the Monument continues to move toward a comprehensive biogeographic, cultural, and historic understanding of the NWHI, prevention and emergency response methods will improve (see the Information Management Action Plan, Section 3.6.2).

### **Need for Action**

In light of recent vessel grounding events in the NWHI and devastating natural disasters around the world, a clear need exists for the Monument to participate in emergency response efforts to address situations that threaten resources in and around the Monument. Grounded vessels and their related debris and pollution must be removed from the reefs as soon as possible to prevent damage to coral reef ecosystems and protected marine mammals, turtles, and seabirds.

Emergency response for events such as vessel groundings; oil, fuel, or chemical spills; or releases of hazardous substances is addressed through the Hawai'i Area Contingency Plan, which is a local plan under the larger structure of the National Response Plan. The Monument Co-Trustees and Interagency Coordinating Committee will seek to address NWHI responses as part of the Area Contingency Plan.

Developing a response capacity for events that fall beyond the scope of the existing response structure of the Area Contingency Plan is necessary to support the mission of the Monument and

the long-term protection of the resources of the NWHI. Events that may require an MMB-directed response include vessel groundings that neither pose the threat of hazardous release nor navigational hazard, as well as detrimental natural events such as disease outbreaks, severe storms, alien species introductions, or impacts of climate change (e.g., coral bleaching).

This action plan describes strategies and activities to plan for and respond to an emergency within the established Incident Command System (ICS) for the region, and other unanticipated events that fall outside the scope of the Hawai‘i Area Contingency Plan. The MMB will establish a Monument Emergency Response and Assessment Team (ERAT) that will determine what types of emergencies are likely within the Monument. For each identified possible emergency, the type and scope of necessary response will be determined.

### **Strategies to Achieve the Desired Outcome**

Within the context of the existing Area Contingency Plan and other informational tools, including SHIELDS, the MMB seeks to integrate its resources in a way that benefits both Monument resources and regional efforts. The MMB can contribute primarily through building an internal and interagency capacity to contribute to emergency response efforts and by providing relevant and current information regarding NWHI resources so that current data are readily available and accessible to the Regional Response Team and any unified command that may be established to address an incident.

To coordinate Monument response to emergencies in a manner that minimizes damage to resources and mechanisms to assess damage, the following strategies have been identified. The strategies and activities are coded by the acronym for the action plan title, “Emergency Response and Natural Resource Damage Assessment” (ERDA). A summary of strategies and activities is provided in Table 3.3.4 at the end of this action plan.

- ERDA-1: Create a Monument Emergency Response and Assessment Team within 1 year.
- ERDA-2: Assess response needs for non-Incident Command System emergencies within 2 years.
- ERDA-3: Update and create, as necessary, Monument resource protection plans and protocols within 3 years.

### **Strategy ERDA-1: Create a Monument Emergency Response and Assessment Team within 1 year.**

An interagency team will be created and integrated with local responders from other federal and state agencies to assess resource damage and respond to emergencies in the Monument. The Monument ERAT will interface with the existing local area response team within the Incident Command. Whenever possible, the team will provide assistance and coordination in an actual response. Following an emergency, the ERAT will participate in an injury assessment with other federal and State of Hawai‘i natural, cultural, and historic resource trustees. In the event of a response to and assessment of injury from a non-ICS event, such as severe storm damage or coral bleaching, the team will conduct this assessment and initiate appropriate monitoring.

***Activity ERDA-1.1: Create a Monument Emergency Response and Assessment Team for ICS responses.***

An ERAT will be created to interface with the existing local area response team within the Incident Command, the Regional Response Team, and the Scientific Support Team. The team members will include specific species experts, law enforcement, and experts by area and habitat type, and may recruit or consult other such experts as needed. Because this is an interagency effort, regular reports on the status of the ERAT will be made to the ICC. The team will also assist in identification of primary and compensatory restoration options as well as implementation and oversight of restoration and monitoring. The team will also develop standard operating procedures for onsite incident investigations, resource injury determination, asset conditions, emergency detection, assessment, and restoration.

***Activity ERDA-1.2: Acquire and maintain training and certification to complement and support the Regional Response Team.***

Under the Area Contingency Plan, the Regional Response Team is charged with preparedness for emergencies. This preparedness will necessitate training and certifications, including ICS, Hazardous Waste Operations and Emergency Response (HAZWOPR), boat safety, flight safety, first responder, and first aid.

***Activity ERDA-1.3: Participate in emergency response and preparedness drills and meetings throughout the life of the plan.***

The ERAT will attend Regional Response Team meetings, as appropriate, to keep abreast of current communication and training and to build working relationships with agency staff that make up both the Regional Response Team and the Coast Guard agency staff. Participation in emergency response drills and other events will help with preparedness and better integration into the response process. One of the main functions of the ERAT is to provide information and data to minimize impact on Monument resources by the event or the response.

***Activity ERDA-1.4: Participate in damage assessment programs and training throughout the life of the plan.***

Damage assessment is an important component of any emergency response. The ERAT is expected to contribute in area and resource knowledge; therefore, training in natural resource damage assessment is necessary. The ERAT will work closely with the FWS Environmental Contaminants Program and Oil Spill Response Coordinator and the ONMS Resource Protection Team in Silver Spring, Maryland, State on-scene coordinator, and State Department of Health Office of Hazard Evaluation and Emergency Response, as appropriate, to ensure that appropriate response, injury assessment, and restoration activities take place for any given case. This effort may include coordination with the DOI, FWS, NOAA Natural Resource Damage Assessment and Restoration Programs, the U.S. Department of Justice, Coast Guard, and other federal and State of Hawai'i resource damage assessment programs to assess the extent of injury from a particular emergency event (see Section 3.3.2, Alien Species Action Plan, Activity AS-1.1).

**Strategy ERDA-2: Assess response needs for non-Incident Command System emergencies within 2 years.**

***Activity ERDA-2.1: In the second year, determine the non-ICS emergencies and the necessary type and scope of responses.***

The ERAT will be responsible for determining what types of non-ICS emergencies are likely within the Monument. In the event of a needed response to natural events—such as disease outbreaks, severe storms, alien species introductions, or coral bleaching events,—or vessel groundings not releasing oil or hazardous substances, the ERAT will need specialized protocols for response. For each identified possible non-ICS emergency, the type and scope of necessary response will be determined.

***Activity ERDA-2.2: Designate appropriate Monument personnel for each non-ICS response team.***

The team members will include specific species experts and experts by area and habitat type, and may recruit or consult other such experts as needed. Because this is an interagency effort, regular reports on the status of the response teams will be made to the Papahānaumokuākea ICC. Each team member will also assist in the identification of primary and compensatory restoration options, if warranted, as well as implementation and oversight of restoration and monitoring. Team members will also develop standard operating procedures for injury determination, emergency detection, assessment, and restoration.

***Activity ERDA-2.3: Throughout the life of this plan, ensure that appointed personnel acquire and maintain training and certifications.***

Designated response personnel will maintain preparedness for emergencies. Preparedness will necessitate training and certifications including HAZWOPR, boat safety, flight safety, and first aid. Additional training considerations can include the Oil Pollution Act (OPA) and Natural Resource Damage Assessment (NRDA) process.

**Strategy ERDA-3: Update and create, as necessary, Monument resource protection plans and protocols within 3 years.**

Multiple agency and interagency emergency plans that apply to the Monument currently exist, such as continuity of operations plans, oil spill response plans, and aircraft incident plans. To ensure efficiency and effectiveness, the MMB agencies will coordinate and update these plans, as well as develop new plans or protocols as needed.

***Activity ERDA-3.1: Update and improve upon the Area Contingency Plan and the Environmental Sensitivity Indices.***

In concert with partners, MMB staff will update and improve upon the Hawai‘i Area Contingency Plan to better describe a range of potential emergency response actions in the NWHI and appropriately define how the ERAT will assess and respond to an emergency. Monument-specific information will be presented to the area committee for inclusion as appropriate in the Area Contingency Plan. In order to determine and develop appropriate response strategies to emergencies in the NWHI, a workshop will be held involving all partner agencies, parties that are typically involved in responses, and individuals, organizations, and researchers who are active in the region or have a particular specialty area that relates to the NWHI.

***Activity ERDA-3.2: Within 3 years, create damage assessment criteria and protocols.***

Following an emergency, the ERAT will participate in an injury assessment with other federal and State of Hawai‘i natural resource trustees. In the event of an MMB response to a non-ICS event, the team will conduct the assessment and initiate appropriate monitoring. Therefore, the ERAT will develop damage assessment criteria and protocols for the natural, cultural, and historic resources in the Monument.

## **3.4 Managing Human Uses**

---

### **3.4.1 Permitting Action Plan**

### **3.4.2 Enforcement Action Plan**

### **3.4.3 Midway Atoll Visitors Services Action Plan**

---

### **3.4 Managing Human Uses**

Globally, pollution, coastal development, resource extraction, climate change, natural hazards, and alien species introductions threaten terrestrial and marine ecosystems. As many of these threats are associated with human activities, a common element shared among most protected areas is the need to regulate human activities to minimize impacts. Indeed, this need to regulate human activities is the reason most protected areas are established. In certain sites, protection is achieved through prohibiting all access to a given area. In other areas, education may be the sole tool used to lessen the impacts people have on a given environment. Most protected areas utilize an assortment of management strategies, including zoning, permit authorization, regulations, and conservation plans to manage human activities and their potential impacts.

As a remote site without a significant resident or visitor population, the Monument has an advantage over many other protected areas in that the number of people and overall activity occurring is relatively low. Conversely, the Monument's remote location presents surveillance and enforcement challenges for effective management.

The NWHI have a long history of human activity, including early discovery and use by Native Hawaiians; exploitation of terrestrial and marine resources beginning in the late 1800s; commercial fishing beginning in the mid-1900s; and military activity during World War II. More recent activities in the NWHI include the U.S. Navy's use of Midway Atoll, the U.S. Coast Guard's stations at Kure Atoll and Tern Island, an ecotourism operation at Midway Atoll, and a commercial lobster fishery that was subject to zero harvest in 2000. Current activities are limited primarily to management activities by jurisdictional agencies, including habitat conservation and management, research, education, Native Hawaiian practices, recreation and historic preservation at Midway Atoll, and fishing by a small commercial bottomfish and pelagic trolling fleet. The DOD also conducts missile defense testing and Navy training and testing activities.

Human activities in the Monument are managed through a framework of regulations, permitting, zoning, and enforcement. The three action plans in this section focus on regulating activities through permits and compliance, through enforcement surveillance of activities in the Monument, and under a visitor services program at Midway Atoll. Zoning through Special Preservation Areas, Ecological Reserves, and the Midway Atoll Special Management Area establish spatial restrictions on human activities and are described in more detail in Section 2.0.

The Monument regulations prohibit access except for: passage without interruption; activities and exercises of the Armed Forces (including those of the Coast Guard); activities necessary to respond to emergencies or necessary for law enforcement; and, until June 15, 2011, bottomfish fishing conducted pursuant to a valid permit issued by NOAA. Monument permits are required for activities conducted in the Monument. Prior to the establishment of the Monument, each jurisdictional agency would have considered and issued separate permits for the same activity. Development of the Monument permit application process and application instructions was completed within a year after Monument designation. This process produced a single permit application for all applicants and a general permit template used by Co-Trustees when issuing permits throughout the Monument. Most of the Co-Trustee agency mandates and policies are

met by this general template. Those that are not met are addressed by special conditions that are added in addition to the general terms and conditions listed on each permit.

Compliance with regulations, laws, and permit requirements for all activities is enforced using surveillance, Vessel Monitoring System tracking, relevant technology, operations plans, and penalties. Co-Trustee and interagency cooperation on enforcement will become increasingly integrated and coordinated, allowing for greater capacity, effectiveness, and efficiency over time.

With the establishment of the Monument, Midway Atoll takes on the additional role of providing a “window” so that visitors can learn about and enjoy a small portion of the largest fully protected marine managed area in the world. The Co-Trustees remain committed to offering a high-quality, small-scale visitor program at Midway Atoll. By physically experiencing the Northwestern Hawaiian Islands, visitors will return home with a personal connection and commitment to protecting and conserving the Monument’s unique resources.

Each action plan consists of a set of strategies to address a desired outcome. The desired outcomes of these action plans over the 15-year planning horizon are:

- **Permitting:** Implement an effective and integrated permit program for Papahānaumokuākea Marine National Monument that manages, minimizes, and prevents negative human impacts by limiting access only for those activities consistent with Presidential Proclamation 8031 and other applicable laws, regulations and executive orders.
- **Enforcement:** Achieve compliance with all regulations within Papahānaumokuākea Marine National Monument.
- **Midway Atoll Visitor Services:** Offer visitors opportunities to discover, enjoy, appreciate, protect, and honor the unique natural, cultural, and historic resources of Papahānaumokuākea Marine National Monument.

Action plans described in this section will be implemented in close coordination with Co-Trustee partners and in conjunction with other priority management needs.

### 3.4.1 Permitting Action Plan

#### Desired Outcome

Implement an effective and integrated permit program for Papahānaumokuākea Marine National Monument that manages, minimizes, and prevents negative human impacts by limiting access only for those activities consistent with Presidential Proclamation 8031 and other applicable laws, regulations and executive orders.

#### Current Status and Background

The Monument permit program is an integral part of a management framework based on Monument regulations (see Appendix D), other federal and state regulations, zoning, enforcement, goals, Native Hawaiian cultural values, and collaboration within the MMB. This permit program is designed to ensure long-term protection of the NWHI by providing the Co-Trustees with a management tool to regulate, monitor, and understand the impacts of permitted activities on the ecosystem.

Proclamation 8031 requires a Monument permit for access to the Monument for a limited range of activities. State regulations (HAR sections 13-60.5 and 13-125, 50 CFR Part 25, 26, 38, and 404) are subject to permit requirements in State waters as well. Prior to Monument designation, many of these activities would have required multiple access permits from different agencies. Permits authorized for activities conducted within the national wildlife refuges, the state’s Northwestern Hawaiian Islands Marine Refuge, the State Seabird Sanctuary at Kure Atoll, or the Reserve may have required one or more permits issued by FWS, the State of Hawai‘i, or the Reserve. However, with the advent of the Monument, all proposed activities are reviewed and considered jointly by all three Co-Trustees.

Development and implementation of a unified Monument permit application, application instructions, and Monument permit template occurred within the first year following Monument designation. All permitted activities are authorized under the issuance of a single Monument permit signed by designees of the three Co-Trustees. Most of the Co-Trustee agency mandates and policies are met by this unified permit. Those that are not met by the permit general terms and conditions are added as special conditions. The Co-Trustees issue Monument permits under the authority of the implementing regulations for the Monument, as described in 50 CFR 404.11 and consistent with all other applicable state and federal laws.

Previously, the State of Hawai‘i Land Board was the primary public forum for notification of Monument permit applications under consideration by Co-Trustees. To ensure the general public has access to and is informed of all permit applications under review, a policy on public posting was developed and finalized in November 2007 (Appendix A). This policy was developed jointly by the MMB to guide public notification of permit applications and provide an opportunity to review all proposed activities in the Monument.

Goal 1
Goal 2
Goal 3
Goal 4
Goal 5
Goal 7
Goal 8

### **Monument Permit Types**

All activities in the Monument, with limited exceptions, require a permit (see Monument regulations, Appendix D). Activities are either prohibited, excluded (no permit is needed), or regulated (must be considered through permitting process). Prohibited activities include:

- Exploring for, developing, or producing oil, gas, or minerals within the Monument;
- Using or attempting to use poisons, electrical charges, or explosives in the collection or harvest of a Monument resource;
- Introducing or otherwise releasing an introduced species from within or into the Monument; and
- Anchoring on or having a vessel anchored on any living or dead coral with an anchor, anchor chain, or anchor rope.

Exempted activities include:

- Response to emergencies threatening life, property, or the environment;
- Law enforcement purposes;
- Activities and exercises of the Armed Forces; (including the United States Coast Guard) and
- Passage without interruption.

Domestic vessels wishing to pass through the Monument must meet notification requirements, including notification by phone or email at least 72 hours prior to entry and within 12 hours of leaving the Monument (see Appendix D, Monument Regulations).

The Proclamation allows the Secretaries of the Interior and Commerce to issue permits for sustenance fishing outside of any Special Preservation Area as a term or condition of any permit issued, if the activity is conducted in a manner compatible with the Proclamation. Sustenance fishing in the Midway Atoll Special Management Area can be permitted only if it is determined by the Director of the FWS (or designee) to be compatible with the purposes for which the Midway Atoll NWR was established. In accordance with these specifications, the draft FWS Appropriateness Finding and Compatibility Determination for this activity was available as a part of the Draft MMP and has been finalized.

The existing federally regulated commercial bottomfish fishery (permitted under the authority of NOAA Fisheries) does not require a Monument permit. However, in addition to compliance with the fisheries regulations, these permittees must also comply with the Proclamation and Monument regulations. The Proclamation closes the remaining commercial bottomfish fishery in June 2011.

Regulated activities must be considered in the permit process. Under Monument permit criteria, access may be permitted for six types of activities. These are:

- Research,
- Education,
- Conservation and management,
- Native Hawaiian practices,
- Special ocean uses, and

- Recreation.

These permit categories, although different in name from the three types of activities listed in section 13-60.5-5, HAR are consistent with activities that may be allowed under state law. All activities eligible for a Monument permit must comply with all applicable laws. The unified Monument permitting system was specifically developed to address and incorporate the differences. For example, sustenance fishing is not allowed in state waters.

### ***Research***

Research permits are required for activities designed to enhance understanding of Monument resources and activities to improve resource management decisionmaking. Priority is given to research proposals that help meet the management needs of the Monument and its Co-Trustees, as identified in this Monument Management Plan or the Monument Natural Resources Science Plan (see Section 3.1.1, Marine Conservation Science Action Plan). The types of activities that can be conducted under a research permit include, but are not limited to, biological inventories, ecosystem-based research, restoration investigations, cultural studies, and terrestrial and marine archaeological research.

In the event sampling is requested, research proposals will be evaluated to ensure proposed sample sizes allow for the effective application of statistical techniques while minimizing harm to the population or ecosystem under study. Collection of samples must be justified and meet Proclamation findings.

### ***Education***

Education permits are required for activities that further the educational value of the Monument. Educational activities may enhance the understanding of the NWHI ecosystems, improve resource management decisionmaking, promote Native Hawaiian knowledge and values, or aid in enforcement and compliance efforts. Permits are considered for activities that have clear educational or public outreach benefits to understand Monument resources or management and that promote “bringing the place to the people rather than the people to the place.” Some examples of potentially eligible projects are teacher-at-sea programs, distance learning projects, and university classes.

### ***Conservation and Management***

Conservation and management permits are required for general management of the Monument. This may include activities associated with resource management, such as field station operations, benthic mapping, habitat characterization, marine debris removal, development and maintenance of infrastructure, species and habitat restoration, and long-term resource monitoring programs such as monitoring of endangered species and seabird populations, and terrestrial native plant communities (see Section 3.2.3, the Habitat Management and Conservation, Section 3.2.2, Migratory Bird, and Section 3.2.1, Threatened and Endangered Species action plans). Conservation and management permits provide a mechanism to respond and follow up to urgent events in the Monument that may not have been anticipated, such as response to vessel groundings, coral bleaching episodes, and invasive species detection.

### ***Native Hawaiian Practices***

Permits are required for Native Hawaiian cultural practices. The Native Hawaiian Cultural Working Group, working closely with the Office of Hawaiian Affairs, is currently developing a process whereby permit applications will be reviewed by select cultural practitioners or cultural resource managers. The findings and criteria in Proclamation 8031 and regulations (see Appendices D and E) state that Native Hawaiian Practice permits must be noncommercial, deemed appropriate and necessary by traditional standards, benefit the NWHI and Native Hawaiian community, perpetuate traditional knowledge, and restrict the consumption of harvested resources from the Monument. Permit conditions and protocols will continue to be developed by the Co-Trustees and the Office of Hawaiian Affairs through consultation with the Native Hawaiian Cultural Working Group and the Native Hawaiian community, as appropriate. (See Section 3.1.2, the Native Hawaiian Culture and History, and Section 3.5.3, Native Hawaiian Community Involvement Action Plans.)

### ***Special Ocean Use***

Special ocean use permits are required for projects related to commercial ocean uses, including ecotourism and documentary filmmaking that have a net benefit to the Monument. Special ocean use is defined as any activity or use of the Monument that is engaged in to generate revenue or profits for one or more of the persons associated with the activity or use. These permits are not restricted to activities in the ocean.

Special ocean use permits must meet the additional findings stated in Monument regulations (see Appendix D). These findings include the requirement to provide public notice for any activity not previously identified as a special ocean use and all activities being considered as special ocean use for locations outside of Midway. In addition, the Co-Trustees will authorize the conduct of a special ocean use permit activity only if the activity is compatible with the purposes for which the Monument is designated and is consistent with the protection of Monument resources. Special ocean use permits for activities being permitted for the first time will be restricted to pilot projects. Pilot projects will be closely monitored and restricted in duration. Only after a pilot project for the category has been determined by the Co-Trustees to meet the criteria in Proclamation 8031 can subsequent special ocean use permits be issued for the category of activity. Activities that could qualify as another permit type (e.g., research or education) but that directly generate revenue or profit for one of the persons involved in the activity must be permitted as special ocean use. Furthermore, special ocean use proposals involving activity outside of the Midway Atoll Special Management Area must be for educational or research purposes that directly benefit the conservation and management of the Monument. These activities may not involve use of a commercial passenger vessel, defined in the Monument regulations as “a vessel that carries individuals who have paid for such carriage.”

### ***Recreation***

Recreational permits are required for all recreational activities and are limited to the Midway Atoll Special Management Area. In addition to the general findings, recreational activities may not be associated with any for-hire operation or involve any extractive use. Examples of activities that may be permitted under a recreational activity permit include snorkeling, SCUBA diving, wildlife viewing, and kayaking.

FWS, in close consultation with the MMB, has updated the Interim Visitor Services Plan for the Midway Atoll National Wildlife Refuge, the Battle of Midway National Memorial, and the Papahānaumokuākea Marine National Monument's Midway Atoll Special Management Area (see Section 3.4.3, the Midway Atoll Visitor Services Action Plan, and Appendix B). This plan details the types of recreational activities permitted within the Midway Atoll Special Management Area. This plan also describes the permitting process for recreational activities, the number of annual recreational visitors expected within the Midway Atoll Special Management Area, and accommodations on Midway Atoll.

### **Findings and Review Criteria**

Monument findings and review criteria must be met by all applicants to demonstrate that their proposed activities are consistent with the Proclamation and the goals of the Monument (see Section 2, Management Framework). The MMB may require applicants to submit additional information, apply special conditions, or undergo additional training. To issue a permit, the Secretaries must determine the following:

- The activity can be conducted with adequate safeguards for the resources and ecological integrity of the Monument.
- The activity will be conducted in a manner compatible with the management direction of the Proclamation, considering the extent to which the conduct of the activity may diminish or enhance Monument resources, qualities, and ecological integrity; any indirect, secondary, or cumulative effects of the activity; and the duration of such effects.
- There is no practicable alternative to conducting the activity within the Monument.
- The end value of the activity outweighs its adverse impacts on Monument resources, qualities, and ecological integrity.
- The duration of the activity is no longer than necessary to achieve its stated purpose.
- The applicant is qualified to conduct and complete the activity and mitigate any potential impacts resulting from its conduct.
- The applicant has adequate financial resources available to conduct and complete the proposed activity and mitigate any potential impacts resulting from its conduct.
- The methods and procedures proposed by the applicant are appropriate to achieve the proposed activity's goals in relation to their impacts to Monument resources, qualities, and ecological integrity.
- The applicant's vessel has been outfitted with a mobile transceiver unit approved by NOAA Office of Law Enforcement and complies with the requirements of Proclamation 8031.
- There are no other factors that would make the issuance of a permit for the activity inappropriate.

Additional findings are required for Native Hawaiian Practices, special ocean use, and recreation applications. See Appendix D for additional findings from regulations.

Permit applications include requests for information that will assist the Co-Trustees in determining how the proposed activities are compatible with conservation and management of all of the resources of the Monument: natural, historic and cultural.

### **Permit General Terms and Conditions**

Permitted activities are subject to general terms and conditions that satisfy Proclamation 8031 and Monument regulations (see Appendices D and E) and comply with MMB agency mandates and policies. All authorized permits must meet all applicable federal and state regulations. As previously mentioned, those mandates and policies that are not met within the general permit terms and conditions are addressed by special conditions. General terms and conditions in Monument permits address the following categories, as required by Monument regulations, Proclamation 8031, and other MMB agency mandates and policies:

- Monthly, annual, and summary reporting
- Submittal of a copy of all data acquired under each respective Monument permit
- Adherence to all federal, state, and local laws and regulations
- Coordination with Monument staff while in the field
- Prohibition of alcohol possession and consumption in Hawaiian Islands NWR
- Adherence to hazardous material storage and transport guidelines
- Requirement to demonstrate proof of insurance, or financial capability to cover evacuation in the event of an emergency, medical evacuation, or weather
- Requirement for permittees to attend a cultural briefing on the significance of Monument resources to Native Hawaiians
- Prohibition against the disturbance of any cultural or historic property.

Additional terms for entering the Monument via vessel:

- Maintenance of cruise log
- Notification of entry and exit
- Requirement to demonstrate proof of vessel hull, tender, gear, ballast water, and rat inspections
- Vessel Monitoring System requirements.

### **Permit Special Terms and Conditions**

Each permit may contain special terms and conditions that place additional restrictions on the permitted activity to minimize or eliminate impacts to Monument resources or qualities. Permits may contain terms and conditions addressing sustenance and subsistence fishing reporting requirements, permitted activity locations, scientific collection methods, maintenance and retrieval of temporary structures in the Monument, or disinfection of gear and collecting equipment between permitted activity locations. Special terms and conditions are placed in permits depending on the nature of the permitted activity request and the location and duration of activities permitted to take place in the Monument. For example, all permits that involve collection of samples or specimens contain a special condition prohibiting the sale of the organisms collected, as well as the use or sale of any organisms, by-product, or materials collected within the Monument for obtaining patent or intellectual property rights.

One definition of bioprospecting is the search for new chemicals compounds, genes and their products in living things that will have some value to people. This inherently involves the identification of biological resources with potential commercial value that may be developed into marketable commodities such as pharmaceuticals, pesticides and cosmetics. Thus these conditions, applied to all permits, in effect prohibit bioprospecting for commercialization or for obtaining patent or intellectual property rights for organisms collected within the Monument.

### **Permit Tracking**

The MMB will track and monitor all permitted activities to evaluate potential impacts to Monument resources. A multiagency-accessible database that records and tracks information on all Monument permits is currently under development. Application and reporting data from all permits will provide information on the nature, extent, and location of activities occurring in the Monument. This information is essential for managers to make informed decisions about evaluating types and locations of activities proposed in the Monument. It also provides necessary information to conduct a geospatial assessment of impacts and to assess cumulative impacts over time. The tracking system will also provide data essential for conducting a threat assessment for the Monument.

### **Need for Action**

The Monument is a vast protected natural area, largely uninhabited by humans, and rich in biodiversity, history, and culture. The NWHI have a history of Native Hawaiian cultural access and practices, as well as protections interspersed with periods of commercial exploitation and military use. With the advent of new technology and dedicated resources, there is increased awareness and interest in the region. Access to the Monument for all activities, with limited exceptions, requires a Monument permit.

The Monument permit program allows for a comprehensive review of proposed activities and will be administered to ensure compliance with Presidential Proclamation 8031, as well as other applicable federal and state laws and regulations. Efforts are ongoing to make the permitting process more efficient for applicants, the MMB, and the public while maintaining safeguards for the ecosystem. The following strategies and activities are designed to ensure that the permit program is refined in accordance with Monument requirements and policies within existing law and that permit data are effectively tracked and collected for management purposes.

### **Strategies to Achieve the Desired Outcome**

Three strategies have been identified to achieve the desired outcome to implement an effective and integrated Monument permit program that manages, minimizes, and prevents negative human impacts by allowing access only for those activities consistent with the purpose of the Monument. The strategies and activities are coded with the letter “P,” for “Permitting.” A summary of strategies and activities is provided in Table 3.4.1 at the end of this action plan.

- P-1: Refine, implement, and improve the permit process to integrate all state and federal regulations into a single permitting process on an ongoing basis.
- P-2: Track and monitor permitted activities and their impacts.
- P-3: Coordinate information, outreach, and education regarding Monument permits and regulations.

### **Strategy P-1: Refine, implement, and improve the permit process to integrate all state and federal authorities into a single permitting process on an ongoing basis.**

The strategy of the Monument permitting program is to integrate the previous three jurisdictionally based permitting programs into one. A joint permit application, application

instructions, and a permit template were approved and implemented (see Appendix A). The permitting program for the Monument allows for a comprehensive review of proposed activities to ensure compliance with the regulatory provisions of the Proclamation as well as other applicable federal and state laws and regulations. Efforts are ongoing to make the permitting process more efficient for both applicants and MMB while maintaining safeguards for the natural, cultural, and historic resources of the Monument.

***Activity P-1.1: Effectively and promptly review permit applications to ensure informed permit-related decisionmaking across Co-Trustee agencies.***

Monument staff serve as the central portal through which all permit inquiries and applications are received and processed. These staff will continue to work together to discuss and coordinate permit assessment and review efforts by each Trustee agency. Monument staff will bring all permits and permit-related issues before the MMB on a regular basis for discussion and decisionmaking.

***Activity P-1.2: Refine and update the permit application, instructions, and permit template through feedback from permittees and other users.***

The permit application was developed with extensive input from legal counsel and the MMB to meet agency requirements. Each year, the permit application, instructions, and template will be evaluated and updated based on lessons learned from the previous year. In addition, feedback from permittees and applicants will be gathered on an annual basis to maintain the most efficient and comprehensible permit program possible.

***Activity P-1.3: Coordinate appropriate environmental review for all permitted activities.***

NEPA, the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.), and Chapter 343, Hawai‘i Revised Statutes (“Environmental Impact Statements”), are planning tools used to integrate environmental concerns into federal and state actions and programs, using environmental quality as the essential component. NEPA requires federal agencies to consider the impacts of their actions on the natural and human environment prior to making final management decisions. Hawai‘i requires additional analysis on state agency actions’ potential impacts on the state’s resources, Native Hawaiian culture, and traditional and customary rights. The issuance of Monument permits requires environmental review compliance in the form of one of three documents: Environmental Impact Statements, Environmental Assessments, or Categorical Exclusions. When state agency actions are involved in a permit, a Cultural Impact Assessment is also required. Currently, the federal Co-Trustees follow their individual agency procedures to ensure appropriate environmental review for all permitted activities. However, the Monument staff, along with the MMB and other Co-Trustee experts, will work to develop an efficient integrated process by which all Co-Trustee agencies can continue fulfilling their respective environmental review requirements and effectively document compliance for every Monument permit.

***Activity P-1.4: Engage outside experts in review of permit applications.***

External reviews of Monument permit applications can provide valuable and unbiased technical evaluations of proposed activities. The MMB utilizes experts to consult on permit applications.

This practice will continue by identifying and engaging a pool of experts trained in Monument-related subject matter including culture, policy, purpose, and proclamation findings.

***Activity P-1.5: Investigate individual and vessel insurance and other avenues to fund mitigation of any damages associated with permitted activities.***

Activities conducted throughout the Monument pose varying degrees of risk to the resources of the Monument. Medical evacuations, vessel groundings, alien species introductions, and hazardous material spills are among the possible scenarios that might be mitigated by some form of insurance. The MMB will develop joint criteria for insurance that may be required before a permit authorizes activities in the Monument.

**Strategy P-2: Track and monitor permitted activities and their impacts.**

Detailed tracking of all permitted activities assists the Monument Co-Trustees in making informed decisions about the types and locations of activities permitted in the Monument. It also provides necessary information to conduct a geospatial assessment of impacts and to assess cumulative impacts over time.

***Activity P-2.1: Develop a Geographic Information System-based permit tracking system.***

The Monument will develop a GIS-based system to track and monitor NWHI permit data to aid enforcement and management decisions. This system and associated data will be established to integrate into the Co-Trustee agencies' individual databases. Each agency will enter and document permit data consistent with the individual agency's requirements. Through data-sharing agreements which are consistent with applicable federal and state laws and confidentiality considerations, the GIS-based tracking system will include partner agency information to ensure a comprehensive portrayal of activities in the region (see the Information Management Action Plan, Section 3.6.2). The MMB will also work together to provide input on cruise dates and locations and shared resources to prevent redundancy (see the Coordinated Field Operations Action Plan, Section 3.6.3).

***Activity P-2.2: Analyze permit data to inform management decisionmaking.***

The extent to which current and future levels of activity in the NWHI have the potential to cause cumulative impacts on the ecosystem is an active area of investigation. To assist in ecosystem-based management decisionmaking, a system will be developed to analyze data generated from each permit application and reporting requirements to provide the insight needed to make informed management choices about appropriate levels and locations of permitted activities. This system will allow Monument Co-Trustees and partners to better understand uses and use patterns in the Monument and to develop methodology for assessing the cumulative impacts caused by various activities. Analyses conducted with these data will also be used to modify reporting requirements and make them more relevant, as well as aiding enforcement and other program area planning efforts. In addition to being used to assess the cumulative impacts of the human activities, the data will also be used in the development of a Monument threat assessment (see EN-2.1).

Special ocean use permits issued as pilot projects will require additional tracking to develop an understanding of how often each category of special ocean use activity occurs in the Monument,

as well as the location of these activities. This information will be used to conduct ecological and socioeconomic evaluations to aid in management decisions on authorizing future special ocean use permits.

***Activity P-2.3: Analyze permit data for patterns of compliance.***

The MMB will regularly review permit files for patterns of compliance, and compliance will be evaluated every two years (see the Enforcement Action Plan, Section 3.4.2). Specifically, the MMB should undertake a technical analysis of the effectiveness and consistency of the permits that were issued compared to the permitting criteria. Permit criteria, permits issued, applications processed, and patterns of use which will be evaluated.

***Activity P-2.4: Develop and implement a Monument reporting process.***

Permits are issued based on regulatory requirements as well as proclamation findings and other criteria established by the MMB to assist with permit reviews. One of those criteria is the submittal of reports. An integrated MMB review of the follow-up process is needed to ensure that reports are complete and submitted on time. Additional follow-up includes recording data, ensuring that the results of research are made available, ensuring the systematic reporting of sustenance fishing, and ensuring adherence to regulations and laws. Follow-up may also require compliance visits from enforcement agents.

**Strategy P-3: Coordinate information, outreach, and education regarding Monument permits and regulations.**

Information, education, and outreach are important aspects of the Monument permitting program. Strategies have been developed to ensure that the public is kept informed of Monument regulations and permit requirements. These strategies are geared toward achieving the highest degree of user compliance and assistance, while fostering a broader public understanding of the NWHI ecosystem and cultural values. Coordination will be conducted across partner agencies to ensure that the public is engaged in and informed of the Monument permitting program. In addition, the MMB has established and will maintain a policy to ensure the public is informed of activities proposed to occur in the Monument.

***Activity P-3.1: Develop and implement a permit and regulatory education program.***

Many of the action plans include educational or outreach activities related to permitting or regulations, such as the Enforcement (Section 3.4.2), Ocean Ecosystems Literacy (Section 3.5.4), Midway Atoll Visitor Services (Section 3.4.3), Native Hawaiian Culture and History (Section 3.1.2), Alien Species (Section 3.3.2), and Maritime Transportation and Aviation (Section 3.3.3) action plans. Monument staff will work together to ensure that the educational activities proposed in these action plans are integrated to provide a consistent and effective message.

***Activity P-3.2: Develop and implement a Native Hawaiian cultural education program for permit applicants.***

The MMB will develop and implement an educational program that can be provided online from the Monument web page, which will educate prospective applicants about the Native Hawaiian culture. Those interested in applying for a Monument permit may complete the educational program before submitting their application for review. This educational program will also provide avenues for

additional knowledge gathering should the applicant wish to delve deeper into the Hawaiian culture and develop a greater understanding of the values of the Monument.

***Activity P-3.3: Coordinate permitting outreach.***

Additional information and outreach will aid interagency permitting efforts and better inform the public about Monument permitting. Information on the permitting process will be posted on Monument websites, including application forms and instructions. This information will reduce delay and confusion for applicants, the public, and agencies as they plan for activities in the Monument. Outreach materials such as presentations, publications, and DVDs will be designed to aid public understanding of agency regulatory and permitting responsibilities. In addition, individual MMB agencies will further exchange information on their roles and responsibilities so that each may better understand and explain permitting requirements.

***Activity P-3.4: Develop a pre-access training and briefing program.***

Pre-access training is an important component of all permitted activities. Pre-access training is required for all those planning to enter the Monument for the first time. Several MMB agencies have formal and informal training mechanisms already in place. Many activities conducted in the Monument will span multiple agencies; thus, the MMB will work with Monument staff to develop a comprehensive pre-access training and briefing program that is appropriate for a variety of activities and locations within the Monument. This training will include information on the proclamation regulations, permit terms and conditions, reporting requirements, the significance of the NWHI to Native Hawaiians, and ways to best conduct activities to reduce human impacts to the natural environment and cultural resources. The training program will build on protocols and materials already in place by FWS, the State of Hawai‘i, and NOAA. For those users who have already undergone pre-access training, shorter update briefings will be developed to ensure that all users have the most up-to-date information on the Monument rules and policies.

***Activity P-3.5: Regularly update the public on proposed and permitted activities.***

The MMB is committed to keeping the public engaged and informed on a regular basis on all proposed and permitted activities that will be conducted in the Monument. To ensure broad dissemination to the public, Co-Trustees will share a single URL address that will be designated as the Monument website. This site will be the location for the public to access information regarding the Monument, including information on the Monument permit program. Information such as lists of permitted activities along with associated permit reports, publications, and productions will be made available or referenced on the Monument website. It will also serve as a primary point of access to notify the public of proposed activities to be conducted in the Monument, as both permit summaries and permit applications will be posted (see Appendix A). As required by the Federal Privacy Act, the privacy of individual applicants will be protected, and all sensitive information will be removed from the permit application prior to public posting. Additional opportunities for the public to be notified and comment on Monument permit applications include:

- Special ocean use permit applications are posted for public notice and comment 30 days prior to the issuance of a permit (Monument regulations, 50 CFR Part 404.11).

- Environmental reviews (e.g., environmental impact statements, environmental assessments, and compatibility determinations) related to Monument permit applications are posted for public comment.
- Monument permit applications that include proposed activities within the state's Northwestern Hawaiian Islands Marine Refuge are posted to the Board of Land and Natural Resources (BLNR) website for 7 days prior to the scheduled BLNR meeting as part of the overall Land Board submittal.

**Table 3.4.1 Summary of Strategies, Activities, and Agency Leads for Permitting**

<b>Strategies and Activities</b>	<b>Agency Lead</b>
<b>Strategy P-1: Refine, implement, and improve the permit process to integrate all state and federal authorities into a single permitting process on an ongoing basis.</b>	
Activity P-1.1: Effectively and promptly review permit applications to ensure informed permit-related decisionmaking across Co-Trustee agencies.	NOAA
Activity P-1.2: Refine and update the permit application, instructions, and permit template through feedback from permittees and other users.	NOAA
Activity P-1.3: Coordinate appropriate environmental review for all permitted activities.	NOAA
Activity P-1.4: Engage outside experts in review of permit applications.	NOAA
Activity P-1.5: Investigate individual and vessel insurance and other avenues to fund mitigation of any damages associated with permitted activities.	
<b>Strategy P-2: Track and monitor permitted activities and their impacts.</b>	
Activity P-2.1: Develop a Geographic Information System-based permit tracking system.	NOAA
Activity P-2.2: Analyze permit data to inform management decisionmaking.	NOAA
Activity P-2.3: Analyze permit data for patterns of compliance.	NOAA

<b>Strategy P-3: Coordinate information, outreach, and education regarding Monument permits and regulations.</b>	
Activity P-3.1: Develop and implement a permit and regulatory education program.	NOAA
Activity P-3.2: Develop and implement a Native Hawaiian cultural education program for permit applicants.	OHA
Activity P-3.3: Coordinate permitting outreach.	NOAA
Activity P-3.4: Develop a pre-access training and briefing program.	NOAA
Activity P-3.5: Regularly update the public on proposed and permitted activities.	NOAA

### 3.4.2 Enforcement Action Plan

#### Desired Outcome

Achieve compliance with all regulations within Papahānaumokuākea Marine National Monument.

#### Current Status and Background

The three principal entities with responsibility for managing lands and waters of the Monument—NOAA, FWS, and the State of Hawai‘i—are working cooperatively to administer Monument policies and regulations. This role and the relationships among the three Co-Trustees are further described in a Memorandum of Agreement among the Co-Trustees that provides the general terms and conditions under which they will cooperate. Particular to enforcement activities, the Memorandum of Agreement directs the cooperating agencies to coordinate research and monitoring efforts to better understand and address major threats to Monument resources; to provide access and support for enforcement purposes; share enforcement resources and data, as appropriate; and develop joint enforcement capabilities as needed to ensure compliance with applicable state and federal laws. It also gives the agencies the ability to develop additional interagency agreements, grants, memoranda of understanding, or other appropriate instruments that allow for ease in sharing resources, including funds as appropriate, and a sharing of in-kind assistance and support—such as the sharing of vessel time, aircraft missions, or other logistical support—as a means of facilitating cooperation.

3.5.1	Agency Coordination
3.5.4	Ocean Ecosystems Literacy
3.6.2	Information Management

Links to goals
Goal 1
Goal 2
Goal 3

In addition to the federal and state laws in place prior to the establishment of the Monument, NOAA and FWS promulgated joint regulations (50 CFR Part 404, see Appendix D) that implement the provisions of the President’s Proclamation. These regulations were issued under NOAA and FWS statutory authorities.

#### Need for Action

The size and remote location of the NWHI present challenges to enforcement. The Monument is the largest conservation area under U.S. jurisdiction. An effective law enforcement program is needed to protect and conserve Monument resources. The primary aim of the Monument enforcement program is for the jurisdictional partners to achieve resource protection by gaining compliance with all applicable laws and regulations. Increased law enforcement capacity will move agency partners toward more effective enforcement of all federal and state rules that protect the Monument’s resources.

Managers and law enforcement personnel must work together to prioritize and initiate appropriate activities that will have the greatest impact. Depending on the complexity and breadth of a particular enforcement activity, a single agency may not have the manpower or other resources to commit to the effort. Opportunities to efficiently and economically accomplish priority enforcement activities in the Monument must be optimized.

All activities within the Monument, with the limited, specific exceptions discussed in the Permitting Action Plan (Section 3.4.1), require a permit. In addition, all activities within the Monument, including the transit of vessels, present varying degrees of threat to Monument

resources and varying potential for noncompliance with Monument rules and regulations. To increase voluntary compliance, outreach tailored to address these threats will be emphasized. Informing the permitted and potential users, as well as the general public, about the Monument resource threats and the regulations in place to protect them is important to ensure responsible behavior before resources can be adversely impacted.

### **Strategies to Achieve Desired Outcome**

Effective law enforcement is an essential component to fulfill the overall management vision to protect Monument resources. The enforcement of regulations in the remote Monument can be difficult and time consuming. Natural barriers to law enforcement, such as remoteness and distance from operating bases, must be overcome.

Enforcement capabilities utilized to monitor activity and detect violations within the Monument will include traditional strategies such as patrols by vessel and aircraft. However, the application of emerging technologies will also be necessary to assure the comprehensive coverage of this vast area. Though Vessel Monitoring Systems (VMS) are currently being utilized, the potential use of other technological capabilities such as satellite based surveillance, remote sensors, or use of unmanned aircraft (drones) will need to be researched further to determine if such use is practical and feasible, and if so, how they may be used.

VMS are prevalent in commercial fisheries and are required to be carried by all vessels permitted to operate in the Monument. VMS is useful to monitor the locations and travel of vessels so equipped; however, to assure viable deterrence and compliance, it is important to establish the capacity to intercept and make at-sea contact with vessels actively engaged in activities that constitute a violation, particularly those not equipped with VMS that cannot be tracked or monitored remotely. This is an area that will rely upon an enforcement partner, the U.S. Coast Guard, to play a key role.

Outreach is an essential part of any law enforcement program. Community Oriented Policing and Problem Solving (COPPS), also referred to as “interpretive enforcement,” is a key component to the Monument law enforcement strategy. The goal is to inform Monument users and the general public about the regulations and allowed activities, as well as educate them about the detrimental effects of illegal activities on Monument natural, cultural, and historic resources and the surrounding environment. This goal can be accomplished through focused workgroups with regular and potential permit applicants, public forums, printed materials, interpretive signs, displays, and public service announcements.

This action plan contains three management strategies to achieve the desired outcome of achieving compliance with all regulations within the Monument. The strategies and activities are coded by the abbreviation for the action plan title, “Enforcement” (EN). A summary of strategies and activities is provided in Table 3.4.2 at the end of this action plan.

- EN-1: Increase law enforcement capacity and integration over the life of the plan.
- EN-2: Implement a threat-based detection and monitoring program within 2 years.
- EN-3: Develop and implement a multiagency COPPS/interpretive enforcement program within 2 years.

**Strategy EN-1: Increase law enforcement capacity and integration over the life of the plan.**

This strategy undertakes the activities required to increase the capacity (i.e., quantity and quality of services) of the law enforcement agencies, promote cooperation among these agencies, and build on existing resources to execute an integrated law enforcement program in the Monument.

Standard operating procedures will increase the efficiency of law enforcement activities and may include monitoring responsibilities, coordinating response to intelligence handling of possible violations, standardizing communications, and reporting activities.

***Activity EN-1.1: Charter a Monument law enforcement working group.***

A successful Monument law enforcement program must have active involvement and oversight by each of the law enforcement agencies that have responsibilities in the NWHI. The primary law enforcement team entities for the Monument are NOAA Office of Law Enforcement, NOAA Office of General Counsel for Enforcement & Litigation, FWS Office of Law Enforcement and National Wildlife Refuge System Law Enforcement, U.S. Attorneys, U.S. Coast Guard, and Hawaii DLNR - Division of Conservation and Resource Enforcement, Hawaii Attorney General's Office. Numerous other agencies have enforcement authority and will be consulted as appropriate. Staff from these agencies, primarily credentialed law enforcement officers, will form the Monument law enforcement group. The group will meet regularly to (1) coordinate enforcement-related tasks for each agency in support of this plan, (2) develop operating protocols, and (3) assist in evaluating the overall effectiveness of law enforcement efforts.

***Activity EN-1.2: Develop necessary interagency agreements.***

Effective law enforcement in the Monument would be enhanced by the establishment of formal agreements between law enforcement agencies. At the national level, NOAA and FWS share agreements on enforcement. Cooperative enforcement agreements at a regional level would allow law enforcement officers of partner agencies to enforce statutes under each other's authorities. The MMB will discuss opportunities to formalize Coast Guard support through a memorandum of agreement or other means. Officers of partner agencies can be dedicated to Monument efforts with appropriate funding. For the most effective use of scarce resources on the part of all agencies, law enforcement officers should seek ways to maximize collaboration.

***Activity EN-1.3: Develop an integrated law enforcement training program.***

Training courses will be conducted by Monument staff to ensure that all law enforcement personnel have the most up-to-date information, including environmental education and Native Hawaiian cultural practices. Enforcement personnel must understand the environmental consequences that could occur as a result of violations. In addition, environmental training will enhance the ability of these officers to provide outreach.

