Within Judaism, Christianity, Islam, Hinduism or Shinto, we can see a definite upsurge of fundamentalist movements advocating the maintenance or restoration of the religious system in its totality. Shinto, generally regarded as the natural religion of Japanese tradition, is seeing new tendencies emerge as it adapts to an urban milieu its notions of purity, harmony between the gods, humans and nature, and protection with earthly benefits in view (Plate 114). The Jewish Lubavitch movement proclaims that the coming of the Messiah is imminent, and preaches strict observance of the 813 mitzvoth, or divine commandment, of the Torah. This movement, which is influential in the United States and France, criticizes what it regards as the excessively secular Zionism of the State of Israel, which it wishes to see turned into a purely Jewish state, without non-believers. The Jama'ah Tabligh, the society for the propagation of Islam created in India in 1927, to rid the Muslim minority of cultural contamination, has a widespread presence in all European countries with Muslim minorities. It calls for believers to emulate the prophet in all areas of life and organizes community support networks.

In the United States, revivalist religion is spread by the preaching of tele-evangelists and at giant meetings where

the audience are called upon to convert, bear testimony to healing or be baptised. Within the framework of a fundamentalist trend towards a literal reading of the Bible as the direct expression of divine truth, the revivalist movement campaigns in favour of a 'moral majority' in politics and against secular humanism and such ideas as Darwinism, abortion, divorce, and pornography. Influential in the United States, the revivalists are also enjoying notable success in Latin America, where they draw support from conservative circles. Another movement, the charismatic revival, was born in the United States in 1967, spreading shortly thereafter to Europe, particularly to France; it operates through communities characterized by a strong assertion of identity, an invitation to inward conversion and a group life of an emotionally involving kind, dissociation from the ambient secularization and a desire to rebuild a Christian sociality. In a similar vein, the Communion and Liberation movement, which originated in Italy and includes communities, associations and charities, and has a magazine translated into six languages, radically challenges secularized modernity, which is blamed for both totalitarianism and Western imperialism. It argues that only a return to the all-embracing truth contained in Holy Scripture can provide a basis for the complete reorganization of society. Whereas Jewish, Muslim and Hindu fundamentalists aspire to a society governed by religious law, Christian fundamentalists seem to accept a de facto separation of the temporal and the spiritual.

### 'Recourse' to religion: Liberation theologies

Gustavo Gutiérrez defines liberation theologies as 'discourses on faith in the Latin-American context', a context characterized by the political instability of the 1960s, dependence on American capital, social structures left over from colonial times, runaway population growth, and poverty in the countryside and the urban shanty towns. The Latin-American church was both highly conservative and a church of the common people. Beginning with grassroots communities established in the 1960s, a new ecclesial practice was inaugurated, involving mutual aid, literacy teaching, vocational training and political participation. With that practice came a new reading of the Bible. In 1968, the Latin American Episcopal Council of Medellín (Colombia) denounced 'institutional violence' and advocated 'the preferential option for the poor'. This interplay between the historical reality and the voices of the faith marked the birth of liberation theologies, which have no hesitation in using Marxist analysis to denounce injustice. The ruling and propertied classes clamped down violently on this church of the poor, thousands of whose activists, priests and nuns were killed, including Archbishop Romero of San Salvador, in 1980 (Plate 115). The liberation theologies were condemned in 1983 by the Congregation for the Doctrine of the Faith and came under attack from the highly conservative bishops subsequently appointed in Latin America. With the collapse of communism, liberation theology took a more environmental turn. Elsewhere, however, as in the case of Hinduism in the great Indian cities, there has also been a liberatory religious commitment to the cause of the most deprived.

By virtue of their role as reservoirs of meaning in a world in crisis, religions actually divide men and women more than they contribute to the cause of brotherhood, as most of them claim to do; but today's conflicts are more an expression of the crisis provoked within religion by the need to accept the rule of law and religious pluralism. The question is whether or not their present divisions will ultimately lead to their integration into the democratic model.

## FORMS OF BUDDHISM

At the beginning of the twentieth century, the Buddhist faith was losing its prestige and power in almost every part of the world: in Korea, in Viet Nam, in Japan, where it was losing ground to Shinto, and in China, where it was being supplanted by Confucian studies. The situation was better in some regions of South-East Asia, such as Cambodia, Laos and Siam (now Thailand). The celebration of the 2,500th anniversary of the death of Buddha in 1956 showed that the religion had been revitalized by its association with nationalist movements, as in Burma (now Myanmar) (Plate 116), and through Western scholars' research on the classical texts, which had come to them from the Japanese. In Ceylon (now Sri Lanka), many young converts to Christianity returned to the faith of their ancestors. In India, Buddhism ceased to be regarded as a heretical sect. There was a more vigorous revival in the countries of Mahāyāna tradition than in those of the Theravāda persuasion. Mongolian Buddhism (Plate 117) was almost wiped out, and the Democratic Republic of Korea also proclaimed that the religion had been successfully eradicated.

By the early 1970s, the history of Buddhism seemed at an end in Asia. In 1980, however, China attempted to make amends for its crimes in Tibet, although the problem of its relations with the Dalai Lama, now the uncontested leader of the Tibetan people, is far from being resolved. The Soviet regime's collapse opened up new prospects for Mongolian Buddhism, and monasteries were re-established in 1990. In China, institutes of Buddhist studies have been set up, and the popular practice of pilgrimage has revived, while an increasing number of works of scholarship, popularization and art are being issued. Generally speaking, the spread of Buddhist studies in other parts of the world, including the West, where Japanese Zen and Tibetan Tantrism are making converts, seemed to be playing a significant part in its revival at the end of the twentieth century. However, the movement towards syncretic forms of Buddhism, as in Japan (the Agonshu group or the Soka Gakkai sect), does show evidence of an adaptation to certain Western values such as individualism and universalism.

## FORMS OF HINDUISM

Poised between the chaos of sense impressions and the abstract markers of rational metaphysics, the symbolic universe of the Hindus turns religion into a means of regulating affective tensions. As a symbolic halfway house between the two, Hinduism has a self-protective function, compensating for the necessary social repression of desire with an ideal projection of real life. Human life is at its fullest in a theatre, and all the festivals and rituals of Hinduism play their part in the readjustment of levels of reward for one's acts (Plate 118). The Indian Republic is a

secular state, which is why partition – a betrayal of the hope for unity – continues to be a bone of contention. The republic has developed its own brand of secularism, in which the functions of Brahman and king are embodied in two distinct personages, but in which each community, sharing a certain number of often internalized norms and codes, tends towards automatic defensive or aggressive reactions.

This explains why non-violence is the ideal of this multicultural society; yet the violence held in check within this uneasy coexistence does at times break out, as in the paradigmatic case of the Ayodhya mosque, where there were clashes in 1949 and again in 1992. The mosque stands on the ruins of an earlier temple that once marked the birthplace of Lord Rama, a monarch and one of the most revered deities in the Hindu pantheon, whence its symbolic importance as a focus of political and religious conflict. On the whole, however, the revival of Hinduism has turned a doctrine of renunciation into a strong theory of social reform that has been at the root of India's twentieth-century renaissance. In a society stifled by custom, the doctrine that social upheavals form part of the divine plan when a society is in decay comes as a reassuring revelation. Tilak, Gandhi and Aurobindo were all, in their various ways, interpreters of the Gita in terms of action in daily life. The West also made a significant contribution to this reform, and some English-language commentaries were influential throughout India. Together with political unification, the existence of English as a national language was an essential element in the Hindu renaissance.

A decline in sectarianism ensued, and some genuinely saintly figures have emerged. Drawing upon the exemplary lives of these men and women, as well as the Bhagavad Gita – an episode of the *Mahābhārata*, an authoritative holy book interpreted in the light of modern social problems – Hinduism has been able to keep pace with the major changes in the world and even to rid popular Hinduism of its formerly conservative character. The end of the century did, however, bring something of a revival of sectarian movements, such as the Rashtriya Swayamsevak Sangh or the Shiv Sena, which are reacting to the withdrawal of the religious sanction from social institutions and are attempting to halt modern, constitutionally based political reforms. These extremist movements, reviving the old dream of the Hindu nation, the *Hindutva*, use religion for ideological and nationalist ends, thus posing a threat to the fragile model of the secular state.

## BLACK AFRICAN RELIGIONS

The black African religions, with their insistence on recounting the origins of everything except the Supreme Being, give the impression of having existed unchanged from time immemorial. Yet having encountered Islam and Christianity, they too have undertaken a complex process of survival which, through resistance to colonization, has served to maintain the cohesion of African societies. Whereas in 1965, half of the African population was animist, by 1985 one-third was Christian, one-third Muslim and one-third followers of traditional beliefs. However this relative decline is deceptive, for it conceals a renewed vigour, linked no doubt to an exceptional population growth. African beliefs overcame 'Black Islam' and put pressure on Christianity, setting off a theological reaction of enculturation. The ancestral practices relating to birth, circumcision, marriage, soothsayers, protection against the evil eye, witchcraft and death have continued under cover of the Five Pillars of Islam; but these practices have been confined within an individual life compatible with membership in the transnational confraternities (lay religious movements), and have been reinvigorated by native prophets – thereby according a seal of universality to black African authenticity.

Membership in African independent churches has tripled, using reinterpretation of the Bible as a kind of therapy, and prepared the ground for political reawakenings. The preaching of black messiahs or prophets enables the faithful and their clergy to resolve problems of caring for the sick, predicting the future and protecting against evil, adversity and witchcraft. The key component here is possession, for the trance state in collective therapies affords powers of second sight which make it possible to diagnose the causes of sickness or misfortune, and to prescribe remedies and patterns of behaviour, more or less in keeping with the Biblical message. Simon Kimbangu in Zaire[5] began with miracle-working and ended with thirty years in prison. He foretold an apocalypse that would set black people free, and an era of prosperity. The church structured by his disciples was opposed to fetishism and witchcraft, but it gave fresh impetus to ancestor worship and a certain moral order; its long and fervent services celebrated a faith in the future from which the leaders and popular supporters of the march towards independence would emerge. These independent churches act as intermediaries between the traditional religions and Christianity. They transform the framework of ancestral beliefs and their message of salvation, adapting that message to the upheavals following on from the achievement of political independence, to the wind of freedom that touches all social strata, and to economic difficulties, particularly those affecting the most deprived who, with their aid, are enabled to survive increasing adversity.

## FORMS OF JUDAISM

In 1900, most centres of Jewish teaching and most leaders of the Jewish spiritual communities were found in Eastern Europe. The Nazi programme of systematic extermination did away with almost all of them. By mid-century, the survivors had emigrated either to the United States, where they became full members of a predominantly Christian modern society, or to the new State of Israel, where the problem of the relationship between the state and the Jewish religion arose. The Western European Jewish communities were already partly secularized and integrated into modern society. This tendency was also seen in the United States in the Reform movement, which was opposed to Zionism; and even orthodox congregations became increasingly Americanized. Jewish community unity was further reinforced by the mutual aid services and networks established outside the synagogues. The attempt, around 1950, to give these mutual support networks a Jewish content came into conflict with the traditional stance that recognized the conscience as the sole authority in matters of moral responsibility. It also reinforced the wave of religious enthusiasm after the Second World War, an enthusiasm directed not so much at integration and assimilation as at a strengthening of community ties.

The confrontation between Judaism and modern industrial life also affects the State of Israel. The very diverse religious conceptions in that country run the gamut from strict orthodoxy to atheism. The influx of practising Jews from the Arab countries swelled the ranks of pious families, but the transition to secular Israeli life brought a clash between Eastern and Western cultures. The conflict between conservative orthodox tendencies and secular, left-wing attitudes left the majority of the population somewhere in between, neither religious nor atheist. The problem both in America and in Israel in mid-century was the extent to which the religious component was viewed as necessary for the survival of the Jewish people.

The question itself reveals how important were the problems of secularization. The conflict with Palestine was to reawaken the religious component in order to justify the policy of settlements. After the Six Day War of 1967, the annexation of East Jerusalem, Judea and Samaria that released repressed religious sentiments both in Israel and in the diaspora, led to the rise of ultra-orthodox elements (Plate 119). A messianic and activist religious Zionism (the Gush Emunim of 1974), defended the occupation of Palestinian territories by Jewish settlers in the face of international opinion. The secular aim of its founders that Israel should be a normal state runs up against the stress laid upon the unique character of the Shoah. Although the religious parties play a role as arbiters in Israeli politics for demographic and social reasons, there is no reason to conclude that Jewish fundamentalism is taking over from the time-honoured tolerance of Sephardic Judaism, which is still the majority tradition.

## FORMS OF ISLAM

Twentieth-century Islam, because it determines both the law-making process and the mode of life of its followers, has become an essential factor in the liberation movements of the Muslim peoples, and also in the social upheavals within Muslim societies. Despite what is, in some cases, a marked degree of secularization, the general trend has been towards intensification of religious allegiance (Plate 120). As both a political and a cultural source of nationalism, Islam conferred a religious character first on the struggle against Western domination and then on the combat against those domestic authorities that were regarded as lacking legitimacy. The dissolution of the Ottoman Empire and the abolition of the caliphate in 1924 contributed to the rise of Arab nationalism, and new nations, from Indonesia to Morocco, threw off colonial domination. While a number of Islamic states gained their independence, real religious power remained in the hands of the ayatollahs. The fact is, however, that Islam renews itself in the same way as it originally came into being, namely, when a religious message challenging the establishment rallies a mass following around a core of intellectuals. *Fitna* or dissidence, which is Islam's besetting fear, is also the source of its permanently revolutionary character.

Arabs make up only one-fifth of the world's Islamic population, which is now dominated by India, Pakistan, Malaysia and Indonesia. Any sense of a world Islamic community is at variance with the reality of the geographical states, and with such forms as that practiced by the 'Black Muslims' in Africa and the United States. In spite of some marginal work done by both Christians and Muslims, Koranic exegesis has remained isolated from comparative study. Reformers, both progressive and reactionary, have called for a return to basics whereby the *shari'a* or Islamic law will inevitably conflict with the modern world.

Whereas the tendency early in the twentieth century was to incorporate Western ideas into Islamic thought, by the end of the century it seemed as if the tendency was rather to impose Islamism and its reputed harmony of nature and science on Western thinking. In place of the modernist renaissance movement of the previous century, the end result has mostly produced a popular expression of a radical Islam that seeks to outflank orthodoxy by a practical form of loyalty, by active solidarity and determined struggle. Reformist and modernist ideas are perceived as leading only to irreligion, and activist movements such as the Muslim Brotherhood are prepared to go to any tragic lengths to free people from alien ideas and Western domination. The anti-intellectualism of the reformers is partly responsible for this, because it has not linked the political priority of social reforms and spiritual reawakening with theological advances.

The substantial increase in the number of pilgrims to Mecca as a result of mass transport has strengthened the hand of conservatives in all parts of the Islamic world. Faith alone seems more liberating than considerations of its content: doubt, discussion and questioning are treated as signs of defection from the daily battle. Consequently, it is still ignorance that provides the breeding ground for virulence and extremism; yet, paradoxically, it is the educated, even the university-educated circles who lend unexpected support to fundamentalism through their argument that achieving independence is a religious act.

The fundamentalists have forced all other groups within Islam onto the defensive by arguing that the only choice is between fundamentalism and secularization. In the nineteenth century, the *shari'a* was the official legal code only in Afghanistan, Saudi Arabia and Yemen; everywhere else Islamic principles were integrated into the modern state or, as in Turkey and India, were expressions of a minority voice being heard in a secularized society. In the twentieth century, however, the tide of secularization has turned: the family, religion and human relations are once again seen as the cement of communities, to the detriment of the notion of citizenship. In the former USSR and China, those Muslim religious minorities that had been forced to integrate into the communist state have put up resistance in the form of liberation struggles, particularly since the collapse of communism.

Islam at the end of the twentieth century was a divided Islam, torn between the demands of a simplified faith – one not yet translated into contemporary terms – and the pressures of the modern world. All over the world, whether among immigrant communities in the West, in the Arab countries or in the Indonesian archipelago, the question is how a revealed political and religious faith, albeit one of moderation, can express itself within the framework and the mindsets and imperatives of modernity and internationalism.

## FORMS OF CHRISTIANITY

Western forms of Christianity had sprung from rural societies, and were all affected by the changeover to a predominantly urban, industrial society. In Europe, for

example, there was initially a sense of religious decline, whereas a certain revival occurred in the United States. The churches attempted to adapt their language to what was for them an unfamiliar society, without really succeeding in doing so. The new classes of blue-collar and clerical workers slipped through their nets. However, Christianity fought back, and even found a Protestant-type congruence between the modern assertion of the individual and the Christian dignity of the human person. While Catholicism was chiefly represented by the activity of its leader, the various branches of Protestantism, which diversified yet further during this period, were mainly affected by trends towards religious renewal, ranging from extreme fundamentalism to loose groupings of vague beliefs; some other tendencies within Christianity retreated to aggressively traditionalist positions.

## Vatican II

The Second Vatican Council, proposed by Pope John XXIII in 1959, took place between 1962 and 1965 under his successor, Paul VI. There were three items on the agenda: the biblical movement, seeking to build upon the advances in critical exegesis; the liturgical movement, seeking to offer congregations an understanding of and greater participation in it; and an ecumenical movement, expressing a common resolve to contribute to the unity of the universal Church. Behind all this, however, lay a much broader and deeper drive to adapt the Church to changes in the modern world, a drive that had its origin before the war within the Catholic Action movements; one important feature was the assumption of responsibility by lay people. Vatican II cannot be reduced merely to the documents adopted there, since it generated much ferment. Some of the stands taken do, however, represent a profound change, such as the statement on religious freedom, the half-hearted recognition that non-Catholic churches were genuinely Christian, recognition of the responsibility of lay people and Christian responsibility in determining the values of the human community, and the reform of the liturgy, with the move from Latin to vernacular languages.

With hindsight, it is clear the speed of the transformations help explain the ambiguous character of its results. The fears engendered by the political, economic, technological and cultural crises of society seem to have proved the opponents of the Council within the Church right. The controversy surrounding Mgr Marcel Lefebvre, the French traditionalist prelate who in the 1970s challenged Paul VI by setting up a breakaway community, is a case in point; but this ambiguity is even more apparent in the paradoxical attitude of the papacy under John Paul II (Plate 121): while supporting human rights and justice the world over, it nonetheless used the Vatican's institutions to slow down development and has aggressively retrieved lost authority by limiting the responsibility of the local bishoprics in matters of moral theology and ecumenical relations. However, Rome's decisive resistance to modernity is most clearly revealed in its attitude towards developments in Eastern Europe.

## CONCLUSION

The twentieth century has seen major growth in the secular study of religions – non-theological in character and moving gradually from the description of social praxis and textual interpretations in the direction of anthropology. Religion is viewed less in terms of its messages or its relation to a transcendental reality, and more as a set of ritual observances whereby society sorts things out with itself. It is as though the analysis followed in the wake of the developing matter. One of the major consequences of this development – and there are other reasons underlying it also – is the very novel situation of Christianity, which occupies an ordinary place among the world's religions as one cultural fragment among others. This progressive levelling of the religious field creates the conditions for a fairer cultural partnership between peoples, in which non-Western ways of being modern and of democratic citizenship are rehabilitated or invented.

A gradual decline in the output of theological writings is becoming noticeable. The great voices of the first half of the century fell silent in the second, except for the voices – the stifled voices – of liberation theologies, without any ecumenically based theology really emerging. Is this perhaps an effect of the return to peace, of Third World issues being rapidly forgotten, and then of the world economic crisis? Or is it maybe a consequence of the subtle spread of a reformed, secularized mode of belief, which hands institutions over to civil society, while the spiritual bond becomes an inner one? The voices which do make themselves heard are more those of human compassion or ecological concern, people expressing a mystical inwardness or politico-religious dissidence. Religious thought, especially that of the monotheistic faiths, which is more linked to historical criticism, seems to be giving way to spiritualities that engage in the pursuit of inner happiness or an inchoate revolt, in a world increasingly split between a small, rich minority enjoying the benefits of modernity and, on the other hand, an immense impoverished majority that assembles fragments of encysted memory to denounce injustice or find liberation in the realm of the imagination.

The result has been a proliferation of observances in answer to the need to believe, which, for what are often contradictory reasons, has grown more acute, as though impoverishment, oppression and fear brought about a need for liberation through emotion shared within a community. Whether those communities are spontaneous, clusters of groups or sects, or institutional, developing within institutions or co-opted by them, they follow a particular path: traditional religions, unaffiliated believers, pick-and-choose belief systems. In those instances where a strong traditional religion prevails, these practices are disciplined or regulated with a firm hand, even if they make many concessions to the conditions of modern life. Otherwise, whether apocalyptic, millenarian or merely health-orientated, they often hide a fundamentalist conservatism beneath a cloak of authenticity.

Science and religion, those two great approaches to the mystery of the world, are no longer competing in quite the way they used to. Having revolutionized our lives in the last three centuries, science commands respect, and accordingly gives up the claim to have the final word and to exhaust the mysteries of humanity and the universe. The flourishing science of religions is no obstacle to the life of religious forms, to which it brings instruction and enlightenment. It firmly shows that tolerance is not a concession wrung out of religions, but ensues from their logical organization. It points out that, given the differences between them, the great religions of the world can only welcome and

comprehend the riches that all the other religions have to offer if they have a proper sense of intellectual and cultural pluralism and especially of the plurality of ways of thinking and believing.

The present moment, which seems to be one of confusion and often of faulty logic, heralds the emergence of a meaning. It involves mixing and plurality, the fact that we live, at least through communications, in many spheres at once and that we move around between those spheres. In fact, this plurality is one of the conditions of humanity and its creativity, and the representations of the divine emerging therefrom are now acknowledged once and for all to be partial and relative.

This acknowledgement of pluralism may induce religions to withdraw quietly from the field of domination. The Greeks understood that democracy entailed an attenuation of the status of the gods as sovereigns of a superior world, dominating humanity. If the slow twilight of the twentieth century's false images of the divine has made it possible to set human beings free while strengthening the bonds between them, the unsurpassed horrors which marked the century might enable us to glimpse the possibility that humankind, now at last emerging from the Stone Age, may attempt to write a new chapter of humanism in history, as a renaissance longed for by its most deprived members.

## ETHICS

*Peter Singer*

### INTRODUCTION

We can understand the term 'ethics' either broadly or narrowly. In its broadest sense, ethics pertains to how we ought to live. Any discussion of values, of right and wrong, and of the resulting choices, can therefore be considered within the scope of the field of ethics. If we consider ethics in this sense, the discipline's history in the twentieth century is synonymous with the history of the century itself: that is, the development of the major political, religious and cultural ideas of the century, including the rise and ultimate fall of both fascism and communism, as well as the struggles over religious belief and secularism and over traditional village life vs. modern urban society.

There is also, however, a narrower sense of the term 'ethics', which refers to the attempt to gain a better understanding of the phenomena referred to in the previous paragraph. In other words, ethics in this narrow sense is not just any assertion or opinion about how we ought to live, but rather the systematic study of values and of theories about right and wrong, or of what is of ultimate value. Moreover, this systematic study is usually understood in a philosophical sense. It is not the work of the anthropologist or sociologist, documenting the way in which people in fact make moral choices. Rather it is the work of the philosopher attempting to justify a principle or set of principles that can guide our actions; or else perhaps – for there is no lack of sceptics about ethics – to argue why it is impossible to find any justification for choosing one way rather than another.

In this chapter, we will consider ethics in both senses, focusing primarily on the way in which the twentieth century has seen the emergence of new global ethical issues, but also examining the development of the systematic study of values and theories about right and wrong. These two threads converge, because in the final quarter of the century, philosophers and others studying ethics paid increasing attention to the practical ethical issues that we face, both as individuals and as a global community.

Ethics has a long history. It is to be found in every culture, and it is sometimes said that ethics is always related to culture. If this were so – if there were really no common ground between the ethics of China and France, or Nigeria and Argentina – then the history of ethics in the twentieth century would be the history of many different ethics, with no common pattern or mutual comprehension. But there are common themes to ethics in different societies. These themes draw on shared aspects of our nature, for example, the fact that we are social animals, living in groups but especially concerned with the welfare of our own kin.

This provides the background for the first theme of twentieth-century ethics, the endemic conflict between self-interest and the interests of the group or of others. This conflict has come to the fore as society stresses the ideal of the individual who achieves his or her goals in open competition with others. Thus throughout the history of ethics, some thinkers have sought to show that the good of the individual can only be furthered by doing what is also good in some larger sense, good for the community; while thinkers of a more sceptical frame of mind have doubted that this can be shown and have even charged morality with fraud for purporting to oversee the interests of the individual. The breakdown of traditional cultures in the twentieth century and the replacement of such cultures by an individualist society focused on consumption have made these debates all the more urgent. The twentieth century has produced larger and more anonymous urban societies than ever before, and in many countries, unbridled individual acquisition of wealth has become an acceptable ambition, if not the only one. In these circumstances, while the difficulties of living in such a society have shown how urgently a more ethical approach is needed, the very ability of any ethical standards to survive has been doubted.

Another perennial theme in the history of ethics that has emerged with new force in the twentieth century is whether ethics can be regarded as objective or subjective. These terms are used in different ways, but it is roughly accurate to characterize them as follows: objectivists hold that ethics is a matter of knowledge and some ethical judgments can be shown to be true, or in accordance with reason; subjectivists, on the other hand, see ethics as merely a matter of attitudes, or feelings, which can no more be true or false, or rational or irrational, than a preference.

Historically, religious belief has been a support for one form of objectivism, namely the view that the correct ethical

rules are laid down by God or the gods. With religion under more open challenge than ever before, and an increasing number of people for whom it has become irrelevant, it is not surprising that the twentieth century has seen a considerable rise in subjectivist ways of thinking. Nevertheless, defenders of objectivity in ethics are not lacking, even among those who are not religious, and the debate has been a vigorous one.

A third theme is that of technological development and the challenge it poses to some approaches to ethics. In the twentieth century, science and technology have raised a multitude of new issues. Should we accept new reproductive technologies that make it possible for infertile couples to have children? Is it right to transfer an embryo to the womb of a surrogate, who will give birth to a child to whom she has no genetic connection? Is it ethically permissible to alter the genetic code of living organisms? If so, does it apply only to alterations to the genetic code of non-human organisms or to our own genetic code as well? Must we use all the technological resources at our disposal to maintain the life of a human being who we know will never recover consciousness? Thus, science and technology challenge our old beliefs in the link between reproduction and sexual intercourse, in the randomness of natural reproduction, and ultimately in the sanctity of all human life.

The fourth and last theme is the expansion of the moral community. The nineteenth-century British historian W. E. H. Lecky described how ethics was previously limited to the family or tribe, but gradually expanded to include 'a class, then a nation, then a coalition of nations, then all humanity, and finally, its influence is felt in the dealings of man with the animal world'. There were times in the twentieth century when this idea has seemed naively optimistic. Opponents of any idea of moral equality beyond their own race fought a bitter struggle to maintain their superiority. But in the second half of the twentieth century, the defeat of explicitly racist governments has allowed this 'expanding circle' of ethics to resume something like the kind of progress that Lecky described. As the global community becomes more closely interconnected, and race and class cease to be accepted grounds for excluding someone from the sphere of morality, we appear to be closer to Lecky's penultimate step: a morality that is truly inclusive of all human beings. We are even taking the first tentative forays towards a wider ethic that includes non-human animals and the natural environment, as we will examine below.

## FROM 1914 TO 1945: SCEPTICISM AND COMMITMENT

As the nineteenth century closed, it was possible to believe that industrialization and the spread of education and science were bound to lead to steady progress not only in material prosperity and scientific understanding, but in ethics as well. Many of those who thought philosophically about ethics were also believers in progress, and this meant that they had to be objectivists, at least in the sense of judging the direction of change as progressing towards something better. Among these thinkers in the German tradition were Hegel and his followers, including even 'Leftist Hegelians' like Karl Marx, for whom the transition to communism was a change to a better society. In Britain,

the great English utilitarians, Jeremy Bentham, John Stuart Mill and Henry Sidgwick, all believed in the objective truth of the principle of maximizing pleasure or happiness and minimizing suffering. Darwin's theory of evolution also contributed to this sense of progress, for although Darwin himself declared the course of evolution to be ethically neutral, most of those who popularized his theories were not as scrupulous. Social Darwinism thrived especially in the United States, where it was used to show that the unrestrained competition unleashed by capitalism was a natural process that, cruel as it might seem, would ultimately lead to the evolution of a higher form of human existence.

The machine guns of the First World War killed European society's confidence in progress and objectivity in ethics, as surely as they killed the young men sent to the trenches. When the carnage was over, people rethought their ethical attitudes. In philosophical circles in Europe, *logical positivism* emerged from the Vienna Circle as the most influential new way of thinking about the world. Logical positivists accepted as meaningful only those propositions that could be verified by observation or were logical tautologies. Ethical judgments, it was immediately clear, were neither verifiable nor tautological. Hence they were rejected, either as nonsense, or as mere exclamations, or expressions of subjective feelings. Ludwig Wittgenstein, perhaps the leading philosopher of his generation, was linked with this view, although he sought to disassociate himself from the logical positivists and made clear his abiding respect for ethics. Yet at the same time, he insisted that we could not speak about ethics for whenever we try to do so, we run up against the limits of language.

Both this view of Wittgenstein and the influence of positivism supported the belief that ethics cannot be approached by reason. The ominous rise of fascism in Europe seemed to have confirmed this, for the fascists were quite open in their contempt for intellectuals and their preference for the instincts of the *Volk*, backed up if necessary by raw force. But by the 1930s, as conflicting ideologies confronted each other in Europe, those on the political left and centre who formed a common front against fascism developed a sense of commitment that made the academic arguments for or against subjectivism seem irrelevant. Although fascism had its coterie of intellectual supporters, including in Germany the philosopher Martin Heidegger, it had no body of theory that could compare with the writings of Marx and other socialists. Even political leaders like Lenin and Stalin wrote extensively and were presented by the communist movement as major thinkers. In Europe, North America and Asia, many intellectuals gravitated towards the left, and quite a few to communism.

The attitude of communism to ethics was paradoxical, and the roots of the paradox lie in Marx's own writings. On the one hand, Marx's materialist conception of history meant that ethics was part of the 'superstructure' of society, driven along by changes in the economic base. Hence 'bourgeois ethics' need not be taken seriously; it would disappear when capitalism collapsed, just as feudal ethics had disappeared with the passing of the feudal economy. But what then of 'communist ethics'? Was this just another ethic relative to a particular form of society, and not really superior to any other? If so, why should the workers struggle for the revolution that would bring about communism?

Marx's own approach to this paradox, at least in his later writings, was to consider himself as a scientist describing

the laws by which history works and able to discern that the collapse of capitalism and its replacement by communism was inevitable. On these grounds, both Marx and his twentieth-century followers castigated non-Marxist socialists who extensively debated the issue of socialist ethics; the Marxists considered irrelevant any discussion about the ethical superiority of a communist society. But to most readers, the denunciation of capitalism in Marx's *Capital* – especially in those chapters describing the exploitation of child factory-workers – was fuelled by a moral outrage at what the laws of the marketplace were doing to human beings. And Marx himself had – admittedly rather casually – remarked that the communist society of the future would be based on the principle of 'from each, according to his ability, to each, according to his need', and this certainly sounded like a principle of justice. This contradiction between deep moral commitment and an official stance that communism was based on science, not ethics, continued throughout the 1930s and beyond.

## Equality and human rights

The defeat of Nazism led to a reassessment of subjectivism. As journalists followed the Allied armies into the death camps, and the world began to realize the enormity of the atrocities committed, the subjectivist implication that Nazi morality cannot be said to be worse than any other morality – that all we can say, in effect, is that we do not like what they did – suddenly seemed hollow. Nevertheless, subjectivism of various kinds survived the Holocaust. On the European continent, and to some extent in the United States, existentialism flourished in both literary and philosophical circles. Its leading figures were French writers like Jean-Paul Sartre. Much of Sartre's thought is driven by the absence of God. Because there is no God, Sartre thought, we must abandon the idea that we human beings have been designed for some purpose. Therefore we have no essence: for humans, existence precedes essence – hence the label 'existentialism'. Because we have not been conceived by anyone for any purpose, we are free to choose our own purposes, and the only constraint on us is that we must choose 'authentically'. But what, many critics of the existentialists asked, if one makes an 'authentic' choice and leaps into the arms of Nazism? As the example of Martin Heidegger indicated, this was no idle question.

In order to try to show why an ethical choice had to be more than merely an authentic choice, philosophers began to struggle with ways of reasoning in ethics that could demonstrate a real difference between those who acted like Nazis and those who respected all humans equally. The most promising attempts all seemed to respond, in some way, to an appeal for a universal aspect of moral judgments. This is an ancient idea put forward in many cultures, including ancient China, and India, in Jewish and Christian thought, among the Stoic philosophers of the Roman Empire, and of course by the eighteenth-century German philosopher Immanuel Kant. In the twentieth century, it is perhaps most closely associated with the British philosopher R. M. Hare, who has argued that moral judgments are 'universalizable' prescriptions.

In effect, Hare's notion of universalizability means that I can only say – for example – 'We ought to go to war', and mean this as a sincere moral judgment, if I am prepared to put myself in the place of those affected by the decision to go to war, both for better and for worse. In putting myself in their position, I must take on their wants and desires. Then only if after having fully imagined the desires of all those people and weighed their desires alongside my own desires, I am still willing to prescribe the act of going to war, can I claim to be making a moral judgment when I say that we ought to go to war. Although there are many differences in style and substance between Hare and other leading contemporary moral philosophers, it is remarkable to note how many other moral philosophers have come up with a device that constrains our moral judgments in similar ways to Hare's use of universalizability. Jean-Paul Sartre himself in one lecture, 'Existentialism and Humanism' (1948), backed away from his earlier subjectivism and drew on Kant's idea that moral judgments must be universal in form.

In *A Theory of Justice* (1971), the most debated work of American ethics in the second half of the century, John Rawls introduces a 'veil of ignorance' so that the principles of justice can be chosen by people who do not know what position in society they will occupy. The German critical theorist Jürgen Habermas believes that judgments must be acceptable to an 'ideal speech community'. Utilitarians take it as axiomatic that each counts for one and none for more than one. Common to all of these devices is the idea of choosing, not just for yourself or for those close to you or like you in a certain way, but for everyone, no matter how different or remote.

It is not difficult to see how this approach to ethics is linked to the worldwide movement to combat racism (and later, other forms of discrimination too, for example against women). Racists would not wish to put themselves in the position of those they exploit or discriminate against. The whole point of racism (and sexism, and similar attempts to assert group superiority) is to identify the group to which one belongs, and mark it out as morally superior or more significant. Putting yourself in the place of your victims does not allow you to do that.

These philosophical developments had their parallels at state and international levels. The defeat of Nazism and the re-constituting of the League of Nations in the form of the United Nations Organization gave an impetus to the human rights movement. In Nuremberg, the allied court sitting in judgment on the German war criminals rejected the argument that the Nazis had been acting lawfully, in accordance with the laws that prevailed in Germany at the time. Instead they appealed to a higher law, a universal or natural law that could not be abrogated by any state or government. This made it urgent to say something about what the requirements of this law were. The *Universal Declaration of Human Rights*, adopted and proclaimed by the United Nations General Assembly in December 1948, though not legally binding on its member states, imposed a moral obligation on all United Nations members to achieve for their citizens the rights listed in the declaration. (Subsequently the International Covenant on Economic, Social and Cultural Rights, adopted in 1966 did attempt to give legal force to more specific rights.)

Perhaps the most widely accepted ethical standard was the rejection of racism. In the aftermath of Nazism, the evil of racism was so apparent that it was relatively easy to obtain almost universal agreement to the principle of non-discrimination on the grounds of race. National

independence movements that led to the end of white colonial rule over much of the developing world reinforced this opposition to racism. In India, the movement for independence was led by Gandhi, whose concept of non-violent resistance, based on traditional Hindu values, became a model for the American civil rights movement and subsequently for many other protest movements. By the end of the 1960s, only South Africa remained an overtly and officially racist society, and the exclusion of South Africa from international forums demonstrated the degree of consensus on this issue that prevailed in the rest of the world. At least, this consensus prevailed on an official level. In fact, racial problems did not go away, and even in countries like the United States, it was not until the civil rights movement of the 1960s, that racially discriminatory laws were removed from southern states.

The demand for equality, which had been accepted by major national and international bodies in respect of discrimination on the grounds of race and religion, proved impossible to limit to those areas. During the 1960s, women like Betty Friedan and Germaine Greer began to point out the extent to which every society, irrespective of its culture or religious tradition, was dominated by men. Feminism, which had been largely dormant since early in the century, when women obtained the vote in most democratic nations, underwent a major revival. In those societies in which feminist ideas were able to make some headway, the equality of women became an ethical issue not only at the level of government policy, but also in everyday life, as women increasingly questioned their assignment to domestic duties and their subordination to men. At the beginning of the new century, the ramifications of these changes are still unfolding, as more women enter leading positions in government and business, and a new generation of women grows up with ideas of sex roles that are very different from those with which their mothers grew up.

Other groups also made claims for equality and rights. In the face of opposition from many religious groups and other conservative moralists, homosexual thinkers like Dennis Altman made the case for gay liberation, insisting not only on the right to freedom from prosecution for sexual acts between consenting adults, but also demanding that they not be discriminated against on the grounds of their sexuality. The demand for human rights for the intellectually disabled was taken up by the United Nations General Assembly in 1971, when it passed the *Declaration on the Rights of Mentally Retarded Persons*, and more broadly in 1975, with the *Declaration of the Rights of Disabled Persons*.

Another question raised was whether it was not arbitrary to insist on rights and equality for all human beings, but to deny rights or equal consideration of interests to all those sentient beings outside our species, including animals in laboratories or intensive farms. From the late 1970s, through the 1980s, there was an unprecedented growth in support for the idea of animal liberation, or animal rights, especially in Europe, North America, and Australia. This led to some changes, particularly in the regulations governing experiments on animals, and in some countries, to the prohibition of the most restrictive forms of keeping animals. There was also a marked rise in the number of vegetarians in the developed nations. In the last decade of the century, an international group of distinguished scientists, philosophers and other scholars proposed that we should extend the rights to life,

liberty and protection from torture across the species boundary, at least to our closest relatives, the great apes.

## THE NUCLEAR AGE

The use of the atom bomb at Hiroshima and Nagasaki posed an obvious ethical question for all future generations (Plate 122). It is true that the bombing raids on Hamburg and Dresden, which did not involve nuclear weapons, killed more civilians than did the first two atom bombs. But gradually the realization dawned that these first two bombs were only the beginning and that nuclear weapons were developing to the point of potentially annihilating all human civilization. Albert Einstein, who had initially supported the development of the atom bomb because of his fear that Hitler might obtain it first, subsequently became a strong opponent of nuclear weapons. Many other scientists supported the Pugwash movement, which in a series of international conferences on science and world affairs warned of the threat of nuclear catastrophe. Never before had human beings had such a power or lived under such a threat. The ethical question that had to be faced was: can it be justifiable to use such terrible weapons of destruction?

The English philosopher Elizabeth Anscombe had a clear answer to this question. To use the deaths of civilians as a means of forcing the enemy to surrender or to use any weapon intended to kill civilians, she said, was murder. When President Truman was granted an honorary degree by Oxford University, Anscombe distributed an article denouncing him as a mass murderer. But her view gained little support from the English-speaking philosophical community, perhaps because at that time philosophers were, under the influence of the later work of Ludwig Wittgenstein, focusing more on linguistic analysis than on substantive ethical questions. It is true that Bertrand Russell, a major philosophical figure, dedicated himself to the anti-nuclear movement; but for most philosophers at the time this meant merely that Russell had abandoned philosophy to become a political activist.

Gradually the view came to prevail that the 'first use' of nuclear weapons, even in the midst of a war carried out by conventional weapons, would be wrong because no matter how limited it might be, it would carry the risk of escalation into a global nuclear exchange. Nevertheless it was not until the 1970s, when the NATO powers and the Soviet Union had built up huge arsenals of missiles with nuclear warheads, that a serious debate began about the entire strategy of basing a nation's defence on the threat of what was known as 'mutually assured destruction'. Granted that it would be wrong for any country to be the first to launch a nuclear attack, the question still remained: what about a retaliatory strike? Suppose, it was argued in America, that the Soviet Union did in fact unleash its nuclear missiles in a surprise attack, and this was detected by the American early warning system. There would still be no defence against the destruction of American cities and the loss of tens of millions of American lives. Would this justify the detonating of American nuclear weapons, with equally devastating consequences for Soviet citizens, who had had no say in the firing of Soviet missiles? And even if one were to ignore the deaths of millions of Soviet citizens, the additional nuclear radiation released by firing American missiles would only worsen the global crisis, perhaps triggering the 'nuclear winter' that some scientists

said would occur in any major nuclear exchange. The answer therefore seemed to be that the use of America's nuclear missiles could not be justified even if it were in retaliation for a first strike by the other side. But if it would be wrong to use these missiles, could it be right to base America's strategy on the threat to use them? The opposing sides were still locked in debate when the end of the Cold War came in the late 1980s. The preponderance of ethical opinion at the end of the century was perhaps sufficiently indicated by the award of the Nobel Peace Prize in 1995 to the long-standing anti-nuclear campaigner Professor Joseph Rotblat, followed by the 1996 verdict of the World Court that the use of nuclear weapons is contrary to international law. Despite this legal judgment and the end of the Cold War, the arsenals retained by the United States and Russia demonstrate that the threat of nuclear annihilation has not disappeared. Its place at the centre of public attention has, however, been largely replaced by other global dangers, less terrifying but in the long run perhaps no less threatening to the future of our planet, and certainly no less demanding of a co-ordinated and ethically sensitive solution.

## Environmental ethics

Rachel Carson's 1962 book *Silent Spring* is usually credited with triggering the environmental or 'green' movement. Carson focused attention especially on the pollution of soil and water by long-lasting insecticides, but environmentalists soon moved on to questions of wilderness and species preservation, population growth, the ozone hole, and the human-induced global warming. Each of these issues raises significant ethical questions, which affect all of humanity and cannot be solved without a global response. Thus they take the different nations of the world a step closer to the development of a global ethical community.

In the discussion of the preservation of wilderness and endangered species, there were many calls for a new environmental ethic. Traditional ethics, it was said, are always human-centred. If we want to conserve a forest or a wetland then we must, if we are to make sense within a traditional ethic, argue that it is valuable for humans perhaps because we may find plants there with special medicinal properties or because we can go there and refresh our spirit by communing with nature. But, the advocates of a new environmental ethic urged, some things are of value in themselves, independently of whether human beings value them or ever will value them. Our ethic should not be human-centred and short-term, these environmentalists argued; if our planet is to survive, we need an ethic that is eco-centred and long-term. It was from discussions like these that a new sub-discipline of ethics, environmental ethics, was born, to grapple with, for example, questions about the value of preserving a species of fish that lives in a free-flowing river that the government or some other authority would like to dam, or the value of a forest wilderness as compared with the economic value of the timber that could be obtained by cutting it.

Although the threat of global overpopulation had been noted by Thomas Malthus in the eighteenth century, it was only in the twentieth century that this threat began to be taken seriously by governments. Even then, in the first half of the century, many countries sought to increase their population in the belief that this would enhance their military and economic strength. This attitude was reversed in the last quarter of the century, when the world's population reached 5 billion, and many countries with high birth rates began actively to discourage population growth. The strongest action was taken by the world's most populous country, China, which adopted a 'one child policy'. Attempts to reduce population growth inevitably met with opposition from those who based their ethics on particular religious beliefs. The Roman Catholic Church, for example, opposes the use of contraception or abortion. It recommends instead the use of abstinence during the fertile period of a woman's cycle. Some Islamic nations have taken a similar stance. For this reason, the 1994 International Conference on Population and Development, held in Cairo, proved to be a forum for a significant confrontation between nations that favoured a secular, or liberal religious view, and those that formed their views on the basis of traditional religious beliefs. Some Latin American Catholic nations and some Islamic nations united to oppose the inclusion in the conference communiqué of references to the termination of pregnancy, in particular; but the overwhelming majority of the nations of the world stood firmly behind the need for strong measures to reduce global population growth, and especially to educate women and to give them control over their fertility.

Whether it will be possible to reach equally broad agreement on measures to prevent global warming is, at the time of writing, more difficult to say. The 1992 United Nations Conference on Environment and Development was informed by panels of scientists that the increasing production of carbon dioxide, associated with higher energy consumption, especially from the burning of coal and oil, is bringing about global warming. This will cause widespread changes in climate patterns, including droughts and famines in some areas, and floods in others. It will also bring about a rise in sea levels that could wipe out some low-lying Pacific island nations and inundate the delta regions of Bangladesh and Egypt, which are home to more than 40 million people. This threat led to the signing of a Climate Change Convention, which proposed a cutback in carbon dioxide emissions. But some nations – the United States, Australia, Canada, Russia and certain European countries – have per capita emissions of greenhouse gases that are as much as six times higher than other nations, such as India and China. So it would seem fair for those nations to roll back their greenhouse gas emissions rapidly, while developing nations are allowed to continue to increase theirs. The developed nations are reluctant to embrace a solution that would cause significant, if temporary, disruption to their economies. Here the need is apparent for the world to work out a just solution to a novel problem. The ability of the atmosphere to absorb greenhouse gases while remaining climatically stable is a common resource. The oceans, too, are another common resource, subject to pollution from individuals and corporations from many different nations. If the world community does not find and accept basic ethical standards for the use of these common resources, it is frightening to contemplate the possible consequences.

## Ethical issues raised by medicine and biological sciences

The twentieth century has seen an extraordinary increase in our knowledge of biological processes and in the ability of

337

medicine to prolong life; but this has brought a host of new ethical problems in its wake, and has caused serious difficulties for traditional approaches to questions of life and death. The study of these ethical issues, known as bioethics, has grown rapidly. In the 1950s, there was almost no systematic study of new ethical issues in medicine or the biological sciences, but by the 1990s, there were hundreds of centres or departments of bioethics, not only in Europe and North America, but throughout the world, especially East Asia, South America, and Australia.

One early example of the kind of issue that led to this development was the definition of death. Traditionally, death had been defined in terms of the cessation of heartbeat and circulation; but during the 1960s it became common to use a mechanical respirator to maintain the breathing of patients who would otherwise die. Some of these patients, of course, made good recoveries; but among them were some who had suffered such severe head injury that the brain had irreversibly ceased to function. Was it permissible, doctors asked, to remove patients from the respirator? The question developed a new urgency because of another medical innovation, the technique of transplanting an organ from one person to another. Organs such as the heart became damaged if circulation ceased; but if death could be redefined as the irreversible cessation of all brain function, then these organs could be removed from patients while circulation continued and used to save the lives of other patients. By the 1990s, most of the world's nations accepted the new definition of death.

In a manner that is illustrative of the constantly shifting frontier of this field, questions were then raised about patients who have irreversibly lost consciousness, but still retain some brain functions. In some hospitals, especially in the United States, such patients may be kept alive for many years, whereas in other countries infections are deliberately left untreated, or feeding tubes are removed, and the patient soon dies. This mode of treating a patient is based on a distinction between actively taking life and omitting to preserve life. Some ethicists consider that the latter is acceptable, whereas the former is not, but others deny that the distinction is ethically significant.

The absolute wrongness of taking human life has also been put in doubt by increasing support for the idea that when a patient is terminally ill and asks a doctor for assistance in dying, the doctor is justified in providing such assistance. Throughout the century, there have been advocates of the legalization of voluntary euthanasia, but until the 1980s, this advocacy had met with no success. In that decade, however, courts in the Netherlands began to uphold the right of a doctor to provide assistance in dying to a patient who is terminally ill, finds his or her condition unbearable, and makes a persistent, well-informed and rational request for euthanasia. It has been reliably estimated that about 2,300 deaths each year in the Netherlands are the result of voluntary euthanasia. Widespread popular and medical support for this practice in the Netherlands has led to similar proposals being discussed elsewhere, and in 1995 the Legislative Assembly of Australia's Northern Territory became the first parliament in the world to vote for the legalization of voluntary euthanasia.

At the other end of life, there have also been intense ethical debates about new reproductive technologies. In 1978, Robert Edwards and Patrick Steptoe succeeded in fertilizing a human egg outside the body, and transferring the embryo to the womb of the infertile woman who supplied the egg. The resulting 'test-tube baby' made world headlines. It was ethically controversial for several reasons: it was based on experimentation on human embryos, which some saw as having a right to life; there were fears that it would produce abnormal babies; it opened the way to further new developments, such as the donation of eggs from one woman to another, and the long-term storage of frozen embryos; and it could lead to the selection or genetic manipulation of embryos and hence of human beings.

Many governments set up committees of inquiry into the ethical, social and legal aspects of in vitro fertilization, as the technique was called (Plate 123). In general, these official bodies approved the procedure, under certain conditions. Most allowed some experimentation on human embryos, with some consensus on a limit of 14 days after fertilization for such experiments. Within a decade, in vitro fertilization had become a standard clinical procedure for assisting infertile couples. Fears about a high rate of abnormal babies receded, but controversy remained, especially when the technique was used to help women in their fifties and even early sixties to have children.

Concerns about possible future uses of new reproductive techniques for eugenic purposes also remained. The celebrated discovery by Crick and Watson of the structure of DNA had led, within a 30-year period, to the capability of manipulating the genetic code of living organisms in certain ways. This new control over the design of living organisms was itself the subject of fierce ethical debate, even when applied only to micro-organisms. In the 1980s, the first experiments on genetically engineered plants and animals were carried out (Plate 124), despite objections that this could lead to new and environmentally damaging organisms 'escaping' to the wild. There was also speculation that genetic engineering techniques would eventually be applied to human beings. This speculation was further fuelled by the human genome project, an international project, described as the biological equivalent of sending an astronaut to the moon, which set out to map and sequence the entire human genome, or genetic code. The resulting knowledge, it was hoped, would provide a basis for treating the cause, rather than the symptoms, of many diseases. But critics insisted that while this may be so, it would be impossible to prevent abuses of this knowledge, for example, genetic intervention designed to produce 'superior' human beings. They also pointed to possible misuse by employers or insurance companies, who may wish to screen out prospective employees or clients with undesirable genetic traits.

## A global ethical community

As the twenty-first century begins, the ethical problems we face seem far more daunting than those at the dawn of the last century. War and poverty have not been abolished, and in addition the new powers we have developed pose previously undreamed of threats to the future of all life on this planet.

Yet at the same time there are hopeful signs. The nations of the world are no longer divided into two opposing camps, as were most of the leading powers for much of the twentieth

century. The human rights movement remains strong, although there continue to be cultural differences about the extent to which individual rights are to be placed above the interests of the community. In the United States, for example, the Constitution is based on the Bill of Rights, which in turn derives from John Locke's view that lawful government can only arise from a social contract in which individuals give their consent to the form of a government, while retaining certain rights against that government. In contrast, the Confucian ethic, which has influenced China, Japan, Korea and Singapore, sees the individual as only a part of a larger unit: the family and, by extension, the whole society.

Most promising of all recent developments, perhaps, is the growing willingness to address humanitarian issues, no matter where they occur. In the early 1990s, the developed nations attempted to provide humanitarian assistance in Bosnia, Somalia, and Rwanda (Plate 125). Although none of these attempts can be regarded as an unqualified success, they showed a determination not to let large numbers of people starve or die from epidemics when help can be provided. They can perhaps be seen as a response to the fact that modern telecommunications have created a 'global village', bringing the plight of other human beings into the living rooms of the entire world. The challenge now is for the global village to evolve into the global ethical community, which will be required if we are to solve the global problems of the present century.

# PSYCHOLOGY

## *Hans Pols*

Psychology is the science of human nature. Nowadays, many individuals expect psychologists to provide guidelines for normal and acceptable behaviour. A great number of people make sense of their lives by referring to psychological concepts. Many psychologists are convinced that their discipline has supplanted philosophical, religious, and moral conceptions of human nature. In reality, however, psychologists have always revised their theories. This has, at times, placed the discipline at the centre of controversy. Psychological explanations tend to emphasize individual factors and marginalize social and cultural factors. Such explanations are more acceptable in Western societies with their high degree of individualism. They appear inappropriate in societies whose individuals explain their behaviour in terms of tradition, cultural heritage, or bonds to one's extended family or social group.

Psychology is a fragmented discipline. It has a wide variety of historical roots, many different models of human nature, and several research methods. In this chapter, three main approaches within psychology are presented: experimental psychology, mental testing, and psychotherapy. The relationship between these approaches has always been contentious as they embody different perspectives on the nature of psychology as a scientific discipline, its social function, and the nature of its applications. Experimental psychology is practised in university and industrial laboratories, mental testing generally takes place in schools, while psychotherapy is conducted in clinical settings. The fact that these three main approaches have been incorporated within one academic discipline is the result of historical contingencies.

## EXPERIMENTAL PSYCHOLOGY

The roots of experimental psychology must be traced back to the German universities of the second half of the nineteenth century. During this period, pioneering psychologists were convinced that their discipline had to emulate the scientific standards of physics and chemistry and therefore conducted their research in laboratories. To these early psychologists, methodological rigour was more important than practical utility. German experimental psychology set the standard for the new discipline, particularly in North America. Experimental psychology was characterized more by an adherence to specific research methodologies than to specific theories and models. This emphasis was due to the attempts of psychologists to differentiate their discipline from philosophy, from which psychology originally evolved. Initially, psychologists attempted to answer philosophical questions with the experimental methodology of science.

### Wilhelm Wundt's physiological psychology

Experimental psychology is generally considered to have been born in 1879 when Wilhelm Wundt (1832–1920) established his laboratory in Leipzig, Germany. In his textbook on psychology, Wundt summarized relevant contemporary research on the subject. He published *Principles of Physiological Psychology*, the first comprehensive textbook of the new discipline, in 1874 and founded *Philosophische Studien*, a journal devoted to psychological research in 1881. Scientists from all over the world visited Wundt's laboratory, which became the prototype for the psychological laboratories they established in their home countries.

Wundt named his approach *physiological psychology* because he adapted research techniques from physiology to study the mind. The two basic elements of his programme were psychophysics and mental chronometry. Psychophysics investigated the relationship between the objective world of physics and the subjective world of human experience. Physicists in the nineteenth century had described light and sound as wavelengths of specific frequencies. Physiologists then investigated how the sensory system transformed external physical stimuli into conscious experience. Psychologists concluded that the transformative powers of the mind obeyed general laws. For example, experiments demonstrated that when the brightness of a light-flash increased in geometrical progression, its perception increased in arithmetical progression. The same principle applied to the perception of sound and weight. Mental

chronometry involved reaction-time experiments. In a typical experiment, a person was asked to press a button as soon as he or she observed a flashing light. Wundt assumed that the time lag between the appearance of the light and the person's reaction constituted the time needed for the mental processes involved in acting upon a discrete perception. Wundt then complicated the task by adding discrimination and decision factors, which increased the reaction time. By presenting a great variety of mental tasks, Wundt hoped to determine the reaction times needed for the various mental processes involved in their execution.

Edward B. Titchener (1867–1927) considered himself Wundt's sole faithful disciple in North America even though his approach was more limited. Titchener's programme, known as *structuralism*, entailed the systematic analysis of consciousness into its constitutive elements through introspection under rigidly controlled laboratory conditions. According to both Wundt and Titchener, there were strict limitations to what laboratory research could accomplish because only relatively basic mental processes were amenable to experimental research.

A group of German psychologists unified in the Gestalt School, inspired by holistic philosophical ideas, criticized this atomistic approach to mental phenomena.[1] They disagreed with Titchener's conception that human experience was assembled from thousands of basic elements synthesized by the mind, arguing that experience is perceived as a whole. They demonstrated, for example, that when two lines were flashed in rapid succession, they were perceived as a single moving line. This phenomenon of apparent motion was fundamental for the perception of films as continuous 'moving pictures'. Other alternative approaches to Wundt's experimental psychology were developed to investigate higher mental processes such as thinking, problem-solving, and memory. A number of North American psychologists also reacted against the approaches of Wundt and Titchener as they considered its parameters too narrow, providing no basis for practical applications.

## FUNCTIONALISM

Around the turn of the twentieth century, *functionalism*, an alternative approach to psychological research, was formulated by a group of North American psychologists. The main protagonists of this approach were John Dewey (1859–1952) and James Rowland Angell (1869–1949). Functionalist psychologists were not particularly concerned with the structure of the mind or the constitutive elements of consciousness. Inspired by the evolutionary theories of Charles Darwin (1809–1882), they endeavoured to investigate the function of mental activity both in the evolution of the human species and in the adaptive relationship of individuals to their social environments. Strongly inspired by the American philosophy of pragmatism, functionalists were deeply interested in the practical applications of psychological research, such as mental testing and educational psychology.

Functionalist psychologists interested in child development focused on how children learned to adjust to their environment while growing up. This perspective enabled investigators to study the origins of several mental and behavioural characteristics in the development of the human personality. Research in developmental psychology was conducted by Granville Stanley Hall (1844–1924) and James Mark Baldwin (1861–1934) and later continued by the Swiss psychologist Jean Piaget (1896–1980). Within an evolutionary framework, research on animals was considered relevant to psychology because certain animal species (such as white rats, cats, dogs, pigeons) displayed elementary characteristics of learning that were shared with human beings. During the 1910s and 1920s, psychologists increasingly focused their research on learning in human beings and animals.

## BEHAVIOURISM

The school of behaviourism, initiated by John B. Watson (1878–1958), dominated North American psychology from 1920 to 1960. According to Watson, who had studied with Dewey and Angell, psychology's aim as a purely objective branch of natural science was the prediction and control of behaviour, which he regarded as entirely determined by environmental factors. Because he was convinced that psychologists could only study objectively observable behaviour, Watson argued that the study of consciousness through introspection fell outside the scope of the discipline. Watson believed that the principles governing the behaviour of humans and animals were essentially the same. He and his followers conducted most of their research on animals because fewer complicating factors were involved.

Watson was influenced by the experiments on animal behaviour conducted by the Nobel-prize winning physiologist Ivan Pavlov (1849–1936) and made this work the foundation of his own theories. Pavlov had conditioned laboratory dogs to salivate at the sound of a bell by repeatedly sounding this bell just before presenting food (Plate 126). Pavlov called the innate and automatic digestive response of salivating the unconditioned reflex, and the response acquired through repeated experience the conditioned reflex. He investigated the conditions necessary for establishing conditioned reflexes, their strength, and the period of time that elapsed before they disappeared (extinction). According to Watson, conditioned reflexes were the constitutive elements of habits, which, according to him, were the building blocks of human behaviour. In this perspective, the formation of habits and the establishment of conditioned reflexes could potentially explain all human behaviour.

Watson asserted that behaviour was based on three innate, primary emotions: fear, rage, and love. The subtleties and variety of adult emotional expression were derived from these basic emotions through elaborate conditioning processes. He became notorious for illustrating this theory by experiments involving an eleven-month-old boy, later named Little Albert, in whom he conditioned a fear of white rats by striking a metal bar with a hammer when the boy showed an interest in the animal. By pairing the presentation of the rat with a loud noise on successive occasions, Little Albert became frightened upon seeing the rat even when the loud noise was absent. The child had developed a strong fear response to other white furry objects as well, including rabbits, dogs, cotton wool, and a seal coat.

The behaviourist school gave rise to several experimental traditions generally labelled neo-behaviourism. One of its most influential protagonists following the Second

World War was B. F. Skinner (1904–1990), who modified Watson's scheme of conditioned reflexes by introducing rewards as a motivating force for behaviour. According to Skinner, Watson's model assumed a passive organism merely reacting to changes in its environment. Instead, Skinner claimed that organisms actively learn by seeking rewards. To test his theories, he developed the 'Skinner box'. Animals placed in these boxes learned by random exploration that specific actions, such as pressing a bar or pecking at a coloured spot on the wall, led to rewards (such as receiving a pellet of food). After they had learned the specific mechanism of the Skinner box in which they had been placed, animals repeated the response, which had previously been reinforced by a reward. Skinner called this procedure of shaping behaviour through rewards *operant conditioning*. In other experiments, he investigated the effects of different reinforcement schedules on the speed of learning and the persistence of acquired behaviour patterns.

Behaviourism has been praised for its optimism in claiming that virtually all behaviour is learned and can therefore be modified by using appropriate training and rewards. But it has also been criticized for inspiring the manipulation of human beings and for excluding a great number of psychological phenomena, such as cognition and human experience, as appropriate topics for research. Although behaviourism dominated psychology for four decades, alternatives remained viable. Gestalt psychologists, for example, conducted experiments demonstrating the importance of insight as a factor in learning. In the 1960s, experimental psychologists transcended some of the restrictions imposed on the discipline by behaviourism by investigating mental processes.

## COGNITIVE PSYCHOLOGY

In the late 1950s, the linguist Noam Chomsky claimed that the linguistic abilities of human beings could not possibly be explained by behaviourist principles such as reinforcement and selective extinction. He proposed the theory of *transformational generative grammar*, which suggests the existence of innate rules and principles governing the way the mind operates. Chomsky's assertions inspired the tradition of cognitive psychology, which investigates phenomena such as perception, attention, reasoning, problem-solving, language processing, and the organization of memory.

Cognitive psychologists view human beings as information processing systems and investigate the analogies between human cognition and computer technology.[2] They define thinking as the systematic manipulation of symbols. Computers process information by transforming input through processes of encoding, storage, and retrieval, providing a specific output. In their research, cognitive psychologists have differentiated between sensory memory, short-term memory, and long-term memory, each operating according to its own principles. Encoding takes place in humans via sensory memory as, for example, pattern recognition, while storage and retrieval are processes constituted by interactions between short- and long-term memory.

Cognitive psychologists have developed numerous computer simulations of cognitive functioning. Recently, they have started to apply neurophysiological research methods such as magnetic resonance imaging (MRI) techniques to study the neurological processes underlying specific cognitive processes.

## SOCIAL PSYCHOLOGY

Social psychologists study how human beings function in small groups. Social psychologists have developed entirely different methods for their research. Solomon Asch (1907–1996) devised several experiments to investigate the effects of peer pressure and social conformity. In what was presented to a group of individuals as a visual discrimination task, Asch asked participants to identify the longer of two lines presented on a screen. However, all participants except one were accomplices of the experimenter. When they collectively gave the obviously wrong answer, most uninformed participants tended to vote with the group despite their awareness that the answer was incorrect. If only one of the other individuals gave the right answer, most participants were able to uphold their own opinion. On the basis of these experiments, Asch drew some troublesome conclusions about the power of social pressure in, for instance, politically repressive regimes.

In what became a very influential experiment, Stanley Milgram (1933–1985) asked individuals to participate in a behaviouristic learning experiment where they were told to administer electric shocks to a student when he made mistakes during a straightforward learning task. The student, who was located in another room so that subjects could only hear him, was an accomplice of the experimenter. In reality, no shocks were administered; the student only acted as if there had been. Milgram reported that when he ordered the research participants to administer increasingly high electric shocks, most of them complied. Many participants even administered lethal shocks when ordered to do so. The implications of these experiments were profoundly disturbing and led to extensive discussions about the nature of human morality and responsibility.

Experimental psychology originated in Germany but flourished in the United States. However, only a relatively small number of psychologists have been and are currently involved in laboratory research. The majority of psychologists specialize in the development and application of mental tests and in psychotherapy.

## MENTAL TESTS AND THE PSYCHOLOGY OF INDIVIDUAL DIFFERENCES

The mental test is by far the most widely used tool developed by psychologists. Psychologists have designed tests that measure intelligence, personality characteristics, and specific abilities and aptitudes. Many individuals encounter mental tests while in primary school or as part of an application procedure. Psychologists interested in mental tests want to measure individual differences instead of investigating the general laws governing human nature. Test psychologists are generally practically oriented; they develop tests for use in vocational guidance, selecting and placing job applicants, and placing schoolchildren into appropriate educational tracks. Given their interests in individual differences and practical applications, test psychologists form a sub-group within the field of psychology.

Intelligence tests have been highly controversial because a number of test psychologists have claimed that intelligence is a single, measurable, inherited, and stable quality that determines an individual's potential for success in life. Several psychologists have claimed that racial and ethnic groups other than those of European descent are, on average, less intelligent. Other test psychologists have made similar claims about individuals from less privileged social backgrounds. Critics of intelligence tests have argued that these tests are culturally and racially biased. Instead of measuring intelligence, they indicate level of education, social privilege, and conformity to specifically Euro-American standards.

## Intelligence tests

Around the turn of the century, several countries in Europe and North America passed universal primary education laws, mandating that all children attend school for a minimum number of years. As a consequence, children from radically diverse social backgrounds and aptitudes were placed in the same classroom, giving greater visibility to pupils with learning disabilities or mental handicaps. In response to a request from the Paris Board of Education, Alfred Binet (1857–1911) and his colleague Théodule Simon (1873–1961) designed the first intelligence test in 1905 to identify pupils in need of remedial education.

This test, which was administered individually to pupils who could not keep up with the curriculum, provided a number corresponding to the mental age of schoolchildren relative to their chronological age. Very soon, the concept of mental age was replaced by that of the intelligence quotient (IQ), which was defined as equal to a child's mental age divided by his or her chronological age multiplied by one hundred. The average intelligence score was therefore defined as 100.

Research into the nature of intelligence became the lifework of Charles Spearman (1863–1945), the first psychologist to receive an appointment at a British university. Spearman analysed the test scores of a large number of individuals on a variety of mental tests using his statistical technique of factor analysis. According to him, all intelligence tests, despite the fact that they measured different mental abilities, produced comparable results. Individuals who scored high on one test tended to score high on all other tests; conversely, those who scored low on one test also tended to score low on all the others. On the basis of these statistics, Spearman concluded that all intelligence tests measured an inherent quality of general intelligence, which he conceived of as a single measurable quality and equated with general mental energy.

Spearman's approach was further developed by his successor Cyril Burt (1883–1971), who translated the Binet-Simon test into English and made it available for use in the British educational system. Burt defined intelligence as innate general cognitive ability, a stable characteristic in individuals explaining differences in social class, educational achievement, and income. Since he considered the level of intelligence in individuals virtually unalterable, the quality of education received did not influence their later success in life. In Burt's views, a child's innate capacity set definite limits to what he or she could achieve. According to Burt, educational administrators only needed to measure the intelligence of children in their charge and provide them with an education compatible with their ability. Burt advocated placing of schoolchildren in different secondary schools based on their scores on intelligence tests, a practice which was institutionalized in Britain until the 1960s. In order to support his views, Burt initiated an ambitious research project testing the intelligence of twins who had been raised separately. Such twins, Burt argued, had been raised in different environments but had exactly the same genetic endowment. The results of this study confirmed Burt's ideas. However, later inquiry revealed that some of his data were fabricated.

A number of American psychologists adapted intelligence tests for use in the army when the United States entered the First World War in 1917. Psychologists aided in the selection and placement of inductees by testing their mental abilities. For this purpose they developed written tests that could be administered to groups. Never before had such a large number of individuals, about 1.75 million army recruits, taken intelligence tests. Psychologists felt that this project helped them to gain public recognition, although army officers did not pay much attention to the test results. Moreover, it took several years to analyse the data, which yielded rather controversial conclusions. According to psychologist Carl C. Brigham, the results proved that the great majority of American soldiers had the intelligence of thirteen- or fourteen-year-old children. Additionally, the results showed that white, Anglo-Saxon men had the highest intelligence scores while recent immigrant groups and African-Americans scored, on average, significantly lower. At the time these psychologists did not consider the possibility that cultural and linguistic differences in addition to the level of education attained were responsible for these differences.

On the basis of his experience in the army project, Lewis M. Terman (1877–1956) further developed the intelligence test for use within the American educational system. Terman was not particularly interested in diagnosing mental retardation and developmental disabilities. Instead, he recommended that whole school populations be tested and individual pupils placed into different curricula according to the results. Terman's version of the intelligence test, the Stanford-Binet test, has become the most widely used intelligence test in North America. It served as the prototype for intelligence tests worldwide. Because Terman espoused the view that intelligence was inherited, he advocated immigration restrictions to limit the entrance of those ethnic groups which he considered to be of inferior intelligence to the United States.

Psychologists advocating the use of mental tests have argued that intelligence tests measure general cognitive ability, which is largely innate. The use of mental tests in schools purportedly reduced prejudice and made educational administration more objective as pupils were placed in schools based on ability rather than on social background. However, the psychologist Louis Leon Thurstone (1887–1955), using statistical techniques very similar to those developed by Spearman and Burt, argued that there were several primary mental abilities instead of a singular general intelligence. Thurstone argued that the use of a single test score as an indication of intelligence was highly misleading.

Other psychologists have criticized the dubious nature of some of the research that led to the more controversial psychological theories of intelligence. Kamin, Lewontin

Rose and Gould have argued that intelligence tests merely measure social privilege and educational background. According to them, the widespread reliance on intelligence tests has only reinforced unequal access to education. Mental tests generally consist of items familiar to those who have been educated by Western European or North American standards and are often presented in English, thus favouring English native speakers. Individuals of Euro-American descent have therefore consistently scored the highest. These results, however, do not suggest the racial and ethnic inferiority of non-Euro-Americans but only indicate the way in which intelligence tests were devised. The translation and use of intelligence tests in other countries without significant modifications often leads to inappropriate results. Recently, some psychologists have attempted to develop 'culture-fair' intelligence tests that do not favour individuals from specific cultural or national backgrounds.

### Personality tests

Psychologists have also developed tests that measure personality characteristics. The work of the British psychologist Hans J. Eysenck (1916–1997) has been particularly influential. Eysenck believed that most personality characteristics were highly stable during the lifespan. Using the statistical techniques developed by Spearman and Thorndike to analyse the results of various types of personality tests, Eysenck concluded that there are four dimensions to the human personality: intelligence, introversion versus extroversion, neuroticism, and psychoticism. Eysenck developed several personality tests to measure these characteristics. Several other psychologists, using slightly different statistical techniques or employing different theoretical perspectives, have defined other dimensions of personality.

In the United States, the Minnesota Multiphasic Personality Inventory (MMPI) was published in 1943, after more then ten years of research. This test was developed with the purpose of identifying the presence of psychological disorders to aid clinical psychologists. It is still used as a diagnostic tool today. The MMPI contains 550 test questions, which, after statistical analysis, yield scores on scales measuring depression, paranoia, psychopathic deviance, and other clinical syndromes as well as scales measuring masculinity-femininity and social introversion. Several variations of these clinical tests, each measuring particular clinical syndromes, have subsequently been developed. Of particular interest due to its widespread use and popularity is the Rorschach test, which consists of pictures of ink-blots. Individuals are asked to report what images they see in these ink-blots. Their responses are supposed to reveal unconscious mental processes, which have been projected onto the figures shown.

### DEVELOPMENTAL PSYCHOLOGY

The Swiss psychologist Jean Piaget (1896–1980) started his career standardizing the French translation of one of Burt's tests with Simon in Paris. Piaget found mental tests superficial because they measured intelligence quantitatively whereas he was far more interested in the qualities of the

cognitive processes that lay behind the answers given to specific test questions. Piaget's research demonstrated that the way children think changes qualitatively as they mature. Piaget's developmental epistemology described the unfolding of the cognitive abilities of children through four major stages: sensory-motor, pre-operational, concrete operations, and formal operations.[3] Each of these stages was characterized by specific cognitive structures and could be defined by the tasks children were able to complete successfully. Children move to the pre-operational stage around the age of two when they acquire a sense of object permanence, that is, when they recognize that an object still exists even though they can no longer observe it. Around the age of five, children progress to the stage of concrete operations when they recognize the conservation of quantity. Prior to this, children generally assume that the amount of liquid increased when it was poured into a taller and thinner glass since the fluid rose higher. Around the age of eleven, children are normally able to think logically without referring to specific situations and events.

Piaget's work has been of great interest to educational psychologists who have argued that school curricula should be adapted to reflect the cognitive development of children. Piaget's work has been incorporated in teacher education programs worldwide. His theories have been tested in several cultural contexts, but such investigations have cast considerable doubt on the universality of the developmental stages outlined by Piaget.

### CLINICAL PSYCHOLOGY AND PSYCHOTHERAPY

Today, most psychologists work as clinical psychologists providing psychotherapy to individuals, couples, and families in need of expert guidance. Psychotherapists aid individuals in gaining a clearer understanding of themselves, which equips them to better cope with the challenges of life. Clinical psychologists form the third group of practitioners within the discipline of psychology. Initially, psychotherapy was practised only by physicians, many of whom were inspired by the psychoanalytic theories of Sigmund Freud. Only after the Second World War did psychologists begin to provide psychotherapy.

### PATHOLOGICAL PSYCHOLOGY

In France, the earliest psychologists were fascinated by abnormal mental states, of which multiple personality was the most intriguing. In this country, psychology developed alongside medicine, in particular psychiatry. Psychological theories of the abnormal mind were modelled on medical views of mental disorder. Pierre Janet (1859–1947) called his approach, which relied on clinical case studies of individuals as examples of psychological abnormality, *pathological psychology*. Janet defined psychology as the science of consciousness and its laws, and was particularly interested in subliminal and altered states, among them hypnotic trance, hallucinations, somnambulism, hysteria, reveries, dreams, and delirium. He believed that altered mental states provided a much more profound insight into human nature than could the conscious individual on the basis of self-reflection. According to Janet, unconscious

aspects of the human psyche were far more important than conscious ones. Janet is well known for his research in the repression of memories related to traumatic events. Hypnosis proved to be a successful means of accessing memories which had become unconscious through the process of dissociation.

## SIGMUND FREUD AND PSYCHOANALYSIS

Sigmund Freud (1856–1939), the founder of psychoanalysis, is without question one of the most influential thinkers of the twentieth century. Freud's work has been said to represent the last of three intellectual revolutions that have irrevocably changed modern human thought. First, Copernicus asserted that the Earth was not the centre of the universe. Subsequently, Darwin placed human beings at the end of the process of evolution, emphasizing the similarity of humans to animals. Finally, Freud debunked the prevailing belief in the superiority of reason by stating that human beings were driven by unconscious motives. Freud's ideas have informed conceptions of selfhood and identity, and have been incorporated into popular culture.

When Freud opened his private practice in 1886 in Vienna, Austria, he specialized in treating patients suffering from nervous disorders, of which hysteria was the most pronounced. Hysteria had been treated without much success by physicians because it was based on psychological distress rather than physiological disturbance. In 1885, Freud visited Janet's teacher, the French physician Jean-Martin Charcot, who had become famous for his efforts to study hysteria using hypnosis. Charcot considered hysteria to be a special pathological condition of the central nervous system. When he returned home, Freud learned that it was often possible to retrieve repressed memories of traumatic events in his patients without the aid of hypnosis. Through this experience, he became convinced that hysterics suffer mainly from reminiscences. Soon, he replaced hypnosis with the method of free association during which patients were instructed to speak freely and refrain from self-censorship in order to uncover emotionally charged memories. Freud then applied what has been called the 'talking cure': when his patients related and thereby re-experienced previously repressed memories of traumatic events, their symptoms subsided.

Freud developed an elaborate theory of the human personality on the basis of his clinical experience and refined it throughout his life. On the basis of his earliest experiences with psychotherapy, he inferred the existence of the unconscious and the mechanism of repression, which were essential elements of the dynamics of the human personality. Later, Freud claimed that most emotional conflicts were related to the desire to fulfil infantile wishes for sexual gratification. Because such wishes were socially unacceptable they provoked strong feelings of anxiety that were almost immediately repressed. As a consequence, such wishes could be expressed only indirectly, in the form of dreams, neurotic symptoms, odd behaviour, or personality traits. Repressed emotions and wishes were uncovered through free association, dream analysis, and close attention to neurotic symptoms or slips of the tongue (also known in English as 'Freudian slips').

Freud presented a structural model of the human personality. He named the irrational part of the human personality, seeking fulfilment of primal urges, the id, which he thought was present at birth and ruled by the pleasure principle. The second component of the human personality, the ego, developed later and mediated between the id's desires and external reality. It could suspend the pleasure principle temporarily by postponing gratification. The third tier of the human personality, the superego, was the last to develop. It represented the norms and values of society as instilled in the child by parental authority through praise or punishment. The superego also instilled the drive for perfection in the child. By the time the superego had fully developed, the ego mediated between its demands, the primal urges of the id, and external reality.

Freud also developed a model of human development. According to this model, the child passed through a number of developmental stages in which particular parts of the body were the dominant erogenous zone. Newborn babies derived pleasure from the oral zone; their desires were fulfilled when breast-fed. When toilet training commenced, the child derived pleasure from the conscious control of bodily functions and the anal zone gained particular emotional significance. At the age of five, stimulation of the genital zone became a source of sensual pleasure. During this phase, according to Freud's rather speculative ideas, the child developed an attraction to the parent of the opposite sex and felt strong rivalry towards the parent of its own sex. Freud named this predicament the Oedipus complex. After the child identified with the same-sex parent, he or she entered the latency phase, which at adolescence was superseded by the genital phase. The culmination of personality development was the full development of sexual identity and the ability to form lasting relationships with members of the opposite sex. If conflicts during any of these phases were not successfully resolved, the adult personality would suffer from neuroses.

From the 1910s, Freud attracted a group of loyal followers who met regularly and, eventually, established the psychoanalytic movement. Freud's followers generated a great variety of psychoanalytic theories and psychotherapeutic treatment methods, often deviating from Freud's ideas. Alfred Adler (1870–1937), for example, emphasized the power of the ego over the unconscious. He thought that the ego compensated for feelings of inferiority by striving to realize idealistic goals in an attempt to restore personal balance. In Adler's view, relationships with other human beings were essential to the growth of the ego.

Carl Gustav Jung (1875–1961), initially Freud's close collaborator, eventually rejected his emphasis on the role of sexual desire in the origin of neuroses. Jung was interested in spirituality, which he felt could not be reduced to the need to fulfil unconscious wishes. He believed all human beings shared a collective unconscious containing memories from the history of humanity that were common to all cultures and societies. Through the analysis of the myths, rituals, symbols, and folklore from a wide variety of cultures, elements of the collective unconsciousness could be investigated. Other neo-Freudians, among them Karen Horney (1885–1952), Erich Fromm (1900–1980), Erik H. Erikson (1902–1993) and Harry Stack Sullivan (1892–1949), also emphasized the ego over the power of the unconscious and the importance of social interaction in the developing child and healthy adults. They called their

approach *ego psychology*. Anthropologists (most notably Margaret Mead and Ruth Benedict) have concluded from their fieldwork that Freud's theories have only limited applicability to other cultures.

## HUMANISTIC PSYCHOLOGY

Before the Second World War, very few psychologists practised psychotherapy. Physicians were generally opposed to laymen's involvement in psychotherapy, which they considered a medical skill. This changed after the Second World War, when the demand for psychotherapeutic services, initially by returning veterans but later by the general public, far exceeded the supply of psychiatrists. This led to psychologists being allowed to conduct psychotherapy, which, in due time, became the most visible branch of the discipline.

Initially, clinical psychologists drew upon the theory and practices of psychoanalysts and neo-Freudians. During the 1960s, however, they formulated their own unique approach to psychotherapy. Abraham H. Maslow (1908–1970) and Carl Rogers (1902–1987) defined humanistic psychology as the third force in psychology. According to them, psychologists had thus far been inspired by behaviourism, which they criticized for being too mechanistic, and by psychoanalysis, which they found pessimistic and deterministic. Humanistic psychologists emphasized the dignity and intrinsic worth of human beings and maintained that each individual contained the potential for healthy and creative growth within. In Maslow's optimistic view, human beings always strove to realize their potential. Therefore, psychotherapy's primary purpose was not to cure disease or provide diagnoses but to aid individuals in attaining a higher level of fulfilment and self-actualization. Maslow studied a number of highly successful, self-actualizing individuals in his investigation of the principles of growth and self-actualization.

Rogers' client-centred psychotherapy became very influential within clinical psychology. According to Rogers, human beings possessed an inherent tendency towards growth, differentiation, and maturation that was realized when they were involved in relationships characterized by openness, empathy, unconditional positive regard, and genuineness. Rogers' client-centred therapy supported the creation of such a relationship between therapist and client. Ideally, the therapeutic relationship was intensely personal and subjective, wherein therapists provided unconditional positive regard to their clients in order to stimulate them to explore their own feelings. Therapists encouraged clients to take charge of their own lives while refraining from offering advice, interpretations, and diagnoses. Rogers instructed therapists to listen carefully to their clients and summarize the essence of what they had heard. Therapists were to accept their clients' feelings as entirely legitimate in order to restore their self-confidence, the key to mental health and the pursuit of greater fulfilment in life.

## BEHAVIOUR AND COGNITIVE THERAPY

More recently, behaviouristic psychologists have proposed methods of psychotherapy aimed at behaviour modification. The American experimental psychologist Joseph Wolpe (1915–1997) had conducted Pavlovian conditioning experiments with cats before he became interested in psychotherapy. He pioneered behaviourist techniques to cure phobias (such as fear of heights or snakes) through a process of systematic desensitization. He argued that anxiety was aroused when an individual encountered a situation similar to one that had previously induced anxiety. This reaction could be overcome by a process of reconditioning. First, Wolpe encouraged individuals to overcome their anxieties in situations that were just mildly anxiety-provoking, then proceeded in stages to successfully manage situations that caused greater anxiety until the underlying problem had been resolved.

Inspired by developments in cognitive psychology, a number of clinical psychologists have recently developed cognitive therapy. According to Albert Ellis (b. 1913) and Aaron T. Beck (b. 1921), emotional problems were the result of faulty reasoning processes. By analysing these cognitive processes and learning alternative ones, emotional problems were alleviated. Beck has proposed cognitive approaches to anxiety and depression.

Psychologists have conducted extensive studies on the effects of psychotherapy. Eysenck reported that, on the basis of numerous studies, hardly any measurable effect had been demonstrated. He suggested that being put on a waiting list was equally effective as actually receiving psychotherapy. Only the effects of behaviour therapy appeared to be measurable to some extent. Eysenck's challenge generated an enormous amount of research on the effectiveness of psychotherapy. Lester Luborsky summarized this research by concluding that most psychotherapy is moderately effective. In addition, he concluded that different styles of psychotherapy differed only in non-significant ways. The stark divisions between different psychotherapeutic approaches did not appear to be particularly important in determining the success of psychotherapy. Currently, extensive research is being conducted on psychotherapeutic processes. These studies generally indicate that the investigation of such processes is highly complicated.

## CONCLUSION

Psychology is a fragmented discipline. There is no consensus within psychology about the characteristics of human nature, research methodology, the social function of the discipline, and the nature of its applications. Three components of the discipline have been described: experimental research, mental testing, and psychotherapy. The relationships between these three approaches have always been tenuous. Experimental psychologists purport to investigate the laws underlying human nature. Psychologists involved in the development and application of mental tests are interested in individual differences. Clinical psychologists approach their clients as unique human beings and provide help to them on an individualized basis. These different orientations and practices impede the unification of the discipline.

### Psychology in developed countries

Psychology is currently thriving in many countries around the world. Psychology in the United States has produced a

considerable amount of experimental research without direct practical applications. In many other countries, the development of the discipline has been motivated by practical concerns connected to the development of the educational system and health care facilities. As a consequence, educational psychology, mental testing, and psychotherapy are the dominant forms of psychology outside of the United States. National differences in psychology significantly decreased towards the end of the twentieth century due to an increase in international exchange among scholars. Generally, psychologists in different countries have selectively incorporated elements of experimental research, mental testing, and psychotherapy. The development of the discipline has often been spearheaded by scholars who have studied with leading psychologists, initially in Germany, the United Kingdom, and France and, currently, in the United States.[4]

Psychology has become very influential in the United States, having grown dramatically since the Second World War because of extensive military funding and the expansion of clinical psychology. Although clinical psychologists greatly outnumber experimental psychologists, the latter group has been reluctant to release its position of power and influence within the American Psychological Association. This has led to the peculiar situation where a relatively small number of experimental psychologists control the profession even though it consists mostly of practitioners engaged in psychotherapy and mental testing.

Since 1945, psychology throughout the world has been heavily dominated by developments in the United States, where an estimated 80 per cent of the world's psychologists live and work. There is a rather asymmetrical relationship between American psychologists and practitioners in the rest of the world. In teaching, American textbooks are used virtually everywhere. Psychologists all over the world read American publications while their own work, even when published in English, is mostly ignored in the United States. This state of affairs impedes progress within the discipline and makes it very difficult for American psychologists to correct cultural biases in their own work. Psychologists from several countries have applied American theories, models, and techniques uncritically and without much modification, which is inherently problematic.

The origins of experimental psychology are generally considered rooted in nineteenth-century Germany, when university life flourished. Several approaches to the field have origins in the first three decades of the twentieth century: Wundt's physiological psychology, investigations of higher mental processes (the Würzburg school), the Gestalt school, and phenomenological psychology. With the onset of National Socialism, many Jewish psychologists fled the country and continued their careers elsewhere. At this time, psychology developed its practical side, in particular its military applications. After the war American approaches strongly influenced the growth of the discipline in the Federal Republic of Germany. The German Democratic Republic aligned itself with Russian psychology, which examined the effects of social arrangements on individuals in order to aid the building of a socialist industrial society.

Psychology in the United Kingdom has always had a strong psychometric tradition and an emphasis on practical applications. In particular, the application of mental tests within the educational system was extensively developed.

After the Second World War, there were still only a very small number of academic positions in psychology. As a consequence, British psychology was characterized by its applications, mostly in the educational system, in industry, and in medicine. The same holds true for a number of Commonwealth countries, among them Canada, Australia, New Zealand, and South Africa, whose academic systems are based on the United Kingdom model.

Psychology in France was initially characterized by the pathological psychology of Janet. After the Second World War, Daniel Lagache (1903–1972), a philosopher, physician and psychoanalyst, defined and inaugurated clinical psychology in universities and contributed to the professional establishment of psychologists in medicine. Psychology in France has always leaned heavily towards psychotherapy and became strongly psychoanalytic in nature through the influence of Jacques Lacan (1901–1981). Lacan's version of psychoanalysis was built around the entrance of the growing child into the symbolic order at the moment language was acquired. Until the 1960s, there were also existentialist and phenomenological currents in French psychology. At the same time, a small experimental tradition continued to grow.

In Spain, psychology has always had a strong practical emphasis and has developed in close relation with medicine and education. Its association with the educational system led to an interest in developmental psychology, in which the theories of Piaget were particularly influential. An early prominent figure was the physician Emilio Mira y Lopez (1896–1964), who was instrumental in promoting psychoanalysis in Spain. He was also interested in the adaptation and creation of mental tests in aiding personnel selection, vocational guidance, and educational administration. Like many other influential psychologists, Mira was forced to leave Spain after the Civil War. He settled in Brazil and has exerted a strong influence on the development of the discipline in Latin America.

Psychology in Russia developed under the influence of the political organization of the Soviet Union. Under Communism, the discipline predominantly addressed educational and developmental issues and gained a strong theoretical orientation. From the early 1930s until the late 1950s, psychoanalysis, mental testing, and approaches dealing with mental phenomena were banned as 'bourgeois' in nature while Pavlov's reflexology was presented as the official Marxist doctrine. One of the most interesting attempts to reconcile a psychology of consciousness with the official doctrine of dialectical materialism was the cultural-historical school led by Lev S. Vygotsky (1896–1934), who was interested in the relationship between cultural and child development. Vygotsky's ideas were further developed by his collaborator Alexei N. Leontiev (1903–1979), who developed the theory of activity, which became the official Soviet psychological doctrine in the 1960s. Currently, Russian psychologists are redefining their identity in the post-Communist era.

In Japan, the discipline has evolved almost entirely along Euro-American lines with a strong emphasis on research. Early in the twentieth century, Wundtian experimental psychology set the tone; after 1930 Gestalt psychology predominated. In the wake of the Second World War, neo-behaviourism became influential. Psychological research has been generously funded by the Japanese government and large industrial firms. A great number of mental tests

have been imported, translated, and standardized on Japanese samples. There is currently a strong interest in artificial intelligence and cognitive psychology. Some research has been conducted in traditional Japanese psychology, especially Zen Buddhism.

## Psychology in developing countries

The development of psychology in countries outside of Europe and North America has been slow and beset by difficulties. In most developing countries, psychology was imported by the colonial powers. When these nations gained independence, their universities had to redefine their programmes. Many industrialized nations held the view that developing nations must undergo the same processes of modernization that they themselves did. They assumed that socio-economic change should be guided by an academic elite trained in Euro-American universities. Psychologists in developing countries who share this perspective have attempted to emulate Euro-American approaches, often by uncritically importing psychological theories and techniques. This has frequently caused psychology in these countries to be derivative, unoriginal, and irrelevant to national development. Often, the discipline has not evolved in response to local needs but in opposition to national and cultural traditions. In some developing countries, psychologists have recently initiated a number of research projects that address local needs and are receptive to traditional practices. This does not diminish the dilemma they face: either they conduct Euro-American style research, which is locally irrelevant, or they initiate locally relevant research and are ignored by their colleagues internationally.

Psychology in Latin America is highly developed and is characterized by educational, clinical, and industrial applications. Its development was stimulated by German and Spanish émigrés who settled there in the 1930s. In Brazil, psychology developed out of philosophy, education, and the medical sciences. Until the 1960s, it mainly followed European tendencies; thereafter, it became increasingly oriented towards North American developments. There is a strong emphasis on educational, industrial, and clinical psychology, psychoanalysis being the most influential psychotherapeutic approach. Currently there is strong interest in qualitative methods, which are better suited to address specifically Brazilian issues. Some psychologists prefer research in natural settings rather than laboratory work. Psychology in Mexico has been influenced by the approaches of James Mark Baldwin and Erich Fromm, both of whom resided there.

In India, psychology began at the turn of the twentieth century as a series of imitations and replications of research projects conducted in Germany and the United Kingdom, where most psychologists had received their training. After Indian independence in 1947, psychology rapidly expanded. Psychological research was primarily undertaken to validate mental tests for use in India and to address psychological problems related to industry, vocational guidance, education, and community service. Initially, psychologists indiscriminately imported Euro-American psychological theories, models, and tools without questioning their relevance to the Indian context. This situation changed in the 1960s, after it had been extensively criticized. In order to outgrow the alien framework, a rapid indigenization of the discipline commenced. Increasingly, scholars developed theories, concepts, and models that were relevant to the Indian context. Psychologists felt the need to orient their discipline towards addressing the myriad socio-economic stresses characteristic of a rapidly developing country. Research projects started to investigate rural life as well as the consequences of poverty. Using ethnographic approaches, child development in different cultural and religious groups has been studied. Clinical psychologists study the collective and contextual features determining personality and behaviour rather than rely on individualistic models prevalent elsewhere. An interest in indigenous modes of health care, such as Ayurveda, has led to specifically Indian conceptions of psychotherapy.

In many different countries in sub-Saharan Africa, psychology is mainly part of teacher education programmes, where the focus is on human development, learning, and educational applications. Africans have frequently been the subjects of anthropological and psychological research conducted by scholars from colonizing countries. Not surprisingly, much of this research has had limited relevance to Africans themselves. At present, serious attempts to make psychology an indigenously based discipline pertinent to national development are in progress. Unfortunately, language barriers still impede communication among African psychologists from neighbouring countries, which slows the development of a unified African perspective on the discipline.

The research conducted during the last thirty years in countries outside of North America has challenged the universality of Euro-American psychological theories. This has resulted in the development of cross-cultural psychology, which is concerned with interplay of culture, individual behaviour, and modes of experience.[5] Thus far, however, cross-cultural psychology has primarily been a Euro-American activity testing the universality of essentially Western concepts. Ideally, experts from developing countries would be considered equal partners in this research to be conducted in a spirit of dialogue aimed at mutual enrichment. Psychologists throughout the world need to be sensitive to local conditions when they appropriate Euro-American approaches. However, in addition to transforming predominant models, theories, and techniques for use within their own national context, they need to develop a psychology informed by their own nation's cultural norms and needs. On the basis of such work, exchanges can be instigated among psychologists from different countries and cultural backgrounds. These could potentially rectify the insensitivity of Western psychological theories to sociocultural factors and thereby enhance the discipline in the future.