***Activity EN-1.4: Assess Monument law enforcement capacity and program effectiveness.***

The Monument law enforcement working group will assess the effectiveness of ongoing law enforcement activities, including analyzing efforts to determine if there are any "hot spots" that require focus. On an annual basis, the group will present a formal briefing to the MMB on

ongoing and planned activities, consider new technologies, and discuss potential opportunities for new personnel and sharing law enforcement resources.

***Activity EN-1.5: Increase law enforcement capacity on Midway Atoll within two years.***

As a predicted hub of activity for the Monument and the site of the only authorized recreational activities, Midway Atoll will be a major access point into the Monument. Presence of credentialed officers at Midway Atoll is necessary to ensure visitor and staff safety, regulatory compliance, and enforcement. Midway is unique in that it is located outside the State of Hawai‘i and, as such, regulations are in place to direct public civil obedience (50 CFR Part 38).

**Strategy EN-2: Implement a threat-based detection and monitoring program within 2 years.**

Before surveillance resources can be effectively deployed Monument-wide, law enforcement agencies should accurately assess current existing threats. Threats to be assessed include the potential for regulatory violations as well as the potential for resource damage. Once threats are well described, the law enforcement agencies can orient detection and monitoring activities toward the highest-priority areas. Traditional surveillance methods (aircraft and vessel patrols), electronic sensors (land and satellite-based), and automated monitoring (VMS) should be implemented immediately, where needed, to detect violations and resource threats. If needed, expansion of the program to include high-tech and emerging remote surveillance technologies (e.g., unmanned aerial vehicles) may bring long-term cost savings.

***Activity EN-2.1: Conduct a comprehensive threat assessment and draft an enforcement plan.***

It is important to analyze the level and types of activities occurring throughout the Monument, and then assess the potential for violations and threats to Monument resources. Multiple sources of information should be accessed to analyze vessel and activity patterns. The MMB has already initiated a threat assessment in late 2007 that will continue through 2008 and will include cost-benefit analyses of applicable technologies and solutions. The Monument law enforcement working group will collaborate on this threat assessment and subsequent enforcement plan. The plan will identify effective means of coordination, opportunity for further collaboration and efficient use of limited resources.

***Activity EN-2.2: Operate a Vessel Monitoring System for all permitted vessels.***

A mandatory monitoring system for all permitted vessels was identified as one of the most critical components of a successful law enforcement program in the NWHI. NOAA Office of Law Enforcement will maintain and operate a VMS to monitor compliance with Monument regulations (50 CFR Part 404).

***Activity EN-2.3: Integrate additional automated monitoring systems and ship reporting systems for all vessels transiting the Monument.***

Existing automated monitoring and ship reporting systems will be utilized for vessels transiting the monument and that are so equipped. Many “larger” vessels are required to carry and utilize Automated Identification Systems. As mandated through the Maritime Transportation Security Act, the use of Automated Identification Systems is required on all commercial vessels longer than 65 feet. As Coast Guard and Naval researchers develop and expand the systems to collect,

manage (sort), and distribute this information through shore based and satellite technologies, its use may be an effective tool to monitor ship traffic within and around the monument.

***Activity EN-2.4: Increase available platforms to support law enforcement.***

On-the-water presence will help to ensure that users of Monument resources are deterred from willful or inadvertent violations and will place law enforcement personnel in a better position to respond to violations and other resource emergencies. Because of the remoteness of this area, increased aerial and ship-based resources, both for surveillance and for response, are needed. The Monument law enforcement working group will identify existing platforms that could be used if deemed necessary to increase enforcement, surveillance, and response; as well as to develop proposals to acquire new assets if feasible.

**Strategy EN-3: Develop and implement a multiagency COPPS/interpretive enforcement program within 2 years.**

COPPS and interpretive enforcement are approaches that seek voluntary compliance with Monument regulations, primarily through education of users about existing regulations, why and how they apply, and how users can play a role in protecting Monument resources. The primary objectives of interpretive law enforcement are to protect Monument resources by increasing the public's understanding of the importance of Monument regulations and to inform the public through educational messages and literature about responsible behavior. On-site methods will be used to reach the public with educational messages. For example, Monument enforcement officers will deliver interpretive programs both onsite and in the main Hawaiian Islands, targeting specific user groups. Reaching out to the community through educational messages and literature is a cost-effective, prevention-oriented measure to reduce the number of violations and foster a sense of stewardship among Monument users.

***Activity EN-3.1: Integrate regulations briefings into pre-access training required for all Monument users.***

As part of pre-access briefings for all users of the Monument, training programs will be developed to inform users of regulations, permit requirements, and best management practices. Working closely with partner agencies and in consultation with the NWHI enforcement group, specific information on all applicable laws will be developed for these workshops. Workshop materials will include videos, printed materials, and presentations (see the Permitting Action Plan, Section 3.4.1, and Alien Species Action Plan, Section 3.3.2).

**Table 3.4.2 Summary of Strategies, Activities, and Agency Leads for Enforcement**

<b>Strategies and Activities</b>	<b>Agency Lead</b>
<b>Strategy EN-1: Increase law enforcement capacity and integration over the life of the plan.</b>	
Activity EN-1.1: Charter a Monument law enforcement working group.	NOAA
Activity EN-1.2: Develop necessary interagency agreements.	NOAA
Activity EN-1.3: Develop an integrated law enforcement training program.	NOAA
Activity EN-1.4: Assess Monument law enforcement capacity and program effectiveness.	NOAA
Activity EN-1.5: Increase law enforcement capacity on Midway Atoll within 2 years.	FWS
<b>Strategy EN-2: Implement a threat-based detection and monitoring program within two years.</b>	
Activity EN-2.1: Conduct a comprehensive threat assessment and draft an enforcement plan.	NOAA
Activity EN-2.2: Operate a Vessel Monitoring System for all permitted vessels.	NOAA
Activity EN-2.3: Integrate additional automated monitoring systems and ship reporting systems for all vessels transiting the Monument.	NOAA
Activity EN-2.4: Increase available platforms to support law enforcement.	NOAA
<b>Strategy EN-3: Develop and implement a multiagency COPPS/interpretive enforcement program within two years.</b>	
Activity EN-3.1: Integrate regulations briefings into pre-access training required for all Monument users.	NOAA

### 3.4.3 Midway Atoll Visitor Services Action Plan

#### Desired Outcome

Offer visitors opportunities to discover, enjoy, appreciate, protect, and honor the unique natural, cultural, and historic resources of Papahānaumokuākea Marine National Monument.

Links to other Action Plans	
3.4.1	Permitting
3.5.2	Constituency Building and Outreach
3.5.4	Ocean Ecosystems Literacy
3.6.3	Coordinated Field Operations

#### Current Status and Background

Since 1995, FWS has been strongly committed to welcoming visitors to Midway Atoll. This island is the first and only remote NWR in the Pacific to provide the general public with an opportunity to learn about and experience these unique ecosystems. With the establishment of the Monument, Midway Atoll takes on the additional role of providing a “window” so that visitors can learn about and enjoy a small portion of the largest fully protected marine managed area in the world.

Links to Goals
Goal 3
Goal 4
Goal 5
Goal 7
Goal 8

A regularly scheduled visitor program operated on Midway Atoll from 1995 until early in 2002, but ended when the FWS cooperator left the atoll. Since then, visitors have arrived almost exclusively by the occasional cruise ship or sailboat, or for a Battle of Midway commemorative event. In May 2007, the FWS approved an interim visitor services plan to guide a small-scale visitor program on Midway Atoll until the Monument Management Plan is completed. In January 2008, a regularly scheduled visitor program began, offering limited opportunities for people to experience Midway’s wildlife and history.

As part of the interim visitor services plan and in accordance with the National Wildlife Refuge System Administration Act of 1966, the following wildlife-dependent recreational uses were determined to be compatible at Midway Atoll Special Management Area and National Wildlife Refuge: wildlife observation and photography, environmental education and interpretation, and participatory research. Hunting and fishing, which normally are given priority on national wildlife refuges if they are determined to be compatible, will not take place at Midway Atoll. All animal species are protected by law or occur in numbers too low for harvest to allow hunting opportunities. Recreational fishing is precluded under the Presidential Proclamation designating the Monument. Additional compatibility determinations allow for nonwildlife-dependent beach use activities such as swimming and volleyball, nonadministrative airport operations, limited outdoor sports such as bicycling and jogging, and amateur radio use.

Each compatibility determination includes stipulations necessary to ensure protection of Midway’s natural, cultural, and historic resources. These compatibility determinations are valid for 15 years for wildlife-dependent visitor activities and ten years for nonwildlife-dependent activities.

Any additional activities that may be proposed within Midway Atoll NWR would need to be evaluated through the compatibility determination process with formal public review. Activities that are determined to be compatible are authorized through the issuance of Monument permits, which fall within six permit types: conservation and management, research, education, Native Hawaiian practices, special ocean uses, and recreation. The permitting process is discussed in Section 3.4.1, the Permitting Action Plan.

Some strategies and activities outlined in the Midway Atoll Visitor Services Plan are included within other action plans; see the Ocean Ecosystems Literacy (Section 3.5.4), Constituency Building and Outreach (Section 3.5.2), and Coordinated Field Operations (Section 3.6.3) action plans.

Visitors spend part of their time on Midway helping to restore wildlife habitat.

### **Need for Action**

Since the Interim Visitor Services Plan was designed to be in effect only until a Monument Management Plan was completed, this action plan addresses a longer-term visitor services program for Midway Atoll. The interim program was initiated in January 2008, so only minimal updates are included in the Midway Atoll Visitor Services Plan (Appendix B).

The Co-Trustees remain committed to offering a high-quality, small-scale visitor program at Midway Atoll as a “window” to the Monument. The aim is that by physically experiencing the Northwestern Hawaiian Islands, visitors will return home with a personal connection and a commitment to protecting and conserving the Monument’s unique resources.

### **Strategies to Achieve the Desired Outcome**

The Midway Atoll Visitor Services Plan includes numerous detailed activities that constitute the visitor program. Since the reinitiated program is only a few months old, the MMB will be monitoring the program and adapting it as necessary to ensure protection of natural, cultural, and historic resources and visitor safety, accessibility under the Americans with Disabilities Act (ADA), and satisfaction. The strategies and activities are coded by the acronym for the action plan title, “Visitor Services Action Plan” (VS). A summary of strategies and activities is provided in Table 3.4.3 at the end of this action plan.

- VS-1: Implement the Midway Atoll Visitor Services Plan, providing visitor opportunities for up to 50 overnight guests at any one time.

- VS-2: Assess the level of visitor satisfaction, financial stability of the program, staffing needs, and program structure, resulting in recommendations for improvement beginning in 2009 and biennially thereafter.

**Strategy VS-1: Implement the Midway Atoll Visitor Services Plan, providing visitor opportunities for up to 50 overnight guests at any one time.**

The Midway Atoll Visitor Services Plan extends the interim visitor program that was reinitiated on a regular schedule in January 2008. Most of the same restrictions and stipulations identified in the interim plan have been carried over into this longer-term plan. In light of infrastructure limitations and to ensure a quality program, the maximum number of overnight visitors will be limited to no more than 50 people at any one time; because of transportation availability, that number generally will be from 15 to 30 people. This number of visitors may be exceeded for short-duration prearranged visits (less than one day) by ocean vessels or aircraft.

***Activity VS-1.1: Provide visitors with opportunities for wildlife-dependent recreation to enhance their knowledge and appreciation of the Monument's natural resources.***

As outlined in the Midway Atoll Visitor Services Plan, visitors will be offered opportunities for guided interpretive tours, wildlife photography, snorkeling, diving, kayaking, and self-guided walks. At few other places in the world can visitors be so totally surrounded by wildlife. Midway's seabirds have little fear of humans, and visitors are offered opportunities to observe and photograph them from the time they arrive until they leave. More sensitive species, such as the Hawaiian monk seal and green turtle, are observed from a distance to ensure they are not disturbed. Snorkeling and diving will allow visitors a glimpse of the Monument's magnificent coral reefs and their inhabitants. The focus of all activities will be educational in nature, and visitors will be encouraged to share their experiences and knowledge when they return to their homes to develop a broader constituency for the Monument.

***Activity VS-1.2: Provide visitors with opportunities to learn about and appreciate the Monument's cultural and historic resources.***

Visitors will be offered guided interpretive tours, self-guided walks, interpretive exhibits, and written materials that focus on Midway's and the Monument's distinguished human history. In establishing the Battle of Midway National Memorial, FWS was charged with helping others keep knowledge of this important battle alive for future generations. Numerous historic structures on Midway Atoll were present during World War II and serve as reminders of the heroic courage of the men who risked their lives in the midst of the Pacific and turned the tide of the war.

Because it serves as the "window" to the Monument, it is important that interpretation at Midway be broadened to include information about the Northwestern Hawaiian Islands' importance in Native Hawaiian culture. Interpretive exhibits will be developed to reflect all of Midway's "eras," from prerecorded history to Polynesian and Western contact, to shipwrecks and the Commercial Pacific Cable Company days, the Pan American Flying Clipper period, the Battle of Midway, and on through the Cold War and Vietnam conflicts. Additional exhibits will focus on the cultural and historic sites throughout the NWHI, such as the archaeological remains at Nihoa and Mokumanamana and submerged resources throughout the NWHI.

To the extent possible, remnants of these eras will be interpreted as they exist on Midway. To ensure all cultural and historic resources are included in the story, one of the historic buildings on Sand Island will be restored to house a permanent museum and library that will be available to all visitors.

***Activity VS-1.3: Continuously monitor the impacts of visitors and other users on wildlife and historic resources to ensure their protection.***

Monument staff will monitor the impacts of visitors and other users on wildlife and historic resources to ensure continuing compatibility, as required by Monument and FWS policies. Monitoring methodology to assess impacts on seabirds, Hawaiian monk seals, sea turtles, corals, and fishes has been developed based on previous work on other refuges and protected areas and is included in the Midway Atoll Visitor Services Plan. The visitor program supervisor, in consultation with FWS and NOAA Cultural Resources Program staffs, monitors impacts on historic resources.

Based on FWS experience from 1996 to 2002, when up to 100 overnight visitors were allowed on Midway at any one time, few impacts are anticipated as long as visitors comply with Refuge and Monument rules and regulations.

**Strategy VS-2: Assess the level of visitor satisfaction, financial stability of the program, staffing needs, and program structure, resulting in recommendations for improvement beginning in 2009 and biennially thereafter.**

A more regularly scheduled visitor program resumed operation on Midway Atoll in January 2008 during development of this Monument Management Plan. After gathering approximately one year of experience and data, Monument staff will be in a better position to make recommendations to improve the program.

***Activity VS-2.1: Monitor visitor satisfaction surveys completed by outgoing visitors, adjusting activities, facilities, and maintenance schedules as appropriate on a monthly basis.***

The FWS contractor has designed and implemented a visitor satisfaction survey to be completed as visitors depart Midway Atoll. These questionnaires provide valuable insight into how the visitor program could be improved, as well as providing practical information such as room maintenance needed. The information is compiled on a monthly basis and provided to the refuge manager for appropriate action.

***Activity VS-2.2: Convene a team of visitor services specialists and Midway Atoll staff to review the visitor program on a biennial basis.***

Beginning in March 2009, the team will conduct a visitor services requirements evaluation to assess whether the visitor program is meeting the standards outlined in the Visitor Services Plan, as well as the purposes and goals of the Refuge and Monument, and provide recommendations to management based on their evaluation. The team will also review the results of monitoring visitor activities for impacts to wildlife and historic resources, review financial information relevant to the visitor program to assess the need to adjust visitor fees, and make recommendations on the program's financial stability, including staffing and facility needs.

***Activity VS-2.3: Based on the assessment above, seek funding, authority, or other needs to implement the recommendations for improvement.***

Depending on the results of the visitor services evaluation, steps will be taken to implement improvements to the visitor program. Possible improvements could include revisions to the Midway Atoll Visitor Services Plan, facility improvements, additional staffing, changes in fee structure, changes to visitor activities or stipulations associated with them, or new implementation structures (such as working through a concessionaire).

**Table 3.4.3 Summary of Strategies, Activities, and Agency Leads for Midway Atoll Visitors Services**

Strategies and Activities	Agency Lead
<b>Strategy VS-1: Implement the Midway Atoll Visitor Services Plan, providing visitor opportunities for up to 50 overnight guests at any one time.</b>	
Activity VS-1.1: Provide visitors with opportunities for wildlife-dependent recreation to enhance their knowledge and appreciation of the Monument's natural resources.	FWS

## **3.5 Coordinating Conservation and Management Activities**

---

### **3.5.1 Agency Coordination Action Plan**

### **3.5.2 Constituency Building and Outreach Action Plan**

### **3.5.3 Native Hawaiian Community Involvement Action Plan**

### **3.5.4 Ocean Ecosystems Literacy Action Plan**

---

### 3.5 Coordinating Conservation and Management Activities

Many government agencies and nongovernmental organizations work in close coordination with the MMB to achieve Monument goals. Implementation of action plans relies on resources and efforts from a variety of partners. The Co-Trustees and the MMB generally have a high level of involvement for most action plans, while other governmental agencies and nongovernmental organizations will contribute to action plans at varying levels. As Monument projects develop, more organizations will likely be involved. Section 2, Management Framework, and Section 3.5.1, the Agency Coordination Action Plan, provide discussions on the importance of collaboration and partnerships in effectively achieving Monument goals.

Participation by a broad sector of the public is also essential to any successful system of governance (Creighton 1981). The NWHI face an array of complex issues and competing interests. Public input into the decisionmaking process can help ensure that those interested are fairly represented and a strong base of support is built. Without a forum for participation and collaboration, disputes can linger and resources degrade (Pew 2003).

Working together, the MMB will adopt a three-part approach to coordinate management of the Monument. Each part is integral to the success of the whole: (1) agency coordination, which is essential to foster stewardship that takes ecosystem effects into account, (2) involvement of stakeholders, and (3) a strong program of education and outreach to build community support for ecosystem conservation.

Responsibility for management of the Monument is shared by the Co-Trustees. Stakeholders include Native Hawaiians, researchers, educators, conservation groups, fishers, and others. Collaborative management mechanisms are needed to facilitate effective interagency coordination for management and to provide opportunities for active stakeholder participation and input from community forums and various partnerships, and specifically from the Native Hawaiian community.

Action plans to facilitate collaboration and partnerships in the management of the NWHI focus on providing the operational framework to enhance interagency coordination and to provide broad stakeholder involvement in managing the NWHI. Each action plan consists of a set of strategies to address a desired outcome. The desired outcomes of these action plans are as follows:

- **Agency Coordination:** Successfully collaborate with government partners to achieve publicly supported, coordinated management in Papahānaumokuākea Marine National Monument.
- **Constituency Building and Outreach:** Cultivate an informed, involved constituency that supports and enhances conservation of the natural, cultural, and historic resources of the Papahānaumokuākea Marine National Monument
- **Native Hawaiian Community Involvement:** Engage the Native Hawaiian community in active and meaningful involvement in Papahānaumokuākea Marine National Monument management.

- **Ocean Ecosystems Literacy:** Cultivate an ocean ecosystems stewardship ethic, contribute to the nation's science and cultural literacy, and create a new generation of conservation leaders through formal environmental education.

Action plans described in this section will be implemented in close coordination with agency partners and in conjunction with other priority management needs.

### 3.5.1 Agency Coordination Action Plan

#### Desired Outcome

Successfully collaborate with government partners to achieve publicly supported, coordinated management in Papahānaumokuākea Marine National Monument.

Links to other Action Plans	
3.3.1	Permitting
3.3.2	Enforcement
3.5.3	Coordinated Field Operations

#### Current Status and Background

The NWHI has had a long history of multiagency coordination as a result of the divided responsibilities among several management agencies over the past 100 years (Shallenberger 1984). The Navy assumed jurisdiction over Midway Atoll in 1903. In 1909, President Theodore Roosevelt signed Executive Order 1019 to create the Hawaiian Islands Reservation, and management responsibility was given to the U.S. Department of Agriculture; the reservation was later renamed the Hawaiian Islands National Wildlife Refuge and managed under the authority of the FWS. On February 10, 1936, President Franklin Roosevelt set aside Kure Island to the U.S. Navy by Executive Order 7299. Sixteen years later, President Harry Truman “restored” “Kure (Ocean) Island, together with the surround reef, ... to the possession, use, and control of the Territory of Hawaii” (Executive Order 10413, November 17, 1952). The Hawaii Organic Act and the Hawaii Admission Act gave the Territory of Hawai‘i responsibility for nearshore waters of the NWHI, excluding Midway. In 1988, Midway Atoll was designated a National Wildlife Refuge. Under federal law, NOAA Fisheries is responsible for the management of monk seals, as well as for sea turtles when they are in marine waters; FWS is responsible for the management of sea turtles when they are on land. The State of Hawai‘i also has jurisdiction over these species under state wildlife and endangered species laws. NOAA’s National Ocean Service, through the National Marine Sanctuary Program, joined the jurisdictional players in December 2000, when Executive Order 13178 (as amended by 13196) created the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve (adapted from Shallenberger 2004).

Links to Goals
Goal 1
Goal 2
Goal 4

Several innovative programs involving federal, state, and private entities have resulted in cooperative efforts to protect and restore natural, cultural, and historic resources in the NWHI. Notable examples include the following:

- The creation of a State Marine Refuge in the NWHI in 2005.
- Several multiagency collaborative research efforts under the Northwestern Hawaiian Islands Reef Assessment and Monitoring Program, conducted since 2000.
- Collaborative educational partnerships, including Navigating Change, Hawai‘i’s Living Reef program, and outreach for the 2002 and 2004 Northwestern Hawaiian Islands Research and Monitoring Program efforts.
- A multiagency collaborative process to establish a regional research forum and to identify regional research and science priorities.
- The NWHI Third Scientific Symposium (2004).
- A regional collaboration that led to the identification of several maritime archaeology and history sites.
- A process to identify opportunities for collaborative permitting and enforcement efforts.
- Development of a unified permitting system for the Monument.

- Critically needed multiagency marine debris removal efforts, ongoing since 1996.
- Collaborative support of Hawaiian monk seal and green turtle recovery and field camps.

Coordination of Monument resource management is overseen by the Co-Trustee agencies, while day-to-day management is implemented by the MMB, as described in Section 2. However, several other federal agencies, including the U.S. Coast Guard, U.S. Geological Survey, EPA, and DOD and various state agencies have roles to play in the Monument, including helping to implement the various strategies and activities in the Monument Management Plan. They could be part of the larger Interagency Coordinating Committee (ICC). Coordination among all parties with regulatory and management responsibilities is crucial to successful Monument operations. The ICC is further described in Section 2.2.

### **Need for Action**

The creation of the Papahānaumokuākea Marine National Monument in 2006 offers a unique opportunity to carry out coordinated management across multiple federal and state agencies to achieve strong, long-term protection of the NWHI. While management of the Monument is the responsibility of the three Co-Trustees, as described in Proclamation 8031, many important government partners also have missions that are affected by and may affect Monument management strategies. Collaboration with all government stakeholders is essential, which is why the MMB and the ICC were established. The unique biological, cultural, scientific, educational, historic, and recreational values of the NWHI require that the region be carefully managed to ensure these values are not diminished for future generations. This action plan presents strategies and activities for facilitating interagency coordination to successfully collaborate with government partners in the NWHI.

### **Strategies to Achieve the Desired Outcome**

Agency coordination in the remote Monument ecosystems is essential to the lasting protection of ecosystems and resources. To achieve the desired outcome of publicly supported coordinated management, three strategies have been developed. The strategies and activities are coded by the acronym for the action plan title, “Agency Coordination” (AC). A summary of strategies and activities is provided in Table 3.5.1 at the end of this action plan.

- AC-1: Ensure effective communications and procedural operations of the MMB.
- AC- 2: Establish and support cooperative management agreements with agency partners.
- AC-3: Promote international, national, and local agency collaborations to increase capacity building and foster networks that will improve management effectiveness.

### **Strategy AC-1: Ensure effective communications and procedural operations of the MMB.**

The MMB was established by the Co-Trustee MOA in 2006 (see Section 2, Management Framework). The MMB is charged with promoting coordinated management of the Monument at the field level and implementing day-to-day management activities necessary to achieve strong, long-term protection of the NWHI for current and future generations. Working across multiple agencies can present a challenge to management if clear and effective procedures are not established.

***Activity AC-1.1: Establish standard operating procedures, as needed, to provide direction and improve communication within the MMB.***

Standard operating procedures are often necessary to facilitate consistent implementation and ensure that processes are continued and completed on a prescribed schedule. They also serve as a historical record of steps taken and a basis for revising the steps when changes to the process are proposed. In order to ensure that unwritten knowledge and skills do not disappear when positions are filled with new staff, standard operating procedures for the MMB will be written and properly maintained. Standard operating procedures will be developed and included in the interagency MMB charter that will guide the operations of the MMB. These procedures will be reviewed on a regular basis and updated as necessary.

**Strategy AC-2: Establish and support cooperative management agreements with agency partners.**

The MOA signed in 2006 by the State of Hawai‘i, the DOI, and the DOC promotes coordinated management of the Monument and establishes the functional relationships to effectively coordinate on all management actions. This agreement serves as the foundation for entering into other agreements among the Co-Trustees and with agencies and other entities, as appropriate. Formal partnerships and agreements will be developed with essential agency partners who can help provide comprehensive protection for the ecosystems and resources of the NWHI. The MMB will explore the potential of developing new agreements, including the possibility of amending the 2006 MOA to increase Native Hawaiian involvement in the management of the Monument.

***Activity AC-2.1: The MMB will explore the potential of developing new agreements, including the possibility of amending the 2006 MOA to increase Native Hawaiian involvement in the management of the Monument.***

The Native Hawaiian voice is missing at the Co-Trustee level under the MOA signed in 2006 for the coordinated management of Papahānaumokuākea, which is precious and sacred to Native Hawaiians. The MMB will explore the potential of developing new agreements, including the possibility of amending the 2006 MOA to increase Native Hawaiian involvement in the management of the Monument. If it is determined that the 2006 MOA should be amended to include a Native Hawaiian governmental organization as a signatory party, the Office of Hawaiian Affairs could fill the position of the fourth Co-Trustee until a Native Hawaiian governing entity is re-established to assure that the cultural significance of Papahānaumokuākea is given as much importance as is noted in Presidential Proclamation 8031.

***Activity AC-2.2: Establish agreements for coordinated management and conduct cooperative management operations.***

Building on the MOA signed in 2006 and any subsequent amendments, new agreements will be developed among the MMB to support collaborations that facilitate coordinated management. Such agreements will specify roles, responsibilities, and periodic reviews. Opportunities for interagency collaboration may include personnel agreements and crosscutting budget initiatives to promote coordinated management and effective implementation of strategies identified in the action plans. The MMB will work together to establish priorities and initiate joint activities.

***Activity AC-2.3: Develop interagency agreements, grants, and memoranda of agreement as needed to carry out specific program priorities.***

Cooperative projects will be pursued with agencies outside of the MMB that allow for ease in sharing resources and in-kind assistance and support, as appropriate. Efforts will continue to coordinate with and support the ICC. Formal agreements required for specific program areas will be developed as needed. Collaborative agency efforts that may benefit from formal and other informal agreements are described in the following action plans: Alien Species (Section 3.3.2), Coordinated Field Operations (Section 3.6.3), Emergency Response and Natural Resource Damage Assessment (Section 3.3.4), Enforcement (Section 3.4.2), Threatened and Endangered Species (Section 3.2.1), Information Management (Section 3.6.2), Maritime Heritage (Section 3.1.4), Marine Debris (Section 3.3.1), Permitting (Section 3.4.1), and Habitat Management and Conservation (Section 3.2.3).

***Activity AC-2.4: Convene Interagency Coordinating Committee meetings, including an annual workshop.***

The ICC is an important venue for state and federal agencies to share information about the Monument's natural and cultural resources and their activities in and around the Monument. This venue also provides an opportunity to facilitate agency coordination and collaboration on implementing the various MMP strategies and activities. The MMB is committed to organizing and supporting periodic ICC meetings to improve coordination and information exchange and as necessary to discuss and resolve interagency issues. An annual interagency strategic planning workshop will be conducted with the ICC to discuss previous year activities and align planned activities and priorities. Gaps and additional needs will be identified along with strategies to address them. (See the Evaluation Action Plan, Section 3.6.4)

**Strategy AC-3: Promote international, national, and local agency collaborations to increase capacity building and foster networks that will improve management effectiveness.**

Collaborations at the international, national, and local levels are needed to promote information sharing, relationship building, and adaptive use of management tools for conservation and resource management. These partnerships can provide a regional and global context to better understand the significance of traditional knowledge in resource management, the need for scientific and cultural research, and the development of management models that could be applied to the Pacific and beyond.

***Activity AC-3.1: Enhance communication and cooperation with the U.S. Department of Defense and the U.S. Navy Pacific Fleet.***

Through the ICC and other forums, the MMB will maintain open communication with the DOD and the Navy on potential areas of cooperation, including enforcement; minimizing adverse impacts on Monument resources and qualities; support of zoning, permitting, and tracking programs; and regional and local restoration and wildlife protection efforts.

***Activity AC-3.2: Network with other marine protected areas in the Pacific.***

The MMB will foster and promote relationships with the marine protected area managers and constituents in Hawai'i and the Pacific that face impacts of climate change, enforcement,

surveillance, and other challenges common to coral reef ecosystem management. Through such regional collaboration, participating organizations could share information on subjects such as coordinated management plan development, mitigation and response strategies to deal with climate change, enforcement, incorporating traditional knowledge, research, and outreach about the importance of coral reef ecosystems to the world. Networking with other marine protected areas in the Pacific is essential for promoting collaborations and to establish the role of the Pacific in the overall global context of marine conservation. Efforts will also be made to promote exchanges within the Pacific Region to an international audience.

**Activity AC-3.3: Support the bid for World Heritage Site status.**

In 2007, the Monument was included on the new U.S. World Heritage Tentative List as a site within the United States for outstanding universal value for both its natural and cultural heritage. The U.S. Tentative List was submitted to the UNESCO World Heritage Center for consideration in February 2008. The MMB will continue to support the bid for World Heritage designation across agencies to ensure a high level of communication and coordination.

**Table 3.5.1 Summary of Strategies, Activities, and Agency Leads for Agency Coordination**

Strategies and Activities	Agency Lead
<b>Strategy AC-1: Ensure effective communications and procedural operations of the MMB.</b>	
Activity AC-1.1: Establish standard operating procedures, as needed, to provide direction and improve communication within the MMB.	NOAA
<b>Strategy AC-2: Establish and support cooperative management agreements with agency partners.</b>	
Activity AC-2.1: Explore the potential of developing new agreements, including the possibility of amending the 2006 MOA to increase Native Hawaiian involvement in the management of the Monument.	OHA
Activity AC-2.2: Establish agreements for coordinated management and conduct cooperative management operations.	NOAA
Activity AC-2.3: Develop interagency agreements, grants, and memoranda of agreement as needed to carry out specific program priorities.	NOAA
Activity AC-2.4: Convene Interagency Coordinating Committee meetings, including an annual workshop.	NOAA
<b>Strategy AC-3: Promote international, national, and local agency collaborations to increase capacity building and foster networks that will improve management effectiveness.</b>	
Activity AC-3.1: Enhance communication and cooperation with the U.S. Department of Defense and the U.S. Navy Pacific Fleet.	State of Hawaii
Activity AC-3.2: Network with other marine protected areas in the Pacific.	State of Hawai‘i
Activity AC-3.3: Support the bid for World Heritage Site status.	State of Hawai‘i

### 3.5.2 Constituency Building and Outreach Action Plan

#### Desired Outcome

Cultivate an informed, involved constituency that supports and enhances conservation of the natural, cultural, and historic resources of Papahānaumokuākea Marine National Monument.

Links to other Action Plans
All Action Plans

#### Current Status and Background

The MMB currently conducts diverse constituency building and outreach activities related to the Monument, such as:

Links to Goals
Goal 4 Goal 5 Goal 6 Goal 8

- Operating discovery centers and visitor facilities, including Mokupāpapa Discovery Center in Hilo and the Midway Atoll visitor center;
- Developing and disseminating informational materials such as fact sheets, brochures, planning updates, and reports;
- Updating and maintaining Monument websites;
- Conducting informational meetings, workshops, and seminars to inform constituencies and seek input on various aspects of Monument management;
- Issuing news releases, feature stories, and public service announcements;
- Working with partners in community fairs, photography exhibits, and documentaries;
- Partnering with support groups such as the Friends of Midway Atoll NWR and the National Marine Sanctuary Foundation;
- Involving volunteers in management and support activities;
- Seeking public review of Monument permit applications for activities proposed in State waters at the State Board of Land and Natural Resources; and
- Seeking public review of draft plans and environmental analyses through NEPA requirements.

The Monument’s diverse constituencies in Hawai‘i and beyond include federal and state agencies with responsibilities for the region; industry and community stakeholders; and prospective and permitted users. Key Monument constituencies that have been identified to date include, but are not limited to, the following:

- Government agencies with responsibilities in the NWHI
- Native Hawaiian community
- Conservation groups
- Research/academia
- Commercial and recreational fishers
- Local community experts
- Schools, organizations, and institutions that conduct marine education and outreach programs throughout Hawai‘i
- Other states, territories, and Pacific nations managing coral reefs
- Business/industry
- Elected officials
- General public at large

Outreach to these diverse communities must be coordinated closely with the strategies and activities identified in the individual action plans detailed in this management plan. A vigorous public outreach and education effort that bridges community concerns and needs with measures applied to protect the resources of the Monument will galvanize broader support for ocean and island conservation and the MMB’s work. Such support will bolster the MMB’s ability to effectively protect NWHI marine resources.

A strong, sustained constituency-building effort is particularly important in the Monument’s early formative years to establish its role in the region and in local, national, and global resource management circles and to set a proactive course into the future.

**Need for Action**

Stakeholder and community involvement is an integral component to creating an informed and engaged constituency that would further the successful protection of the ecosystems and resources of the NWHI, thus achieving the goals of the Monument (see Section 2, Management Framework). Active and meaningful engagement between management and local experts is considered integral to resilient and adaptive approaches (Berkes 2003; Leslie & Mcleod 2007).

A study conducted by Ward Research in March 2006 for the National Marine Sanctuary Foundation found that the majority of residents of the State of Hawai‘i were unaware of the NWHI and its protected status. More than 50 percent of Hawai‘i’s residents believed that there are only eight Hawaiian Islands (Ward Research 2006). For the question, “How many islands, atolls, and other land masses make up what we know as the Hawaiian Islands?,” the proportion of residents who answered the correct, “more than 15” or “plenty/too many to count” decreased from the previous year (22 percent, compared with 28 percent in 2005).

**Figure 3.1 Perceived Number of Hawaiian Islands**

The establishment of the Monument provides opportunities for the managing agencies to collaborate and share resources for effective constituency building and outreach activities. Currently, the agencies often implement public outreach activities separately, use a similar and limited range of strategies and activities, and target similar constituencies. As the Monument constituencies comprise a wide range of user groups and individuals, various methods will be

needed to best engage them in Monument management. A range of strategies and activities are needed to develop, engage, and sustain the active involvement and support of constituencies in Hawai'i as well as national and international publics. These strategies and activities will keep the public informed as well as provide opportunities for input on management decisionmaking from various stakeholder groups. This action plan presents strategies and activities to develop an integrated constituency-building framework supported by collaborative activities of the Co-Trustees.

### **Strategies to Achieve the Desired Outcome**

The following strategies have been identified to achieve the desired outcome of cultivating an informed, involved constituency that supports and enhances conservation of the natural, cultural, and historic resources of the Monument. These strategies provide both capacity building, which will ensure continuity and effectiveness of Monument communication efforts, and public interface, which will allow for various levels of support for and participation in activities related to the Monument. The strategies and activities are coded by the acronym for the action plan title, "Constituency Building and Outreach" (CBO). A summary of strategies and activities is provided in Table 3.5.2 at the end of this action plan.

- CBO- 1: Develop and implement an integrated communications strategy, based on an assessment of ongoing activities and future needs, to coordinate outreach and engage Monument constituencies within 5 years.
- CBO-2: Continue to develop and disseminate materials and improve and update tools that help inform Monument constituencies about the Monument over the life of the plan.
- CBO-3: Continue initiatives that allow Monument constituencies to be more involved in the Monument and enhance opportunities for long-term engagement over the life of the plan.
- CBO-4: Develop and implement an overarching Monument interpretive strategy, including site-specific planning documents for the Monument's visitor facilities, within 5 years.

#### **Strategy CBO-1: Develop and implement an integrated communications strategy, based on an assessment of ongoing activities and future needs, to coordinate outreach and engage Monument constituencies within 5 years.**

The integrated communications strategy will be made up of various components, including visitor site administration, capacity building, research and development, telecommunication tools, and assessment. The following activities will help to achieve the initiatives of these components and ensure the effectiveness of the integrated strategy.

##### ***Activity CBO-1.1: Develop an integrated communications strategy based on an assessment of ongoing activities and future needs.***

A unified strategy for constituency building and outreach for the Monument will be developed. The integrated strategy will include a description of the different types of constituencies that need to be informed, engaged, and sustained in support of the Monument; specific strategies, messages, and activities related to each constituency; and indicators to evaluate effectiveness. In developing the document, the MMB will engage analogous entities, such as administrating agencies of

Australia's Great Barrier Reef, to learn lessons from their constituency building and outreach successes. Existing constituency building activities of all MMB agencies generally will be continued under the new Monument framework. This will ensure continued support for already successful programs and the development of new activities that enhance existing support for the region. The Monument communications strategy will be reviewed and updated every 3 years, at a minimum.

***Activity CBO-1.2: Continue to refine and implement the Monument Media Communications Protocol to engage news media in informing the public about the Monument's resources and activities.***

A key aspect of the communications strategy is media protocol. In February 2007, a Monument media communications protocol was developed to ensure the media receive accurate, consistent, and timely information about the Monument; its natural, cultural, and historic resources; and ongoing activities related to the Monument. An interagency communications team implements the strategy, ensuring that all of the managers are included in the review process and presenting a unified position to the public. Contacts, standards, and procedures are clearly identified within the protocol. Unlike the communications strategy overall, the protocol will be reviewed any time the need arises from any agency or is deemed necessary because of unforeseen external circumstances.

***Activity CBO-1.3: Develop a consistent Monument identity to be used in all communications strategies that reflects its comanagement within 1 year.***

The Co-Trustees currently maintain their three separate identities and include all agency logos on most communications materials. The MMB will develop a new Monument "corporate identity," reflecting its shared management on behalf of the American people.

***Activity CBO-1.4: Incorporate new perspectives for understanding the value of NWHI ecosystems, including socioeconomic studies, to increase ocean ecosystems literacy and conservation in the Monument within 5 years.***

The Monument will serve as a powerful focal point for understanding climate change and increasing ocean ecosystems literacy. To engage a broad and diverse base of constituents and local experts, Monument staff must continuously expand the types of products, messages, and modes of communication used in education and outreach programs. The MMB will support and seek out traditional and local knowledge as well as new perspectives that contribute different ways of valuing the ecosystems of the NWHI. New and innovative ways to look at the value of marine ecosystems, such as socioeconomic analysis of the nonmarket value of coral reefs, will also be supported.

***Activity CBO-1.5: Research and implement new technologies and tools to increase public understanding of the NWHI ecosystems within 5 years.***

Telepresence (technologies that allow a person to feel as if they were present, to give the appearance that they were present, or to have an effect at a location other than their true location) is an important tool for helping to educate the larger community about the special region of the Monument. Since most people will not be able to visit the Monument because of its remoteness and fragility, it is important to bring the place to the people. Telepresence technologies such as underwater video cameras, real-time video transmission, virtual field trips, website interfaces,

and exhibits in discovery centers that present this content will play an important role in educating the public about the NWHI. Obstacles to implementing these technologies do exist, such as cost, feasibility, and ecological sensitivities, but the Monument will continue to invest in and utilize new technologies for providing this virtual experience.

**Strategy CBO-2: Continue to develop and disseminate materials and improve and update tools that help inform Monument constituencies about the Monument over the life of the plan.**

Providing information about the Monument through products such as websites, brochures, and other media is one of the first steps toward raising the overall awareness of the Monument with the public (local, national, and international). The MMB will also seek to provide versions of materials in ‘ōlelo Hawai‘i when appropriate and possible.

***Activity CBO-2.1: Establish a new Monument website that will allow constituents to visit a single site for all Monument-related information within 1 year.***

Currently, the three Co-Trustee agencies all maintain separate websites that provide information about the Monument. The MMB is developing a single interagency website (<http://www.papahānaumokuākea.gov>) that will be jointly managed and regularly updated with information about permit and management activities, planning updates, and other information.

***Activity CBO-2.2: Continue to develop and update printed materials to aid Monument constituencies in understanding key aspects of the Monument.***

Although an overall site brochure is the primary informational mechanism to help the public understand the Monument, additional materials will be developed to aid in the understanding of more specific aspects of the entire region and on the ways in which the public can participate. Topics to be addressed will include, but will not be limited to, Native Hawaiian culture; research; management activities; permitting; Monument wildlife, historic, and cultural resources; impacts associated with climate change; and volunteer activities. These materials will be printed pieces, such as the update letter that was provided to the public during the development of the Monument Management Plan, but may also include multimedia components or be developed as a suite of materials.

***Activity CBO-2.3: Support other entities’ efforts to broaden knowledge of and appreciation for Monument resources and management priorities.***

Establishment of the Monument has created interest from documentary filmmakers, writers, photographers, and other entities to help us “bring the place to the people.” The MMB will support those endeavors that provide benefit to Monument resources and management and our constituents without impacting Monument resources.

**Strategy CBO-3: Continue initiatives that allow Monument constituencies to be more involved in the Monument and enhance opportunities for long-term engagement over the life of the plan.**

This strategy will continue efforts to create an interactive experience with constituents by providing the support and activities necessary to develop a long-term commitment to the

Monument from a growing number of increasingly knowledgeable constituents. This strategy will also explore means by which local experts can be actively and meaningfully involved in the management of the Monument. The Monument is a vast region that will need a strong network of constituents who are connected to the NWHI in order to ensure that the plans initiated today are carried out and implemented successfully over time. However, this kind of success is realized only when the support is rooted in an engaged community and when the relationship between the agency and its constituents has matured into one of collaboration.

***Activity CBO-3.1: Continue to seek out and participate in events that reach a broader audience and provide constituents with knowledge of the Monument.***

The MMB agencies individually have a history of participating in various public outreach activities. We will collaborate to enhance existing participation and find new venues. Examples of such activities include, but are not limited to, events such as fairs, lecture series, and public forums.

***Activity CBO-3.2: As needed, hold focused forums on various Monument-related issues or topics to inform and engage a broader range of constituents.***

The MMB will offer public forums on specific topics or issues both to exchange information with our constituencies and to build awareness and support. These forums will be offered at various locations to facilitate participation by a broad range of constituents.

***Activity CBO-3.3: Continue to seek out and support partnership opportunities that focus on Oceania-related issues.***

As the Hawaiian Archipelago is most closely related to other sites across Oceania, it is important for the Monument to collaborate with a network of marine managed areas in this region. These partnerships will allow for a greater exchange of knowledge and expertise. They will also provide opportunities to build awareness about the important connection between cultural and conservation practices.

***Activity CBO-3.4: Continue to build and nurture volunteer programs that develop knowledge of, involvement in, and support for Monument programs and resources.***

Volunteers offer an opportunity to build a new base of constituents who are closely connected to and involved in efforts of the Monument. Volunteers are essential in carrying out our mission to protect this valuable resource. We will work to enhance existing efforts and to build capacity to support these important efforts.

Long-term volunteers help with outreach and education needs, especially at Mokupāpapa Discovery Center and Midway Atoll, and with habitat restoration and wildlife monitoring, especially at Tern Island, Laysan Island, Midway Atoll, and Kure Atoll. In addition, we will incorporate Midway Atoll visitors into volunteer programs for habitat restoration, wildlife population monitoring, and historic restoration projects, as outlined in the Midway Atoll Visitor Services Plan. Overnight visitors will be encouraged to participate in volunteer activities, including eradication of invasive plants, collection of marine debris, and restoration of native plants and historic structures. Many visitors want to “give something back” to the environment during their time on the atoll, and these activities will help restore acres of habitat.

***Activity CBO-3.5: Establish and support a Papahānaumokuākea Marine National Monument Alliance to engage a broad range of constituents, who will provide recommendations and information on specific management issues on a regular basis.***

The Co-Trustees are committed to establish a Monument Alliance within 1 year, composed of individuals who represent communities and stakeholders interested in the Monument's stewardship. The Alliance will provide individual advice and recommendations to the Monument management agencies regarding management of Monument resources over which the Co-Trustees have responsibilities. It will serve as a community-based forum to exchange information; provide community input and individual recommendations on Monument policies, activities, and management; advocate for Monument conservation; and enhance broader community and public understanding. Within 2 years after the release of the Monument Management Plan, the Co-Trustees will charter the Alliance as an advisory committee under the Federal Advisory Committee Act (FACA), or as a FACA-exempt advisory body to allow the Alliance to provide consensus advice to the Co-Trustees, per the amended Memorandum of Agreement. Meetings of the Monument Alliance will be convened on a regular basis, with specific topics identified for each meeting. The meetings will be well publicized and open to the public, and will be held at various locations to facilitate

***Activity CBO-3.6: Continue to support the Native Hawaiian Cultural Working Group through the Office of Hawaiian Affairs.***

This group is made up of members of the Native Hawaiian community who provide guidance to the State of Hawai'i through the Office of Hawaiian Affairs. This group has offered support on permit review and cultural protocols, and provided the Monument with its name. By better incorporating Hawaiian culture into Monument management, we gain long-term support and greater understanding from the community that represents the host culture of the entire Hawaiian Archipelago.

***Activity CBO-3.7: Continue working with the Friends of Midway Atoll National Wildlife Refuge through FWS and support the establishment of a Monument-related "friends" group.***

The Friends of Midway Atoll NWR is a nonprofit group that was formed in 1999 and currently has more than 200 members from across the nation who contribute to the interpretation, recreation, and educational programs of the Refuge. In addition to continuing to work with the Friends of Midway Atoll NWR, we will work with other Monument-wide "friends" groups if established.

***Activity CBO-3.8: Continue to convene the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve Advisory Council through NOAA's Office of National Marine Sanctuaries until the Monument Alliance is established.***

The Reserve Advisory Council (RAC) was formed in 2001 and has served as a mechanism for public input and a venue for public comment on management activities. The composition of the Reserve Advisory Council is designed to provide formal advice to the ONMS from a variety of stakeholder viewpoints and geographic representation. Continuing the RAC would provide a public forum for members of the community and constituencies to allow for input on the Reserve until such a mechanism is established for the Monument.

**Strategy CBO- 4: Develop and implement an overarching Monument interpretive strategy, including site-specific planning documents for the Monument’s visitor facilities, within 5 years.**

As one of many means of communication, several facilities that interpret Monument resources and activities have been developed, most of them prior to designation of the Monument. This strategy includes the development of an interpretive plan, as well as evaluation strategies and maintenance schedules. By unifying all Monument interpretation under a single strategy, the MMB can ensure targeted, appropriate messages are delivered to our constituents in a consistent manner that leads to achievement of Monument goals.

***Activity CBO-4.1: Develop interagency Monument interpretive themes to guide all interpretive products and activities.***

Although initial discussions of Monument-wide interpretive themes have been held among the Co-Trustee agencies, a more focused study is needed. These interpretive themes will guide the development and presentation of interpretive sites and products, linking tangible resources to intangible meanings, creating emotional and intellectual connections to the meanings of the resource, and making the Monument personally relevant to individuals.