## INTELLECTUAL CULTURE

*Anouar Abdel-Malek,* coordinator

## INTRODUCTION

*Anouar Abdel-Malek*

From the outset, the notion of *intellectual culture* gives rise to a two-part query: Is the difference between intellectual culture and the more common notion of culture simply a matter of terminology? Or is there a need to refine the substantive analysis of the field of culture towards a more specific definition of the field under study?

The term 'culture' usually designates that level of social life and activity that is distinct from the level of production of the necessities of life, traditionally based on agriculture, as in many under-developed areas around the world today. 'Culture' is commonly used to designate the level above material culture, i.e. the superstructure of social life and activities.

Culture thus understood encompasses all formative component factors and processes of superstructure: ideas and aesthetics, science and religion, philosophy and technology, power, the whole range of human or social sciences. Hence the notion of intellectual culture comprises the realm of ideas and thought, the natural and physical sciences, and the field of aesthetics (art, literature, music, etc.). However, this distinction can only be used for analytic purposes, since all component factors and processes of superstructure are simultaneously related to each other and to the whole range of economic and social structures.

The study of intellectual culture can thus be understood as the study of the *Zeitgeist* ('the spirit of the times') prevailing in the world at a given period of history. And yet, it is being used to this day to explore the spirit of the dominant Western civilization, which has become equated with the civilization of the contemporary world, as evidenced by the majority of general and specialized studies.

A word of caution is thus in order. The study of the spirit of the times can be accepted as a starting point towards the urgent task of taking stock of the whole range of civilizations, cultures and national specificities of our changing world.

In this context, any meaningful attempt to study intellectual culture in our times must take into account three major considerations:

 – The major factors – science, technology, thought processes – constitute major formative inputs of the dominant sector of advanced societies. These general factors will be considered in their dialectical interrelation with the endogenous dimension, i.e. the manifold specificities which constitute the real-concrete world of contemporary societies. This endogenous dimension is assuming a growing role in the more general sphere, at the very time of the rise of hegemonism of the central area.

 – The proper study of 'intellectual culture' in our changing world should proceed along two paths, simultaneously. Major component formative factors and processes constitute the general exogenous dimension, which can best reveal the global superstructural level. Hence, the validity of the study of the set of global factors in the thematic sections of the UNESCO project, including 'intellectual culture'. The study of this exogenous level will become meaningful if it is engaged upon simultaneously with studies of the endogenous circles undertaken in the relevant area studies of this same project.

 – In the exploration of the exogenous dimension – exemplified by 'intellectual culture', caution is required. While the exogenous circle/level deals with the more general universal dimension, it ought to be rooted in the historical and living processes at work in the different units of the endogenous circle, instead of being relegated to the area studies of the endogenous dimension. Field studies must always be given a central place. Thus, the tonality of each section of the exogenous circle/level will express its composite nature as both general 'specialism', and as output of the manifold distinct areas of our changing world.

# HIGH CULTURES AND DOMINATED CULTURES

*Gananath Obeyesekere*

## THE EMERGENCE OF OTHER CULTURES AND A NEW FORM OF HISTORY WRITING

One of the fascinating cultural phenomena of the early twentieth century is the advent of a unique form of writing history involving societies that have never been recorded in the official history books. The great historians of Western Europe, the Middle East, China and South Asia were interested primarily in dynastic histories and the histories of wars and conquest that lead to the self-glorification of the nation or empire. The subalterns rarely emerged as actors on the world stage, and their societies were at best only peripherally mentioned. However, in the early twentieth century, when ethnography appeared on the scene, there emerged systematic descriptions and analyses of societies and cultures never before recorded. Had we accounts of such small-scale societies for earlier periods, our knowledge of human history or culture would have been enormously enriched, and a different world view would surely have arisen. It is not that the knowledge of small-scale societies was unknown prior to the twentieth century. The colonial archives provided much admittedly biased information on the cultures dominated by colonial and imperial powers particularly after the so-called 'discovery' of the Americas and especially so after the later voyages of Captain Cook to Polynesia sponsored by the Royal Society of Great Britain. In the nineteenth century, various scientific societies devoted to the study of 'primitive' societies sprang up in the major European capitals. The strategy for studying these groups was strongly influenced by Darwinism, the period's predominant scientific paradigm, but began focusing on the evolution of a specific cultural practice or human culture as a whole. Thus, early theorists in the human sciences were interested in such things as the evolution of specific forms of marriage or kinship, and a common concern was the shift from matriarchy to patriarchy or the very opposite (both forms were perhaps antedated by primitive promiscuity, which obsessed Victorians). Another concern was the sequential evolution of religion from animatism (*mana*), animism, polytheism, and henotheism and monotheism.[1] Alternatively, it was hypothesized that human societies developed from savagery to barbarism to civilization, and these broad stages were then supplemented with early, middle or late phases, each phase heralded by a specific type of technological innovation. For example, the 'later' or third period of savagery began with the invention of the bow and arrow and led to the older period of barbarism, which in turn began with the invention of pottery and so forth. At the risk of oversimplifying, one might say that such doctrines were by and large supported by nineteenth-century thinkers like James Frazer, Edward Tylor, Herbert Spencer, Auguste Comte and Lewis Henry Morgan.[2] What made such systemic evolution possible, according to an interesting theory formulated by Adolf Bastian, was the 'psychic unity of mankind', that is, that in spite of differences, human beings were psychically the same, a much more interesting and productive notion than that of Levy-Bruhl, who postulated the idea of a primitive mentality, a sort of mystical thinking characteristic of preliterate peoples.[3]

The evolutionary paradigm and the simplistic views of small-scale societies from colonial archives, themselves mechanisms of domination (see Arjun Appadurai, Nicholas Dirks and the work of other scholars), received a severe blow as a consequence of the development of fieldwork in the United States by the German émigré Franz Boas.[4] This produced a historical anthropology of mostly Amerindian and Inuit (Eskimo) cultures (Plate 127) and an elaborate taxonomy to classify cultures, in terms of such criteria as traits, patterns and complexes, which could then be grouped into larger cultural areas.[5] Two distinguished British anthropologists, W. H. R. Rivers and C. G. Seligmann, conducted expeditions to New Guinea and Africa to undertake sustained fieldwork in two now classic 'primitive' societies, the Todas of South India and the Veddahs of Sri Lanka (Ceylon), in the first decade of the twentieth century.[6] Their students, A. R. Radcliffe-Brown and Bronislaw Malinowski, began a tradition of sustained fieldwork that in turn led to a revolution in the description and analysis of small-scale societies generally labelled as 'tribes'.[7] American cultural historians and British ethnographers and their followers throughout the world were interested in small-scale societies organized on the basis of kinship, lineage and clan organization. Kinship theory became one of the key paradigms for the study of small-scale societies, which were (it was suggested) cut from larger trans-local forms of political and social organization. Even when the emphasis later moved to the study of villages located in complex civilizations, the analytical model remained the same. By the 1960s, the scholarly world fully discovered the richness and diversity of human societies and engaged in theoretical discussions regarding the components that held each society together, namely, the idea of culture.

The attempts to understand 'culture' resulted in a multiplicity of contending definitions, but perhaps the most influential one was first formulated by Max Weber and subsequently developed by the sociologist Talcott Parsons and adapted to the field of anthropology by his heirs, especially Clifford Geertz.[8] Weber made the point that reality in the natural world is essentially meaningless; human beings impose meaning on this intrinsically formless, meaningless reality of the world, and in this way culture becomes that segment of the world 'on which human beings confer meaning and significance'. When publicly shared meanings are conferred in this manner, culture itself ends up by becoming the reality through which the world is perceived, defined and structured. It follows that if animal societies can be divided into species, human societies can be divided into cultures, and this led in turn to the more controversial thesis of cultural relativism.

The model of the 'primitive' or small-scale society contained within a frame of constructed values or culture received a severe blow with the creation of newly independent states, after the Second World War. Equally significant was the interconnecting of the world through global trade and communications, which distorted the notion of the isolated primitive. In hindsight, one wondered whether that model was supported by empirical evidence, because even the most remote societies were directly and indirectly interlocked through trade and other kinds of networks, as indeed the study of the *kula* ring (linking many New Guinea societies through trade and gift exchange) demonstrated in Melanesia by Bronislaw Malinowski.[9] Although the model of the isolated community had a sort of heuristic validity, it is also true that the 'the primitive world and its transformations' had long been ongoing. However, this process accelerated after the mid-nineteenth century.

## THE EMERGENCE OF 'HIGH CULTURE' AND ITS PROBLEMATIC NATURE

Robert Redfield was one of the pioneers that expanded the model of the small-scale society, which was deemed inadequate to deal with complex societies and 'civilizations', namely, those societies with a high degree of cultural development, a doctrinal religious corpus and a written literary tradition.[10] Here the older notion of 'culture' encompassing literary and artistic achievement met the more socially grounded Weberian notion of culture. Redfield argued that the primitive world was being transformed but also that there were multiple cultural traditions in past and contemporary civilizations in places such as India and China. Focusing on his knowledge of the cultures of India and the Americas, Redfield formulated a model for studying the small-scale society within a larger civilization (which possesses what one might call a 'high culture') by suggesting two key distinctions, the 'great tradition' of the civilization and the 'little tradition' of the village. This model was followed by his colleagues and students at the University of Chicago, who became the leading researchers in the study of 'complex societies'. Though the terms 'little and great traditions' were popularized by Redfield, similar ideas surely existed at the turn of the century at least in the work of scholars of Buddhist texts, who noted that ordinary people in Buddhist societies knew little of the doctrinal corpus or the high

culture. Consequently, they were said to be actually 'animists' or those who possessed cultural beliefs with little or no doctrinal sanction. Redfield's laudable attempt to solve this dilemma probably led to the coining of the two terms. Unfortunately, this solution, like previous ones, produced its own dilemmas. Is the little tradition of the 'ordinary folk' so different from the great tradition of the learned few, and are there not complex interconnections between the two, such that the so-called great tradition might have influenced the little and vice versa? One has only to look at the doctrinal corpus of early Buddhism to realize that it contained many popular and folk elements together with lofty philosophical speculation. Further, the idea of great and little traditions is intrinsic to the Western social science preoccupation with binary oppositions such as tradition vs. modernity, primitive vs. civilized, class vs. classless, centre vs. periphery, and many more that effectively obviate a middle ground or a blurring of distinctions. Soon fieldwork in villages of so-called civilizations and the study of doctrinal traditions themselves could no longer sustain the distinction between great and little traditions. However, this erosion of binary conceptions was not directly the result of fieldwork per se but also derived from the impact of the emerging theoretical disciplines in the global cultural scene after the 1970s and in the aftermath of the structuralism of Claude Lévi-Strauss.[11] Especially significant was the post-structuralist thought of Foucault, which examined knowledge and its relation to power, and Edward Said's *Orientalism* (developing the work of Anouar Abdel-Malek).[12] Others dealt with the important fact that some traditions are often considered ancient even though they can easily be proved to be recent.[13] Not only are traditions being constantly invented, but old traditions are being reinvented in terms of new values of modernity and post-modernity. This last issue was directly or indirectly influenced by post-modern thought that seems to radically question older ways of theorizing in the human sciences. Foucault's work in particular should make us consider whether the concepts used by early ethnographers to describe other cultures were directly or indirectly involved in the colonial domination of those same cultures. Finally, one cannot ignore the emerging new research on globalization that has focused on the possibility of a breakdown of the integrity of separate cultural forms that had preoccupied earlier scholars.

Nevertheless the idea of high culture will not simply go away, because there is the unmistakable historical phenomenon of a written, literate culture of the great civilizations of the sort historically typified by Karl Jaspers as 'axial age' civilizations, such as that of ancient China, Greece, the Near East, Iran and India.[14] These civilizations self-consciously claimed to be the heirs to a 'great tradition' or a high culture and it seems futile to deny this self-image, even though one ought to resist binary thought and not oppose high culture with a 'low culture.' Hence the title of Sherry Ortner's book, *High Religion*, which effectively deals with the recent implantation among the Sherpas of Nepal of the doctrinal traditions of Tibetan Buddhist monasticism as opposed to the popular or folk religion of the ordinary people that prevailed until now.[15] Although Ortner shuns opposing high with low, the problem of the epistemological status of both high and folk religions still remains. How high is the new 'high religion' and how removed from the 'high religion' are the traditions of ordinary Sherpas? This raises an additional question: does the high religion

dominate the already existing popular traditions? Domination is always one of degree, and while there is no doubt that the doctrinal traditions of Buddhism have transformed local beliefs, including pre-Buddhist ones, there is little evidence that domination entailed the wilful elimination of the latter by the state. The intolerance regarding local beliefs is more a function of the great monotheistic cultures, which view the pre-existing traditions as the worship of sticks, stones and idols, thereby justifying their destruction if not with impunity, at least with good conscience. In general, one could say that as far as most pre-modern states were concerned, there was little or no attempt to force the local traditions, whether tribal or village, into a mould set up by the state (regardless of the state's form). For example, in the Buddhist states of South and South-East Asia, there was little ideological control from the centre. Ordinary Buddhists were permitted to continue a multiplicity of local practices as long as they did not flagrantly violate the basic principles of Buddhist doctrine. Thus, over time most Theravāda Buddhist societies managed to abolish animal sacrifices, though such practices did continue on the local level out of reach or sight of monastic centres,[16] whereas in modern times, with the development of the nation state based on the European model, Buddhist nations have become more ideologically intolerant and have made widespread attempts to homogenize the nation in terms of the real or imagined values of the 'high' religion. This is also true of the small-scale societies or 'tribes' as recent research has shown. Indeed, throughout the world, nation states have imposed their ideologies on these societies. Thus, in his provocatively titled book *Peasants into Frenchmen*, Eugen Weber documents in great detail the manner in which local languages and traditions were threatened by the state, not necessarily through the use of direct force but rather through various means of what might be called symbolic coercion. Examples are the imposition of Parisian French as the national language to replace the various regional *patois*, and a national system of education that slowly but relentlessly reached virtually every region of the nation state.[17] In the new states of Africa and Asia, the ideological role of the nation state has been completely adopted, though the processes of domination of local regions, communities and cultures have by no means been fully achieved. In some instances, there are recent counter ideological movements that put a premium on the value of local traditions and belief systems and the benefits of cultural heterogeneity and pluralism. Once again, these ideological movements are not simply a resurrection of past traditions by political and literary elites but a function of modern social theories mentioned earlier that place value on cultural difference and diversity and the impact of these theories on public knowledge and government policies through various direct and indirect channels.

## HIGH CULTURES, ORAL TRADITIONS, AND LITERACY

One of the distinctions that some scholars believe are applicable to high religions or cultures in contrast with the 'little traditions' deals with literate vs. oral cultures. If divested of its binary oppositional features, this distinction might have some heuristic value. The major exponent of the oppositional view of the oral and literate is Jack Goody.[18] It is certainly the case, according to Paul Ricoeur, that the written text produces a kind of 'distancing' (*distanciation*) of the reader and an authoritativeness and fixity that the oral tradition lacks.[19] Ricoeur's general point is basically correct, but even this does not apply to all oral traditions as demonstrated by the Vedic texts that were memorized with remarkable accuracy and 'fixed' by Brahmin priests for over ten centuries before being recorded in writing. Further, Goody and others claim that writing and literary cultures produce more complex forms of thought than oral ones. This however can easily be disproved. Anyone will agree that the early Buddhist texts contained highly complex philosophical discourses yet it is almost certain that Buddha did not put any of it in writing, as it is not known with certainty whether writing was known or practised in his time. Further, until at least the first century BC these texts were transmitted orally. When Buddhist texts were recorded in writing, they then took on a textual fixity. Written texts also facilitated the spread of the religion to China, a literary culture par excellence. However, the distinction between oral and written is complicated by the fact that Buddhist writings operated, one might say, 'in an oral field'.

Until the development of modern printing techniques, Buddhist texts were written on palm leaves or in print in the regions under Chinese influence. Written texts facilitated memorization. In Sri Lanka, for example, monks chanted written texts, even prose ones, because through chanting one could put punctuation marks that were not conventionally found in these texts. Further, memorized texts were recited at public gatherings and in sermons. Sometimes 'textual fetishism' occurred. Thus the great Buddhist chronicle of Sri Lanka, the Mahāvamsa, was not only read but, like the Bible in medieval Europe, was treated with reverence and paraded in processions. This fact brings into question whether written texts are really 'distancing' as Ricoeur has suggested, though a certain degree of fixity is attached even to ancient texts. This was also true of Buddhist texts, known as *pāritta*, recited for the purpose of blessing people. They were carried in procession to a special place prior to being recited from memory by monks. One must also recognize that doctrinal texts produced a whole genre of edifying written literature in both Buddhism and Christianity that was modelled on their respective repertoires of folk tales. These 'intermediate texts', such as the life stories of Buddha in his previous existences, were recited at public gatherings. The texts were then appropriated by illiterate listeners who retransmitted them via the oral tradition. Additionally, like other Buddhist societies, Sri Lanka had a considerable number of literate people even in villages. We know that orally transmitted songs and ritual texts used in communal thanksgiving rituals and exorcisms were written down as early as the sixteenth century for the purpose of facilitating memorization. In more remote parts of the country, outside the orbit of Buddhist civilization, the very same texts and related ones persisted through oral transmission. Thus the field of the oral often embraced the written and the field of the written embraced the oral in complex processes of interpenetration. It was only with the advent of 'print capitalism' – i.e. the universal prevalence of printed texts in the nineteenth and twentieth centuries – that a radical separation of the two fields resulted in the partial erosion of oral expression in favour of the written word.

## NOTES

1. These writers are hardly read today. Some of the better known are J. F. McLennan, *Primitive Marriage: An Inquiry into the Origin of the Form of Capture in Marriage*, Edinburgh, 1865; R. R. Marett, *The Threshold of Religion*, London, 1909; A. C. Haddon, *Evolution in Art: As Illustrated by the Life Histories of Designs*, London, 1895; and J. Bachofen, *Das Mutterrecht: Eine Untersuchung über die Gynaikokratie der alten Welt nach ihrer religiösen und rechtlichen Natur*, 1861.

2. The reader will get a sense for the approach of cultural evolutionism in the title of Lewis Henry Morgan's book, *Ancient Society, or Researches in the Lines of Progress from Savagery through Barbarism to Civilization*, New York, 1877. Many of these ideas can be found in any good introductory text in anthropology. I suggest F. W. Voget, 'The History of Cultural Anthropology', in J. J. Honigmann (ed.), *Handbook of Social and Cultural Anthropology*. Chicago, 1973, pp. 1–88.

3. Adolf Bastian, an ethnologist, whose most significant work on primitive mentality was *Ethnische Elementargedanken in der Lehre von Menschen*, Berlin, 1895; for Lucien Levy-Bruhl read, *Primitive Mythology: The Mythic World of the Australian and Papuan Natives* (trans. Brian Elliott), St Lucia and London, 1983 [1935].

4. For criticisms of colonial classification in South Asia, see A. Appadurai, *Modernity at Large: Cultural Dimensions of Globalization*, Minneapolis, MN, 1997; and N. Dirks, *Castes of Mind: Colonialism and the Making of Modern India*, Princeton, NJ, 2001. 'Subaltern studies' was initiated by Indian scholars to draw attention to actors and events neglected by mainstream history; it was strongly influenced by Edward Said, *Orientalism*, New York, 1978. Franz Boas wrote extensively on the Northwest Coast Indians and for the general reader his work could best be understood by looking at some of the secondary literature; however an easy read would be his posthumous *Kwakiutl Ethnography*, edited by H. Cordere, Chicago, 1966.

5. For an overview of American historical ethnography, see A. L. Kroeber, *The Nature of Culture*, Chicago, 1952.

6. W. H. R. Rivers, *The Todas*, London, 1906; C. G. and Z. Seligmann, *The Veddahs*, Cambridge, 1911.

7. An easy and readable source for the development of fieldwork is G. W. Stocking (ed.), *Observers Observed: Essays on Ethnographic Fieldwork*, Madison, MI, 1985. For A. R. Radcliffe-Brown, there is once again G. W. Stocking (ed.), *Functionalism Historicized: Essays on British Social Anthropology*, Madison, 1984; for Malinowski read the convenient collection edited by M. W. Young, *The Ethnography of Malinowski*, London, 1979 and the study by R. Firth, *Man and Culture: An Evaluation of the Work of Malinowski*, London, 1960.

8. For the multitude of definitions of 'culture' see the authoritative text by A. L. Kroeber and C. Kluckhohn, *Culture: A Critical Review of Concepts and Definitions*, New York, 1963; Weber's classic definition of culture is found in '"Objectivity" in Social Science and Social Policy', in M. Weber, *The Methodology of the Social Sciences* (trans. E. A. Shils and H. A. Finch), New York, 1949, p. 81. For the modern usage see the seminal essays by C. Geertz, *The Interpretation of Cultures*, New York, 1973.

9. For Malinowski see note 7.

10. Robert Redfield's seminal work is very readable. See *The Primitive World and Its Transformations*, Ithaca, 1953; and *The Little Community*, Chicago, 1955. For the early application of these ideas to India read, M. Marriott (ed.), *Village India: Studies in the Little Community*, Chicago, 1960.

11. Claude Lévi-Strauss is not easy to understand but, as with Foucault, there are good popular expositions of his work. The general reader however ought to read his *The Savage Mind*, Chicago, 1966. My suggestion for the inquisitive non-specialist reader is H. H. Penner, *Teaching Lévi-Strauss*, Atlanta, GA, 1998

12. Michel Foucault is a must for all interested in contemporary thought though his extensive corpus is perhaps somewhat forbidding. However, everyone ought to read at least *The Archaeology of Knowledge* (trans. A. M. Sheridan Smith), New York, 1972; and *The Birth of the Clinic* (trans. A. M. Sheridan Smith), New York, 1973. For Edward Said, see note 4; and see Anouar Abdel-Malek, 'Orientalism in Crisis', in *Diogenes*, Vol. 44, (winter) 1963.

13. E. Hobsbawm and T. Ranger (eds), *The Invention of Tradition*, New York, 1983.

14. K. Jaspers, *Vom Ursprung und Ziel der Geschichte*, Zurich, Artemiss-Verlag, 1949; and the development of his thought by S. Eisenstadt, 'The Axial Age: The Emergence of Transcendental Visions and the Rise of Clerics', *European Journal of Sociology*, Vol. 23, 1982, pp. 294–314.

15. S. B. Ortner, *High Religion: A Cultural and Political History of Sherpa Buddhism*, Princeton, NJ, 1989.

16. For details read, G. Obeyesekere, *Imagining Karma: Ethical Transformation in Amerindian, Buddhist and Greek Rebirth*, Berkeley and London, 2002.

17. E. Weber, *Peasants into Frenchmen: The Modernization of Rural France, 1870–1914*, Stanford, CA, 1976.

18. For convenience one could read J. Goody (ed.), *Literacy in Traditional Societies*, Cambridge, 1968; for a critique of Goody and for the significance of oral traditions for history read J. Vansina, *Oral Tradition as History*, Madison, WI, 1975.

19. Read especially P. Ricoeur, 'The Hermeneutical Function of Distanciation', in: *Hermeneutics and the Human Sciences*, (J. B. Thompson, ed.), Cambridge, 1981, pp. 131–44; and his essay in the same volume, 'The Model of the Text: Meaningful Action Considered as a Text', pp. 197–221.

## SOCIAL CONDITIONING AND THE IDEOLOGICAL TREND IN THE HISTORICAL-CULTURAL PROCESS

### Geoffrey Hawthorn

### THE INHERITANCE

In 1914, the prevailing self-consciously progressive ideologies were nationalism, liberalism and socialism. Nationalism – the conviction that peoples, defined by a common history, a common homeland, or a common culture (and in certain cases, all three) should be free to govern themselves – constituted a challenge to foreign rule. Liberalism, the conviction that individuals were bearers of common civil and political rights, challenged the precepts and practices of absolutism and, according to some, imperialism as well. Socialism, the conviction that all were entitled to live in what was previously called a 'commonwealth', presented a challenge to the first two ideologies. Nationalism, the socialists argued, would undermine the cosmopolitan promise of the eighteenth century, while liberalism would subvert the promise of equality.

Nationalists often referred to 'authenticity' in the language, customs and courage of ordinary people, especially those drawn into what eighteenth-century commentators had described as the new 'commercial society'. Nationalists celebrated this notion in idealized histories and romantic art. The liberals stressed the freedom of individual judgement, which, they believed flourished best in a commercial society. This line of thinking was celebrated in histories of the triumph of freedom over oppression, and in realistic artistic expressions. Socialists emphasized the need to overcome the material constraints and social divisions of commercial society. They embraced histories cast either in an evolutionary mode or a dramatically revolutionary manner. Their art also was realistic but directed more at ordinary people.

Some nationalists were liberal, others conservative. Some liberals foresaw evolving towards socialism, and many socialists shared the liberals' emphasis on economic change. During the First World War, however, and in the war's aftermath, these convictions intermingled in new ways. The collapse of the second Socialist International at the outbreak of the war and the failure of the Russian Bolsheviks, at the end of the conflict, to spread the revolution across Europe to prompt the liberation of what Lenin called the colonized 'peoples of the East' from their imperial masters, led socialists to postpone their internationalist ambitions and concentrate on the project of 'socialism in one country'. In

this effort, they found themselves united with the once-despised nationalists. Liberals in Europe were dismayed by the war, by the Bolshevik revolution in Russia, and by the resultant fragility of their economies. Adherents of all three ideologies were forced to reconsider their positions.

Those active in the new movements for independence from colonial rule in Asia and Africa, however, were encouraged by the collapse of the Austro-Hungarian and Ottoman empires, by the subsequent realization of nationalist ambitions in Central and Eastern Europe, and by the United States' refusal to allow the victorious imperial powers to re-colonize German and Ottoman territories in Africa and the Arab lands. In India and South-East Asia, as in China after the end of imperial rule in 1911, they adopted positions that were both nationalist and socialist. In the Arab lands, Islam was beginning to shape a specific identity and provide a moral and constitutional charter for a less locally defined brand of nationalism. Only in Latin America were intellectuals unaffected by the upheavals of the war, and even in Mexico, whose long revolution was influenced by ideas of agrarian socialism, debate continued on the familiar nineteenth-century ideological arguments and notably concerning the virtues of 'ancient' vs. 'modern' liberty.

### THE YEARS 1918–1939

The changes were initially most manifest in Europe. This occurred for four reasons. It was in Europe that the most far-reaching social transformations had been taking place, the most painful of which was the transformation of millions of peasants into industrial workers. It was in Europe that people had suffered most directly from the war. It was at Europe's doorstep that the Bolsheviks had launched their revolution. And it was in Europe (as well as in North America) that via print, radio, television and the development of other information technologies, there arose a popular culture that would spread to every corner of the world by century's end.

In politics, the old conservative ideologies, predicated on a settled agrarian order, began to fade. National liberals were now fighting alongside national socialists (and in the south, with the Roman Catholic Church) for the allegiance and

control of the new urban working classes. In those countries in which the transition to industrialization had been particularly brutal and the wounds of war most severe, there emerged what the Italians called 'fascist' alliances against both liberals and the perceived threat of communism. In the realm of culture, the more adventurous writers, painters and composers turned away from romanticism and realism to capture the movement and disruption of social and technical changes in self-consciously 'modernist' forms of aesthetic construction. In social and political thought, it became more difficult to see a continuity between the present and the past, and except among the Marxists and a few diehard liberals, historical understanding gave way to a 'logical positivism' or unhistorical 'phenomenologies' in philosophy, to historical social sciences, and to a renewed enthusiasm for the achievements and methods of the natural sciences.

But these changes were not limited to Europe. In the United States, where there was no strongly rooted conservative tradition and European-style socialism had little appeal, politics remained liberal. But the culture in America was enthusiastically democratic. The new mass culture – fuelled by extensive literacy, a lively popular music scene invigorated by the migration of black workers from the South to the cities of the East and the Midwest, and the rapid development of radio and the commercial cinema – was sweeping the country. In American universities, which were more open than those in Europe and accordingly more responsive to social changes, the natural and social sciences expanded even more rapidly. And the government's economic intervention in the 1930s, which also fostered the mobilization of writers and artists for the purposes of documenting American society, increased the nation's awareness of the lives of ordinary people. In Latin America, where the governments of the larger countries promoted an industrial economy, to combat the threat to their agrarian exports posed by the Depression, there was renewed enthusiasm for the new politics and culture of Europe, particularly among the educated middle classes who embraced European tastes. In Japan, where the urban population was expanding and the government had embarked upon a programme of forced industrialization at the end of the nineteenth century, increased literacy and the new technologies were creating a popular culture that drew on increasingly stylized images from Japan's past.

By contrast, in colonial societies, industrialization and its concomitant urbanization (except in Japanese-occupied Korea) progressed less rapidly, literacy was very restricted, indigenous communities were not encouraged to celebrate their own past, and rule remained firmly in the hands of the imperial power. Only in the Arab countries did more than a few Westernized intellectuals venture into a completely redefined form of modernity.

## FROM 1945–1991

Wars cause societies to reconsider their past, often to break with it, and to create new possibilities and practices for the future. The First World War had taken place principally in Europe. It gave nationalists new hope, made liberals pause, and gave some confidence to socialists. Because it mobilized large numbers of workers, it also accelerated the cultural consequences of social and technological change. With the exception of the Arab world, however, its impact was felt largely in Europe itself and in the United States. The scope of the Second World War, by contrast, extended around the world. The war had involved virtually all nations except those in Latin America, and its impact, even on the Arab societies, was correspondingly great. But it also served to divide the world. The defeat of Germany, Italy and Japan by the Allies led to the subsequent 'Cold War', characterized by political and cultural antagonism on an unprecedented scale. The previously colonial territories were also becoming sovereign states and connected to the divided new world, not least through a United Nations Organization that was more extensive and more ambitious and enduring than its precursor, the League of Nations. But even as the new nation states were drawn into this new world order, their material disadvantages gave rise to a division of a different kind.

The relations between ideology and culture thus changed again. In the industrial economies of the Americas, across Central and Eastern Europe and Soviet Asia, in Australasia and East Asia, culture became more divorced from politics. Most of the liberal democracies in the American sphere of influence had opted for some type of social democracy, guided by precepts of a more moderate liberalism and socialism. This trend was accompanied by a discernibly new detachment (except on the part of deliberately political intellectuals) in their literature, visual arts and music. The adventurous, and sometimes aggressive modernism of the interwar years was softened in the new political context.

This was not the case in the new Third World of post-colonial states. Having been freed from one set of constraints, many intellectuals in these countries found themselves faced by another. The world into which they had come was defined by the United States and the Soviet Union. The influence of each, however, was different. In its ideological liberalism, economic power, and popular culture, the United States was seen by many to be the continuation of European imperialism under another flag. In its ideological socialism, its apparently proven capacity to resist the power of international capital, and its open opposition to the United States, the Soviet Union seemed to offer an alternative.

Therefore, it was not surprising that in their desire to assert their new independence and to offer a vision for a future that they could at last call their own, many Third World politicians and intellectuals, like those in many parts of post-war Europe, combined nationalist enthusiasm with socialist conviction. These newer post-colonial societies, however, were more diverse than those in Europe, and they embarked upon independence with a variety of metropolitan influences. Their ideologies were correspondingly different. In the formerly British territories in Africa and South Asia, the dominant voices had received a legal and political education in Britain itself, and argued their case in the idiom of reformist socialism. In the formerly French territories of Africa, whose dominant voices had received a more broadly humanist education in France and been affected by the enthusiasm there for the music and dance of black America, the idiom – as in the defence of *negritude* – was more literary. The former French territories of South-East Asia, the former Spanish and Portuguese territories in Africa that achieved independence somewhat later, and the former Dutch territory of Indonesia, were influenced by the European communist parties' sympathy with the anti-colonial cause. In the larger countries of Latin America, where independence from Spain and Portugal had been

achieved at the beginning of the nineteenth century, where there was less anxiety to construct a new political and cultural identity, where European forms of socialism had not taken root, but where the influence of American popular culture was more pervasive, intellectuals concentrated on lamenting what they described as the continent's increasing cultural and economic 'dependence' on the United States. Only in the smaller countries of Central America, where a nationalist revolution in Cuba in 1959 attracted the interest and support of the Soviet Union, was this anger at dependence expressed in a more openly socialist manner.

The situation was different in East-Asian societies and the Arab world. Notwithstanding their commitment to the principles of Marxist-Leninism, the governments of the People's Republics of China and North Korea distanced themselves from the Soviet Union and promoted a syncretism of socialist principles and precepts drawn from Confucian tradition. In those Asian states politically aligned with the West – Japan, South Korea, Taiwan, the Philippines, Malaysia, Singapore and Indonesia – the governments were hostile to communism and did not resist the spread of American popular culture. In all the states of East Asia, whatever their political inclination, the intellectual community was marginalized. In the Arab world, by contrast, Islam, which had conferred a new pan-nationalist identity after the end of Ottoman rule in 1919 and provided a foundation for law, produced a closer connection between the state, the intellectuals and the people. The adherence to traditional Islamic principles also kept the secular liberalism and socialism of the West at a distance and gave rise to a remarkably powerful, pervasive and coherent culture.

## AFTER 1945

Between the two world wars and during the Cold War, intellectuals everywhere had assumed that there was a political and cultural choice between the past and the present. With the demise of the Soviet Union in 1991, however, one of the two great political choices of the beginning of the century – the choice between a conservative and perhaps liberal past and a liberal or socialist future – seemed to have been pre-empted. The truly conservative regimes had almost everywhere disappeared. Now socialism, it appeared, had no future either. What remained was a liberal international economy, an enthusiasm (at least in principle) for democracy and nationalism. In the West, the moment of the Soviet Union's collapse was even proclaimed as the 'end of history'. The alternatives to liberalism had been tried and been found wanting. Democracy satisfies peoples' desire for recognition, and science met their material needs. Although this might be an exaggeration, considerable changes were nonetheless underway. Transformations of a technical as well as a political nature had freed international financial markets, and the United States had taken the lead in urging a greater freedom of international trade. Other governments could only protect their currencies by reducing inflation and its alleged causes, which included their own expenditures, and had increasingly less control over their economies. Across Latin America and Africa and in parts of Asia, the difficulty had been compounded by accumulation of debt. The post-colonial project of constructing and defending a national economy was greatly weakened. Those who had looked forward to one or another kind of 'socialism

in one country' could no longer convincingly do so. Internationally, and in the new enthusiasm for liberal democracy, domestically also, there seemed to be only one possible course.

However, in cultural matters the collapse of what had been seen, outside Russia, as Moscow's foreign rule, and the effects of the new international economy and its information technology on even the most established nation states, released new vigour. In parts of south-east Europe and western Asia, old nationalisms reappeared and several previously dormant ones began to surface. In the more established nation states, there was renewed enthusiasm for cultural difference.

In insisting on newness, the 'modernism' of the early twentieth century had remained connected to the past. The movement that came to be known as 'post-modernism' by the 1980s broke that connection. Post-modern intellectuals rejected the 'grand narratives' of progress that had inspired and guided their predecessors. The self-examination of the late twentieth century, they argued, had to be different. In high culture (philosophy, literature, music, and the visual arts) and popular culture (styles of food and dress and leisure) the old and the new now co-existed in a kaleidoscope with no meaning beyond itself, indeed with no single meaning. Post-modernism as a doctrine was a product of the North and West, i.e. of the intellectual culture of the United States and Western Europe. As a mood, however, it also affected the societies of the South and East. At the beginning of the twentieth century, these societies had been largely rural. By century's end, they were fast becoming urban. The cities of Latin America, Africa, and Asia – parts of which were as prosperous as anywhere in the cities of the North, parts of which were also collections of urban villages, and poor – were now also kaleidoscopes of styles. This new metropolitan culture was fast becoming truly 'global' and 'multi-cultural'.

## CONCLUSION

In 1914, the concepts of the cultural and political future were those formed in the self-examination of Western Europe and the United States. To self-consciously progressive Europeans and Americans, despite the obvious tensions and even contradictions between them, the beliefs on which these concepts rested were self-evident. To those, elsewhere in the world, who were aware of them, they could seem self-evident also. These people, who had been considered backward by Europe, were often inclined to accept European criteria of advancement. By the 1990s, this situation had changed. Even though this fact was temporarily overshadowed by the West's triumph at the end of the Cold War, and despite the more enduring victory Western liberalism appeared to have secured, political and cultural intellectuals in the North were losing confidence in what had once been considered the inevitable and universal consequences of their own intellectual development. A new type of history was in the making in East Asia and an alternative history guided the Islamic world. Despite the spread of a new and truly global popular culture, nowhere in the South did the future correspond to any of the ideals imagined by the North. At the end of a century that had been driven by war, there appeared to be no winner in matters of thought and feeling.

## THE EFFECTS OF SCIENCE AND TECHNOLOGY ON INTELLECTUAL CULTURE AND ART

*Oumar Dioume*

To investigate the impact of science and technology on the activities of the mind, we need to consider how they are influenced by philosophy, culture and ethics in their turn. Our intention here is to shed light on the imprint left by science and technology on the development and the state of culture and the arts in the twentieth century. Science and technology affect our everyday lives and weigh on our future. In contrast to nature, culture (and art in particular) includes everything that is the work of human beings. It is therefore legitimate to reflect on the paradigm of the interaction of culture, cultures and progress in the realms of science and technology.

To varying degrees, scientific and technological progress has penetrated every corner of the world, irrespective of the level of development. This progress has resulted in a great diversity of effects, quantitative and qualitative, negative or positive, depending on the criteria adopted in our everyday lives. The economic and financial impact is not always compatible with the cultural consequences when it comes to ensuring the preservation and survival of the diversity of cultures – diversity being the necessary counterweight to the process of uniformization engendered by globalization, an irresistible movement of waves of prodigious power sweeping through every sector of activity and thinking in every country. Humanity today enjoys extraordinary access to other cultures, made possible by the phenomenal developments in air transport (tourism and organized travel), telecommunications, television and all the new information and communication technologies (ICTs).

Despite this priceless treasure of ready access to other cultures, we should bear in mind these words of Claude Lévi-Strauss:

> Every culture represents an asset of considerable human richness. Every people has an asset of beliefs and institutions which represents experience that is irreplaceable in the whole of humanity. When humanity feels threatened by standardization and monotony, it becomes aware once again of the importance of differential values. We would have to completely give up the idea of seeking to understand what it means to be human if we did not recognize that hundreds, or indeed thousands, of peoples have invented original and different ways of being human. Each brings us an experience of the human condition different from our own. If we do not try to understand it, we cannot understand ourselves.

Lévi-Strauss's observations represent an updated version in the age of ICTs of the words of the ancient Roman poet Terence: 'I am a human being, I count nothing human foreign to me' ('Homo sum, nihil humanum a me alienum puto').

It is therefore natural to grant analytical priority (but not primacy) to the effects of the newest, most recent sciences and knowledge-based technologies. These current technologies influence and enhance efficiency of the traditional sciences and technologies of the first half of the twentieth century. The prodigious development of the cultural industries serves to illustrate this point.

Today, the globalization of the means of communication enables us to exchange knowledge, technology and values at the speed of light. The exchanges generated by the cultural industries harbour both a potential for fruitful intercultural dialogue and a multicultural mercantilism that facilitates an intermingling of cultures, previously unknown to one another.

Cultural industries cover sectors of activity in which the creation, production and exchange of goods and services interact. Their specificity is defined by the intangibility of their culturally defined content, which is usually protected (especially in the countries of the North) by copyright law. To be more precise, cultural industries include crafts, design, print publishing, multimedia and film, audiovisual and phonographic production, in addition to the visual arts, architecture, the performing arts (music, dance, theatre, etc.), the production of musical instruments, sports, advertising and cultural tourism. With such a wide range of activities, it is possible to include under the umbrella of cultural industries virtually all activities practised by existing societies however disparate their levels of economic development. Cultural industries promote the raw material of creativity, which is in turn stimulated by imagination. Einstein used to say that 'imagination is more important than knowledge'.

One decisive impact of the cultural industries on every society in the twentieth century is their capacity to increase the economic value of intellectual work, which in turn generates new values, for both individuals and societies. The case of the United States offers a significant illustration of this assertion. The emergence of a 'brown' culture from the spread of hip-hop music, derived from the rap music of the black ghettos, to various categories of American youth is currently shifting interracial relations towards a more shared culture for future generations.

The main characteristic trait of cultural industries is their dual nature: cultural and economic. Cultural industries contribute to the preservation and promotion of cultural diversity while expanding public access to culture, but they also create employment, wealth and innovation in terms of production and distribution. An interesting illustration of this phenomenon is the market for electronic games, which expanded astronomically over the last decade of the twentieth century. The result was an exponential growth in job creation in the developed countries. That growth was also the catalyst of the famous trade dispute over the issue of the 'cultural exception', an issue involving not only hundreds of millions of dollars but also the sociocultural impact of the globalization of all sorts of exchanges.

The notion of the 'global village' elaborated by Canadian sociologist Marshall McLuhan implicitly encapsulates the intermingling of cultural industries and the new ICTs. These technologies raise the question of the interrelatedness of culture, technical skills, technology and philosophy, and the pervasiveness of technical skills and technologies in our everyday experience. This ubiquitousness and omnipotence forces us to question the relevance of devising new concepts to describe the increasingly present and obtrusive effects of the so-called 'philosophy of technology'.

Such questions also pertain to the relationship between technology and culture. Technology is acknowledged to be one of the most important factors of evolution in the history of humanity. The twentieth century illustrates this more clearly than ever before. Given the century's unprecedented scientific and technological progress, it seems therefore crucial to examine the links between technical skills and philosophy and between technology and culture. Such an investigation raises questions more vast than the effects of the products themselves.

In everyday life, we are immersed in a culture steeped in technology, which is omnipresent and powerfully affects our lives. The challenge then can be stated in the following terms: what are the intangible effects of information technology (IT)? Today, IT influences every aspect of the processes of wealth creation, knowledge and information exchange, health-care innovation, distance learning, and overcoming the technological gap between developed and developing countries. By using the springboard of innovation, developing countries are able to make similar technological leaps as those made by the countries of the North, more quickly and at lower cost. Two examples worth mentioning are Bangalore, India's Silicon Valley, and the impressive advance of teledensity in many poor countries. Concerning these 'successes', we must measure the impact of computer-dependent technologies.

Even those not versed in information technologies are affected by the omnipresence of the computer as a tool with huge information processing power and unimagined capacities to perform multiple tasks. The transmission and processing of information, major components of culture and vectors of a new culture are subject to permanent upheavals and innovation. Computers and the other technical information tools have dramatically altered the various types of interactions between the human race and its environment. In numerous fields, such as biotechnology, telemedicine, distance teaching, robotics, electronic commerce, artificial intelligence, wireless interpersonal communications and numerous types of exchanges dependent on electronics and IT, it is more the cost of progress that determines the value of our consumption than the actual cost of the goods exchanged. Such is the face of the new economy, which emerged in the twentieth century, developed in the second half, and accelerated at even greater speed in its last decade. This economy is based on the production, distribution and consumption of intangible goods, knowledge, know-how and information.

The most characteristic impact of this revolution may be described as the:

> re-appropriation of the knowledge of which industrialization has robbed us ... After many centuries of divorce between highly specialized techniques and non-specialized culture, the technopole now mediates between what some know and what others do. There is thus a return to the technical culture that has marked each stage of human development ... In this attempt at re-appropriation, we are benefiting from a second-degree technology whose goal is to make access more and more simple to technologies that are more and more complex. These are enabling technologies. They give us back knowledge, but they also re-establish contact with other people. These are the interceding technologies. Overcoming space, telecommunications enable us to talk to anyone on earth. Overcoming time, recordings (audio and visual) provide us with a living memory of humanity in the past and the future.[1]

We should also note the obverse of the benefit gained from these technologies 'whose goal is to make access more and more simple to technologies that are more and more complex'. Referring to the atomic bomb, Albert Einstein said: 'The release of atom power has changed everything except our way of thinking ... the solution to this problem lies in the heart of mankind. If only I had known, I should have become a watchmaker.' Beyond the moral impact of the confusion between real and virtual killings and the subliminal incitement to violence peddled by many electronic games among adolescents and adults, there is another problem that has to do with the perverse effects of these 'enabling technologies': what is the role of play within a culture that promotes the spirit of technological creation?

We need then to ask, in a more general context, about the impact of the growing grip of technology on philosophy. This grip is a permanent reality manifested by such extreme cases as the debate on human cloning, human reproduction through artificial insemination, euthanasia, and the creation of databases containing information on individuals that limit their freedom. All these discoveries and achievements are occurring in a context of the headlong development of genetic, protein and molecular engineering, and increasingly sophisticated computer systems and equipment.

Because of the multiple ethical and moral consequences of these technologies, there are good reasons for engaging in

a debate on the future of humankind. Culture's dependence on technology threatens to become even greater in the future when we think of the advantages of the continual development of 'enabling technologies'. Considered together, technology, science and engineering constitute an instrument for constructing the future and especially the future of society and consciousness. More then ever, technology today plays an existential role and is an integral part of general future trends. Today, the philosophical character of technology becomes clearer with the growing interconnection between technology and information sciences and biology.

Such a paradigm naturally raises questions about the ultimate purpose of the survival and preservation of those cultures currently most at risk, which are natural in the context of a debate on the relationship between philosophy and technology. But, in that case, is it relevant and meaningful to refer to the notion of philosophy of technology? If technology is understood as a science of the most efficient possible concretization of the means required to perform the functions necessary to society, it should be recalled that the evolution of technology is a socio-historical process, which cannot be apprehended separately from the sociocultural reality and philosophy of the given environment. Even so formulated, it is not obvious that this vision of technology facilitates the emergence of a consensus as to the meaning to be ascribed to the concept of philosophy of technology.

Nor should we lose sight of the fact that the relationship between technology and philosophy was long seen through the prism of classical technology based on mechanics, even after the emergence and diffusion of information technologies. Such an approach, which neglects information technologies and their impact on technology in general, is certainly inappropriate today. That impact is determinant in the creation of our current world view.