***Activity CBO-4.2: Review existing interpretive sites and activities to determine their current relevance to the Monument and how they could better represent Monument themes.***

Two existing interpretive facilities—Mokupāpapa: Discovery Center for Hawai‘i’s Remote Coral Reefs in Hilo, Hawai‘i, and the Midway Atoll NWR visitor center on Sand Island, Midway Atoll—and the proposed visitor facility at NOAA’s Pacific Regional Center on Ford Island, O‘ahu, will be reviewed and updated so that they better reflect the Monument’s cultural, natural and historic resources as a whole.

***Activity CBO-4.3: Develop a Monument interpretive plan to guide future interpretive projects and activities.***

The overarching Monument interpretive strategy will identify the Monument’s interpretive themes, audiences, messages, and media, and include information on project priorities, costs, staffing needs, and schedules.

***Activity CBO-4.4: Seek additional opportunities to expand Monument interpretive efforts to new sites and through new technologies, creating a network of coordinated interpretive sites.***

The MMB will identify new sites and technologies to better reach our audiences. In many cases, we will work with private or other government entities to include Monument messages in broader arenas. Possible partnership opportunities exist in aquaria, schools and universities, parks, government buildings, hotels, and many other locations.

***Activity CBO-4.5: Working with the National Park Service, U.S. Navy, and other key entities, develop off-site exhibits on the Battle of Midway and the associated National Memorial to be integrated into World War II memorial sites of the Pearl Harbor Historic District.***

In establishing the Battle of Midway National Memorial at Midway Atoll, FWS was charged with ensuring that the heroic courage and sacrifice of those involved in the battle will never be forgotten. Although this interpretive theme will be important at Midway Atoll, a relatively small

number of visitors will be reached. A much broader audience will be found within the Pearl Harbor Historic District, where the USS Arizona Memorial, USS Missouri, USS Bowfin, and sites on Ford Island receive at least 1.5 million visitors each year. The MMB, working with partner agencies and other key entities, will develop exhibits about the Monument that can be integrated with other existing interpretative facilities and sites.

**Table 3.5.2 Summary of Strategies, Activities, and Agency Leads for Constituency Building and Outreach**

Strategies and Activities	Agency Lead
<b>Strategy CBO-1: Develop and implement an integrated communications strategy, based on an assessment of ongoing activities and future needs, to coordinate outreach and engage Monument constituencies within 5 years.</b>

### 3.5.3 Native Hawaiian Community Involvement Action Plan

#### Desired Outcome

Engage the Native Hawaiian community in active and meaningful involvement in Papahānaumokuākea Marine National Monument management.

Links to other Action Plans	
3.1.2	Native Hawaiian Culture and History
3.5.1	Agency Coordination
3.5.2	Constituency Building and Outreach

#### Current Status and Background

The Executive Order that designated the NWHI Coral Reef Ecosystem Reserve (Reserve) in 2000 required that Native Hawaiians, among others, provide advice regarding management of the Reserve and ensuring the continuance of Native Hawaiian practices. It did so through provisions allowing for “culturally significant, noncommercial subsistence, cultural, and religious uses” in the Reserve by Native Hawaiians, and set aside three voting seats on the Reserve Advisory Council for Native Hawaiians. During its first five years of operation, the RAC established a Native Hawaiian Cultural Working Group, which broadened the inclusion of Native Hawaiians in the operations of the Reserve and in planning for a proposed National Marine Sanctuary.

Links to Goals
Goal 2
Goal 3
Goal 4
Goal 5
Goal 6
Goal 7

In addition to Native Hawaiian representation on the RAC and the establishment of a Native Hawaiian Cultural Working Group, the Reserve began efforts to consult with the Native Hawaiian community through a grant to the University of Hawai‘i’s Kamakakūokalani Center for Hawaiian Studies. This grant provided an opportunity for Native Hawaiians to develop the content of NOAA’s report on the cultural history of the NWHI from an indigenous point of view. The grant also convened key Native Hawaiian community members for a two-day planning session to make recommendations about future research, educational, and cultural activities that should be made available to Native Hawaiians and others to ensure a strong cultural link in the planning and management of the Reserve and throughout the sanctuary designation process.

These efforts provided a foundation for Native Hawaiian involvement in the Reserve, and this foundation has continued and expanded in the management of the Monument. Many Native Hawaiians remain unaware of efforts under way to protect the NWHI through management of the Monument. Although several prominent members of the Native Hawaiian community have been involved in the management and implementation of the Reserve, many others should be engaged, in part by working more closely with Native Hawaiian institutions.

Participants of the 2004 NWHI workshop on Native Hawaiian issues and concerns held at Kamakakūokalani Center for Hawaiian Studies at U.H. Mānoa. Photo: Dr. Kekuni Blaisdell

The Reserve set a standard for recognition and inclusion of Native Hawaiians in determining the future management of the NWHI. Strategies will be developed to involve the Native Hawaiian

community in the management of the Monument not only because of strong public support, but also because of the mandates of the Office of National Marine Sanctuaries to protect biological and cultural resources in the areas it manages, of the FWS to preserve historic sites as well as conserve and promote wildlife and their habitat, and of the State to protect ceded lands and the rights of Native Hawaiians.

An increasing number of resource management and conservation partnerships are being formed between indigenous groups and governmental bodies worldwide. In Hawai‘i, the Kaho‘olawe Island Reserve Commission and Mo‘omomi, Moloka‘i partnerships are examples of how traditional knowledge and values are integrated into resource management. An international example is seen in New Zealand, where Maori involvement in government conservation management projects ranges from consultation to full control over marine and terrestrial tribal regions.

The Native Hawaiian community has expressed a strong interest in participating in management decisions affecting the Reserve and Monument. Respecting Native Hawaiian traditions and values and providing an effective degree of participation in the protection and stewardship of the Monument will provide an opportunity for Native Hawaiians to maintain ancestral connections to the NWHI. Such connections will continue to further ongoing reconciliation efforts between Native Hawaiians and the United States.

Efforts are needed to directly engage Native Hawaiian concepts and participation in resource management, including perspectives in managing natural, cultural, and historic resources. The resulting synthesis of western and Hawaiian management concepts and practices is a significant step toward improving relationships and communication regarding Monument management. The MMB is committed to working with the Native Hawaiian community to identify specific and meaningful ways of engagement in managing the Monument. A variety of strategies to promote this engagement have been identified in this action plan as well as those in Section 3.1.2, the Native Hawaiian Culture and History Action Plan.

### **Need for Action**

Numerous public comments collected during the scoping process for the proposed National Marine Sanctuary identified the need to include Native Hawaiians and Native Hawaiian traditional resource management practices in the management of the NWHI. Communities also expressed concern that Native Hawaiians must have access to continue cultural practices in the region. The comments indicated the need for direct consultation with Native Hawaiians, or more consultation over and beyond the representation of Native Hawaiians currently included in the management of the Monument.

The inclusion of terrestrial areas (particularly Nihoa, Mokumanamana, and Kure Atoll) and waters in the Monument creates a greater urgency to include Native Hawaiian perspectives in the Monument’s management. All of the documented Native Hawaiian archaeological sites in the NWHI are on Nihoa and Mokumanamana; they hold some of the densest scatters or concentrations of prehistoric structural sites in Hawai‘i; and they represent a pure example of the culture prevailing in Hawai‘i before the 13<sup>th</sup> century.

The Constitution of the State of Hawai‘i requires the State to care for Hawai‘i’s public trust resources and recognizes the state’s obligation to work for the cultural rights of Native Hawaiians. Given the unique history and constitutional and statutory requirements of the State to protect the claims and rights of Native Hawaiians in their homeland, the Native Hawaiian community must be involved in the planning, management, and operations of the Monument.

### **Strategies to Achieve the Desired Outcome**

Three strategies have been identified for achieving the desired outcome of engaging the Native Hawaiian community in active and meaningful involvement in Monument management. The strategies and activities are coded by the acronym for the action plan title, “Native Hawaiian Community Involvement” (NHCI). A summary of strategies and activities is provided in Table 3.5.3 at the end of this action plan.

- NHCI-1: Regularly involve the Native Hawaiian community for the life of the plan.
- NHCI-2: Develop and annually maintain partnerships with Native Hawaiian organizations and institutions.
- NHCI-3: Identify and integrate Native Hawaiian traditional knowledge and management concepts into Monument management annually for the life of the plan.

### **Strategy NHCI-1: Regularly involve the Native Hawaiian community for the life of the plan.**

The MMB includes representation by the Office of Hawaiian Affairs (OHA). Currently, OHA is the only State agency with a statutory mandate to advocate for Native Hawaiians and to assess the policies and practices of other agencies’ impacts on Native Hawaiians. OHA, on behalf of the MMB, will continue to convene the Native Hawaiian Cultural Working Group to obtain advice and guidance from Native Hawaiian cultural experts, including kūpuna (respected elders) and practitioners, on all Monument actions affecting Native Hawaiians and cultural resources in the Monument. Over time, the MMB may develop other mechanisms to bring together Native Hawaiians to participate in Monument activities and management.

#### ***Activity NHCI-1.1: Formalize, expand, and convene the Native Hawaiian Cultural Working Group.***

During year 1, the MMB, through OHA, will formally establish a cultural working group, expanding the previously established working group, to ensure a strong cultural link in the planning and management of the Monument. Like its predecessor, this body would consist of kūpuna, cultural practitioners, Native Hawaiian resource managers, and others (see Section 3.5.2, the Constituency Building and Outreach Action Plan).

#### ***Activity NHCI-1.2: Engage the Native Hawaiian Cultural Working Group in the development of a Monument Cultural Resources Program.***

The MMB will work with the Native Hawaiian Cultural Working Group and other Native Hawaiian organizations and institutions to develop a Monument Cultural Resources Program and corresponding cultural resource management activities. (See Section 3.1.2, the Native Hawaiian Culture and History Action Plan.)

***Activity NHCI-1.3: Establish an annual cultural resources exchange.***

The MMB will annually convene groups of Native Hawaiians who have visited the Monument to provide a safe venue to discuss the knowledge, experiences, and new questions gained during the past research season. The MMB will also update the Native Hawaiian community on its lessons learned from the last research season, including synopses of nonproprietary cultural reflections provided in various permittees' final reports. These exchanges may also include previous and on-going research, as well as status of curated cultural resources. These exchanges will not only update the Native Hawaiian community, but will also engage that community in determining the priorities and proposed methodologies of forthcoming research queries, theories, and needs. (See Section 3.1.2, the Native Hawaiian Culture and History Action Plan.)

**Strategy NHCI-2: Develop and annually maintain partnerships with Native Hawaiian organizations and institutions.**

Memoranda of Understanding, grant programs, and cooperative agreements have been useful in developing working relationships with partner agencies and organizations. Partnerships with Native Hawaiian organizations could similarly help to strengthen that community's involvement in Monument management and the development and implementation of programs involving Native Hawaiians. Partnering will help the Monument to consult with the broader Native Hawaiian community and aid in gathering information about cultural resources and practices.

***Activity NHCI-2.1: Continue to expand and explore opportunities to partner with institutions serving Native Hawaiians.***

In 2003, the Reserve established a partnership with the Kamakakūokalani Center for Hawaiian Studies and the University of Hawai'i to conduct cultural research, consult with the Native Hawaiian community, and produce educational materials related to the NWHI. The MMB will seek other opportunities to formally consult with and engage other Native Hawaiian groups and will develop outreach programs for the Native Hawaiian community. (Interagency partnerships are also addressed in Section 3.5.1, the Agency Coordination Action Plan.) Additional partnerships, contracts, grants, or formal agreements with Native Hawaiian organizations will be considered and established as opportunities arise.

**Strategy NHCI-3: Identify and integrate Native Hawaiian traditional knowledge and management concepts into Monument management annually for the life of the plan.**

Traditional resource management involves recognizing local variations, observing patterns, periodically applying kapu (restrictions on resource extraction and other activities) by konohiki (local managers), and maintaining a deep respect for, and intimate knowledge of, the environment. Integrating traditional knowledge will not only strengthen the relationship between Monument managers and the Native Hawaiian community, but will also provide additional tools and methods for improving management practices. This relationship will also perpetuate the application of traditional knowledge across the Hawaiian Archipelago.

***Activity NHCI-3.1: Engage the Native Hawaiian community to identify how traditional knowledge will be integrated into Monument activities.***

The Monument's cultural resources staff, to be developed pursuant to the Native Hawaiian Culture and History Action Plan (Section 3.1.2), will work with the Native Hawaiian community

and cultural experts to preserve and recover the knowledge of traditional Hawaiian resource management strategies and to identify how traditional knowledge and associated practices may be woven into Monument management and research activities. This activity will include developing recommendations for integrating these skills and knowledge into Monument management, and preparing a report of the recommendations within 2 years.

***Activity NHCI-3.2: Use and integrate Native Hawaiian traditional knowledge in Monument management activities.***

Based on recommendations developed under Activity NHCI-3.1, the MMB will integrate traditional perspectives, knowledge, and approaches in the management of Monument resources.

**Table 3.5.3 Summary of Strategies, Activities, and Agency Leads for Native Hawaiian Community Involvement**

<b>Strategies and Activities</b>	<b>Agency Lead</b>

Activity NHCI-3.2: Use and integrate Native Hawaiian traditional knowledge in Monument management activities.	NOAA

### 3.5.4 Ocean Ecosystems Literacy Action Plan

#### Desired Outcome

Cultivate an ocean ecosystems stewardship ethic, contribute to the Nation’s science and cultural literacy, and create a new generation of conservation leaders through formal environmental education.

Links to other Action Plans	
All action plans in:	
3.1	Understanding and Interpreting the NWHI
3.2	Conserving Wildlife and their Habitats
3.3	Reducing Threats to Monument Resources
3.4	Managing Human Uses

#### Current Status and Background

Prior to the establishment of the Monument, the Co-Trustees took active steps to address the need for ocean ecosystems literacy. Adopting a cooperative approach has exponentially enhanced and extended the agencies’ educational efforts. Educational partnerships have enabled the implementation of programs far beyond the resources of any one agency, institution, or organization alone.

Links to Goals
Goal 5
Goal 6
Goal 8

The NWHI provide a model and rare benchmark of a healthy, intact ecosystem, conserved in its natural state, that may serve to inspire Hawai’i residents, all Americans, and the global community to take part in ocean restoration efforts. Inspired by the Polynesian Voyaging Society, this guiding premise brought together resource management agencies and partners to implement the multiyear “Navigating Change” project, which focuses on raising awareness and motivating people to change their attitudes and behaviors to better care for Hawai’i’s land and ocean resources. A five-part video, standards-based educational curriculum, and teleconferences with the traditional Polynesian voyaging canoe *Hōkūle‘a* during its 2004 expedition to the NWHI have been completed in partnership with several agencies and organizations. Teacher workshops on the “Navigating Change” program have been held since 2003 across Hawai’i. The MMB also organized a number of education-at-sea initiatives.

The multiagency educational partnership remains active and fluid and continues to work well, even in the absence of formal agreements because of the clear benefits to all parties. Shared objectives include information sharing, aligning education with management needs, setting regional priorities, reducing duplication of efforts, and sharing resources. Through partnering, organizations and agencies are better able to meet their educational mandates. Partnerships take advantage of existing expertise and experience, as well as preexisting markets for educational outreach. Cost and staff sharing of education and outreach programs help to alleviate limited funding and staffing issues for these programs.

#### Mokupāpapa: Discovery Center for Hawai’i’s Remote Coral Reefs

The Reserve built a visitor/education center collocated with its Hilo office to

Students visit Mokupāpapa Discovery Center in Hilo.

spur greater public awareness of the region and ocean conservation issues. Mokuapāpapa: Discovery Center for Hawai‘i’s Remote Coral Reefs was conceived and built in 2003 to interpret the natural science, culture, and history of the NWHI and surrounding marine environment. The 4,000-square-foot center brings the region to people by proxy, since most will never have the opportunity to visit the area. At the time of this publication, more than 300,000 people have been exposed to the wonders of the NWHI through the center. The center has served as a physical hub of learning, regularly hosting well-attended educational talks, summer programs, and activities, while drawing a constant stream of field trips for school and community groups from around the State and beyond.

### **Need for Action**

The U.S. Commission on Ocean Policy (2004) stressed the need to strengthen the nation’s ocean awareness and to improve ocean-related education efforts as “critical to building an ocean stewardship ethic, strengthening the nation’s science literacy, and creating a new generation of ocean leaders.” The report concluded that an interested, engaged public is an essential prerequisite “to successfully address complex ocean- and coastal-related issues, balance the use and conservation of marine resources, and realize future benefits from the ocean.”

The President’s Ocean Action Plan places a major emphasis on ocean-related awareness and education. This action plan addresses the need to build upon our environmental education efforts to cultivate students as an informed, involved constituency that cares about restoring, protecting, and conserving our precious ocean resources. Strengthening awareness of the importance of the NWHI as a model of a wild marine ecosystem being maintained in its natural state requires a heightened focus on stewardship values and resource management issues through both formal and informal education efforts. School curricula, starting in kindergarten, will expose students to ocean issues and prepare the next generation of scientists, managers, educators, and leaders through diverse educational opportunities. Furthermore, students’ increased understanding is anticipated to naturally influence their families, extending the extracurricular reach of the Monument’s educational activities.

### **Strategies to Achieve the Desired Outcome**

Monument staff will work closely with existing and new partners to further their environmental education goals. Two strategies have been identified to cultivate an ocean ecosystem ethic, strengthen the nation’s science literacy, and create a new generation of conservation leaders. The strategies and activities are coded by the acronym for the action plan title, “Ocean Ecosystems Literacy” (OEL). A summary of strategies and activities is provided in Table 3.5.4 at the end of this action plan.

- OEL-1: Develop and implement educational programs in Hawai‘i to increase ocean ecosystems literacy and promote stewardship values within 5 years.
- OEL-2: Develop and implement new tools to “bring the place to the people” with a focus on students, within 3 years.

**Strategy OEL-1: Develop and implement educational programs in Hawai‘i to increase ocean ecosystems literacy and promote stewardship values within 5 years.**

A coordinated and long-term strategy for mainstreaming NWHI and ocean ecosystem stewardship values-based educational materials into Hawai‘i’s schools will be developed. Appropriate educational materials and curricula geared to improve ocean literacy, understand climate change and increase ocean stewardship will be developed in concert with the NWHI education partnership and the State of Hawai‘i Department of Education, Independent Schools of Hawai‘i, Nā Lei Na‘auao Native Hawaiian Charter School Alliance, and the Charter School Association of Hawai‘i. Materials developed through activities in other action plans will be used as resource and support materials for development of curricula. Programming will also be developed in the Hawaiian language for use in Hawaiian language immersion and culture-based charter schools. Ultimately, increased knowledge of ocean ecosystems issues, in particular of the NWHI, will allow Hawai‘i’s children, their families, and lifetime learners to be more active ocean stewards and to better understand the issues related to ocean management and climate change.

***Activity OEL-1.1: Expand and improve the NWHI educational partnership’s Navigating Change curriculum for elementary and middle school students, with increased focus on ocean ecosystems literacy, within 3 years.***

Building on existing NWHI-based curricula developed under the Navigating Change partnership and the new Hawai‘i Marine Curriculum, the MMB will contract with curricula developers to improve and expand “A Teacher’s Guide to Navigating Change.” Additional study units will be added for the current guide targeted at 4<sup>th</sup> and 5<sup>th</sup> grade students, and units focusing on other grade levels will be developed. As the effects of climate change are further studied and potential mitigations are identified, a unit on this topic will be developed. External grants for curricula development will also be sought. Education partners will work with the Department of Education and private and charter schools as curricula are being developed to ensure that the department’s and schools’ needs are incorporated into the work and to facilitate incorporation of the new curricula into existing educational programming. Whenever possible, families will be drawn into the lesson plans and activities. Planting the seed of awareness in young minds and those of their families concerning alien species, climate change and ocean acidification, and marine debris cleanup and prevention issues will effectively support long-range prevention efforts to deal with these threats.

***Activity OEL-1.2: As curricula are developed, work with Hawaiian-language immersion schools to ensure the curricula meet their needs, including translation into the Hawaiian language.***

The Navigating Change partnership will work closely with the Native Hawaiian community to ensure appropriate cultural information is included within all curricula, and that the units meet the needs of Hawaiian-language immersion and culture-based charter schools.

***Activity OEL-1.3: Develop an ocean stewardship program for middle school and high school students within 5 years.***

In concert with development of Navigating Change educational materials for primary schools, an ocean stewardship program will be developed with educational partners to give middle and high school students real-world, hands-on experience with the issues of ocean management. Real

examples from the Monument will be used as the basis for the science- and culture-based program, which will use educational activities such as interviews with people in the student's communities, and collecting and analyzing research data to resolve management issues. Through these activities, students will be encouraged to apply their newfound knowledge to help restore the ecosystems closer to their homes.

***Activity OEL-1.4: Conduct at least four teacher workshops in the main Hawaiian Islands per year to introduce and support the elementary school and middle/high school environmental education programs.***

Teacher workshops to present and demonstrate the use of Monument-developed educational materials, activities, and curricula, as well as those developed with partners, are effective ways to get Monument-based information into classrooms and informal education venues. Development and distribution of educational materials is not enough; teachers are often overwhelmed by available materials and should be taught how to use them, assisted in implementing materials in their classrooms, and supported by follow-up activities.

***Activity OEL-1.5: Continue Teacher and Class-at-Sea programs on an annual basis.***

In 2005, the first teacher and class-at-sea educational expedition to the NWHI was conducted. During NOAA vessel allocation meetings, NOAA agreed to accommodate annual education missions aboard one of the several research vessels active in the NWHI. Teachers who have been active in using existing Monument educational materials will be chosen to participate in these educational cruises, and select students will be sought. These programs allow teachers and students who are active in learning about the NWHI to experience the area firsthand and share the wonder of the place with the rest of the educational community. Annual expeditions will be planned in conjunction with educational opportunities with state and FWS partners. Monument educational materials developed in activity OEL-1.3 will be used during these expeditions. For linked activities, see also the Native Hawaiian Culture and History Action Plan, strategy NHCH-5, in Section 3.1.2.

***Activity OEL-1.6: Expand educational programs for school groups at Mokupāpapa: Discovery Center for Hawai'i's Remote Coral Reefs to host at least ten groups per month.***

Educational programming at the Monument's premier education and outreach venue, Mokupāpapa: Discovery Center for Hawai'i's Remote Coral Reefs, will be expanded. Working closely with local public, private, and charter schools, Discovery Center staff will create educational partnerships to promote Mokupāpapa as an educational facility and field trip venue. Discovery Center staff will collaborate with the Monument's educational partners to co-develop standards-based education programs at the Discovery Center for K-12 students. Visitation calendars, pre- and post-visit teacher background and activities packets, and volunteer docent capacity will be developed to meet the various needs of school and community groups. Expanded programming, such as guided tours in the Hawaiian language, monthly talks, tide pool classes, and reef-at-night visits to the aquarium, will provide continuing education opportunities for adults. Discovery Center staff will work with partner facilities and agencies on Hawai'i Island to codevelop on- and off-site programming, where appropriate, and to develop an education strategy and identify areas of collaboration.

***Activity OEL-1.7: Provide annual wildlife-dependent educator and conservation leader workshops at Midway Atoll, targeting a mix of formal and informal educators and community and conservation leaders and building upon Navigating Change curricula and vision.***

One goal of these educator and conservation leader workshops is to inspire a new group of educators as a method of connecting students and lifelong learners to Hawai'i's wildlife and culture. Another goal is to have participants in these workshops actually propose and implement an environmental stewardship program in their community, utilizing their experience at Midway as inspiration. The major themes discussed during these workshops could provide the stepping stones for future development of educational activities such as telepresence, distance learning projects, and ocean stewardship programs.

Agency planning for Midway Atoll educator workshops began in 2007, and a focus group of teachers, curriculum developers, educational leaders, and Navigating Change Educational Partnership members held a planning workshop on Midway Atoll in January 2008. Co-Trustee education staff will be coordinating and conducting these workshops with input from previous classes of workshop attendees, collectively referred to as Alaka'i. As curricula geared at new grade levels and targeting different audiences are developed, the number of educator workshops offered within the Monument may increase. Offering more educators and conservation leaders the opportunity to experience Midway Atoll and bring the Monument back to their students and lifetime learners will be an important role for Midway in the coming years.

***Activity OEL-1.8: Facilitate at least two opportunities per year for educational groups, private/nonprofit environmental, or historical organizations to conduct wildlife-dependent or historical courses or to administer informal educational camps, within 2 years.***

Organizations have already shown their interest in using Midway for educational experiences, since it provides unparalleled wildlife-dependent educational opportunities. Sponsoring organizations will be responsible for providing instructors and leading their participants. Monument staff will provide guidance during a mandatory advance orientation. When possible, Monument staff can provide learning opportunities that engage participants in biological and historical projects such as habitat restoration or historic preservation. FWS staff will also monitor group activities to ensure Midway's wildlife and historic resources are protected.

The MMB also will collaborate with universities to offer semester internship opportunities for students interested in resource management, cultural studies, history, or natural sciences. In the future, the MMB will investigate opportunities to bring select middle and high school students to Midway for courses in atoll ecosystems. The MMB supports expanding environmental education opportunities to the extent feasible on Midway Atoll. Developing lower-cost housing, increasing classroom and laboratory space, providing grants to help cover their costs at Midway, and finding a lower-cost means of transportation, will facilitate these programs. An opportunity to study Midway's unique natural resources could be the catalyst to inspire lifelong devotion to the field of science.

***Activity OEL-1.9: Build formal evaluations into education programs within 2 years.***

Evaluation of education and outreach programs and activities is critical to ensuring that the MMB is achieving its desired goals and reaching target audiences. This information is also

useful in helping to redesign current efforts to be more successful. Formal evaluations take time, expertise, and will require external assistance in development.

**Strategy OEL-2: Develop and implement new tools to “bring the place to the people,” with a focus on students, within 3 years.**

The Monument will serve as a powerful focal point for increasing ocean literacy in Hawai‘i, the nation, and the world. To engage a broad and diverse base of students around the world, the MMB will continuously expand the types of products and modes of communication used in educational programs. The MMB will benefit from continually exploring new research initiatives, new technologies, and best management practices that may advise its efforts and enhance its ability to restore, protect, and conserve Monument resources.

***Activity OEL-2.1: Identify and prioritize research and development projects to increase ocean ecosystems literacy and conservation in NWHI.***

The MMB, working together with educational partnerships and other relevant groups, including the private sector, will identify and prioritize research and development projects for new products and innovative technologies that could be employed to increase ocean ecosystems literacy and support for conservation of the NWHI. These tools may include technologies for making remotely collected scientific data available for education purposes on a real-time basis, and the possibility of hosting student research projects in the Monument, similar to what NASA does with the space shuttle and space station. Since the challenges of increasing awareness of the Monument have been likened to those involved in increasing understanding of space, the MMB will work with NASA to learn from their extensive education programs.

***Activity OEL-2.2: Use telepresence technology for educational and outreach activities within 5 years.***

Telepresence is an important tool for helping to educate the larger community about the special ocean region of the NWHI. Since most people will not be able to visit the NWHI because of its remoteness and fragility, it is important to bring the place to the people. Technologies such as underwater video cameras, real-time video transmission, virtual field trips, formal distance learning programs, website interfaces, and exhibits in discovery centers can play an important role in educating students and the public about the NWHI. Obstacles to implementing these technologies do exist, such as cost, feasibility, and ecological sensitivities, but the MMB will continue to invest in and use new technologies for providing this virtual experience.

**Table 3.5.4 Summary of Strategies, Activities, and Agency Leads for Ocean Ecosystems Literacy**

## **3.6 Achieving Effective Monument Operations**

---

### **3.6.1 Central Operations Action Plan**

### **3.6.2 Information Management Action Plan**

### **3.6.3 Coordinated Field Operations Action Plan**

### **3.6.4 Evaluation Action Plan**

---

### 3.6 Achieving Effective Monument Operations

Monument operations provide the support system for implementing strategies and activities described in other action plans. This support system includes improvement and maintenance of infrastructure in Honolulu to support field sites in the NWHI, information management, coordination of field operations and improvement and maintenance of field infrastructure, and program evaluation for both Honolulu and field sites.

Action plans to achieve effective operations focus on building and maintaining the vital personnel and infrastructure needs, both on land and at sea. The Information Management and Evaluation Action Plans (Sections 3.6.2 and 3.6.4) describe programs and functions necessary to effectively carry out and assess the effectiveness of all other action plans. Each action plan consists of a set of strategies and corresponding activities to address a desired outcome. The desired outcomes of these action plans over the 15-year planning horizon are as follows:

- **Central Operations:** Conduct effective and well-planned operations with appropriate human resources and adequate physical infrastructure in the main Hawaiian Islands to support management of Papahānaumokuākea Marine National Monument.
- **Information Management:** Consolidate and make accessible relevant information to meet educational, management, and research needs for Papahānaumokuākea Marine National Monument.
- **Coordinated Field Operations:** Coordinate field activities and provide adequate infrastructure to ensure safe and efficient operations while avoiding impacts to the ecosystems in the Papahānaumokuākea Marine National Monument.
- **Evaluation:** Determine the degree to which management actions are achieving the vision, mission, and goals of Papahānaumokuākea Marine National Monument.

Action plans described in this section will be implemented through close coordination among the MMB and in conjunction with other priority management needs.

### 3.6.1 Central Operations Action Plan

#### Desired Outcome

Conduct effective and well-planned operations with appropriate human resources and adequate physical infrastructure in the main Hawaiian Islands to support management of Papahānaumokuākea Marine National Monument.

<b>Links to other Action Plans</b>
All action plans

#### Current Status and Background

The Hawaiian Islands NWR, Midway Atoll NWR, NWHI Coral Reef Ecosystem Reserve, NWHI Marine Refuge, and State Seabird Sanctuary at Kure Atoll were established prior to 2006, and remain part of the Monument. The MMB agencies had varying levels of human resources and facility infrastructure in place when the Monument was established. The majority of the staff and administrative support is located in Honolulu. Outreach and other activities are conducted at other locations within the main Hawaiian Islands, and some on-site management is conducted as needed at a few sites within the Monument.

<b>Links to Goals</b>
Goal 1 Goal 4

The FWS and its preceding natural resource agencies have conducted management activities in the NWHI since the establishment of the Hawaiian Islands NWR in 1909. Full-time staff were assigned for administrative and logistical support in 1979 when the U.S. Coast Guard abandoned its presence at French Frigate Shoals. These FWS operations in support of the Hawaiian Islands NWR were first conducted at Kīlauea Point NWR on the island of Kaua‘i, and were later moved to the central FWS refuge office in Honolulu. FWS assumed wildlife management responsibilities at Midway Atoll NWR in 1988.

The FWS currently maintains numerous Monument staff, in diverse roles, in Honolulu in the Prince Jonah Kūhiō Kalaniana‘ole Federal Building. Support also is provided by other FWS staff within the federal building, including from the Hawaiian and Pacific Islands National Wildlife Refuge Complex, the Pacific Islands External Affairs and Visitor Services, and the Pacific Islands Fish and Wildlife Office. Both the Hawaiian Islands and Midway Atoll NWRs, under the Monument staffing structure, maintain staff in Honolulu and in the NWHI (see Section 3.6.3, Coordinated Field Operations Action Plan). In addition to the facilities at the federal building, FWS maintains a bunkhouse and storage facility in the Kapahulu area of Honolulu. This facility, while periodically available for FWS Monument needs, is administered by and primarily serves the Pacific Remote Islands National Wildlife Refuge Complex.

Much of the necessary NOAA-related infrastructure and personnel were established while implementing the Reserve from 2001 to the present. This infrastructure included the creation of an office in Hilo and an office in Honolulu, hiring of key staff, and the design, construction, and opening of the Mokuapāapa: Discovery Center for Hawai‘i’s Remote Coral Reefs in Hilo.

Prior to Monument designation, Reserve staff carried out operations specific to the Reserve while devoting a considerable amount of time working toward the designation of the Reserve as a national marine sanctuary. Because of these demands, staff size increased steadily between 2000 and 2005, with most staff managing multiple diverse roles and becoming more centralized in the

Honolulu office. In 2004, Honolulu Reserve staff located to offices shared by the NMSP Pacific Region and Hawaiian Islands Humpback Whale National Marine Sanctuary. Also in 2004, NOAA began plans to relocate all Hawai‘i NOAA offices to a new consolidated Pacific Regional Center on Ford Island by 2010. The Mokuāpapa: Discovery Center exceeded expectations for the number of annual visitors in its first year of operation requiring additional staff for managing the facility.

In 2006, when the NWHI were designated as a marine national monument by Presidential Proclamation 8031, staff involved in managing the Hawaiian Islands NWR, Midway Atoll NWR, and the Reserve became Monument staff and immediately began carrying out a rolling implementation of management of the newly designated Papahānaumokuākea Marine National Monument.

NMFS provides management support and program coordination for the Monument from the Pacific Islands Regional Office (PIRO), located in downtown Honolulu. Established in 2004, PIRO has increased its resources to meet a growing number of regional, national and international requirements. In addition to senior leadership direction, a NMFS Management Officer was reassigned from existing staff to directly support the development and implementation of Monument activities. NOAA’s Pacific Islands Fisheries Science Center, located adjacent to the University of Hawai‘i’s Mānoa campus, supports a variety of scientific activities taking place within the Monument.

The State of Hawai‘i has had an active presence in monitoring and managing resources in NWHI, starting with assessing and managing fisheries in the 1950s and continuing with the on-site management of Kure Atoll in the late 1980s when the U.S. Coast Guard returned atoll management to the State. Resources under state jurisdiction are mainly managed by the DLNR. The key line offices for undertaking this management are the Division of Aquatic Resources and the Division of Forestry and Wildlife, both administrative offices located in the Kalanimoku Building in downtown Honolulu. Staff involved in the management of the Monument are located at this site and are also collocated with NOAA staff at its offices in Hawai‘i Kai. Staff involved in the management of the State NWHI Marine Refuge immediately began carrying out rolling implementation of the Monument as the needs of comanagement evolved. While state staff involved in Monument operations have not grown in the past few years, recent state administrative and legislative action has created additional positions to implement state Monument activities.

In addition to those activities undertaken at the state administrative offices, staff involved in the management of the State Seabird Sanctuary at Kure Atoll are located at the Division of Forestry and Wildlife baseyard. All staff associated with the support of wildlife activities in the O‘ahu district (of which Kure is a component) are located at this site. The Division of Aquatic Resources also has an additional site for staging all boating and diving operations at its Ānuenu Fisheries Research Facility at Sand Island in Honolulu Harbor.

Additional support activities, including conservation enforcement, alien species response, emergency response, and historic preservation, are located throughout the DLNR and the Department of Health.

OHA serves as a member of the MMB, and, along with the Native Hawaiian Cultural Working Group, represents Native Hawaiian interests on Monument matters. The nine OHA trustees and OHA's main administrative staff are housed in the Pacific Plaza Building in Honolulu, with community resource offices on five of the main Hawaiian Islands, including two offices on Hawai'i Island.

Volunteers currently provide support to the Monument in a number of locations, including administrative offices, the Mokupāpapa Discovery Center in Hilo, French Frigate Shoals, Laysan Island, Midway Atoll, and Kure Atoll. These volunteers help Monument staff in carrying out their missions to protect the natural, cultural, and historic resources of the Monument (see Section 3.5.2, Constituency Building and Outreach Action Plan).

### **Need for Action**

Effectively managing such an extraordinary and high profile marine conservation project requires a strong operational foundation to support management goals. Operational support of on-site management and day-to-day operations require that highly trained and experienced staff are maintained and recruited to implement the strategies and activities described throughout this management plan. Volunteer services are also needed to augment this staff. In addition, the appropriate physical infrastructure must be in place to support operations. Each of the MMB agencies currently has infrastructure to maintain and possibly collocate both in Honolulu and elsewhere in the main Hawaiian Islands. Successful site operations are achieved through a synergy of personnel and available resources. This action plan presents strategies and activities designed to implement the shared facilities, coordinated schedules, and cooperative agreements required to achieve effective site operations.

### **Strategies to Achieve the Desired Outcome**

Three strategies have been identified to ensure the necessary human resources, physical infrastructures, and administrative procedures are in place to successfully manage the Monument. The strategies and activities are coded by the acronym for the action plan title, Central Operations (CO). A summary of strategies and activities is provided in Table 3.6.1 at the end of this action plan.

- CO-1: Coordinate annual site operations planning and implementation over the life of the plan.
- CO-2: Assess and enhance human resource and organizational capacity over the life of the plan.
- CO-3: Assess and enhance physical infrastructure and facilities, as necessary, in the main Hawaiian Islands over the life of the plan.

### **Strategy CO-1: Coordinate annual site operations planning and implementation over the life of the plan.**

Monument management agencies develop annual operating plans guided by their agency policies and procedures and consistent with the Monument Management Plan. These individual agency operating plans may be integrated to the extent possible to better guide day-to-day activities based on budget allocations to ensure efficient and effective use of public resources.

***Activity CO-1.1: Coordinate and implement annual operating plans.***

Annual operating plans will be developed and coordinated in accordance with agency requirements and guided by site-specific needs articulated in planning documents and based upon funding availability. The results of annual evaluation activities and current priorities will be reviewed and considered in developing annual operating plans (see Section 3.6.4, Evaluation Action Plan). Financial administration includes budget tracking, managing the financial portions of memoranda of understanding and contracts, and purchasing and travel planning according to state and federal purchasing regulations. Administrative procedures and functions also include planning for emergencies to ensure staff safety; complying with programmatic reporting requirements; records retention; purchasing and maintaining equipment, supplies, and vehicles; maintaining communication equipment including telephones, cellular phones, satellite phones and connections, and radios, as well as communication policy. Although each agency will follow their own procedures, activities will be coordinated to the extent possible to increase efficiencies and, where possible, standard operating procedures will be developed to outline roles and responsibilities as needed.

**Strategy CO-2: Assess and enhance human resource and organizational capacity over the life of the plan.**

Both human resource and organizational capacity are needed to achieve effective site operations. With the proclamation announcement comes high expectations for the Monument to implement management actions in a short amount of time. To effectively meet Monument goals, the MMB will develop a strong operational framework of human resources as early as possible. Human resources and organizational capacity may be increased to carry out programs, including administration, research and monitoring, threat reduction, education and outreach, information management, and enforcement.

***Activity CO-2.1: Regularly assess current status and future needs for human resources.***

In order to implement the Monument Management Plan effectively, human resource and organizational capacity needs will be regularly assessed. These assessments will be used to organize and better utilize existing staff, and identify technical and administrative human resource overlaps and gaps. The assessments will also identify and prioritize capacity building opportunities, and regional capacities and opportunities to coordinate and share resources with partners. Alternative human resource capacity-building measures, such as internships, volunteer programs, and partnerships, will be considered in the assessments as a means to increase staffing capacity.

***Activity CO-2.2: Improve human resources and organizational capacity.***

As funding, field-based housing, and other factors allow, the human resource and organizational capacity of the Monument will be enhanced to address specific needs and carry out the strategies and activities contained within the Monument Management Plan. Human resource development includes staff recruitment, retention, recognition, training, communication, regular meetings, time and attendance, as well as staff safety.

**Strategy CO-3: Assess and enhance physical infrastructure and facilities, as necessary, in the main Hawaiian Islands over the life of the plan.**

Effective and efficient human resources must be supported by sufficient physical infrastructure resources. Efforts will be ongoing to maintain existing facilities in the main Hawaiian Islands and design and improve facilities as required to support Monument administration and operations and to ensure compliance with the ADA.

***Activity CO-3.1: Regularly assess current status and future needs for infrastructure and facilities.***

In conjunction with assessments of human resource needs, infrastructure and facilities needs will also be reviewed to optimize facilities utilization. These assessments will aim to organize and better utilize existing facilities and infrastructure in the main Hawaiian Islands, identify physical resource overlaps and gaps, and identify needs to support projected future growth and collocation. These assessments will also identify and prioritize capacity building opportunities, and regional capacities and opportunities to coordinate and share resources with partners.

Additional educational venues, such as Mokuapāpapa, will be considered for development as stand-alone facilities or in partnership with existing educational and interpretive facilities. Additional consideration will be given to the already planned and scheduled NOAA transition to the NOAA consolidated facility.

***Activity CO-3.2: Maintain and improve infrastructure and facilities.***

Maintenance and retention of current physical assets and the procurement or lease of additional assets will be driven by need and available funding. All efforts will be made to combine utilization of assets among MMB agencies for more efficient use of available resources.

***Activity CO-3.3: Improve information technology infrastructure.***

Computer and information technology are an integral part of site infrastructure. Appropriate equipment will be acquired, upgraded, and maintained to meet management needs. New technologies will be regularly integrated (see Section 3.6.2, Information Management Action Plan).

**Table 3.6.1 Summary of Strategies, Activities, and Agency Leads for Central Operations**

### 3.6.2 Information Management Action Plan

#### Desired Outcome

Consolidate and make accessible relevant information to meet educational, management, and research needs for Papahānaumokuākea Marine National Monument.

Links to other Action Plans
3.1.1 Marine Conservation Science
3.1.4 Maritime Heritage
3.3.1 Permitting
3.3.2 Alien Species

#### Current Status and Background

Biogeographic studies, bathymetric spatial data, temporal analyses, research notes, maritime heritage data, Native Hawaiian cultural research, historic charts, published field project results, and other data all comprise the large and varied collection of NWHI information. These data sets include databases, oral histories, raw scientific results, physical specimens, and digital imagery. This collection has in the past been scattered among federal and state agencies, universities, museums, and other agencies and institutions in varied formats, and some has simply remained in the possession of the individual investigator. Often, the data are not adequately documented, creating the need for resource intensive validation for future integration purposes. Both the data and associated documentation are needed in order to be useful for long-term ecosystem-based management.

Links to Goals
Goal 1
Goal 2
Goal 3
Goal 4

Strategic efforts to address the broad issue of data management for the NWHI have begun. Multiagency Reef Assessment and Monitoring Program expeditions in the NWHI, begun in 2000, represent an initial attempt to establish a multiagency data clearinghouse for management purposes. To date, only a portion of the many years of existing NWHI data have been processed and made available.

Several complementary projects have been initiated to address information management needs. A GIS spatial bibliography database for the NWHI is under development. This GIS incorporates georeferenced journal articles, gray literature and other sources of information into a spatially reference on-line search tool. Additionally, an annotated bibliography of cultural resources for the NWHI is available on line at <http://www2.bishopmuseum.org/noaanwhi/index.asp>, which incorporates past cultural, geological, and biological studies in the NWHI. This annotated bibliography of past cultural, geological, and biological studies in the NWHI was created with the support of NOAA’s National Ocean Service and the Reserve. The resources catalogued are primarily available in the Bishop Museum Library and Archives, the libraries at the University of Hawai‘i at Mānoa, and the State of Hawai‘i Archives. Additionally, the Office of Hawaiian Affairs is developing an archipelago-wide Wahi Pana Database of cultural information, and the MMB is working to integrate this database with other Monument data sets.

The MMB also participates in the ONMS Information Management and Spatial Technology (IMaST) plan for all field sites. The IMaST plan organizes the many spatial resources within the National Marine Sanctuary System and makes them available to all sites and partner staff needing geospatial information, data, training, software, hardware, and hands-on experience. IMaST enhances capacity and integrates capabilities for site and national program staff in the utilization of geospatial technology.

Additionally, the MMB has initiated the development of a field-based data collection tool that will help to facilitate collection of research and vessel activity data from scientific expeditions conducted aboard research vessels active in the NWHI. This system will help to meet permit criteria for data management and reporting, and will assist in data entry, metadata recording, and data integrity. This system is one component of the larger information management system that is addressed in strategies outlined below and is already being developed based on management data needs.

### **Need for Action**

Access to accurate information is essential to implement an adaptive, ecosystem approach to the management of the Monument. A large amount of data have been, and will continue to be, collected on the NWHI environments by various state, federal, and academic institutions, as well as private-sector partners. Presently, results of research efforts are in multiple independent locations and in formats not readily available to resource managers, who need access to pertinent characterization information and up-to-date reports as a basis to make decisions for the protection of ecosystems. To address this difficulty, this action plan presents strategies and activities to develop a comprehensive data management and retrieval system, and to consolidate and organize information gathered from diverse sources, thus ensuring that stakeholders will share access to an expanding repository of knowledge on the NWHI.

### **Strategies to Achieve the Desired Outcome**

Research and information compilation on the Monument is ongoing; therefore, gathering and consolidating that information is also an ongoing process. A comprehensive approach is critical to achieving the desired outcome, which is to ensure that relevant information is collected and integrated in a standardized and useable manner, consolidated, and made accessible. Only a broad and comprehensive approach can ensure that information management will promote data gap analysis for the purposes of management and research. The Monument will not duplicate data, but along with partners, has already begun to build a decentralized information system that allows data discovery and access while allowing principal investigators and major agencies to house and maintain their own data.

The MMB will create the Papahānaumokuākea Information Management System (PIMS), a crucial tool for integrated management of the Monument. Aggregated data in the PIMS will provide material for multiple purposes, including outreach and education products, Monument management and evaluation, regional coordination among partners, and comparative data for regional research work. As a clearinghouse node for information, the PIMS must ensure that appropriate material is made available to managers, researchers, and the public in a timely manner. Some of the data available for management or research purposes may be of a sensitive nature and, therefore, not appropriate for public and education-focused release. Security procedures and policies will be in place to ensure that only appropriate users can access specific data, including proprietary cultural information.

Through the PIMS, managers will have access to integrated biogeographic and spatial analyses, maps, and reports that define the characterization of the ecosystem diversity, maritime heritage data, and Native Hawaiian cultural information to aid in evaluating the interaction and effectiveness of past, current, and future management efforts. Management of information in a

manner that is responsive to the changing needs of the Monument is part of an adaptive, ecosystem-based management system and ensures that NWHI research will be fully valued. The following strategies are designed to consolidate and make more readily available the abundance of useful information on the NWHI for management, research, education, and enforcement purposes. The strategies and activities are coded by the acronym for the action plan title, “Information Management” (IM). A summary of strategies and activities is provided in Table 3.6.2 at the end of this action plan.

- IM-1: Within 5 years, develop and implement a system for handling Monument data.
- IM-2: Within 5 years, facilitate appropriate access and use of PIMS.

**Strategy IM-1: Within 5 years, develop and implement a system for handling Monument data.**

The sources and types of NWHI data are diverse and do not necessarily adhere to uniform data management. For all data to be accessible by the PIMS, data protocols and Federal Geographic Data Committee-compliant metadata standards will be implemented. These standards must also adhere to existing data management and metadata protocols established by the federal government. Agreements between various agencies for data sharing, access, security, and use must also be developed and implemented.

***Activity IM-1.1: Develop and implement a data discovery, inventory, and acquisition strategy.***

A data discovery, inventory, and acquisition strategy will be developed and implemented based on meetings and workshops with partners and other organizations. The strategy will identify the types, format, and sources of existing information and data sets, as well as potential new data sources. Workshops will be held annually to review progress of data acquisition and revise the strategy as needed.

***Activity IM-1.2: Develop appropriate data management protocols, procedures, and agreements with partner agencies.***

One of the first tasks in information management, after data sources have been identified, is to develop and implement protocols for how data are collected, documented, stored, and shared, as well as their schema and format. Existing metadata standards within NOAA will be utilized to document the data. Agreements with data providers to define use and access restrictions, as well as data transfer methods, will be developed. A shipboard data collection tool is currently being developed and implemented aboard the NOAA ships active in the NWHI. This tool will help to facilitate data capture, standardization, and chain of custody. A rigorous quality assurance/quality control protocol will be developed and implemented to maintain information and data quality in the system in accordance with the Data Quality Act (Public Law 106-554). A long-term strategy for data assimilation and review will be developed in conjunction with data providers.