We are thus led to inquire still further into the ultimate aims of technology. The debates between environmentalists and advocates of energy self-sufficiency – a form of economic development that intensively exploits natural resources even at the risk of threatening the survival of the planet – are fundamental debates about our society, way of life and general philosophy. The impact of such choices is not only economic and cultural but also political since certain influential countries in the North are now governed by majorities in which the Greens have a decisive voice.

The existential questions about the survival of the human species result directly from the possible consequences of humanity's technological activity. Any number of perverse effects such as a nuclear or ecological disaster might annihilate humankind. On the other hand, preventive strategies to preserve the human species will also be based to a large extent on technological underpinnings. A major impact in our paradigm is the spread in all present-day societies, naturally to varying degrees, of the debate on the finality of technology and of the concrete implications of that debate.

To assess the impact of ICTs on culture requires a capacity to apprehend the intrinsic issues and challenges of that culture in all their complexity. Thus culture would be in the position of both judge and defendant. The first challenge to grasp is inherent in the profound differences between ICTs and the communication networks. The former transcend borders, in contrast to traditional networks designed for national or regional use. Through images and sound, all information regardless of its relevance can be transmitted virtually instantaneously to any community, however remote geographically, provided that is connected to an adequate ICT network. Although still incomplete, the web into which ICTs have woven all countries is perhaps the most complete reflection of the globalization of intangible exchanges which has critically restructured entire sectors of the world economy.

This restructuring reflects a deregulation, which, from telecommunications to the audiovisual media, is in the process of shaping and altering the relationships between the state, corporations and individuals.

The Internet was born of the encounter between the computer and telecommunications. Only a minority of countries, hence only a small portion of the world's population, has reliable access to a computer in case of need. Is the Internet a factor tending to deepen the gap between rich and poor countries? With the capacity to transport a vast quantity of information in real time, the Internet is a decisive factor in the expansion of the exchange of goods and information worldwide. The facilities for downloading files, sending emails and conducting e-business are concrete manifestations with decisive economic and cultural consequences for the future.

Never in the history of humanity has information been exchanged so quickly and over such a vast area. The Internet has also transformed the means of access to culture. José Saramago, the winner of the 1998 Nobel Prize in Literature, has written: 'Information makes us wiser and more knowledgeable only if it brings us closer to our fellow humans. Now that we have long-distance access to all the documents we need, we run an increasing risk of dehumanization, and of ignorance. Nowadays, the key to culture lies not in experience and knowledge, but in your aptitude at hunting down information on the Net. You can be entirely ignorant of the world – the real social, economic, and political world you live in – yet accumulate every possible kind of information. Communication is ceasing to be a form of communion. We are sadly seeing the ending of real person-to-person communication.'[2] Thus one striking impact of the Internet is to deprive communication of its character as a friendly interpersonal exchange of information.

According to Marc Augé, 'new techniques of communication and image-making render the relation to the Other more and more abstract; we become accustomed to seeing everything but there is some doubt whether we are still looking. The substitution of media for mediations thus contains within it the possibility of violence.'[3] If that is so, then what will become of art in light of these challenges from new technologies, nowadays affecting virtually all human activities?

A correlation between art and technology becomes apparent through the needs of artistic research. Artistic expression also reflects the scientific and technological achievements of its time. It is obvious that it is no coincidence that the impressionists and their works appeared at the end of the nineteenth century rather than in Rembrandt's time. Technology has long been one of the most important and most durable factors influencing art. One has only to observe the prominence of the visual and audiovisual arts in the new realms of creation and communication opened up by the new technologies of the twentieth century.

The demands of art and the modus operandi of artists have always stimulated scientific research and technological innovation, and the arts feed education, leisure and the cultural industries with vast economic potential. The confrontation between demand and creative capacity, on the one hand, and analytical and technical power, on the other, offers considerable potential for innovation. Examples from the field of music illustrate the extent to which science and technology can seek their inspiration in the arts. The most recent example is the compact disc, the result of the extraordinary applications of IT and electronics in the music industry.

This is one stage in the fantastic leap from the pre-electronic age to the computer-generated music of our times. Indeed, computer-synthesized sound, a collaborative effort by scientists and musicians, has altered our conception of musical sound. The development of microelectronics is making digital techniques more accessible. Synthesizers, mostly digital, are specialized computers dependent on software that is the fruit of know-how brought about by hands-on experience and research.

In some case, only those musicians who are comfortable with IT have been able to fulfil the technical requirements of music, as in the case of computer-assisted musical notation. This problem was solved by the composer and instrumentalist Leland Smith, by developing a specialized computer language. In the field of robotics, US developers have collaborated with choreographers to give more grace to robots designed to assist the disabled.

The progress and achievements of artistic works whose sources of inspiration lie in science and technology are today virtually taken for granted. Yet we should do well to remember the importance of these processes in the development of the arts. In the field of painting and sculpture, the computer has become a tool of creation through computer graphics and digital photography. We should also note the role of the physical sciences (lithography and electroplating). For architects, digital programmes are replacing manual drawings. Even in the field of dance, the computer is proving to be a powerful tool for stage technology. As for the theatre, the development of stage lighting has allowed the development of sophisticated staging techniques. Cinema technology, with its spectacular special effects, exerts such an influence that nowadays we no longer look at a film or a play in the same way.

An economics of culture thus came into being as a result of the effects of science and technology on culture and art in the twentieth century. Moreover, this intermingling engendered an economic and technological culture based on the fetishism of efficiency for its own sake. Rich in extraordinary potential for cultural and artistic creativity, this intermingling can also entail, if we are not careful, the risk of accelerating the process of uniformization of cultures, whose diversity should always remain one of the treasures of humanity. To preserve this balance of cultures requires an ethical vision of the impact of the sophisticated tools that we use to develop the intellectual culture and art of our times.

## CULTURE AND MASS PRODUCTION
### CULTURAL INDUSTRIES

*Elizabeth K. Jackson* and *Alemseghed Kebede*

As noted by Karl Marx, ever since capitalism surfaced as a viable socio-economic system, it has never ceased to revolutionize the instruments of production. Despite his interest in post-capitalist society, Marx acknowledged that capitalism is a highly dynamic and productive social system: 'The bourgeoisie, during its rule of scarcely one hundred years, has created more massive and more colossal productive forces than have all preceding generations together'.[1] However, the development of capitalism has taken place in unprecedented fashion well beyond the predictions of the author of *Das Kapital*. Capitalism has endured despite the expectation of its imminent demise. The capitalist system has not fettered the development of the productive forces as envisioned by Marx. Rather, tremendous advances in technology have taken place. By and large, as a reaction to new developments, capitalism has readjusted itself, giving rise to manifold alterations within the framework of the capitalist system. And this readjustment has taken place without radically challenging the fundamental attributes of the system.

### FORDISM

Perhaps one of the most salient features of capitalism during the early twentieth century has been the development of Fordism.[2] Fordism was a mode of economic and social regulation that led to a series of interrelated outcomes. The semi-automatic assembly line technique, introduced by Henry Ford and based on unskilled collective labour in which each worker carries out a strictly defined task, led to mass production (Plate 128). But this development must be accompanied by mass consumption, since the former would be meaningless without the latter. In order to further maintain the production-consumption continuum, two conditions must be fulfilled. In the first place, workers had to change certain aspects of their behaviour in accordance with the emergent productive processes. Every aspect of the worker's life had to be rationalized so as not to impede the dynamism of a cohesive course of action. Secondly, workers had to consume given a certain level of income. To the extent that the market was expanding and the rhythm

of capital accumulation intensified, via higher wages, the purchasing capacity of the worker had to be augmented. Furthermore, in order for this process to be facilitated, the role of the state had to be recast. Accordingly, the state became the 'interventionist state' whose responsibility, among other things, was to facilitate effective demand among the populace. This was made possible by the introduction of minimum wage and social security benefits.

### THE CULTURE INDUSTRY

Fordism was not limited to the economic sphere, for it extended to the realm of culture as well. Theodor Adorno and Max Horkheimer have described this process in their concept of the *culture industry*,[3] referring to an industry-culture formation in which everything social yields to the logic of capital. Consequently, products lose their intrinsic worth; they become significant only when they are exchangeable. Under a state in which the culture industry reigns supreme, the goals considered worth pursuing by the powerful are sought by available means, without considering the ethical repercussions of the latter. Even art, with its claims to the highest form of self-determination, falls prey to this process.

Debunking the idea that the arts were somehow pristine, original and independent of forces that would dictate both the nature and quantity of cultural material, Adorno and Horkheimer argued instead that the so-called 'traditional' arts have been pushed aside by a mass, industrialized and capitalist profit-making machine. While appearing to offer unique artistic or cultural representations, culture industries instead produce items characterized by uniformity, predictability, and assembly-line sameness designed to sell the maximum number of cultural units (goods) to the consumer. 'What is new is not that it [art] is a commodity, but that today it deliberately admits it is one; that art renounces its own autonomy and proudly takes its place among consumption goods constitutes the charm of novelty.'[4] In this context, the dictum that the purpose of art is purposelessness, that it is valuable unto itself, loses its

meaning. The market has declared its definitive triumph over the realm of purposelessness.

Two features, namely, standardization and pseudo-individuality, specifically characterize the culture industry.[5] Standardization refers to cultural production being carried out in accordance with rigidly defined sets of principles. Adorno and Horkheimer imply that standardization eradicates the impromptu and unpremeditated, proliferating sameness:

> How formalized the procedure is can be seen when the mechanically differentiated products prove to be all alike in the end. That the difference between the Chrysler range and General Motors products is basically illusory strikes every child with a keen interest in varieties. What connoisseurs discuss as good or bad points serve only to perpetuate the semblance of competition.[6]

Consequently, the implication is that culture is disentangled from its critical feature, that of spontaneity. This umbrella of uniformity encompasses all aspects of the capitalistic corporation within the arts and culture industries. Radio, for example, is tightly linked to the concepts of various formats: rhythm and blues, jazz, soul, rock, rap, classical, and talk. Any configuration outside of this predetermined construction fails. Likewise, film adheres doggedly to the characteristics of certain genres (horror, comedy, etc.), a formulaic blueprint that guides virtually every twist of the story plot from the opening sequence to the last frame. Indeed, film students are required to memorize the particularities of each genre, encouraged to create products that fall exactly within the specified guidelines. The culture industry of Hollywood then rewards filmmakers best able to play to the dictates of the genre with Oscars, a reinforcement that further encourages the redundancy of filmic products.

Pseudo-individuality is connected with the concept of standardization. The idea suggests that there is nothing new (or original) under the sun, despite the efforts of culture industries to sell 'freshness' and a belief in the idiosyncratic nature of a creative product or talent. Adorno charges that pseudo-individuality is just as applicable to the individual 'film star'. All virtually clones of the other: hair, eyes, voice, figure; anything even vaguely different about the self is mandated as a tightly controlled monopoly commodity determined by society, with 'every single person transformed by the power of generality'.[7]

Pseudo-individuality entails what could be termed as the colonization of the artist. The artist, the creative individual, succumbs to the forces of the powerful and loses his/her identity as a self-dependent producer. From a self-actualizing process, art turns into a mere means to an end, namely profit. In the final analysis, the 'talented performer' and 'the attitude of the public' form a unified whole within the culture industry. Thus culture loses its aesthetic significance.

The imprint of pseudo-individuality and standardization make for a complex psychological component: such familiarity with form and content breeds a kind of dullness in the recipient, thus creating a passive and fairly uninspired cultural consumer (reader, viewer, listener). This passivity, which Adorno called *regressive listening*[8] presumably lulls people into a mind state that would allow them to accept the status quo and succumb to authoritarianism. This populace thus becomes an unmindful 'mass' capable of being hoodwinked and exploited by capitalist corporations or autocratic systems of administration.

## NEW SOCIAL MOVEMENTS

It is clear that the culture industry has not achieved a total victory over society, as Adorno and Horkheimer would like us to believe. One of the unforeseen consequences of the culture industry has been the proliferation of collective actions that have emerged as a result of the conflicts within the 'domains of cultural reproduction, social integration and socialization.'[9] These collective actions (including movements in favour of the environment, gay rights, and women's rights) defy 'colonization of the lived world', the interventions exercised by formidable social structures, such as the state, in the operations of everyday life. Because the loss of meaning and freedom is the fundamental concern of these collective actions, sociologists refer to them as 'new social movements'. 'Old' social movements, including the labour movement, focused primarily on political and economic issues. Unlike 'old' social movements, new social movements are conditioned by 'post-materialist values' that have come as a result of the structural changes engendered by both Fordism and later post-Fordism.[10]

## POST-FORDISM

This term refers to a new regime of accumulation that has emerged as a result of the weaknesses of Fordism.[11] The mismatch between effective demand and mass production, the rising cost of labour, and changes in consumer behaviour constituted some of the major problems that Fordism failed to address. Accordingly, post-Fordism emerged as a system with distinct characteristics. In essence, in contrast to its predecessor, post-Fordism is highly flexible, owing to several factors. First, the new system is geared towards the production of highly specialized products. The scheme of mass production that focused on the manufacturing of standardized products had to be transcended. This in turn gave rise to a mode of organization that allowed the very existence of different styles of production. Secondly, the flexibility in production is contingent upon flexibility in labour, requiring workers to possess more skills than under the Fordist system. The post-Fordist worker is sufficiently resourceful to make adjustments whenever and wherever deemed necessary. Ultimately, as a result of the new adjustments that have taken place, post-Fordism responded to the calls of the market. The proliferation of different types of products met the needs of the new consumer society, whose members' behaviour is cultivated and regularly reinforced by advertising.

## GLOBALIZATION AND PRODUCTION

The heightened consumerism that resulted from post-Fordism was further buttressed by globalization in three distinct ways.[12] First, globalization has engendered the very existence of transworld articles. Consumer articles, such as Coca Cola and Sony electronic products, have penetrated almost every part of the planet. Secondly, contemporary technology has shaped international consumer behaviour.

Air travel, electronic mass media, and online communications have been instrumental in paving the way for consumer consumption of colossal proportions. Lastly, the global context has set the stage for the glorification of 'commodification'. Thanks to today's transnational mass media, international events, such as the World Cup and the Olympic Games, allow consumerism to flourish extensively. By and large, globalization is a new phenomenon to the extent that the development of international capitalism has brought a qualitative change 'in the trade and transfer of capital, labour, production, consumption, information, and technology'.[13] However, globalization has not changed the fundamental characteristics of capitalism. Instead, its impact is limited to deepening supra-territorial interconnections to an extraordinary degree. David Harvey describes this process as 'time-space compression' with 'a disorienting and disruptive impact upon political-economic practices, the balance of class power, as well as upon cultural and social life.'[14]

## GLOBALIZATION AND CULTURE

Scholars disagree on the impact of globalization on the cultural and social life of the peoples of the world. The two opposing views on the effects of globalization on culture are centred on the notions of 'cultural synchronization' and 'globalization'.[15] The former refers to the universalizing impact of globalization. Globalization is believed to have introduced 'a single world culture centred on consumerism, mass media, Americana, and the English language.'[16] On the other hand, those who uphold globalization contest this universalizing impact. According to this view, globalization, far from creating a uniform international social system, has paved the way for the enhancement of cultural pluralism. Different societies have adapted to global processes in accordance with the specific conditions of their respective situations. Certainly, 'many groups have championed national, religious and other particularisms as a reaction to and defence against a universalizing 'McWorld'. [17]

## VOICES OF DISCOURSE

Jensen asserts that it is impossible to study culture as a product of non-interpretive forces. Rather, the forces which make up the character and nature of cultural materials are determined by the assumptions, biases, and beliefs of the producers about their work, the audiences, the times, the genres. Cultural material is not 'processed' like soap by organizational, technical, and economic 'factors'.[18] In addition, Collins rejects the critical theorists' view that culture is primarily produced by a power elite. Indeed, the opposite seems to be true. The production and consumption of culture occurs in a decentralized and unforeseeable way as a result of a variety of cultural discourses.[19] It is therefore impossible, according to Bjorkegren, to achieve totalitarian control over production and consumption of the arts.[20] Hebdige sees music consumption as a site of creativity and resistance to the dominant social order.[21]

While it is true that the so-called New Age music of the last two decades was created for the exclusive purpose of soothing and lulling the listener into a kind of a meditative state, rap music, on the other hand, which was created primarily to agitate, has radicalized the industry. Speaking

to and from the disenfranchised, and created by marginalized black American youth that viewed themselves as rejected by and invisible to society at large, rap music serves as a scathing, subversive, musical menace to society. Unapologetic in its loathing of agents of authority – especially the police – its sentiment flies in the face of everything that Adorno would hold dear. So poignant and far-reaching are the messages embodied in the acerbic lyrics, that rap has come to be embraced as the global music of protest.

Especially in light of the worldwide proliferation of rap music, many scholars firmly reject Adorno's views that music pacifies and otherwise hypnotizes the listener into accepting authoritarianism. American essayist Cornel West asserts that African-American music is first and foremost a 'countercultural' practice with deep roots in political opposition. As such, it serves well to give voice to 'rootless and alienated young people … dissatisfied with the status quo.'[22] Researchers Basu and Werbner echo West, and reiterate that the initial roots of hip hop music as an art form had more to do with the airing of black voices of dissent. It was only later that the phenomena of the international proliferation of the music made its creators successful entrepreneurs. They agree that for African-American youth, hip-hop was a protest art form, and as such, 'became a new form of expressive culture that was tailored to the historical circumstances and existential desires of black ghetto dwellers.'[23]

By the end of the twentieth century, other scholars served up harsh criticism of Adorno's ideology. Gendron argued that his analysis ignored the inherent differences between text (written or oral) and functional artefacts (i.e. paper, recordings, CDs). While text is 'universal', a functional artefact is a 'particular,' yet to be marketed and possessed, and every universal text must be embodied in some functional artefact. While he acknowledges that the functional lends itself to assembly-line mass production, 'one simply doesn't mass produce universals … Thus, whatever the technological state of the culture industry, the assembly-line is simply an inappropriate model for the production of texts as universals.'[24]

New voices continue to debate Adorno and Horkheimer's original premise, and this debate may well evolve over the next several decades. For Protherough, an ardent detractor of Adorno, the ultimate question remains: 'Is Culture an Industry?' He insists that it is not. To be an artist is idiosyncratic; most are underpaid transient workers on temporary or part-time contracts. Most are self-employed. What they do is essentially individual, not mass-produced. Works of art are not mechanically turned out and sold like other manufactured goods, and art producers sell potential experiences rather than material 'products.' Finally, he writes:

Ten people who buy a particular brand of toothpaste all get the same product at the same price; ten people who see a play or a sculpture all receive distinct impressions and respond to them differently. Audiences are active and selective in the way they react to and interpret books, music, and paintings. Art 'goods' therefore have no 'value' until personal reactions and critical debate create it.'[25]

## CULTURE AND POLITICS

*Anne Legaré*

In studying the links between culture and politics, several approaches may be adopted. Politics, in the modern sense, primarily concerns the state and its action, although it is generally accepted that the state is the outcome of struggles arising in the private sphere of life. Culture encompasses two opposing domains: civil society, which is rooted in diversity, and the state, which tends to seek cohesion.

Culture may be incorporated in state reasoning through the legitimization of dominant cultures via direct action in the private domain (assistance, financial support and selective means of enhancing cultural productions) or, on the contrary, through refusal to grant recognition, exclusion from the scope of legitimacy, or even censorship, prohibition and all forms of repression. Accordingly, on the one hand, 'culture' designates representations expressed by structures, practices and codes or embodied in forms of behaviour that distinguish places, eras and peoples from each other as a result of a series of socio-historical processes and, on the other hand, it encompasses a range of practices that are outside the realm of politics and the state. In fact, art, being both creation and invention, is produced in an imaginary space, which definitely requires freedom and does not necessarily relate to reality. Politics and culture may then come into conflict. The links between the two may concomitantly be integrated, harmonious or conflictual.

In the twentieth century, the primacy of reason in the field of politics constituted the main link between culture and politics. The fundamental importance ascribed to reason was based on the belief, advanced by the moderns in the eighteenth century, that it was possible to extract from reality its inherent rationality. Science was used to demonstrate that reality could be rationalized and thus transformed by the power that it derived from the exteriority of reason. State domination over society took the form of belief in the inexhaustibility of the rationalization of reality. The twentieth century was marked by the conquest of reality through reason and of the social realm by the political sphere, as formulated by the Rationalists during the Enlightenment, and by the corrosive power of capitalism and the increase in inequalities. Relations among states and between states and cultures were influenced by the new dogma. The power of reason over reality and the critical awareness derived from

exteriority were the conditions on which the state's relative independence from society rested. Liberal countries drew on this autonomy when instituting the conditions for freedom and equality before the law. Relative autonomy was also invoked in transforming the state into an instrument governed by class rationality or the logic of domination. A new culture of politics emerged among the states that regarded the break with tradition as the hallmark of absolute faith in the power of the human mind.

The dominant states, custodians of the new hegemonic culture, sought to extend its standards to all political, cultural and social relations and to ensure that the break with the past made eighteenth-century Europeans spread worldwide. Those states hoped to impose a conception of law that placed it in a position of exteriority overseeing religion, culture and individual interests, which were regarded as private matters. The new philosophical culture and that vision of domination pervaded relations between state and society in the dominant countries, and attempts were made to incorporate them into all international political relations. Existing tensions between the centre and the periphery, caused by economic and political inequalities, were exacerbated by efforts to impose a culture of reason and state rationality from which all belief and tradition had been expunged thereby placing the matter outside the political arena.

Born of philosophical thought by the moderns, particularly Kant, Hegel and Fichte, the primacy of reason was defined as will or action on a society viewed in a context of relative independence and exteriority. Politics was regarded as the expression of power that could change society rather than as an internal force that recognizes, either in the name of God or a higher authority, a community bound together by a belief or sense of belonging. In return, modern society broke with the unanimism sought by the community of the ancients and became a focus of division and conflict between a variety of rationalities and a unifying rationality, that of the state. The transcendency of reason, a sign of its exteriority and critical position or ability to transform reality, marked the twentieth century. This product of Western modernity had an effect on the rest of the world where, under cover of proclaimed liberalism, the

will to master reality was closely linked to a balance of power between unequal forces.

The cultures of regions under such domination were confronted with the need to reconcile their ways of organizing and conceptualizing reality with the predominance of the Western culture of rationality, firmly rooted in the predominance of the law and in all the practices of social management, which were dominated by technological adaptability. Accordingly, Western systems patterned on a liberal conception of politics increasingly turned to knowledge while political ties elsewhere continued to be modelled on a religious community of beliefs. In those societies, culture took precedence over politics. The Arab Muslim countries, for example, were isolated by the profound difference wrought by an order whose legitimacy was based on a tradition that deferred to a superior source of explanation through recourse to faith. This culture of obedience was confronted with the civilizational divide that occurred when people in the twentieth century became aware that the mind was independent of reality and its representations. There were different models of civilization in other parts of the world, such as Africa, Asia and Oceania, but the culture of modernity established in the twentieth-century West laid the foundations of a politico-cultural hegemony and sought to spread it to all regions and all cultures, both Eastern and Western.

The new political culture, widespread in the West, caused conflicts with and within other regions and greater incomprehension between the centre and the periphery, between regions of the world separated by increasingly divergent visions and between equally legitimate and different civilizations. The unequal development of the North and the South and of the East and the West, in addition to deep cultural differences, exacerbated those inequalities and hampered the dialogue initiated between the different models of civilization. Attracted by the prosperity of the dominant countries and hoping to overcome inequalities, traditional states strove to reconcile their practices with the demands of modernity, thereby creating tensions within their own population.

At the same time, the political culture of modern states was marked by various divisions. Such a society, capable of rationalizing its own will, was characterized by three forms of political culture that were evident in the growth of modern democracy in the dominant countries and its claims to universality, which were clearly set out as a blueprint for civilization. The importance ascribed to human rights in Britain, the institutionalization of citizenship in the United States and republican equality in France, both universally and individually, marked these different models of political culture that brought together the inseparable components of the same conception of politics as a means of rationalizing social relations. Each cultural form of rationality adopted by the liberal states reflected, in its own way and to varying degrees, the constituent elements of democracy, freedom, equality and solidarity. Modernization was not, however, confined only to countries permeated by the democratic ideal from the outset. Other countries – Japan, Turkey, Brazil and India, for example – drew on the state's regulating role in their efforts to modernize and rationalize relations with those societies.

In the dominant countries, yet another form of differentiation in the political culture could be distinguished. With the independence of reason reigning supreme in these countries, the struggle to gain recognition for cultural diversity pitted liberals against republicans – the former, as defenders of world standardization through abstract equality established by law, and the latter, as champions of the distinctive interests of groups claiming cultural specificity and relative differentiation. Both modernization and development characterized the twentieth century, as did a deep-seated clash of civilizations that made cultural diversity a key issue at the heart of political conflict.

Furthermore, for two-thirds of the century, attempts were made to extend yet another conception of the role of reason and of the state to regions of the world not yet touched by the liberal model of rationalization of politics and which were the object of imperialist designs. Marx, Kant and Hegel all recognized, albeit in different ways, the strength gained from the relative autonomy of the mind. A vision derived from nineteenth-century Marxism was imposed on Eastern Europe under an authoritarian and centralizing Marxist conception of the role of the state, which stemmed from the break made by the Enlightenment and the rejection of tradition. That culture of domination, based on the will to ensure identity between the society and the state, spread to South-East Asia, mainly China, and to countries of the South during decolonization struggles. An entirely new culture of rationality was used in this way to promote the movement to revolutionize social relations by abolishing social classes and the class struggle. The rationalism of the Enlightenment found new expression through this form of totalitarianism. The *principle of identity* between reality (society) and reason (the state) vested a higher principle of rationalization in the necessary dictatorship of the revolutionary class, the proletariat. Seeking to transform the world, historical materialism, which placed the class struggle over all other representations of reality, entailed dictatorship under this new theoretical model. Democratic centralism in Europe therefore created the 'Gulag', an extreme form of the culture of reason.

The dictatorship of reason also culminated in the other form of totalitarianism known as fascism. The quest for identity between the political nation and the actual society, leading to the fantasy of 'national' purity promoted under the regimes of Mussolini or Hitler, informed the 'scientistic' excesses for rationalization and led to its destructive potential and its downfall. There exist several extreme examples in the twentieth century, such as the concentration camps, the extermination of the European Jews, Nazism, acts of genocide, the repression of the Kurds by Turkey in the name of the unity of the Turkish nation, the imprisonment of opponents in Siberia, and the use of prisons and psychiatric hospitals purportedly to treat various forms of mental illness. These abuses of 'scientism' shattered the modern illusion of the general good. These extremes, described by the Frankfurt school as the 'eclipse of reason', harbingered the crisis that would strike at the very foundations of modernity.

The ultimate authority of the people (Argentina), the proletariat (Russia) and the nation (Germany) were invoked to impose repressive dictates on society or on different cultural or social groups in the name of unity, national cohesion or the Revolution. Such abusive excesses of belief in the supremacy of will and reason ran counter to freedom of the individual and the pluralism of civil society vis-à-vis the state. The rejection of all claims to the established truth, whether embodied by fascism, the Chinese Cultural

Revolution or Soviet-style democratic centralism, characterized this phase of modernity.

The century was also marked, however, by cultural censorship, which illustrated the totalitarian trends underlying the unbridled recourse to the will to rationalize and master reality. Two main issues were identified. First, cultural expression could be defined as a form of self-recognition in a context of immanent relations, in other words, free and independent of the institutional hierarchy. On another level, the primacy of reason over reality and of the state over society meant that knowledge and science were separate from reality, which they could therefore form and inform. In certain cases, the subordination of art and artistic practices to the state's designs led to action contrary to the principles of autonomy and pluralism of civil society. Whereas culture, the ideal form of expression of the principle of freedom, should have been protected from the authority of those in power, certain states sought to censor, control and ban creative imagination.

There were several examples of such excesses. The Nazi regime was no doubt the one that deployed repressive state structures most systematically against culture and creation. The persecution of left-wing writers and composers and the destruction of books were but a few of the means of oppression used against creators in the name of supreme rationalization and the will to ethnically cleanse Germany and exterminate the Jews, inspired by deep-seated, albeit irrational, anti-Semitism. In the last few decades of the century, the emergence of *Berufsverbot* policies against East German intellectuals and artists left them without work. In the former Soviet Union, repressive state action against thought and creation characterized a regime that sought to make all Soviet citizens no more than the cogs of the revolutionary class, the proletariat. This pretext was used after the 1917 Revolution to expel large groups of intellectuals in 1922. The Communist Party of Leningrad persecuted writers such as Zoschenko and Akhmatova, and the literary journal *Zvezda* was banned.

In an opposing political view, the threat of communism was used to justify the witch-hunt that characterized the McCarthy era, named after the US Republican senator Joseph Raymond McCarthy, in the early 1950s. Hollywood actors, famous writers and directors such as Charlie Chaplin, suspected of communist sympathies, were banned or persecuted. Curiously enough, the protection of the values of freedom was one argument used to justify those acts of censorship. In fact, security featured prominently in discourse towards the end of the century culminating, after the tragedy of 11 September 2001, in the adoption of measures to control and monitor thought and many forms of cultural expression (the Patriot Act). These measures were evident or obvious to varying degrees and promoted the idealization of an exclusive political model.

We must also mention the destruction of Afghanistan's Bamayan Buddhas, figures of alterity and of a religion intolerable to the Taliban extremists. The temporal demolition by human beings of purely symbolic human works illustrated the extent of the absolutism of the will to subject the field of representation to prohibitions rationalized by man. The case of the *fatwa* (death threat) pronounced by Iran's religious authorities against writer Salman Rushdie in the late 1980s was another example of the power that politics attributes to culture and creation, fearing that they express an uncontrolled and discernibly subversive freedom.

As we have seen, totalitarianism usurped the principles of rationalism in the first half of the twentieth century. Yet, the positive values of freedom that had determined the autonomy of economic activity subsequently led to globalization, that is to say, the creation of a global economy increasingly independent of states. Economic and social progress and confidence in political authorities committed to reinforcing social relations while ensuring respect for diversity guided efforts to bring in a new modern era. That illusion notwithstanding, in the last third of the century, the gap widened between the logic of a globalized market in the West and the cultural worlds demanding the recognition of individual and collective identities. A deep-seated cultural crisis had begun.

One of the first consequences of that development was the explosion of mass culture, caused by the general overemphasis on freely satisfying needs and tastes. Disillusioned by the inflated growth in trade and in the resources available to cater to its insatiable appetite and unbounded selfishness, society entered the first stage of the contemporary crisis of modern rationality by expressing deep disenchantment. That crisis was followed by anguish over the loss of benchmarks, as technology gained the ascendancy to the detriment of human and social values. Radical modernity led to absolute relativism. This latter form of Western counter-culture broke with the very idea of society as a unified whole. Society was merely a combination of desires and interests, with no discernible centre. Cultural parameters then broke down when all trace of triumphant unity was lost. As a result, the social forces that might have rebuilt modernity on new bases grew steadily weaker.

The increasingly frequent recourse to human nature and an emphasis on human impulses was portrayed, in art and films in particular, both as excess or abuse and as somewhat inevitable. In the United States, religions were on offer as market products, and everywhere, in France, Italy, the United Kingdom and the Netherlands, sexuality became a commodity. This was accompanied by the reification of an unlimited conception of consumption because of the heavy emphasis on the market as the new social regulator. Rationality was thus subordinated to consumer demands for the symbolic attributes of individual and collective differentiation.

Culture and politics were founded on liberalization based on market logic only. In the field of knowledge, organizational skills and private and public management science featured more and more prominently in scientific and social thought in order to adapt to and master the new demands of a free-trade society focused on meeting its needs. The workplace and enterprise therefore came to be regarded as new centres of knowledge. Management science was first listed as a university subject in the United States before all Western countries followed suit, thereby establishing business management as an organizational model for the state and for society as a whole. Compared to this managerial conception of universal matters, national and state sovereignty was an empty reference. The twentieth century therefore tended to be the century of heterogeneity in which individual aspirations clashed more and more with all integrative principles. Representation of the world as a whole unified by the market became the new symbolic construct, and it obscured the increasingly profound and real social and cultural differences between people and identities.

Attempts were made to establish new conditions of differentiation and dialogue between the cultures of hypermodernity and traditional cultures. The tragedy of 11 September 2001 showed that it was impossible for certain forms of anti-modern culture to be expressed in the language of modern democratic institutions. The forms of fanaticism that burst onto the international scene as exemplified by Afghanistan's Taliban, Saudi Arabia's Wahhabis (whose influence spread to the West), or suicide bombers who believed in the idealization of certain verses of the Koran, were a means of expressing what was felt to be inexpressible in the language of modernity. Those extremist movements in pre-modern cultures opted for violence, hatred and sacrifice rather than compromise, which they considered inconceivable.

The latter phase of the twentieth century was marked by a new and deep rift between civilizations, signalling the retreat of the universal values of equality, liberty and solidarity. The extension of rights and freedoms in modern states was confronted with relativism, which trivialized all democratic accomplishments. Owing to the tensions identified, a distinction could be drawn between modernity, whose basic premises failed to gain sway, and the limits of modernization imposed from outside on societies founded on the 'cult of the ancient', in which rationality rested on the coherence of revealed truths.

Freedom of thought, conscience and action, and respect for the exercise of those values by others – in a world in which communications permitted unlimited contact – created conditions for mutual tolerance, which was vital for the peaceful coexistence of dissimilar cultures. For such a dialogue to be successful, freedom of conscience and action could not be left to the atemporal order mediated by theologians, but had to be ensured increasingly by the political process. Followers of Islam, for whom subjectivity inhered in obedience, which effectively barred them from any subjectivity, drew closer to the culture of criticism through modernization, literacy, birth control by women and the general provision of education. The identity of thought shared with the West on those matters restored a measure of authority to the power of reason over real-life conditions. Such closer ties marked the end of the twentieth century.

The need to move forward from an incomplete liberal democracy was clearly identified in other parts of the world as well. Subjectivity therefore had to be viewed in relation to a crisis that everyone faced in different ways. Westerners, who enjoyed freedom but were constrained by the reification of the imagination in the materialistic strength of supply and demand, had to regain freedom and awareness as the architects of the institutions that determined the way they related to freedom, equality and solidarity. Social movements, such as feminism and the promotion of cultural identities, and movements in defence of alternative world views rallied to the cause of renewable freedom at the end of the twentieth century.

The various levels of opposition between the two main cultures of politics, one based on the transcendency of reason under the liberal model and the other shaped by the immanence of a community of belief and tradition, continued to be linked to highly unequal social development detrimental to the weakest. They needed to be addressed politically in the context of a new universalism based on dialogue rather than to be reduced to power conflicts between models of civilizations. On the one hand, in the internal crisis of modernity, the various forms of rational determinism were widely called into question. Doubt and the reflective identity of the modern mind had fostered openness to critical awareness focused on changing conditions rather than on veneration of a social order rooted in immutability or revelation. On the other hand, intersubjective dialogue between traditional cultures and cultures that had introduced secularization and the separation of politics had to be initiated in order to end worldwide tension between culture and politics. Awareness of cultural diversity, encompassing beliefs, religions, philosophical representations and the thirst for domination, stands out as the key issue in the social and political transformations of the twentieth century.

## CULTURE, THE ARTS AND SOCIETY
### INDIVIDUAL FREEDOM AND EXPRESSION

*Anisuzzaman*

## CENSORSHIP AND SOCIAL CONTROL

The issue of individual freedom and expression in the fields of culture and the arts in relation to society is extremely complex. First, it is intimately connected with the basic political questions regarding freedom of the individual and freedom of speech. Secondly, special privilege has been claimed for the artist and cultural actors on the ground that art forms cannot flourish without freeing creators from all constraints. The state, however, has found it expedient to defend itself and its favoured institutions (such as the Church) from attacks by individuals and groups and to protect its citizens from what it views as obscenity, violence and horror.

For centuries, societies have attempted to impose restrictions while at the same time freeing themselves from such controls. A landmark in this struggle in Britain was the ruling of the parliament of Henry VIII in 1534 that treason may be committed 'by words or writing'. A quarter of a century later, the Catholic Church compiled a list of proscribed books, the *Index Librorum Prohibitorum* – a practice which has existed in various forms since the fifth century. In 1642, the Lord Chamberlain took over as stage censor. Two years later, John Milton's *Areopagitica* appeared as a passionate defence of free speech and cogent argument against censorship. In Britain, censorship was abandoned in 1695. From the days of Milton, however, a succession of thinkers, notably many eighteenth-century British and French philosophers, have voiced their concern for freedom of thought and speech. It was in this context that the First Amendment of the Constitution of the United States was enacted in 1791, guaranteeing Americans freedom of speech, based on the British parliamentary privilege, and freedom of the press. Although it was aimed at granting political freedom, the amendment's scope has been extended to all kinds of cultural forms by judicial decisions in the last two centuries. Meanwhile the Universal Declaration of Human Rights, adopted by the United Nations in 1948, succinctly grouped all such freedoms under the heading of 'freedom of opinion and expression' and made it obligatory for the signatory-state to accord this freedom to all its citizens.

The argument for intellectual freedom rests mainly on the primacy of the individual, a concept on which there is not universal agreement. A society is composed of individuals and, in order to function as a society, it demands conformity from the individuals. The individual, on the other hand, may wish to free himself from any or all restraints imposed by the society. While the society aims at self-preservation and the protection of traditional values, the individual voices dissent. Ideally a balance should therefore be struck between rights and duties of both parties. However, as history has demonstrated, this is extremely difficult to achieve. In most cases the conflict ends either in the destruction of the individual or a gradual change in the standards of society. The best one can hope for is that, 'Out of this dichotomy of society and the individual, the tension between the many and the one, must come whatever success there really is, what progress is possible in the future, as in the past.'[1]

Society has various ways of controlling recalcitrant individuals or cultural expressions that challenge its traditional values. Leaving aside the state that imposes censorship of one kind or another, and the Church that prescribes or proscribes, private groups are often formed to act as guardians of public morality. The broadcasting media in the United States is particularly susceptible to private pressures. Groups such as the Citizens for Decent Literature, Daughters of the American Revolution, the General Federation of Women's Clubs, the John Birch Society and the National Legion of Decency have assumed the role of community conscience-keepers in the United States. They have demonstrated their disapproval by burning books and picketing movie houses. In Britain, there are such groups as the Catholic Teachers' Federation and the Public Morality Council, but these are not as influential as their American counterparts. In many cases, individuals, such as Mary Whitehouse, have been more eloquent and successful. Often crowds choose to publicly register their disagreement. In Bangladesh, India and Pakistan, crowds have angrily demonstrated against an author or publication of a book. In 1944, Pablo Picasso's announcement of his decision to join the Communist Party was greeted with unfavourable demonstrations in Paris. Local authorities, both in the United States and Britain, have used their powers to censor

plays and films and to remove certain books from the public or school libraries. The authority to choose school textbooks has been seen by many as a process of thought-control. There has been much advocacy for testing literature and other art forms by 'contemporary community standards' as distinct from 'national' ones. The judiciary in the United States, however, has defeated such claims. Opposed to the attitude of these groups, the American Civil Liberties Union, the American Library Association (particularly its Office for Intellectual Freedom Committee) and the Freedom to Read Foundation have forcefully campaigned for unlimited freedom in the material Americans can read, hear and view.

The system features several kinds of built-in pressures that might come into play. Publishers are capable of exerting economic pressures on the author. It is sometimes feared that the economic pressures faced by American authors 'can seriously affect the contents of their writings'. Booksellers and the Newsagents' Federation in Britain are known to have refused to distribute particular publications or to launch a new newspaper.

The pressure on the media appears to be greater. Just as the owners of newspapers can exert economic pressure on working journalists, the advertisers – be they private or government – are in a position to pressure the newspapers in regard to content. Outside pressures, though informal, have often influenced the media. Internal controls and self-censorship may also operate.

Among the pressures allegedly exerted by the BBC are the ban on a record by Petula Clark for a veiled reference to God, the removal of Malcolm Muggeridge and Lord Altrincham following their comments on the monarchy, and the ban on Noel Coward's records. The BBC is also believed to have periodically compiled lists of forbidden subjects for the benefit of its producers. The Independent Television Authority (ITA) is on record for having refused advertisement of the *Daily Worker* and the telecasting of films by the Institute of Directors for political reasons.[2]

It has been observed that 'the dominant social ethos of private enterprise creates its own constraint: if the British media are rooted in a broadly based social control, American media organizations are bound by powerful economic control mechanisms which exert tremendous influence on both the organizational context of media production and the nature of media output'.[3] The most common impediment to freedom of expression comes in the form of government censorship – not only in time of war, when truth is often sacrificed, but also in peacetime, when the dominant social, political and moral ideologies shape the mind of the censor. We can identify three basic patterns of censorship: preventive censorship, punitive censorship and censorship at the source. The most common form is preventive censorship, in which a piece is censored before dissemination. Punitive censorship does not restrict dissemination, but the person responsible is liable to prosecution by an individual or government in a court of law. The censorship at the source generally applies to the media and involves someone with political or military authority making sure that the facts are concealed for political or strategic purposes.

Interestingly, there is a wide spectrum of views with regard to freedom of expression and censorship. The Freudian approach, for instance, tends to find censorship as both immutable and implacable, rooted, as they are, deep in the human psyche even though they might be fundamentally antagonistic to the desires and needs of the individual. Herbert Marcuse identifies freedom of expression as an ideological construct with specific functions in Western democratic societies and cultures that can be effectively countered by a form of censorship that is creative rather than repressive. Michel Foucault maintains that, in the context of sexuality, censorship plays a more subtle and paradoxical role than the prohibitory one in that it can incite more than prohibit. A recent study puts forward the view that literature is the result, rather than simply the target, of censorship pressure, and thus we are partly in debt to censorship for our concept of 'literature' as a kind of discourse with rules of its own. Another scholar has observed that censorship makes the artist imply rather than state his message directly, instilling the work of art with a subtlety which, in turn, quickens the imagination of the reader or viewer. According to some other authors, three points need to be noted on censorship: (1) that it is present even in texts that seek to elude it, (2) that it is a notion of extraordinary potency, and (3) that we define ourselves as readers, writers and as citizens through it.[4]

Support for censorship has come from some unusual quarters. A number of leftists, for instance, have supported the censorship of racist writings, while a plea has been made to purge racist and sexist ideas from children's reading material. Many feminists favour the suppression of pornography on the grounds that it degrades women. In this case, some of them have joined hands with conservative anti-pornography campaigners who are anxious to protect 'the family' not only from pornography but also from the onslaughts of feminism.

Some hold that 'in its regulation of obscenity, horror and violence, it [censorship] will have universal support, but not in an interpretation of 'offensiveness' which appears to be unduly deferential to monarchy, the Church, and similar institutions.[5] Similar expectations are nurtured for censorship of films: 'The desire to protect the public – the viewers – from depiction of excessive erotica or violence is a concern held reasonably by many reasonable persons'.[6] Others appear to be surer of their grounds for optimism and support for what some[7] have designated as 'censorship of enlightenment': 'there is a consensus in society that displays of violence and sex, publication of personal attacks, some information about government policies and so on should be withheld from the general public'; there is also an 'agreement that laws which prevent people from inciting violence through racist publications or speech are a good thing'.[8]

The fact remains, however, that there is a fairly strong opposing viewpoint holding that the 'democratic philosophy is based on man's ability to reason and decide for himself his own best interests on his educability, and on his conscience', that 'Obviously censorship denies each of these', and that nothing should be withheld 'no matter how hateful or hurtful the idea may be to some individual or group'.[9] The Freedom to Read Statement, issued in 1972 by the American Library Association and the Association of American Publishers says: 'Parents and teachers have a responsibility to prepare the young to meet the diversity of experiences in life to which they will be exposed, as they have a responsibility to help them learn to critically think for themselves', and 'These are affirmative responsibilities, not to be discharged simply by preventing them from reading works for which they are not prepared. In these matters, taste differs, and

taste cannot be legislated; nor can machinery be devised that will suit the demand of one group without limiting the freedom of others'.[10]

Perhaps it will not be out of place to end this debate by bringing in the controversy over the relation between the representation of violence and sex in the arts and the media and crimes of similar nature in society. A British study tends to show that 'reporting of terrorist acts has engendered similar acts' and 'violent films' have led to initiative acts of violence.[11] On the other hand, the National Commission on Obscenity and Pornography, appointed by the President of the United States in 1967, found that the 'analyses of United States crime and illegitimacy rates do not support the thesis of a causal connection between the availability of erotica and either sex crimes or illegitimacy'.[12] What both sides agree upon is that the matter is 'probably impossible to calculate' and that 'the data cannot, however, be said absolutely to disprove such a connection.'

## CENSORSHIP AND PERSECUTION OF PERSONAL CONVICTIONS

It is beyond the capacity of a single author in the present chapter to trace the development of censorship on a global basis from 1914 to century's end. We thus propose in the following pages to examine certain countries, at varying periods, to present a general notion of how authorities have imposed restraints on an array of cultural forms and the media and their contributors and how the latter have responded to such pressures.

We will begin with the case of the United Kingdom. During the First World War, the authorities possessed two weapons to 'effectively restrain editors from publishing materials bearing certain restrictive designation'.[13] These were the Official Secrets Act of 1911, updated and reinforced in 1920, 1939 and 1988, and the system of 'D' notice. It has been alleged that both means were used for matters that had nothing to do with either leakage of official secrets or endangering national security. In 1935, the prestigious auction firm Sotheby's was unable to sell original letters of Lord Nelson to the Duke of Wellington on the grounds that they contained 'official secrets'.[14] By using these same provisions, a reporter of the *Daily Dispatch* was convicted in 1938, the *Daily Worker* was suppressed in 1941 and the *Daily Mirror* was officially threatened with suppression in 1942. The censorship was removed once the war ended, but the committee set up to deal with the press in wartime had survived the war. But then the Cold War had developed, prompting the government to introduce special measures. Such measures led to dismissal and suspension of civil servants and put tremendous pressure on a major firm to dispense with the services of its assistant solicitor because it was found that his wife had been a communist.