***Activity IM-1.3: Continue to design, build, and maintain the Papahānaumokuākea Information Management System.***

An information and database management system is being designed, developed, and configured to meet a broad spectrum of needs of the MMB, including Monument program and site applications, research and educational needs, and public access. The system is built on a sophisticated data model implemented in a relational database, and incorporates custom applications for spatial data management, tabular data management, data import/export and reconciliation, and reporting as an integral part of the data management strategy. Storage and security of data, as well as ease of access, are some of the issues that are being addressed. Agreements with data providers developed in the previous activity (IM-1.2) will be essential to the success and utility of this system, since the PIMS is not a massive data archive but is instead a system that defines interrelationships between distributed data sources, which are the vast majority of data. The PIMS stores some data that are not already maintained by other partner agencies, such as image and video data, and the spatial bibliography.

***Activity IM-1.4: Begin incorporating information into PIMS.***

A significant amount of effort will be involved in data entry, formatting, and regular review. A long-term strategy for data assimilation and review processes will be developed in conjunction with data providers. The prioritization of data entry will be based on specific management and scientific questions. This activity will initiate in-depth analyses to answer these questions. The data needed and accessed for these analyses will be documented and loaded into the inventory. Collaborative links to data that are being maintained by partners will be created and maintained to ensure seamless access to these data. Co-Trustee agencies will make data collected in the Monument available to the PIMS system.

**Strategy IM-2: Within 5 years, facilitate appropriate access and use of PIMS.**

Tools and protocols to access the data in PIMS need to be developed and deployed. Some information may be public domain, and other information, such as the exact locations of historic shipwrecks, will be restricted by law to protect the resources. Levels of access to the data will be determined through agreements with partners. Educational materials that interpret the data and make the information accessible and understandable to a wider audience will also be developed and deployed.

***Activity IM-2.1: Design tools for accessing the PIMS.***

Using the latest technologies, the MMB will develop tools for accessing, updating, analyzing, and retrieving PIMS data. Access tools will be primarily web-based. These tools will allow for integration into GIS, on-line analytical processing via open database connectivity, object linking and embedding, and synchronization with analogous database management system resources.

Tools will include integrated biogeographic and spatial analyses, maps, and reports that define the characterization of the ecosystem diversity, interaction, and health, and the effectiveness of past, current, and future management efforts.

***Activity IM-2.2: Assess data access needs and provide training for PIMS users.***

Assessing the uses of the PIMS will be an evolving process, and providing access will be tightly integrated with activity IM-2.1, above. Before any access is provided, rules and access restrictions will be determined to ensure security and confidentiality of the data. These restrictions will be established in coordination with data providers. A training program for management and other users of the PIMS will be developed so that access and use are facilitated.

***Activity IM-2.3: Develop interfaces to feed data to repositories such as National Biological Information Infrastructure, Pacific Basin Information Node, Coral Reef Information System, and Integrated Ocean Observing System.***

The MMB will maintain standardized metadata records for data indexed within the PIMS to help facilitate the population of other data repositories with NWHI data. To automate this process, agreements and data streaming and sharing mechanisms will need to be developed.

**Table 3.6.2 Summary of Strategies, Activities, and Agency Leads for Information Management**

Strategies and Activities	Agency Lead
<b>Strategy IM-1: Within 5 years, develop and implement a system for handling Monument data.</b>	
Activity IM-1.1: Develop and implement a data discovery, inventory, and acquisition strategy.	NOAA
Activity IM-1.2: Develop appropriate data management protocols, procedures, and agreements with partner agencies.	NOAA
Activity IM-1.3: Continue to design, build, and maintain the Papahānaumokuākea Information Management System.	NOAA
Activity IM-1.4: Begin incorporating information into PIMS.	NOAA
<b>Strategy IM-2: Within 5 years, facilitate appropriate access and use of PIMS.</b>	
Activity IM-2.1: Design tools for accessing the PIMS.	NOAA
Activity IM-2.2: Assess data access needs and provide training for PIMS users.	NOAA
Activity IM-2.3: Develop interfaces to feed data to repositories such as National Biological Information Infrastructure, Pacific Basin Information Node, Coral Reef Information System, and Integrated Ocean Observing System.	NOAA

### 3.6.3 Coordinated Field Operations Action Plan

#### Desired Outcome

Coordinate field activities and provide adequate infrastructure to ensure safe and efficient operations while avoiding impacts to the ecosystems in Papahānaumokuākea Marine National Monument.

**Links to other Action Plans**  
All Action Plans are related to carrying out field operations

#### Current Status and Background

Field operations in the Monument to support protection and management rely on ships, aircraft, seasonal field camps, and three field stations with varying degrees of infrastructure. Interagency planning and sharing of resources for fieldwork began with the Tripartite Commission’s work in the late 1970s (Tripartite Agreement 1978). Recent field activities in the NWHI continue this cooperative work through a number of projects. One of the most significant of these is the annual NWHI Reef Assessment and Monitoring Program (RAMP) research and outreach expeditions. These expeditions are made possible through sharing of both vessels and dive teams.

**Links to goals**  
Goal 1  
Goal 2  
Goal 3  
Goal 4  
Goal 7  
Goal 8

Two NOAA ships service the majority of ship based management needs in the Monument. The NOAA Ship *Oscar Elton Sette* first arrived in Hawai‘i in 2003 primarily to support the scientific missions of NMFS, Pacific Islands Fisheries Science Center in Honolulu. *Oscar Elton Sette* is a 224-foot T-AGOS-class research ship that is designed to conduct and facilitate research operations in remote areas. The ship normally operates throughout the central and western Pacific and conducts fisheries assessment surveys, physical and chemical oceanography, marine mammal projects, and coral reef research. The *Oscar Elton Sette* has participated in coordinated RAMP efforts since its arrival in 2003.

In September 2004, the NOAA ship *Hi‘ialakai* became the first oceanographic research platform primarily dedicated to the National Ocean Service.

*Hi‘ialakai*, the sister ship to the *Oscar Elton Sette*, is a 224-foot T-AGOS-class research ship that is designed to conduct and facilitate research operations in remote areas throughout the

NOAA Ship *Hi‘ialakai*. Photo: Dan Suthers

Pacific. The ship’s primary mission is to support the

research, monitoring, assessment, restoration, and outreach needs of NOAA’s National Ocean Service in waters around the Hawaiian Islands and the American Flag Territories. Maintenance and operations of NOAA ships are managed by NOAA Marine and Aircraft Operations.

Several other vessels, such as the NOAA ships *Ka‘imimoana* and *Okeanos Explorer*, the

University of Hawai‘i’s R/V *Kilo Moana* and R/V *Kaimikai-O-Kanaloa*, Coast Guard vessels, and chartered vessels, are engaged in mapping, deep-water benthic characterization, marine debris removal, protected species recovery activities, management-oriented research, and resupply missions to FWS and state land-based operations throughout the Monument. Collectively, these ships conduct approximately 10 to 12 missions per year during the months of April through November. Much of the field work conducted in the Monument is supported by NOAA ships.

FWS maintains permanent staff and infrastructure at Tern Island (French Frigate Shoals) and Midway Atoll, as well as a year-round FWS field camp at Laysan Island. The State maintains facilities at Kure Atoll, which are staffed for much of the year. Seasonal field camps are located at Nihoa, Lisianski Island, and Pearl and Hermes Atoll.

Midway Atoll NWR includes facilities and infrastructure left by the military when the Naval Air Facility closed. It includes 237 real property assets, including a Federal Aviation Administration (FAA)-approved commercial airport, numerous buildings, airplane hangars, roads, utilities, docks, seawalls, shipping channel, in addition to structures eligible for listing on the National Register of Historic Places. The infrastructure at Midway supports refuge management operations, airport operations, and a limited number of partners and visitors. The FWS and FAA have partnered together to manage Henderson Airfield and maintain Midway Atoll’s aging infrastructure. Over the past 6 years, FWS has been upgrading and rightsizing Midway’s operating systems, and FAA has constructed a new airfield operations building and provided funding for other airfield improvements.

By utilizing the existing World War II and Cold War era buildings, FWS managers are able to preserve the history of the atoll, provide support to the many ongoing management and research projects, and focus on protecting the islands and surrounding reefs for the benefit of the unique mix of species that live at Midway Atoll. In order to effectively plan for future Monument operations at Midway, the Midway Atoll Conceptual Site Plan was drafted. The Conceptual Site Plan (Volume IV) outlines the vision and practical realities of future uses and provides an overarching view of priority actions. Field infrastructure requirements for education, research, restoration, and management programs were identified by the MMB in a requirements planning process carried out in 2007.

Tern Island is the support hub for management operations at French Frigate Shoals. The facilities consist of 42 real property assets that remain from prior Coast Guard use. These facilities include shore protections, two septic tanks, a small barracks that serves as a residential and office facility, a single warehouse, several small storage and utility buildings, water catchment systems, a 3,000-foot crushed coral runway, a shipping channel, and a small boat ramp and dock. All of the Tern Island real property assets are utilized by and support MMB agencies and are maintained by FWS.

Laysan Island is a temporary year-round field camp that supports management of the island. The facility consists of seven temporary wood-framed platform tents used for sleeping, offices, communications, cooking, and storage. To support this field camp, a reverse osmosis water

system, a photovoltaic power system, and a hurricane shelter for high wind and surf emergencies are maintained. Laysan Island is currently accessible only by ship.

Green Island serves as the hub for the State of Hawai'i's Seabird Sanctuary at Kure Atoll. The facilities consist of storage buildings, a four room residential and office building, water tank, septic tank, a nonoperational coral runway, and a small boat pier. The assets on Green Island are maintained by the State.

#### *Past coordination efforts*

In the past, NOAA has hosted an annual NWHI field calendar meeting to facilitate overall field coordination among the Co-Trustees. The goal of this type of meeting was to create a master calendar of all field operations, scheduled flights, cruise plans, field camps, and similar activities. These meetings were open to managers, scientists, and staff from all agencies and groups conducting research or field activities in the NWHI. Attendees provided dates, places, and other logistical details of planned fieldwork to the calendar. Field activities typically included NOAA research vessel cruises, scheduled FWS charter flights to Midway and Tern Island, marine debris cleanup activities, ship charters to support FWS field stations, and special field activities such as *Hōkūle'a* voyages. The purpose of the common calendar was to increase coordination, efficiency, and safety for all NWHI fieldwork.

#### *Impacts of field work*

Well-planned field activities benefit wildlife habitats and historic and cultural resource protection, and are designed to minimize negative impacts to ecosystems, avoid redundant efforts, and achieve efficient use of agency resources. Each year, coordinated planning benefits management activities such as the multiagency-supported effort to remove derelict fishing gear from the reefs and beaches; implementation of endangered plant, monk seal, sea turtle, and bird recovery actions; management and restoration of marine and terrestrial species and their habitats; and conducting management-oriented research. This emphasis on coordinated planning and the application of consistent interagency permit requirements will prevent or minimize potential impacts that could be associated with these types of activities.

#### *Diving Protocols*

Standardization of safety training and diving protocols among different agencies has proved difficult in the past. MMB agencies have established interagency reciprocity agreements for diving protocols and with affiliated institutions of the American Academy of Underwater Sciences. These agreements are renewed and updated as necessary.

#### **Need for Action**

Appropriate vessels, aircraft, facilities, equipment, and training are critical to carrying out field operations in a safe and effective manner. Coordinating these assets among Co-Trustees is central to achieving the goals of the Monument. Field coordination among the MMB and the ICC provides for efficient use of public funds, increased availability of assets, reduced duplication of effort, and minimized impacts to Monument resources. Because of the remote nature of the region and limited availability of facilities, coordination is essential to the success of activities such as emergency response, wildlife and habitat management, law enforcement, research, as well as marine debris removal and other threat reduction tasks.

This plan provides strategies and activities for coordinating the implementation of low-impact field operations by ensuring that necessary facilities, equipment, and transportation are available and that staff is properly trained (see Section 3.3.4, Emergency Response and Damage Assessment Action Plan). One of the important principles in all of these strategies and activities is to use the latest “greening” methodologies and technologies in future operations and infrastructure improvement projects at Midway and all other field sites, including NOAA ships. As required, facilities and other infrastructure will be ADA compliant.

### **Strategies to Achieve the Desired Outcome**

Nine strategies have been identified for achieving the desired outcome of coordinating field activities and providing adequate infrastructure to ensure safety and efficient operations while avoiding impacts to ecosystems in the Monument. The strategies and activities are coded by the acronym for the action plan title, “Coordinated Field Operations” (CFO). A summary of strategies and activities is provided in Table 3.6.3 at the end of this action plan.

- CFO-1: Conduct necessary site planning and infrastructure improvements to increase safety and enhance Monument field operations capacity over the life of the plan.
- CFO-2: Enhance interagency planning and coordination for field operations in support of Monument protection and management, and develop protocols and processes that will be utilized throughout the life of the plan.
- CFO-3: Maintain and improve housing and field camp safety and operational efficiency using short-, medium- and long-term approaches to protect Monument resources across the life of the plan.
- CFO-4: Meet fuel requirements for aircraft, vessel, utility, and equipment needs at Midway Atoll to support operations to protect and manage Monument resources.
- CFO-5: Rehabilitate critical utility systems and ailing structures and facilities at Midway Atoll within 5 to 15 years.
- CFO-6: Within 5 years, improve the small boat operational capacity to enable quick, reliable access to the region in support of protection and management and continue to enhance the program throughout the life of the plan.
- CFO-7: Within 5 years, identify interisland aircraft transportation needed to protect and manage the Monument.
- CFO-8: Develop a safe and comprehensive dive operations program for Monument management activities within 5 years.
- CFO-9: Provide for necessary research, education, visitor, and administrative facilities that will further the protection of Monument resources across the life of the plan.

### **Strategy CFO-1: Conduct necessary site planning and infrastructure improvements to increase safety and enhance Monument field operations capacity over the life of the plan.**

In-depth site planning and analyses are needed to ensure that field operations align with the purpose and mission of the Monument, as well as the purposes of the Midway Atoll and Hawaiian Islands National Wildlife Refuges, NWHI Coral Reef Ecosystem Reserve, the State of Hawai‘i NWHI Marine Refuge, and the Seabird Sanctuary at Kure Atoll. This effort will help

meet the shared responsibilities for management, emergency response, enforcement, education, recreation, and research in the Monument.

***Activity CFO-1.1: Initiate and complete necessary planning to implement the Midway Atoll Conceptual Site Plan.***

Substantial time and resources are required for infrastructure rehabilitation, reconstruction, and development included in the Midway Atoll Conceptual Site Plan (Volume IV). Priority actions for Midway have been identified in Chapter 6 of the Midway Atoll Conceptual Site Plan and are included in this action plan. Several of these actions are projected for completion in the short term, while others will require additional planning and environmental analysis and are anticipated to take place over the life of the plan.

***Activity CFO-1.2: Develop conceptual site plans for Hawaiian Islands National Wildlife Refuge and Seabird Sanctuary at Kure Atoll to enhance management and restoration capabilities.***

Individual conceptual site plans will be developed for the Hawaiian Islands NWR and the State Seabird Sanctuary at Kure Atoll to identify long-term infrastructure alternatives and priorities. These plans will be based on the identification of field requirements developed by the MMB in 2007 and will assess the opportunity for education, research, habitat restoration, and management programs. It is anticipated that these plans will be developed within 3 years.

***Activity CFO-1.3: Develop alternative energy system and waste reduction strategies for the Monument within 2 years.***

In accordance with agency building standards, the strategy will consider solar and other renewable energy generation, integration of kitchen waste with biodiesel or other sustainable fuel types use in machinery, composting of food waste, growing produce on site (at Midway only), passive lighting and cooling, and replacing aging infrastructure using sustainable nontoxic building materials. Each building will be evaluated to determine the feasibility of generating its own power. In the interim period, proven energy efficiencies will be implemented.

***Activity CFO-1.4: Plan for use of sustainable engineering, technology, and landscape architecture for facilities and assets throughout the Monument.***

In support of the “Greening of America” government-wide initiative, the managing agencies will apply feasible “greening” methodologies and technologies to future operations and infrastructure improvement projects at Midway and all other field sites, including NOAA ships. Greening will also be applied to alternative transportation options and opportunities, particularly at Midway. These green principles will be applied to the operation of vehicles at Midway, small boats, selection of nontoxic lubricants and maintenance materials, and development of fuel capacity.

**Strategy CFO-2: Enhance interagency planning and coordination for field operations in support of Monument protection and management, and develop protocols and processes that will be utilized throughout the life of the plan.**

One of the Monument’s operating principles is to use effective planning and communication to coordinate activities in order to minimize resource impacts, avoid redundant or duplicative efforts, and achieve efficient use of agency resources in the implementation of priority

management needs. The MMB will work with partners in planning field operations for these purposes and to contribute to the success of each project. Ship scheduling, coordination of logistical support, and interagency collaboration are elements of field operations that will be addressed in advance of each field season.

***Activity CFO-2.1: Develop interagency agreements to facilitate effective field coordination throughout the Monument.***

Interagency agreements to coordinate field operations, share resources, and commit to joint implementation of field priorities will be developed as appropriate. Agreements will be considered among the Co-Trustee agencies and the Interagency Coordinating Committee, as appropriate. (See Section 3.5.1, Agency Coordination Action Plan)

***Activity CFO-2.2: Develop and implement standardized field operation protocols.***

Environmental, safety, and preparedness protocols for field operations consistent with partner agency standards will be developed to provide resource protection and safe field operations. A field operations manual will be prepared and updated as needed that includes these protocols, as well as protocols and chain of command procedures for reporting environmental and safety incidents, personnel communication, and evacuations. All principal investigators and managers working in the NWHI will receive a copy of the field operations manual.

***Activity CFO-2.3: Assess threats that field activities pose to Monument resources.***

Permitted activities will be monitored through field activity reports to assess the threats they may pose to the resources. Reporting requirements will be developed with partners that will draw on existing databases when available. Any incidents will be tracked to assess potential damages to resources. Data will be managed in PIMS to provide for adaptive management by the MMB in conducting or authorizing future field activities (see the Information Management Action Plan, Section 3.6.2).

***Activity CFO-2.4: Annually coordinate field operations to efficiently deploy personnel and share resources among agency partners.***

The MMB will create an annual NWHI master field calendar of all field operations, scheduled flights, cruise plans, field camps, and similar activities. Agency partners will contribute information on dates and locations of research, management, and field activities in the NWHI. The common field calendar will be developed to ensure that the highest priority management needs are met as efficiently and economically as possible, and with the highest possible level of safety.

***Activity CFO-2.5: Develop a staff coordination agreement between Midway Atoll NWR and the State Seabird Sanctuary at Kure Atoll.***

To assist in island management activities, occasional site “exchange” visits will be conducted between the State and FWS staff at Midway and Kure Atolls. These visits will ensure that habitat restoration and management activities and wildlife monitoring activities are coordinated between FWS and the State.

**Strategy CFO-3: Maintain and improve housing and field camp safety and operational efficiency using short-, medium-, and long-term approaches to protect Monument resources across the life of the plan.**

There is a critical need to plan and design facilities at various field sites to ensure that activities can be accomplished without impairing the ecosystem. Some of the field sites within the Monument include existing buildings, roads, airstrips, and other structures. Many of these buildings are important for management of the Monument. Others will be removed as they outlast their useful life. As structures are re-used and others removed, we expect a net decrease in the number of facilities within the Monument. The needs of resources, visitors, staff, volunteers, contractors, researchers, and educators will be considered, as well as temporary accommodations in case of emergency aircraft landings, ship evacuations, or emergency response events. As stated in Activity CFO-1.4, the MMB will apply all feasible green engineering methods and technologies to all future projects.

***Activity CFO-3.1: Design and construct a pilot low-impact shelter.***

A low-impact shelter will be built on the footprint of a previously existing building, as a pilot project in the housing zone on Midway Atoll within 4 years in accordance with the Midway Atoll Conceptual Site Plan. This pilot project will serve to gauge the feasibility of using this type of structure on Midway. These structures may be used to replace aging, energy-inefficient buildings and will be designed to optimize renewable energy resources. The buildings will incorporate recycled materials, will be nonpolluting, and may potentially increase the available wildlife habitat. The buildings will serve as lodging for short-term and transient visitors.

***Activity CFO-3.2: Utilize the existing footprint of Bravo Barracks for replacement housing at Midway Atoll.***

Bravo Barracks houses permanent operations and maintenance personnel, but the end of its current useful life is within 3 years. The barracks are in critical need of demolition and replacement or major repair. Replacement or improvement is essential in order to provide safe housing for personnel to sustain island operations. The replacement building will be designed to optimize renewable energy resources and improve wildlife habitat.

***Activity CFO-3.3: Utilize the existing footprint of Charlie Barracks for replacement housing at Midway Atoll.***

Charlie Barracks replacement or major repair is essential in order to provide safe housing for island visitors and transient personnel. Such improvement is envisioned to take place within 10 years and will follow the low-impact guidelines.

***Activity CFO-3.4: Rehabilitate “Officers’ Row” Housing at Midway Atoll.***

The ten historic Officers’ Row houses, present during the Battle of Midway, serve as examples of historic Albert Kahn architecture and are identified for restoration in the draft Midway Atoll Conceptual Site Plan. Optimizing the housing capacity within these existing structures will accommodate increased agency and partner personnel without adding structures to the island. The rehabilitation of these structures would take place within 10 years.

***Activity CFO-3.5: Maintain and enhance, where appropriate, the infrastructure at Kure Atoll.***

Well-established, permanent biological monitoring and restoration programs at Kure Atoll are dependent on existing housing and facilities on Green Island at Kure Atoll. Given the harsh environmental conditions that exist, there is an ongoing need to maintain, improve, or replace communications equipment, solar power and water production units, sewage treatment infrastructure, buildings, and equipment. All field operations requirements at Kure Atoll will be assessed in accordance with Activity CFO-1.2.

***Activity CFO-3.6: Maintain and enhance, where appropriate, the infrastructure at French Frigate Shoals.***

A permanent biological field station exists on Tern Island at French Frigate Shoals. The biological monitoring programs that operate from the island are dependent on existing housing, warehouses, small boat facilities, and a short coral rubble air strip. Given the harsh environmental conditions, there is an ongoing need to maintain, improve or replace communications equipment, solar power and water production units, buildings, and equipment. For example, the barracks roof requires replacement by 2012. All field operations requirements at French Frigate Shoals will be assessed in accordance with Activity CFO-1.2.

***Activity CFO-3.7: Evaluate, maintain, and enhance the small tent field camp at Pearl and Hermes Atoll on Southeast Island.***

A seasonal three-person tent field camp is currently maintained at Pearl and Hermes Atoll to support the long-term Hawaiian monk seal population monitoring and recovery effort. Periodic overwashing of the islands by storm surges will require tent platforms to be built as soon as possible to provide for personnel safety and to minimize resource impacts. A year-round small tent camp is also needed to improve habitat by supporting invasive plant species eradication. The establishment of a permanent field camp in addition to upgrading the existing seasonal camp will be evaluated in accordance with Activity CFO-1.2.

***Activity CFO-3.8: Maintain and enhance the existing tent field camp at Laysan Island to support on the ground management and restoration capacity.***

An intensive alien species eradication and native habitat restoration program is currently under way at Laysan Island. A year-round presence of staff on island is necessary. Staff reside in a minimal tent camp, which requires routine maintenance and replacement of solar power, water purification, and communications equipment, as well as periodic replacement of tents and other structures.

**Strategy CFO-4: Meet fuel requirements for aircraft, vessel, utility, and equipment needs at Midway Atoll to support operations to protect and manage Monument resources.**

The current fuel capacity at Midway Atoll was designed to meet the requirements of the FWS, FAA, and the Coast Guard. This capacity includes fuel for island power supply, aircraft, and heavy equipment and a limited amount of gasoline for small boats and vehicles. Additional Co-Trustee fuel requirements will be met by adding storage capacity, using biodiesel or other sustainable fuel types, and improving fuel efficiency in all of Midway's operations.

***Activity CFO-4.1: Maintain recently replaced fuel farm at Midway Atoll.***

The Midway Atoll fuel farm is designed to meet current FWS, FAA, and Coast Guard needs. In the short term, a Memorandum of Agreement will be drafted describing how the MMB agencies can share and replenish existing supplies, while increasing the capacity of gasoline, biodiesel, or other sustainable fuel types. The MMB will convert existing and new small boats, vehicles, heavy equipment, and generators to more fuel-efficient models using other sustainable fuel types where feasible.

***Activity CFO-4.2: Develop biodiesel fuel capacity or other sustainable fuel types at Midway Atoll within 2 years.***

The MMB will work toward converting existing and new small boats, vehicles, and heavy equipment to the use of biodiesel or other sustainable fuel types where feasible. Two locations will be evaluated for storage and distribution of this type of fuel. The first is located on the concrete pad adjacent to the north seawall on the inner harbor of the atoll. This location has the advantage of being close to future small boat piers, which would allow for simple and safe fueling procedures. However, this would require regular supervision of this fuel supply in addition to that required at the fuel farm. Alternatively, the fuel could be stored at the existing fuel farm location, but this option would necessitate a fueling truck or the use of boat trailers to complete fueling operations.

**Strategy CFO-5: Rehabilitate critical utility systems and ailing structures and facilities at Midway Atoll within 5 to 15 years.**

A number of centralized systems, such as water and sewage, and a number of facilities and buildings are utilized by personnel throughout the Monument. Critical infrastructure is also the backbone of all operations that support Midway's conservation and management purpose. Without substantial investment in the rehabilitation and repair of these resources, operations would be seriously impaired. System needs have been identified through the draft Midway Atoll Conceptual Site Plan and will continue to be evaluated to reduce reliance on centralized utilities. All rehabilitation and repair work will follow low-impact guidelines. Additional needs for other islands and atolls throughout the Monument will be developed in the future, as cited in Activity CFO-1.2.

***Activity CFO-5.1: Rehabilitate water catchment and distribution system.***

Within 5 years, the water catchment and distribution system will be rehabilitated in order to adequately supply existing needs and those envisioned in the draft Midway Atoll Conceptual Site Plan.

***Activity CFO-5.2: Rehabilitate septic and wastewater systems.***

Reliable septic and wastewater systems will be required to support existing and additional needs envisioned in the draft Midway Conceptual Site Plan. The rehabilitation of these systems will take place within 5 years.

***Activity CFO-5.3: Treat all wooden historic structures at Midway Atoll for termites.***

All wooden historic structures must be treated for termites within 3 to 5 years in order to maintain the structural integrity of the buildings. Without treatment, the buildings will deteriorate beyond repair.

***Activity CFO-5.4: Evaluate and optimize food services as necessary.***

The Clipper House currently serves as the primary food service facility at Midway. Overall food services will need to be optimized to accommodate population needs.

***Activity CFO-5.5: Rehabilitate seaplane hangar.***

Because of its size (large enough to hold heavy equipment, boats, and workshops), its location (short distance from inner harbor and boat ramp), and its historic significance (designed by Albert Kahn and still contains scars from the Battle of Midway), the seaplane hangar needs to be maintained. A priority is to replace the roof of the building.

***Activity CFO-5.6: Repair inner harbor sea wall.***

The inner harbor is critical to operations at Midway. Any future docking and pier facilities in the harbor must be preceded by the repair of the existing seawall within 15 years.

**Strategy CFO-6: Within 5 years, improve the small boat operational capacity to enable quick, reliable access to the region in support of protection and management and continue to enhance the program throughout the life of the plan.**

Improved access to the islands and atolls of the NWHI has been identified as a top priority. Small boat support is a key component to reliable access between islands and around individual island reef systems. Small boat capacity is instrumental to research, conservation, enforcement, outreach, education, and emergency response throughout the archipelago.

***Activity CFO-6.1: Inventory, maintain, and coordinate the use of small boats and related field resources.***

The Co-Trustees have a variety of small boats and related field resources that are used for fieldwork within the Monument. An inventory of small boats and support equipment will be conducted Monument-wide to determine whether these resources can be used more effectively by the Co-Trustees and to reduce duplicative efforts.

***Activity CFO-6.2: Within 2 years, station additional vessels at Midway for use during the summer marine research field season.***

New vessels will be used to support existing field activities at Midway Atoll and to establish an annual research and monitoring program for marine debris, maritime heritage, and coral reef communities. These vessels will expand the range of operations both inside and outside the lagoon as well as to neighboring islands and atolls on a limited basis.

***Activity CFO-6.3: Within 5 to 10 years, station a small research/enforcement vessel at Midway Atoll.***

A small research/enforcement vessel would expand research, enforcement, education, response, and restoration capabilities from French Frigate Shoals to Kure Atoll. Repair and maintenance facilities will be improved at Midway, and full-time support personnel will be identified to properly manage this asset. This vessel will be permanently based at Midway, but could also be based out of the main Hawaiian Islands for part of the year to service the southeastern portions of

the Monument. This vessel will provide the opportunity to dedicate short cruises to individual projects on a regular basis.

***Activity CFO-6.4: Construct new finger piers inside of Midway's inner harbor.***

To meet the small boat needs, within 5 years evaluate the structural integrity of the inner harbor seawall, make appropriate improvements, and construct up to three finger piers. These piers will be designed to simplify, and increase the safety, of fueling and loading as well as to provide short-term in-water storage for a variety of small boats. Any new piers will follow the low-impact guidelines. Midway's inner harbor is not fully protected from outside sea conditions, and additional piers will allow for sheltered small boat storage under a variety of conditions.

***Activity CFO-6.5: Redevelop existing boathouse at Midway into a multiuse facility.*** Consistent with the priorities contained within the Midway Atoll Conceptual Site Plan, redevelop the existing boathouse at Midway into a multipurpose boathouse, dive center, and storage facility. The facility will have maintenance bays for servicing small boats and a dive locker, including a compressor, recompression chamber, appropriate storage, and work area. The facility may also include temporary, short-term bunk space and limited, interim lab space until other facilities were renovated and reconstructed to meet these needs. The building will be re-sited and potentially raised to address concerns over flooding on the seaplane pad, and to minimize resource impacts. Small boat operations depend on a reliable means of removing the boats from the water. At present, the seaplane ramp that is used is not sufficiently steep and results in inadvisable launch and recovery methods. A new boat ramp will be constructed to address this concern, while renovating the adjacent small boat pier.

***Activity CFO-6.6: Evaluate needed improvements to Pier No. 1 in the ship basin and the Tug Pier at Midway Atoll.***

In order to ensure access for large vessels such as NOAA, Coast Guard, and university research vessels, Pier No. 1 and the Tug Pier will be evaluated for needed renovations and maintenance. The ability for ships to dock at Midway, in conjunction with reliable air transport, will assist in efficient research operations and crew changes on cruises, while also providing an additional place for supply ships and other vessels to dock. All pier renovations will follow the low-impact guidelines.

***Activity CFO-6.7: Make needed improvements to or replace the pier at Eastern Island.***

Eastern Island pier renovation is required to ensure continued access for researchers and field workers. Attention is required as soon as feasible to prevent damage to boats and improve passenger safety. Eastern Island pier renovations will follow the low-impact guidelines.

**Strategy CFO-7: Within 5 years, identify interisland aircraft transportation needed to protect and manage the Monument.**

The small number of regularly scheduled flights to and from the Monument is a limiting factor to the expansion of a visitor services program and science station at Midway Atoll, and a host of management, research, educational activities, and enforcement and emergency response throughout the Monument. Frequent and reliable access in support of these activities is needed. Regular flights are currently contracted and managed by the FWS. Additional flights are

currently booked by individual entities on an as-needed basis, which contributes to their high costs. The following activities will be conducted to ensure that Monument aircraft needs are considered and met.

***Activity CFO-7.1: Identify a reliable, efficient, cost-effective aircraft service to improve the delivery capacity of personnel and cargo between Honolulu and Midway.***

Without reliable air transport, the vast majority of current operations at Midway, as well as many operations in the other islands of the NWHI, would cease to exist. Air transport maintains the link between Midway and Honolulu and allows Midway to serve as the logistical hub for the northern end of the archipelago. Air transport is currently limited by the small cargo and personnel capacity of the aircraft being used. Identifying a more capable aircraft service is key to optimizing the operations on Midway and other areas within the Monument.

***Activity CFO-7.2: Within 5 to 10 years, evaluate the need for a dedicated aircraft for transportation, research, evacuation, education, surveillance, management, and enforcement in the Pacific region.***

A shared aircraft that would be used across the Pacific region, throughout the year or seasonally, may be an effective way to defray the high costs of air transportation. Maintenance facilities and staffing would need to be considered if such a craft were acquired. The need for a dedicated aircraft will be evaluated within 5 to 10 years.

***Activity CFO-7.3: Within 15 years, acquire appropriate aircraft to service the Monument and the Pacific region.***

Pending the outcome of the evaluation (Activity CFO-7.2), an appropriate aircraft or use of multiple platforms will be acquired as necessary to meet the needs of the Monument and region.

**Strategy CFO-8: Develop a safe and comprehensive dive operations program for Monument management activities within 5 years.**

Coordinated dive operations are critical to effectively and safely carrying out marine research, monitoring, emergency response, and management activities. Such a program will require infrastructure and equipment investments, training, interagency communication and agreements, and compliance with all agency requirements.

***Activity CFO-8.1: Refurbish or replace the dive recompression chamber at Midway.***

A dive recompression chamber was installed and refurbished on Midway in the late 1990s in support of commercial dive tour operations and research. The chamber has not been serviced in more than 5 years and needs to be assessed and refurbished or replaced. This chamber would be maintained by an on-site chamber operator or dive technician.

***Activity CFO-8.2: Investigate acquisition of a portable dive recompression chamber for use on a small research vessel.***

A small, portable recompression chamber aboard the small research vessel referenced in CFO-6.3 would vastly extend the SCUBA-based research capacity of scientists in the remote NWHI. This equipment would be based at Midway and maintained by an on-site chamber operator or dive technician.

***Activity CFO-8.3: Incorporate a dive operations center into the refurbished boathouse facility at Midway.***

Consistent with the draft Midway Atoll Conceptual Site Plan, the boathouse facility on Sand Island should be re-sited and refurbished to include a dive center complete with storage, maintenance facility, compressor, recompression chamber, and dive locker, as articulated in Activity CFO-6.5.

***Activity CFO-8.4: Support interagency dive operations.***

Agency dive supervisors will support interagency and contract field operations by maintaining updated reciprocity agreements, open communication among agency dive masters and chief scientists, and current records on agency and contract divers to ensure certifications and training requirements are current. Each agency is responsible for maintaining and ensuring the proficiency of its divers.

**Strategy CFO-9: Provide for necessary research, education, visitor, and administrative facilities that will further the protection of Monument resources across the life of the plan.**

A variety of infrastructure needs have been identified by the MMB and partner agencies for research, education, visitor interpretation, and administration to effectively meet the vision, mission, and goals of the Monument. Planning and appropriate redevelopment of existing buildings and limited construction of new low-impact facilities will take place according to the priorities identified in the draft Midway Atoll Conceptual Site Plan and the future Seabird Sanctuary at Kure Atoll and Hawaiian Islands National Wildlife Refuge conceptual site plans, as cited in Activity CFO-1.2.

***Activity CFO-9.1: Design a marine laboratory at Midway and develop in phases.***

A variety of needs will be met by the development of a marine laboratory at Midway. An evaluation and planning effort will help determine if the research and educational needs of potential users will be best met by developing several small facilities over time, or by a design that allows new requirements to be filled as they arise. Initially, the laboratory would provide basic amenities to augment research and education capacity including field schools, seasonal research, and long-term monitoring. A monk seal captive care facility (as outlined in Activity CFO-9.2), wet/dry laboratory infrastructure, and quarantine standards will be included in the plan and engineered as funding becomes available. Several existing buildings are well suited for conversion into a laboratory and will be evaluated to determine which is the most appropriate site.

***Activity CFO-9.2: Complete planning for and construct a captive care monk seal facility on Sand Island.***

A monk seal captive care facility at Midway Atoll has been identified as a critical component for survival of the species. Holding tanks, water treatment and pumping capability, freezer storage, and a dedicated food preparation area are required to be included in this facility, which will dramatically improve the effectiveness of rehabilitating ailing monk seals in the NWHI.

***Activity CFO-9.3: Provide logistical, infrastructure, and transportation support for threatened and endangered species recovery actions.***

Advanced recovery efforts, particularly efforts to address juvenile survival, will require logistical, infrastructure, and transportation capabilities that currently do not exist. For example, the ability to hold Hawaiian monk seals in a temporary facility, likely on Midway Atoll, is a critical component of these types of recovery actions. The ability to transport threatened and endangered species, equipment, and personnel among the various atolls is a challenge to animal relocation efforts, as is the capture and return of animals that may be brought into captivity for nutritional support or medical treatment.

***Activity CFO-9.4: Complete Phase I rehabilitation of Midway Mall and the commissary building.***

Collectively, the commissary building and the Midway Mall present ideal central locations for MMB and partner offices, classroom space, storage, visitor services, and basic laboratory space. Phase I rehabilitation of Midway Mall and the commissary will include cleaning and maintenance, renovation of office and classroom space and a feasibility study of how best to incorporate solar and other renewable energy, a green roof, and other sustainable design principles. The complete Midway Mall rehabilitation will require more substantial work and resources.

***Activity CFO-9.5: Construct airport welcome center on Sand Island within 2 years.***

A passenger terminal/welcome facility will be constructed at the airport to handle passenger arrival to and departures from Midway. This simple facility will offer restrooms, baggage handling, and a waiting area out of the weather. Design of the welcome center will follow the low-impact guidelines.

**Table 3.6.3 Summary of Strategies, Activities, and Agency Leads for Coordinated Field Operations**

Strategies and Activities	Agency Lead
<b>Strategy CFO-1: Conduct necessary site planning and infrastructure improvements to increase safety and enhance Monument field operations capacity over the life of the plan.</b>	
Activity CFO-1.1: Initiate and complete necessary planning to implement the Midway Atoll Conceptual Site Plan.	FWS
Activity CFO-1.2: Develop conceptual site plans for Hawaiian Islands National Wildlife Refuge and Seabird Sanctuary at Kure Atoll to enhance management and restoration capabilities.	State of Hawai'i FWS
Activity CFO-1.3: Develop alternative energy system and waste reduction strategies for the Monument within 2 years.	FWS
Activity CFO-1.4: Plan for use of sustainable engineering, technology, and landscape architecture for facilities and assets throughout the Monument.	FWS
<b>Strategy CFO-2: Enhance interagency planning and coordination for field operations in support of Monument protection and management, and develop protocols and processes that will be utilized throughout the life of the plan.</b>	
Activity CFO-2.1: Develop interagency agreements to facilitate effective field coordination throughout the Monument.	NOAA
Activity CFO-2.2: Develop and implement standardized field operation protocols.	FWS
Activity CFO-2.3: Assess threats that field activities pose to Monument resources.	NOAA
Activity CFO-2.4: Annually coordinate field operations to efficiently deploy personnel and share resources among agency partners.	NOAA
Activity CFO-2.5: Develop a staff coordination agreement between Midway Atoll NWR and the State Seabird Sanctuary at Kure Atoll.	State of Hawai'i
<b>Strategy CFO-3: Maintain and improve housing and field camp safety and operational efficiency using short-, medium- and long-term approaches to protect Monument resources across the life of the plan.</b>	
Activity CFO-3.1: Design and construct a pilot low-impact shelter.	FWS
Activity CFO-3.2: Utilize the existing footprint of Bravo Barracks for replacement housing at Midway Atoll.	FWS
Activity CFO-3.3: Utilize the existing footprint of Charlie Barracks for replacement housing at Midway Atoll.	FWS
Activity CFO-3.4: Rehabilitate "Officers Row" Housing at Midway Atoll.	FWS
Activity CFO-3.5: Maintain and enhance, where appropriate, the infrastructure at Kure Atoll.	State of Hawai'i
Activity CFO-3.6: Maintain and enhance, where appropriate, the infrastructure at French Frigate Shoals.	FWS
Activity CFO-3.7: Evaluate, maintain, and enhance the small tent field camp at Pearl and Hermes Atoll on Southeast Island.	FWS
Activity CFO-3.8: Maintain and enhance the existing tent field camp at Laysan Island to support on the ground management and restoration capacity.	FWS

Strategies and Activities	Agency Lead
<b>Strategy CFO-4: Meet fuel requirements for aircraft, vessel, utility, and equipment needs at Midway Atoll to support operations to protect and manage Monument resources.</b>	
Activity CFO-4.1: Maintain recently replaced fuel farm at Midway Atoll.	FWS
Activity CFO-4.2: Develop biodiesel fuel capacity or other sustainable fuel types at Midway Atoll within 2 years.	NOAA FWS
<b>Strategy CFO-5: Rehabilitate critical utility systems and ailing structures and facilities at Midway Atoll within 5 to 15 years.</b>	
Activity CFO-5.1: Rehabilitate water catchment and distribution system.	FWS
Activity CFO-5.2: Rehabilitate septic and wastewater systems.	FWS
Activity CFO-5.3: Treat all wooden historic structures at Midway Atoll for termites.	FWS
Activity CFO-5.4: Evaluate and optimize food services as necessary.	FWS
Activity CFO-5.5: Rehabilitate seaplane hangar.	FWS
Activity CFO-5.6: Repair inner harbor sea wall.	FWS
<b>Strategy CFO-6: Within 5 years, improve the small boat operational capacity to enable quick, reliable access to the region in support of protection and management and continue to enhance the program throughout the life of the plan.</b>	
Activity CFO-6.1: Inventory, maintain, and coordinate the use of small boats and related field resources.	NOAA
Activity CFO-6.2: Within 2 years, station additional vessels at Midway for use during the summer marine research field season.	NOAA
Activity CFO-6.3: Within 5 to 10 years, station a small research/enforcement vessel at Midway Atoll.	NOAA
Activity CFO-6.4: Construct new finger piers inside of Midway's inner harbor.	FWS
Activity CFO-6.5: Redevelop existing boathouse at Midway into a multiuse facility.	FWS NOAA
Activity CFO-6.6: Evaluate needed improvements to Pier No. 1 in the ship basin and the Tug Pier at Midway Atoll.	FWS
Activity CFO-6.7: Make needed improvements to or replace the pier at Eastern Island.	FWS
<b>Strategy CFO-7: Within 5 years identify interisland aircraft transportation needed to protect and manage the Monument.</b>	
Activity CFO-7.1: Identify a reliable, efficient, cost-effective aircraft service to improve the delivery capacity of personnel and cargo between Honolulu and Midway.	FWS
Activity CFO-7.2: Within 5 to 10 years, evaluate the need for a dedicated aircraft for transportation, research, evacuation, education, surveillance, management, and enforcement in the Pacific region.	NOAA
Activity CFO-7.3: Within 15 years, acquire appropriate aircraft to service the Monument and the Pacific region.	NOAA
<b>Strategy CFO-8: Develop a safe and comprehensive dive operations program for Monument management activities within 5 years.</b>	
Activity CFO-8.1: Refurbish or replace the dive recompression chamber at Midway.	NOAA

<b>Strategies and Activities</b>	<b>Agency Lead</b>
Activity CFO-8.2: Investigate acquisition of a portable dive recompression chamber for use on a small research vessel.	NOAA
Activity CFO-8.3: Incorporate a dive operations center into the refurbished boathouse facility at Midway.	FWS NOAA
Activity CFO-8.4: Support interagency dive operations.	NOAA State of Hawai‘i FWS OHA
Strategy CFO-9: Provide for necessary research, education, visitor and administrative facilities that will further the protection of Monument resources across the life of the plan.	
Activity CFO-9.1: Design a marine laboratory at Midway and develop in phases.	FWS NOAA
Activity CFO-9.2: Complete planning for and construct a captive care monk seal facility on Sand Island.	FWS NOAA
Activity CFO-9.3: Provide logistical, infrastructure, and transportation support for threatened and endangered species recovery actions.	NOAA
Activity CFO-9.4: Complete Phase I rehabilitation of Midway Mall and the commissary building.	FWS
Activity CFO-9.5: Construct airport welcome center on Sand Island within 2 years.	FWS

### 3.6.4 Evaluation Action Plan

#### Desired Outcome

Determine the degree to which management actions are achieving the vision, mission and goals of Papahānaumokuākea Marine National Monument.

#### Current Status and Background

The Monument evaluation process is designed to meet specific site-level vision, mission, goals, and desired outcomes, as well as FWS', NOAA's, and the State of Hawai'i's overarching missions, goals, and priorities. The Government Performance and Results Act seeks to make the federal government more accountable to the American people for the tax dollars it spends and the results it achieves. NOAA and FWS view the use of performance measures for assessment and evaluation as critical to continued success.

Act 100, Session Laws of Hawaii, 1999, 'Relating to Government Operations' holds departments and agencies of the State of Hawai'i responsible for identifying their goals, objectives, and policies in order to provide a basis for determining priorities and allocating limited public funds and human resources. The State of Hawai'i DLNR approach in responding to these requirements was to develop an annual response that includes goals and objectives against which performance will be measured over the next one, two, and five years. This approach is designed to produce a more effective tool for measuring performance and will assist DLNR in establishing departmental priorities (DLNR Report to the Twenty-Fourth 2008 Legislature).

NOAA's strategic plan (2004a) and NOAA's National Ocean Service Strategic Plan (NOAA 2003a) outline four mission goals and six cross-cutting priorities. ONMS falls under the first mission goal:

Protect, restore, and manage the use of coastal and ocean resources through ecosystem-based management.

The ONMS also clearly supports five of the six cross-cutting priorities:

- Integrated global environmental observation and data management system
- Environmental literacy, outreach, and education
- Sound, reliable, state-of-the-art research
- International cooperation and collaboration
- Organizational excellence

The DOI is complying with the Government Performance and Results Act through its performance management system, which provides useful information to managers and promotes accountability for results. Specifically, FWS has adopted the following principles and priorities, which all apply to Monument management:

#### Conservation Principles:

- Science: Our work is grounded in thorough, objective science.

- Stewardship: Our ethic is to conserve natural resources for future generations.
- Service: It is our privilege to serve the American people.
- Professionalism: We hold ourselves to the highest ethical standards, strive for excellence, and respect others.
- Partnerships: We emphasize creative, innovative partnerships.
- People: Our employees are our most valued asset.
- Legacy: We ensure the future of natural resource conservation by connecting people with nature.

Priorities:

- National Wildlife Refuge System: Conserving our lands and resources.
- Landscape Conservation: Working with others.
- Migratory Birds: Conservation and management.
- Threatened and Endangered Species: Achieving recovery and preventing extinction.
- Aquatic Species: National Fish Habitat Initiative and trust species.
- Connecting People with Nature: Ensuring the future of conservation.

Given the similarity of NOAA and FWS priorities and the alignment of DLNR's Goals with the unifying Monument vision, mission, and goals, the Co-Trustees are committed to developing management plan performance measures to evaluate whether the strategies and activities contained in the action plans are achieving the goals and desired outcomes of the Monument. The management plan performance measures fall into three categories: annual benchmarking, management capacity assessment, and outcome assessment.

Annual benchmarking measures will be used to determine whether activities have occurred as planned. Management capacity assessment measures will be used every two to three years to determine the adequacy of implementation mechanisms and processes, including interagency coordination and stakeholder and community participation. Outcome assessment measures will be used every four to five years to evaluate the impacts of management actions on the resources and ecosystem status. These measures will be further defined through the process described in Activity EV-1.1, below.

**Need for Action**

One of the largest challenges in the management of ocean resources lies in knowing whether management actions are effective over time (Pomeroy 2004). Research and long-term monitoring programs are essential in an ecosystem-based management context, to provide reliable information and data to determine whether management actions are achieving desired outcomes. A second and equally important challenge is improving management based on reliable information and data, a sound governance process, and experience (Olsen et al. 1999).

Evaluation is needed to determine if management actions are achieving the desired outcomes, addressing priority management needs, and meeting the goals of the Monument. The outcomes of evaluation processes can then be used to improve processes, programs, and accountability; prioritize activities; and inform constituents.

The U.S. Commission on Ocean Policy recommends that national goals and guidelines be developed leading to a uniform process for effective design, implementation, and evaluation of marine protected areas. The President's Ocean Action Plan has elements addressing this issue. Since the Monument is the largest marine protected area in the United States, NOAA, FWS, and the State of Hawai'i are in a unique position to respond to these challenges and recommendations through a comprehensive evaluation process.

### **Strategies to Achieve the Desired Outcome**

A meaningful evaluation requires the use of measurable strategies and the ability to monitor, evaluate, provide feedback, and then assess what is working and what needs to be changed in terms of desired outcomes, strategies, and activities. The strategy and activities are coded by the abbreviation for the action plan title, "Evaluation" (EV). A summary of strategies and activities is provided in Table 3.6.4 at the end of this action plan.

- EV-1: Implement a comprehensive evaluation process within 1 year.

### **Strategy EV-1: Implement a comprehensive evaluation process within 1 year.**

Management plan measures will be used to determine the degree to which management actions achieve desired outcomes, address priority management needs, and meet the goals of the Monument. The use of site performance measures will ensure that potential changes are consistent with the Monument vision, mission, management principles, and goals.

Evaluation activities will be developed and implemented by the MMB. Evaluation reports will be prepared and reviewed by partner agencies and organizations for review and recommendations.

#### ***Activity EV-1.1: Prepare a comprehensive Monument evaluation strategy.***

A comprehensive evaluation strategy will be designed to guide evaluation activities over a 5-year period. The strategy will describe information and data needs and methods to evaluate activity outputs and to quantify site measures. The output from this activity is a Monument evaluation strategy that describes site performance measures, their evaluation methods and timeframes, measurable elements, and roles and responsibilities of the Co-Trustees, partner agencies, and other organizations involved in the evaluation process.

#### ***Activity EV-1.2: Conduct annual program review.***

Agency leads will be identified and responsible for developing milestones for each plan, tracking progress, and reporting to the MMB regarding milestones reached or interventions needed. The status of implementation of each action plan will be reviewed annually. MMB staff leads for each action plan will be responsible for determining the status of completion of planned activities and accomplishment of activity outputs. Data and information on site indicators will be compiled and analyzed in accordance with the timeframes described in the evaluation plan. The output of this activity is an annual report describing the status of activity implementation and recommended adjustments.

***Activity EV-1.3: Conduct comprehensive evaluation and prepare a State of the Monument Report.***

Every 5 years, a comprehensive evaluation will be conducted, considering the results of preceding annual reports and incorporating surveys, assessments, and long-term research and monitoring studies as described in the comprehensive evaluation plan (Activity EV-1.1). The comprehensive evaluation will describe the degree to which management actions have achieved desired outcomes, addressed priority management needs, and met goals for the Monument over the 5-year period. Status and trends of Monument resources, management issues, and ecosystem components will be described with recommendations for improved management actions. The output from this activity is a State of the Monument Report.

***Activity EV-1.4: Conduct a management plan review.***

As part of an adaptive management approach to ensure that Monument management is effective, the Monument Management Plan will undergo a review every 5-years. Scientific discoveries, identification of new sensitive or representative resilient areas for rezoning, advancements in managing marine resources and human dimensions approaches, and new resource management issues or approaches to issues will be updated over time.

The comprehensive evaluation and State of the Monument Report will serve as the primary input for the 5-year management plan review. Monument staff, together with partner agencies and organizations, will review past activities, revise strategies and activities accordingly and, as appropriate, add new strategies and activities based on priority management needs. The output of this activity will be a revised Monument Management Plan and revised regulations (as needed) for the next 5 years of operations, based on the review of recommended changes identified by the comprehensive evaluation.

**Table 3.6.4 Summary of Strategies, Activities, and Agency Leads for Evaluation**

Strategies and Activities	Agency Lead
<b>Strategy EV-1: Implement a comprehensive evaluation process within 1 year.</b>	
Activity EV-1.1: Prepare a comprehensive Monument evaluation strategy.	NOAA
Activity EV-1.2: Conduct annual program review.	NOAA
Activity EV-1.3: Conduct comprehensive evaluation and prepare a State of the Monument Report.	NOAA
Activity EV-1.4: Conduct a management plan review.	NOAA

---

## **GLOSSARY**

---

## GLOSSARY

**Abiotic:** Pertaining to the non-living components of the environment.

**Abyssal (zone):** Relating to the bottom waters of oceans, usually below 1,000 meters.

**Adaptive management:** The process of adjusting management actions or directions as new and better information emerges about the ecosystem

**Adaptive reuse:** A process that changes a disused or ineffective item into a new item that can be used for a different purpose.

**Alien species (exotic, nonnative):** With respect to a particular ecosystem, any species, including its seeds, eggs, spores, or other biological material capable of propagating that species, that is not native to that ecosystem.

**Anthropogenic:** Caused by humans.

**Apex predator:** A species (e.g., fish) at the top of the food chain.

**Appropriate Use (NWR):** A proposed or existing use on a refuge that meets the criteria in 603 FW 1.

**Aquaculture:** Cultivation of aquatic organisms under controlled or semi-controlled conditions.

**Archipelago:** A group or cluster of islands.

**Ballast water:** Any water and associated sediments used to manipulate the trim and stability of a vessel

**Bathymetry:** Study and mapping (benthic mapping) of sea floor elevations and the variations of water depth; the topography of the sea floor.

**Battle of Midway:** A naval battle in the Pacific Theater of World War II. It took place from June 4, 1942 to June 7, 1942, approximately one month after the Battle of the Coral Sea, about five months after the Japanese capture of Wake Island, and six months after the Empire of Japan's attack on Pearl Harbor that had led to a formal state of war between the United States and Japan.

**Benthic habitat:** Of the sea floor, or pertaining to organisms living on or in the sea floor.

**Biodiversity:** Defined as the number of different organisms or species that inhabit a given ecosystem or the earth overall. It can also refer to the variability within species and among species living on the earth or in a particular community. Many ecologists also include the interaction of species the environment when describing biodiversity. All biodiversity has its origins in the different combinations of genetic material (DNA) and how this is expressed in different organisms.

**Biogeographical:** Of relating to or involved with biogeography, a branch of biology that deals with the geographical distribution of animals and plants.

**Biological community:** A naturally occurring assemblage of plants and animals that live in the same environment and are mutually sustaining and interdependent.

**Biological inventory or Biodiversity inventory:** Catalog of all biota in a given area.

Inventories of large clades (a clade is a related group with a common ancestor) of organisms that are likely to contain many undescribed species or otherwise require major revision to complete their taxonomy.

**Biomass:** The total weight of all the living organisms, or some designated group of living organisms, in a given area.

**Bioprospecting:** Search for new chemicals compounds, genes and their products in living things that will have some value to people.

- Biota:** All the organisms, including animals, plants, fungi and microorganisms, living components of an ecosystem.
- Biotic:** Pertaining to any aspect of life, especially to characteristics of entire populations or ecosystems.
- Bishop Museum:** Founded in 1889, the Bishop Museum is the largest museum in Hawai‘i and the premier natural and cultural history institution in the Pacific, recognized throughout the world for its cultural collections, research projects, consulting services and public educational programs. It also has one of the largest natural history specimen collections in the world.
- Board of Land and Natural Resources:** An appointed Board of the State of Hawai‘i composed of seven members, one from each land district and two at large, and the Chairperson, the executive head of the Department. Members are nominated and, with the consent of the Senate, appointed by the Governor for a 4-year term. The BLNR convenes twice monthly to review and take action on department submittals, including Monument permits.
- Bottomfish species:** Means bottomfish management unit species as defined at 50 CFR 665.198.
- Bottomfishing:** Fishing for bottomfish species using hook-and-line method of fishing where weighted and baited lines are lowered and raised with electric, hydraulic, or hand-powered reels.
- Calderas:** A crater whose diameter is many times that of the volcanic vent because of the collapse or subsidence of the central part of a volcano or because of explosions of extraordinary violence.
- Catch-per-unit-effort (CPUE):** The average number of fish caught in a discrete amount of time.
- Categorical Exclusion:** A category of actions that the agency has determined does not individually or cumulatively have a significant effect on the quality of the human environment.
- Ciguatera toxin:** Toxins produced by a marine microalgae called *Gambierdiscus toxicus*. These toxins become progressively concentrated as they move up the food chain from small fish to large fish that eat them, and reach particularly high concentrations in large predatory tropical reef fish.
- Co-Trustees:** U.S. Department of Commerce, through the National Oceanic and Atmospheric Administration, the U.S. Department of the Interior through the Fish and Wildlife Service, and the State of Hawai‘i.
- Commercial Fishing:** Fishing in which the fish harvested, either in whole or in part, and are intended to enter commerce through sale, barter or trade.
- Compatible use:** A proposed or existing wildlife-dependent recreational use or any other use of a national wildlife refuge that, based on sound professional judgment, will not materially interfere with or detract from the fulfillment of the National Wildlife Refuge System mission or the purposes of the national wildlife refuge. (50 CFR 29.21)
- Comprehensive Conservation Plan:** A document that describes the desired future conditions of the refuge, and provides long-range guidance and management direction for the refuge manager to accomplish the purposes of the refuge, contribute to the mission of the system, and to meet other relevant mandates.
- Coral bleaching:** When zooxanthellae, symbiotic algae that live in coral tissue, leave the coral as a result of thermal and other types of stress.
- Crustacean:** A member of the phylum Crustacea, such as a crab, shrimp, or lobster.

- Cultural literacy:** The art and understanding of the intangible meanings and emotions conveyed through a particular written cultural language.
- Cultural resources:** Any resources, whether they are tangible or intangible, such as stories, people, structures, or artifacts that identifies a certain native people's culture inherent in the way they live and practice their traditions.
- Cumulative effects** (National Environmental Policy Act, NEPA): Cumulative impact of the direct and indirect effects of the proposed action and its alternatives when added to the aggregate effects of past, present, and reasonably foreseeable future actions.
- Customary rights:** Rights customarily and traditionally exercised for subsistence, cultural, and religious purposes and possessed by ahupua‘a tenants who are descendants of Native Hawaiians who inhabited the Hawaiian Islands prior to 1778.
- Derelict:** Abandoned, especially by the owner or occupant; forgotten or unused.
- Direct effects** (NEPA): Effects caused by the action and occurring at the same time and place.
- Distance-learning:** Education initiated on-site at a remote location offered to others often times providing two way communication through audio or video (or both) technology links.
- Ecological:** Of, or having to do with, the environments of living things or with the pattern of relations between living things and their environments.
- Ecological impacts:** The effect that a human-caused or natural activity has on living organisms and their environment.
- Ecological Reserve:** An area of the Monument consisting of contiguous, diverse habitats that provide natural spawning, nursery, and permanent residence areas for the replenishment and genetic protection of marine life, and also to protect and preserve natural assemblages of habitats and species within areas representing a broad diversity of resources and habitats found within the monument.
- Ecological Restoration:** Replacement of lost ecosystem function and integrity.
- Ecosystem:** A geographically specified system of organisms (including humans), the environment, and the processes that control its dynamics.
- Ecosystem Health:** A condition in which structure and functions allow the desired maintenance over time of biological diversity, biotic integrity, and ecological processes.
- Ecological Integrity:** A condition determined to be characteristic of an ecosystem that has the ability to maintain its function, structure, and abundance of natural biological communities, including rates of change in response to natural environmental variation.
- Ecosystem Services:** The natural processes by which the environment produces resources. Common examples are water, timber, and habitat for fisheries, and pollination of native and agricultural plants.
- Ecosystem-based management approach:** Management that carefully considers impacts to all species and trophic interactions, including maintenance of biological communities and the protection of natural habitats, populations and ecological processes. The approach emphasizes the inherent value of ecosystems and recognizes the importance of species interactions and conservation of habitats, and only permits resource utilization in a manner that is consistent with the Monument's primary goal of resource protection.
- Ecotourism:** Travel to natural areas to foster environmental and cultural understanding, and appreciation and conservation. The Proclamation defines Ocean-Based Ecotourism as a class of fee-for-service activities that involves visiting the Monument for study, enjoyment, or volunteer assistance for purposes of conservation and management.

**Effects (Impacts):** As defined by NEPA (direct, indirect, cumulative): Effects include ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative. Effects may also include those resulting from actions that may have both beneficial and detrimental effects, even if on balance the agency believes that the effect will be beneficial.

**El Niño:** A climatic phenomenon characterized by a large scale weakening of the trade winds and warming of the surface layers in the eastern and central equatorial Pacific Ocean. El Niño events occur irregularly at intervals of two to seven years, although the average is about once every three to four years and typically last 12 to 18 months. During El Niño, unusually high atmospheric sea level pressures develop in the western tropical Pacific and Indian Ocean regions, and unusually low sea level pressures develop in the southeastern tropical Pacific. Southern Oscillation tendencies for unusually low pressures west of the date line and high pressures east of the date line have also been linked to periods of anomalously cold equatorial Pacific sea surface temperatures, sometimes referred to as **La Niña**.

**Endangered species:** An animal or plant species in danger of extinction throughout all or a significant portion of its range.

**Endemic:** Referring to species native to and confined to a particular region, thus often having a comparatively restricted distribution.

**Environmental Assessment (EA):** A concise public document, prepared in compliance with the National Environmental Policy Act, that briefly discusses the purpose and need for an action, alternatives to such action, and provides sufficient evidence and analysis of impacts to determine whether to prepare an environmental impact statement or finding of no significant impact.

**Environmental Impact Statement (EIS):** Documentation that assesses the impacts of major Federal actions significantly affecting the quality of the human environment as required by Section 102(2)(C) of NEPA.

**Exclusive Economic Zone (EEZ):** A zone contiguous to the territorial sea, including zones contiguous to the territorial sea of the United States, the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands (to the extent consistent with the Covenant and the United Nations Trusteeship Agreement), and United States overseas territories and possessions extending to a distance of 200 nautical miles from the baseline from which the breadth of the territorial sea is measured.

**Fathom:** A unit of length equal to 1.8 meters (6 feet) used to measure water depth.

**Field camp (camp):** In this document refers to both seasonal camps that are placed on Lisianski, Pearl and Hermes, Kure, and Nihoa; and one permanent camp at Laysan Island. Seasonal camps are established for specific activities such as monk seal research. The Laysan Island camp is staffed year-round to work on restoration of the island. Camps depend on tents, import all water, and have very limited communications and physical access.

**Field station:** In this document is used to refer to permanent infrastructures on Tern Island or Midway Atoll. These stations have buildings, water-making abilities, greater power sources, advanced communication, and regular access by boat and aircraft.

**Fishery:** The act, process, or season of taking fish or other sea products for sale or consumption.

**Friends of Midway Atoll NWR:** Association whose mission is “[t]o support the Midway Atoll National Wildlife Refuge in its efforts to preserve, protect and restore the biological diversity

and historic resources of Midway Atoll, while providing opportunity for wildlife-dependent recreation, education and scientific research.”

**Geographic Information System (GIS):** A system of spatially referenced information, including computer programs that acquire, store, manipulate, analyze, and display spatial data.

**Geomorphologic:** Relating to geomorphology, a science that deals with land and submarine relief features of the earth’s surface.

**Hazardous material:** A substance or material that is capable of posing an unreasonable risk to health and safety or property when transported in commerce and has been designated as hazardous under the Federal Hazardous Materials Transportation Law (49 USC 5103).

**Hazardous Waste:** The Resource Conservation and Recovery Act (RCRA) specifically defines a hazardous waste as a solid waste (or combination of wastes) that, based on its quantity, concentration, physical, chemical, or infectious characteristics, can cause or significantly contribute to an increase in mortality. RCRA further defines a hazardous waste as one that can increase serious, irreversible, or incapacitating reversible illness or pose a hazard to human health or the environment when improperly treated, stored, disposed of, or otherwise managed.

**Hi‘ialakai:** NOAA research vessel. Hi‘ialakai means “embracing pathways to the sea” in the Hawaiian language.

**Hōkūle‘a:** A traditional Hawaiian double hulled voyaging canoe recreated by the Polynesian Voyaging Society in the 1970s which signified a rebirth of ancient voyaging and navigation and a new cultural renaissance period in Hawaiian history. [*Hōkūle‘a* is Hawaiian for star of gladness].

**Hypersaline:** Salinity well in excess of that of seawater; found in enclosed water bodies.

**Impacts:** See **Effects**

**Indirect effects (NEPA):** Those are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems.

**In situ** [Latin]: In place

**In-reach:** Purposefully communicating to personnel working within your agency, or Co-Trustees.

**Indigenous (species):** Existing within a historical ecological range, usually within a balanced system of coevolved organisms.

**Infrastructure:** In this document refers to physical buildings and structures, roads, and utility and communications systems.

**Interagency:** Involving two or more public or government agencies.

**Introduced Species:**

1. A species (including, but not limited to, any of its biological matter capable of propagation) that is nonnative to the ecosystem(s) protected by the Monument; or
2. Any organism into which genetic matter from another species has been transferred in order that the host organism acquires the genetic traits of the transferred genes.

“Introduction” means the intentional or unintentional escape, release, dissemination, or placement of a species into an ecosystem as a result of human activity.

- Invasive species:** A nonindigenous species that may threaten the diversity or abundance of native species or the ecological stability and or uses of infested waters and the introduction of which into an ecosystem may cause harm to the economy, environment, human health, recreation, or public welfare.
- Invertebrates:** Any animal that is not a vertebrate, that is, whose nerve cord is not enclosed in a backbone of bony segments.
- Island-specific:** Pertains to a specific island of the Monument and may not be translated to other islands.
- Knowledge-base:** Information and ideas acquired through pre-existing experiences and cumulative education.
- La Niña:** see **El Niño**
- Larval:** An immature stage of any invertebrate animal that differs dramatically in appearance from the adult.
- Lead-based paint:** Paint that contains high levels of lead, generally found in houses and apartments built before 1978, when the federal government banned it from housing.
- Longline Protected Species Zone:** The area in the Northwestern Hawaiian Islands where longline fishing is prohibited, described as within a 50 nm radius from the geographic centers of Nihoa, Mokumanamana, French Frigate Shoals, Gardner Pinnacles, Maro Reef, Laysan Island, Lisianski Island, Pearl and Hermes Atoll, Midway Atoll, and Kure Atoll.
- Management Zones:** Special Preservation Areas, Ecological Reserves, and the Midway Atoll Special Management Area (SMA) as defined in Monument regulations (50 Code of Federal Regulations [CFR] 404).
- Marine debris:** Any persistent solid material and contents that is manufactured or processed and directly or indirectly, intentionally or unintentionally, disposed of or abandoned into the marine environment.
- Maritime:** Of or relating to navigation or commerce on the sea.
- Memorandum of Agreement or Understanding (MOA/U):** A nonbinding agreement between state or federal agencies, or divisions within an agency, that delineates tasks, jurisdiction, standard operating procedures or other matters which the agencies or units are duly authorized and directed to conduct.
- Meta-population:** A subdivided population of a single species.
- Midway Atoll Special Management Area:** The area of the monument surrounding Midway Atoll out to a distance of 12 nautical miles, established for the enhanced management, protection, and preservation of Monument wildlife and historical resources.
- Migratory bird:** Birds that are listed in Title 50 of the Code of Federal Regulations, Section 10.13.
- Mitigate (mitigation):** To make less severe. An action or series of actions that offset the environmental impact, or reduce the severity or consequences. Usually done by sequestering or reducing contact thereby reducing risk or by compensating, enhancing, or restoring areas adversely affected.
- Mobile transceiver unit:** A vessel monitoring system or VMS device installed on board a vessel that is used for vessel monitoring and transmitting the vessel's position as required by this proclamation.
- Monument Management Board (MMB):** The MOA established a locally based Monument Management Board (MMB) to guide field level coordination. The seven-member MMB includes representation of the Co-Trustee agencies and the Office of Hawaiian Affairs.

- Monument Regulations:** Initial regulations prescribed by Presidential Proclamation 8031 completed jointly by the FWS and NOAA on August 29, 2006 (71 FR 51134). Monument regulations, codified under 50 CFR Part 404, establish the scope and purpose, boundary, definitions, prohibitions, marine zones, and regulated activities for managing the Monument.
- National Historic Landmark:** Nationally significant historic places designated by the Secretary of the Interior possessing exceptional value or quality in illustrating or interpreting the heritage of the United States.
- National Historic Properties:** Properties listed in, or eligible for listing in the National Register of Historic Places (National Historic Preservation Act of 1966, as amended; implementing regulation for evaluation and determination of eligibility are in 36 CFR 60), “National Register of Historic Places.”
- National Marine Sanctuary Foundation:** A private, nonprofit, 501(c)(3) tax-exempt organization created to assist the federally managed National Marine Sanctuary Program with education and outreach programs designed to preserve, protect, and promote meaningful opportunities for public interaction with the nation’s marine sanctuaries.
- National Monument:** An area on lands owned or controlled by the Government of the United States designated by the President of the United States under the Antiquities Act of 1906, to recognize historic landmarks, historic and prehistoric structures, and other objects of historic or scientific interest.
- National Register of Historic Places:** The nation’s official list of cultural resources worthy of preservation. Authorized under the National Historic Preservation Act of 1966, the National Register is part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect our historic and archeological resources.
- National Wildlife Refuge System:** All lands, waters, and interests therein administered by the U.S. Fish and Wildlife Service as wildlife refuges, wildlife ranges, wildlife management areas, waterfowl production areas, and other areas for the protection and conservation of fish, wildlife, and plant resources.
- Native Hawaiian:** Any individual who is a descendent of the aboriginal people who, prior to 1778, occupied and exercised sovereignty in the area that now constitutes the State of Hawai‘i.
- Native Hawaiian Practices:** Cultural activities conducted for the purposes of perpetuating traditional knowledge, caring for and protecting the environment, and strengthening cultural and spiritual connections to the Northwestern Hawaiian Islands that have demonstrable benefits to the Native Hawaiian community. This term may include, but is not limited to, the noncommercial use of monument resources for direct personal consumption while in the Monument.
- Native species:** A species (plant or animal) within its natural range or natural zone of dispersal without human aid.
- Natural variability:** Uncertainties that stem from inherent or assumed randomness and unpredictability in the natural world.
- Northwestern Hawaiian Islands (NWHI):** Beginning 155 miles (249.4 kilometers) from the main Hawaiian Island of Kaua‘i, the 10 islands and atolls of this chain that extend for 1,200 miles (1,931 kilometers) to Kure Atoll. In past decades, also known as the Leeward or Kūpuna Islands, and now as Papahānaumokuākea.

**NOWRAMP or NWHIRAMP:** The Northwestern Hawaiian Islands Coral Reef Assessment and Monitoring Program, which began in 2000, to rapidly evaluate and map the shallow water reef habitats in the NWHI.

**Oceania:** Collective name for the islands scattered throughout most of the Pacific Ocean.

**Oceanographic:** Of or relating to oceanography, a science that deals with the ocean and its phenomena.

**Outreach:** The act of communicating activities and conceptual ideas to public audiences outside the administering agency/agencies and actively involving them in Monument activities.

**Pacific Rim:** includes the countries that lie along the Pacific Ocean, plus the island countries of the Pacific.

**Passage without interruption:** A vessel passing through waters within the Monument boundary without stopping anywhere within the boundary of the Monument.

**Pelagic:** Referring to the open ocean.

**Pelagic species:** From the Proclamation: Pelagic Species means Pacific Pelagic Management Unit Species as defined at 50 CFR 660.12.

**Permit:** As used in the Monument Management Plan, authorization by the Co-Trustees to conduct an activity within the Monument that: (i) is research designed to further understanding of monument resources and qualities; (ii) will further the educational value of the monument; (iii) will assist in the conservation and management of the monument; (iv) will allow Native Hawaiian practices; (v) will allow a special ocean use; or (vi) will allow recreational activities.

**Petrels:** Any of numerous seabirds constituting the families Procellariidae and Hydrobatidae.

**Polynesian Voyaging Society (PVS):** A society founded in 1973 to research how Polynesian seafarers discovered and settled on the islands in the Pacific Ocean before European explorers arrived in the 16th century.

**Pono:** [Hawaiian] Appropriate, correct, and deemed necessary by traditional standards in the Hawaiian culture.

**Precautionary approach:** In the decisionmaking process, if there is a reasonable suspicion of harm, this approach urges a full evaluation of available alternatives for the purpose of preventing or minimizing harm. When consequences are uncertain, managers err on the side of caution thereby giving the benefit of the doubt to nature, public health, and community well-being.

**Predator-dominated marine ecosystem:** Reef ecosystems that have relatively greater abundance of large fish, such as sharks and jacks and fewer smaller fish that graze on the coral and algae.

**Presidential Proclamation 8031:** Establishment of the Northwestern Hawaiian Islands Marine National Monument, A Proclamation by the President of the United States of America, June 15, 2006. **(also Proclamation, Presidential Proclamation, and Proclamation 8031)**

**Productivity:** Rate of energy fixation or storage per unit time; not to be confused with production.

**Prohibitions:** Actions prohibited by authority of law.

**Recreational Activity:** For the purposes of the Monument, an activity conducted for personal enjoyment that does not result in the extraction of Monument resources and that does not involve a fee-for-service transaction. This term includes, but is not limited to, wildlife viewing, SCUBA diving, snorkeling, and boating.

**Remediation:** Rehabilitation of a section of the environment that has been polluted or degraded from a sustainable (self-repairing) state.

**Repatriation:** The transfer of legal interest in and physical custody of Native American cultural items to lineal descendants, culturally affiliated Indian tribes, and Native Hawaiian organizations.

**Resiliency:** The ability of an ecosystem to recover from, or adjust to, stress or change.

**Restoration:** Replacement of lost ecosystem function and integrity.

**SCUBA:** A self-contained underwater breathing apparatus and includes, but is not limited to, open circuit and rebreather technology.

**Seamount:** Submerged volcanic mountain rising above the deep-sea floor.

**Secretaries:** For the Monument, collectively refers to the Secretary of Commerce and the Secretary of the Interior

**Sessile invertebrates:** Organism being attached to a substrate.

**Shoal:** Elevation of the sea bottom comprising any material except rock or coral (in which case it is a reef) and which may endanger surface navigation.

**Socioeconomic:** Relating to or involving a combination of social and economic factors.

**Spawning:** The direct release of sex cells into the water for reproduction.

**Special Ocean Use:** An activity or use of the Monument that is engaged in to generate revenue or profits for one or more of the persons associated with the activity or use, and does not destroy, cause the loss of, or injure monument resources. This term includes ocean-based ecotourism and other activities such as educational and research activities that are engaged in to generate revenue, but does not include commercial fishing for bottomfish or pelagic species conducted pursuant to a valid permit issued by NOAA.

**Special Preservation Area (SPA):** Discrete, biologically important areas of the Monument within which uses are subject to conditions, restrictions, and prohibitions, including but not limited to access restrictions. SPAs are used to avoid concentrations of uses that could result in declines in species populations or habitat, to reduce conflicts between uses, to protect areas that are critical for sustaining important marine species or habitats, or to provide opportunities for scientific research.

**Stakeholder:** Any and all interested parties; an organization, governmental entity, or individual that has a stake in, or may be affected by, a given approach to environmental regulation or other agency action.

**Submersible:** A research submarine, designed for manned or remote operation at great depths.

**Substrate:** The material making up the base on which an organism lives or to which it is attached.

**Substratum:** The bottom of the bay, the soils of the bay bottom. May also refer to any surface that allows for the colonization of marine life.

**Sustenance Fishing:** For the Monument, sustenance fishing means fishing for bottomfish or pelagic species in which all catch is consumed within the Monument, and that is incidental to an activity permitted.

**Symbiotic:** Situation in which two dissimilar organisms live together in close association.

**Temporary Structure (Nonpermanent):** A structure with no permanent foundation that is easy to assemble, dismantle, and transport and is removed from a site between periods of actual use except as specifically permitted otherwise.

**Terrestrial species:** Plants and animals living on land.

**Threatened species:** Any species that is likely to become endangered within the foreseeable future throughout all or a significant portion of its range.

**Topographic:** General elevation pattern of the land surface or the ocean bottom.

**Traditional knowledge:** A way of knowing and learning that is acquired through expressions of dance or other forms of art, orally, or thru actual hands-on experiences passed down from generation to generation.

**Trolling:** Fishing using one or more lines with hooks or lures attached and drawn through the water behind a moving vessel.

**Trophic:** Relating to nutrition; the position of an organism in a food chain or food pyramid.

**Unexploded Ordnance (UXO):** Munitions that contain explosive components. In the Monument, refers to lost or abandoned military items.

**Unified Ocean Governance:** An integrated ecosystem-based management approach using an overall governance framework of shared principles and authority, clear communications and protocols.

**Unusual Mortality Events:** Criteria used to determine if mortalities seen in the Hawaiian monk seal are significantly abnormal to indicate an underlying vector. Criteria include: a marked increase in the magnitude of strandings is occurring when compared with prior records; animals are stranding at a time of the year when strandings are unusual; an increase in strandings is occurring in a very localized area; the species, age, or sex composition of the stranded animals is different; stranded animals exhibit similar or unusual pathologic findings, or the general physical condition; mortality is accompanied by unusual behavior patterns; and endangered species are stranding.

**Vessel Monitoring System (VMS):** Means a vessel monitoring system or mobile transceiver unit approved by the NOAA Office for Law Enforcement for use on vessels permitted to access the Monument in accordance with the Proclamation and 50 CFR 404. The hardware and software used by vessels to track and transmit their positions to a receiver in a remote location.

**Wayfinding:** Noninstrument navigation. Wayfinding involves navigating on the open ocean without sextant, compass, clock, radio reports, or satellites reports. The wayfinder depends on observations of the stars, the sun, the ocean swells, and other signs of nature for clues to the direction and location of a vessel at sea.

**Zooxanthellae:** A group of dinoflagellates living symbiotically in association with one of a variety of invertebrate groups and found in corals and other marine organisms.

## ***ENVIRONMENTAL ASSESSMENT ORGANIZATION***

This environmental assessment addresses the Proposed Action presented in the Papahānaumokuākea Marine National Monument (Monument) Management Plan and the No Action alternative of continuing existing management activities. The Proposed Action includes implementation of new and expanded activities described in the Monument Management Plan. The Monument Management Plan was developed to carry out Presidential Proclamation 8031 (Establishment of the Northwestern Hawaiian Islands Marine National Monument, June 15, 2006) to develop a joint management plan for the Monument. As required by the National Environmental Policy Act and Hawaii Revised Statutes Chapter 343 Environmental Impact Statement Law, this environmental assessment is a survey of the important environmental issues associated with the Proposed Action and alternative that are to be considered in the decision-making process including but not limited to actions the Co-Trustees will take to ameliorate or minimize the effect on the environment.

The ***NOTE TO READERS*** is a brief description of the cooperative and individual responsibilities of the Co-Trustees and provides a summary of their respective analysis represented in this EA.

### ***TABLE OF CONTENTS***

- CHAPTER 1.0:***    ***INTRODUCTION*** provides overview and background information, summarizes the purpose of and need for the Proposed Action, and describes the scope of the environmental effects analysis process. This section also includes a discussion of the Proposed Action and No Action alternative, comparison of alternatives, actions described requiring future NEPA/HRS Chapter 343 Analysis and regulatory framework.
- CHAPTER 2.0:***    ***AFFECTED ENVIRONMENT*** is a description of the existing environmental and socioeconomic setting in the Papahānaumokuākea Marine National Monument.
- CHAPTER 3.0:***    ***ENVIRONMENTAL CONSEQUENCES*** is a discussion of the potential effects of implementing the Proposed Action and No Action alternative and is a summary of the resulting environmental effects.
- CHAPTER 4.0:***    ***OTHER NEPA ANALYSES*** is an assessment of the potential effects of implementing the cumulative actions, with or without contribution of the Proposed Action, and summarizes the resulting environmental effects.
- CHAPTER 5.0:***    ***AGENCY AND PUBLIC PARTICIPATION*** is a discussion of the agency and public involvement efforts and list of public meeting dates and locations.
- CHAPTER 6.0:***    ***REFERENCES*** contains bibliographical information for cited sources.
- CHAPTER 7.0:***    ***LIST OF PREPARERS*** is a listing of persons who prepared this document.
- APPENDIX A:***    ***CULTURAL IMPACT ASSESSMENT***  
***APPENDIX B:***    ***CATEGORICAL EXCLUSIONS***  
***APPENDIX C:***    ***STATE AND FEDERAL FINDING OF NO SIGNIFICANT IMPACT***  
***APPENDIX D:***    ***SUMMARY OF SCOPING***

**Note to Readers:**

This Environmental Assessment (EA) represents the Co-Trustees' analyses in compliance with their individual agency policies and State and Federal environmental review law and statutes, including the National Environmental Policy Act of 1969 (NEPA) and Chapter 343, Hawaii Revised Statutes (HRS).

In keeping with the purpose of environmental review and to avoid unnecessary repetition, the EA incorporates by reference many of the descriptors and background from the Monument Management Plan and other documents accompanying the Monument Management Plan. Therefore, although the Monument Management Plan and EA are in different volumes, the two should be read together to obtain a clear understanding of the environmental consequences of the actions in the Monument Management Plan.

The Co-Trustees remind the reader that prior to its designation by Presidential Proclamation 8031 issued by President Bush on June 15, 2006, several Federal conservation areas existed within the Monument, namely the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, managed by the National Oceanic and Atmospheric Administration (NOAA) within the Department of Commerce, and the Hawaiian Islands and Midway Atoll National Wildlife Refuges, managed by the U.S. Fish and Wildlife Service (FWS) within Department of the Interior. Nothing in the establishment of the Monument, the Monument Management Plan, or the EA will diminish the responsibilities and requirements by the Federal agencies to continue to manage these areas.

Furthermore, the Proclamation establishing the Monument expressly stated it did not diminish or enlarge the jurisdiction of the State of Hawai'i, therefore, the State's responsibilities and requirements to manage its areas also remain intact. In 2005, the State designated all of its waters in the Northwestern Hawaiian Islands (NWHI) as a State Marine Refuge, and it has jurisdiction over the State Seabird Sanctuary at Kure Atoll, the northwesternmost emergent island in the NWHI. To provide for the most effective conservation and management of the natural, cultural, and historic resources of the NWHI, Governor Lingle on December 8, 2006, entered into an agreement with the two Secretaries to have State lands and waters in the NWHI managed as part of the Monument, with the three parties serving as Co-Trustees. The agreement also provided for the inclusion of the Office of Hawaiian Affairs into the monument management process to provide a voice for Native Hawaiians in the management of the Monument and its cultural resources.

The analysis in this EA focuses on the scope of actions proposed by the Co-Trustees in the context of 6 priority management needs with 22 separate action plans developed to address these needs. Activities outlined in each action plan have already been analyzed through project-specific environmental reviews for activities listed in the No Action Alternative. Any new or expanded activities listed in the Proposed Action are analyzed as appropriate under NEPA and HRS 343 in this EA. Many specific agency activities will be individually assessed, on a case-by-case basis, for future NEPA analysis (i.e. all

research and access that requires permits, any major construction, etc.). Activities that are beyond the scope of this assessment may require further analysis in order to comply with NEPA (e.g. preparation of a supplemental EA or an Environmental Impact Statement). These activities are identified as such and they are discussed on a programmatic level. All other activities have been analyzed in a more detailed, site specific manner and the environmental consequences of implementing these activities are described in this document.

In addition to NOAA and FWS NEPA policies, this Monument Management Plan satisfies FWS' requirements for National Wildlife Refuge System Comprehensive Conservation Planning and the State's statutory requirements under HRS 343.

**CHAPTER 1:**  
**INTRODUCTION**

# CHAPTER 1

## INTRODUCTION

---

This environmental assessment (EA) evaluates the activities proposed in the Papahānaumokuākea Marine National Monument (Monument) Management Plan. The proposed Monument Management Plan is the Monument Co-Trustee agencies' overall guiding framework for their mission to carry out seamless integrated management to ensure ecological integrity and achieve strong, long-term protection and perpetuation of Northwestern Hawaiian Islands (NWHI) ecosystems, Native Hawaiian culture, and heritage resources for current and future generations. Management of the Monument is the responsibility of three Co-Trustees: the State of Hawai'i, through the Department of Land and Natural Resources (DLNR); the U.S. Department of the Interior, through the Fish and Wildlife Service (FWS), and the Department of Commerce, through the National Oceanic and Atmospheric Administration (NOAA). The Monument Management Plan was developed to carry out Presidential Proclamation 8031 (Establishment of the Northwestern Hawaiian Islands Marine National Monument, June 15, 2006) to develop a joint management plan for the Monument, an effort that the State of Hawai'i joined through a Memorandum of Agreement (MOA) signed by the Governor and the Secretary of Commerce and the Secretary of the Interior in December 2006. This EA has been developed in accordance with the National Environmental Policy Act (NEPA) of 1969 and Hawaii Revised Statutes (HRS) Chapter 343 Environmental Impact Statement Law. The purpose of the EA is to inform the relevant state and federal agencies and the public of the likely environmental consequences of the activities contained in the Monument Management Plan. It focuses on site-specific issues within the boundaries of the Monument and the socioeconomic effects on the State of Hawai'i. This EA is not intended to analyze the impacts of Presidential Proclamation 8031 or the requirements and findings that are contained within the Proclamation.

### 1.1 OVERVIEW AND BACKGROUND

The NWHI make up the northern three-quarters of the Hawaiian archipelago, beginning in the northwest at Kure atoll, the most northerly coral reef atoll in the world, and extending approximately 1,200 miles (1,043 nautical miles[nm], 1,931 kilometers [km]) southeast to Nihoa, 165 miles northwest of Kaua'i. The President issued Presidential Proclamation 8031, which created the Monument under the authority of the Antiquities Act of 1906, as amended (16 United States Code [USC] 431-433).

Presidential Proclamation 8031 and the December 2006 MOA between the Governor and the Secretaries of Commerce and the Interior (see Volume III, Appendix E) describes the principal entities responsible for managing the Monument, the U.S. Department of Commerce/NOAA, the U.S. Department of the Interior/FWS, and the State of Hawai‘i (collectively, the Co-Trustees), the primary responsibility of each, and the institutional arrangements for management among the Co-Trustees. The December 2006 MOA created a Monument Management Board (MMB) and described institutional arrangements and responsibilities to fulfill the vision, mission, and guiding principles of the Monument including representation of Native Hawaiian interests by the Office of Hawaiian Affairs (OHA) on the MMB. The MMB implements policy guidance from the Co-Trustees and is responsible for on-site planning and program implementation.

The federal managers—NOAA and FWS—promulgated joint implementing regulations on August 29, 2006 (Northwestern Hawaiian Islands Marine National Monument, 71 FR 51134, 50 CFR Part 404; see Appendix D). Specifically, these regulations codify the scope and purpose, boundary, definitions, prohibitions, and regulated activities of the Monument. Presidential Proclamation 8031 was amended on March 6, 2007, to declare the Native Hawaiian name for the Monument, Papahānaumokuākea, and to clarify some definitions (Presidential Proclamation 8112, Establishment of the Papahānaumokuākea Marine National Monument, March 6, 2007).

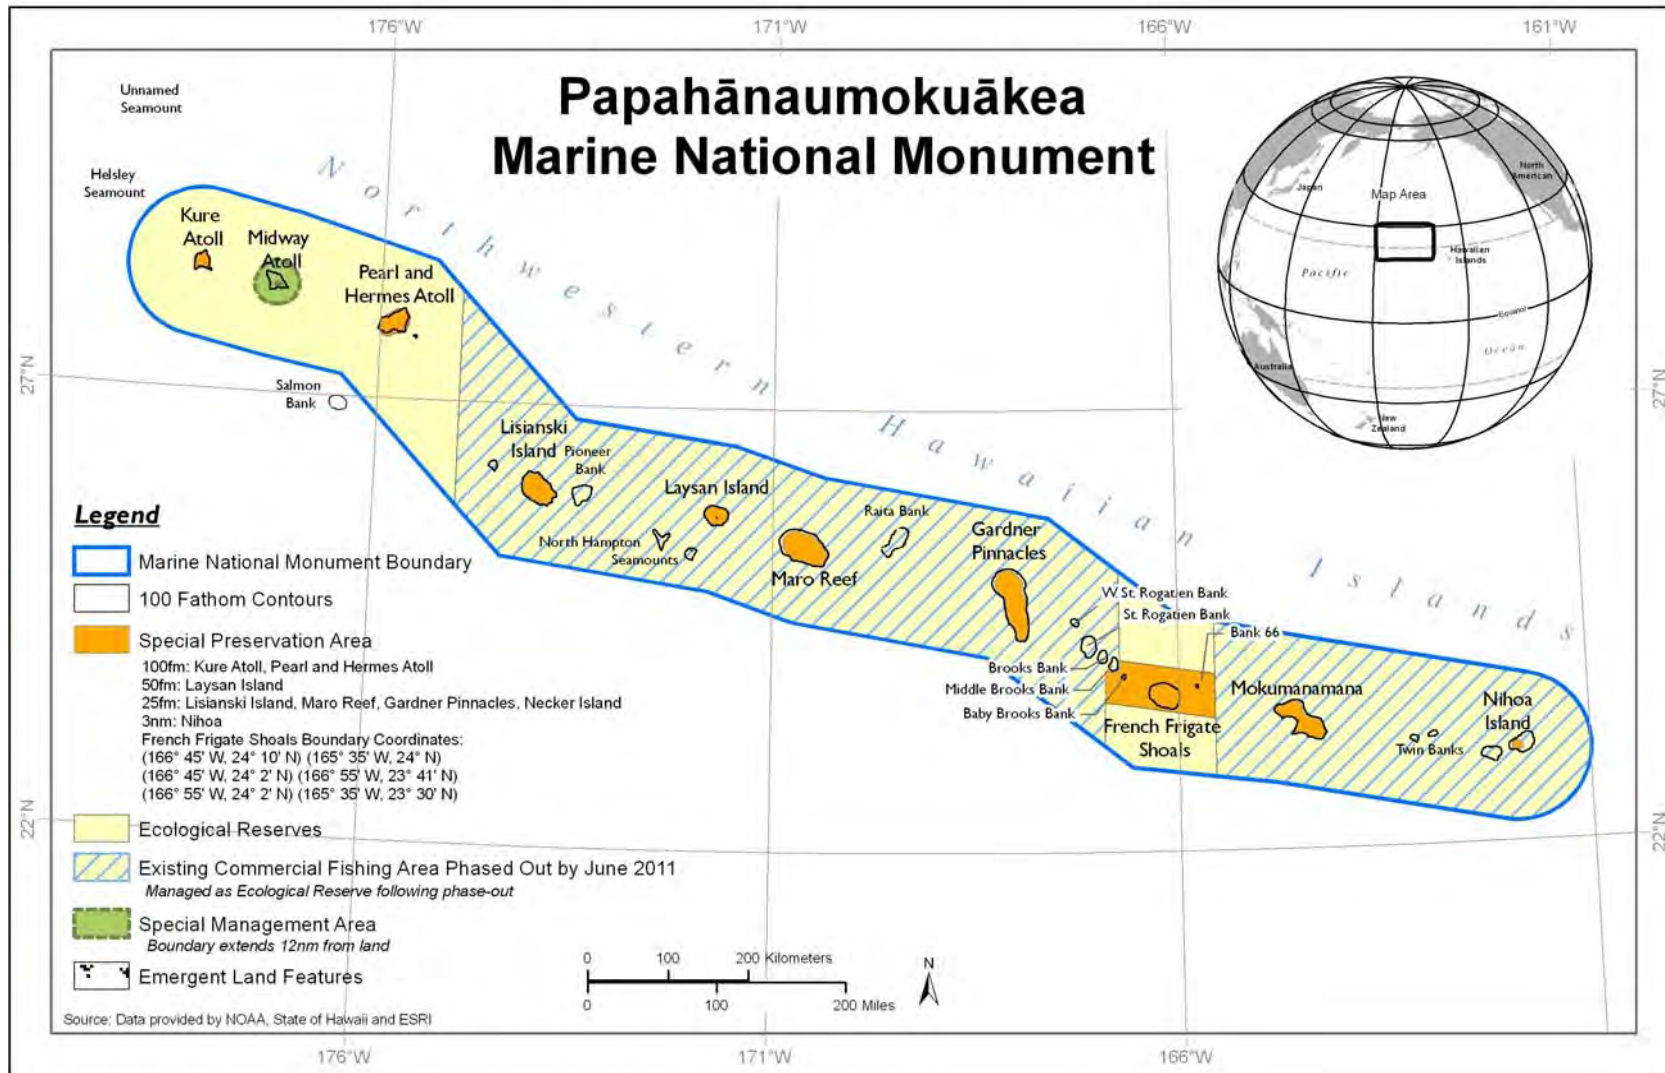

The Monument is one of the world’s largest marine protected areas (Figure 1.1). It encompasses 137,792 square miles (356,881 square kilometers) of the Pacific Ocean, an area larger than all U.S. National Parks combined. The Monument includes the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve, State of Hawai‘i Northwestern Hawaiian Islands Marine Refuge, State Seabird Sanctuary at Kure Atoll, the Midway National Wildlife Refuge (NWR), the Hawaiian Islands NWR, and the Battle of Midway National Memorial. This region supports a dynamic reef ecosystem, with more than 7,000 marine species, half of which are unique to the Hawaiian Island chain. This diverse ecosystem is host to many species of coral, fish, birds, marine mammals, and other flora and fauna, including the endangered Hawaiian monk seal, the threatened green sea turtle, and the endangered leatherback and hawksbill sea turtles. In addition, this area has great cultural significance to Native Hawaiians and a connection to Polynesian culture worthy of protection and understanding, as noted in Presidential Proclamation 8031.

The boundaries of the Monument, Special Preservation Areas (SPAs), ecological reserves (ERs), and the Special Management Area (SMA) at Midway Atoll are illustrated in Figure 1.1 and Appendix A to 50 CFR Part 404. In addition to activities that are prohibited throughout the Monument, those prohibited within the SPAs are swimming, snorkeling, or scuba diving and discharging or depositing any material or other matter except vessel engine cooling water, weather deck runoff, and vessel engine exhaust. In addition to the overarching regulations that govern activities in the Monument, the regulations governing activities in the reserve and wildlife refuges and State of Hawai‘i jurisdiction also apply.

## **1.2 PURPOSE AND NEED FOR THE PROPOSED ACTION**

The purpose of the Proposed Action is to protect and manage the Monument in a manner that satisfies legal mandates set forth in the designation of the Monument and priority management needs identified by the Co-Trustee agencies. The Monument is important both nationally and

Figure 1.1 Papahānaumokuākea Marine National Monument

globally because it contains one of the world's most significant marine and terrestrial ecosystems and areas of cultural significance. In accordance with Presidential Proclamation 8031, the Monument Management Plan is built on the foundation of the draft National Marine Sanctuary Management Plan, the Reserve Operations Plan, and input obtained through many hours of public consultation. In addition, the National Wildlife Refuge System Administration Act (NWRSA) of 1966, as amended (16 U.S.C. § 688dd-688ee) instructs FWS to develop Comprehensive Conservation Plans (CCPs) with NEPA compliance for all National Wildlife Refuges by October 2012. So that there would be a single management plan for the Monument, FWS moved its planning effort forward to have the Monument Management Plan also serve as, and meet the requirements of, the CCPs for the two refuges within the Monument. The proposed Monument Management Plan would serve as a collective guiding framework to enable the Co-Trustees to effectively and efficiently achieve the overall vision of the Monument to ensure the health, diversity, and resources of the NWHI – its unique wildlife and Native Hawaiian cultural significance - are protected forever. The ecosystems would be managed over the long term to achieve agency and Monument missions and purposes.