It is worth mentioning here that the pacifist activities of Bertrand Russell in the First World War years led to his being fined in 1916, his dismissal from lectureship at Trinity College, Cambridge, six months' imprisonment in 1918, and incarceration again in 1961, for anti-nuclear protest.

In 1923, the United Kingdom signed an international convention for the suppression of the circulation of traffic in obscene publications, which resulted in an increase in prosecutions for obscenity. The government moved the court in 1928 for an order to destroy copies of Radclyffe

Hall's novel *The Well of Loneliness*, which was described by the attorney-general as 'lesbian propaganda'. Having refused to admit expert evidence, the magistrate ordered its destruction. A gradual cessation of prosecution of literary works was noticed in the next quarter of a century, but it was revived in 1954. Curiously enough, *The Decameron*, by the fourteenth-century Italian writer and scholar Boccaccio, was ordered to be destroyed. The same year *Julia* by Margot Bland, *The Philanderer* by Stanley Kauffmann, *The Image and the Search* by Walter Baxter, and *The Man in Control* by Hugh McGraw were among the works prosecuted with a varying measure of success.

The persistent attacks on literature led the Society of Authors to set up a committee, with Sir Alan Herbert as chairman. The committee produced a bill for reform of the law, which was introduced in the House of Commons, but nothing came out of it. Two new laws – The Children and Young Persons (Harmful Publications) Act and The Obscene Publications Act – were adopted in 1955 and 1959 respectively. The latter made an attempt to distinguish literature from pornography.

Under the Post Office Act of 1953, postal authorities seized copies of *Lady Chatterley's Lover* by D. H. Lawrence, which had been banned in the United Kingdom since 1930. Under the new Obscene Publications Act, the first prosecution was brought out against this book in 1960. Having accepted the expert evidence, however, the jury acquitted the work. In 1964, the eighteenth-century novel *Fanny Hill* by John Cleland was banned. The government made an unsuccessful attempt to persuade the French authorities to suppress the publication in France of the original English version of *Lolita* by Vladimir Nabokov, a novel first published in the United States, although the work was never prosecuted in the United Kingdom. A bookshop in London was prosecuted in 1988, under the Customs and Excise Act of 1876, for catering obscene materials to the public, and the objectionable matters included some medical books and works by Oscar Wilde and Kate Millet. Similarly, customs authorities seized the works of Jean Genet – the French petty-criminal-turned-great-literary-figure (and saint, according to Jean-Paul Sartre) – in the original French. The second edition of *Ulysses* by James Joyce met a similar fate. Irish customs seized *The Observer* because it contained an article on family planning, and the Australian customs seized copies of J. P. Donleavy's comic novel *The Ginger Man*.

The 1988 publication of *The Satanic Verses* by the Indian-born British author Salman Rushdie created a worldwide furore. Considered by Islamic fundamentalists as blasphemous, particularly in its depiction of the Prophet Muhammad, the book was banned in a number of countries with significant Muslim communities and burned by Muslims in Britain and elsewhere. The sharpest reaction came from the Ayatollah Khomeini of Iran, who immediately condemned its author, editors and publishers to capital punishment and called on 'all valiant Muslims wherever they may be in the world to execute this sentence without delay'. Rushdie was forced to go into hiding, and abandoned plans to bring out a paperback edition of his novel when its Japanese translator was stabbed to death in 1991. There have been protests against banning the book but more so against Khomeini's *fatwa*, which delivered the death sentence to a citizen of another country and without the due process of a proper trial. A collection of one

hundred works by Arab and Muslim writers, entitled *Pour Rushdie*, appeared in Paris in 1993, defending not necessarily the novel but the right of the author to free speech, and criticizing the inhuman and what some called the 'anti-Islamic character' of the *fatwa*.

However we must also mention the noteworthy signs of progress in the struggle for freedom of expression. The twentieth edition of the *Index Librorum Prohibitorum* – which appeared in 1948, and which had proscribed, among others: all works of Balzac, Stendhal and Emile Zola, the novel *Pamela* by Richardson, *the Prince* by Machiavelli, and *The History of the Decline and Fall of the Roman Empire* by Gibbon (but no works by Marx, Lenin and Freud) – was abolished in 1966. The following year saw the end of theatre censorship. And in 1984, Clive Ponting was acquitted from the charge of violating the Official Secrets Act.

In the United States, 'for a great part of the twentieth century the federal government policed many of the most revered American authors and playwrights and also watched well-known writers from other countries who are read and admired here'. The authorities might suspect American authors for a variety of reasons: the themes they chose for their books, their association with professional writers' groups or meetings, signing petitions, publications they subscribed to, and the places visited within the country and abroad. The FBI maintained dossiers on at least 150 such persons between 1911 and 1968. The list reads like a *Who's Who* of American literati. Some of the names are given below in, more or less, the chronological order in which files were opened on them: Ezra Pound, Walter Lippman, Jack London, Archibald MacLeish, Eugene O'Neill, John Reed, Robert Sherwood, Carl Sandburg, Sinclair Lewis, Edna St.Vincent Millay, Lewis Mumford, Upton Sinclair, Langston Hughes, Theodore Dreiser, Dorothy Parker, Edgar Snow, Erskine Caldwell, Howard Fast, Lillian Hellman, Thornton Wilder, Van Wycke Brooks, Ernest Hemingway, Irwin Shaw, Dale Carnegie, John Steinbeck, Lionel Trilling, Steven Vincent Benet, Moss Hart, Arthur Miller, Quenton Reynolds, William Faulkner, Jessica Mitford, John O'Hara, William Dean Howells, Ogden Nash, Grace Paley, Robert Frost, Erle Stanley Gardner, Robert Lowell, Anaïs Nin, Henry Miller, Richard Wright, Edmund Wilson, Tennessee Williams, Gore Vidal, T. S. Eliot, Norman Mailer, F. Scott Fitzgerald, e. e. cummings, Truman Capote, Allen Tate and Allen Ginsberg. The notebooks and manuscripts of Carl Sandburg were confiscated by the authorities in 1918, and, in 1959, they tried to prevent the 81-year-old poet from going to Russia as they considered such a visit 'extremely undesirable'. Howard Fast, Jessica Mitford and Grace Paley were unanimous in their belief that the activities of the FBI destroyed 'social writing' in America, which had been the hallmark of all great American authors right up to and immediately after the Second World War.

Others who attracted the authorities' dubious attention included British luminary and sculptor Henry Moore and the distinguished American publisher Alfred A. Knopf. The foreign authors that made the government uncomfortable included Thomas Mann, W. H. Auden, Stephen Spender, Graham Greene and Aldous Huxley. Bertolt Brecht, who was forced to flee Germany as we shall see later, left the United States (where he had lived six years) when he was required to testify before the House Un-American Activities Committee in 1948.

Works of Walt Whitman, Theodore Dreiser, William Faulkner, Upton Sinclair, James Cabal, Erskine Caldwell, Lillian Hellman, Edmund Wilson and John O'Hara have been subject to censure by United States authorities. Between 1917 and 1925, Cabal, Dreiser, Henry Miller, Schnitzler and, of course, D. H. Lawrence, won victories in their legal battles with the censors. *Ulysses* by James Joyce, which was once burned by customs officials, was allowed to be imported into United States in 1931. In the 1930s and 1940s, a host of authors including James Farrell, William Faulkner, Erskine Caldwell and James Cain faced the censor. Censorship trials of *Lady Chatterley's Lover, Fanny Hill, Tropic of Cancer* by Henry Miller, *Memories of Hecate Country* by Edmund Wilson, *Ten North Frederick* by John O'Hara, and *End as a Man*, a play by Calder Willingham, were important landmarks cases.

During the First World War, a law barred 'matter of a seditious, anarchistic, or treasonable character' from being handled by the United States Postal Service. Some considered that between 1917 and 1927, the Postmaster General was given more power in any other period of American history. The Second World War brought an Office of Censorship, whose main target was material of foreign origin that was 'inimical to the war effort of the United States or contrary to the interests of the United States or its Allies'. In the 1950s and 1960s many attempts on the part of the Postal Service to censor were thwarted or modified by court orders.

Between 1948 and 1961, against the backdrop of the Cold War, post-publication cases were brought against Communist Party leaders. Attempts by the authorities to suppress such publications as the *Pentagon Papers*, concerning the Vietnam War were defeated by the court. A greater victory came with the passage of the Freedom of Information Act (1966, 1974), which requires government officials to explain why some information should not be released.

Thanks to the efforts on the part of state and local censor boards and organized religious groups, combined with the film industry's own regulations, an entire generation of Americans grew up with the 'family film', characterized by some as 'an artistically immature, morally safe, and highly profitable entertainment'. During the Second World War, the film industry enjoyed the same privilege as the press and radio and was not subject to war censorship. The advent of television in the 1950s, which affected the film industry adversely, and the inclusion of films within the scope of the First Amendment, made films 'freer in the law and provocative in the content'.[15] But the post-war period was dominated by the Cold War, and the fear of communism was taken to new heights by the House Un-American Activities Committee (HUAC). Deciding to investigate communist influence in the film industry, it called 100 witnesses including many of Hollywood's most talented and popular figures to testify on their alleged communist connections or those of their associates. A group of eight screenwriters and two directors (Alvah Bessie, Herbert Biberman, Lester Cole, Edward Dmytryk, Ring Lardner Jr., John Howard Lawson, Albert Maltz, Samuel Ornitz, Adrian Scott and Dalton Trumbo) refused to answer questions and were sentenced to imprisonment. The members of the Motion Pictures Association immediately published the Waldorf Declaration, sacking the ten and expressing support for HUAC. Known as the 'Hollywood

Ten', these courageous individuals were blacklisted by the studios, and hundreds of others were fired from the industry. Throughout this era, filmmakers mostly produced conservative works, leading to a period of creative stagnation. The blacklist disappeared in the 1960s. In 1965, the court decided that prior censorship of films was unconstitutional, thus ending a long battle between the industry and the censors. The elimination of almost all censorial standards except obscenity, and the liberalization of the concept of obscenity itself, have completely altered the condition of filmmaking in the United States.

The rise of Nazism in Germany brought about a period of persecution of the arts and artists. The ideology of Nazi racism was fully applied to the field of culture, excluding from it all 'non-Aryan' elements and attacking what was called 'Negro culture' as a whole. Censorship of all forms of art, films and music was carried to the extreme. The works of Igor Stravinsky, the celebrated Russian-born composer who was then living in France, and those of Paul Hindemith, one of the leading German composers and musical theorists, were banned. Wilhelm Furtwängler – who conducted an orchestral version of what is considered Hindemith's greatest work, *Mathis der Maler*, with the Berlin Philharmonic in 1934, and supported the opera in the press – was barred from conducting it. As a result, Hindemith eventually left Germany for Turkey. Nazis threw a stink bomb into a Frankfurt theatre during the performance of Bertolt Brecht's *Mahagony*, and Kurt Weill, who directed Brecht's *Die Dreigroschenoper (Three Penny Opera)*, was also banned. For Brecht, whose books were burned and citizenship withdrawn, exile was the only viable alternative. The film version of Erich Maria Remarque's novel, *Im Western nichts Neues (All Quiet on the Western Front)* was banned for 'reasons of national prestige', and the novelist himself was also forced to flee Germany. The art works of Ernest Barlach, Wassily Kandinsky, Paul Klee and Lyonel Feininger were removed from an exhibition in 1930. Similarly Käthe Kollwitz's works were removed from two exhibitions in 1934 and 1936, and the police destroyed engraving plates of George Grosz, who fled to the United States in 1932. In 1934, the architect and educator Walter Gropius secretly sought exile in England, after the government closed down the famous Bauhaus school for architecture and applied arts, which he had founded in 1919. The frescoes executed in the Bauhaus by Oskar Schlemmer were ordered to be destroyed. Max Pechstein, painter and printmaker, was forced to resign his teaching position at the Berlin Academy when the Nazis declared his works 'decadent'. After Hitler came to power, modern art was virtually outlawed in Germany, and the function of art was reduced to the glorification of Nazism and the Führer. As a consequence of Nazi racism, studies of race and intelligence were outlawed in the German Democratic Republic.

Formal censorship was introduced in South Africa in 1937 to restrict attacks on Hitler and Mussolini in the foreign press. In doing so, the South African government hoped to eliminate 'anti-national' and 'un-national' members of the press and 'discipline' the radio service. Prior to 1950, censorship in South Africa served three related purposes: the continuation of the political economy of colonialism and its attendant social mores; the adoption of legislation designed to control the areas inhabited by blacks; and the repression of the trade union movement and communists.

After 1950, a series of new laws established an extensive censorship and self-censorship structure. South Africa carried on the policy of apartheid and denied all freedoms to the black majority. Under the Suppression of Communism Act of 1950, anybody suspected of non-compliance with the regime's policy could be prosecuted on various charges, including sedition. In the early years following the Second World War, when the judiciary was still independent, the acquittal of many accused of sedition greatly embarrassed the government. In retaliation, the parliament then removed certain cases involving sedition from the jurisdiction of the courts.

Between 1950 and 1990, thousands of books, newspapers and other publications were banned on the orders of the Ministry of Interior. This ban was later re-enforced by the Publications and Entertainments Act of 1963. The children's classic *Black Beauty* was seized by the customs authority, presumably because of its title. The Suppression of Communism Act, with its many subsequent amendments, and later, the Internal Security Act of 1982, authorized the government to ban organizations and individuals. Such organizations included the African National Congress, the Communist Party of South Africa and the Pan African Congress. Among the more than 2,000 individuals concerned by such legislation was Stephen Biko, banned for black activism in 1973, at the age of 17, arrested four times between 1975 and 1977 and jailed in Port Elizabeth. Biko eventually died of brain lesions in captivity in 1977. Even such brutalization could not undermine the fighting spirit of the black people. Their undisputed leader, Nelson Mandela, convicted of treason in 1964, suffered imprisonment for 28 years (1962–90). In 1994, Mandela was overwhelmingly elected as South Africa's first black president.

The Russian Revolution of 1917 established the world's first socialist state, the USSR. Within days of the revolution, censorship was put in place to control a hostile press. Intended as a temporary measure to be withdrawn after the restoration of normalcy, censorship was institutionalized in 1922 with the creation of the Central Censorship Office, empowered with final authority over printed matter and the performing arts. The Office, which became one of the most effective systems of censorship, endured until the demise of the communist regime in 1991. During Lenin's lifetime, a certain degree of tolerance was allowed in cultural matters, but no political dissent was tolerated. The early days of Stalin's rule were also less dogmatic in the cultural field. On the contrary, the theory of Socialist Realism, which required all creative people to serve the cause of the proletariat revolution, was adopted in 1934, but strong censorship was nevertheless enforced.

Soviet censorship required pre-publication supervision of manuscripts. The censor was guided by the infamous *Perechen*, a large volume listing all the types of information to be banned in the media. The aim was to ensure that no state secret was divulged and nothing against the communist ideology propagated. The censor did not directly prevent information from appearing; instead when he noticed something incompatible with the ideological directives, he made a recommendation to the editor who had submitted the text. Only the editor was allowed to modify the manuscript, but he invariably followed the censor's recommendation, for it was common knowledge that non-compliance would be reported to the relevant authorities of the Communist Party.

The Soviet system not only empowered the censor but also led to a great deal of self-censorship on the part of the authors themselves. Khrushchev sanctioned the suppression of Boris Pasternak's *Doctor Zhivago*, which was published in the West in 1957 (the novel was banned in the Soviet Union until 1980), and the author was prevented from accepting the Nobel Prize for literature awarded to him in 1958. Khrushchev did however allow the publication of *One Day in the Life of Ivan Denisovich* by Alexander Solzhenitsyn. But scores of other writers and artists were denied such freedom and reprimanded or persecuted. To escape the censor, a few authors, like Pasternak, arranged publication of their manuscripts abroad with the risk of its consequences. In certain cases, uncensored versions of works were circulated privately.

In order to stifle all opposition, the Romanian Government's denial of the freedom of expression took a curious form. By a 1963 decree, the government was authorized to decide who could possess a typewriter. The right to own a typewriter could be denied on grounds that a person had a police record or that his or her conduct posed a threat to public security. In collaboration with the local militia, the Ministry of Internal Affairs maintained records on the production, use and maintenance of typewriters, typewriter ribbons, duplicators, ink and other materials for the reproduction of printed matter. Even the repainting of typewriters could only be carried out in specific workshops.

In 1989, Israel, which has a rigid censorship system, banned the use of fax machines in the Gaza strip, confiscated all such machines found in the possession of journalists and made buying or operating a fax machine subject to obtaining a special license. The Israeli State bans anything that fosters Palestinian nationalism or extols Palestinians' history. In 1986, a Palestinian book exhibition was raided, some of its organizers arrested and a thousand titles confiscated. Thousands of books are banned in Israeli-occupied territories. Journalists are placed under severe restrictions in Israel – from controlling their access to the West Bank and the Gaza strip to placing them under house or town arrests – while authors who do not conform to the government line are often held, with or without trial.

Following the revolution in 1949, China took the same path as the Soviet Union in the early years after its revolution. The address that Mao Zedong delivered in Yemen in 1941 was considered a manifesto for writers and artists. The principle dictated that the creative individual should come closer to the people and reflect their revolutionary spirit in his works. In order to achieve this, he was required to abide by the dictates of the Communist Party. Strict censorship imposed in the 1950s was somewhat relaxed in the early 1960s, but that was more than offset by the Cultural Revolution, which lasted from 1966 to 1976. At that time, the cultural system in China was seen as elitist and tending towards 'bourgeois values', and Mao sought to correct the situation. His wife, Jing Qing, who was later decried as the leading figure of 'the Gang of Four', was anti-intellectual by conviction but gathered a band of radical intellectuals to implement the new cultural policy. According to an official statement, 'They totally negated the cultural accomplishments achieved under the guidance of socialist cultural policies in the seventeen years since the founding of the People's Republic, ruthlessly attacked and persecuted literary and artistic workers, banned the splendid Chinese and foreign cultures, both ancient and modern'. Many intellectuals were verbally abused and physically attacked by the Red Guards – the urban groups who enforce the principles of the revolution – and were subjected to forced labour, imprisonment and, in some cases, abusive treatment leading to death. Among those persecuted were the historian Wu Han, deputy mayor of Beijing, and esteemed creators like Peng Zhen, Lu Dingyi and Zhou Yang.

The end of the Cultural Revolution brought the return to the old policy of 'serving the people and socialism'. This implied serving 'all those who support socialism', 'eulogizing communist ideas and moral values', bringing up a new generation of socialist-minded young people and raising society's ideological, cultural and moral levels'.[16] The special role of literature and the arts in achieving these goals is acknowledged, and there are signs of some relaxation of the rigid cultural atmosphere.

In British India, the press was never free, and only the extent of the restrictions varied from time to time. The First World War coincided with a growing national aspiration in India and the intensified activities of the Indian revolutionaries in Germany and the United States. The government, already armed with the Press Act of 1910, was accorded more powers under the Defence of India Act of 1914, which imposed rigid censorship. The press was expected to contribute to ensuring state security. Thus approximately 10 per cent of Indian newspapers and printing presses were under fiscal control. Journalists were harassed, muzzled or imprisoned, and the government established a Central Publicity Bureau to inform the public of events at home and abroad. During the war years, over a thousand titles were banned.

As the political movement for freedom gathered momentum after the end of the war, the government applied the numerous acts available in its legislative arsenal, but shortly afterwards some concession to public opinion were deemed necessary. In 1922, the Press Act of 1910 and the Newspapers (Incitement to Offences) Act of 1908 were repealed.

With the launching of the Civil Disobedience Movement, the government sought a greater degree of authority to suppress the press through the Indian Press (Emergency Powers) Act of 1931 and the Foreign Relations Bill of 1932, both of which were widely used. Between March and June, 'the British had issued formal warnings to 150 publishers and banned approximately 400 books and tracts, 40 posters and 50 newspapers.' Nationalist writings were prosecuted, with their authors often jailed. The Indian newsmen founded the Free Press of India, an independent news agency, while clandestine presses operated and 'potentially dangerous writings' widely circulated.

The Second World War years marked a step backward in India's struggle for freedom of expression. Expanded censorship was imposed in 1942 and continued until 1945; many newspapers and periodicals suspended publication, and the number of banned books had swelled. Indian and Pakistan had inherited the legal and administrative system left by the British. Although India maintained stringent press laws related to national or state security, sedition, obscenity, heresy or blasphemy, the judiciary and the press associations have successfully countered these attempts to enforce censorship.

In Pakistan, power over the press and other published material was further strengthened by the Public Safety Act

of 1949, the Security Act of 1953 and the Defence of Pakistan Rules of 1965. 'In a continuing atmosphere of political turmoil newspapers were censored, forced out of business and brought under stringent security provisions'. Following the adoption of Pakistan's first constitution in 1956, the situation appeared to have improved, but frequent imposition of martial law led to further restrictions on the freedom of expression. The gradual Islamization of the country since the 1970s fostered more severe restrictions either by amending the old laws or introducing new ones like the far-reaching Blasphemy Law. In a bid to control the freedom of expression, the authorities have burned books, subjected journalists to physical punishment and authors to harassment and arrests.

Periodic long-time military rule in Bangladesh has interfered with the freedom of expression in general, but an attempt by conservative voters and legislators to pass a Blasphemy Law similar to the one in Pakistan has failed.

The history of censorship and the struggle for freedom of expression in the twentieth century has been marked by triumphs and setbacks. As we begin the twenty-first century we hope that it will portend a freer world for humanity.

## HIGH CULTURE AND POPULAR CULTURE

*Theotônio dos Santos*

The notion of 'high or learned' culture resulted from the growing individualization of the cultural producer during the European Renaissance. The cultural producer (craftsworker, scholar, member of a religious order, etc.) generally belonged to the community and seldom acted as a separate, independent agent. During the sixteenth and seventeenth centuries, the development of the royal courts and the rise of a bourgeoisie enriched by the expansion of world trade paved the way for the emergence of painters, sculptors, singers, musicians, actors, playwrights, poets and writers, who became major individual figures recognized and lionized by their patrons or customers (the monarchical state, churches and convents, wealthy individuals, etc.). This increasingly professional activity gave rise to unique and inimitable works of art as part of a well-defined cultural world.

In the eighteenth and nineteenth centuries, that cultural world was marked by the baroque and classical styles, interpreted by many creative geniuses who laid the foundations of Western art and culture. Polyphonic music, the theatre, opera, dance, painting and sculpture (as disciplines independent of architecture), poetry and novel writing, in addition to the development of science, which influenced these autonomous forms of cultural expression – all this gave rise to a cultural heritage in the West that was distinct from the cultural production of the past, and was presented as 'high culture', deeply rooted in what was termed Greco-Roman antiquity.

Access to high art required specific training and learning through schools, universities, academies and conservatories. Appreciation of that cultural output required a process of initiation, since it was produced and consumed in these specially designated contexts. This was the world of the Enlightenment: a philosophical, scientific, moral and aesthetic cultural model that was to conquer the whole of humanity, since it was a product of pure reason and of the match between the social order and the requirements of human nature. Such, at least, was the European vision from the eighteenth century until the Second World War.

### TRADITIONAL AND POPULAR CULTURE

High culture developed partly in contrast to a traditional rural or popular culture, and to the cultural and religious rites that took on special importance in Europe during the Middle Ages. But that period also saw the development of a new and distinctive urban culture that was no longer based on folklore, which tends to rely on collective, non-evolving and non-professional work.

Popular culture sprang from a number of innovations: the advent of the press and printing; the generalized use of ink and canvas; the progress of acoustics and musical instruments; the building of places for public entertainment and new techniques of communication. This new culture also developed from the formation of bourgeois tastes and of an increasingly complex and differentiated civil society which, in several revolutionary waves, took possession of the gardens and parks of the nobility and the monarchy to establish its own cultural world in which entertainment, emotion and sensuality had a much more prominent role than in the rationalistic 'high culture' of the Enlightenment.

The new bourgeois world often sought its roots in the tradition of ethnic groups, which seemed more adept at developing lively arts, such as gypsy music that inspired the songs of Central Europe and Russia and the Spanish flamenco (just as it inspired the learned musicians of the romantic and nationalist schools), the songs of southern Italy or the Viennese waltz, which originated as popular expressions before reaching the salons and the public stage. In America, the rich cultural tradition of African slaves gave rise to Negro spirituals and jazz, whose subsequent development often mingled with learned music. It is curious that this artistic world, which includes lyrics from both popular and learned sources, often became involved in the theatre, imitating the opera and ballet of the courts, and subsequently of the national theatres, with lighter versions such as vaudeville, the *zarzuelas*, North American musicals and several other similar forms of expression such as the Japanese kabuki theatre (Plate 129), which popularized the classical theatrical discipline of the Noh theatre or even Beijing opera.

The bohemian world was also the setting for much aesthetic production that broke with classical high culture while not forsaking its elitist credo of 'art for art's sake', that is, the pure, autonomous and independent artistic work. Movements such as impressionism, art nouveau, expressionism, futurism and other schools of abstraction, dada and surrealism did not break completely with high culture, despite their search for broader and more accessible

techniques that dispensed with the classical form and content and the romanticism and realism of the nineteenth century.

Without breaking with classic techniques and forms of representation, they sought new artistic and aesthetic content closer to the common people (understood as the European peasant, the American Indian or the Japanese peasant, all idealized as the source of human purity and spontaneity destroyed by civilization) or even, in the case of the socialist states, of the modern working class.

## THE INTERACTION OF HIGH CULTURE WITH POPULAR CULTURE

As the state cultivated high culture – particularly through its system of education from the primary to the university level, the religious schools and ideological associations, museums, art galleries and national theatres – the new structure of popular culture was gaining unprecedented momentum. It entered the brothels, the popular theatres, the newspapers and the popular publishing houses that were increasingly catering for a non-official readership. Among the new potential audiences were women, who, being denied access to high culture (since they were debarred from formal education, above all secondary and university), found instruction in novels, newspaper serials and women's magazines covering fashion and other pastimes.

The strongest impact was made by the advent of new techniques such as linotype typography (Plate 130), photography, radio and cinema and television. At the same time, industrial objects were influenced by new aesthetic principles unrelated to the classical style. This far-reaching revolution eventually affected high culture itself. Under the pressure of the social conflicts of the late nineteenth and early twentieth centuries, high culture was evolving, with notable changes in the means of aesthetic production. The introduction of aesthetic considerations in mass production and the capability of reproducing works of art for a much broader public led to dramatic possibilities for art. The Russian Revolution and the revolutionary wave following the First World War produced a rigorous quest to exploit mass production for art's sake. The Russian avant-garde and subsequently the Bauhaus school (which offered a refuge for some of those who were discontent with the direction the Russian Revolution was taking) attempted to change the concept of art by subordinating it to functionality.

The art object was becoming transformed into work of intrinsic value increasingly integrated into the industrial revolution. It was the period of the advance of the scientific management of production, referred to as Taylorism or Fordism: mass production based on the division of labour executed by machines and by workers. It was a time of increased productivity through the full development of mechanics and of electric and fossil-fuel energy. Artistic production had to take into account the new materials, mechanization, mathematics and engineering. Art had to be reintegrated into daily life. A break was needed with the traditional theatre scene, with museums and with any notion of a performance, in order to take art to the streets. A break was needed with the opposition between high culture and popular culture, the latter being turned into an applied expression of the former.

But the result was not initially encouraging. The aesthetic revolution of the Russian avant-garde did not win support among the masses and was easily crushed by the Stalinist state. It must be remembered, however, that the USSR was predominantly a country of peasants and that it was very difficult for the rural population moving to the urban centres to identify with the modern proposals that portrayed an abstract and mechanical industrial world devoid of sensitivity. The same oppression and suppression occurred in Nazi Germany with the Bauhaus movement. In addition, no governments were ready to accept the anarchist content of the programme of the surrealist artists. It is interesting to note, however, that the Mexican Revolution remained faithful to its artists. Mexico's mural artists, nationalist musicians, 'magical-realist' writers and even surrealist production were maintained and supported by the revolutionary state. Of course, after the Second World War, Mexico was unable to resist the pressures of the industrial culture of the United States.

From the Second World War onwards, the apparatus of learned culture came into stiff competition with the nascent cultural industry. The cinema, photography, radio and television were new activities based on mass production. The cinema developed its own aesthetics, which conferred upon it the status of art (the so-called seventh art). Photography also received significant aesthetic recognition. Radio and television never achieved a similar status but attracted novelists, playwrights, film directors, and several other categories of professionals who flirted with high art. The novel and the theatre ultimately incorporated substantial aesthetic aspects of the cinema and mass media. Pure scientists also approached these mass media. In some cases, such as the British Broadcasting Corporation (BBC), major documentary schools were born.

Alongside the new communication media, typography was advancing very rapidly, with offset techniques, and opening up opportunities for publications. Then came the famous comic magazines with a new type of illustrated literature. Mass-reproduced drawing became highly sophisticated under the influence of expressionism and other aesthetic trends. Comics began as literature for young people but then progressed to an adult readership. The Japanese mangas offer an example of this changing pattern, which had substantial precedents in the nineteenth century. Comics were later to influence pop art of the 1960s and 1970s.

Popular music developed immensely in the period, relying on full orchestras and giving rise to jazz and the 'big band' sound. Jazz had a very strong influence on traditional music in the 1920s and 1930s. Gershwin (Plate 131) and Cole Porter brought jazz to the stage with highly acclaimed musicals. The progress of the new electronic instruments cleared the way for more technically complex shows in the 1960s. The Beatles emerged from working-class areas and raised rock and roll (originally regarded as a white version of jazz) to new heights. The great rock concerts were part and parcel of the movements contesting the Vietnam War or defending other causes and drew audiences in the hundreds of thousands. This new young public danced, demonstrated politically and, above all, indulged openly in new behaviour generally prohibited in other circumstances, particularly drug-taking. The way was open for youth gangs associated with different versions of rock, rap and other expressions of a new social and cultural phenomenon, as a by-product of unemployment and social exclusion, while at the same time

reflecting the development of technology and more leisure time in a demographic structure where young people achieved a pre-eminence.

The appropriation of this cultural dynamism by the communication media has sometimes been hesitant but, by and large, they sought to exploit these phenomena. The world of the young and of rock music influenced the language of the audiovisual systems. The rapid cut, the unfinished sentences, a specific vocabulary and the crude jokes gave rise to the clips that take up more and more television time, particularly on programmes conceived for young people. There is growing perplexity in the fields of aesthetic, social and political thinking in the face of these changes. Many believe there to be a growing opposition between the various elements of this technological revolution: high culture is said to be threatened by the cultural industry; reading is reportedly threatened by the audiovisual media, and the cinema is seen as facing extinction because of television and videos. The latter in turn are threatened by multimedia, and so on. There should be some scrutiny of these attempts to theorize about such phenomena. It is regrettable to note, however, that they often reflect more the authors' prejudices than any in-depth study of humanity's cultural evolution or revolution.

## THEORIES ON HIGH CULTURE AND POPULAR CULTURE

While the Enlightenment was certain about the superiority of its cultural programme, Romanticism expressed doubts when insisting on the thematic presence of the universe of the peasants, indigenous inhabitants and others. However, the point was to incorporate these other realities as ingredients of modernity. The clashes of the late nineteenth century were already revealing alternative social movements. The workers were pressing for a new economic, political and cultural order. During the Russian Revolution, the cultural proletariat postulated the superiority of proletarian culture, but saw themselves as the beneficiaries of high culture, insisting that it be opened up to the world of industrial production. The Bauhaus also called for the triumph of the useful and the functional created by mass production, but was bent on reforming high culture. Marxist authors like Walter Benjamin attempted a synthesis between high culture and the nascent urban popular culture. Bertolt Brecht attempted such a synthesis in the theatre. But the Nazis seemed to have won this battle by turning the masses themselves into a spectacle, giving them a group identity and dictatorial political power without any clear limits. Brecht sought to educate the masses through the performing arts, while the Nazis succeeded in mobilizing them by the same means. On the other hand, authors like Gabriel Tarde in the late nineteenth century, and Ortega y Gasset in the 1920s and 1930s, regarded the emergence of the masses as a threat to high culture and to human values in general. They feared the totalitarian force that derived from the political exploitation of the masses.

Adorno and Horkheimer were perhaps the first to identify the new popular mass culture as a culture industry. This was not just an expression of the temperamental behaviour of the masses, but reflected a manipulation that was both political and a blueprint for civilization, a totalitarian threat out to banish the rationalist modernity

that high culture signified. The defence of reason, even though critical reason could question its elevation to an absolute by the Enlightenment, was the defence of civilization against the totalitarian threat of Nazism, Stalinist bureaucracy and, subsequently, of the culture industry dominated by the capitalist production system. The critique of Adorno and Horkheimer did not seek to understand the dialectic offered by this culture industry, but they saw it as an expression of capitalist mercantilism or totalitarianism. They spoke out for a proper defence of high culture – despite its class content – insofar as it allowed the progress of human thought independent of the objectives purely geared to mercantilism, entertainment, utilitarianism and the manipulation of emotions and feelings of mass culture converted into an industry. And while their criticism was really directed against the Enlightenment itself (which they sought to transcend in a positive version), the readers of their essay on the culture industry tended to completely negate the culture industry, which they considered to be a monster spawning alienation. The notion developed by Althusser, many years later, of the state ideological apparatus bolstered this approach by adding to it a structuralist methodology viewing capitalism as a self-sustaining system whose components were always functional in terms of its self-reproduction. Both mass culture and bourgeois high culture were viewed as instrumental in constituting the system and reproducing it. Marcuse accounted for this discourse by perceiving modern capitalism as a one-dimensional system. There was no longer any internal contradiction between the components of the system, and it could only be negated by external factors. The dialectic no longer existed, and Marxism became just one more modality of non-dialectical formalist thought. Many studies of the 1960s and 1970s embraced this approach.

Without completely breaking with these methodological problems, we must highlight another line of criticism represented by the studies on the domination exerted by the major economic groups and the imperialist states over the communication media. Authors such as Herbert I. Schiller, Armand Mattelart and Ariel Dorfman applied the dependence theory of international domination to the field of culture. In the 1970s, this line of thought reached UNESCO and gave rise to the proposed New World Information Order. The aim in fact was to transform into a real process the historical reaffirmation of the peoples subjugated by the expansion of European capitalism from the sixteenth century up to the Second World War. The point was to show that the world system (which centred on European countries and subsequently the United States) had given rise to a cultural Eurocentrism that took characteristics intrinsic to European societies and cultures and to the process of primitive accumulation of capitalist expansion and identified them more generally with civilization, modernity and humanity. Among these idiosyncratic European elements was the racial superiority of the white peoples. European racism was the outcome of the triumph of white peoples over other peoples, but in particular, starting in the nineteenth century, the triumph of the Anglo-Saxon peoples who claimed to be identifiable by racial characteristics. This even entailed discriminating against the whites who had previously been hegemonic but were now decadent (perhaps on account of mixing with the African peoples). Slaves were also excluded, since their enslaved past ruled them out of Western civilization.

The criticism of Eurocentrism and its view of modernity launched by the emerging peoples is compounded by the complaints of the feminist movement, which revealed certain ethical and aesthetic values and the dominant and hegemonic position of the patriarchal system consolidated in the West since Greco-Roman times. High culture thus saw itself under attack from various flanks. While it was previously branded as elitist and disdainful of the world of the working class and the poor in general, its Eurocentric, racist and sexist content was now also decried. But mass culture and the culture industry were of no avail in overcoming those ills questioned by the development of new social forces originating in the late nineteenth century. The efforts to develop a counter-culture, an alternative or underground culture, in the 1960s and 1970s, or even a New World Information Order, ended in the 1980s with the absorption of its myths and proposals by the Establishment's culture industry or its forceful replacement by a process of cultural globalization dominated by the major economic groups.

This prompted an enormous strengthening of the structuralist and pessimistic approach through such authors as Derrida and Foucault, who led the way to the idea of a post-modernity in which the cultural forms are dissolved in a flow of never-ending changes. In this new context, high culture and mass or popular culture and the culture industry all merge into an indeterminate dynamic process. In this pessimistic context, UNESCO's *Report of the World Commission on Culture and Development* is of great use in that it has sought to redefine the role of culture, high or low, in a globalizing world where pluralism, creativity and the support for social movements and for women, children, young people and other minorities can thrive through the defence of the cultural heritage of humanity, environmental protection, and cultural policies in tune with the changes of our time.

## CULTURE, NATIONAL CULTURES, CROSS-CULTURALIZATION, ACCULTURATION AND INCULTURATION

*Henri Madelin*

### INTRODUCTION

According to the American anthropologist A. L. Kroeber, 'the most significant accomplishment of anthropology in the first half of the twentieth century has been the extension and clarification of the concept of culture'.[1] This terse statement seems pertinent as far as the notion of *extension* is concerned, but much more debatable as regards *clarification*. The concept of culture made great strides in the last century, encompassed numerous fields and became ensconced at the heart of several disciplines in the social sciences. But the gains in extension were often made at the expense of clarification. By overusing the concept of culture, scholars became somewhat lost in the construction of a sort of colourful mosaic that misinterprets this complex reality to such an extent that there has been a growing scepticism towards what specialists tell us about 'culture'.

Our aim in this chapter is therefore to attempt to bring some order into the area generally called 'culture' and to make a number of necessary distinctions enabling us to refine our understanding of it in the context of our times. As the philosopher Jacques Maritain liked to say, it is important to be able to 'make distinctions in order to unite', to decompose in order to reassemble. The firmament of culture has been shattered and lies scattered in a thousand pieces. The task is to find these pieces and bring them together in order to reconstruct a new fountain of light once more able to play in the sunlight of understanding. We shall thus address what should be understood by the terms *culture, cultures, national cultures, enculturation, cross-culturalization, acculturation* and *enculturation*.

### CULTURE: THE PORTAL OF HUMANIZATION

To begin with the simplest notion, we may say that a human being can truly accede to humanity only through *culture*, that is, by putting nature's resources or wealth to good use. During the Neolithic period, technology made it possible to transform the soil and cultivate it so as to make it propitious for those capable of nourishing themselves from the fruits of the earth. This is the meaning of the word *agriculture*.

In the words of Vatican II:

> The word *culture* in its general sense indicates everything whereby man develops and perfects his many bodily and spiritual qualities; he strives by his knowledge and his labour to bring the world itself under his control. He renders social life more human, both in the family and the community, through improvement of customs and institutions. Throughout the course of time, he expresses, communicates and conserves in his works great spiritual experiences and desires so that they might be of advantage to the progress of many, even of the whole human family.[2]

Those who wrote these words for Vatican II were not content merely to enumerate the meanings of the word *culture* in the life of each individual and in the origin of human societies. They noted that the word often has a sociological and even ethnological meaning that makes it possible to speak of a *plurality of cultures*. It is like a ladder that enables us to pass from the level of the individual to the collective level, and from cultures in the plural to a national culture, rising to the concept of a universal human heritage.

> Different styles of life and multiple scales of values arise from the diverse manner of using things, of labouring, of expressing oneself, of practising religion, of forming customs, of establishing laws and legal institutions, of cultivating the sciences, the arts and beauty. Thus the customs handed down form the distinctive heritage of each human community. It is also in this way that there is formed the definite, the historical milieu which enfolds people of every nation and age and from which they draw the values that permit them to promote civilization.[3]

In all periods, lifestyles, value systems, legal codes, legislation, work, science and technology, religion, art and aesthetics form a cultural fabric. This can be seen in fundamental

expressions, ethnic traditions and national customs. Our own age is even witnessing the dawning of new aspirations to rise to wholeness and to the search for a global civilization encompassing all humanity.

## NATIONAL CULTURES AND CROSS-CULTURALIZATION

The conclusion established by Max Weber in the wake of the First World War remains valid: national culture takes shape under the pressure of violence. The modern state in fact appropriates legitimate and legitimized violence for its own benefit, removing it from the intermediate groups, clans and social classes that had historically made use of it. If there existed only social structures from which all violence had vanished, the concept of the state would have disappeared and nothing would remain but 'anarchy' in the literal sense. There is an intimate relationship between the state and violence, and its manifestations can be seen all over the world, all the more so as a dark and centralized nationalism is taking shape at the internal level and is aggressively seeking to spread to other nations.

'Today', Max Weber explains, 'we have to say that a state is a human community that (successfully) claims the monopoly of the legitimate use of physical force within a given territory. Note that "territory" is one of the characteristics of the state'.[4] The national state is not completely encapsulated in the privileged use of violence, but rather resorts to it in decisive moments as a 'specific means'. The more a country's cultural nationalism attempts to be powerful, the more the politicization of the country becomes necessary.

In order to exist in space and time, a national culture needs an administrative tool, which requires financial resources, a specialized body of civil servants of all ranks, and a bureaucracy at all levels. For a national culture to bear fruit, people with different views, organized opposition groups, and specific ways of dealing with the minorities scattered throughout the country and abroad have to be allowed to mingle. This implies a long-term effort concerning the myths that make up a collective history, the management of a system of symbols, openness towards a liberated world of the imagination, and help from an ideology that affirms individual identity.[5]

Behind the collective screen, however, the rise of individualism among ordinary citizens and within groups is being noted everywhere. It is promoting the advent and intermixing of cross-cultural networks. It may promote the emergence of counter-cultures that disagree or conflict with the official tone or aggressive character of the national culture. This can be seen in all parts of the world. A person is no longer identified with a single nation, a single system or a single culture. British political scientist Derek Urwin has rightly noted that in every individual, even if he or she is a migrant, there exist two conflicting rights: the 'right to roots' and the 'right to choose'. Rootedness constitutes the essence of identity since it helps us to answer these crucial questions: Who am I? What am I? Where am I? But other questions also arise: What will I become? How can I progress? The right to choose and change is just as important since every person may wish not to remain enclosed within a community that would limit his or her horizons. Individual or fragmentary cultures can therefore call into question the

symbolic order of a nation, come to arrangements with state institutions, bring pressure to bear on the leaders of countries, and exert an appeal by offering new concepts to the imagination.

Likewise, no nation can now remain fixed in the culture that it inherited. Education, travel and the new means of communication cultivate a critical outlook and circumvent the repetitive aspects of a national culture. The national state, as Daniel Bell has stressed, is too large to spot and assess the networks that are spreading at the micro-cultural level, and too weak to counter the pressure of the macro-cultural forces now capable of crossing borders. Languages, different forms of music, films, trade, television and radio programmes, the weaving of new relationships across the Internet, groupings with a religious basis, and various other pairings are joining forces to encourage a process of cross-culturalization. This combines contributions from neighbours and from the world at large. The national culture is expanding, changing its priorities in its system of values, and absorbing new contributions that one day will be the foundations of reconciliations, alliances and agreements between nations that were once enemies. Interest is suddenly growing in searching for long-ignored treasures beyond national borders. Thus the title of a book written by the Senegalese wise man, Hamidou Khane, is justified: *Comme si nous nous étions donné rendez-vous* (As If We Had Arranged to Meet). Cross-culturalization has come of age.

## THE SYMBOLIC, THE UNCONSCIOUS AND ENCULTURATION

Ethnologists tend to focus on past cultures. They decipher texts and monuments and artistic work that preceded present-day cultures. By contrast, anthropologists observe the present. They seek to grasp how people live in the here and now, understand each other and express themselves, and give significance to their own lives and the lives of others. This is why the over-emphasized distinctions between the culture of 'elites' and 'popular' culture ignore the cultural background that, from the beginning, nurtures all members of a society. Likewise, the separation between 'primitive' art and 'modern' art is unfortunate. A true work of art is valuable in its own right, regardless of the period that produced it.

Unlike science, which is linked to progress, art is independent. Thus works of art are free and innovative creations, produced under the circumstances made possible by the techniques of its time. As Max Weber stated, 'A work of art which is genuine "fulfilment" is never surpassed; it will never be antiquated.'[6]

The American anthropologist Clifford Geertz has had a profound influence on the definition of the culture of a given society. Geertz lays stress on the role of the symbolic as the key to the cognitive dimension. He believes that culture is 'a historically transmitted pattern of meanings embodied in symbols, a system of inherited conceptions expressed in symbolic forms by means of which men communicate, perpetuate, and develop their knowledge about and attitudes towards life'.[7]

However, we must avoid exaggerating the cognitive dimension. Symbols contribute to informing and structuring human beings in a given society, but the role of values remains vital in order to provide goals for what is undertaken

and to enable weighty decisions to be made. The absorption of values by every individual involves a hidden aspect, in which the unconscious does as much work as the conscious mind. This is brought to the fore by the concept of *enculturation*. It is through enculturation that an individual becomes a cultural being with well-defined features and follows processes that continually unfold in time. From birth, individuals enter into possession of, internalize and develop those aspects of the culture that integrate them into society: habits, values, reflexes, means of expression, and norms. Enculturation is therefore a sort of long-drawn-out and effective impregnation. It endows human beings, over the years, with a wide variety of models that orient their lives in a specific direction while excluding other potential orientations. It is a conscious and unconscious process that invades an entire existence and subtly but profoundly affects it. To begin with, it presupposes slow periods of learning and initiation in the family setting and the social and school environment. Everyone adopts a cultural language and swims in a culture like a fish in water. Passivity is complemented by activity, and things given are complemented by things acquired. In any event, it is not until we are exposed to other cultural experiences that we become more conscious of our own enculturation.

## TOTAL OR SELECTIVE ACCULTURATION

When a culture evolves and changes through contact with another culture, we speak of *acculturation*. In the contemporary world, few societies live in a state of cultural self-sufficiency. Acculturation frequently takes on an aggressive quality since it is often a one-way process, from dominant to dominated societies subjected to this excessively one-sided kind of invasion. We speak of *deculturalization* when the long-term violence exercised by the most powerful destroys the culture of the weakest. After the uprooting of those who suffer this prolonged pressure, collective death may occur (cultural genocide or systematic ethnocide). To counter such destructive processes there are projects for *reculturalization* or for *counter-acculturation* that seek to re-establish the cultural identity of a group threatened by an outside cultural force. These phenomena of acculturation and the reactions they provoke are now occurring through expanding worldwide communication as exemplified by television and radio, intrusive music, dominant languages, fascination with the Internet, advertisements, the exporting of technologies that deceive by wearing a mask of neutrality, the stimuli of new and outrageous forms of consumption and ostentatious lifestyles, the development of global tourism, wars, etc.