The need for the Monument Management Plan is defined both by legal mandates set forth in the designation of the Monument and priority management needs identified by the Co-Trustee agencies, with input from scientists, Native Hawaiian practitioners, and other stakeholders through numerous public scoping meetings and workshops. Priority management needs address multiple Monument goals and define areas for focused action, including improving our understanding of the NWHI, conserving wildlife and habitats, reducing threats to the ecosystem, managing human uses, coordinating conservation and management efforts, and achieving effective Monument operations. These priority management needs are described below and form the overall framework of action for the proposed Monument Management Plan.

**Understanding and Interpreting the Northwestern Hawaiian Islands.** The NWHI represent a unique opportunity to advance our understanding of ecosystem science through research, monitoring, and the incorporation of traditional knowledge. Coordinated research and continued development of long-term monitoring is needed to deepen our understanding of the composition, structure, and function of the NWHI ecosystems. The information from these activities would generate vital data necessary to document changes in ecosystem composition and function over time. This would provide the needed predictive tools to make informed decisions and to evaluate the effectiveness of management measures in protecting and restoring environmental integrity to the NWHI.

Incorporating traditional ecological knowledge into management practices would enrich and inform the MMB's approach to long-term planning. The further characterization of Native Hawaiian cultural relationships to the NWHI, through the study of oral histories, place names, and practices associated with the region, would enhance the physical record of activities in the NWHI. The unique aspects of island and Pacific maritime history, as well as historical and archaeological resources, collectively can provide a basis for developing effective management of resources.

**Conserving Wildlife and Habitats.** The preservation of the NWHI through active conservation and management of wildlife and their habitats is in the public interest. The NWHI constitute a large ecosystem home to many diverse terrestrial and marine flora and fauna, including many

endemic species and 23 federally listed threatened or endangered species. This priority management need is concerned with maintaining biological integrity, diversity, and environmental health of the Monument and with assisting in the recovery of threatened and endangered species, managing migratory bird populations, and conserving, managing, and where appropriate, restoring the habitats of the Monument's native flora and fauna.

**Reducing Threats to Monument Resources.** Despite their remote location, marine and terrestrial ecosystems of the NWHI are at risk from a range of threats from human activities within and outside the Monument. Natural and anthropogenic threats to the Monument include habitat alteration or damage from marine debris, the changing climate, including increased storm intensity and frequency, introduction of alien species, potential vessel and aircraft effects, release of hazardous materials from former landfills, vessel grounding, and past human effects. Developing and implementing threat reduction protocols and monitoring are needed to protect, preserve, maintain and, where appropriate, restore natural communities as a public trust for current and future generations. These communities included habitats, populations, native species, and ecological processes. In addition to threat reduction, emergency response in the Monument would be coordinated through building an internal and interagency capacity to contribute to emergency response efforts.

**Managing Human Uses.** The NWHI have experienced a long history of human use, with periods of overexploitation that have contributed to the current endangered status of some species, including land birds, several plants, sea turtles, and the Hawaiian monk seal. Although the extent of resource exploitation has been limited in recent years, human activities and the use of Monument resources must be carefully managed through permitting, enforcement, and managing uses, including Native Hawaiians engaging in cultural practices and people visiting Midway Atoll NWR.

**Coordinating Conservation and Management Activities.** The Monument can only be comprehensively conserved and monitored through effective interagency coordination and partnerships with a broad range of stakeholders. Coordination among the Co-Trustees, MMB members, and other stakeholders is needed to maintain existing resource protection measures, to increase the efficiency and effectiveness of management and enforcement, and to reduce conflicts and duplication of Monument management activities. Education and outreach require coordination among government agencies, nongovernmental organizations, and other stakeholder groups. Coordination with stakeholders and the public is needed to provide a forum for advice and input on Monument management and to improve awareness and understanding of the ecological significance, Native Hawaiian cultural significance, and historic significance of the NWHI. Coordination with international initiatives is needed to address Pacific regional and global management issues affecting the Monument.

**Achieving Effective Monument Operations.** Monument operations include central and field operations, information management, and overall program evaluation. Central and field operations are essential to support action plans to address all other priority management needs. Central operations are located in the main Hawaiian Islands and include support offices, interpretive facilities, and information management facilities. Field operations include, but are not limited to, shipboard and research diving operations, operation of power generation facilities, and maintenance of buildings and other infrastructures at field stations and camps. Operational

effectiveness must be evaluated and improved through an adaptive management process that captures lessons learned and transforms them into action.

### **1.3 SCOPE OF ANALYSIS**

This EA has been developed in accordance with NEPA and HRS Chapter 343. Its purpose is to inform decision makers and the public of the likely environmental consequences of the Proposed Action and No Action Alternatives. This EA identifies, documents, and evaluates the effects of the Proposed Action to implement new and expanded activities described in the Monument Management Plan and No Action, if no new activities were to be conducted beyond the current activities. This EA is not intended to analyze the impacts of Presidential Proclamation 8031 and requirements and findings that are contained within the Proclamation.

The Monument Management Plan is composed of 22 action plans, organized under six priority management needs. Each action plan describes strategies and activities to achieve a desired outcome under each priority management need. Many activities described in the Monument Management Plan are ongoing and are mandated by federal and state laws and existing agency policies and programs. These ongoing activities serve as the baseline for analyzing environmental and socioeconomic consequences. Current activities are described as the No Action alternative and would continue regardless of the development of the Monument Management Plan. Other activities in the Monument Management Plan represent expanded or new activities proposed to achieve the desired outcome for each action plan. Collectively, these activities are the Proposed Action alternative, and their environmental and socioeconomic effects are analyzed in comparison to the No Action alternative. Activities in the Monument Management Plan are also categorized as planning and administrative, field activity, or infrastructure and development. This is to distinguish between those activities that focus primarily on coordination among Co-Trustee agencies and those activities that occur primarily in the Monument.

An interdisciplinary team of environmental scientists and other specialists has analyzed the Proposed Action in light of existing conditions and has identified relevant effects associated with implementing the Proposed Action compared to the No Action alternative. The new or expanded activities listed in the Proposed Action are analyzed as appropriate under NEPA and HRS 343 in this EA. Many specific agency activities will be individually assessed, on a case-by-case basis, for future NEPA analysis (i.e. all research and access that requires permits, any major construction, etc.). Activities that are beyond the scope of this assessment may require further analysis in order to comply with NEPA (e.g., preparation of a supplemental EA or an Environmental Impact Statement). These activities are identified as such and they are discussed on a programmatic level. All other activities have been analyzed in a more detailed, site specific manner and the environmental consequences of implementing these activities are described in this document. This analysis covers the biological, cultural, and historic resources of the Monument, as well as the terrestrial and marine environments of the NWHI and the main Hawaiian Islands, as appropriate.

## **1.4 ALTERNATIVES CONSIDERED BUT NOT ANALYZED**

In the development of the Monument Management Plan, the MMB considered the following alternatives to the Proposed Action for managing the Monument:

### **Closing the Monument to the Public**

While a commenter suggested the Monument be closed entirely to the public, Presidential Proclamation 8031 establishes parameters and provides for certain access and activities in the Monument administration, and as such, this is not an option for the Co-Trustees. Providing public use opportunities, education, and interpretation at Midway Atoll NWR facilitates a broader understanding and appreciation of the unique NWHI ecosystem.

### **Enhanced Operations: Habitat Restoration and Historic Preservation**

The Enhanced Operations to support field activities and visitor services at Midway Atoll would focus on restoring Midway Atoll habitat and species, cleaning up contaminated sites, preserving historic resources, and limiting visitor services. This alternative would require additional staff and housing to support larger and more focused efforts. Short-term overnight visitation would be as much as 50 volunteer-visitors, while seasonal or long-term contractors, researchers, and habitat specialists would be up to 130 people, thus totaling approximately 180 people on any given night. The increased island population from the current regular capacity of 120 people would require increased utility systems infrastructure. Increased staffing for accelerated restoration and preservation would limit public visitation, and on-site interpretive and educational facilities would be minimal. Visitation would be restricted to those who would carry out approved refuge management activities, essentially closing the Monument to a large interested constituency, including many World War II veterans. Since, the existing infrastructure cannot accommodate the number of staff and contractors described; this alternative would require additional infrastructure and facility construction that is not consistent with its management for wildlife and habitat. In addition the restrictions that would be required for visitation are not consistent with the intent for Midway to serve as the only portion of the Monument open to the public. Based upon these associated issues, this alternative was not considered reasonable and was not appropriate for analysis.

## **1.5 DESCRIPTION OF NO ACTION ALTERNATIVE**

Under the No Action alternative, the Co-Trustees would continue to implement activities to address priority management needs of the Monument based on agency-specific plans. These current activities fall under 22 action areas, as summarized below and described in detail in the Monument Management Plan. Efforts that would result in direct actions are identified and described in the paragraphs below as planning and administrative, field, or infrastructure and development activities. Some of the current activities in the Monument described below would be expanded under the Proposed Action alternative and are described in section 1.6. The expanded activities as well as new activities described in section 1.6 may qualify as “categorical exclusions” while others may require additional compliance actions as additional plans are completed, including NEPA, section 7 of ESA, section 106 of the NHPA, and (Marine Mammal Protection Act (MMPA)).

### **1.5.1 Marine Conservation Science**

Current marine conservation science activities in the Monument are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, Sections 1.1, 1.2, and 1.4 and Section 3.1.1, Marine Conservation Science Action Plan). A summary of current activities in the Monument is provided below with references to specific activities in Marine Conservation Science (MCS) Action Plan.

#### **1.5.1.1 Current planning and administrative activities**

Current marine conservation science planning and administrative activities would continue to be focused on coordinating research efforts, managing data, and incorporating research results into school curricula. Monument research update meetings are coordinated among research partners (MCS-2.5). Regularly scheduled meetings are coordinated among managers, staff, and researchers to facilitate information exchange and to provide updates on research efforts in the Monument. These ongoing activities engage scientists conducting research in the NWHI to share their results with each other and with the MMB to assist in identifying research priorities to improve management decision making. Annual meetings are conducted to present research in the NWHI (MCS-3.1). These meetings provide a forum for the multidisciplinary research community, managers, and interested public to present current research initiatives and recent findings from research, including studies of the ecosystem, Native Hawaiians, maritime heritage, and economics.

Research, monitoring, and bathymetric data are being collected, analyzed, and entered into appropriate databases to better inform management decisions (MCS-1.6). Current protocols ensure consistency in data collection methods over time, which is of primary importance in any monitoring program in order to enable statistically valid comparisons among time periods (MCS-2.2).

Efforts are underway to translate NWHI research findings to the public and to incorporate them into the classroom curricula (MCS-3.2). Many of the materials developed during previous marine research expeditions have been incorporated into other outreach products, specifically displays at the Mokupāpapa Discovery Center, slideshows, and educational curricula. Similarly, educational materials have been associated with satellite tracking of albatross and migration of Golden Plovers (MCS-3.4).

#### **1.5.1.2 Current field activities**

Current marine conservation science field activities would continue to be focused on characterizing shallow- and deepwater marine habitats and on integrating education components on some research expeditions. The MMB and its partners would continue to conduct fieldwork to characterize shallow-water marine habitats and their spatial distributions in the NWHI, using a combination of methods, including remote sensing and underwater surveys (MCS-1.1). The shallow-water coral reef ecosystems would continue to be monitored, using sampling protocols developed through an interagency collaborative effort (MCS-1.2).

The MMB and its partners would continue to conduct deepwater mapping and characterization using submersibles, remotely operated vehicles, remote underwater cameras, and multibeam and

sidescan sonar (MCS-1.3). Some current scientific expeditions include educational components that have been highly successful for education and outreach. Components include live Web sites with updates from the research vessel, imagery, and video (MCS-3.3).

Current activities described above that would be expanded under the Proposed Action alternative include MCS-1.3, MCS-1.6, MCS-2.2, MCS-3.2, MCS-3.3, and MCS-3.4.

## **1.5.2 Native Hawaiian Culture and History**

Current Native Hawaiian culture and history activities in the Monument are described in the Monument Management Plan and include planning and administrative and field activities (see section 1.3 on resource condition and status and section 3.1.2, Native Hawaiian Culture and History Action Plan, which describes current status and background). A summary of activities in the Monument is provided below with references to specific activities in the Native Hawaiian Cultural and History (NHCH) Action Plan.

### **1.5.2.1 Current planning and administrative activities**

Current Native Hawaiian culture and history planning and administrative activities would continue to be focused on identifying research needs and priorities, assessing cultural resource capacity, and integrating Native Hawaiian traditional knowledge and management into Monument management. Scientific and Native Hawaiian cultural research needs would continue to be identified and prioritized through consultation with the Native Hawaiian Cultural Working Group and other Native Hawaiian institutions and organizations (NHCH-1.1). Ongoing efforts to develop cultural research priorities would continue alongside associated management challenges and opportunities (NHCH-1.2). Limited cultural and historical research about the NWHI has already been directly conducted by NOAA and FWS, in conjunction with partner organizations such as OHA and the Bishop Museum (NHCH-2.1). Supporting Native Hawaiian cultural research needs began prior to the Monument establishment and the MMB would continue to provide support for research efforts. Current agreements with the University of Hawai'i are limited to curriculum development (NHCH-2.7). The MMB would continue to assess capacity to support cultural resource management activities (NHCH-3.1). Monument resource managers have varying backgrounds in and experiences with Native Hawaiian cultural significance in the Monument, and efforts would continue to inform them about these issues (NHCH-3.3). Native Hawaiian traditional knowledge and management concepts would continue to inform management decisions in the Monument (NHCH-3.4). Native Hawaiian values and cultural information have been used in certain outreach and education programs targeted at both Native Hawaiians and the general public (NHCH-5.1). The development of a culturally based strategy for education and outreach makes information relevant, attractive, and accessible to Native Hawaiians (NHCH-5.2). Currently anyone granted a permit to access the Monument receives a cultural briefing to help foster a deeper respect for the NWHI through better understanding of, and respect for, Hawaiian values and cultural significance of the place (NHCH-5.3).

### **1.5.2.2 Current field activities**

Current Native Hawaiian culture and history field activities would continue to focus on cultural field research and education. Monument staff has facilitated limited cultural field research and education opportunities.(NHCH-2.3). Two cultural access trips have occurred since the Monument was established (NHCH-2.6). Native Hawaiian practitioners and cultural experts, along with the Native Hawaiian Cultural Working Group, have been advising OHA on Monument management activities; OHA provides information and recommendations based on this advice to the MMB (NHCH-3.2). Both Nihoa and Mokumanamana are recognized as culturally significant. They are listed on the National Register of Historic Places (NRHP) and protected in accordance with the NWRSA of 1966, as amended, and the National Historic Preservation Act (NHPA) of 1966 (NHCH-4.2).

Current activities described above that would be expanded under the Proposed Action alternative include NHCH-2.1, NHCH-2.2, NHCH-2.3, NHCH-2.6, NHCH-2.7, NHCH-3.2, NHCH-3.3, NHCH-4.2, NHCH-5.1, NHCH-5.2, and NHCH-5.3.

### **1.5.3 Historic Resources**

Current historic resources activities in the Monument are described in the Monument Management Plan and include planning and administrative and infrastructure and development activities (see Monument Management Plan, section 3.1.3, Historic Resources Action Plan). A summary of current activities in the Monument is provided below.

#### **1.5.3.1 Current planning and administrative activities**

Current historic resources planning and administrative activities would continue to be guided by the Midway Atoll NWR Historic Preservation Plan for long-term management and treatment for each of the 63 historic properties eligible for inclusion in the NRHP. The procedures in the plan would continue to be used for treating new discoveries. Updates to the Midway Atoll Historic Preservation Plan would continue by reconciling it with the Midway Visitor Service Plan, lead paint abatement plan, and other facilities maintenance and use plans (HR-1.1). Approval of the updated Historic Preservation Plan from Monument partners and the Advisory Council on Historic Preservation would be executed in an agreement document (HR-1.2). Historic preservation responsibilities and procedures would continue to be addressed in annual training of Monument staff and Midway contractors (HR-2.2). Planning and conducting a field survey and documentation of selected National Historic Landmark (NHL) sites and features would occur within 2 years (HR-3.2). Updating and maintaining the Battle of Midway NHL would continue, and interested parties would be included in this planning activity (HR-3.3).

FWS manages the historic properties at Midway Atoll according to a Programmatic Agreement and Historic Preservation Plan. This plan prescribes six different treatment categories for each of the 63 historic properties, based on qualitative measures recommended by interest groups, specialists, and the Advisory Council on Historic Preservation.

### **1.5.3.2 Current infrastructure and development activities**

Current historic resources infrastructure and development activities would continue to be guided by the Midway Atoll NWR Historic Preservation Plan for long-term management and treatment for each of the 63 historic properties eligible for inclusion in the NRHP. The procedures in the plan would continue to be used for treating new discoveries. Repair and maintenance treatments to NHL features would continue to be implemented, with volunteers and unskilled laborers performing maintenance activities and specially trained historic preservation architects and engineers performing repair work (HR-3.4).

Current activities described above that would be expanded under the Proposed Action alternative include HR-1.1, HR-1.2, HR-2.2, HR-3.2, HR-3.3, and HR-3.4.

### **1.5.4 Maritime Heritage**

Current maritime heritage activities in the Monument are described in the Monument Management Plan and include planning and administrative, and field activities (see Monument Management Plan, section 3.1.4, Maritime Heritage Action Plan). A summary of current activities in the Monument is provided below with references to specific activities in the Maritime Heritage (MH) Action Plan.

#### **1.5.4.1 Current planning and administrative activities**

Current maritime heritage planning and administrative activities would continue to be focused on basic documentary research. Current maritime heritage resource documentation and inventory plans and practices would continue to include annual collection and review of appropriate documentation (MH-1.1). Artifact recovery operation status reports would be developed (MH-1.4), along with an internal maritime heritage resource database (MH-1.5). Maritime heritage information would continue to be incorporated into public education and outreach (MH-2.1). Presentations on maritime heritage resources would continue to be developed and delivered at professional conferences and public events (MH-2.2).

Coordination of interagency maritime heritage resource management would continue to be conducted annually (MH-3.1). Protective measures would be enhanced for selected sites within the NWHI through the NRHP nomination process (MH-3.2). A Monument Maritime Heritage Research Plan is being developed for implementation within two years (MH-3.3).

#### **1.5.4.2 Current field activities**

Current maritime heritage field activities would continue to focus on coordinated field mapping surveys (MH-1.2). These field surveys include shoreline terrestrial surveys and inventory and marine remote sensing using a magnetometer and side-scan sonar.

### **1.5.5 Threatened and Endangered Species**

Current threatened and endangered species activities in the Monument are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan sections 1.1, 1.2, and 1.4 (Monument setting, resource status and

conditions, and stressors) and 3.2.1 (Threatened and Endangered Species Action Plan, Current Status, and Background). A summary of current activities in the Monument is provided below with references to specific activities in the Threatened and Endangered Species (TES) Action Plan.

#### **1.5.5.1 Current planning and administrative activities**

Current threatened and endangered species planning and administrative activities would continue to focus on evaluating potential threats and management needs for threatened and endangered species and continued implementation of appropriate species recovery plans, such as that for the Hawaiian monk seal. NOAA's National Marine Fisheries Service (NMFS) has conducted initial habitat loss projections due to sea level rise to evaluate potential threats to Hawaiian monk seals (TES-1.3). Monument staff would continue to reduce any effects of human interactions with Hawaiian monk seals through a variety of methods, including consultations, permitting, and promoting watchable wildlife guidelines. Increased outreach and education activities focused on the Hawaiian monk seal are now being conducted (TES-1.5). Materials have been created for public outreach and attendance at domestic and international meetings to carry out government-to-government communication on fisheries measures that can reduce by-catch of birds that may nest in the Monument during commercial fishing operations that are taking place outside the Monument (TES-4.3).

Ongoing efforts to cooperate with the Japanese government continue to establish one or more breeding populations of short-tailed albatrosses on islands free from threats, such as active volcanoes and introduced mammals (TES-4.1). FWS would continue to evaluate the potential to establish one to three colonies of three endangered plants, *Amaranthus brownii*, *Schiedea verticillata*, and *Pritchardia remota* outside of their historic ranges (TES-7.5). In addition, the MMB would continue to conduct Endangered Species Act (ESA) consultations for all authorized actions (TES-8.1, TES-8.3).

#### **1.5.5.2 Current field activities**

Current threatened and endangered species field activities would continue to focus on conserving, protecting, and managing habitat specifically for the Hawaiian monk seal, green turtle, cetaceans, short-tailed albatross, Laysan duck, passerines (perching birds), and a variety of listed plant species. One aspect of habitat management is the ongoing efforts to reduce marine debris, particularly in key Hawaiian monk seal habitat; this action is intended to reduce the number of injuries and mortality due to entanglement (TES-1.1). Current emergency response efforts related to Hawaiian monk seals are handled on a case-by-case basis in Hawaiian monk seal camps (TES-1.2). Current efforts by Monument staff to monitor effects of shark predation on Hawaiian monk seals and develop and implement methods to deter predation as appropriate would continue (TES-1.6)

Cetacean (whales, dolphins, and porpoises) population census research is ongoing (TES-2.1). Spinner dolphin mark and recapture photo identification surveys would continue yearly (TES-2.2), and Monument staff would continue monitoring, characterizing, and addressing the effects of marine debris on cetaceans (TES-2.3). To date, no cases of a cetacean with an infectious disease have been documented in the NWHI, but the appropriate response to any suspected

infectious disease incidents would be completed in a timely manner, and contingency response plans would be developed, if required (TES-2.4). However, controls are being used to prevent negative human-cetacean interactions that may occur as a result of visitor programs or research activities (TES-2.5).

Research has been conducted on the green turtle nesting population in the NWHI since 1973 and is one of the longest series of nesting abundance data for any sea turtle population around the globe (TES-3.1). Green turtle nesting and basking habitat is protected by prohibiting undesirable habitat alteration and controlling access to nesting and basking beaches (TES-3.2). People are prevented from driving and in some cases walking on nesting beaches. Turtle best management practices (BMPs) are being implemented to avoid and to minimize any potential to disturb sea turtle foraging areas (TES-3.3).

Initial studies have been conducted to evaluate the correlation between reproductive success of albatross and contaminant body burdens (TES-4.2). The population of the Laysan duck would continue to be monitored (TES-5.2). The feasibility of translocating Laysan finch, Nihoa finch, and the Nihoa millerbird to other areas of the Monument is being evaluated to buffer against catastrophic declines of current natural populations (TES-6.2).

Efforts to protect all endangered plant species from extinction would continue by collecting their seeds from Nihoa and Laysan Island and sending them to seed banks, such as the Lyon Arboretum and National Tropical Botanical Garden (TES-7.1).

The Co-Trustees and partners action agencies do not stop at monitoring existing population but seeks to increase numbers and locations of *Amaranthus brownii* and *Schiedea verticillata* on Nihoa by 2018 (TES-7.2) and to establish a self-sustaining Nihoa fan palm (*Pritchardia remota*) population on Laysan Island by 2012 (TES-7.3). These efforts are supported through continued greenhouse operations on Laysan Island to propagate and outplant these and other rare plant species (TES-7.4).

The Co-Trustees and partners action agencies continue to monitor populations of threatened and endangered species by conducting annual spinner dolphin mark and recapture photo identification surveys (TES-2.2), population monitoring of Laysan ducks on Laysan Island and Midway Atoll (TES-5.1), and annual censuses of populations of each passerine species, along with monitoring their food and habitat requirements (TES-6.1). In addition, ecological baselines of listed species and critical habitat, description of sensitive areas, and other information currently and is being periodically updated (TES-8.2).

Current activities described above that would be expanded under the Proposed Action alternative include TES-1.2, TES-1.3, TES-1.5, TES-1.6, TES-2.1, TES-2.3, TES-2.4, TES-2.5, TES-3.1, TES-3.3, TES-4.1, TES-4.2, TES-4.3, TES-5.2, TES-6.2, TES-7.1, and TES-8.2.

### 1.5.6 Migratory Birds

Current migratory bird activities in the Monument are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, section 3.2.2). A summary of current activities in the Monument is provided below, with references to specific activities in the Migratory Bird (MB) Action Plan.

### **1.5.6.1 Current planning and administrative activities**

Current migratory bird planning and administrative activities would continue to focus on reducing the effect of fisheries outside the Monument on migratory bird populations and ensuring that spill response plans are aimed at minimizing mortality to migratory birds. The Monument staff work with partners to reduce the effect of commercial and sport fisheries on migratory bird populations (MB-2.5). They provide data on seabird population and status and biological expertise regarding migratory bird bycatch and other fishing effects on bird species, particularly the Laysan albatrosses and black-footed albatrosses. Monument staff's biological expertise is tapped to teach seabird identification skills to fishers and fisheries observers and assisting with the development of mitigation techniques should significant effects occur. The MMB would ensure that all spill response plans have adequate coverage of actions necessary to minimize mortality to migratory birds (MB-2.3).

### **1.5.6.2 Current field activities**

Current migratory bird field activities would continue to focus on controlling or eradicating nonnative species, conducting surveillance of avian diseases, monitoring contaminant levels in birds and the environment, monitoring populations of seabirds, and restoring seabird populations. Nonnative species would continue to be controlled at all sites where they have a negative effect on the survivorship or reproductive performance of migratory birds (MB-1.1). Native plant communities would continue to be restored that are important to seabird nesting (MB-1.2). In addition, species-specific social attraction techniques, such as automated playback of calls and providing nesting boxes to encourage recolonization of Bulwer's petrels and Tristram's storm-petrels are ongoing at Midway Atoll (MB-4.1).

The MMB and participating agencies would continue to conduct surveillance for evidence of avian disease outbreaks (including Asian H5N1 Avian Influenza), reporting all instances of unusual mortality, collecting samples, and following response plans if disease is detected (MB-2.1). Contaminant levels in birds and their habitats would continue to be evaluated to determine if the potential exists to cause lethal or slightly below lethal effects (MB-2.2). Furthermore, rigorous quarantine protocols would be maintained to prevent the introduction of alien species that may prove hazardous, specifically to migratory birds (MB-2.4).

Using standard methods devised for tropical seabirds, monitoring a suite of 15 focal seabird species would continue at specific sites in the Monument to track changes in population size and help researchers understand the underlying causes of that change (MB-3.1). Changes in habitat quality would continue to be monitored by measuring reproductive performance and diet composition in selected seabird species (MB-3.2). Standardized methods would continue to be used to accurately assess the population size and trends of overwintering and migrating Pacific golden plovers, bristle-thighed curlews, wandering tattlers, and ruddy turnstones (MB-3.3).

Current activities described above that would be expanded under the Proposed Action alternative include MB-1.1, MB-1.2, MB-2.2, MB-2.3, MB-3.1, MB-3.2, and MB-3.3.

### **1.5.7 Habitat Management and Conservation**

Current habitat management and conservation activities in the Monument are described in the Monument Management Plan and include field activities (see Monument Management Plan, sections 3.2.3). A summary of current activities in the Monument is provided below with references to specific activities in the Habitat Management and Conservation (HMC) Action Plan.

#### **1.5.7.1 Current field activities**

Current habitat management and conservation field activities would continue to focus on habitat restoration and monitoring to document contamination that is degrading habitats within the Monument. Locations of shoreline dumps and other discarded material are documented when found at Kure Atoll (HMC-2.1). Locations of documented landfills would continue to be sought (HMC-2.3). Monument staff would continue to collect and fingerprint washed up oil from mystery spills and its effect on wildlife (HMC-2.5). Oil fingerprinting is used to determine its origin and to build an oil sample archive for possible use as evidence in assigning liability. Studies also would continue on an area of Laysan Island that was contaminated by the insecticide carbofuran (HMC-2.6) to document contamination that degrades habitats within the Monument.

Propagation and outplanting of extant native species identified in the pollen record and historical documents from Laysan Island would continue to occur in 250 acres of vegetated area at Midway Atoll (HMC-4.1). Alien and invasive species would continue to be replaced with native species on Midway and Laysan Islands (HMC-4.3). Habitat restoration activities are part of the routine field season on Kure Atoll (HMC-4.6).

Currently, MMB is monitoring changes in species composition and structure of the coastal shrub and mixed grass communities on all the coralline islands and atolls of the Monument (HMC-4.7) and on basalt islands (HMC-5.2). Water levels, salinity, and other water quality parameters of Laysan Lake continue to be monitored (HMC-6.1). When needed, activities such as installing drift fences are undertaken to slow the movement of sand and the drift of dunes into the lake (HMC-6.2).

Activities described above that would be expanded under the Proposed Action alternative include HMC-2.1, HMC-2.3, and HMC-4.7.

### **1.5.8 Marine Debris**

Current marine debris activities in the Monument are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, section 1.4 and section 3.3.1, Marine Debris Action Plan). A summary of current activities in the Monument is provided below, with references to specific activities in the Marine Debris (MD) Action Plan.

### **1.5.8.1 Current planning and administrative activities**

Current marine debris planning and administrative activities are focused on collating marine debris data from various entities. Information and data are collected from these entities that use a variety of data collection methods (MD-2.2).

### **1.5.8.2 Current field activities**

Current marine debris field activities focus on multiagency marine debris cleanup. These efforts have been highly effective in removing marine debris from shallow water areas and beaches of the Monument (MD-1.1). They have also included documenting, securing, and removing hazardous materials that wash ashore (MD-1.2). The MMB also works with governmental, nongovernmental, and industry partners to support studies on marine debris issues. One study underway is to assess net scar recovery over time at Midway Atoll (MD-2.1).

Current activities described above that would be expanded under the Proposed Action alternative include MD-1.1, MD-1.2, MD-2.1, and MD-2.2.

## **1.5.9 Alien Species**

Current alien species management activities in the Monument are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan section 3.3.2, Alien Species Action Plan). A summary of current activities in the Monument is provided below, with references to specific activities in the Alien Species (AS) Action Plan.

### **1.5.9.1 Current planning and administrative activities**

Current alien species management planning and administrative activities would continue to focus on developing outreach materials and working with various groups to address invasive species issues. As part of the outreach to all Monument permittees, Monument staff would continue to develop BMPs to prevent, control, and eradicate alien species (AS-1.2) and to develop outreach informational materials that include information on regulations, permit requirements, and BMPs related to alien species (AS-9.1). The spread of invasive species and the success of control measures would be tracked in a geographic information system (GIS) database of marine and terrestrial alien species (AS-2.2). Some alien species information has been integrated into general Monument outreach materials. For example, the “Navigating Change” curriculum and video series developed in 2004 contained information on the threat of invasive species to native ecosystems (AS-9.2). The MMB is currently working with a number of groups addressing invasive species in Hawai‘i, including the Hawai‘i Invasive Species Council, the Alien Aquatic Organism Task Force, and the Coordinating Group on Alien Pest Species, among several others. The Pacific Invasives Network is addressing invasive species issues in Pacific islands (AS-10.1).

### **1.5.9.2 Current field activities**

Current alien species management field activities would continue to focus on alien species prevention, detection, control, and eradication methods. The control of alien species would continue to be addressed through the continued strict enforcement of existing quarantine

protocols (AS-3.1), mandatory hull inspections of all permitted vessels entering the Monument (AS-3.2), and ensuring that state ballast water exchange regulations are complied with to keep the incidence of new invasive species in the NWHI low. Aggressive control of nonnative species is occurring at Tern, Laysan, and Midway Atoll (AS-6.1). For example the grass, sandbur, was eradicated at Laysan (AS-6.2), and work is occurring to control *Pluchea*, *Sporobolus*, and swine cress at Laysan (AS-6.3). Also, alien species have begun to be surveyed and mapped on Kure (AS-6.4).

Research is conducted on alien species detection and effects of invasive species on native ecosystems (AS-8.1). Terrestrial research is conducted on alien species prevention and control methods for native ecosystems (AS-8.2). Existing invasions of alien species are periodically monitored to determine rate of spread and distribution relative to sensitive species (AS-2.1).

Current activities described above that would be expanded under the Proposed Action alternative include AS-1.2, AS-2.1, AS-2.2, AS-6.1, AS-6.2, AS-6.3, AS-6.4, AS-8.1, AS-8.2, AS-9.1, AS-9.2, and AS-10.1.

### **1.5.10 Maritime Transportation and Aviation**

Current maritime transportation and aviation activities in the Monument are described in the Monument Management Plan and include planning and administrative, field, and infrastructure and development activities (see Monument Management Plan, section 3.3.3, Maritime Transportation and Aviation Action Plan). A summary of current activities in the Monument is provided below, with references to specific activities in the Marine Transportation and Aviation (MTA) Action Plan.

#### **1.5.10.1 Current planning and administrative activities**

Current maritime transportation and aviation planning and administrative activities conducted to manage maritime transportation within the NWHI include coordinating implementation of domestic and international shipping designations with appropriate entities (MTA-1.1). The International Maritime Organization (IMO) has designated the Monument as a Particularly Sensitive Sea Area (PSSA) (See Volume III, Appendix G). This augments protective measures by alerting international mariners to exercise extreme caution when navigating through the area. The IMO adopted associated protective measures for the area that include expanded areas to be avoided and a ship reporting system. Protocols exist for safe aircraft and vessel operations within the Monument (MTA-2.2). Information on alien species introductions, cultural protocols, anchoring, discharge, and Monument regulations are incorporated into training for Monument users and vessel operators before they can access the area (MTA-2.3).

#### **1.5.10.2 Current infrastructure and development activities**

Current maritime transportation and aviation infrastructure and development activities would continue to focus on encouraging energy and water conservation on all vessels operating within the Monument. Water and energy conservation measures would be continually improved on all vessels operating within the Monument, upgrading to new practices and technologies as they become available (MTA-2.4). The NOAA vessel *Hi'ialakai* is increasing shipboard conservation measures by recycling, installing water-saving devices, and testing alternative fuels

and hydraulic fluids. The MMB would continue to work with various ship managers to encourage similar practices for all vessels operating within the Monument.

Activities described above that would be expanded under the Proposed Action alternative include MTA-2.2 and MTA-2.3.

### **1.5.11 Emergency Response and Natural Resource Damage Assessment**

Current emergency response and natural resource damage assessment activities in the Monument are described in the Monument Management Plan and include planning and administrative activities (see Monument Management Plan, section 3.3.4, Emergency Response and Natural Resource Damage Assessment Action Plan). A summary of activities in the Monument is provided below, with references to specific activities in the Emergency Response and Natural Resource Damage Assessment (ERDA) Action Plan.

#### **1.5.11.1 Current planning and administrative activities**

Current emergency response and natural resource damage assessment planning and administrative activities include incident response and contingency planning. Emergency response in the NWHI is coordinated under a series of plans and systems, including the National Response Plan and the National Incident Management System. The National Response Plan establishes a comprehensive all-hazards approach to enhance the ability of the United States to manage domestic incidents, including oil and hazardous chemical spills. This plan incorporates the National Contingency Plan and its regulations governing how response is conducted by various parties. The NWHI is also covered by a more specific Area Contingency Plan for the Hawaiian Islands.

Appropriate Monument staff would receive training and certifications, including Incident Command System (ICS), hazardous waste operations and emergency response, boat safety, flight safety, first responder, and first aid, as needed (ERDA-1.2). Monument staff attend Regional Response Team meetings, as appropriate, to keep abreast of current communication and training and to build working relationships with agency staff that make up both the Regional Response Team and the United States Coast Guard (USCG) agency staff. Participation in emergency response drills and other events would help with preparedness and better integration into the response process (ERDA-1.3). Appropriate Monument staff have been trained and work closely with a variety of damage assessment programs, to ensure that appropriate response, injury assessment, and restoration activities take place for any given case (ERDA-1.4). There is an area contingency plan and environmental sensitivity indices for the Monument, which damage assessment personnel follow (ERDA-3.1). Monument staff respond to non-ICS events within the Monument (ERDA-3.2). The MMB uses technical experts to consult on permit applications.

Activities described above that would be expanded under the Proposed Action alternative include ERDA-1.2, ERDA-1.3, ERDA-1.4, ERDA-3.1, and ERDA-3.2.

### **1.5.12 Permitting**

Current permitting responsibilities and activities in the Monument are described in the Monument Management Plan and include planning and administrative activities (see Monument

Management Plan section 2, Management Framework and section 3.4.1, Permitting Action Plan). A summary of current activities in the Monument is provided below, with references to specific activities in the Permitting (P) Action Plan.

#### **1.5.12.1 Current planning and administrative activities**

Current permitting planning and administrative activities include reviewing and tracking permit applications and reports. The Monument staff serves as the central portal through which all permit inquiries and applications are received and processed (P-1.1). Each year, the permit application, instructions, and template are evaluated and updated based on lessons learned from the previous year (P-1.2). Monument staff regularly brings all permits and permit-related issues before the MMB for discussion or to recommend action to the Co-Trustees. In addition, individual permit applications are reviewed for environmental, cultural, and historic effects, and a case-by-case environmental analysis under NEPA may be conducted as necessary (P-1.3). The MMB uses technical experts to consult on permit applications (P-1.4). Monument staff have begun to develop a GIS-based permit tracking system, consisting of historical permit data (P-2.1).

Permits are issued based on regulatory requirements and proclamation findings and other criteria established by the MMB to assist with permit reviews. Currently, reports from permittees are received in an unstandardized format (P-2.4). Many of the action plans include educational or outreach activities related to permitting or regulations (P-3.1). Permit applicants are required to meet the findings detailed in Presidential Proclamation 8031 and receive a cultural briefing before they are allowed access to the Monument (P-3.2). Information on the permitting process has been placed on the Monument website, including application forms and instructions (P-3.3). Training in advance of a visit to the Monument is an important component of all permitted activities and is required for all those planning to enter the Monument for the first time. Several MMB agencies have formal and informal training mechanisms already in place (P-3.4).

Previously, the State of Hawai'i Land Board was the primary public forum for being notified of Monument permit applications under consideration by Co-Trustees in Hawaiian waters. To ensure that the general public has access to and is informed of all permit applications under review, a policy on public posting was developed and finalized in November 2007 to regularly update the public on proposed and permitted activities (P-3.5). In addition, the permit application, instructions, and template are evaluated and updated yearly based on lessons learned from the previous year. In addition, feedback from permittees and applicants are gathered yearly to maintain the most efficient and comprehensible permit program possible.

Activities described above that would be expanded under the Proposed Action alternative include P-1.4, P-2.1, P-2.4, P-3.1, P-3.2, P-3.3, and P-3.4.

#### **1.5.13 Enforcement**

Current enforcement responsibilities and activities in the Monument are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, section 2, and section 3.4.2, Enforcement Action Plan). A

summary of current activities in the Monument is provided below with references to specific activities in the Enforcement (EN) Action Plan.

#### **1.5.13.1 Current planning and administrative activities**

Current enforcement planning and administrative activities would continue to focus on enforcement of Monument and other applicable regulations, assessment of threats, and operation of a vessel monitoring system (VMS). Enforcement activities in the Monument are conducted by the individual Co-Trustee agencies, NOAA Office of Law Enforcement, FWS Law Enforcement, DLNR Division of Conservation and Resource Enforcement, and the USCG. At the national level, NOAA and FWS have agreements on enforcement (EN-1.2). Collaboration among agencies is conducted on an informal basis as needed to address enforcement issues. Enforcement training is conducted individually by each enforcement entity. A comprehensive threat assessment and enforcement plan is being developed to ensure surveillance resources can be effectively deployed Monument wide and law enforcement agencies can accurately assess threats (EN-2.1).

Currently the Monument relies on USCG platforms for enforcement operations (EN-2.4). A VMS is required by Monument regulations (50 CFR Part 404), and all permitted vessels must have this system to operate in the Monument (EN-2.2). Current briefings for permittees include information on Monument regulations, permit requirements, and BMPs (EN-3.1). No enforcement personnel are currently stationed in the Monument.

#### **1.5.13.2 Current field activities**

Current enforcement field activities would continue to focus on enforcement of Monument and other applicable regulations, assessment of threats, and operation of a VMS. Enforcement activities in the Monument are conducted by the individual Co-Trustee agencies, NOAA Office of Law Enforcement, FWS Law Enforcement, DLNR Division of Conservation and Resource Enforcement, and the USCG. Midway Atoll is predicted to be a hub of activities for the Monument, and a continued increase in law enforcement capacity is necessary to ensure visitor and staff safety, regulatory compliance, and enforcement (EN-1.5).

Current activities described above that would be expanded under the Proposed Action alternative are EN-1.2, EN-1.5, EN-2.4, and EN-3.1.

#### **1.5.14 Midway Atoll Visitors Services**

Current Midway Atoll visitor services are described in the Monument Management Plan and include field activities (see Monument Management Plan, 3.4.3, Midway Atoll Visitor Services Action Plan). A summary of current activities in the Monument is provided below with references to specific activities in the Midway Atoll Visitor Services (VS) Action Plan.

##### **1.5.14.1 Current field activities**

Current Midway Atoll visitor services field activities would continue to focus on tours and educational opportunities to visitors consistent with the May 2007 Interim Midway Atoll National Wildlife Refuge Visitor Services Plan. In January 2008, the new program began

offering limited opportunities for visitors to experience Midway and the Monument's natural, cultural, and historic resources. The interim visitor services plan, in accordance with the Refuge System Administration Act, has determined that certain recreational uses are compatible. Educational opportunities, which include diving, kayaking, and photography, are consistent with the interim visitors services plan (VS-1.1). Currently, walking tours and snorkeling are offered up to 40 people at a time, consistent with the interim visitors services plan (VS-1.2). Visitor effects and compatibility, as required by FWS policies, would continue to be monitored (VS-1.3). A voluntary visitor satisfaction survey is provided to each guest, with information provided to the refuge manager for appropriate action (VS-2.1).

Current activities described above that would be expanded under the Proposed Action alternative are VS-1.1, VS-1.2, VS-1.3, and VS-2.1.

### **1.5.15 Agency Coordination**

Current agency coordination activities in the Monument are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, section 2, Management Framework, and section 3.5.1, Agency Coordination Action Plan). A summary of current activities in the Monument is provided below, with references to specific activities in the Agency Coordination (AC) Action Plan.

#### **1.5.15.1 Current planning and administrative activities**

Current agency coordination planning and administrative activities are focused on agency coordination among government partners responsible for Monument management activities and other government entities. The MMB currently employs standard operating procedures for meetings and other events (AC-1.1). A Memorandum of Agreement among the Department of Commerce, the Department of the Interior, and the State of Hawai'i was signed in 2006 and outlines the coordinated management of the Monument (AC-2.2). Efforts exist to coordinate with agencies outside of the MMB through the Interagency Coordinating Committee (AC-2.3). The collaboration of agencies provides a means to improve management effectiveness in order to assess, prioritize, and plan activities at the Monument. An interagency strategic planning workshop is conducted with the Interagency Coordination Committee to discuss previous year activities, to plan and prioritize new activities, and to identify gaps or additional needs (AC-2.4).

The MMB maintains open communication with the Department of Defense (DoD) and the U.S. Navy on potential areas of cooperation (AC-3.1). The MMB collaborates with managers of marine protected areas and constituents in Hawai'i and the Pacific to share information on the management challenges common to coral reef ecosystems and the importance of those ecosystems to the world (AC-3.2). The State of Hawai'i would continue to take the lead within the MMB and collaborate with agencies to support the bid for obtaining World Heritage Site status from the United Nations Educational, Scientific, and Cultural Organization (UNESCO) World Heritage Center (AC-3.3).

Current activities described above that would be expanded under the Proposed Action alternative are AC-1.1, AC-2.2, AC-2.3, and AC-3.1.

### **1.5.16 Constituency Building and Outreach**

Current constituency building and outreach activities are described in the Monument Management Plan and include planning and administrative activities (see Monument Management Plan, section 3.5.2, Constituency Building and Outreach Action Plan). A summary of current activities in the Monument is provided below with references to specific activities in the Constituency Building and Outreach (CBO) Action Plan.

#### **1.5.16.1 Current planning and administrative activities**

Current constituency building and outreach planning and administrative activities would continue to focus on building a constituency of informed stakeholders. Monument staff would continue to refine and implement the Monument Media Communications Protocol to engage news media in informing the public about the Monument's resources and activities (CBO-1.2). The Monument serves as a powerful focal point for engaging a broad and diverse base of constituents and increasing ocean ecosystem literacy (CBO-1.4).

Monument staff will continue to produce a variety of materials to aid Monument constituencies in understanding key aspects of the Monument. The overall site brochure is the primary informational mechanism to help the public, and update letters have been provided to the public regularly during development of the Monument Management Plan (CBO-2.2).

Establishment of the Monument has created great interest from documentary filmmakers, writers, photographers, and others. The MMB supports those endeavors that provide significant benefit to Monument resources and management, and our constituents without affecting Monument resources (CBO-2.3).

Because most people are not able to visit the Monument due to its remoteness and fragility, it is important to bring the place to the people. Through discovery centers, Web sites, public outreach activities and materials, and the Monument media communications protocol, Monument information is dispersed in an accurate, consistent, and timely manner in order to reach a broader audience (CBO-3.1). Public forums have been held regarding specific aspects of the Monument (CBO-3.2). As the Hawaiian Archipelago is most closely related to other sites across Oceania, it is important for the MMB to continue to collaborate with a network of marine managed areas in this region (CBO-3.3). These partnerships would allow for a greater exchange of knowledge and expertise. They would also provide opportunities to build awareness about the important connection between cultural and conservation practices. A volunteer program would continue to be conducted in support of the Monument (Tern, Laysan, Midway, and Kure) (CBO-3.4). Guidance and support relative to Native Hawaiian cultural issues would continue to be provided to the Monument through OHA (CBO-3.6). Nonprofit friends groups would continue to be partners in contributing to the interpretation or recreation and educational programs of Midway (CBO-3.7). The NWHI Coral Reef Ecosystem Reserve Advisory Council, formed in 2001 for the Reserve, would continue to be convened until the Monument Alliance is established (CBO-3.8). The Reserve Advisory Council has served as a mechanism for public input and a venue for public comment on management activities.

Initial discussions of Monument-wide interpretive themes have been held among the Co-Trustee agencies (CBO-4.1). Two existing interpretive facilities at Hilo and on Midway Atoll NWR would continue to provide interpretive information (CBO-4.2). Monument staff would continue to be engaged in a variety of interpretive efforts to better inform Monument constituencies (CBO-4.4).

#### **1.5.16.2 Current field activities**

Because most people are not able to visit the Monument due to its remoteness, current constituency building and outreach field activities are focused on investigating new technologies to bring the place to the people. To accomplish this goal, Monument staff is investigating a variety of technologies, including underwater video cameras, real-time video transmission, virtual field trips, Web site interfaces, and exhibits in discovery centers (CBO-1.5).

#### **1.5.17 Native Hawaiian Community Involvement**

Current Native Hawaiian community involvement activities are described in the Monument Management Plan and include planning and administrative activities (Monument Management Plan, section 3.5.3, Native Hawaiian Community Involvement Action Plan). A summary of current activities in the Monument is provided below, with references to specific activities in the Native Hawaiian Community Involvement (NHCI) Action Plan.