A number of variables generally temper the one-way processes of acculturation. According to sociologists, the magnitude of cultural changes should be gauged with reference to the groups in contact with each other. It is also necessary to observe the circumstances of the contacts, depending on whether they are the result of an ideological impregnation (the limited sovereignty of the socialist countries in the time of the USSR); colonialism, with the occupation of places and territories (Maghreb, Rhodesia); tribal or international war; or migrations of workers. Actions and reactions vary according to the size and relative importance of the cultures under consideration, the type of urbanization and rural society, and the demographic importance and size of the territory occupied by the groups in conflict. Despite muted opposition between indigenous and conquering cultures, a process of selection and partial acceptance of imported traits generally occurs. The clash between cultures can, however, lead to a reorganization of the borrowing culture and a reinterpretation of the things that are accepted.[8]

## RELIGIOUSLY BASED ENCULTURATION

According to the definition given by J. Scheuer, *enculturation* 'is the process by which the Christian life and message become established within a cultural community or a given society, and become so well rooted that they produce new treasures, new forms of thought, action and celebration'.[9] Inculturation aims to naturalize the Church in each country or social sector, with due regard for the inherent character of each collective entity. This may be a region, an ethnic group, or a social group.

The term was coined in the theological context of the Catholic Church at the time of Vatican II. By its root *culture*, the word *enculturation* lays stress on the consistency of cultures and may appeal to recent findings in anthropology. By its prefix *in*, the word spontaneously evokes the mystery of 'the Word made flesh' referred to in the Prologue to the Gospel according to Saint John. The term was coined recently in order to describe the worldwide expansion of the Church in a way that showed regard for the cultures being approached. It allows a reinterpretation of the shortcomings noted in past actions, so as to inaugurate a new way of relating to the variety of cultures filling the earth. It is reinterpreted today as a key for understanding the history of Catholicism and its missionary expansion from the West. It opens up new prospects for the future dialogue between different cultures, especially those in Asia and Africa. Pope John Paul II spoke in new terms of the clash of present-day cultures on the religious level in an encyclical letter, *Fides et Ratio*, published on 15 October 1998, which inspired this paper.[10]

A cultural tradition cannot seek to preserve its distinct identity by withdrawing from any contact with others. It would be contrary to the very nature of the human spirit to believe that one is able to grow by opposing other traditions. To speak of faith and reason thus leads to the connection between cultures and faith and to what is at stake in the contact between different cultures. The lesson is valid for Europe as well.

No future is possible if every culture withdraws into splendid isolation. Preaching the faith, for its part, can only wither if it arrogantly ignores the 'reality' of the soil in which it is planted.

It is important not to view too pessimistically the globalization of the world that is a feature of our times and is now influencing cultures and religions. The *transversality*, or communication by osmosis, of cultural, religious, poetic, philosophical and theological values does not inevitably lead to an intolerable uniformity. What is taking place in these spheres rather contradicts the similar features to be found in the global expansion of science and technology. In fact, one option always remains open in the universal confrontation of cultures, and that is the possibility of understanding each other through our respective differences.

Herein is revealed the identical nature of the human condition and the unity of that condition when faced by the same demands that life makes, namely, for food, shelter, communication, reproduction, suffering, prayer, and courageously pursuing a life that is always uncertain yet exciting. It is by being rooted in the riches of their cultures that human beings discover what they share, and how they respond to this universal demand in such varied ways.

## LITERARY AND ARTISTIC CULTURE

## 26.1
### LITERATURE

*Marc Bensimon* and *Astrid Guillaume*

While setting out the main trends in world literature from 1914 to 1999, this chapter cannot claim to cover every literary movement, author, language or country, and all of their distinctive features. Space constraints have ruled out a comprehensive account of every great writer and the predominant themes in every nation. Any attempt to do so would result in nothing more than a long list or a catalogue of sorts. Moreover, there will inevitably be omissions but these should not be interpreted as a form of censorship. Rather we hope to demonstrate that, despite the diversity and profusion of literary forms, the literatures of all five continents share several fundamental aspirations.

### INTRODUCTION

Recent discoveries by scientists concerning the atom led them to speculate about the nature of human beings comprising such atoms and in constant evolution. Human consciousness is ever-changing and, within its limited perspective, is constantly seeking to improve its perception of itself.

Literature never ceases in its task of recording humanity's endless questioning of its traditional self-image. It has reflected on human beings' relations to themselves, one another, and the world at large, and has speculated on one of humanity's chief means of expression: literature. Never has this been more true than in the twentieth century.

In the nineteenth century, literature, like the other humanities, sought to fix certain human beings in a particular history and chronology; a national heritage would be claimed, in the form of an idealized and deeply cherished past. By contrast, twentieth-century literature looked rather to synchronism and common space. Similar aspirations simultaneously expressed in different countries caused traditional borders to dissolve. In addition, relations were explored between various forms of art, and the outlook became international. Even writing spawned by particular revolutionary, national or regional causes (on behalf of a given struggle waged against colonialism, racialism or some other form of oppression) could only hope to last and emerge

as work of significance by encompassing humanity: that is, by being relevant to all the inhabitants of the planet.

Early twentieth-century writers felt impelled to probe beyond traditional limits in order to discover and explore both the self and its surrounding world. Links with the past were deliberately cut in order to find new wholeness within. Even in the eyes of those authors still committed to religious transcendency, works of art were regarded as a means to restore lost meaning to the self and the world.

The shock of the First World War toppled hitherto widely held assumptions of unquestionable European supremacy; the conflict precipitated a crisis whose full consequences were felt in the West after the armistice. As if by after-shock, writing in the Americas and in the East either turned away from Western European models or assimilated them to express their own view of modernity.

When coming to grips with reality, not all writers had shown particular enthusiasm for technical breakthroughs and the waning of traditional values; in fact, their works rather expressed foreboding of catastrophe in apprehensive, anguished or nihilistic terms. Even before hostilities ceased, horror and profound disgust with war led some authors to take up a provocative, iconoclastic attitude and to denounce the shortcomings of both reason and culture with their various moral, ideological or aesthetic taboos. While many writers spoke out against the war and the societies responsible for it, few actually took up the conflict as a subject in their works. They preferred to turn away from it, as if to start a new chapter. The rejection of old values encouraged a cult of non-sense. However, the lifting of Europe's antiquated yoke also liberated fresh, dynamic idealism and sheer joy of life, a rejuvenated language, and new ethical, cultural, social, and philosophical values.

Economic crisis and political disillusion in the wake of the new totalitarian states soon darkened horizons for writers again. Literary works became stages for conflict, with characters placed on the brink. Convictions were shaken to the core, and one's identity, role, and very purpose in existence were now questioned in a world henceforth considered absurd. Many writers became involved in desperate struggles on behalf of peace or against fascist ideology in their works; some sacrificed their freedom and even their life.

The Second World War tore the world apart, and its demented atrocities and sadistic acts of cruelty defied all rational comprehension, further swelling intellectual and emotional bewilderment. Anguish reached its peak with the threat of atomic apocalypse. Nevertheless, even in the darkest or most nihilistic novels, many protagonists experienced moments of wholeness, or peace, regardless of whether or not such characters were fated to die in tragic circumstances. Such a trend, even in the most anti-artistic works, seemed to affirm that, beyond all the would-be humanistic demagoguery with its attendant conflicts and despair, the faith in human worth consecrated through the aesthetic act could endure worldwide. This faith in the individual also found its expression in the writings of women, who defended their rights, were listened to and were recognized as equal by the intellectual community in the world at large.

The movement known as *le nouveau roman* (new novel) in France in the 1960s served as a blanket term for a whole host of literary experiments. While this vogue did not seem to extend equally to other countries, translations in many languages testify to the movement's popularity. In the *nouveau roman*, the central subject is banished, and the characters are devoid of memory. Although such an approach precludes any attempt to search for meaning, this genre lent itself to explorations in form and language. Inviting the reader to participate in creating fictitious or gratuitous meanings, writers submitted various possibilities for staging a scene or concluding a novel.

Over the last twenty years, representational works, and particularly autobiographies, have proliferated. The value of such first-hand accounts lies in the coherence of the narrator as witness regardless of his or her standpoint or place of origin. This demonstrated that the individual, as citizen of this planet, was seeking to be recognized through literature. Some new works have shed various constraints and the normal barriers between genres (prose, poetry, essays), while incorporating components inspired by less prestigious genres such as detective or adventure novels, or science fiction. Writers gave free rein to their imagination, roaming at will through literature related to everyday life, fantasy, myth, or parody. Periods and places may multiply and intermesh within the same text, with the purported narrators themselves becoming manifold. But, even though such writing may question all established meaning, or even claim to be purely gratuitous, it can nevertheless disclose fresh truths at unexpected turns. Furthermore, the development of planet-wide means of communication offers writers and their readers new prospects, with the latter increasingly expected to take part in the act of creating and circulating literary works.

## EUROPE

Few authors took the First World War for their subject matter, though English poet Isaac Rosenberg did try to express the experience in an apocalyptic rendering, while France's Henri Barbusse made the unfamiliar life of the trenches better known to the public in an unusual and harrowing journal (*Le Feu*, 1916). Barbusse joined novelist Romain Rolland (1915*) as a member of the pacifist group, Clarté. Rolland published articles condemning the war (*Au-dessus de la mêlée*, 1915), drawing fire from German and French circles alike. Despite a Nobel Prize awarded in the

same year, Rolland continued to be accused of treason; but as a *world citizen*, he persisted in working towards universal independence, generosity, and peace. The feeling of catastrophe and the profound crisis engendered by the horror of war left many writers in emotional disarray. In 1916, in both Europe and America, a violent desire to break with all forms of traditional arts and beliefs arose. Springing up from a deep-rooted unease felt throughout the world, this trend crystallized in the dada movement in Zurich (1916), where a number of young Europeans, led by Romanian poet Tristan Tzara, deliberately courted scandal. This nihilistic movement found echoes in many lands.

This was particularly true in Germany, where expressionism offered fertile soil. While they do have their differences, works of the expressionist school, inspired by Friedrich Nietzsche's philosophy of protest and by Sigmund Freud's ideas on human psychology, were at one in aiming to strip off smug bourgeois masks and to revolt against father figures and other forms of social or hierarchical authority. Absurd or grotesque manifestations of reality were often depicted in burlesque forms and language. Gottfried Benn's macabre poetry evoked urban rot and wretchedness. In one of his short stories, the main character is a surgeon who loses his own lucidity after operating on the brains of more than two thousand corpses (*Gehirne*, 1916). Personally confronted with the spectacle of butchery, the poet Georg Trakl sought to express the mayhem through apocalyptic imagery (*Sebastian im Traum*, 1914), then committed suicide shortly afterwards. The expressionists strove to give words to their deepest anxieties regarding the threat posed by the modern world and to their hopes for a better world. Most of their works were later consigned to the flames by the Nazis, who considered them degenerate. The novel, by Alfred Döblin, *Berlin Alexanderplatz* (1929), which broke with all conventions and seemed as incoherent as the reality it sought to portray was another 'degenerate' work. A similar fate befell the writings of Leon Feuchtwanger, whose novels on the fate of the Jewish people (*Jud Süss*, 1925, and *Der jüdische Krieg*, 1932) saw their original meaning completely distorted by Nazi propaganda. Franz Kafka would loom as a precursor if increasing familiarity with his work did not show it to be an outcome of the whole expressionist approach. Kafka, who examined the limits of traditional communication, attempted through new language to convey cries, gestures, even conversion to a new faith, although such a conversion could only result in failure, since all writing, according to Kafka, would ultimately yield only non-meaning. Kafka's texts continue to exert influence throughout the world: ranging from *Die Verwandlung* (1912–15), whose protagonist is suddenly changed into an enormous cockroach, to *Das Schloss* (1921–22), where the castle is merely an illusion – just like the attempt to find any meaning through writing.

Tristan Tzara was welcomed in Paris like a messiah. The dada movement's destructiveness had its positive side: it opened fresh avenues of approach. Resorting to spontaneity and free association opened the floodgates of the unconscious, encouraging freer writing and the use of happenstance offered by life. Here was to be found the whole surrealist programme championed by André Breton in his *Champs magnétiques* (1920) and *Manifestes du surréalisme* (1924): automatic writing, the use of the language of dreams, and the search for objective happenstance in

half-serious, half-playful collective creations (known as exquisite corpses) (Plate 132). Later Breton embarked upon a virtually mystic quest for a supreme point, where dreams and reality might no longer be mutually exclusive (*Les Vases communicants*, 1932). Several poets continued to experiment in free verse forms along with Breton. Robert Desnos explored dreams (*Deuil pour deuil*, 1924; *La Liberté ou l'amour*, 1927). Pierre Reverdy's sober surrealist imagery could run the full gamut of readers' emotions (*Les Epaves du ciel*, 1924; *Main-d'oeuvre*, 1949). The verse of Paul Eluard, the poet of surrealist love, expressed the universe as seen through the desire for women (*La Vie immédiate*, 1932). During the Second World War, Eluard became a symbol of the Resistance with his *Poésie et vérité* (1942) and *Au Rendez-vous allemand* (1944).

To return to the 1920s, if the term *via negativa* may be applied to a poet's quest, then Paul Valéry's work is the best example; the sparse result of a compelling drive to attain perfection is purely an exercise, a game, the application of mental toil. It is the mind's ability to be anything – its exploration, the detached knowledge of the Great Work, as he called the ways of the mind – that interests Valéry (*La Jeune Parque*, 1917; *Le Cimetière marin*, 1920; *Variété*, 1924–44).

Marcel Proust's *A la Recherche du temps perdu* (1913–22) rose above the day's political, ideological or literary disputes. The writer caused buried memories to rise from the uttermost depths of the unconscious, reconstructing and capturing a mobile, fluid reality perceived with such art that it came to seem more real than reality. The narrator thus brought an entire society back to life, described, often not without irony, with all its underpinnings and illusory values and changes, in addition to the role played by imagination and desire through the intermittences of the heart. Proust's writing reached peaks of ecstasy where all the bonds of time seemed to come loose, the present was denied, and timelessness affirmed. Proust's work would profoundly mark the entire twentieth century.

So did the books of the Irish writer James Joyce, whose novel *Ulysses* (1922) sought to weave twenty-four hours of a Homeric – but hardly heroic – existence, through inner monologue and stream of consciousness. His resulting text jumbled thoughts, sensations, desires, and dreams, while abandoning any traditional plot line. Nevertheless, in terms of artistic structure, this odyssey of the consciousness did faithfully follow its model, Homer's *Odyssey*. But in *Finnegan's Wake* (1939), Joyce, like a Platonic creator-god, wrought a poem whose central Proteus-like character constantly changed, while words shifted and took in additional letters and syllables, endlessly adopting new forms according to the needs of the text. Even today, in the farthest reaches of the earth, writers and poets are wringing extra meaning from language in the manner invented by Joyce.

In England, John Galsworthy (1932*), who wrote in the traditional manner, continued to satirize Victorian and Edwardian society, greed and hypocrisy, in his great 'tale' *The Forsyte Saga* (1888–1922). The influence of Proust and Joyce is evident in Virginia Woolf's vibrantly poetic and musical writing, which sought to catch the most elusive emotions (*Mrs Dalloway*, 1925; *The Waves*, 1931). D. H. Lawrence attempted, for his part, to shake off the shackles of puritanical Christianity and the fetters of an alienating and absurd civilization, in order to recover a natural relationship with the cosmos (*Women in Love*, 1921; *The*

*Plumed Serpent*, 1926). In France, poet and dramatist Paul Claudel saw in nature, as a whole, something to be 'rounded off to a finish', and believed that only through complete unfolding might the world acquire meaning (*Le Soulier de satin*, 1924). Renunciation procured its own spiritual joy and a feeling of possessing the universe.

With *Siddhartha* (1922), the Swiss writer Herman Hesse (1946*) turned towards Buddhist models in his quest for fusion with the cosmos. In 1943, he evoked a secular abbey of the year 2200 whose monks would indulge in gratuitous mystical play (*Das Glasperlenspiel*). By contrast, Austria's Robert Musil saw incestuous love and the quest for the One dissolving in the failure of a disintegrating Austro-Hungarian Empire (*Der Mann ohne Eigenschaften*, 1930–42). Germany's Thomas Mann (1929*) (*Der Zauberberg*, 1924) turned a sanatorium into a symbolic home for the declining Western civilization; with ironic realism, he conjured up 'the world's feast of death' from which he nevertheless hoped love might spring. In exile in California, Mann continued his struggle against Nazism and pursued his work (*Doktor Faustus*, 1947).

The American-turned-British poet, T. S. Eliot (1948*), in a long, cryptic poem, *The Waste Land* (1922), diagnosed the illness of the modern world as a lack of religious consciousness. Among other things, the poem dismisses as vain the various attempts to find any kind of salvation. The poets of the 1930s followed Eliot in his conversion, but W. H. Auden turned away from metaphysics to take an angry look instead at the social conditions of the working class.

In the Soviet Union, writers expressed in their own way the prevailing unease felt by other authors of the time. The October Revolution sparked a proletarian-oriented literature that dwelt upon the exploitation of workers and the spirit of the homeland. But with censorship imposed in 1917, important writers became dissidents defending creative freedom. Mikhail Bulgakov bitterly satirized the bureaucracy in his *D'yavoliada (Devilry*, 1925), a work that foreshadowed his masterpiece, *Master i Margarita (The Master and Margarita*). In this novel, finally published in 1966, Satan descends upon Moscow and sows discord and panic among the system's Pontius Pilates and other toadies. The author mingled two time periods by taking up the story of Christ, thereby achieving the work that Dostoyevsky had hoped to write. On the subject of war, Stanislavsky's 1926 staging of Bulgakov's *Beg (Flight*) scandalized the literary establishment. Boris Pasternak (1958*), considered one of the greatest Russian poets, wrought lyrical, timeless, imagistic verse, seeming to hover above present concerns – and this was held against him. Nevertheless, Pasternak did compose verses on the horrors of the Second World War. His celebrated novel *Doctor Zhivago* angered the Soviet authorities, and had to be published in Italy (1957). Pasternak narrated the lives and passions of characters caught up in the chaotic whorls of Russian history around 1905. Only in 1987 was Pasternak's work rehabilitated. By contrast, *Tikhii Don (And Quiet Flows the Don*, 1928–40), by Mikhail Sholokhov, was warmly approved as a model of Socialist realism, with its flowing narrative in the Tolstoyan manner evoking civil war between Reds and Whites in the Cossack region, along with depictions of the peasant world and a tender love story. A group of young writers known as the Serapion Brethren, under the protective wing of Maxim Gorky tried to reform prose in the early 1920s by marking

distance with conventional imitation and by yielding pride of place to the spoken language. Mikhail Zoschenko resorted to *skaz*, a mixture of slang, ancient forms, and ready-to-use modern expressions, to mould his tales (*Koza, The Goat*, 1924). Isaac Babel depicted the civil war with original imagery in his *Konarmiya* (*Red Cavalry*, 1926), while describing the lower depths of the Odessa Ghetto through the story of an almost legendary bandit (*Benja Krik*, 1927).

Poetry was modernized through the verse of revolutionary poet Vladimir Mayakovsky (*Pro Eto/About This*, 1923). Mayakovsky was soon crushed by the contradictions between political constraints on the one hand (the method of dialectical materialism), and the search for formal liberty, on the other. No less torn by conflict was his domestic life, and he committed suicide in 1930 shortly after completing *Vo Ves Golos* (*At the Top of My Voice*), in which he carried poetry to new heights. The remarkably erudite poet Osip Mandelstam questioned the very essence of human beings in his *Tristia* (1922) and *Voronejskie tetradi* (*Voronej Notebooks*) (1935–37). Criticized, hounded, and finally interned, Mandelstam died in a concentration camp, and his contribution was only recognized much later. The great poet Anna Akhmatova, another victim of blistering attacks, was never published after her collection *Anno Domini MCMXXI* (1921). Not until 1956 did the review *Literary Moscow* make known her masterpieces like *Rekviem* (*Requiem*, 1935–40), in which the sufferings of a wife and mother mirror those of a whole people. Young poets like Yevgeny Yevtushenko, Andrey Voznesensky and B. Okujava then took up the same cause, expressing a desire for freedom and change in passionately lyrical poems, while aspiring to a literary renaissance. Konstantin Fedin, in a highly wrought novel, depicted the tragic fate of a revolutionary intellectual caught in the vice of prevailing ideological blindness (*Goroda i Gody, Cities and Years*, 1924). Rejecting psychologism and harking back to Tolstoy's 'living man', Aleksandr Fadeyev (*Razgrom, The Nineteen*, 1927) also portrayed the anguish of intellectuals trying to fight the system. In 1927, Andrei Platonov denounced forced labour in a collection of tales, *Epifanovy Slyuzy* (*Epiphan's Sluices*). Platonov's novel *Chevengur* (1928–29) described a family of workers whose revolutionary idealism is tempered by Stalinist reality. Only in 1980 was Platonov's work seriously recognized in the Soviet Union as one of the richest and most original literary creations of our time. The Soviet regime once again tightened its control on literature in 1946. In the name of peace, Ilya Ehrenburg was able to denounce capitalist societies in such novels as *Padenie Parija* (*The Fall of Paris*, 1941–42) and *Ottepel* (*Thaw*, 1947). But his *Chernaja Kniga* (*Black Book*), a document on the Holocaust which he helped put together with a Jewish Anti-Fascist Committee, was never allowed to see the light of day, and the committee itself was dissolved in 1948 in an atmosphere of persecution against anyone branded as a *cosmopolite*: and thus began party strictures against Jewish authors, even those once admired, like Zoschenko or A. Akhmatova.

Among Russian writers in exile, Ivan Bunin (1933*) published a great autobiographical novel in the Proustian manner, known in English as *The Life of Arsenev*, a work glowing with profound philosophical questionings and considered one of the masterpieces of Russian prose (Plate 133). Vladimir Nabokov, a Russian writer steeped in European culture, who eventually moved to the United States, became as great a novelist in English as in his native language. His masterpiece in Russian, *Dar* (*The Gift*, 1937–38), shows his desire to evoke his Russian heritage to forge an identity, but not without observing a certain ironic distance from his subject, if only through wit and a sharp critique of literature. Even in exile, Joseph Brodsky (1987*) penned works of a virtuosity that followed in the St Petersburg tradition of Mandelstam and Akhmatova, exploring every possible avenue of poetic writing. Imprisoned for 'social parasitism' in 1964, he was eventually released and immigrated to the United States in 1972. He is regarded as one of the greatest poets of his generation (*Ostanovka v pustyne, A Halt in the Wasteland*, 1970; *Uraniia, Urania*, 1987; *Primechaniia k paportniku, The Fern's Remarks*, 1990).

In France, Catholic writer Georges Bernanos described characters symbolizing good pitted against evil, in almost Manichaean combat (*Sous le Soleil de Satan*, 1926). The writer's poetic and dramatic flair casts a supernatural pall over this sombre novel, as it does over *Les Grands Cimetières sous la lune* (1938), where the narrator, a witness to the Spanish Civil War, strives to understand the nature of evil. The failure of traditional values, economic crisis, and the rise of totalitarian regimes left Western writers profoundly unsettled; they became involved in social struggles or desperately endeavoured, in solitude, either to bestow new meaning upon life, or to deny that it held any meaning at all.

In Spain, among other poets to emerge from the so-called Generation of 1898, Antonio Machado helped free lyric poetry from pretentious rhetoric, and plumbed the depths of the soul: through love, life, death, and time (*Campos de Castilla*, 1912–17). Machado thus blazed the trail for the starkly simple poetry of Federico García Lorca (*Romancero gitano*, 1928), which revealed surrealist influences, as did the verse of Vicente Aleixandre (1977*) (*La destrucción y el amor*, 1935), where language appeared to rise from the abyss of dreams. After a symbolist and modernist period, Juan Ramón Jiménez (1956*) used poetry to look beyond the appearance of things in the search of their uniqueness and essence. His poetry then went on to express an ecstatic joy (*Animal de fondo*, 1947), especially in his later work *Dios deseado y deseante* (1949). It was mainly Lorca's outspoken, liberating and innovative drama that earned him an international reputation. His three tragedies, *Bodas de sangre* (1933), *Yerma* (1934), and *La casa de Bernarda Alba* (1936), three powerful allegories whose roots reached far down into Andalusian soil, expressed life's revolt against all forms of oppression. Lorca's murderers, members of Franco's forces, made no mistake about it: they killed the poet shortly after the appearance of his last drama in 1936. Miguel de Unamuno also died in 1936 while under house arrest. His essentially philosophical works dwell on human contradictions in the face of destiny. As early as 1914 (*Niebla*) and throughout his writing career, he was preoccupied by themes concerning the relationship between a character and its author and how these might lead to considerations of the worth of any revolt against fate. His *Tres novelas ejemplares* (1920) used writing as a means of speculating on the links between the different aspects of a single personality. Spanish novelists of the next generation criticized society. In *La familia de Pascal Duarte* (1942) by Camilo José Cela (1989*), a juvenile delinquent describes how, in yielding to his instincts, he committed crimes that neither his family nor his own conscience could ever

THEMATIC SECTION

condone. In new wording and through more than two hundred characters, Cela's *La Colmena* (1951) brilliantly captured the sordid atmosphere of post-war Madrid. The novels of Miguel Delibes, who depicts life in a Castilian village in *Las ratas* (1962) through the monologue of a peasant woman at a wake, possess a universal dimension. Juan Goytisolo deconstructs the official version of historical events and satirizes modern youth in *Juegos de manos* (1954). Luis Martin Santos recounts a single day in Madrid in 1949 with corrosive wit (*Tiempo de silencio*).

In Portugal, Miguel Torga consistently opposed the Salazar dictatorship. Already famous by the 1930s for his great biblically inspired work *A Criaçâo do mundo*, he was internationally recognized for his poetry by 1977. The Portuguese poet Fernando Pessoa was clearly influenced by French Symbolism, Walt Whitman and the English language and its literature. His work, published in reviews under many pen names, expressed different, sometimes contradictory, ideological viewpoints. This was Pessoa's way of seeking a certain form of wisdom, untrammelled by any religious constraints or metaphysical claims. His complete works fill eight volumes (*Obras completas*, 1942–56). Extremely well known and influential among European literary circles, his *Poesias* (1942) were published under the pseudonym Álvaro de Campos. At a later date, numerous very active younger poets became exposed to European influences (surrealism, existentialism, the *nouveau roman*, structuralism), but nevertheless kept an eye on Africa and also on Brazil, as was the case with Alexandre Cabral (*Historias do Zaire*, 1956). José Saramago (1998*) is probably the best-known Portuguese writer active today in theatre, poetry, the novel, and journalism. From his first book published in 1925, *Terra do Pecado*, to his more recent novels like *Memorial do Convento* (1982) and *Evangelho segundo Jesus Cristo* (1991), probably his most controversial work, and the publication of the last part of his diary (*Diario III de Cadernos de Lanzarote*, 1996), his reputation in international letters has never ceased to grow.

In France, Céline's anti-hero was a lucid but merciless character who cultivated hatred of both self and others until he cynically sank into his own moral quagmire (*Voyage au bout de la nuit*, 1932). In 1933, André Malraux juxtaposed dramatic and blood-soaked scenes in almost journalistic depictions of a Communist insurrection in Shanghai, with a vast and varied host of characters groping for the meaning of life, in *La Condition humaine*. In a gesture of fraternal and sacrificial communion, a young revolutionary helps one of his comrades, sentenced like himself to be burned alive, to die more easily by giving him his own cyanide. On the threshold of death, the self could thus fuse with the real and even be projected into eternity. Such nearly ecstatic moments mark the apex of many contemporary works, even though these otherwise seek to exclude any totalitarian discourse or metaphysical purpose. Beyond despair and the absurd, Malraux expressed his faith in humanity's capacity continually to affirm its presence through art or action; human beings must stay constantly attentive to life's message, perceived as an 'infinite possibility as to their fates' (*L'Espoir*, 1937).

Novels increasingly concerned with rounding out their authors' previous philosophical writings followed hard upon Malraux's existential anguish. Jean-Paul Sartre drove home the philosophical theses contained in his essay *L'Etre et le néant* (1943) by stretching them to the limit, as it were, in concrete situations illustrated by a novel like *La Nausée* (1938), a collection of short stories like *Le Mur* (1939), and especially the play *Huis clos* (1944). This play, known as *No Exit* in English, confines three characters 'to hell'. The utterly empty consciousness of each one of these three 'dead' creatures, all equally forgotten by those on earth, sinks to such depths as only to exist in the viscous and baleful glare of the other two inmates. Rather than risk walking out the door into the unknown or into sheer nothingness, the three characters choose to face one another in complete bad faith, the *en-soi*. Yet an alternative does exist: the freedom of the *pour soi* – despite the happenstance, the meaninglessness, or the absurdity of things. According to Sartre, each lucid human being should seek such an alternative, while remaining constantly on guard against any temptation to mythologize reality. Since every word is an act, the writer put his or her entire responsibility on the line.

In the view of Albert Camus (1957*), human beings may transcend their limitations through revolt (*L'Homme révolté*, 1951), despite a gnawing sense of the absurd, with acts resembling those of Sisyphus, the mythological Greek hero eternally doomed to roll his heavy stone up a hill only to see it slip from his grasp and roll down again. Nevertheless, in Camus's *L'Etranger* (1942), as in the novels of Malraux and Sartre, the darkest moments, on the very threshold of death or even suicide, can also yield a vision of ecstasy – however utterly negative and desperate the revealing experience might be. Moreover, even at their most pessimistic or anti-heroic moments, Camus's works never allow humanity's cause to sink to the lower depths.

Existentialism enjoyed a worldwide vogue. In Romania, poet Marin Sorescu saw revolt as the only way out from fate's absurdity (*Don Quixote's Youth*, 1968). For Marin Preda, regarded as a first-rate novelist, the peasant is a philosopher who cultivates his garden with humour (*Moromeţii*, 1955); his satire of the regime and its institutions resulted in the meditations of *Cel mai iubit dintre pămînteni* (*The Most Beloved of All Mortals*, 1960). Preda's ironic detachment is also to be found in the works of the late philosopher Emile Cioran, who chose exile in France and regarded history as 'cacophony' and perceived self-deluding agitation with cynical distaste but also humanistic empathy (*L'inconvénient d'être né*, 1974). The struggle on behalf of human rights waged by Paul Goma, also in French exile, has become a symbol. Goma's works evoke the absurd world of prisons, repression, and torture (*Le Tremblement des hommes*, 1979). The theatre of the absurd of yet another Romanian exile, Eugène Ionesco, drawing on humour from his native land, scored considerable success on the French and international stage.

Czechoslovak literature was racked by the country's successive Nazi and Soviet occupations, and many intellectuals went into exile. Before 1938, Karel Capek was famous for a work of science fiction (*War of the Salamanders*, 1935), and especially for a trilogy of novels: *Hordubal*, *The Meteor*, and *An Ordinary Life* (1934–37). As early as 1919, Capek was translating Apollinaire and blazing the trail of 'poetism,' a surrealist movement that found its finest expression in the powerful imagery of Vitezslav Nezval (*Edison*, 1928) and in the lyricism of Jaroslav Seifert (1984*) (*Garbed in Light*, 1940). Seifert soon symbolized resistance against the Nazi and Soviet occupations. As of 1948, 'official' or at least 'tolerated' writers could remain on good terms with the regime, but others had to publish

clandestinely or go into exile, especially after 1968. Thus Bohumil Hrabal, the best-known author to remain in Czechoslovakia, was forced to publish abroad (*Too Loud a Solitude*, 1976). Milan Kundera, probably the most famous of all contemporary Czech writers, first brought out, in his native tongue, *Valcik na rozlouecenou* (*A Waltz of Farewells*, 1973), a tragic tale told in an ironic, deliberately banal tone, as if from a distance, thereby stripping the story of the grandeur normally accorded to tragic themes. After moving to France in 1975, Kundera published, in French, the successful *L'Insoutenable légèreté de l'être* (1984) and *L'Identité* (1977). Kundera attempts to render the complexity of the modern world while remaining clear, hypothetical, playful and ironic, thereby conferring a post-modern stamp on his work.

When not drawing on the resources of their folklore or national history, Bulgaria's pre-war writers were busy attempting to free their poetry from its traditional fetters. After the Second World War, a love of life coupled with metaphysical disquiet haunted works that expressed the crisis in traditional values as well as the rejection of the new values. Pavel Vezinov spoke out against the decadence of humanism, and in *The White Lizard* (1977) branded modern man as a 'spiritual eunuch'.

In Hungary, Lajos Kassak, in his eight-volume work cast in autobiographical form, *A Man's Life* (1927–35), told the story of the rise of a self-taught mechanic. Pursuing the same socialist vein, Attila Jozsef's verse, the most important Hungarian poetry written in the interwar period, expressed working-class views, mingling literary reminiscences with snatches of popular songs. After 1945, an intellectual elite persecuted under Nazi rule was hardly in a position to re-emerge under the Soviet regime. Tibor Dery (*The Unfinished Sentence*, 1966) denounced dictatorship, and Jószef Lengyel, the concentration camps (*Bitter Bread*, 1966). Many post-modern writers chose for their model the sardonic novels of István Ôrkény (*The Tót Family*, 1968; and *The Minimyths*, 1970), influenced by the works of Beckett and Ionesco.

Modern works of Polish literature mainly drew their inspiration from the classical French novelists or from the two founding fathers of twentieth-century letters: Proust and Joyce. Witold Gombrowicz is considered one of the greatest contemporary Polish writers (*Ferdydurke*, 1937; *Journal*, 1957–66). In the 1990s, the poetry of Wislawa Szymborska (1996*) was recognized as a major work by the literary world (*Unexaggerated Death*, 1997).

In Italy, the futurist and modernist adventures of such poets as F. Tommaso Marinetti caused some literary upheaval during the First World War. The drama and novels of Luigi Pirandello (1934*) expressed nihilism tinged with irony through depiction of the disintegrating identities of their characters (*Sei personaggi in cerca d'autore*, 1923). Pirandello's theatre has influenced many modern playwrights. Alberto Moravia's first novel, *Gli Indifferenti* (1929), was interpreted as a condemnation of decadent bourgeois. His later writings brought him closer to the manner of the Surrealists. After the decline of literature during the Fascist years, the neo-realistic novel returned to the fore, and writers sought to exclude an 'arcane' approach to literature, which was criticized for shunning social realities. The novels of Carlo Cassona and Giorgio Bassani (*Le Storie ferraresi*, 1960), profoundly influenced by Proust and Joyce, evoked the grimness of exclusion and solitude in themes related to the resistance, deportation and regionalism.

*Se questo è un uomo* (1958), Primo Levi's autobiography as a survivor of the Nazi death camps, is one of the most gripping of all eyewitness accounts of the utterly degrading slavery of that daily horror, depicted with unusual courage, modesty, and grandeur of the soul. In the 1960s, Italian writers mainly focused on the world of labour and industrialization, to the extent that their work came to be labelled as a 'literature of industry'. Pier Paolo Pasolini's hard neo-realism and political involvement melted into something approaching hedonism in his final collection of poetry (*Trasumanar e organizzar*, 1971). Dino Buzzati's fantastic approach resulted in reflections on love, the absurdity of fate, and death, in such novels as *Il Deserto dei Tartari* (1940) and finally *Il Bestiario* (1991), where the author's fable uses animals to show our gradual slide into an absolutely unthinkable reality. The fantastic fables of Italo Calvino are also noteworthy. One character in his major trilogy, an eccentric nobleman in an imaginary eighteenth century, climbs up a tree and refuses to come down because of the world's absurdity (*Il barone rampante*, 1957). Calvino could also show characters acting out sometimes-hilarious situations in more realistic tales, without revealing their innermost thoughts but still reflecting considerable art (*Palomar*, 1983). Dreams often blur reality in Elsa Morante's novels; in *La Storia* (1979), war victims revolt against atrocities as old as the world. Umberto Eco first became known in academic circles for his essays on semiotics, but then achieved international renown with a first historical-detective novel: *Il Nome della rosa*, 1981. Not without wit, Eco described medieval monks seriously grappling with the limits to human knowledge in a fourteenth-century abbey, stressing the importance of wisdom, reason, and freedom against folly and superstition.

In Greece, the two writers who set the tone for contemporary literature were Nikos Kazantzakis and Konstantin Kavafis (more commonly known as Cavafy). Kazantzakis was open to every kind of literary, political and spiritual influence, and his novels were universally acclaimed. They expressed a feeling of anguish and alienation, which the author struggled to surmount in such works as *Alexis Zorba* (*Zorba the Greek*, 1948), and *Letter to El Greco* (1961). Cavafy, in his poetry, mingled popular and learned language, linking the ancient world to the modern in a mythical and ironical dimension. After 1945, a 'generation of the defeated', committed to moral combat against political oppression, emerged on the literary scene. Among these, George Seferis (1963*) gave a voice to despair and suffering, but also to his faith in humanity and its future (*Three Secret Poems*), while Odysseus Elytis (1979*) (*The Tree of Light*, 1971) pegged his hopes on the sea, as the very symbol of Hellenism. In the 1970s, sarcastic wit could blend with political opposition. Writing in poetic prose mingling Stendhalian inspiration with stylistic innovations, S. Tsirkas's trilogy (*Akybernates politeias, Drifting Cities*, 1960–65) is widely considered the greatest novel in modern Greek. The work follows ethnic Greek leftists through the Second World War in Jerusalem, Cairo and Alexandria. Taki Theodorakis tells of the quest of a Greek painter searching for a landscape which he finally discovers within himself – just as his native Greece contained such a landscape within herself as a symbol of the country's contemporary identity (*Landscape of the Absolute*, 1992).

The Albanian writer Ismail Kadaré is quite prolific. His novel *The Concert*, 1988, at once tragic, burlesque, poetical, and metaphysical, based on the relations between Beijing

and Albania, is considered his masterpiece. Kadaré's *Three-Arched Bridge*, a medieval chronicle about the building of a cursed bridge, met with international success in 1981. Another symbolic bridge supported a blood-drenched tale of clashing cultures at once linked and separated down the centuries in the 1945 novel by Bosnian writer Ivo Andrič (1961*), *The Bridge on the Drina*.

In France, Louis Aragon's work in both poetry and prose extended over more than 60 years: from his surrealist novel *Paysan de Paris* (1926), through a cycle of Marxist novels in the 1930s, tirelessly denouncing the rising tide of fascism, to a less politicized autobiography in 1956, and down to his final poems, *Les Adieux et autres poèmes* (1982), in which he continued to stress that 'love is absolute'. Mainly concerned with communicating experience, writers no longer restricted themselves to any particular genre. Michel Leiris, a former surrealist, used such forms as journalism, poetry and the essay, to create a vast and complex autobiographical work (*La Règle du jeu*, 1939–76). Georges Bataille, another ex-surrealist who wielded considerable influence, composed works difficult to classify, such as his *Somme athéologique* (1943–45) or 'Mme Edwarda' (1942), a short story whose violent eroticism provoked a scandal. Bataille sought a sort of illumination, even 'consummation', through the contemplation of pain, enjoyment enhanced by fierce eroticism, or transgression of taboos. Literature was only acceptable to Bataille if it refused to accept itself: 'Whoever does not die on account of being only a man', Bataille used to say, 'will never be anything but a man.' Through the poetry and prose of former surrealist René Char, odd metaphors shoot forth like lightning bolts, lifting his work to the summits of modern poetry. Although difficult, Char's work endeavours to be 'synonymous with truth' and carries the reader to heights of enjoyment of nature and beauty in the name of peace and our brief life on this Earth (*Retour amont*, 1966; *Dans la pluie giboyeuse*, 1968).

In the early twentieth century, theatre enjoyed less prominence than the novel, but succeeded in arousing renewed interest after the Second World War. By 1950, Ionesco's *Cantatrice chauve* (*The Bald Prima Donna*) was spouting nonsense on the stage, thus marking the birth of the theatre of the absurd. Major sources of inspiration claimed by practitioners of the new theatre were Strindberg, Joyce, Brecht, and especially Antonin Artaud (*Le Théâtre et son double*). As early as 1930, Artaud wanted the stage to become a space for the forces of good and evil – as a metaphor for life. In his view, a 'theatre of cruelty' ought, as for sufferers of the plague, 'to be lancing boils'.

In Belgium, between 1930 and 1939, Michel de Ghelderode developed a powerful dramatic style with *Don Juan* (1928), *Magie rouge* (1931), and *Mademoiselle Jaïre* (1934). His aggressive and vivid plays pursued the tradition of the old Flemish puppeteers, featuring buffoons, executioners and other characters seemingly straight out of the paintings of Bosch or Bruegel. Ghelderode's plays were originally written in French, but were first performed in Flemish in the 1920s at the Vlaamse Volkstoneel, an avant-garde theatre, before touring in Paris and other European cities after 1950.

Ionesco's theatre of the absurd could show human beings turning into blindly egotistical, bestial and ferocious rhinoceroses (*Rhinocéros*, 1960). His stage might fill up with objects before becoming empty once again (*Les Chaises*, 1952). Or a corpse might explode, and crash through panels

(*Amédée ou comment s'en débarrasser*, 1954). Arthur Adamov also expressed the moral failures of his characters through their physical activities: they might limp across the stage, for example (*La Parodie*, 1952; *Off Limits*, 1969). Brecht wished effectively to deprive his spectators of any possibility of catharsis, and his example was followed by the advocates of 'anti-theatre'. Thus Jean Genet basically drew his inspiration from this vein in such powerfully crafted plays as *Le Balcon* (1957), and *Les Nègres* (1959). Armand Gatti cultivated the Brechtian notion of 'epic theatre' to wreak havoc with the basic conceptions of drama, exploring every 'possible me' of his characters (*Chant public devant deux chaises électriques*, 1966). Irish-born Samuel Beckett (1969*), who wrote in English and French, peopled his stage with picturesque characters: human ragamuffins devoid of identity, conviction, will, or any God to believe in (Plate 134). Indeed, in a sense Beckett's 'theatre of the void' is filled with the absence of God as he dramatizes a world emptied of all meaning (*Waiting for Godot*, 1953; *Endgame*, 1957). The new theatre was really consecrated by Beckett's 'visible' and 'literalist' masterpiece, *Waiting for Godot*. Since this sort of drama pointed to no discernible reality which might lie beyond what was being shown on the stage itself, it paradoxically opened the way to a whole new form of literature: the nouveau roman, which enjoyed an extraordinary vogue over the next 20 years.

Alain Robbe-Grillet, the chief exponent of the new novel, was imitated in many countries. The rather vague term *nouveau roman* refers to self-built texts that eschew reference to any reality in existence before the text, in so far as language could allow. Readers are expected to decipher stories to which only the author holds the key. Obsessive fantasies might be exploited, such as rape and other sexual crimes, along with the imagery of delirium, thus whirling the puzzled reader in search of the work's meaning into a vortex of speculation. Such a literary approach did undoubtedly result in some successful achievements; but most works of this school remain word-centred and two-dimensional, and mark the abdication of art's claim, at least in literature, to the right to uncover truths about the world outside or about the human condition. Claude Simon (1985*), in his word-puzzles, jumbled fragments of various images with snippets from history or geography, injecting epithets of colour (*Triptyque*, 1973; *Les Géorgiques*, 1981; *L'Invitation*, 1988). Simon once described his novels as works to be perceived as 'a successfully prepared mayonnaise sauce' (*Orion aveugle*, 1970).

Other poets and novelists experimented with language's arbitrary forms and constraints to turn them into tools for infinitely varied creativity. In his *Exercices de style*, 1947, Raymond Queneau, with his so-called 'OuLiPo Group' (*Ouvroir de Littérature Potentielle*), developed this particular trend first initiated by the surrealists and such writers as Raymond Roussel (*Les Nouvelles impressions d'Afrique*, 1932). Georges Perec came to be one of the main representatives of this school. In *La Disparition* (1969), Perec dropped the letter 'e' entirely from his text; and in *La Vie, mode d'emploi* (1978), he submitted a collection of stories to be composed and combined by the reader in different patterns.

It may be inaccurate to consider Nathalie Sarraute and Marguerite Duras as belonging to the *nouveau roman* school, but they did much to renovate the novel as a genre. Sarraute exposed the little telltale signs that reveal life far more

authentically than traditional discourse or the usual representations of action. Hence, the underlying purpose of her stories tend to disappear from view (*Portrait d'un inconnu*, 1948; *Les Fruits d'or*, 1963). In her starkly rendered dialogues, Duras managed to suggest things unutterable and inaccessible, like separation, loss, solitude, or flights into madness, crime, amnesia. In Duras's *India Song* (1976), characters disappear altogether, leaving only voices to express the author's words. In the 1980s, Duras incorporated subject matter in more classically constructed texts (*Agatha*, 1981; *L'Amant*, 1982), while Sarraute split her own personality in two in *Enfance* (1983), an autobiographical tale. Always one to mystify, Robbe-Grillet also wrote some self-admittedly 'indirect' autobiographical works: *Le miroir qui revient* (1985); and *Angélique ou l'enchantement* (1988).

Other novelists mirrored sometimes very bitter personal experience indeed in their own works of fiction. Elie Wiesel, a survivor of the Nazi death camps and recipient of the 1986 Nobel Peace Prize, erected an 'invisible monument' to his people, whose agony he recounted through the 'mystical power of memory', and thereby commemorated the suffering of all peoples deprived of freedom (*Silence et mémoire d'homme*, 1989; *L'Oublié*, 1989). Marguerite Yourcenar used the historical novel's projection into a different period to shed new light on fundamental questions. Her *Mémoires d'Hadrien* (1951) pondered the meditations of a Roman emperor as death approached, while in her *L'Oeuvre au noir* (1968), she related the philosophical quest of an imaginary physician in the stormy period of the Renaissance (Plate 135). Edmond Jabès (1965*), questioned existence and its relation to God in short prose poems that were also philosophical essays (*Le Livre des questions*, 1963–73; *Le Livre de l'hospitalité*, 1991).