##### **1.5.17.1 Current planning and administrative activities**

Current Native Hawaiian community involvement planning and administrative activities would continue to focus on partnerships with existing Native Hawaiian groups and identifying how traditional knowledge can be integrated into Monument management and research activities. A working group consisting of kūpuna, cultural practitioners, Native Hawaiian resource managers, and others established under the NWHI Coral Reef Ecosystem Reserve would continue through OHA to provide advice regarding management of the Monument and ensure the continuance of Native Hawaiian practices (NHCI-1.1). Cultural research and consultation related to the NWHI under the established partnership with the Kamakākūokalani Center for Hawaiian Studies would continue (NHCI-2.1). The Monument's cultural resources staff would work with the Native Hawaiian community and cultural experts to identify how traditional knowledge and associated practices may be woven into Monument management and research activities (NHCH-3.1).

Current activities described above that would be expanded under the Proposed Action alternative are NHCI-1.1 and NHCI-2.1.

#### **1.5.18 Ocean Ecosystems Literacy**

Current ocean ecosystems literacy activities in the Monument are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, section 3.5.4, Ocean Ecosystems Literacy Action Plan). A summary of activities in the Monument is provided below, with references to specific activities in the Ocean Ecosystems Literacy (OEL) Action Plan.

### **1.5.18.1 Current planning and administrative activities**

Current ocean ecosystems literacy planning and administrative activities focus on education in elementary, middle, and high school. “A Teacher’s Guide to Navigating Change” is an integral part of the NWHI-based curricula developed under the Navigating Change partnership and the new Hawai‘i Marine Curriculum (OEL-1.1). The Navigating Change partnership would continue to work closely with the Native Hawaiian community to ensure appropriate cultural information is included in curricula (OEL-1.2). Multi-agency educational partnerships would continue to conduct teacher workshops in the main Hawaiian Islands in support of middle/high school environmental education programs, including the “Navigating Change” curriculum (OEL-1.4). The Mokupāpapa Discovery Center for Hawai‘i’s Remote Coral Reefs hosts an average of six school groups per month (OEL-1.6). Education programs would continue to be evaluated to ensure desired goals are being met and target audiences are being reached (OEL-1.9). Monument staff have begun to identify new and innovative projects that could help to increase ocean ecosystems literacy (OEL-2.1).

### **1.5.18.2 Current field activities**

Current ocean ecosystems literacy field activities would continue to focus on teacher development both in the main Hawaiian Islands and NWHI and on exploring technologies to help those who cannot visit the NWHI experience it remotely. Over the past five years, more than 15 workshops have been conducted on the main Hawaiian Islands to introduce the standards-based Navigating Change curriculum to local teachers. Agency planning for Midway Atoll teacher workshops began in 2007, and a focus group of teachers, curriculum developers, educational leaders, and Navigating Change Educational Partnership members held a planning workshop on Midway Atoll in January 2008 (OEL-1.7). Each year, teachers active in learning about the NWHI and using Monument educational materials are provided with opportunities to participate in teacher and class-at-sea expeditions in conjunction with NOAA research cruises (OEL-1.5). Two opportunities per year are provided for educational groups, private/nonprofit environmental, or historical organizations to conduct wildlife-dependent or historical college-level courses or to administer informal educational camps (OEL-1.8). The MMB would continue to use new technologies for educational and outreach activities (OEL-2.2).

Activities described above that would be expanded under the Proposed Action alternative are OEL-1.1, OEL-1.2, OEL-1.6, OEL-1.7, OEL-1.9, OEL-2.1, and OEL-2.2.

### **1.5.19 Central Operations**

Current Central Operations activities in the Monument are described in the Monument Management Plan and include planning and administrative and infrastructure and development activities (see Monument Management Plan section 2 and section 3.6.1, Central Operations Action Plan). A summary of current activities in the Monument is provided below with references to specific activities in the Central Operations (CO) Action Plan.

#### **1.5.19.1 Current planning and administrative activities**

Current Central Operations planning and administrative activities would continue to focus on coordination among the MMB. The MMB has had varying levels of human resources and

facility infrastructure in place before the Monument was established. Although research and management activities are conducted in the Monument, most staff and administrative support is conducted in Honolulu and at other locations within the main Hawaiian Islands. To better coordinate among management agencies and to increase the effectiveness of site operations, annual operating plans would be developed and coordinated in accordance with the Monument management agencies' guiding policies and procedures (CO-1.1). Human resource and organizational capacity needs are regularly assessed to organize and better utilize staff, and identify technical and administrative human resource overlaps and gaps (CO-2.1). Human resource development, including staff recruitment, retention, recognition, training, communication, regular meetings, time and attendance, and staff safety, would continue (CO-2.2). Although some Monument staff are collocated, individual agencies primarily assess the status and future needs of their infrastructure independently (CO-3.1).

#### **1.5.19.2 Current infrastructure and development activities**

Current Central Operations infrastructure and development activities would continue to focus on maintaining physical assets. Maintaining and retaining current physical assets and procuring or leasing additional assets would continue to be driven by individual agency need and available funding (CO-3.2). Appropriate computer equipment would continue to be acquired, upgraded, and maintained to meet management needs (CO-3.3).

Current activities described above that would be expanded under the Proposed Action alternative are CO-2.1, CO-2.2, CO-3.1, CO-3.2, and CO-3.3.

#### **1.5.20 Information Management**

Current information management activities in the Monument are described in the Monument Management Plan and include planning and administrative activities (see Monument Management Plan, section 3.6.2, Current Status and Background). A summary of activities in the Monument is provided below.

##### **1.5.20.1 Current planning and administrative activities**

Current information management planning and administrative activities are focused on compiling a broad spectrum of information and data into an information management system. Multiagency Reef Assessment and Monitoring Program expeditions in the NWHI, which began in 2000, represent an initial attempt to establish a multiagency data clearinghouse for management purposes. This effort would continue because only a portion of the many years of NWHI data has been processed and made available. An annotated bibliography of cultural resources for the NWHI incorporates past cultural, geological, and biological studies in the NWHI and would continue to be updated. The MMB would continue to participate in the ONMS Information Management and Spatial Technology (IMaST) plan for all field sites. The IMaST plan organizes the many spatial resources within the National Marine Sanctuary System and makes them available to all sites and partner staff needing geospatial information, data, training, software, hardware, and hands-on experience.

Additionally, the MMB would continue developing a field-based tool to help collect research and vessel activity data from scientific expeditions conducted aboard research vessels active in

the NWHI. This system would help to meet permit criteria for data management and reporting and would assist in data entry, metadata recording, and data integrity. This system is one component of the larger Information Management System that would continue to be developed based on a set of priority management questions. A GIS spatial bibliography database for the NWHI is under development and will continue to be updated. This GIS incorporates geographical positions of past habitat characterization and field research into spatially referenced electronic documents.

### **1.5.21 Coordinated Field Operations**

Current coordinated field operations activities in the Monument are described in the Monument Management Plan and include planning and administrative, field activities, and infrastructure and development (see Monument Management Plan, section 3.6.3). A summary of current activities in the Monument is provided below with references to specific activities in the Coordinated Field Operations (CFO) Action Plan.

#### **1.5.21.1 Current planning and administrative activities**

Current coordinated field operations planning and administrative activities are focused on coordinating field operations and supporting dive operations. Continuing activities include implementing infrastructure rehabilitation, reconstructing and developing facilities on Midway Atoll (CFO-1.1), and applying “greening” methods and technologies for facilities and assets (CFO-1.4). An overarching MOA defines the working relationship among MMB agencies and provides a foundation for future specific field oriented agreements (CFO-2.1).

#### **1.5.21.2 Current field activities**

Current coordinated field operations field activities would continue to focus on interagency planning and coordination for field operations procedures. Field operations in the Monument rely on ships, aircraft, seasonal field camps, and field stations. Permitted activities are monitored through field activity reports to assess the threats they may pose to the resources. Reporting requirements are being developed with partners that would draw on existing databases when available (CFO-2.3). To enhance interagency planning and coordination for field operations, field operations are coordinated annually to efficiently deploy personnel and share resources among agency partners and ensure that priority management needs are met (CFO-2.4).

Individual MMB agencies inventory, maintain, and coordinate the use of their own small boats and related field resources (CFO-6.1). Interagency dive operations would continue to focus on maintaining reciprocity agreements, communication between dive masters and chief scientists, and ensuring certifications and training (CFO-8.4).

#### **1.5.21.3 Current infrastructure and development activities**

Current coordinated field operations infrastructure and development activities include routine maintenance activities at Tern and Laysan Islands and Kure and Midway Atolls. Houses would continue to be routinely maintained at Midway Atoll, and lead-based paint removal efforts would continue or be planned for all buildings (CFO-3.4). Routine maintenance of housing and facilities at Kure Atoll are part of the day-to-day operation during the field season (CFO-3.5).

Buildings and equipment would continue to receive routine maintenance and solar power and water would continue to be produced at French Frigate Shoals (CFO-3.6), along with seasonal tent camp operations at Pearl and Hermes Atoll (CFO-3.7) and routine maintenance of tent camps at Laysan Island (CFO-3.8).

Regular maintenance of a recently replaced fuel farm at Midway would continue to be conducted to meet fuel requirements for vessel, aircraft, and utility and equipment needs (CFO-4.1). The present water catchment area, storage tank, and distribution pipeline would be maintained (CFO-5.1). The recently rehabilitated septic and wastewater system would continue operation (CFO-5.2). Termites would be treated in all historic wooden structures at Midway Atoll if funding is available (CFO-5.3). The Clipper House would continue to have limited food service capacity for approximately 70 (CFO-5.4). The seaplane hangar is a historic structure that would be maintained as is, without needed repairs (CFO-5.5). The inner harbor seawall would continue to deteriorate creating safety issues (CFO-5.6).

FWS maintains several small boats at Midway for work in and around the atoll (CFO-6.1). FWS currently charters a twin engine aircraft (Gulf Stream 1 or G-1) to transport people and supplies to Midway. The G-1 would continue to provide service through fiscal year 2008 (CFO-7.1). Marine field research would be limited to Midway Atoll and its surrounding area with the existing small boats (CFO-6.2), and research/enforcement would continue to be limited by the availability of small research/enforcement vessels (CFO-6.3).

The Navy installed a dive recompression chamber at Midway, which was refurbished in the late 1990s in support of commercial dive tour operations and research (CFO-8.1). This diving chamber is no longer functional. Scientists would continue scuba-based research in the remote NWHI, but their research capacity would be limited by the availability of a portable dive recompression chamber (CFO-8.2). The current boathouse at Midway would continue to be in a state of disrepair; it is subject to flooding and limits dive operations' support capability (CFO-6.5 and CFO-8.3).

Limited transportation is arranged on a case-by-case basis to assist in moving threatened and endangered species as issues arise (CFO-9.3). Rehabilitation of the Midway Mall and commissary building would be minimal (CFO-9.4).

Current activities described above that would be expanded under the Proposed Action alternative are CFO-1.1, CFO-1.4, CFO-2.1, CFO-2.3, CFO-3.5, CFO-3.6, CFO-3.7, CFO-3.8, CFO-5.1, CFO-5.2, CFO-5.3, CFO-5.4, CFO-5.5, CFO-5.6, CFO-6.1, CFO-6.2, CFO-6.3, CFO-6.5, CFO-7.1, CFO-8.1, CFO-8.2, CFO-8.3, CFO-9.3, and CFO-9.4.

### **1.5.22 Evaluation**

Evaluation activities in the Monument are described in the Monument Management Plan and include planning and administrative activities (Monument Management Plan, section 3.6.4, Evaluation Action Plan). A summary of current activities in the Monument is provided below with references to specific activities in the Evaluation (EV) Action Plan.

**1.5.22.1 Current planning and administrative activities**

Current evaluation planning and administrative activities would focus on agency-specific annual program reviews (EV-1.2). Agency leads are responsible for describing the status of activity implementation and making recommendations for adjusting activities if considered necessary.

**1.6 DESCRIPTION OF PROPOSED ACTION ALTERNATIVE**

Under the Proposed Action alternative, the Co-Trustees would continue to implement activities described in the No Action alternative to address priority management needs of the Monument. These activities are described above and are not repeated here. In addition, some of the No Action alternative activities would be expanded. This section describes new and expanded activities proposed for the Monument. Some of the proposed activities may qualify as “categorical exclusions” while others may require additional compliance actions as additional plans are completed, including NEPA, section 7 of ESA, section 106 of the NHPA, and MMPA.

**1.6.1 Marine Conservation Science**

Proposed marine conservation science activities are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan sections 1.1, 1.2, and 1.4 and section 3.1.1, Marine Conservation Science Action Plan, which describes current status and background and activities). All activities described in the No Action alternative would continue, and several of these activities would be expanded. New activities are proposed to increase understanding of the distributions, abundances, and functional links of marine organisms and their habitats in space and time to improve ecosystem-based management decisions in the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Marine Conservation Science</b>	<b>Status</b>	<b>Activity Type</b>
Activity MCS-1.3: Map and characterize deepwater habitats.	Expanded	Field activity
Activity MCS-1.4: Establish and implement monitoring program for deep-water ecosystems, as appropriate.	New	Field activity
Activity MCS-1.5: Measure connectivity and genetic diversity of key species to enhance management decisions.	New	Field activity
Activity MCS-1.6: Collect, analyze and input research, monitoring, and bathymetric data into appropriate databases to inform management decisions.	Expanded	Planning/administrative
Activity MCS-2.1: Develop a prioritized Natural Resources Science Plan to support protection and management activities within 1 year.	New	Planning/administrative
Activity MCS-2.2: Assess monitoring program protocols.	Expanded	Planning/administrative
Activity MCS-2.3: Formalize collaborative regional monitoring programs for the NWHI.	New	Planning/administrative
Activity MCS-2.4: Implement management-driven research priorities identified in the Monument Natural Resources Science Plan.	New	field activity

<b>Proposed Action Alternative: Marine Conservation Science</b>	<b>Status</b>	<b>Activity Type</b>
Activity MCS-3.2: Identify and prioritize research, monitoring, and modeling projects for education and outreach.	Expanded	Planning/administrative
Activity MCS-3.3: Include an educational component in marine research expeditions.	Expanded	Field activity
Activity MCS-3.4: Use materials gathered and created during research expeditions to develop or enhance education and outreach products.	Expanded	Planning/administrative

Note: This table only includes proposed expanded and new activities; however, there are other activities in this action area, which are described under the No Action alternative.

**1.6.1.1 Expanded planning and administrative activities**

Expanded marine conservation science planning and administrative activities include efforts to regularly update information management systems, to evaluate the effectiveness of monitoring and sampling protocols, and to identify and disseminate research project results for education and outreach. While efforts to collect research and monitoring data would continue, the Monument Information Management System would be updated regularly to manage, analyze, summarize, and interpret research data collected in the NWHI (MCS-1.6). As management needs evolve and our understanding of ecosystem variability improves, monitoring protocols, sampling design, and sampling intervals would be evaluated for their effectiveness in meeting management needs and accurately reflecting change in the environment (MCS-2.2). These evaluations would be conducted on a cycle consistent with five-year management plan reviews with the interagency technical group on research. Working with partner agencies, research, monitoring, and modeling projects would be identified and prioritized for dissemination for education and outreach (MCS-3.2).

**1.6.1.2 New planning and administrative activities**

New marine conservation science planning and administrative activities include the development of a Natural Resources Science Plan (NRSP) and formalization of collaborative regional monitoring programs for the NWHI. The NRSP would identify and prioritize marine and terrestrial research and monitoring activities conducted in the NWHI and would serve as a more detailed implementation plan that supports the management and research strategies, as well as specific management-related surveys, research, and monitoring priorities found in other action plans (MCS-2.1). The NRSP would align management priorities among agencies to facilitate resource and information sharing and would address both baseline information needs and management-driven needs. Several independent monitoring initiatives are being conducted in the NWHI, and new initiatives are being planned, such as monitoring for invasive species, seabird colonies, Monument management zone’s effectiveness, and water quality (MCS-2.3). Regional monitoring programs would provide essential information to track long-term ecological integrity in the Monument.

**1.6.1.3 Expanded field activities**

Expanded marine conservation science field activities would include use of new technologies to map and characterize deepwater habitats and new ideas to integrate education and outreach components on all research expeditions. In addition to the current use of submersibles, ROVs, sidescan sonar, and other methods, technical diving would be used to collect data needed to continue mapping and characterizing deepwater habitats in the Monument (MCS-1.3). While education and outreach components have been previously integrated on research expeditions, innovative ideas would be explored to incorporate education and outreach components on all marine research and monitoring expeditions aboard NOAA research vessels (MCS-3.3).

**1.6.1.4 New field activities**

New marine conservation science field activities include establishing a monitoring program for deepwater ecosystems, measuring connectivity and genetic diversity of key species groups, and implementing research priorities identified in the NRSP. Monitoring deepwater ecosystems would provide essential information and data for ecosystem-based management of the Monument (MCS-1.4). Measuring connectivity and genetic diversity of key species would be helpful in forecasting, preparing and mediating potential threats to populations (MCS-1.5). The implementation of research priorities identified in the NRSP would ensure that research activities are focused on addressing critical questions of managing Monument resources, especially endangered and threatened species (MCS-2.4).

**1.6.2 Native Hawaiian Culture and History**

Proposed Native Hawaiian culture and history activities are described in the Monument Management Plan and include planning and administrative and field activities (see section 1.3 on resource condition and status and section 3.1.2, Native Hawaiian Culture and History Action Plan). All activities described in the No Action alternative would continue, several of which would be expanded. In addition, new activities are proposed to increase the understanding and appreciation of Native Hawaiian histories and cultural practices related to the Monument and to effectively manage cultural resources for their cultural, educational, and scientific values. New and expanded cultural activities are described in the Monument Management Plan (section 3.1.2, Native Hawaiian Culture and History AP). These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Native Hawaiian Culture and History</b>	<b>Status</b>	<b>Activity Type</b>
Activity NHCH-2.1: Continue to compile information and conduct new cultural and historical research about the NWHI.	Expanded	Planning/administrative
Activity NHCH-2.2: Support Native Hawaiian cultural research needs.	Expanded	Planning/administrative
Activity NHCH-2.3: Facilitate cultural field research and cultural education opportunities annually during the field season.	Expanded	Field activity

<b>Proposed Action Alternative: Native Hawaiian Culture and History</b>	<b>Status</b>	<b>Activity Type</b>
Activity NHCH-2.4: Convene a Native Hawaiian nomenclature working group.	New	Planning/administrative
Activity NHCH-2.5: Incorporate cultural resources information into the Monument Information Management System.	New	Planning/administrative
Activity NHCH-2.6: Continue to facilitate Native Hawaiian cultural access.	Expanded	Field activity
Activity NHCH-2.7: Establish agreements with local universities and museums to address possible curation, research, use, return, and repatriation of collections.	Expanded	Planning/administrative
Activity NHCH-3.2: Engage Native Hawaiian practitioners and cultural experts and the Native Hawaiian Cultural Working Group in the development and implementation of the Monument’s management activities.	Expanded	Field activity
Activity NHCH-3.3: Increase knowledge base of Native Hawaiian values and cultural information through “in reach” programs for resource managers.	Expanded	Planning/Administrative
Activity NHCH-4.1: Prepare a cultural resources program plan.	New	Planning/ administrative
Activity NHCH-4.2: Develop and implement specific preservation and access plans, as appropriate, to protect cultural sites and collections at Nihoa and Mokumanamana.	Expanded	Field activity
Activity NHCH-4.3: Implement the Monument Cultural Resources Program.	New	Field activity
Activity NHCH-5.1: Integrate Native Hawaiian values and cultural information into general outreach and education program.	Expanded	Planning/administrative
Activity NHCH-5.2: Develop a culturally based strategy for education and outreach within the Native Hawaiian community.	New	Planning/administrative
Activity NHCH-5.3: Integrate Native Hawaiian values and cultural information into Monument permittee education and outreach program.	Expanded	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.2.1 Expanded planning and administrative activities**

Expanded Native Hawaiian culture and history planning and administrative activities include efforts to increase knowledge and appreciation by MMB, resource managers, and the public of Native Hawaiian culture and history. Efforts would increase to compile existing information about the region and to initiate new research based on the priorities developed (NHCH-2.1). As management needs evolve and our understanding of ecosystem variability improves, monitoring protocols, sampling design, and sampling intervals would be evaluated for their effectiveness in meeting management needs and accurately reflecting change in the environment. These

evaluations would be conducted on a cycle consistent with five-year management plan reviews with the interagency technical group on research. Native Hawaiian cultural research needs would be supported by the MMB through grants, logistical support, berthing space aboard research vessels and other in-kind resources (NHCH-2.2). The scope of future agreements would be expanded to provide proper stewardship of cultural resources and artifacts. Agreements would be developed as the need arises and would be established in concert with the Cultural Resources Program Plan (NHCH-2.7). Efforts would be made to increase the knowledge base of Native Hawaiian cultural significance by Monument resource managers. This would be accomplished by having Monument resource managers and staff and MMB members, as appropriate, participate in informal and formal briefings, cultural workshops, and cultural exchanges in cooperation with other marine protected area sites that integrate traditional knowledge into their management (NHCH-3.3). Cultural information and traditional Native Hawaiian values would be infused into education and outreach materials aimed at the general public through the “Navigating Change” program, school curricula, promotion of Hawaiian place names in Monument materials, videos, articles, and the lecture series at Mokuāpāpapa Discovery Center (NHCH-5.1). Integration of Native Hawaiian values and cultural information into Monument permittee education and outreach programs would be increased to include numerous other approaches (NHCH-5.3).

#### **1.6.2.2 New planning and administrative activities**

New Native Hawaiian culture and history planning and administrative activities include efforts to convene a nomenclature working group, to incorporate research into the Monument Information Management System, and to develop a Cultural Resources Program and education and outreach programs. The MMB would convene a working group for nomenclature for yet-to-be discovered regions, islands, geographical and oceanic features, sites, and plant and animals species. Partnerships would be made through agreements with local universities and museums to facilitate research (NHCH-2.4). New knowledge learned through additional research would be incorporated into the Monument Information management System (NHCH-2.5). A Cultural Resources Program Plan would be developed to identify cultural resources, sites, and other locations and procedures for collections, curation, and disposition of archaeological materials, other artifacts, and human remains (NHCH-4.1). Native Hawaiian values and cultural information has been used in certain outreach and education programs targeted to both Native Hawaiians and the general public (NHCH-5.2).

#### **1.6.2.3 Expanded field activities**

Expanded Native Hawaiian culture and history field activities would provide additional opportunities to conduct cultural research and education activities in the Monument. Cultural research and education activities in the field would be expanded to provide logistical support and berthing space aboard research vessels and to put researchers and educators in touch with others doing similar work (NHCH-2.3). Increased cultural access would be facilitated and would include consistent access to Mokumanamana for Hawaiian religious practices and regular access for Polynesian voyaging canoes for wayfinding, navigational, and cultural protocol training (NHCH-2.6). The Native Hawaiian Cultural Working Group and other Native Hawaiian cultural practitioners and experts would be consistently consulted and integrated into the creation and implementation of programs. Examples of their participation may include providing cultural

briefings; where feasible, accompanying permittees accessing the Monument to experience, practice, and learn from the Monument resources while educating others; and including Native Hawaiians, particularly the younger generations, as part of cultural and scientific research teams, when feasible (NHCH-3.2). To further protect cultural sites and collections at Nihoa and Mokumanamana, preservation plans for both islands would be developed and implemented, as would plans for other cultural elements and yet-to-be discovered sites within the Monument. These preservation and access plans would address the monitoring and stabilization of cultural sites and curatorship or potential return/repatriation agreement with museums and institutions that house the artifact collections (NHCH-4.2).

**1.6.2.4 New field activities**

New field activities for Native Hawaiian culture and history would be based on the Cultural Resources Plan. The MMB would initiate strategies and activities contained in the Cultural Resources Plan (NHCH-4.3).

**1.6.3 Historic Resources**

Proposed historic resources activities are described in the Monument Management Plan and include planning and administrative, field, and infrastructure and development activities (see Monument Management Plan, section 3.1.3, Historic Resources Action Plan). All activities would continue as described in the No Action alternative, but several activities would be expanded. Recognizing their statutory responsibilities to inventory, evaluate, and interpret historic resources throughout the NWHI, the Co-Trustees propose new activities to identify, document, preserve, protect, stabilize, and, where appropriate, reuse, recover, and interpret historic resources associated with Midway Atoll and other historic resources within the Monument. These activities are listed in the table below and are summarized in this section.

Proposed Action Alternative: Historic Resources	Status	Activity Type
Activity HR-1.1: Reconcile the Historic Preservation Plan with the Midway Visitor Service Plan, lead paint abatement plan, and other facilities maintenance and use plans.	Expanded	Planning/administrative
Activity HR-1.2: Submit the updated Historic Preservation Plan for approval to the Advisory Council on Historic Preservation and Monument partners.	Expanded	Planning/administrative
Activity HR-2.1: Within 3 years, create dedicated capacity to implement the updated Historic Preservation Plan.	New	Planning/administrative
Activity HR-2.2: Annually train Monument staff and the Midway contractors on the content of the Historic Preservation Plan and implementation of appropriate treatments.	Expanded	Planning/administrative
Activity HR-2.3: Incorporate into the Midway Atoll visitor services program semiannual opportunities and events for visitors or volunteers to implement historic preservation treatments.	New	Field activity
Activity HR-3.1: Identify, collect, and review publications, data sets, and documents on the National Historic Landmark within 2 years of Monument Management Plan adoption.	New	Planning/administrative

<b>Proposed Action Alternative: Historic Resources</b>	<b>Status</b>	<b>Activity Type</b>
Activity HR-3.2: Plan and conduct a field survey and documentation of selected National Historic Landmark sites and features within 2 years.	Expanded	Field activity
Activity HR-3.3: Consult with interested parties and update the National Historic Landmark nomination within 4 years.	Expanded	Planning/administrative
Activity HR-3.4: Implement repair and maintenance treatments at National Historic Landmark features within 6 years.	Expanded	Infrastructure and development
Activity HR-4.1: Prepare a Scope of Collections Statement within 5 years.	New	Planning/Administrative
Activity HR-4.2: Remodel the Midway museum space within 7 years.	New	Infrastructure and development
Activity HR-4.3: Organize and curate collections within 8 years.	New	Planning/administrative
Activity HR-5.1: Identify, collect, and review publications, data sets, and documents within 12 years.	New	Planning/administrative
Activity HR-5.2: Plan, conduct, and report on field surveys and documentation of selected sites within 15 years.	New	Infrastructure and development
Activity HR-6.1: Begin a long-term annual program to compile, collect, curate, and publish oral histories of life on Midway Atoll within 3 years.	New	Planning/administrative
Activity HR-6.2: Conduct archaeological investigation of the Commercial Pacific Cable Station site within 10 years.	New	Field activity
Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.		

### 1.6.3.1 Expanded planning and administrative activities

Expanded historic resources planning and administrative activities involve updating the Midway Historic Preservation Plan and National Historic Landmark nomination, training staff on plan contents and implementation, and consulting interested parties on updates. To better identify, interpret, and protect historic resources in the NWHI, the Historic Preservation Plan would be reconciled with the Midway Visitor Service Plan, lead paint abatement plan, and other facilities maintenance and use plans (HR-1.1). The updated plan would be submitted for approval to the Advisory Council on Historic Preservation and MMB (HR-1.2). Annual training programs for Monument staff and Midway contractors would be conducted to ensure that the content of the updated plan and implementation of appropriate treatments are communicated and understood by all (HR-2.2). Interested parties would be consulted to prepare an updated National Historic Landmark nomination within four years (HR-3.3).

### 1.6.3.2 New planning and administrative activities

New historic resources planning and administrative activities involve increasing capacity to implement the updated Historic Preservation Plan, organization collections, conducting archival research and recording oral histories. A dedicated capacity to implement the updated plan would be developed within three years (HR-2.1). Within two years of the Monument Management Plan adoption, data would be gathered on the National Historic Landmark (HR-3.1). For the purpose

of improving the function and capacity of the Midway museum, a Scope of Collections Statement would be prepared within five years (HR-4.1). Collections would be organized within eight years (HR-4.3). Additionally, archival research on historic resources would be conducted beyond Midway Atoll NWR within 12 years (HR-5.1). A long-term program to record oral histories of life on Midway Atoll would begin within three years (HR-6.1).

### **1.6.3.3 Expanded field activities**

Expanded historic resources field activities include field surveys on selected National Historic Landmark sites (HR-3.2). Standard historical archaeological practices would be exercised.

### **1.6.3.4 New field activities**

New historic resources field activities include semiannual opportunities and events for visitor participation in historic preservation treatments, which would be incorporated into the visitor services program as well (HR-2.3). The Refuge visitor services program would be refined to recruit volunteers to help maintain historic properties, including painting, window restoration, and landscape maintenance. An archaeological investigation of the Commercial Pacific Cable Station site would be conducted within 10 years (HR-6.2). Archaeological and historical research, including excavation, would be conducted to shed light on Midway's earliest permanent residents.

### **1.6.3.5 Expanded infrastructure and development activities**

Expanded historic resources infrastructure and development activities include the appropriate maintenance and repair treatments on the National landmark within six years (HR-3.4). Depending on the treatment, some repair and maintenance activities may be accomplished by volunteers.

### **1.6.3.6 New infrastructure and development activities**

New historic resources infrastructure and development activities include remodeling the Midway museum space (HR-4.2). The Scope of Collection Statement would help define the types of artifacts and other historic materials that Monument staff would acquire for proper curation. Archaeological field surveys would be conducted on selected sites in the Monument within 15 years (HR-5.2). Standard historical archaeological practices would be exercised.

## **1.6.4 Maritime Heritage**

Proposed maritime heritage activities are described in the Monument Management Plan and include planning and administrative activities (Monument Management Plan, section 3.1.4, Maritime Heritage Action Plan). All activities described in the No Action alternative would continue under the Proposed Action. One new activity is proposed to identify, interpret, and protect maritime heritage resources in the Monument. This activity is listed in the table below and summarized in this section.

<b>Proposed Action Alternative: Maritime Heritage Resources</b>	<b>Status</b>	<b>Activity Type</b>
Activity MH-1.3: Complete a status report on potential environmental hazards within 1 year, and update it annually.	New	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.4.1 New planning and administrative activities**

New maritime heritage planning and administrative activities would aim to document environmental hazards from maritime heritage resources to natural resources and water quality. A status report would be completed on potential environmental hazards posed by wreck sites and other debris. This report would be updated annually as new sites are identified (MH-1.3).

**1.6.5 Threatened and Endangered Species**

Proposed threatened and endangered species activities are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, section 3.2.1). All activities described in the No Action alternative would continue; however several activities would be expanded under the Proposed Action. In addition, new activities are proposed to protect marine mammals and aid in the recovery of threatened and endangered species populations within the Monument. These activities are listed in the table below and summarized in this section.

<b>Proposed Action Alternative: Threatened and Endangered Species</b>	<b>Status</b>	<b>Activity Type</b>
Activity TES-1.2: Support and facilitate emergency response for Hawaiian monk seals.	Expanded	Field activity
Activity TES-1.3: Conserve Hawaiian monk seal habitat.	Expanded	Planning/ administrative
Activity TES-1.4: Reduce the likelihood and impact of human interactions.	Expanded	Planning/administrative
Activity TES-1.5: Support outreach and education on Hawaiian monk seals.	Expanded	Planning/administrative
Activity TES-1.6: Reduce shark predation on monk seals.	Expanded	Field activity
Activity TES-2.1: Census cetacean populations.	Expanded	Field activity
Activity TES-2.3: Monitor, characterize, and address the effects of marine debris on cetaceans in the Monument.	Expanded	Field activity
Activity TES-2.4: Respond to any suspected disease and unusual mortality incidents affecting cetaceans.	Expanded	Field activity
Activity TES-2.5 Prevent human interactions with cetaceans.	Expanded	Field activity
Activity TES-3.1: Collect biological information on nesting turtle populations.	Expanded	Field activity
Activity TES-3.3: Protect and manage marine habitat, including foraging areas and migration routes.	Expanded	Field activity
Activity TES-4.1: Work cooperatively with the Japanese government to establish one or more breeding populations on islands free from threats, such as active volcanoes and introduced mammals.	Expanded	Planning/administrative

<b>Proposed Action Alternative: Threatened and Endangered Species</b>	<b>Status</b>	<b>Activity Type</b>
Activity TES-4.2: Conduct studies to examine the correlation between reproductive success and contaminant loads.	Expanded	Field activity
Activity TES-4.3: Create and disseminate information on fisheries bycatch and bycatch reduction to all fisheries occurring outside the Monument.	Expanded	Planning/administrative
Activity TES-5.2: Carry out translocations to other sites in the Monument.	Expanded	Field activity
Activity TES-6.2: Implement translocations of each species and site restoration as needed by developing appropriate techniques for capture, translocation, release and monitoring.	Expanded	Field activity
Activity TES-7.1: Ensure all endangered plant species from Nihoa and Laysan Island are fully represented in an ex situ collections, such as a nursery or arboretum.	Expanded	Field activity
Activity TES-8.2: Develop baseline assessments for listed species and critical habitat and streamline the Monument consultation process to facilitate ESA consultations.	Expanded	Field activity

Note: Activities TES-6.2 and TES-7.1 would require Hawai'i State Cultural Impact Assessment Evaluation. This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.5.1 Expanded planning and administrative activities**

Expanded threatened and endangered species planning and administrative activities include conducting feasibility studies for habitat restoration, scrutinizing permit applications for an expanded range of factors that may affect endangered and threatened species, and enhancing education and outreach for human effects on Hawaiian monk seals. The MMB would investigate the feasibility of restoring and enhancing habitat essential for endangered and threatened species. Restoring or rebuilding habitat may be essential for the reproduction of Hawaiian monk seals and other protected species, such as turtles and sea birds, at several alternative sites that could lead to rebuilding preferred, stable pupping habitat (for example, accessibility, long shoreline, and stable beach) (TES-1.3). To reduce the likelihood and effect of human interactions, Monument staff would scrutinize all permit applications that may involve increased nearshore ship traffic, beach use, noise, and unnecessary research, among others. The MMB would expand its support of outreach and education on Hawaiian monk seals to provide the public and interest groups with information to understand the critical status of the Hawaiian monk seal population and the urgent action that is needed to prevent extinction (TES-1.5).

The Monument staff would expand cooperation with the Japanese government by working directly with Japanese biologists on satellite tagging projects and other studies. These efforts are needed to identify sites for one or more breeding populations of short-tailed albatross on islands, free from threats in Japanese breeding colonies, such as active volcanoes and introduced mammals (TES-4.1).

Materials would be created for public outreach and attendance at domestic and international meetings for government-to-government communication on fisheries measures that can reduce

bycatch during commercial fishing operations that could affect Monument resources, such as albatross (TES-4.3).

### **1.6.5.2 Expanded field activities**

Expanded threatened and endangered species field activities include expanding efforts to conserve threatened and endangered species habitat and to protect individual plants and animals, including Hawaiian monk seal, green turtle, cetaceans, short-tailed albatross, Laysan duck, passerines, and a variety of listed plant species.

Agreed-on and standardized protocols would be put into place to ensure that a rapid and well-organized response, including assessment, proper collection of evidence, and continued monitoring, occurs during and after an emergency response. The Monument would facilitate these types of responses through coordination, permitting, transportation, and logistical support (TES-1.2). In effort to reduce predation of sharks on Hawaiian monk seals, Monument staff would continue to monitor predation and its effects and develop and implement methods to deter predation as appropriate (TES-1.6).

In order to best develop management strategies for cetaceans in the Monument, surveys and observations would be pursued to gain information on species presence and abundance estimates (TES-2.1). Annual population census monitoring activities, in addition to other ongoing monitoring would support characterizing and addressing the effects of marine debris on cetaceans in the Monument (TES-2.3). Planning and pre-stage equipment would be established, Should an affected cetacean be sighted, it would be examined and sampled for a spectrum of possible diseases, and it would be treated appropriately and monitored for recovery (TES-2.4). Cetacean conservation would be further enhanced by preventing human interactions. This would be accomplished by eliminating disturbances to resting cetaceans in Monument lagoons or nearshore and by preventing geological research using sound levels known to be dangerous to marine mammals (TES-2.5). (Note: Under the terms of Presidential Proclamation 8031, activities and exercises of the Armed Forces are exempt from Monument prohibitions or permitting requirements. However, activities that may impact cetaceans or other marine mammals remain subject to laws of general applicability, such as the MMPA and the ESA, which apply within the Monument to the same extent they do elsewhere.)

In addition to maintaining current green turtle nesting abundance monitoring at East Island, distribution of nesting activity throughout the Monument would be periodically reassessed. As the population increases, new sites may be used for nesting (TES-3.1).

Monument staff would identify turtle foraging habitat in the Monument to better manage these areas and minimize vessel hazards to turtles (TES-3.3).

The short-tailed albatross is endangered in the U.S. Most of the world's population breeds on two small Japanese islands (TES-4.1). MMB and partnering agencies would cooperate with the Japanese government to establish one or more breeding populations of short-tailed albatross on islands free of threats, such as active volcanoes and introduced mammals. These efforts include attracting birds to Midway Atoll using decoys and recorded colony sounds. Once a breeding colony is established, it would be monitored. Data collected from studies of contaminant levels

in black-footed albatrosses would be used as surrogate data to estimate contaminant body-burdens in short-tail albatrosses (TES-4.2). Finally, because of the hazards to seabirds, the MMB would create and disseminate information on fisheries bycatch and bycatch reduction techniques to all fisheries outside the Monument that may effect seabirds (TES-4.3).

To supplement conservation efforts targeting the Laysan duck, the MMB would restore and create habitat necessary to support Laysan duck populations, translocate juveniles, and implement post-release monitoring (TES-5.2). Further efforts to establish additional bird populations include implementing translocations of Laysan finch, Nihoa finch and Nihoa millerbird and site restoration by developing appropriate techniques for capture, translocation, and release (TES-6.2).

Lastly, all endangered plant species from Nihoa and Laysan would be fully represented in ex situ collections, such as nurseries or arboretums. This would ensure the endangered plants' genetic material would be preserved in perpetuity (TES-7.1).

Information regarding ecological baselines of listed species and critical habitat and description of sensitive areas would be made available to agencies to determine whether or not their activities may affect listed species and, if so, to improve their biological assessments for consultations. Also, ESA and other consultation procedures would be reviewed and streamlined to benefit from the preparation of current baseline descriptions (TES-8.2).

**1.6.6 Migratory Birds**

Proposed migratory bird conservation activities are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, section 3.2.2). All activities described in the No Action alternative would continue, but several activities would be expanded under the Proposed Action alternative. In addition, new activities are proposed to conserve migratory populations and habitats within the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Migratory Birds</b>	<b>Status</b>	<b>Activity Type</b>
Activity MB-1.1: Control or eradicate nonnative species at all sites where they have a negative impact on the survivorship or reproductive performance of migratory birds.	Expanded	Field activity
Activity MB-1.2: Restore components of the native plant communities that are important to seabird nesting.	Expanded	Field activity
Activity MB-2.2: Monitor contaminant levels in birds and their habitats, and respond if the potential exists to cause immediately lethal or sublethal effects.	Expanded	Field activity
Activity MB-2.3: Ensure that all spill response plans have adequate coverage of actions necessary to minimize mortality to migratory birds.	Expanded	Planning/administrative
Activity MB-2.6: Research mite impacts on black-footed albatross chicks on Kure Atoll.	New	Field activity
Activity MB-3.1: Using standard methods devised for tropical seabirds, monitor a suite of 15 focal seabird species at specific sites in the Monument to track changes in population size and understand underlying causes of that change.	Expanded	Field activity

Proposed Action Alternative: Migratory Birds	Status	Activity Type
Activity MB-3.2: Monitor changes in habitat quality by measuring reproductive performance and diet composition in selected seabird species.	Expanded	Field activity
Activity MB-3.3: Develop and use standardized methods to accurately assess the population size and trends of overwintering and migrating Pacific golden plovers, bristle-thighed curlews, wandering tattlers, and ruddy turnstones.	Expanded	Field activity
Activity MB-4.1: Use social attraction techniques to encourage recolonization at Midway and Kure Atolls by Bulwer’s petrels and Tristram’s storm-petrels.	Expanded	Field activity

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.6.1 Expanded planning and administrative activities**

Expanded migratory bird conservation planning and administrative activities would expand existing oil spill response plans to include actual response plans and natural resource damage assessments through multiagency collaboration. These plans would be evaluated, revised, and followed to minimize mortality to migratory birds (MB-2.3).

**1.6.6.2 Expanded field activities**

Expanded migratory bird conservation field activities would expand habitat restoration efforts and establish standardized methods for monitoring the health and status of seabirds. To protect and enhance terrestrial and marine migratory birds’ habitats, Monument staff would control and eradicate nonnative species at all sites where they have a negative effect on the survivorship or reproductive performance of migratory birds (MB-1.1). Alien species eradication would be followed by restoring native coastal mixed grass and shrub communities (MB-1.2). Each of these activities minimizes the effect of alien species and habitat destruction on migratory birds. Monument staff, using standard methods devised for tropical seabirds, would monitor a suite of 15 focal seabird species at specific sites in the Monument to track changes in population size and to understand underlying causes of that change (MB-3.1). Specifically, they would monitor contaminant levels in birds and their habitats and would respond if the potential exists to cause immediately lethal or sublethal effects (MB-2.2). In addition, Monument staff would monitor changes in habitat quality by measuring reproductive performance and diet composition in selected focal species (MB-3.2). These efforts would not be limited to seabirds, but staff would develop and use standardized methods to accurately assess the population size and trends of overwintering and migrating Pacific golden plovers, bristle-thighed curlews, wandering tattlers, and ruddy turnstones (MB-3.3).

**1.6.6.3 New field activities**

New migratory bird conservation field activities would target the design and conduct of research on the effect of mites on black-footed albatross chicks on Kure Atoll (MB-2.6). In addition, species specific social attraction techniques, such as automated playback of calls and provision of nesting boxes to encourage recolonization of Bulwer’s petrels and Tristram’s storm-petrels, are proposed at Kure Atoll (MB-4.1).

### 1.6.7 Habitat Management and Conservation

Proposed habitat management and conservation activities are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, section 3.2.3). All activities described in the No Action alternative would continue, several activities would be expanded under the Proposed Action. In addition, new activities are proposed to protect and maintain the native ecosystems and biological diversity of resources in the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Habitat Management and Conservation</b>	<b>Status</b>	<b>Activity Type</b>
Activity HMC-1.1: Identify and prioritize restoration needs in shallow-water reef habitats impacted by anthropogenic disturbances within 5 years.	New	Planning/administrative
Activity HMC-1.2: Analyze historic and present impacts on reef growth at Midway Atoll and determine factors limiting nearshore patch reef growth to facilitate restoration of natural reef building.	New	Field activity
Activity HMC-1.3: Where feasible, implement appropriate restoration activities.	New	Field activity
Activity HMC-2.1: Evaluate effects of contamination in terrestrial and nearshore areas from shoreline dumps at French Frigate Shoals and at Kure, Midway, and Pearl and Hermes atolls and prioritize cleanup action based on risk assessments.	Expanded	Field activity
Activity HMC-2.2: Work with partners and responsible parties to verify the integrity of known landfills and dumps and to conduct additional remediation if necessary.	Expanded	Field activity
Activity HMC-2.3: Locate historic disposal sites at French Frigate Shoals and at Kure, Midway, and Pearl and Hermes atolls, and investigate them for contamination.	Expanded	Field activity
Activity HMC-2.4: Evaluate costs to ecosystem function and benefits of removing anthropogenic iron sources such as metal from shipwrecks and discarded debris from reefs throughout the Monument.	New	Planning/administrative
Activity HMC-2.7: Conduct ecological risk assessment to determine allowable lead levels in soils at Midway and remove lead from buildings and soils to nonrisk levels.	New	Planning/administrative
Activity HMC-3.1: Evaluate loss of beach strand and crest due to erosion and sea level rise to aid in formulating a restoration plan that would stop as much net loss of beach strand and beach crest habitat as is possible.	New	Field activity
Activity HMC-3.2: Inventory and map manmade structures and changes in natural beach and reef state that may influence erosion and depositional processes at all of the beach strand units of the Monument.	Expanded	Field activity
Activity HMC-4.4: Formulate and implement a restoration plan for Lisianski Island using guidelines established for neighboring Laysan Island.	New	Planning/administrative
Activity HMC-4.5: Propagate and outplant native vegetation on 34-	New	Field activity

<b>Proposed Action Alternative: Habitat Management and Conservation</b>	<b>Status</b>	<b>Activity Type</b>
acre Southeast Island at Pearl and Hermes Atoll to replace native plant community extirpated by invasion of the alien plant golden crownbeard.		
Activity HMC- 4.6: Implement the coordinated ecosystem restoration activities on Kure Atoll.	Expanded	Field activity
Activity HMC-4.7: Monitor changes in the species composition and structure of mixed grass and shrub communities at each site.	Expanded	Field activity
Activity HMC-5.1: Inventory and document life histories of endemic terrestrial invertebrates at Nihoa and Mokumanamana.	Expanded	Field activity
Activity HMC-7.1: Monitor salinity, parasites, contaminants, and native arthropods associated with freshwater seeps, ponds, and streams.	Expanded	Field activity
Activity HMC-7.2: Evaluate potential for development, and create as needed, additional freshwater sources at potential translocation sites of the Laysan duck, Nihoa finch, and Nihoa millerbird.	Expanded	Planning/administrative
Activity HMC-8.1: Remove ironwood on Sand Island from 50 acres outside designated woodland and control young ironwood in areas managed for grass and shrubs.	Expanded	Field activity
Activity HMC-8.2: Devise and implement methods for monitoring population size and reproductive success in tree-nesting seabird species.	New	Field activity
Activity HMC-9.1: Educate other federal agencies about overflight rules and promote compliance regarding overflights and close approaches.	Expanded	Planning/administrative
Activity HMC-9.2: Develop and implement techniques for monitoring plant and animal populations on cliff habitats in the Monument within 10 years.	New	Planning/administrative
Activity HMC-10.1: Conduct a wilderness review of the Hawaiian Islands and Midway Atoll NWRs within 5 years.	New	Planning/administrative

Notes: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.7.1 Expanded planning and administrative activities**

Expanded habitat management and conservation planning and administrative activities include evaluating potential translocation sites for endangered endemic birds and education activities regarding overflight to sensitive habitats in the Monument. The potential for developing additional freshwater sources would be evaluated at potential translocation sites of the Laysan duck, Nihoa finch, Laysan finch, and Nihoa millerbird (HMC-7.2). Personnel at other federal and state agencies would be educated about rules for overflights and close approaches to Nihoa and Mokumanamana cliff habitats to promote compliance with rules and regulations (HMC-9.1).

**1.6.7.2 New planning and administrative activities**

New habitat management and conservation planning and administrative activities include developing habitat- and species-specific restoration plans, risk-based approach for prioritizing

cleanup and remediation actions, and techniques to monitor cliff-dwelling plant and animal populations. Habitat- and species-specific restoration plans would also be developed and implemented. Restoration needs would be developed and implemented for shallow-water reef habitats modified by humans (HMC-1.1); a plan would include restoring original population levels of black-lipped pearl oysters at Pearl and Hermes Atolls. Ecological risk assessments would be conducted to determine allowable lead levels in soils at Midway and to remove lead from buildings and soils to nonrisk levels (HMC-2.7). The costs to ecosystem function and benefits of removing man-made iron sources, such as metal from shipwrecks and discarded debris from reefs throughout the Monument, would be evaluated (HMC-2.4). Cleanup and remediation actions would be prioritized, based on risk assessments. The MMB would also formulate restoration and management plans or would implement administrative plans for various islands including Kure Atoll and Lisianski Island (HMC-4.4). This activity would undergo additional NEPA analysis, as described in section 1.8. Techniques for monitoring plant and animal populations on cliff habitats in the Monument would be developed and implemented (HMC-9.2). A wilderness review of the Hawaiian Islands and Midway Atoll NWRs will be conducted within five years (HMC-10.1).