Since 1980, an increasing number of writers have been trying to shake off the shackles of the novel, a genre now regarded with suspicion even though still recognized as one capable of handling anything that a writer may wish to pour into it. More and more authors are turning to short stories and other brief works, where fiction, musings, poetry and history are mingled so as to allow the narrator to capture the unpredictable.

In England, writers like Aldous Huxley, George Orwell, and William Golding (1983*) denounced, in the blackest possible anti-Utopias, the shortcomings of individuals and society as a whole. In *Brave New World* (1932), Huxley offered a pessimistic vision of a future dominated by Americanization and scientism. Under the cover of a Swift-like fable, Orwell satirized a world of animals rebelling against exploitation by humans. The animals end up proclaiming the equality of all animals, but the triumph of the exploited is short-lived: the pigs betray the revolution (an allusion to Stalinism) while the dogs (the police) impose a reign of terror (*Animal Farm*, 1945). With his best-known novel, *1984* (1949), Orwell described a state waging a war far from its borders that brings it relative prosperity. But the state's citizens are constantly watched by the eye of 'Big Brother' and are banned from loving and even thinking. The novel's hero stages an unsuccessful attempt at triggering an uprising and narrates the outcome. William Golding harked back to the very source of conflicts where evil is seen almost metaphysically. *Lord of the Flies* (1954) took a hard look at the beast lurking within human beings and drew pessimistic conclusions, illustrated through the strange political organization concocted by a group of children stranded on a desert island, with all its ensuing tragedy. The characters in Harold Pinter's plays are significantly hard put to it to express their own thoughts, which stem from ambiguous motivations they scarcely understand (*The Homecoming*, 1965; *Betrayal*, 1980). More novels are offering variant possible endings (as with John Fowles) or actually self-deconstructing (as with Graham Swift); others are becoming complex self-parodies, like the works of David Lodge (*Nice Work*, *Parlour Games*, 1988).

During the Nazi period, German writers in exile were politically active. Bertolt Brecht, first in Scandinavia and then in California, continued to apply his aesthetic theory of efficiency to his revolutionary plays, rejecting all notions of catharsis (*Mutter Courage und ihre Kinder*, 1939; *Der gute Mensch von Sezuan*, 1938–40; *Der aufhaltsame Aufstieg des Arturo Ui*, 1941). After the war, realistic-minded writers depicted a Germany raised from its ruins and sought to explain her drama from within, as with Heinrich Böll (1972*) (*Haus ohne Hüter*, 1954; *Ansichten eines Clowns*, 1963). Günter Grass (Plate 136) told the story of a child symbolizing the entire German people, whose growth was stunted by its past (*Die Blechtrommel*, 1959). In *Mein Jahrhundert*, 1999), a partly autobiographical work, Grass stages his own life story, with his customary biting wit, summing up each year of 'his century' with a tapestry of events and characters.

In Switzerland, Max Frisch showed how mass prejudice and lies might entrap a whole society in the clutches of anti-Semitism (*Andorra*, 1961). Lying somewhere between the dramas of Brecht and Ionesco, Friedrich Dürrenmatt's plays staged grotesque characters bereft of certainties, cast adrift in a world whose ideologies amounted merely to farce (*Die Physiker*, 1962; *Der Meteor*, 1966). The 1970s and 1980s gave rise to a more personal and autobiographic literature dwelling on suffering and death. Fritz Zorn perceived cancer as the significant illness of a morbid environment, with Zurich's bourgeoisie as the disease's agent (*Mars*, 1981).

East German writers who rejected their regime fled to the West, or at least published there. Günter Kunert left East Germany in 1979. In 1980, Christa Wolf was the first East German writer to be appreciated in West Germany. After the fall of the Berlin Wall in 1989, the two German literatures fused. Increasingly, the involvement of German-language writers revolved around peace and ecological threats to the planet. In 1984, Kunert called for self-knowledge through meditation 'to bear with this world which was constantly dissolving in nothingness' (*Zurück ins Paradies*). Even more intensely than many other post-modern European writers, young German authors expressed a sense of depersonalization, disintegration of the self, solitude, and fear, faced with the emptiness of modern life. In Peter Handke's work, the individual's alienation and pain found expression through novels, short stories (*Versuch über die Jukebox*, 1990) and plays which jolted audiences, deconstructed rhetorical models, and revealed the constraints of language from which their author sought to break away. Handke even tried to undo the very gestures he regarded as hindering communication, going so far as to stage a completely mute drama (*Der Mündel und sein Vormund*, 1969.) The German-language autobiographical works of Elias Canetti (1991*), born in Austria-Hungary but a naturalized British subject, included the reflections and aphorisms of an individual who, after experiencing a tormented childhood and young adult life, still felt that life

was a value to be treasured, wishing as he did 'to live as if death did not even exist' (*Die Provinz des Menschen*, 1942–72; *Aufzeichnungen*, 1976–78).

As for post-Stalinist literature in Russia, Alexandr Solzhenitsyn (1970*) wrote realistic, classical works couched in fresh language to bear witness to his experience as an inmate of the Gulag and as a fighter against oppression. *V kruge pervom* (*The First Circle*, 1955–58) related the spiritual castration of intellectuals interned in a 'luxury camp', but also showed how the world of concentration camps could forge and temper the mind. The immense fresco of his *Krasnoe koleso* (*The Red Wheel*, 1971–83) dwelt on the causes of the Russian Revolution. His story *Odin den iz zhizni Ivana Denisovicha* (*One Day in the Life of Ivan Denisovich*, 1962) imparts the horror of daily life in the Gulag, playing on the reader's emotion and indignation, and encouraging a nostalgia for traditional values. The countryside, natural beauty, and moral and religious values, even nationalism, were increasingly common themes in Soviet literature, giving rise to an abundance of 'rural' literature. V. Belov related how a peasant manages to triumph over the trials and tribulations of the kolkhoz, thanks to his faith in those values, in *Privychnoe delo* (*A Matter of Habit*, 1966). V. Rasputin told the story of an elderly woman on her deathbed, surrounded by her four children; in the highly successful *Matushka* (1970) he went as far as to reject anything that belongs to the modern world. In V. Astafyev's *Pechal'nyi detektiv* (*Sad Detective Story*, 1986), nostalgia for the countryside is coupled with xenophobia, and even anti-Semitism. The crisis of the agrarian revolution, a thirst for freedom and opposition to the nuclear arms race were all subjects tackled by the popular Kyrgyz writer Chingiz Aitmatov (*Proshchay, Gulsary!*, *Farewell, Gulsary!*, 1966; *I bol'she veka dlitcia den'*, 1980, *The Day Lasts More Than a Hundred Years*). In the latter story, with shades of science fiction, the author wrote of a robot-person suffering from amnesia amid the ruins of his country in a world of folly. The war, which enabled official literature to sing the praises of patriotism and Soviet heroism during the Stalinist period, was bitterly and realistically described by V. Nekrassov (*Vokopakh Stalingrada*, *In the Stalingrad Trenches*, 1946), by K. Simonov in his novels (*Dni I nochi*, *Days and Nights*, 1944; *Jivye I Mertvye*, *The Living and the Dead*, 1960) and in his poetry. War and post-war realities were described by young novelists such as I. Bondarev, who denounced Stalinist repression of those who had fought for their country and their families (*Poslednie zalpy*, *The Last Salvoes*, 1959; *Tichina*, *Silence*, 1964). V. Bykov (*Mertvym ne bolno*, *The Dead Do Not Feel Pain*, 1966) showed how war pushes people to their limit and forces them to ask fundamental questions about their condition. In 1961, V. Grossman completed *Jizn i Sudba* (*Life and Fate*), the final part of a long, highly controversial tableau published in 1952. His last novel, published abroad and only in 1980, deals with Soviet society after Stalingrad and compares Nazism with Stalinism.

At the end of the 1950s, the Sputnik era, science fiction became a very popular genre, enabling authors, whose works very often circulated underground, to express their condemnations of oppression more freely. For example, I. Efremov's *Tumannost Andromedy* (*The Nebula of Andromeda*, 1957); or *Lezvie britvy* (*The Razor's Edge*, 1963), and *Ulitka na sklone* (*The Snail on the Slope*, 1966) by the brothers A. and B. Strugatsky. Other writers, like A. Sinyavsky (*Gololëd*, *The Hoarfrost*, 1962), who considered revolt, freedom and the renewal of literature as obvious companions, looked to satirical realism, producing writings of a fantastic nature. In a similar vein, Erofeyev ripped language apart in such works as *Moskva-Petuski* (*Moscow-Petushki*, 1977). But after 1985, in the years following the restoration of freedom of expression, post-modernist prose invaded the world of the novel; reality and phantasmagoria mingled in a kind of 'mythological realism' leading to self-destruction, as in a short story by S. Kaledin whose intellectual hero turns into an undertaker (*Smirennoe kladbishche*, *Tranquil Cemetery*, 1991).

Several Belgian authors staged avant-garde plays in Flemish, while humanist and expressionist aspirations were summarized in Wies Moens's *Celbrieven*, 1920, and Paul Van Ostaijen sought 'pure poetry' in his *Het eerste boek van Schmoll*, 1928. Dutch literature strove to free itself from moral and religious bonds. Gerard Walschap violently rejected Catholicism and expressed the wish to live as a pagan with the greatest possible intensity in his novel *Houtekiet* (1940). Willem Elsschot wrote tales marked by disillusion and irony (*Het Dwallicht*, 1946). After 1950, a brand of poetry claiming inspiration from Artaud and the surrealists adopted the label 'atonal' and sought to express itself in 'visceral' language. Johan Daisne interjected 'magic realism' into his prose, while Hugo Claus (*Le Chagrin des Belges*, 1985) and other fiction writers reflected the influence of experimental German and French novelists.

Indebted to German expressionism, Swedish literature was, especially in the interwar period, tinged with religious feeling: Swedish writers either sought faith, or advocated a secular and free-minded mysticism. In the 1930s, they expressed anxiety over threats of war and their country's neutrality. As early as 1915, Pär Lagerkvist (1951*) wrote with anguish of the horrors of war (*Steel and Men*, 1915) and went on to condemn all forms of dictatorship (*The Executioner*, 1933; *Victory in Darkness*, 1936). Eyvind Johnson (1974*) urged his contemporaries to oppose Nazism (*Krilon*, 1941–43), and wrote many novels and short stories (*Of Rose and Fire*, 1949; *During the Time of His Grace*, 1960). Harry Martinson (1974*) penned the poem *Anaria*, which served as the basis for a famous opera, and several novels including *The Road to Klockrike* (1948). After the war, Stig Dagerman described the anxiety of 'neutral' Swedish soldiers in 1942 (*The Serpent*, 1945). In his play *Sentenced to Death* (1947), Dagerman revealed an existential anguish reminiscent of the works of Kafka and the French existentialists. The 1950s heralded a renewal of interest in regional literature, with the novels of Sara Lidman, who explored the poor and wild North in *The Country of Mulberries and Thorns* (1955), while Lagerkvist turned his attention to more religious subjects (*Barabbas*, 1950). Torsten Ekböms's *Opening Gambits* (1964) bears the influences of the *nouveau roman*.

In Norway, during the Nazi occupation, writers fled or went on strike, while the population buried themselves in the classics in an attempt to protect themselves symbolically from Nazism. War poetry, 'Krigslyrikken', between 1940 and 1945, was published both in Norway and in exile, but only after the war did most such material see the light of day. Two poets, Arnuf Overland and Nordahl Grieg, whose works galvanized the Norwegian resistance, were regarded as heroes. In the post-war years, novels recognized the importance of the individual in making existential choices,

as with Kåre Holt's *The Great Crossroads*. Tarjei Vesaas was renowned throughout Scandinavia for his expressionist works, which rejected the traditional realistic novel in order to describe the hidden and fundamental workings of character. Vesaas's finest works include a collection of short stories, *Winds* (1952), and the novels *House in Darkness* (1945), and *The Laundry Room* (1946).

In Denmark, along with Martin Andersen Nexo's and Leck Fischer's realistic novels written between the wars, the great historical romance by Nis Petersen won acclaim; it is regarded as one of the most outstanding works on ancient Rome. Karen Blixen's work, so fraught with literary allusions and rich in mystery, won international acclaim (*Anecdotes of Fate*, 1958). Klaus Rifbjerg's plays (*Evolutions*) achieved significant success, but opinions vary regarding his lengthy and rather esoteric poem, *Camouflage* (1961).

In Finland, on the heels of the surrealist-inspired movement Tulenkantaja (Fire-Bearer), came a 'social' novel, *Holy Misery* (1919), and a 'vitalist' novel, *Human Beings on a Summer Night* (1934), both by Frans Sillanpää (1939\*). Post-war writer Väinö Linna earned international fame with a first novel, *Unknown Soldiers* (1954), and later with a highly successful trilogy, *Here Under the Polar Star* (1959–62). Linna's criticism of his country's social and political structures caused an uproar, but the work has enshrined the author as a kind of spiritual leader in contemporary Finland.

## THE AMERICAS

### The United States

American literature truly came into its own when writers began turning away from essentially bookish inspiration to consider their own immediate context, either to idealize conservatism, or to seriously criticize it. At the turn of the twentieth century, Henry James had already depicted, in remarkably minute detail, a rich and decadent American leisure class that haunted the drawing rooms of European high society. But James's concern had been mainly aesthetic. With Theodore Dreiser, stories now became careful and sometimes lengthy demonstrations of situations which inexorably determined their characters' fates. Dreiser's works, *The Financier* (1912) and *The Titan* (1914), described speculation and graft in high places, with no apparent interjection of the author's own opinions. In *An American Tragedy* (1925), Dreiser allowed a protagonist to be driven to murder by sheer solitude, a need to please, and social circumstances, thus shifting blame for a crime on society itself. E. L. Masters, through a series of imaginary epitaphs in the *Spoon River Anthology* (1915), criticized life in a small American town. Masters's works mark the beginnings of modern poetry in a realistic vein similar to Dreiser's sombre vision, bringing to the fore a sense of unease already evinced by Mark Twain and Henry James at the beginning of the century.

After the First World War, American novelists noted that nothing had changed for the better. Values crumbled and money reigned supreme. Shallow-rooted religion indulged in sterile hypocritical gestures to ensure social ascension. The prevailing puritanism hardly cloaked widespread soulless lust and unbridled violence. Prohibition merely whetted society's thirst for alcohol and swelled the

pockets and power of the mobsters. The belief in a democratic dream of opening doors to a new world was criticized by some and cultivated by others.

James T. Farrell's trilogy (*Studs Lonigan*, 1932–35) dealt with the Irish Catholic urban poor living on the wrong side of the tracks. On a spree from one bar to another, Farrell's main character here goes on a 'nostalgic' and useless personal quest, if only to redeem himself in his own eyes. As with Dreiser's writing, Farrell's approach was naturalistic and precise with abundant detail. Although F. Scott Fitzgerald's world was peopled with the wealthy and was perhaps more subtle, he nevertheless also described desperate social climbers, caught in meanders of their own making (*This Side of Paradise*, 1920), corrupted by drink and incest or utterly paralyzed with cowardice (*The Great Gatsby*, 1925) (Plate 137).

Similar despair haunted the autobiographical novels of Thomas Wolfe, another realist in the Dreiser vein, whose style also showed a strong lyric touch (*Of Time and the River*, 1935). Sherwood Anderson scathingly described the suffocation of youthful dreams of freedom in small-town life, as in *Middle West* and *Winesburg, Ohio* (1919). The anonymous, stereotyped small town with its cast of drab characters also featured in the satirical novels of Sinclair Lewis (1930\*), such as *Main Street* (1920) and especially *Babbit* (1922), whose title character became a universal symbol of the average American. Lewis also denounced bogus preachers (*Elmer Gantry*, 1927), budding fascism (*It Can't Happen Here*, 1935), and racism (*King's Blood Royal*, 1947). The writing of Southern gentleman William Faulkner (1949\*) belonged to the tradition of realism, but with sombre allegory darkening his almost macabre fiction (*The Sound and the Fury*, 1930). Faulkner denounced the legacy of slavery and believed that the solution would have to come from an act of love on the part of the South. Only suffering might make up for past inflicted pain (*Intruder in the Dust*, 1948). Faulkner's fiction won universal acclaim. Indeed, the multiplicity of its narrators, sites, time frames, and characters, would even come to influence the *nouveau roman*. Perhaps somewhat like Malraux in France, Ernest Hemingway (1954\*) cultivated a heroic male image through war journalism: an image which might impart a meaning to life over and beyond existential despair. Again like Malraux, Hemingway portrayed Republican Spain and its struggle against fascism (*For Whom the Bell Tolls*, 1940). In *The Old Man and the Sea* (1952), Hemingway turned towards more symbolic writing. In general, Hemingway aimed for the purified 'right phrase', rising like the tip of an iceberg to suggest the mass below, to borrow the writer's own metaphor.

The fictional trilogy by John Dos Passos, *U.S.A.* (1930–36), wove together newspaper clippings, snatches of popular song and snippets of biography and poetry. Dos Passos denounced war and its hidden cogs and wheels and generally deplored modern society; his almost photographic eye depersonalized characters, nearly reducing them to mechanical toys played upon by chaotic forces. His *U.S.A.* later inspired a trilogy by Sartre, who considered Dos Passos 'the most important writer of the century'. Henry Miller, another critic of modern society, and especially American society, composed an expressionist, lyrical body of work very different from the writings of Dos Passos. Miller attacked all Western values, whose hypocrisy and puritanism he condemned in the name of freedom. He denied, however,

responsibility for the sexual revolution that later shook America. But the fact remains that his chief works, including *Tropic of Cancer* (1934), *The Air-Conditioned Nightmare* (1945), and *The Rosy Crucifixion, (Sexus, Plexus, Nexus,* 1949–60), were all banned in the United States until 1961.

Modern American verse experienced a sudden flowering in Chicago from 1912 onwards, with the literary journal *Poetry*, which for the next half-century published a wide variety of works. Twentieth-century American poetry showed no homogeneity whatsoever. It refracted, at a distance, the influence of Ezra Pound, an expatriate in Europe since 1908. Pound's lessons included economy of language, the 'direct' approach, and special attention to rhythm. But these lessons might be combined with the most divergent tendencies: some poets broke with tradition, others were keen to maintain it; and where some writers of verse evoked only a city or region, others sought to render the spirit of an entire nation, or themes of universal importance. Carl Sandburg spoke of Chicago, then of the United States (*Chicago*, 1916; *The People, Yes*, 1936), and Robert Frost pondered the landscape of New England. Around 1955, there arose a new school of poetry, surrealist and even dadaist in inspiration, generally read aloud, with jazz music in the background, in the San Francisco bars frequented by the Beats. Allen Ginsberg's incantations (*Howl*, 1956) reproduced the slang, violence, and rawness of the drug culture.

Eugene O'Neill (1936*) was arguably the most outstanding representative of twentieth-century American theatre. He greatly contributed as of 1916 to free the stage from Broadway 'commercialism'. Influenced by Greek tragedy, Shakespeare, Strindberg, German expressionism, Nietzche, and Freud, O'Neill wrought highly original drama. His characters, weak creatures buffeted by a blind, cruel world, can neither reform, nor communicate with one another (*The Emperor Jones*, 1920; *Anna Christie*, 1921). Towards the end of his life, O'Neill revealed more of himself in plays in an autobiographical vein (*A Long Day's Journey into Night*, 1956). After the Second World War, Tennessee Williams staged erotic and violent neuroses (*A Streetcar Named Desire*, 1947). Arthur Miller's plays symbolize political persecution with characters victimized by their convictions in a pitiless American environment (*Death of a Salesman*, 1949; *The Crucible*, 1953) (Plate 138). In reaction against Broadway, then Off-Broadway, a new, Off-Off-Broadway theatre cropped up. This dramatic genre was a continuation of the Beat movement, and revealed inspiration from Dada, Artaud, and even Zen Buddhism, traces of all of which can be detected in the plays of Bob Wilson, which feature much music and dance (the opera composed by Philip Glass, *Einstein on the Beach*, 1976). David Mamet's experimental theatre dwelt on the city of Chicago, with two or three characters (*Duck Variations*, 1971; *Edmund*, 1983). Sam Shepard's later plays, very much in the American grain, devoted attention to family plights (*Curse of the Starving Class*, 1976; *True West*, 1980; *Fool for Love* 1983).

The period after the Second World War saw the appearance of many autobiographical novels. Black novelists were eager to testify to the black experience in America. Richard Wright's *Black Boy* (1945) showed crime as the only choice available to a black youth in a white world (Plate 139). In *The Invisible Man* (1952), Ralph Ellison traced the searing progress of an unnamed individual literally forced by society into the ground. But while a given black individual might bear witness to a particular condition, still, he or she was made to speak on behalf of a broader human vision, as in Ellison's writings and, again, in the works of James Baldwin. Later writers, in works even more symbolic than Ellison's, explored the problems of literary art as such, or issues with less overt links to political activism, as was the case with *Tar Baby* (1981) by Toni Morrison (1993*), which dealt with a black woman's lot.

Such a shift has, indeed, been apparent in American literature in general. Social realism is everywhere being replaced with fantasy or the outright fantastic, with symbolism, philosophical or moral reflections, or the quest for love. An urban tradition tinged with Jewish humour is very visible in such important novels by Saul Bellow (1976*) as *The Adventures of Augie March* (1953) and *Herzog* (1964), or in the fiction of J. D. Salinger (*Catcher in the Rye*, 1951; *Franny and Zooey*, 1961). In this tradition again were the profoundly humane works of Isaac Bashevis Singer (1979*) written in Yiddish. Singer evoked the Jewish legends of the Polish ghettoes, and the successive waves of Jewish immigration to the United States (*Shosha*, 1978). For his part, Nabokov, first a Russian writer, then an Anglo-American one, but always with a distinct European flair, limned American realities with distant, ironic wit (*Lolita*, 1955; *Pale Fire*, 1962). In *Ada or Ardor: A Family Chronicle* (1969), Nabokov related the amorous episodes of a couple adrift in a world of dream and fantasy. Both William Gass and John Barth (*Lost in the Funhouse*, 1968) ironically toyed with narrative patterns, breaking them up into bewildering fragments with reflections on writing itself. American post-modern trends were mostly spurred by distaste for realities falsified by politics and the media, which gave rise, by way of reaction, to the 'unreal', surrealistic, and even dadaistic jeering of so many writers. Such discredit cast upon outside 'reality' provoked authors such as Robert Coover to inveigle the reader into confronting different possible outcomes for the same erotic scene. In one of his latest novels, *Pinocchio in Venice* (1991), the many levels of significance of Coover's plot follow the adventures of the famous half-real, half-fantastic puppet, as a tale of initiation where the strings and temptations of society prevent the poor creature from fulfilling his total human potential. At the dawn of the twenty-first century, a number of writers were using global electronic networks. Thus the poet and novelist John Updike (*Midprint*, 1969; *Hugging the Shore*, 1983) opted for interactive literature, and initiated an 'exquisite corpse' in partnership with 18,000 internauts.

## Canada

One of the distinctive characteristics of anglophone Canadian authors is their quest for identity against the backdrop of their vast and sometimes overwhelming natural environment. One of the most famous Canadian poets, E. J. Pratt, transformed the construction of the transcontinental railway into a song with epic overtones (*Towards the Last Spike*, 1952). The many poets who succeeded him (more than a thousand collections were published in the 1960s alone) often expressed, in modern forms, their attachment to the region, the prairies in particular, and the great outdoors. In his autobiography, *In Search of Myself* (1921), and in his novel *Over Prairie Trails* (1922), Frederick Grove evoked the vast expanses of Saskatchewan, in his reflections

on the human condition. Emily Carr wrote of her life among the Indians of the poverty-stricken villages of British Columbia (*The House of Small*, 1942), and then of her Victorian childhood (*The House of All Sorts*, 1945). Sheila Watson described the mountains of western Canada, dealing with the same themes as Carr, but with an art that transcended regionalism (*The Double Hook*, 1959). Numerous writers, especially Michael Ondaatje, with his poetic novel *In the Skin of the Lion* (1987), chose Ontario and the city of Toronto as their subject. In *Two Solitudes* (1945), Hugh MacLennan deplored the divide between French and English Canadians and, in a science fiction style, suggested a brighter future in the form of a marriage (*Voices in Time*, 1980). Margaret Lawrence's characters tried to take stock of their lives in an attempt to find some meaning in them (*The Stone Angel*, 1964). Malcolm Lowry, in his famous novel *Under the Volcano* (1947), set in Mexico, evoked Canada (British Columbia) as an earthly paradise. In *The Piano Man's Daughter* (1995), Timothy Findley painted the portrait of a Canadian family in Ontario from the nineteenth century to the Second World War. He showed with the utmost sensitivity how its members were gradually sapped by hereditary madness. The author of many novels, including *The Wars* (1977) and *Famous Last Words* (1981), Findley is widely considered one of Canada's finest writers.

The lyrical poetry of Fernand Ouellette has been highly praised in Canada and Europe alike (*Tu regardais intensément Geneviève*, 1978). To this day, francophone Québécois authors continue to feel kinship with three cultures – French, Canadian, and North American, but with a sense of alienation from all three. Rina Lasnier's poetry expressed the stifling solitude she felt as an artistically gifted child (*Madonnes canadiennes*, 1944; *Les Gisants*, 1963). The cultural revolution that swept Québec in the 1960s produced a great crop of writers, including many women who denounced all forms of alienation, including those imposed by a male-oriented language. Québécois authors claimed full liberation of the body, perceived as the site of a daily experience of the senses but one that could yield keys to metaphysical dimensions. Rejection of political and social structures and confines found expression through a wide spectrum of literary activity in the crafting of novels-within-the-novel, exploration of form, marginal writings, and sheer manipulations of language with spurts of parody and punning as with Jean Daunais's *Les Douze coups de mes nuits* (1979) and especially works by Réjean Ducharme, who explodes language in his novels (*Le Nez qui Voque*, 1967; *Les Enfantômes*, 1976). Ducharme's last works (*Dévadé*, 1990; *Va savoir*, 1994) confirmed him as one of Quebec's finest novelists. A recurrent theme in all of his works is a rejection of all constraints. A similar vein can be found in the work of many poets. Like their European counterparts, Québécois authors in the 1980s paid closer attention to problems of identity. The protagonist in *Volkswagen Blues* (1989) by Jacques Poulin, for example, searches the length and breadth of the United States for his roots. Revolt, violence and death are never far away in Anne Hébert's novels; and incest, symbolizing an oppressive Church and an unacceptable colonization, is a major theme in her work as late as 1975. In *Les Enfants du sabbat*, a nun becomes the very incarnation of ecclesiastical witchcraft. Marie-Claire Blais described the material poverty and spiritual emptiness of human beings, the theme of love and impossible

communication, and – like so many authors – death as often the only existential solution left (*Une Saison dans la vie d'Emmanuel*, 1965; *Vision d'Anna ou le vertige*, 1982). Michel Tremblay's output includes more than forty works (*Chroniques du plateau Mont-Royal*, 1989–95), and his plays rank among the best on international stages today (*Les Anciennes odeurs*, 1981; *Albertine en cinq temps*, 1984). Much in the manner of Latin American authors, French-Canadian writers of novels and short stories have been going back to their cultural roots to add a 'magic' dimension to the realism of their fiction.

## West Indies

Martinique's Aimé Césaire raised a poetic cry in three 'acts' in *Cahier d'un retour au pays natal* (1939), denouncing both the physical and moral wretchedness of the islands and the boasted 'reason' of the West, which made the poet prefer the madness of the wretched. Haiti's poet Jacques Roumain (*Gouverneurs de la rosée*, 1944) mourned the misery of oppressed peasants on his island, but glorified blacks in general, a theme taken up by his countrymen Jacques-Stephen Alexis (*Compère Général Soleil*, 1955), who was assassinated by the Haitian regime, and René Depestre (*Etincelles*, 1945; *Bonjour et adieu à la négritude*, 1980). In broken language, mingling dreams and fact, another poet of Martinique, Edouard Glissant (*La Lézarde*, 1958; *Malemort*, 1975), told of slavery and aborted revolts. In the neighbouring English-speaking Caribbean islands, Derek Walcott (1992*), born in Saint Lucia, founded a theatre in Trinidad which, until 1988, staged his plays, which were praised as brilliant reflections of the Caribbean's cultural diversity (*Dream on Monkey Mountain*, 1970; *The Odyssey*, 1992) (Plate 140). Walcott's widely known verse (*In a Green Night*, 1962; *The Arkansas Testament*, 1987; *Omeros*, 1990) skilfully blends English with Creole.

## Spanish-language literature in Latin America

Nicaraguan poet Ruben Darío, the very soul of the Iberian world's modernist movement, renovated the expressive powers of the Spanish language and enhanced Latin America's contribution to world literature. After the publication of Darío's last work, *Canto a la Argentina y otros poemas* (1914), Spanish-language literature addressed a larger audience and dealt with social problems. With writers of the stature of Argentina's Jorge Luis Borges, the reputation of Latin American letters became truly international (Plate 141).

Still, as his lyrics on Buenos Aires and Argentina in *Cuadernos de San Martin* (1929) showed, Borges's work remained deeply rooted in its own paradoxically complex Latin American reality and culture. At the same time, the increasingly cosmopolitan and universal-minded Borges relied on numerous foreign influences (*Discussión*, 1932), notably Germanic mythology and literature. The lonely, blind Argentine author who was incessantly solicited to give lectures around the world after the Second World War, rejected all labels and religions, except that of literature. He explored all literary genres and readily blended them. Through his self-defined 'polyphonic' fiction, Borges set out 'to change the faculty of imagination.' *El Aleph* (1949)

earned him the reputation of a metaphysician. His disquieting stories, laced with elements of the fantastic, have never left readers indifferent (*Ficciones*, 1941–44; *El libro de arena*, 1975). His ironic distance and scepticism regarding all systems have earned him the disapproval of some critics, but most recognized Borges as a committed and authentic humanist.

In neighbouring Chile, Gabriela Mistral (1945*) wrote compassionate verses on the condition of children in distress, while her countryman, Pablo Neruda (1975*), attained worldwide fame. In intimate texts inspired by surrealism, Neruda expressed anguish and solitude (*Veinte poemas de amor y una canción desesperada*, 1924), probed the meaning of life (*Residencia en la tierra*, 1933–37) and became involved in the struggle against Franco and dictatorship in all its manifestations (*España en el corazón*, 1938). His *Canto general* powerfully evoked the soil, its human inhabitants and native animals, the very life of the new continent, while denouncing the oppression and exploitation of its peoples by the conquerors. Cuba's Nicolás Guillén also protested against the Franco regime, returning to live in his homeland after the Castro revolution. Peruvian poet César Vallejo, in his *Heraldos Negros* (1918), dwelt on the confusion of blacks faced with a hostile world, which both eluded and excluded them; in his *Nada*, a disillusioned individual apprehends pantheism through transcended pain. Vallejo's Marxist- and surrealist-inspired *Poemas humanos* (1939) expressed his love for the animate and inanimate. Chilean poet Vicente Huidobro turned away from imitations of nature to 'create' instead (*Creacionismo*). He also drew on European avant-garde influences to blend with Latin American narrative material in his novel, *Mio Cid Campeador* (1929). In 1931, Huidobro published his greatest poem, *Altazor o el viaje en paracaidos*. Mexico's José Gorostiza pondered existential problems and life and death in *Muerte sin fin* (1939), dislocating language to the point of destruction.

Latin American novelists turned their attention to the great indigenous myths and to pressing social issues. In *La Vorágine* (1924), Colombia's José Eustacio Rivera described his homeland's mighty, violent forests, with which human beings had constantly to contend. This work in turn inspired the highly successful novel *Doña Barbara* (1929), by Rómulo Gallegos, Venezuela's president in 1948. Rich in local colour, *Doña Barbara*, set in the Venezuelan *pampa*, features a ferocious individual who devours every corrupt surrounding creature, a symbol of avenging justice over barbarism. Guatemala's Miguel Angel Asturias (1967*) dealt with Mayan mythology or with individuals in search of their identity, while satirically castigating dictators and denouncing exploitation by foreign firms (*El señor presidente*, 1946; *Hombres de maíz*, 1949; *El papa verde*, 1954). Asturias's *Maladrón* (1969) related in a style known as 'magic writing' the ancient quest for an ocean passage between the Atlantic and the Pacific: an exuberant pretext for religious or humanistic discourse, packed with passages of sheer delirium. Cuba's Alejo Carpentier, much like Asturias, approached whatever 'reality' he described from multiple perspectives and with many magical digressions – landscapes, characters, etc. – as in his masterpiece, *El siglo de las luces* (1962). Carpentier also penned the mordant character sketch of a dictator in *El recurso del método* (1974). Mexican poet Octavio Paz (1990*) first drew his inspiration from the surrealists, then turned to the Far East. Love and

freedom are the subjects of his *Piedra de sol* (1957) and *Ladera Este* (1962–68). The force of poetic imagery, according to Paz, should be able to leave its unsettling imprint in many contexts, even on social revolution: a point stressed both in his poems (*Libertad bajo palabra*, 1949) and in his essays (*El arco y la lira*, 1956; *Las peras del olmo*, 1965; *Conjunciónes y disyunciónes*, 1969). *Laberinto de Soledad* (1950), with its meditations on the human condition and the world, established Paz's international reputation. His last collections of verse, such as *Corriente alterna* (1967) and *El fuego de cada día*, continued to reflect Paz's concerns with Mexican identity.

While the Dominican priest Pedro Henríquez Ureña helped capture one definition of Latin American identity (*Ensayos en busca de nuestra expresión*, 1928–52), Mexico again, its spirit and people in the throes of poverty and revolution, provided the main themes for the fiction of Mariano Azuela (*Los de abajo*, 1916; *Los caciques*; *Pedro Moreno*; *El insurgente*), the author, philosopher and statesman José Vasconcelos (*La raza cósmica*, 1925), and Juan Rulfo (*El llano en llamas*, 1953; *Pedro Páramo*, 1955). Mexico's Carlos Fuentes stripped off society's hypocritical mask (*Los días enmascarados*, 1954), trounced self-serving revolutionaries who betrayed their cause (*La muerte de Artemio Cruz*, 1962), and pondered the issue of identity in yet another major novel, *Terra nostra* (1975). Attempting to uncover what history most often cloaks, Fuentes experimented with language and the techniques of fiction, including the *nouveau roman*, often resorting to interior monologue. His essay 'La nueva novela hispano-americana' explains his distinctive approach to literature

Peruvian national identity was examined by José Carlos Mariátegui in many works such as those collected in his influential *Siete ensayos de interpretación de la realidad peruana*, first published in 1928 and still popular today. José María Arguedas described the gap between rich white landowners and the Indians whose culture he lovingly described (*Yawar fiesta*, 1941). *Los ríos profundos* (1958) told of the Indian revolt and the ensuing white repression, while modern Peru appeared overwhelmed by its problems in *Todos los sangres* (1964): indeed, in despair over the endless struggle between dominant whites and oppressed Indians, Arguedas committed suicide in 1969. Mario Vargas Llosa unveiled the secrets of smug Lima society under the Odria dictatorship in *Conversación en la catedral* (1970). After writing *La Guerra del fin del mundo* (1983), he turned to Latin America's most pressing issues as summarized in his collection of essays, *Contra viento y marea III* (1990).

In Argentina, Julio Cortázar employed 'magic realism' with cosmopolitan adventures and daily happenings at once disquieting, baffling, and fantastic, thus exploring the mystery of human nature (*Libro de Manuel*, 1973). Cortázar's *Rayuela* (1963), a half-serious fictional labyrinth, left the succession of chapters to the reader's discretion, along with a medley of essays, poems, and short stories. Manuel Puig explored the yearnings and sensitivity of two homosexual prison inmates in *El beso de la mujer arana* (1979).

Colombia's Gabriel García Márquez (1982*), in his extraordinary epic novel *Cien anos de soledad* (1967), harnessed every trend in Latin American literature, coupling ancestral myth with brutal present-day social reality: through an individual's solitary and magical quest for a lost paradise (Plate 142).

## Brazilian literature

In Brazil, São Paulo's Modern Art Week sparks off effervescent literary activity. With a variety of formal innovations of European inspiration, poets and novelists gradually developed a specifically Brazilian brand of literature. Leading writer Oswald de Andrade drew on the prose of the early Portuguese chroniclers for the subject matter of his collection of poems *Pau Brasil* (1925). Another modern poet, Mário de Andrade, depicted a multiracial Brazil where Indian and African mythology mingled through the ages in a language as composite as the multi-cultural country itself (*Macunaíma*, 1928). This poem in turn greatly influenced João Guimarães Rosa, whose regionalist evocations of the *sertão* or 'interior', the country's desiccated north-east region, through the poetic language of his *Grande sertão: Veredas* (1956), continued to stress a major theme of Brazilian literature. In works by Guimarães Rosa, dwellers of the *sertão* – children, peasants, old blind men – tell their life-stories to an invisible narrator. The *sertão* was already the main feature of Garciliano Ramos's *Vidas secas* (1938), where poverty-stricken families flee the arid interior for the beckoning mirage of the seemingly opulent coast. Raul Bopp's *Cobra Norato* (1928–31), a fable in free verse incorporating myth, further defined the emerging Brazilian reality. Satire found its finest expression in the works of Alcântara Machado (*Brás Bexiga e Barrafunda*, 1927), and again with Ramos who condemned the 'cannibals' of the new bourgeois class (*Caetés*, 1933). After 1930, both fable and satire combined in Jorge Amado, a poet deeply rooted in the past of his native north-east region, with its suffering mulatto population (*Cacau*, 1933; *Mar morto*, 1936). Amado described his country with humour but with great tenderness as well (*Teresa Batista cansada de guerra*, 1975; *A America descoberta pelos Turcos*, 1992), while contemplating the future with optimism (*Camisola de dormir*, 1980). Rapid urbanization has caused writers of fiction such as Rubem Fonseca (*Zona sul*; *Feliz Ano Novo*, 1975) and Marcelo Rubens Paiva (*Agosto*, 1990; *O selvagem da Opera*, 1994), to cast a rather baleful eye on the possibilities of picaresque adventure in Rio de Janeiro's urban jungles.

## AFRICA AND THE NEAR EAST

### North Africa

Many Algerian authors, such as Jean Amrouche and Kateb Yacine (*Nedjma*, 1956), have written in French even though the protagonist in Yacine's novel symbolically rejects his foreign spouse to search for an ancestral and virginal Algeria. Mohammed Dib's distinguished work extends over half a century. Like the writing of Amrouche and Yacine, Dib's trilogy, *Algérie* (*La Grande Maison*, 1952; *L'Incendie*, 1954; *Le Métier à tisser*, 1957), claimed the right to a 'new soul' on behalf of the many social classes making up Algeria's colonized population. In 1962, Dib shifted his approach to fiction and wrote in poetic terms of the sea as a symbol of renewal and permanence. Independence brought other issues to the fore. By 1968, Dib was speaking out against official conformism and lies, while Rachid Boudjedra denounced the structure of the traditional North African family (*La Répudiation*, 1969). Nabile Farès deplored 'the

exile within our own souls' (*L'Exil et le désarroi*, 1976) and Rachid Mimouni condemned a ruling and corrupt bourgeoisie and bureaucracy (*Le Fleuve détourné*, 1982). Nouredine Aba's plays staged a drama of protest, and Aïssa Khelladi described an atmosphere of terror, suspicion, and secret informers in contemporary Algeria (*Peur et mensonge*, 1996). Dib's latest work similarly depicted a country village with its groves, hills, memories, aspirations, and present distress under siege by bloodthirsty, cut-throat 'mad dogs' (*Si Diable veut*, 1998). In addition, more than 34 Algerian women writers have examined the question of women in their society since 1947. Like so many other literate North African women, Assia Djebar regarded the French language as an instrument for liberation (*Les Alouettes naïves*, 1967; *Ombre sultane*, 1985).

French-language Moroccan authors also addressed the contrast between tradition and modernism, with various claims, protests, and quests for identity. By 1954, Driss Chraïbi was attacking paternal authority and an ossified Islamic tradition (*Le Passé simple*), but he also denounced the condition of migrant Moroccan workers in France (*Les Boucs*, 1955) and further probed East/West or traditional/modern contrasts in his quest for absolute values (*Naissance à l'aube*, 1986). Mohammed Khaïr-Eddine's novels are a fantastic medley of prose, verse, and theatre (*Le Déterreur*, 1973), while Abdellatif Laâbi considered the past dead and sought fresh identity and purpose (*L'Oeil et la Nuit*, 1969; *Le Chemin des Ordalies*, 1975). Driss Chraïbi took up similar themes (*Mort au Canada*, 1975). Tahar Ben Jelloun's very poetic novels brought to light the ambiguous sexuality of lost souls (*La Nuit sacrée*, 1987) and expressed the most intimate thoughts of an old man abandoned by all (*Jour de silence à Tanger*, 1990).

After 1950, Tunisia's significant writing in French was principally represented by the autobiographic works of Jewish writer Albert Memmi. In *Statue de sel* (1953) and *Le Scorpion* (1969), Memmi pitted the colonized subject against the colonizer, but also stressed the need for the colonized subject to undergo searching self-criticism as well: self-satisfaction would never do because 'rejection of self' was also a requirement for liberation. In fact, many North African authors, in a state of 'abiding frustration', concluded that their enemy was not only the colonial ruler, but themselves as well. This realization gave rise to the fresh perspective of the new novelists, short-story writers and poets of the 1980s on social upheavals, on themselves, and on the Other, while searching farther afield to raise issues of universal significance. The young Tunisian writer Emna Bel Haj Yahia recounted the efforts of two women to find their place in a would-be modern society still ruled by the laws of the Koran (*Chronique frontalière*, 1991). Like the literary output in French, the number of new novels in Arabic in independent North Africa began to rise steadily, despite what some perceived as a religious taboo on using the form 'I' in writing: hence the theoretical impossibility of writing an autobiography in Arabic.

In neighbouring Egypt, Arabic was certainly being used for realistic fiction in the wake of Muhammad Husayn Haykal's *Zaynab* (1914). In 1930, Haykal published his autobiography, *Al-Ayyâm (Days)*, in classical Arabic. Haykal is regarded as one of the greatest contemporary writers in the Arabic language. In his novel *The Damned of the Earth* (1949), he describes the plight of the unfortunate men who see the 'tree of poverty' grow in their fields. Tawfiq

al-Hakîm wrote plays on themes inspired by ancient Greek mythology before turning to more modern themes without eschewing dreams and the irrational; he became famous for his novel *Journals of a Rural Assistant District Commissioner*, in 1937. By 1955, Haykal was championing women's rights. The novel as such, then emerging from under the shadow of European influences, took firm root in Egypt. Abdel Rahman al-Sharqawi's realistic tale *The Earth* (1954) described the oppression and misery of Egypt's children of the soil. Naguib Mahfouz (1988*) brought to life Egypt's capital city in his Cairo trilogy (1956–67), which brought him international fame and established the originality and universal importance of contemporary Arabic literature. Mahfouz has written more than forty novels and short stories. His most controversial novel, *The Children of Gebelawi* (1959), stressed the link between the three great monotheistic faiths. Mahfouz explored fresh paths in *Miramar* (1987). Young novelists who followed the literary trail blazed by Mahfouz, but with sensitivity for new forms all their own, included Edouard al-Kharrât, Sonallah Ibrahim, and Nabeul Na'hum.

## The Near East

In Lebanon, the poet Adonis ('Ali Ahmad Sa'id) made a clean break with the Near Eastern poetic tradition by composing verses in a surrealistic vein, drawing on a tradition partly inspired by Walt Whitman's poetry. This highly nostalgic poetry is known as poetry of exile (*mahjar*) as it is mainly written by Lebanese refugees in Egypt, like Mikha'il Nu'aima and Gibran Kahlil. The renowned Iraqi poet Nazik al-Mala'ika relies on classical Arabic metres for the rhythm and music of her verse, while addressing new themes, such as her hopes for improving the condition of women. The Middle East conflict was central to the politically *engagé* novel of the Palestinian writer Ghassan Kanafani (*Men in the Sun*, 1963), and *The Secret Life of Saeed the Pessoptimist* (1974) by Emile Habibi relates with bitter irony the life of an Arab living in Israel who finds nobody to listen to him but beings from outer space. The celebrated Palestinian poet Mahmoud Darwish in turn reflected present-day political concerns. In *Why Have You Left The Horse Alone?* (1994), Darwish searches for a national identity through writing.

In the region that would become the State of Israel, writers who published in Hebrew after the 1920s were for the most part immigrants. S. Y. Agnon (1966*) is considered the first great author of modern Israeli literature for his witty and bittersweet tales of Jerusalem, as well as for his evocation of the Holocaust. A new generation of authors rejuvenated writing styles to deal with the changes and psychological, economic and political problems of Israeli society. Avraham B. Yehoshua's portrait of this society was both realistic and ironic in *Molkho Five Seasons*, 1989. In *Mr. Mani*, 1990, Yehoshua invented a series of father-to-son dialogues from 1880 to the present. Amos Oz showed how proximity could engender conflict between neighbours, but also created the needed links for peace (*Voices of Israel*, 1982). Oz's *Black Box* (1987) explored the contrasting feelings of love and hate between two human beings. The country's current crop of writers, sometimes called 'the generation of normalization', dwells on problems pertaining to the issue of coexistence, while most Israeli authors find themselves swept along by the leading international literary trends. David Grossman's characters, maddened by sullied and violence-ridden realities, escape into imaginary worlds (*The Smile of the Lamb*, 1983). In Grossman's *See Under: Love*, 1986, two survivors of the Nazi death camps refuse to discuss the matter while their son carries on an obsessive investigation.

In Turkey, after the liberation of the language by the poetry of Nazim Hikmet (who was in turn influenced by the works of Mayakovsky) from the 1950s onwards, numerous writers of peasant origin related the evolution and modernization of social structures in Anatolia. *The Lords of Akçasaz* by Yasar Kemal is the best example. In *Kara Kitap* (*The Black Book*, 1990), Orhan Pamuk used Joycean form to describe someone searching for his identity in Istanbul, a city of snow and slush, mysterious and laden with its past, and yet very close to Europe. In Iran, after Hejazi's combative prose and novels of love and mores, and the familiar stories of Jamalzade, the realist novellas of Sadeq Hedayat describe the problems of Persia after 1941. Hedayat has strongly influenced all contemporary Persian writers.