### **1.6.7.3 Expanded field activities**

Expanded habitat management and conservation field activities include increased investment in identifying, containing, and removing contaminated sites, in determining the feasibility of creating water sources or wetlands for translocating endangered species, in conducting comprehensive monitoring and inventorying all terrestrial habitats, and in restoring native terrestrial vegetation. The effects of contamination due to shoreline dumps on birds nesting on the dumps and marine organisms in adjacent waters would be investigated at Kure Atoll, French Frigate Shoals, Midway Atoll, and Pearl and Hermes Atolls (HMC-2.1). Efforts to ameliorate the effects of contamination would focus on locating, evaluating, monitoring, containing, and removing contamination from shoreline dumps and landfills (HMC-2.2). The USCG created a new unlined landfill on Green Island, Kure Atoll, during remediation of the LORAN (Long-Range Aid to Navigation) station. The landfill would be investigated to confirm that PCBs placed in it are not leaching to groundwater and that the documented surface hotspots have been removed. Cleanup levels of PCBs need to be evaluated to ensure that these levels protect wildlife (HMC-2.3).

Monument staff would inventory and map man-made structures and changes in natural beach and reef condition that may influence erosion and depositional processes at all the beach strand units of the Monument (HMC-3.2). Feasibility studies would determine if Kure is appropriate as a translocation site for Laysan ducks. If feasible, appropriate wetland habitats, such as a pond, would be developed for this purpose (HMC-4.6). Changes in the species composition and structure of mixed grass and shrub communities would be monitored on all coralline islands and atolls (HMC-4.7).

The MMB intends to implement, and if necessary, develop methods to inventory and monitor a range of habitats and a variety of organisms. Endemic terrestrial invertebrates at Nihoa and Mokumanamana would be inventoried and their life histories would be documented (HMC-5.1). The salinity, parasites, contaminants, and native arthropods associated with freshwater seeps, ponds, and streams would be monitored to evaluate the potential for development. Additional

freshwater sources would be created, with particular emphasis on potential translocation sites of the Laysan duck, Nihoa finch, and Nihoa millerbird (HMC-7.1). Examples of these restoration goals are to remove ironwood on Sand Island from 50 acres outside designated woodland and to control young ironwood in areas managed for grass and shrubs (HMC-8.1).

**1.6.7.4 New field activities**

New habitat management and conservation field activities would focus on evaluating historic and present effects on reef growth, evaluating the loss of beach habitats, outplanting new areas, and employing new methods to monitor tree-nesting seabird populations. New field research would be conducted to analyze historic and present effects on reef growth at Midway Atoll and to determine limiting factors of reef growth (HMC-1.2); then, if appropriate, using best available information about pre-disturbance conditions, restoration would be conducted to facilitate natural reef building (HMC-1.3). Research would be designed to evaluate loss of beach strand and crest due to erosion and sea level rise (HMC-3.1); this would help formulate a restoration plan that would stop as much net loss of beach strand and beach crest habitat as is possible. Propagating and outplanting native vegetation on 34-acre Southeast Island at Pearl and Hermes Atolls would be conducted to replace the native plant community extirpated by the invasive golden crownbeard (HMC-4.5). Methods for monitoring population size and reproductive success in tree-nesting seabird species would be devised and implemented (HMC-8.2).

**1.6.8 Marine Debris**

Marine debris cleanup activities would continue, as described in the Monument Management Plan, and include planning and administrative and field activities (see Monument Management Plan, section 3.3.1, Marine Debris Action Plan). All activities described in the No Action alternative would continue, but several activities would be expanded under the Proposed Action. In addition, new activities are proposed to reduce the negative effects of marine debris to Monument resources and to reduce the amount of debris entering the North Pacific Ocean. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Marine Debris</b>	<b>Status</b>	<b>Activity Type</b>
Activity MD-1.1: Continue working with partners to remove marine debris in the Monument and reduce additional debris entering the Monument.	Expanded	Field activity
Activity MD-1.2: Catalog, secure, contain, and properly remove hazardous materials that wash ashore in the NWHI.	Expanded	Field activity
Activity MD-1.3: Develop and implement a 5-year marine debris removal and prevention strategy for the Monument.	Expanded	Planning/administrative
Activity MD-1.4: Work with the U.S. Department of State to gain international cooperation and involvement for marine debris issues.	New	Planning/administrative
Activity MD-1.5: Work with the fishery management councils to address marine debris prevention with U.S. fishing fleets.	Expanded	Field activity
Activity MD-2.1: Work with partners on marine debris studies.	Expanded	Field activity
Activity MD-2.2: Develop and standardize marine debris monitoring protocols for marine and terrestrial habitats.	Expanded	Planning/administrative
Activity MD-3.1: Work with partners to continue to develop and	New	Planning/administrative

Proposed Action Alternative: Marine Debris	Status	Activity Type
implement an outreach strategy for marine debris.		

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.8.1 Expanded planning and administrative activities**

Expanded marine debris planning and administrative activities include developing standardized protocols for marine debris removal and developing a multiagency outreach strategy for marine debris. The MMB would work with all federal and state partners to standardize marine debris protocols to maximize the use and utility of data collected by the various programs (MD-2.2). To better explain the scope and effects of marine debris in the NWHI, an outreach strategy would be developed with the multiagency partnership to reach a broad audience and specific fishing communities (MD-3.1).

**1.6.8.2 New planning and administrative activities**

New marine debris planning and administrative activities include highlighting marine debris prevention internationally. The MMB would work through the Interagency Marine Debris Coordinating Committee, the U.S. Department of State, and other appropriate U.S. agencies to call international attention to marine debris problems in the NWHI and to identify approaches to reducing foreign debris sources (MD-1.4).

**1.6.8.3 Expanded field activities**

Expanded marine debris field activities include increased efforts to intercept marine debris at sea before it enters the Monument. Efforts to remove marine debris in the Monument would be increased, and efforts to reduce additional debris entering the Monument would be undertaken. New technology, such as unmanned aerial vehicles, would be tested to detect marine debris at sea (MD-1.1). Efforts to document, secure, and remove hazardous materials that wash ashore would increase (MD-1.2). Marine debris removal in the Monument would be expanded through the efforts of multiagency partnerships and working with the fishery management councils to address marine debris prevention with U.S. fishing fleets (MD-1.5). The MMB would continue current research efforts with the Marine Debris Program and would expand them to determine marine debris accumulation rates, biological and habitat effects, efforts to track sources and types of debris, and documentation of the cost estimates of damage (MD-2.1).

**1.6.9 Alien Species**

Proposed alien species management activities are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, section 3.3.2, Alien Species Action Plan). All activities described in the No Action alternative would continue, but several activities would be expanded under the Proposed Action. In addition, new activities are proposed to detect, control, eradicate where possible, and prevent the introduction of alien species into the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Alien Species</b>	<b>Status</b>	<b>Activity Type</b>
Activity AS-1.1: Complete an Integrated Alien Species Management Plan.	New	Planning/administrative
Activity AS-1.2: Develop best management practices to prevent, control, and eradicate alien species.	Expanded	Planning/administrative
Activity AS-2.1: Survey distributions and populations of known alien species at regular intervals.	Expanded	Field activity
Activity AS-2.2: Maintain a GIS database of marine and terrestrial alien species.	New	Planning/administrative
Activity AS-2.3: Develop and implement monitoring protocols for early detection and characterization of new infestations.	New	Field activity
Activity AS-4.1: Produce a house mouse eradication plan within 5 years and procure appropriate permits for chosen eradication techniques.	New	Planning/administrative
Activity AS-4.2: Implement and complete house mouse eradication.	New	Field activity
Activity AS-5.1: Within 5 years, formulate a priority list of locations and species and a treatment plan to control and eventually eradicate all social Hymenopterans, such as ants and wasps, at all islands in the Monument.	New	Planning/administrative
Activity AS-5.2: Conduct toxicant trials to evaluate their efficacy and document ecological effects at selected islands on highest-priority invasive species of ants and wasps.	New	Field activity
Activity AS-5.3: Control and if possible eradicate the two introduced mosquito species at Midway Atoll within 10 years using methods prescribed in the Integrated Pest Management Plan.	New	Field activity
Activity AS-5.4: Develop and implement a plan to control and if possible eradicate the invasive gray bird locust wherever it occurs.	New	Field activity
Activity AS-5.5: Protect endangered plants threatened by gray bird locust outbreaks at Nihoa by developing appropriate baits for localized application of toxicants to protect specific high-priority plant sites.	New	Field activity
Activity AS-6.1: Control and eventually eradicate golden crownbeard and co-occurring weedy shrubs in all areas where they occur.	Expanded	Field activity
Activity AS 6.2: Control and eventually eradicate the invasive grass sandbur from all areas of the Monument where it currently occurs.	Expanded	Field activity
Activity AS-6.3: Control and eventually eradicate Indian pluchea, <i>Sporobolus pyramidatus</i> , and swine cress from Laysan Island.	Expanded	Field activity
Activity AS-6.4: Control and eventually eradicate prioritized alien plant species from Kure Atoll.	Expanded	Field activity
Activity AS-7.1: Map, control and eventually eradicate invasive red algae where it occurs.	New	Field activity
Activity AS-7.2: Conduct surveillance at appropriate sites for	New	Field activity

<b>Proposed Action Alternative: Alien Species</b>	<b>Status</b>	<b>Activity Type</b>
snowflake coral and other incipient marine invasives.		
Activity AS-8.1: Support and conduct research on alien species detection and the effects of invasive species on native ecosystems.	Expanded	Field activity
Activity AS-8.2: Support and conduct research on invasive species prevention, control methods, and eradication techniques.	Expanded	Field activity
Activity AS-9.1: Integrate alien species information into the overall outreach program for Monument permittees.	Expanded	Planning/administrative
Activity AS-9.2: Integrate alien species information into general Monument outreach materials.	Expanded	Planning/administrative
Activity AS-10.1: Build relationships with other resource managers and invasive species experts in the state, nation, and other countries based on shared challenges concerning invasive species.	Expanded	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

### 1.6.9.1 Expanded planning and administrative activities

Expanded alien species management planning and administrative activities include developing enhanced outreach materials and working with new groups involved with alien species control. Specific protocols and requirements for preventing, controlling the spread of, and eradicating alien species, such as hull inspections and island quarantine protocols, a description of each partner’s role in alien species control, BMPs to prevent the spread of species within the NWHI, and priority areas would be expanded to address threats from alien species on Monument resources. Monument staff would expand activities for responding to alien species through further development of BMPs for preventing, controlling and eradicating alien species (AS-1.2). Outreach activities would be expanded through the integration of alien species information in outreach materials for both general education and to provide Monument permittees with information on regulations, permit requirements and BMPs for preventing alien species introductions. A guide to marine and terrestrial alien species with photographs, modes of transport, reporting protocols, and BMPs would be used as part of the outreach program. Outreach may consist of printed materials, as well as presentations that are part of the permit application process and as taxonomy training for staff and volunteers (AS-9.1). Monument staff would increase integration of messages on alien species into general education and outreach materials when appropriate opportunities arise (AS-9.2). Monument staff would participate in public and professional conferences, working group meetings, and activities focused on reducing the effects of alien species statewide and in the Pacific region. Increased information exchange would maximize the effectiveness of collective resources and keep the MMB current on invasive species research, management, and outreach efforts throughout Hawai‘i and the Pacific (AS-10.1).

### **1.6.9.2 New planning and administrative activities**

New alien species management planning and administrative activities include developing an integrated plan to control and eradicate alien species, implementing new monitoring protocols for early detection, and prioritizing control efforts for ants and wasps.

An Integrated Alien Species Management Plan would be developed to prioritize alien species management actions for the Monument (AS-1.1). Data collected during alien species monitoring would be added to the Monument's GIS database for tracking and analysis (AS-2.2). This data would help track the spread of invasive species and the success of control measures instituted by Monument managers. Through the development and implementation of monitoring protocols, new infestations of alien species can be detected and characterized early. An eradication plan would be developed for the house mouse at Midway Atoll (AS-4.1). A priority list of locations and species would be formulated and a treatment plan would be developed to control and eventually eradicate all social Hymenopterans, such as ants and wasps, at all islands in the Monument (AS-5.1).

### **1.6.9.3 Expanded field activities**

Expanded alien species management field activities include additional monitoring and standardization of data collection protocols. Monitoring would be expanded and standardized and new data collection would be incorporated into existing annual monitoring (AS-2.1). The distributions and populations of known alien species would be surveyed annually to facilitate early detection. The highest priority terrestrial alien plant species would be controlled using hand pull, mowing where appropriate, and treatment with glyphosate at 1,098 acres at Midway, 75 acres at Kure, and 34 acres at Pearl and Hermes (AS-6.1). Sandbur would be controlled and eradicated at all other locations in the Monument. A year-round program of hand-pulling and limited glyphosate spraying would be used (AS-6.2). Further removal efforts of invasive species would treat and prevent seed set to eventually eradicate at Laysan (AS-6.3). The eradication of alien species would be prioritized according to the management plan (AS-6.4).

Research would be expanded beyond terrestrial areas to include the marine ecosystem. Monument staff, working with experts, would determine which methods for alien species detection and control would be appropriate for use in the NWHI (AS-8.1). Successful invasive species control and eradication programs require systematic investigations into the efficacy of techniques chosen and the ecological effects of any methods used. Terrestrial and marine research to document the effectiveness of these measures would aid those managing other wildlands in choosing quarantine methods (AS-8.2).

### **1.6.9.4 New field activities**

New alien species management field activities would include controlling and if possible eradicating the house mouse, ants and wasps, two introduced species of mosquitoes, and the gray bird locust and mapping of and conducting surveillance on two marine invasive species. The house mouse eradication plan would be implemented using the methods proven successful for eradicating black rats (AS-4.2). Toxicant trials would be conducted on highest-priority invasive species of ants and wasps to evaluate their efficacy and document the ecological effects (AS-

5.2). Monument staff would control and if possible eradicate two introduced mosquito species at Midway Atoll through using the methods prescribed in the Integrated Pest Management Plan (AS-5.3). Monument staff would continue efforts to address the gray bird locust invasion by developing and implementing a plan to control and possibly eradicate the gray bird locust (AS-5.4). Gray bird locust outbreaks that threatened endangered plants at Nihoa would be controlled by developing appropriate baits for localized application (AS-5.5). Early detection and characterization of new infestations of alien species would be possible through monitoring (AS-2.3). The Monument staff would map the extent of red algae infestation through the use of scuba or remotely operated vehicles to control and eventually eradicate invasive red algae (AS-7.1). The MMB would devise a plan to conduct surveillance activities at appropriate sites where snowflake coral and other incipient marine invasive species have been identified (AS-7.2).

**1.6.10 Maritime Transportation and Aviation**

Proposed maritime transportation and aviation activities are described in the Monument Management Plan and include planning and administrative and field activities (see Monument Management Plan, section 3.3.3, Maritime Transportation and Aviation Action Plan). All activities described in the No Action alternative would continue, but several activities would be expanded under the Proposed Action. In addition, new activities are proposed to investigate, identify, and reduce potential threats to the Monument from maritime and aviation traffic. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Maritime Transportation and Aviation</b>	<b>Status</b>	<b>Activity Type</b>
Activity MTA-1.2: Develop boundary and zoning informational tools.	New	Planning/administrative
Activity MTA-1.3: Provide necessary updates to nautical charts and Notice to Mariners.	New	Planning/administrative
Activity MTA-2.1: Conduct studies on potential aircraft and vessel hazards and impacts.	New	Field activity
Activity MTA-2.2: Develop protocols and practices as needed and integrate with existing protocols for safe aircraft and vessel operations.	Expanded	Planning/administrative
Activity MTA-2.3: Improve existing pre-access information for inclusion on the Monument website and in permit application instructions.	Expanded	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.10.1 Expanded planning and administrative activities**

Expanded maritime transportation and aviation planning and administrative activities include developing new protocols and practices to reduce risk from maritime transportation and aviation. Existing protocols would be evaluated and other recommendations sought to reduce risks to personnel and the environment through pre-access training and standard procedures. New protocols and practices would be developed as needed (MTA-2.2). Existing and additional pre-access information would be incorporated into the Monument website and in permit application instructions. Additional information may include navigational hazards, zoning designations, including waste discharge location and types, and preventing the introduction of alien species (MTA-2.3).

**1.6.10.2 New planning and administrative activities**

New maritime transportation and aviation planning and administrative activities include the development of boundary and zoning information tools (MTA-1.2). In addition, existing nautical charts and mariner notices would be updated with boundary and zoning information (MTA-1.3). Overall, protocols and practices would be expanded to ensure safe aircraft and vessel operations, and improvements would be made to make pre-access information available on the Monument website and in permit application instructions.

**1.6.10.3 New field activities**

New maritime transportation and aviation field activities include various studies on potential aircraft and vessel hazards, which would be conducted based on priority threats identified in a comprehensive threat assessment conducted by the MMB (MTA-2.1). A range of studies may be conducted, such as feasibility studies on anchoring and mooring locations, effects of discharge, long-term study of hull inspections, alien species introductions via aircraft and other studies that would aid the MMB in making informed management decisions to protect Monument resources.

**1.6.11 Emergency Response and Natural Resource Damage Assessment**

Proposed emergency response and natural resource damage assessment activities are described in the Monument Management Plan and include planning and administrative activities (see Monument Management Plan, section 3.3.4, Emergency Response and Natural Resource Damage Assessment). All activities described in the No Action alternative would continue, but several activities would be expanded. In addition, new activities are proposed to minimize damage to Monument resources through coordinated emergency response and assessment. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Emergency Response and Damage Assessment</b>	<b>Status</b>	<b>Activity Type</b>
Activity ERDA-1.1: Create a Monument Emergency Response and Assessment Team for ICS responses.	New	Planning/administrative
Activity ERDA-1.2: Acquire and maintain training and certification to complement and support the Regional Response Team.	Expanded	Planning/administrative
Activity ERDA-1.3: Participate in emergency response and preparedness drills and meetings throughout the life of the plan.	Expanded	Planning/administrative
Activity ERDA-1.4: Participate in damage assessment programs and training throughout the life of the plan.	Expanded	Planning/administrative
Activity ERDA-2.1: In the second year, determine the non-ICS emergencies and the necessary type and scope of responses.	New	Planning/administrative
Activity ERDA-2.2: Designate appropriate Monument personnel for each non-ICS response team.	New	Planning/administrative
Activity ERDA-2.3: Throughout the life of this plan, ensure that appointed personnel acquire and maintain training and certifications.	New	Planning/administrative
Activity ERDA-3.1: Update and improve upon the Area	Expanded	Planning/administrative

<b>Proposed Action Alternative: Emergency Response and Damage Assessment</b>	<b>Status</b>	<b>Activity Type</b>
Contingency Plan and the Environmental Sensitivity Indices.		
Activity ERDA-3.2: Within 3 years, create damage assessment criteria and protocols.	Expanded	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.11.1 Expanded planning and administrative activities**

Expanded emergency response and natural resource damage assessment planning and administrative activities include additional training, drills, and contingency plan updates and protocols development. Additional Monument staff receives training and certifications, such as ICS, hazardous waste operations and emergency response, boat safety, flight safety, first responder, and first aid, as needed (ERDA-1.2). Additional Monument staff would be added to the emergency response and assessment team and would participate in team meetings and drills, along with current staff (ERDA-1.3). Additional staff would be trained to work closely with a variety of damage assessment programs to ensure that appropriate response, injury assessment, and restoration activities take place for any given case (ERDA-1.4). Monument staff would update and improve on the area contingency plan and environmental sensitivity indices for the Monument (ERDA-3.1) Monument staff would develop non-ICS damage assessment criteria and protocols for the natural, cultural, and historic resources in the Monument (ERDA-3.2). The MMB would formalize the permit review process further by identifying and engaging a pool of experts trained in Monument-related subject matter, including policy, purpose, and proclamation findings.

**1.6.11.2 New planning and administrative activities**

New emergency response and natural resource damage assessment planning and administrative activities include creating a Monument Emergency Response and Assessment Team (ERAT) for ICS responses (ERDA-1.1)

With the creation of an ERAT, the regional response team’s training and certification would be enhanced and continual emergency response and preparedness drills would be conducted to increase emergency preparedness. This team would also continually participate in damage assessment programs and training to improve response capabilities. The MMB would also determine the type and scope of non-ICS emergencies likely to occur within the Monument (ERDA-2.1) and would designate appropriate Monument personnel for each non-ICS response team (ERDA-2.2).

All personnel involved in the emergency response and natural resource damage assessment activities would be required to acquire and maintain the necessary training and certifications throughout the life of the plan (ERDA-2.3).

**1.6.12 Permitting**

Permitting activities would continue, as described in the No Action alternative, but several activities would be expanded. In addition, new activities are proposed to implement an effective

and integrated permit program for the Monument. This program would manage, minimize, or prevent negative human effects by allowing access only for those activities consistent with Presidential Proclamation 8031 and the implementing regulations of the Monument. In addition, individual permit applications would continue to be reviewed for environmental effects. Also, the MMB would develop a case-by-case environmental analysis under NEPA or HRS Chapter 343 for each permit issued. New and expanded permitting activities are described in the Monument Management Plan (section 3.4.1, Permitting Action Plan). These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Permitting</b>	<b>Status</b>	<b>Activity Type</b>
Activity P-1.4: Engage outside experts in review of permit applications.	Expanded	Planning/administrative
Activity P-1.5: Investigate individual and vessel insurance and other avenues to fund mitigation of any damages associated with permitted activities.	New	Planning/administrative
Activity P-2.1: Develop a Geographic Information System (GIS)-based permit tracking system.	Expanded	Planning/administrative
Activity P-2.2: Analyze permit data to inform management decision making.	New	Planning/administrative
Activity P-2.3: Analyze permit data for patterns of compliance.	New	Planning/administrative
Activity P-2.4: Develop and implement a Monument reporting process.	Expanded	Planning/administrative
Activity P-3.1: Develop and implement a permit and regulatory education program.	Expanded	Planning/administrative
Activity P-3.2: Develop and implement a Native Hawaiian cultural education program for all permit applicants.	Expanded	Planning/administrative
Activity P-3.3: Coordinate permitting outreach.	Expanded	Planning/administrative
Activity P-3.4: Develop a pre-access training and briefing program.	Expanded	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.12.1 Expanded planning and administrative activities**

Expanded permitting planning and administrative activities include enhancing the permit review and tracking process and information outreach to permittees and the public. Expanded permitting activities also include emphasizing the cultural significance of the Monument to Native Hawaiians and the environmental and cultural conduct necessary for access to the Monument. An integrated MMB review of reports generated from the vast array of permit data collected would be established to ensure that reports are completed and submitted on time. One aspect of the report review process would ensure that data is logged and research results were made available. The MMB would formalize the permit review process further by identifying and engaging a pool of experts trained in Monument-related subject matter, including policy, purpose, and proclamation findings (P-1.4). Current and future permit data would be integrated into the GIS-based permit tracking system to ensure a comprehensive portrayal of activities in the region (P-2.1). The permit reporting process as a follow-up to field activities would be standardized (P-2.4).

Monument staff would work together to ensure that the educational activities proposed in these action plans are integrated to provide a consistent and effective message (P-3.1).

The MMB would develop and implement an educational program that could be provided online from the Monument Web site, which would educate prospective applicants about the Native Hawaiian culture (P-3.2).

Multiple information, outreach, and education programs would be developed to communicate permitting processes and regulatory information to the public, with particular attention given to interagency permitting efforts. Additional information and outreach, including presentations, publications, and DVDs, would aid interagency permitting efforts and better inform the public about Monument permitting (P-3.3). The MMB would develop and maintain a single Web site address committed to keeping the public engaged and regularly informed on all proposed and permitted activities that would be conducted in the Monument. This Web site would be the location for the public to access information regarding the Monument, including information on the Monument permit program (3.5).

In addition to the current pre-access training, new information on the proclamation regulations, permit terms and conditions, reporting requirements, the significance of the NWHI to Native Hawaiians, and ways to best conduct activities to reduce human effects on the natural environment and cultural resources would be incorporated into the training (P-3.4).

#### **1.6.12.2 New planning and administrative activities**

New permitting planning and administrative activities include defining insurance requirements for permittees and developing a data analysis system to identify potential environmental effects and patterns of compliance. The MMB would develop joint criteria for insurance that may be required before a permit authorizes activities in the Monument. Insurance requirements are intended to mitigate the potential risks of medical evacuations, vessel groundings, alien species introductions, and hazardous materials spills (P-1.5).

To assist in ecosystem-based management decision making, permit data generated from each permit application and report would be analyzed to provide the insight needed to make informed management choices about appropriate levels and locations of permitted activities (P-2.2). Data generated from permit applications and reports would be analyzed to modify reporting requirements and make them more relevant. In addition, this data would be used to evaluate patterns of compliance and to aid in enforcement and other program area planning efforts (P-2.3).

#### **1.6.13 Enforcement**

Enforcement activities would continue, as described in the No Action alternative, but several activities would be expanded. In addition, new activities are proposed to achieve compliance with all regulations within the Monument. New and expanded enforcement activities are described in detail in the Monument Management Plan (section 3.4.2, Enforcement Action Plan). These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Enforcement</b>	<b>Status</b>	<b>Activity Type</b>
Activity EN-1.1: Charter a Monument law enforcement working group.	New	Planning/administrative
Activity EN-1.2: Develop necessary interagency agreements.	Expanded	Planning/administrative
Activity EN-1.3: Develop an integrated law enforcement training program.	New	Planning/administrative
Activity EN-1.4: Assess Monument law enforcement capacity and program effectiveness.	New	Planning/administrative
Activity EN-1.5: Increase law enforcement capacity on Midway Atoll within 2 years.	Expanded	Field activity
Activity EN-2.3: Integrate additional automated monitoring systems and ship reporting systems for all vessels transiting the Monument.	New	Planning/administrative
Activity EN-2.4: Increase available platforms to support law enforcement.	Expanded	Infrastructure and development
Activity EN-3.1: Integrate regulations briefings into pre-access training required for all Monument users.	Expanded	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.13.1 Expanded planning and administrative activities**

Expanded enforcement planning and administrative activities would include efforts to enhance interagency agreements, increase law enforcement capacity and assets, and refine pre-access briefings. Additional cooperative agreements at a regional level would allow law enforcement officers of partner agencies to enforce the variety of federal and state statutes that apply within the entire Monument, as well as future collaborations (EN-1.2). Current pre-access briefings would be standardized using videos, printed materials, and presentations (EN-3.1).

**1.6.13.2 New planning and administrative activities**

New enforcement planning and administrative activities include developing a Monument law enforcement working group, which would enhance communication and collaboration on law enforcement issues and needs (EN-1.1). The working group would also regularly assess the effectiveness of law enforcement activities and would identify hot spots that require additional focus (EN-1.4). New training programs would be developed to provide officers with the most current information, including environmental education and Native Hawaiian cultural practices (EN-1.3).

**1.6.13.3 Expanded field activities**

Expanded enforcement field activities include on-site enforcement presence at Midway Atoll NWR. Credentialed officers would be stationed there to ensure visitor and staff safety and regulatory compliance (EN-1.5) providing on-site enforcement capacity at the refuge and Monument-wide to respond to increased operations and recreational activities. Additional automated monitoring systems and ship reporting systems would be integrated in the Vessel Monitoring System to track vessels transiting the Monument (EN-2.3).

**1.6.13.4 Expanded infrastructure and development activities**

Expanded enforcement infrastructure and development activities would be used to evaluate aerial and ship-based surveillance systems. Due to the remoteness of this area, increased aerial and ship-based resources would be evaluated both for surveillance and for response and would be added as needed (EN-2.4).

**1.6.14 Midway Atoll NWR Visitor Services**

Proposed Midway Atoll visitor services activities are described in the Monument Management Plan. They include planning and administrative, field, and infrastructure and development activities (see Monument Management Plan, section 3.4.3, Midway Atoll Visitor Services Action Plan and Volume III, Appendix B). All activities described in the No Action alternative would continue, but several activities would be expanded. In addition, new activities are proposed to offer visitors opportunities to discover, enjoy, appreciate, protect, and honor the unique natural, cultural, and historic resources of the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Midway Atoll Visitor Services</b>	<b>Status</b>	<b>Activity Type</b>
Activity VS-1.1: Provide visitors with opportunities for wildlife-dependent recreation to enhance their knowledge and appreciation of the Monument’s natural resources.	Expanded	Field activity
Activity VS-1.2: Provide visitors with opportunities to learn about and appreciate the Monument’s cultural and historic resources.	Expanded	Field activity
Activity VS-1.3: Continuously monitor the impacts of visitors and other users on wildlife and historic resources to ensure their protection.	Expanded	Field activity
Activity VS-2.1: Monitor visitor satisfaction surveys completed by outgoing visitors, adjusting activities, facilities, and maintenance schedules as appropriate on a monthly basis.	Expanded	Field activity
Activity VS-2.2: Convene a team of visitor services specialists and Midway Atoll staff to review the visitor program on a biennial basis.	New	Planning/administrative
Activity VS-2.3: Based on the assessment above, seek funding, authority, or other needs to implement the recommendations for improvement.	New	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.14.1 New planning and administrative activities**

New Midway Atoll visitor services planning and administrative activities would include engaging specialists to review the visitor services program every two years. A team of visitor services specialists and Midway Atoll staff would assess whether the visitor program is meeting the standards outlined in the Visitor Services Plan (VS-2.2). The team would also evaluate the need to adjust visitor fees and make recommendations on the program’s financial stability, including staffing and facility needs (VS-2.2). FWS would seek funding authority or other needs to implement any recommendations to improve the visitor program (VS-2.3).

**1.6.14.2 Expanded field activities**

Expanded Midway Atoll visitor services field activities include efforts to provide visitors with opportunities to come to Midway Atoll and to improve visitor services, based on monitoring effects and visitor satisfaction. As outlined in the Midway Atoll Visitor Services Plan (Volume III, Appendix B), up to 50 visitors would be offered educational opportunities through tours, diving, kayaking, and photography (VS-1.1). In addition, tours and exhibits would be offered focusing on Midway’s and the Monument’s cultural and historic resources. One of the historic buildings on Sand Island would be restored to a visitor center and educational facility, offices and a permanent museum/library, which would include Monument-wide information.

An expanded snorkel and new dive program would be developed (VS-1.2). The Midway Atoll Visitor Services Plan would extend the interim plan and would include most of the same restrictions that would be carried over into a longer-term plan. To ensure resource protection, visitor effects and compatibility with conservation management would be monitored, as required by FWS policies (VS-1.3). A higher level of evaluation would be conducted with formal recommendations for improvements (VS-2.1).

**1.6.15 Agency Coordination**

Proposed agency coordination activities are described in the Monument Management Plan and include planning and administrative activities (see Monument Management Plan, section 2.0; Management Framework; and section 3.5.1, Agency Coordination Action Plan). All activities described in the No Action alternative would continue, but several activities would be expanded under the Proposed Action. In addition, new activities are proposed to continue the successful collaboration with government partners to achieve publicly supported, coordinated management in the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Agency Coordination</b>	<b>Status</b>	<b>Activity Type</b>
Activity AC-1.1: Establish standard operating procedures, as needed, to provide direction and improve communication within the MMB.	Expanded	Planning/administrative
Activity AC-2.1: Explore the potential of developing new agreements, including the possibility of amending the 2006 MOA to increase Native Hawaiian involvement in the management of the Monument.	New	Planning/administrative
Activity AC-2.2: Establish agreements for coordinated management and conduct cooperative management operations.	Expanded	Planning/administrative
Activity AC-2.3: Develop interagency agreements, grants, and memoranda of agreement as needed to carry out specific program priorities.	Expanded	Planning/administrative
Activity AC-3.1: Enhance communication and cooperation with the Department of Defense and the U.S. Navy Pacific Fleet.	Expanded	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.15.1 New planning and administrative activities**

New agency coordination planning and administrative activities to establish and support cooperative management agreements with agency partners would explore the potential of developing new agreements, including the possibility of amending the 2006 MOA to increase Native Hawaiian involvement in the management of the Monument. (AC-2.1).

**1.6.15.2 Expanded planning and administrative activities**

Expanded agency coordination planning and administrative activities include enhanced coordination among Co-Trustee agencies and expanded collaborative agreements with other agencies, as appropriate. In order to ensure that unwritten knowledge and skills do not disappear when positions are filled with new staff, standard operating procedures for the MMB would be recorded, updated as necessary, and properly maintained (AC-1.1).

Building on the MOA signed December 8, 2006, new agreements would be developed among the MMB to help coordinate management. Such agreements would specify roles, responsibilities, and periodic reviews (AC-2.2). Cooperative projects that may benefit from formal and other informal agreements would be pursued with agencies outside of the MMB. This would allow for ease in sharing resources and in-kind assistance and support, as appropriate (AC-2.3).

Formal and informal agreements may be developed for specific program priorities that require cooperative assistance from agencies outside the MMB. Through the ICC (International Code Council) and other forums, the MMB would enhance communications with the DoD and the U.S. Navy on potential areas of cooperation, including enforcement; minimizing the effects of military activities in the Monument; supporting zoning, permitting, and tracking programs; and restoring and protecting regional and local wildlife (AC-3.1).

**1.6.16 Constituency Building and Outreach**

Constituency building and outreach activities would continue, as described in the No Action alternative, but several activities would be expanded. In addition, new activities are proposed to cultivate an informed, involved constituency that supports and enhances conservation of the natural, cultural, and historical resources of the Monument. New and expanded constituency building and outreach activities are described in the Monument Management Plan (section 3.5.2, Constituency Building and Outreach Action Plan). These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Constituency Building and Outreach</b>	<b>Status</b>	<b>Activity Type</b>
Activity CBO-1.1: Develop an integrated communications strategy based on an assessment of ongoing activities and future needs.	New	Planning/administrative
Activity CBO-1.3: Develop a consistent Monument identity to be used in all communications strategies that reflects its co-management within 1 year.	New	Planning/administrative
Activity CBO-1.4: Incorporate new perspectives for understanding the value of NWHI ecosystems, including socioeconomic studies, to increase ocean ecosystem literacy and conservation in the Monument	Expanded	Planning/administrative

<b>Proposed Action Alternative: Constituency Building and Outreach</b>	<b>Status</b>	<b>Activity Type</b>
within 5 years.		
Activity CBO-1.5: Research and implement new technologies and tools to increase public understanding of the NWHI ecosystems within 5 years.	Expanded	Field activity
Activity CBO-2.1: Establish a new Monument website that would allow constituents to visit a single site for all Monument-related information within 1 year.	New	Planning/administrative
Activity CBO-3.2: As needed, hold focused forums on various Monument-related issues or topics to inform and engage a broader range of constituents.	Expanded	Planning/administrative
Activity CBO-3.4: Continue to build and nurture volunteer programs that develop knowledge of, involvement in, and support for Monument programs and resources.	Expanded	Planning/administrative
Activity CBO-3.5: Establish and support a Papahānaumokuākea Marine National Monument Alliance to engage a broad range of constituents, who would provide us with recommendations and information on specific management issues on a regular basis, within 1 year.	New	Planning/administrative
Activity CBO-3.6: Continue to support the Native Hawaiian Cultural Working Group through the Office of Hawaiian Affairs.	Expanded	Planning/administrative
Activity CBO-3.7: Continue working with the Friends of Midway Atoll National Wildlife Refuge through FWS and support the establishment of a Monument-related “friends” group.	Expanded	Planning/administrative
Activity CBO-4.1: Develop interagency Monument interpretive themes to guide all interpretive products and activities.	Expanded	Planning/administrative
Activity CBO-4.2: Review existing interpretive sites and activities to determine their current relevance to the Monument and how they could better represent Monument themes.	Expanded	Planning/administrative
Activity CBO-4.3: Develop a Monument interpretive plan to guide future interpretive projects and activities.	New	Planning/administrative
Activity CBO-4.4: Seek additional opportunities to expand Monument interpretive efforts to new sites and through new technologies, creating a network of coordinated interpretive sites.	Expanded	Planning/administrative
Activity CBO-4.5: Working with the National Park Service, U.S. Navy, and other key entities, develop off-site exhibits on the Battle of Midway and the associated National Memorial to be integrated into World War II memorial sites of the Pearl Harbor Historic District.	New	Infrastructure and development

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.16.1 Expanded planning and administrative activities**

Expanded constituency building and outreach planning and administrative activities include new products, messages, and modes of communication. The MMB would support and seek out traditional knowledge, as well as new perspectives that contribute different ways of valuing the ecosystems of the NWHI. New and novel ways to look at the value of marine ecosystems, such

as socioeconomic analysis of the nonmarket value of coral reefs, would also be supported (CBO-1.4). Additional materials would be developed to aid in the understanding of more specific aspects of the entire region and on the ways in which the public can participate. These printed materials may also include multimedia components or may be developed as a suite of materials (CBO-2.2).

The MMB would offer public forums on specific topics or issues, both to exchange information with our constituencies and to build awareness and support. These forums would be offered at various locations to facilitate participation by a broad range of constituents (CBO-3.2). The volunteer program would continue to be nurtured and grown in support of the Monument (CBO-3.4). Guidance and support provided to the Monument by the Native Hawaiian Cultural Working Group through OHA would be further considered (CBO-3.6). In addition to continuing to work with the Friends of Midway Atoll National Wildlife Refuge, the MMB would evaluate the possibility of establishing a Monument-wide friends group to provide similar support (CBO-3.7).

A more focused study would be conducted to develop Monument-wide interpretive themes to guide the development and presentation of interpretive sites and products (CBO-4.1); existing interpretive facilities would be reviewed and updated. The Midway Atoll visitor center would be upgraded to include Monument-wide information (CBO-4.2). In addition, the inclusion of an interpretive facility at the proposed NOAA facility on Ford Island would be reviewed. The MMB would identify new sites and technologies to better reach our audiences and to include Monument messages in broader arenas (CBO-4.4).

#### **1.6.16.2 New planning and administrative activities**

New constituency building and outreach planning and administrative activities include a unified approach and identity for constituency building and outreach. To better reflect the shared management of the Monument, the MMB would work toward a unified strategy for constituency building and outreach (CBO-1.1). A consistent identity incorporating aspects of all Co-Trustee agencies would be developed for the Monument, and a consolidated website for information would be created (CBO-1.3 and CBO-2.1). A range of constituent participation would be encouraged through holding public forums, expanding volunteer activities, and establishing a Monument Friends Group and a Monument Alliance group (CBO-3.5). The development of site specific planning documents would include developing a Monument interpretive plan to guide future interpretive projects and activities (CBO-4.3).

#### **1.6.16.3 Expanded field activities**

Expanded constituency building and outreach field activities would incorporate new technologies to increase public understanding of the Monument and its resources. The MMB would increase support for projects such as documentaries, photography, and writing, which would bring the place to the people (CBO 2.3). Telepresence technologies would play an important role in educating the public about the NWHI. Significant obstacles to implementing these technologies do exist, such as cost, feasibility, and ecological sensitivities, but Monument staff would continue to use and expand these new technologies for providing this virtual experience (CBO-1.5).

**1.6.16.4 New infrastructure and development activities**

New constituency building and outreach infrastructure and development activities include possible additional interpretative centers. Additional opportunities to expand interpretive sites would be examined through working with the National Park Service, the U.S. Navy, and other key entities to develop off-site exhibits (CBO-4.5).

**1.6.17 Native Hawaiian Community Involvement**

Proposed Native Hawaiian community involvement activities are described in the Monument Management Plan and include planning and administrative activities (Monument Management Plan, section 3.5.3 Native Hawaiian Community Involvement Action Plan). All activities described in the No Action alternative would continue, but several activities would be expanded under the Proposed Action. In addition, new activities are proposed to engage the Native Hawaiian community in active and meaningful involvement in the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Native Hawaiian Community Involvement</b>	<b>Status</b>	<b>Activity Type</b>
Activity NHCI-1.1: Formalize, expand, and convene the Native Hawaiian Cultural Working Group.	Expanded	Planning/administrative
Activity NHCI-1.2: Engage the Native Hawaiian Cultural Working Group in the development of a Monument Cultural Resources Program.	New	Planning/administrative
Activity NHCI-1.3: Establish an annual cultural resources exchange.	New	Planning/administrative
Activity NHCI-2.1: Continue to expand and explore opportunities to partner with institutions serving Native Hawaiians.	Expanded	Planning/administrative
Activity NHCI-3.2: Use and integrate Native Hawaiian traditional ecological knowledge in Monument management activities.	New	Planning/administrative

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.17.1 Expanded planning and administrative activities**

Expanded Native Hawaiian community involvement planning and administrative activities include formally establishing the Native Hawaiian Cultural Working Group and establishing additional partnerships with other Native Hawaiian groups. The MMB, through OHA, would formally establish the Native Hawaiian Cultural Working Group, expanding the previously established working group, to ensure regular involvement of the Native Hawaiian community and a strong cultural link in planning and managing the Monument (NHCI-1.1). In addition to the partnership with the Kamakakūokalani Center for Hawaiian Studies, the MMB would also seek other opportunities to formally consult with and engage other Native Hawaiian groups and would develop outreach programs for the Native Hawaiian community (NHCI-2.1). Additional partnerships, contracts, grants, or formal agreements with Native Hawaiian organizations would be considered and established as opportunities arise.

**1.6.17.2 New planning and administrative activities**

New Native Hawaiian community involvement planning and administrative activities include developing a Monument Cultural Resource Program and integrating Native Hawaiian traditional knowledge into Monument management activities. A Monument Cultural Resource Program and corresponding cultural resource management activities would be established and based on the recommendations of the Native Hawaiian Cultural Working Group and other Native Hawaiian organizations (NHCI-1.2). The MMB would annually convene groups of Native Hawaiians to discuss the knowledge, experiences, and new questions gained during the past research season (NHCI-1.3). This conference would update the Native Hawaiian community and would engage that community in determining the priorities and proposed methods of forthcoming research queries, theories, and needs. Based on traditional Hawaiian resource management strategies and traditional ecological knowledge, the MMB would integrate traditional perspectives, knowledge, and approaches in the management of Monument resources (NHCI-3.2).

**1.6.18 Ocean Ecosystems Literacy**

Ocean ecosystem literacy activities would continue, as described in the No Action alternative, but several activities would be expanded. In addition, new activities are proposed that would cultivate an ocean ecosystems stewardship ethic, strengthen the Nation’s science and cultural literacy, and create a new generation of conservation leaders through formal environmental education. New and expanded enforcement activities are described in the Monument Management Plan (section 3.5.4 Ocean Ecosystems Literacy Action Plan). These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Ocean Ecosystem Literacy</b>	<b>Status</b>	<b>Activity Type</b>
Activity OEL-1.1: Expand and improve the NWHI educational partnership’s Navigating Change curriculum for elementary and middle school students, with increased focus on ocean ecosystems literacy within 3 years.	Expanded	Planning/administrative
Activity OEL-1.2: As curricula are developed, work with Hawaiian-language immersion schools to ensure the curricula meet their needs, including translation into the Hawaiian language.	Expanded	Planning/administrative
Activity OEL-1.3: Develop an ocean stewardship program for middle school and high school students within 5 years.	New	Planning/administrative
Activity OEL-1.6: Expand educational programs for school groups at Mokupāpapa: Discovery Center for Hawai’i’s Remote Coral Reefs to host at least 10 groups per month.	Expanded	Planning/administrative
Activity OEL-1.7: Provide annual wildlife-dependent educator and conservation leader workshops at Midway Atoll, targeting a mix of formal and informal educators and community and conservation leaders and building upon Navigating Change curricula and vision.	Expanded	Field activity
Activity OEL-1.9: Build formal evaluations into education programs within 2 years.	Expanded	Planning/administrative

<b>Proposed Action Alternative: Ocean Ecosystem Literacy</b>	<b>Status</b>	<b>Activity Type</b>
Activity OEL-2.1: Identify and prioritize research and development projects to increase ocean ecosystems literacy and conservation in NWHI.	Expanded	Planning/administrative
Activity OEL-2.2: Use telepresence technology for educational and outreach activities within 5 years.	Expanded	Field activity

Note: This table includes only proposed expanded and new activities. Activities in this action area that are not included in this table are described under the No Action alternative.

**1.6.18.1 Expanded planning and administrative activities**

Expanded ocean ecosystem literacy planning and administrative activities include developing new curricula, ensuring appropriate cultural information is included, increasing the capacity of the Discovery Center for education and outreach, evaluating the outcomes of educational programs developed for the Monument, and identifying priority research needs on new educational technologies. Additional study units would be added for the current guide targeted at fourth and fifth grade students, and units focusing on other grade levels would be developed. Education partners would work with the Department of Education and private and charter schools as curricula are being developed to ensure that the Department’s and schools’ needs are incorporated into the work and to help incorporate the new curricula into educational programming (OEL-1.1). The Navigating Change partnership would work closely with the Native Hawaiian community to ensure appropriate cultural information is included within all curricula and that the units meet the needs of Hawaiian-language immersion and culture-based charter schools (OEL-1.2). Educational programming at the Monument’s education and outreach venue, Mokupāpapa: Discovery Center for Hawai‘i’s Remote Coral Reefs, would be expanded. Discovery Center staff would create educational partnerships to promote Mokupāpapa as an educational facility and field trip venue. Volunteer docent capacity would be developed to meet the increasing needs of school and community groups (OEL-1.6) Evaluating education and outreach programs and activities is critical to ensuring that the MMB is achieving its desired goals and reaching target audiences. Formal evaluations would be integrated into Monument education programs (OEL-1.9). The MMB, working together with educational partnerships and other relevant groups, including the private sector, would identify and prioritize research and development projects for new products and innovative technologies that could be used to increase ocean ecosystem literacy and support for conservation of the NWHI (OEL-2.1).

**1.6.18.2 New planning and administrative activities**

New ocean ecosystem literacy planning and administrative activities include working with educational partners to develop an ocean stewardship program for middle and high school students that provides real-world, hands-on experiences with issues of ocean management (OEL-1.3).

**1.6.18.3 Expanded field activities**

Expanded ocean ecosystem literacy field activities include providing additional opportunities to engage teachers in experiencing Midway Atoll and use telepresence technologies to support broader public education. The teacher workshop program would be expanded to include annual

workshops on Midway Atoll. Offering more educators the opportunity to experience Midway Atoll and bring the Monument back to their students would be an important role for Midway in the coming years (OEL-1.7). Because most people are not able to visit the NWHI, the Monument staff would use such technologies as underwater video cameras, real-time video transmission, virtual field trips, formal distance learning programs, websites, and exhibits in discovery centers to educate the public about the NWHI. Significant obstacles to implementing these technologies do exist, such as cost, feasibility, and ecological sensitivities, but Monument staff would continue to use and expand these new technologies to provide this virtual experience, as appropriate (OEL-2.2).

**1.6.19 Central Operations**

Proposed central operations are described in the Monument Management Plan and include planning and administrative and infrastructure and development (see Monument Management Plan, section 2.0 and 3.6.1, Central Operations Action Plan). All activities described in the No Action alternative would continue, but several activities would be expanded under the Proposed Action. In addition, new activities are proposed to conduct effective and well-planned operations with appropriate human resources and adequate physical infrastructure in the main Hawaiian Islands to support management of the Monument. These activities are listed in the table below and are summarized in this section.

<b>Proposed Action Alternative: Central Operations</b>	<b>Status</b>	<b>Activity Type</b>
Activity CO-2.1: Regularly assess current status and future needs for human resources.	Expanded	Planning/administrative