## Sub-Saharan Africa

As in the Maghreb, writers in sub-Saharan Africa have focused on several themes: exorcizing the legacy of colonialism and racialism, reasserting cultural identity particularly in relation to the West, denouncing domestic political or economic oppression, and seeking a new language. All these elements might, quite simply, be taken to define Negritude, a blanket term covering the ethical and cultural claims made by pioneer black francophone poets on African soil, in the Caribbean and in the Indian Ocean region. French Guyana's Léon Damas published the first collection of verse of the Negritude movement, *Pigments*, with a preface by Robert Desnos in 1937. Damas's poetry celebrated black revolt against exploitation and humiliation, with flashes of wit, profound tenderness and nostalgia for a mythical Africa. Madagascar's Jean-Joseph Rabearivelo drew on oral sources to express his people's anguish in modern terms (*Traduit de la nuit*, 1935), while his private diary, *Cahiers bleus*, bore witness to Malagasy conditions on the eve of the Second World War.

Senegal's Léopold Sédar Senghor felt less bitterness towards France than had Aimé Césaire and dwelt on childhood memories transfigured through a past of legends and magic (*Chants d'ombre*, 1945). Other Africans publishing in French included Birago Diop, who borrowed from the traditional griots or storytellers to describe the realities and values of village life in the West African Sudan (*Les Contes d'Amadou Koumba*, 1942); and Djibril Tamsir Niane, who did the same for the Mandingo people (*Soundjata ou l'Epopée mandingue*, 1960), while Amadou Hampaté Bâ safeguarded and transcribed the legacy of the Fulani or Peul people (*Amkoullel, l'enfant peul*, 1991), and Sory Camara related the tales of the Malinké griots (*Gens de la parole*, 1976). Nigeria's John Pepper Clark proceeded along similar lines to render in English the mythic feats of the hero of the Ijo people, in *The Ozidi Saga* (1977).

Senghor was succeeded by other poets of protest. Senegal's Sembene Ousmane described a strike against colonial racialism and administrative corruption (*Les Bouts*

*de bois de Dieu*, 1960). Cameroon's Ferdinand Oyono exploded the myth that a colonizing power felt any special gratitude towards colonized subjects (*Le Vieux Nègre et la médaille*, 1956). Also from Cameroon, Mongo Beti attacked the incurable gangrene of colonialism with corrosive wit, in *Le Pauvre Christ de Bomba* (1956). He later went on to ridicule contemporary African power brokers (*La Ruine presque cocasse d'un polichinelle*, 1979; *Les Deux mères de Guillaume Ismaël Dzewatama*, 1983; *La Revanche de Guillaume Ismaël, Dzewatama*, 1984). Coming after Senghor and Césaire, the brilliant Mauritian poet Edouard Maunick panned ideas like gold dust through the sieve of the French Creole speech of his luxuriant island homeland (*Paroles pour solder la mer*, 1988; *Anthologie personnelle*, 1989). Very different verse was written by one of Africa's leading poets, Congo-Brazzaville's Tchicaya U'Tamsi (*Mauvais sang*, 1955; *Le Ventre*, 1978), in clashing syntax, with harsh music and violent imagery. *L'Enfant noir* (1953), by Guinea's Camara Laye, a story of idealized childhood, might be compared with Senghor's *Chants d'ombre*. *L'Aventure ambiguë* (1961), by Senegal's Cheikh Hamidou Kane, is a profound meditation on the successive phases of acculturation among his Diallobé people through the clash between two civilizations. On his return to his homeland, Kane's protagonist, torn between impossible choices, can no longer live. Kane further denounced the alienation of contemporary human beings as a result of the consumer society and prophesized the West's self-destruction.

*The Palm-Wine Drinkard* (1952), by Nigeria's Amos Tutuola, played astonishingly with English. In the wake of Tutuola's achievement, Chinua Achebe's work skilfully showed how English might be fully put to African purposes and thereafter enjoyed great influence. Achebe's fiction (*Things Fall Apart*, 1958; *No Longer at Ease*, 1960; *A Man of the People*, 1966), and verse (*Beware, Soul Brother*, 1972) described the destruction of village society by missionaries and corrupt politicians. In *Anthills of the Savannah* (1987), Achebe resumed his meditation of his country's history by setting the proverbs of the Igbo people against the slogans of politicians. Wole Soyinka (1986*) (Plate 143) used English in his verse, but in his drama mingled Yoruba with the most polished English (*Death and the King's Horsemen*, 1975).

The novels by Kenya's Ngugi wa Thiong'o (*A Grain of Wheat*, 1967; *Petals of Blood*, 1977) attack corrupt government officials and exploitative foreign investors in his homeland. His works are written in English and interwoven with chants in Gikuyu and Kiswahili. Ngugi's spoken play in the Gikuyu language, *Ngaahika Ndeenda* (1982), was banned by the authorities. In Somalia, when Nurudin Farah's novel in his mother tongue was banned, the author went into exile and began writing in English. Nigeria's leading human-rights activist Ken Saro-Wiva, who was executed in 1995, resorted to a 'rotten language', mixing pidgin with English, the better to reflect the dislocated and dissonant society of his protagonist (*Sozaboy*, 1987). The Kiswahili language completely replaced English in Shaaban Robert's *Kusadikika* (1951) and *Insha ya Mashairi* (1967). When Kiswahili became the official language of the United Republic of Tanzania, most writers, indeed, turned away from English. Euphrase Kezilahabi deplored rural emigration, poverty and the problems of his country's youth (*Dunya Uwanja wa Fujo*, 1975). But such attempts to recover their national language could turn against authors

who denounced the shortcomings of their own new ruling social class, while failing to secure a large foreign readership. In Zimbabwe, Chenjerai Hove published *Bones* (1988) in English, but stressed 'the power of the people' in *Masimba Avanhu* (1986), written in his own Shona tongue. David Yali-Manis presented texts (1977) in Xhosa, in order to transcribe the spontaneous oral poetry known as *isibongo*. Zulu poet B. W. Vilakazi mixed *isibongo* with Western-inspired verse. After pioneering African novelist Thomas Mofolo published *Chaka* in 1925, a work in the Suto language, the conflict between the Zulu and the British was again described in this same tongue by B. M. Khaketla.

South Africa's Nadine Gordimer (1991*) (Plate 136) related the suffering of individuals caught up in the clashes of apartheid. Gordimer chose to struggle against racialist oppression and on behalf of reconciliation between her country's ethnic groups (*July's People*, 1981). Her novel denounced the violence of a modern society where firearms might be procured at will. Deep-probing descriptions of violence with J. M. Coetzee (2003*) became truly nightmarish (*Waiting for the Barbarians*, 1980). D. M. Zwelonke pondered the dichotomy between unavoidable outside reality and the fiction intended to portray it. South Africa's favourite literary genre is the short story, and one of its major proponents, Es'kia Mphalele, stressed that writing must create continuous music despite all external violence and chaos (*The Unbroken Song*, 1981).

In *Soleil des indépendances* (1968), Côte d'Ivoire's Ahmadou Kourouma pursued Achebe's experimentations in the French language, and shattered the illusions of those who thought that independence would resolve all of the country's problems. Kourouma denounced the worship of French and introduced Malinké speech into his writings, in a tour de force of Africanization of vocabulary, which he repeated in *Monné, outrages et défis* (1990). Congo-Brazzaville's S. L. Tansi, however, captured the popular French manner of speaking of the capital city Brazzaville (*Les Sept Solitudes de Lorsa Lopez*, 1985).

## ASIA

### India

Rabindranath Tagore (1913*), the Bengali-language novelist, playwright, poet, musician and painter, is one of the most revered and universally known figures of Indian literature. The verses of his *Gītānjali* (1912), translated into English and French, earned him the Nobel Prize. While his immense body of work was created at the beginning of the twentieth century, his humanism, optimism and message of love have continued to exert an influence throughout the century.

Sir Muhammad Iqbâl, heir to the two great writers in the Urdu language, A. K. Ghalib and A. H. Hali, and regarded as the foremost poet of Muslim India, composed Urdu and Persian verse inspired by fervent Sufi mysticism. He believed that, through writing, writers could achieve a personal rebirth that they could then share with the rest of the community (*Gabriel's Wing*). Iqbâl is also known for his philosophical works and for conceiving of the idea that led to the creation of Pakistan in 1947. M. K. Mahatma Gandhi, another emblematic figure, wrote numerous texts in his native Gujarati in addition to his memoirs and an

autobiography translated into English (*The Story of My Experiments with Truth*, 1929), which went largely unnoticed. His ideas later reached a wider readership thanks to Tamil writer K. S. Venkataramani, in his novels (*Murugan the Tiller*, 1927; *Kandan, the Patriot*, 1932) that examine the traditions of Indian villages, initially published in English and later translated into Tamil. Jawaharlal Nehru is best known for his autobiography written in English while in prison and hailed as a masterpiece (*An Autobiography*, 1936). Dhan Gopal Mukerji, a friend of Nehru and a political activist fighting for independence, also published an autobiography (*Caste and Outcast*, 1923). Punjabi writer Mulk Raj Anand wrote a number of novels and Marxist-inspired political works about the Punjab; his *Untouchable* (1935), relating a day in the life of a sweeper, was highly acclaimed. The novels of the left-wing writer Khwaja Ahmad Abbas described a changing society and belong to the same realist-progressive current. Like many others, Abbas recorded his personal perspective in an autobiography (*I Write as I Feel*, 1948). The very popular novelist Krisan Candar also worked in the realist vein with a socialist flavour and an occasional hint of poetic melancholy reminiscent of the work of Rajindar Singh Bedi, which captures Punjabi village life. The Brahmin Raja Rao considered literature a 'religious act' and painted a detailed portrait of an Indian village as it metamorphosed thanks to the inspiration given by Gandhi (*Kanthapura*, 1938); he often travelled abroad and described the problems encountered in other countries by Indian intellectuals (*The Chessmaster and His Moves*, 1988). British author E. M. Forster's *A Passage to India* (1924) continued to be regarded as a classic even after independence. Nirad C. Chaudhuri, born in 1897, in his *Autobiography of an Unknown Indian* (1951), recounted his daily experience of Bengal and retraced the history of India. In England from 1970 onwards, Chaudhuri harshly criticized both countries in the second part of his autobiography, *Thy Hand, Great Anarch* (1990).

In his eight-volume masterwork *Mānasarovar* (*The Holy Lake*), Prem Chand (pseudonym of Dhanpat Rai Srivastava) wrote in a masterly styled Hindi influenced by the nineteenth-century novel tradition. In his novels, especially in *The Gift of a Cow* (1936) and in some three hundred novellas, he focused on the common people rather than the elite. Although the Hindi poetic tradition is deeply rooted in literary and social revolt, it gave rise to a romantic and mystical school, known as Chayavad, characterized by free verse, musicality, and a more meaningful mode of expression. Of the four principal Chayavadi poets, Mahadevi Varma stands out (*Nihar, Rasmi* and *Dipsikha*). *A Time to Change* (1952) collects works by one of the finest English-language poets and playwrights in India, Nissim Ezekiel.

Writing in Urdu, Faïz Ahmed Faïz enriched his poetry with Western prosody, widening the register of traditional images and techniques (*Daste Saba*, 1952). His poems have been frequently reprinted and translated into several languages. One of the finest recent works in Tamil is U. V. Swaminatha Iyer's autobiography (1950). *Vati va cal* by Cellapa explores new possibilities of writing while depicting Tamil village life, whereas the short stories of Jeyakantan described the dire poverty of huge cities. Among the poets writing in Malayalam, three authors stood out in the years prior to 1970, considered the 'golden age' of Malayalam poetry: Vallathol Narayana Menon, Kumaran Asan and Ullor S. Parameshwar Iyer.

After the romantic phase of the Chayavad school, Hindi literature turned to a more socialist and progressive vein, influenced by Marx and Gandhi. Another, so-called experimental trend deals with individuals willing to evaluate themselves critically to make existential commitments or to explore their ego in the light of psychoanalysis. As part of this trend, the novels of Jainendr Kumar, *Tyag Patr, Sunita* and *Parakh*, are regarded as masterpieces.

Most novels published after 1950 addressed the same subjects: social hardship, or the confrontation between Western and Indian values. R. K. Narayan already enjoyed a considerable reputation as a writer with his portraits of the middle classes in an imaginary South Indian town, when he resumed these themes in *Waiting for the Mahatma* (1955). Other authors addressed the more sensitive subject of the partition of the Punjab. Attia Hosain told of her life as a Muslim in India during this period (*Sunlight on a Broken Column*, 1961). Nehru's niece, Nayantara Saghal, also evoked the Punjab during partition in her autobiographical writings, as well as in *Storm in Chandigarh* (1969). The same theme was pursued by Chaman Nahal with his story of the flight of a Hindu family (*Azadi*, 1975). Sikh writer Khushwant Singh is famous for his tragic *Train to Pakistan* (1956), as well as for many other works revealing his irreverent, sardonic wit. Anita Desai enjoys an international reputation; her works mostly explore the solitude and maladjustment of young women in conflict-ridden situations (*Bye-Bye Blackbird*, 1968; *Baumgartner's Bombay*, 1988).

An ardent feminist, Mahadevi Varma is famous for her role in transforming poetry but also for denouncing the injustices suffered by the dispossessed, children and women. In her memoirs (*Sketches from My Past: Encounters with India's Oppressed*, 1989), she drew portraits of the oppressed whose sufferings she had witnessed first-hand. Lurking beneath the surface, however, is a feeling of despair over the injustices she witnessed. Mahasveta Devi, one of the best-known women novelists writing in Bengali and winner of the famous Sahitya Akademi prize in 1979 (*Jhansir Rani*, 1956; *The Son*, 1986), described the plight of tribal communities.

Farrakhan Hendy's innovative post-modernism (*Poona Company*, 1980; *Bombay Duck*, 1990) pursued the tradition of Anglo-Indian humour. Salman Rushdie (Plate 136), a Muslim settled in London, satirized Pakistan in *Shame* (1983), and attracted the wrath and death threats of Shi'ite clerics and other Islamic fundamentalists, along with world fame, on account of his novel *The Satanic Verses* (1989), which mingled real and fantastic social and political elements with 'magic realism'. After Romesh Gunesekera recounted recent Sri Lankan history in *Reef* (1994), he went into exile. Shashi Thapoor confronted Hindus and Muslims in a humoristic post-modern parody of the Mahâbhârata (*The Great Indian Novel*, 1989). The novels of multilingual anthropologist Amitav Ghosh introduce the reader to a world filled with misshapen, grotesque creatures, where prosaic daily life mixes with magic, and the past with the future (*The Shadow Lines*, 1988; *The Calcutta Chromosome*, 1996) (Plate 144).

## Indonesia

The literary movement initiated in 1928 through the emergence of a common written language was suppressed by the Japanese invasion. Pramoedya Ananta Toer was the

only significant author to emerge from what Indonesians refer to as the 'Generation of '45'. Toer fought on behalf of independence and examined the themes of war and guerrilla activity (*Partisan Family*, 1950). One of his later works relates the moral lapse of a petty civil servant and his craving for wealth and luxury (*Korupsi, Corruption*, 1961). Mingling reality and dreams, Putu Wijaya sketches the portrait of a young Balinese who receives a telegram that completely disrupts his daily life (*Telegram*, 1973).

## Viet Nam

Towards 1925, Hoang Ngoc Phach published the first 'modern' novel describing the attempts of an individual to tear loose from traditional family bonds. By 1935, ideas of independence and unity took root, allowing complete artistic freedom to writers who generally drew their inspiration from the various currents in contemporary French literature. Individual liberation and a society in turmoil provided subjects for fiction by Hô Biêu Chánh (in the South) and Nhât Linh (in the North). Poetry, novels, and short stories have flourished over the last few years. In *Le Chagrin de la guerre* (1992), Ninh Bao expressed the deep pain of the protagonist returning from war.

## Japan

The Taisho era, which more or less coincided with the First World War, was marked by executions of 'dangerous' intellectuals. Writers like Ogai Mori abandoned naturalism, went into retreat, and reflected on the values of their country's lost traditions (*Shibue Chusai*, 1916). Soseki Natsume's autobiography (*Michikusa, Grass on the Wayside*, 1915) dwelt on conflicts fed by passion and on the demands of traditional Japanese ethics. But wealthy young writers were open to European influences, such as Ibsen, or Strindberg and various Russian novelists. Pessimism and social concerns distinguished Takeo Arishima (*Aru Onna, A Certain Woman*, 1919) from this group. With his medieval tales, Ryunosuke Akutagawa seemed to be standing on the sidelines, but his stories raised important questions pertaining to the artist and, more generally, human beings in the modern age (*Rashomon*, 1915; *Jigokuhen, The Hell Screen*, 1918). Before committing suicide, he analyzed the madness threatening him, and his reasons for putting an end to his life, in *Haguruma* (*Gear Wheels*, 1927). In the 1920s, young artists were tempted by the various European political and literary 'isms': internationalism, expressionism, dadaism, communism, surrealism, and so on. Proletariat-oriented works included Kobayashi Takiji's distinguished *Kani Kosen* (*The Crab-Canning Boat*, 1929), which denounced the wretched conditions of fishermen. Subjected to torture by the authorities, the author died in 1933. Shimazaki Toson traced the effects of modern reforms on the provincial gentry (*Yoakemae, Before the Dawn*, 1929–35). In 1937, Naoya Shiga finished a long autobiographically inspired novel addressing the problems of a young artist coming to grips with himself and his relationship to his family (*An Ya Koro, A Dark Night's Passing*).

Junichiro Tanizaki published his two great novels, *Tade Kuu Mushi* (*Some Prefer Nettles*), and *Shunkinsho* (*A Portrait of Shunkin*) in 1929 and 1933, but had to wait until after the Second World War to see the ban lifted on the publication of his apolitical masterpiece, *Sasameyuki* (*The Makioka Sisters*), in 1947–48. Tanizaki's last novels, *Kagi* (*The Key*, 1956), and *Futen Rojin Nikki* (*Diary of a Mad Old Man*, 1961–62), analyzed in superb style the ambiguities and manifestations of desire in odd situations. Another major novel to appear in 1948 was *Yukiguni* (*Snow Country*), in which Yasunari Kawabata (Plate 145), in very pure and poetic language, explored his characters' feelings with subtlety and depth. Evoking solitude and the cold of winter at the onset of death, Kawabata describes a city-dweller's love for an imaginary woman in the Land of Snow, but the spell dissolves at the end of the novel with a fire typifying despair. The aesthetics of this work, one of the pinnacles of contemporary Japanese literature, stylizes realism and takes a story to the very limits of language's expressive power, shedding masks to disclose the profoundest truths. Kawabata's *Senbazuru* (*Thousand Cranes*, 1949–51) is a 'miniature novel' steeped in the atmosphere of the traditional tea ceremony, and written with intense psychological realism. His *Yama no Oto* (*The Sound of the Mountain*, 1949–51) explores a dull everyday life and its gradual slide into catastrophe, while his strange *Nemureru Bijo* (*The House of Sleeping Beauties*, 1960–61) mirrors the feelings of an old man gazing at the bodies of sleeping prostitutes. Yoshiyuki Junnosuke's *Anshitsu* (*The Dark Room*, 1969), follows a marginal character's search for his own humanity as he ponders homosexuality, life and death. Yukio Mishima carefully explored various perversions, as in *Kinkakuji* (*The Temple of the Golden Pavilion*, 1956), in which he describes the descent into madness of a young monk who finally sets a famous temple on fire, or *Utage no Ato* (*After the Banquet*, 1960), which relates the life and marital problems of a businesswoman. Kobo Abe revealed the identity problems of his characters by putting them in unsettling situations; a city-dweller falls into the hands of a savage tribe in *Suna no Onna* (*The Woman in the Dunes*, 1962). Elsewhere, Kobo resorted to science fiction, the adventure genre, or the detective novel, to cast further psychological light. Kenzaburo Oe (1994*) depicted in tones of grotesque humour an anguished individual's struggles against a hostile environment (*Manen Gannen no Futtoboru, The Silent Cry*, 1967). Jun Ishikawa established his reputation with short stories in the 1950s, but truly came into his own with a post-modern novel of extraordinary fantasy, *Kyofuki* (*Tales of Crazy Winds*, 1980), which blends slang with erudite allusions and explores many facets of contemporary society.

Among younger writers, Kenji Nakagami stands out for the quality of his fiction with *Sen-nen no Yuraku* (*A Thousand Years of Pleasure*, 1982), and *Nichirin no Tsubasa* (*On the Wings of the Sun*, 1984). Yuko Tsushima (*Yoru no Hikari ni Owarete, Pursued by the Light of the Night*, 1987) and Eimi Yamada (*Bedtime Eyes*, 1985), are gaining a considerable reputation for their highly imaginative touch.

## Korea

After Korea was annexed by Japan in 1910, Yi Kwang-su pursued his country's new novel tradition with a didactic work on the theme of good vs. evil, *Mujong* (*Heartlessness*, 1917). As the independence movement gained momentum,

novels acquired a more naturalistic character. Yom Sang-sôp drew a sad and brutal picture of Korean society in *P'yobonshilui ch'nonggaeguri* (*Green Frog in the Specimen Gallery*, 1921). Throughout the 1920s, intellectuals took a stand in favour of their country's workers and peasants; in 1930, Yi Ki-yong published a violent novel, *Sô-hoa*. More 'aesthetic' authors turned their attention to nature again in the 1930s, and, until 1945, harsh measures by Japanese occupation forces effectively muzzled writers. In 1953, after the Korean War, some denounced the country's partition, while others decried the northern expansionism. Subsequently, writers tended to revolt against Syngman Rhee's authoritarian regime. Poet Pak Tu-jin (*Sa-wôl man-bal, April Flowers*, 1966) celebrated the renewal of a literature of revolt. As of 1980, younger writers in their short stories described urban economic and social upheaval, jumbling past traditions with modern conditions. In *Mandala* (1990), Kim Sung-dong wittily recounts the adventures of two Buddhist monks in the modern world.

## China

Although political, social and economic upheavals of all sorts overwhelmed twentieth-century China, considerable literary production continued unabated. Hu Shi's manifesto (1917) pleaded for honest expression of feeling in language closer to modern speech, while the literary world welcomed foreign influences, especially Russian and French. Realism and introspection dominated the novel and especially the short story, the most favoured genre. Poets and writers founded literary reviews, such as the celebrated magazine *Chuangzao* (*Creation*) (1920s) whose two most famous contributors were poet Guo Moruo and playwright Tian Han. Guo Moruo dominated the literary field until his death in 1978, publishing romantic and pantheistic poems like *The Goddesses*, 1921, through which he expressed his wish to see the world lit by a 'new sun', love poems (*The Vase*, 1925), novels, short stories, and autobiographical fiction (*Dead Leaves*, 1936). Tian Han found it harder to attain widespread popularity with his European-inspired plays in the face of a vibrant traditional theatre. Nevertheless, Tian Han's increasingly complex dramas, such as (*Nangui, Return to the South*, 1929) made him a highly esteemed playwright.

Lu Xun is considered by many to be the father of modern Chinese literature (Plate 146). His first major work, *A Madman's Diary* (*Kuangren riji*, 1918) – inspired by Gogol's tale – denounces a society trapped 'in an iron cage', doomed to suffocation, where if there is a glimmer of hope it comes from the tale's children, who are not 'cannibals'. His undisputed masterpiece, the short story entitled 'The True Story of Ah Q' ('Ah Q Zheng-Zhuan'), appears in his collection of novellas (*Na-han, Call to Arms*, 1923). A young man rebelling against the customs of his village is tormented by his fellow villagers and eventually cast out and executed. The village decides that their scapegoat must have been guilty simply because he was punished. Lu Xun condemned the cowardice of both victims and executioners. He explored the deeper recesses of his ego in prose poems with a Nietzschean ring (*Ye Cao, Wild Grass*, 1927), and both criticized and deplored, in brief essays very much appreciated at the time, the injustices of civil war and the turmoil of the intellectuals. Yu Dafu somewhat autobiographically

described the plight of a student exiled in Japan and driven to suicide through exclusion and despair (*Sinking*, 1921). Ye Shengtao's short novel *Gemo* (*Barriers*, 1922) tersely narrated an ordinary young woman's forced marriage, her drudgery on a farm, her repudiation and subsequent widowhood, and her being sold into bondage by her own in-laws. Another of Ye Shengtao's novels, *Ni Huanzhi* (1928), traced a schoolteacher's disillusionment with the behaviour of local notables and the violence of Nationalist repression in Shanghai. Mao Dun's trilogy (1927–28) also depicted disillusioned characters anxious for their future after the failure in Shanghai. Mao Dun's *Hong* (*Rainbow*, 1929), inspired by the intellectual vogue of Ibsen at the time, dwelt upon the difficult emancipation of a young middle-class woman who finally joins a group of Communists. His well-known novel *Ziye* (*Midnight*, 1933) describes industrial blight, workers' strikes, and social conditions in Shanghai during the crisis in 1930. But after *Fushi* (*Putrefaction*, 1941), the journal of a young woman forced to spy for the Nationalists, Mao Dun disappeared from the literary scene until the end of 'deculturation' in 1978. Ba Jin's characters, faced with oppression and injustice, either transcend their limitations through self-sacrifice for their comrades, or struggle for freedom against their family clans. In *Anye* (*Frozen Night*, 1947), a young woman flees in the midst of the Japanese invasion, leaving her husband behind to die slowly of tuberculosis.

Lao She wrote satirical, humorous novels like *Luotuo Xiangzi* (*Rickshaw Boy*, 1936), then told the fable of a peasant in Beijing thrice favoured by fortune and each time left poorer than before. Lao She's *Sishi Tong Tang* (*The Yellow Storm*, 1943) portrayed life in China's capital under Japanese occupation. In 1946, Lao She left China for the United States but returned to her homeland in 1949. Another figure to leave for America was playwright Cao Yu, well known for theatre ranging from his *Leiyu* (*The Thunder Storm*, 1933), reminiscent of Racine's *Phèdre*, to his dramatization of humanity's struggle against the forces of fate (*Qiao, The Bridge*, 1939). When Cao Yu returned to China, he began an autobiography, but in 1966 was humiliated like so many other writers. Wu Zuguang's refined and poetic language marked his plays as among the best in modern Chinese drama (*Fengxue Yegui Ren, Return by Night in a Snowstorm* 1942). Guo Moruo wrote various historical tragedies (*Hufu, The Tiger's Seal*, 1942; *Kongque Dan, Peacock's Gall*, 1942) and went on to produce popular drama in keeping with the dictates of the Maoist regime. In 1961, Wu Han, a professor of history, wrote a play called *Hai Rui Longuan* (*The Dismissal of Hai Rui*), depicting a Mandarin concerned with justice and integrity; but because of its implications against the regime, the piece came under ferocious attack as a 'poisonous weed' by a young Shanghai critic in 1965. Authors like Tian Han and Mao Dun were gradually permitted to write again, but despite official pledges of liberalization, freedom of expression often remained curtailed, and the 'Beijing Spring' of 1978–79 was short-lived. However, literary criticism was somewhat open to foreign influences, and prose writers and poets continued to be heard. Zhang Xinxin published an autobiography in 1981, and hundreds of interviews taped across the country were collected in his *Beijingren* (*Sinanthropus*, 1986). Novelist Wang Anyi was applauded for her *Huangshan Zhi Lian* (*Love on a Desert Mountain*, 1986), while Yu Hua showed how a sense of

honour and dignity could help individuals to stubbornly survive poverty and the miseries inflicted by political upheaval (*Xu Sanguan Mai Xue Ji, Chronicle of a Blood Merchant*, 1996).

## OCEANIA

### Australia

Ethel (Henry Handel) Richardson's trilogy, a novel which relates the tribulations of a nineteenth-century immigrant (*The Fortunes of Richardson Mahony*, 1930) is considered to be the masterpiece of early twentieth-century Australian literature. Judith Wright's poetry, expressed in a modern voice using traditional forms, stressed her faith in life (*The Moving Image*, 1946,) while A. D. Hope's pessimistic verse depicts listless individuals trapped in a meaningless world. Preoccupation with the past and the countryside, along with metaphysical concerns, tended to overshadow urban realism in such novels. Xavier Herbert opposed whites and aboriginals to evoke cosmic energies in *Capricornia* (1938). Patrick White (1973*) retold the story of the explorer Leichart, transforming him into an extraordinary character driven by a godlike urge to create and possess an entire continent (*Voss*, 1957).

After the Second World War, writers focused on social problems: opposition between rich and poor, conflicts between long-time settlers and recent immigrants, and the gender gap. Peter Carey's *The Fat Man in History* (1974) mingled realism and fantasy, with some of the characters defeated and exploited by others. In Carey's *Bliss* (1981), H. Joy appears to 'die' of a heart attack, but returns from the beyond with his perceptions completely modified: he eschews his former hypocritical way of life and takes to the jungle with a young woman in search of happiness. Gerard Lee's *True Love and How to Get It* (1982) described Brisbane's assorted communities of hippies, punks and lesbians, while Helen Garner's *Monkey Grip* (1977) depicted a bleak Melbourne suburb where drugs and poverty held sway. In *The Children's Bach* (1984), Garner took a look at the world of adolescents.

Aboriginal playwright Jack Davis retraced 150 years of confrontation between his people and the whites in *Kullark* (1972). This play included dance, music, pantomime, and patches of dialogue in a mixture of English and aboriginal languages. Davis's verse (*Poems from Aboriginal Australia*, 1978) examines present injustice while dwelling nostalgically on the past. Both Jeff Davis and the country's most noteworthy aboriginal novelist, Colin Johnson, criticized whites and aboriginal communities in equal measure. Johnson's historical novel, *Doctor Wooreddy's Prescription for Enduring the Ending of the World* (1983), involves a Tasmanian aboriginal who, in a trance, interprets the coming of the ghostly whites as a sign of the Apocalypse. With its protagonist who steals, kills, and dodges police, violence again predominated in Johnson's *Wild Cat Falling* (1975), as it did indeed in the novels of many writers after him. Archie Weller's partly autobiographical *The Day of the Dog* (1981) described unemployment, apathy and despair among the police-hounded aboriginals in Perth; the main character and his companions eventually kill themselves to escape falling into the hands of the police.

### New Zealand

Only in the mid-1930s did a truly New Zealander novel see the light of day with the publication of Alan Mulgan's *Spur of the Morning* (1934) and its 'late colonial' mentality. Only five years later, however, his son John won distinction with *Man Alone*, which marked the beginnings of a new so-called 'provincial' sensitivity. Such a break found metaphorical expression in a theme taken up by a majority of writers: an alienated child or adolescent pushed into violence, murder, or madness, under pressure from his or her puritanical parents' brutal or insidious family structure, as in Ian Cross's novel *The God Boy* (1957). David Ballantyne's *The Cunninghams* (1947) portrayed a family in the 1930s, secular but puritanical, hypocritical, uneducated, and devoid of any political awareness or future prospects. Such confrontation reached its apex in Bill Pearson's *Coal Flat* (1963). Playwright, poet and essayist Frank Sargeson dealt with a similar subject in *I Saw in My Dream* (1949), but then moved on to other themes. While social problems remained very much the backdrop for all of Sargeson's writing, the exploration of one's inner life eventually took precedence, along with experimentations in form: his *Memoirs of a Peon* (1965) and *Joy of the Worm* (1969) broke up time and space by resorting to inner monologue, myths and symbols. Maurice Gee's *Plumb* (1978) trilogy brought to life three narrators, each with a distinct perspective, as they progressed through an uncertain and absurd world.

In recent decades, novels and verse by Maori writers have been published in increasing numbers. A number of fiction writers stressed their own identity aggressively, as in Robert de Roo's *Through the Eye of the Thorn* (1984) or Michael Henderson's *The Log of the Superfluous Son* (1975). Keri Hulme's *The Bone People* (1983) was finally taken seriously, after grudging acceptance in some quarters as a mere anthropological or sociological document. Unfortunately, this has been the fate of Maori poetry generally, despite its great wealth.

\* Indicates year in which a writer received the Nobel Prize for Literature.

### NATIONS AND OTHERS

#### Some *Demoiselles*

Sometime around 1907, the Spanish avant-garde artist Pablo Ruiz Picasso fixed a canvas on a wooden stretcher and covered it with oil-based pigments in the traditional manner of classic European paintings. But the particular arrangement of these pigments resembled nothing familiar, and many Europeans were shocked by the work. At first, the title was little more than an informal phrase uttered among the artist's friends and acquaintances. When Picasso finally finished his large canvas, he merely propped it against the wall of his Paris studio where it remained for decades virtually unexhibited. Yet no one who saw it could forget it. Today, despite its somewhat secretive beginnings, the 2.5-metre-high painting hangs in New York's Museum of Modern Art (MOMA), where millions of viewers can read the label identifying one of the most famous of all modern paintings: 'Pablo Picasso y Ruiz; (b. Malaga, 1881, d. Paris, 1973): *Les Demoiselles d'Avignon*' (Plate 147).

There is no better place to begin an investigation of the tensions between nationalism and internationalism in modern art than to imagine ourselves standing before this painting, by this particular artist, in this museum. New York's MOMA (founded in 1929) was one of the first institutions to conceptualize and give concrete meaning to 'modernism' by collecting objects representing a wide range of human activities in the twentieth century: not only painting and sculpture, prints and drawings, but also films, photographs, racing cars, chairs, propellers, and coffee mills. In the implicit and explicit pedagogy of the museum's collections, Picasso's unprecedented *Demoiselles* marked a defining moment in modernism – everything before belonged to an earlier tradition, and everything after it had to contend with a new universe of forms and meanings. This painting also reveals the discourses of nationalism and internationalism of modernism – at least insofar as modernism has historically been defined by the nation-making cultures of the European West. An analysis of *Demoiselles* will illustrate the theme of this chapter: namely, that attempts to be 'modern' in the twentieth-century visual arts have been shaped and constrained by the pervasive discourse of nationalism, yet modernism has also worked to confound, displace, and destroy the common perception of the concept of 'nation'.

From the very beginning, *Les Demoiselles d'Avignon* was perceived as a painting about the disruptions of modern times. The Spanish painter had transplanted himself in Paris, the cultural capital of the Western world. There he produced images related to modernism's recent European past as well as to the distant classical traditions from which it derived its legitimacy. Through *Demoiselles*, Picasso was also investigating the desires of modern European nations to reach outside their own borders in order to become world powers by colonizing 'others'. Fellow painters and critics considered this canvas a declaration of stylistic allegiances that were irrevocably split between the work of late-nineteenth-century French painters such as Paul Cézanne, on the one hand, and works of anonymous African sculptors, on the other. At the time, African objects were gaining popularity among collectors in Paris. Cézanne's canvases had been newly canonized as masterpieces of French modern art. The ethnographic objects that found their echo in Picasso's painting were not considered art at all, but rather representations of a 'primitive,' pre-modern past that the Spanish painter had stumbled upon in the basement of Le Trocadero (France's colonial Musée d'Ethnographie du Trocadéro, now known the Musée de l'Homme). Although Picasso's twin pole stars – Cézanne and Africa – occupied different conceptual universes, each would prove indispensable for the course of modernism in the visual arts.

Taking Picasso's *Demoiselles* as an acknowledged monument of Western painting in the twentieth century, this chapter will first investigate the many claims for modernism involving ideologies of 'nation' through selected objects of visual art. We will examine modernism's ambition to represent a neutral, value-free ideal of progress (encompassing economic, scientific, technological and industrial development), while acknowledging that such claims may be irretrievably Eurocentric. We will also, however, critique simplistic views of modernism as the exclusive agent of a hegemonic Western capitalism, identifying alternative and hybrid forms of modernism found outside the Western or capitalist countries or

within the very interstices of the Western art world. Specific art movements and works will be viewed as 'speaking of nation', and others will be analysed in terms of the ways they have worked to counteract nationalism within the countries and cultures from which they emerged. Finally, we will address the late twentieth-century phenomenon of 'post-modernism,' and ask whether the art forms produced under that label have successfully escaped the nationalism vs. internationalism debate by striving to be 'global'.

From the outset, it must be acknowledged that the two terms in the chapter's title – 'nation' and 'modern' – have been dissected by a variety of post-colonial thinkers. Inherent in the concept 'international' is the assumption that 'nation' is the unitary measure, the basic organizing principle without which the people of the world cannot be conceptualized or understood. Yet although these terms can be deconstructed to reveal the extent to which they are intertwined (both host to a cluster of socially determined, culturally laden meanings), they remain indispensable. The twin axes they present (embedded though they are in the very contexts we seek to understand) remained crucial nodes of discourse throughout the twentieth century, particularly in the visual arts. 'Nation' is merely the modern term for centralized state power. Visual culture, at least since ancient Egyptian times, has provided the most direct way of expressing that kind of power – the astonishingly changeless Egyptian canon powerfully demonstrated the capacity of the Pharaoh to control the means of his own representation (and the constrained possibility of 'the people' to have access to and negotiate with such representations). In the modern period, of course, power can be distributed in less obvious ways, and artists have been less and less dependent upon a centralized source for support and patronage. Yet perhaps because of this independence (or abandonment, depending on one's point of view), which has produced the 'alienated avant-garde artist' as a standard modernist conceit, the twentieth-century artwork illustrates all the more powerfully the ambivalent give and take between the concepts of nation, subject, and modernity.

The five demoiselles of Picasso's painting illustrate this ambivalent dynamic. These members of the world's 'oldest profession' are anything but classically distant. They occupy a 'philosophical brothel', as the painting was described, and yet they confront us with their bodies rather than their minds. The women's hard-edged nudity and provocative poses surely contributed to the painting's final title, which translates as 'the young ladies of Avignon' (a well-known red-light district in Barcelona). Picasso sets this whorehouse in his native Spain, but paints it in Paris, where prostitution proliferated. For Picasso, prostitution had personal as well as intellectual significance.

Art historians have reconstructed in detail the genesis of this work considered so important in Picasso's career. Picasso himself later described the canvas as an 'exorcism', and we know from sketches that he initially put himself in the painting, either as a sailor entertained by the prostitutes or a medical student entering from the left (studies show that both sailor and medical student were veiled self-portraits). The primary confrontation, then, was intended to be between sex and death, disease and knowledge, but Picasso's choice of a sailor to represent one aspect of his identity is significant. On one level, the choice was fuelled by ambition: Picasso's principal competitor, the French Fauve painter Henri Matisse, had also painted several versions of *The Young Sailor* just after returning from the French colonies in North Africa in the summer of 1906. On another level, the sailor stood for the transnational status of Picasso himself. His studies for this figure show him rolling a cigarette (a quintessential New World vice) and wearing the traditional sailor's bib and a dark cap with a white pom-pom. Beyond designating a lowly deckhand, the sailor's costume cannot be easily identified as French or Spanish (or English, Russian or American). Its very undistinguishability and commonness cements the deckhand in a larger maritime system of power, to which he is subordinated, but which he also represents. Sailors are mobile and serve as agents of their flags. They escape the centralized economy of the nation-state, but also play the role of unofficial ambassadors. In addition, they embody both the confrontation with native 'others' and the sexual experience that can result from confrontation. The iconography of the sailor is thus linked to the diffuse and expansive boundaries of the European nation, which was involved at that very period in a global contest to control sub-Saharan Africa.

The sailor (for both Picasso and Matisse) is a transitional figure. Buried in the *Demoiselles*, Picasso's sailor represents the international reach and ambition of the nation, incarnated in an erotically charged, restless, youthful male form. The fact that this male was ultimately transformed into a female in Picasso's numerous preliminary studies confirms the ambiguous status of the demoiselles. Crossing gender borders, the figures eventually lost any clearly male attributes, and their potential maleness remained only in their confrontational stares and the painting's implied male voyeurs. As we gaze at the women in this painting, we take the place of those imaginary modern men.

Since the pictorial space of Western painting is generally read from left to right, there is an implied sequence in the five demoiselles and their surroundings (indeed, Picasso painted and revised them in this left-to-right order). In this progression, the figure on the far left is depicted with an expressionless, mask-like face similar to Oceanic-inspired works by the French painter Paul Gauguin, and her pose was described at the time as Egyptian. Like the two central figures, her face also evokes ancient Iberian sculpture (pre-Christian statuary from present-day Spain) similar to the two Picasso had recently purchased with the help of his dealer. The echo of Iberian sculpture is noteworthy, for this native Spanish style was merely a local variant of the classical sculptural traditions that characterized the prevailing 'international' mode. In the context of French painting, which was still dominated by academic Salons considered the 'true heirs' of ancient Greece, such references to the 'primitive' and the local (Oceania, Egypt, Iberia) were intended, and indeed experienced, as a jolting shock. The ambitious young Picasso was eager to take his place in the Parisian art world, and what interests us here is that he did so by means of one of the oldest forms of Spanish and classical Western art. The artist thus begins with an acknowledgment of his own status in France as a 'Spanish primitive', but makes the simultaneous claim that 'primitive' is a part of a tradition leading to a transnational modern world.

Picasso's first Iberian demoiselle holds up a piece of dark reddish-orange drapery, mirroring her counterpart on the

right, who is enclosed by a pair of blue drapes. This interest with cloth thus brackets the image, and extends throughout the whole painting (the entire painting being a kind of heraldic cloth). The room is claustrophobic and swathed in fabric, atypical for France. It is somewhat overdone when compared with academic painters' much-fantasized Moorish harems and orientalizing baths. Each of the demoiselles wraps herself in textiles of red, white, or blue. These very colours are suggestive of a discourse on nations, and the hues (patriotic within French, English, or American contexts) are arranged in broad vertical bands, as in the French flag. Picasso's painting, however, inverts the colours of the French *tricolour*. As if hung upside-down, or seen from behind, the colours are reversed – leading to the speculation that, if he was conscious of this flag imagery at all, Picasso chose a bottoms-up, backside view against which to display his Spanish primitives.

Concerning the two figures on the right, their faces are not based on Egyptian and Iberian models with their dark, jarring striations and aggressively twisted noses. As mentioned above, the compelling features of these demoiselles derive from African sculpture (primarily masks from the French Congo that Picasso's friends owned or ones that he viewed in the Trocadero Museum). Sub-Saharan Africa is thus the second theme on which Picasso projected his vision of modernism – syncretically amalgamated with European art. These are not depictions of African masks or sculptures such as those that would appear in contemporary works by other French painters such as Matisse or Derain. Nor are they the careful representations of African art forms painted by members of the New Negro Movement in New York a few decades later (by African-American artist Lois Mailou Jones, among others). Picasso's masked demoiselles are neo-Africans, fused figures from Picasso's imagination. Boldly thrusting through a slit in the blue section of the draperies, the uppermost of these neo-Africans stares not at us, but at the other women in the painting. Her frontal eye is black and blank (an unworn mask), and only the profile eye peers sideways at the others. Like the other demoiselles, who take the places of Picasso's vanished sailor and medical student, this angular creature also had a Picasso look-alike in her shadowy past, a male precursor with whom she is now blended. In a sketchbook of preparatory studies for the *Demoiselles*, Picasso drew this male figure over and over again, sometimes endowing it with his own features. Thus, like the Iberian-Egyptian figure, this mirroring African on the right is a substitute for Picasso, both metaphorically and psychologically. If she stands as an African 'other,' she also functions as the projection of Picasso's own desire, a magical exorcist which will enable him to achieve his ambition to be the great painter of the modern age.

The squatting demoiselle, by contrast, was always a female, although her 'wrung' neck appeared only in the last violent stages of the painting's execution. The body below her shockingly twisted head is reminiscent of the great tradition of odalisques, particularly the orientalizing harem scenes painted by the great French neo-classicist Ingres (scholars have unearthed Picasso's many studies of Ingres' odalisque paintings, which had been set in imaginary settings appointed with Turkish or Moroccan furnishings). As in works by Ingres, the bodies of the odalisques in Picasso's masterpiece are depicted with white skin. But in all other respects, Picasso mixes European tradition. His

odalisque does not coyly avert her head, as is the custom in the genre. Instead, the painter violently rotates the head, which is darker than her body (as with the Egyptian-Iberian and other neo-African in the painting), until it meets our gaze. In addition, the head is covered by a mask, which serves to intensify the confrontational stare.

It is hard to make the case that Picasso identified with this scarified sibyl, whose face is as disconnected from her body as a helmet-mask propped upon her strong, muscular shoulders. The suggestive visual reference to helmet masks recalls the female masks worn by the male members of the Gelede masked society of the Yoruba people in West Africa. A typical example of one of the Gelede masks from the Parisian museum that provided Picasso with the inspiration for his 'exorcism' painting shows the facial striations, forehead scarification, pinpoint-pupils in almond-shaped eyes, projecting ears, and thick neck ring that are also present in the second of Picasso's neo-African demoiselles. The head's function as a mask invokes a complex system of criss-crossing associations (between wearer and depicted identity, or between painter and depicted mask) that reflects the transgender aspect of other demoiselles. The transgender traditions of the particular masks Picasso appropriated from the Trocadero Museum have gone largely unnoticed by scholars who have studied primitivism in the work of Picasso. Yet given the strong evidence in the *Demoiselles'* studies for Picasso's own transgender investigations, such traditions seem important for the painting's modernism – reinforcing its purpose to shock, unsettle, and displace Western art by crossing boundaries of nation and sex.

Picasso was undoubtedly incapable of faithfully importing the social intentions of these masks (of which he and his Parisian companions probably understood very little), but neither was he merely 'copying' exoticism within a Parisian milieu. Rather, the artist interjected admittedly foreign forms to construct a hybrid identity, which he introduced in his painting by choice, and in a larger social context by accident, through his stigmatization as a foreigner among the French. Desire-through-identification is extremely complex, for it is the desire of the white male artist to identify with a white female body, itself masked as a black female African (via masks originally intended to be worn by African men). This complex relationship is expressed most powerfully in the last, most transgressive and modern demoiselle, who is squatting at the lower right.

The *Demoiselles'* implications for the discourse of nation are far-reaching. Picasso can place himself into a French modernist tradition only by performing his Spanish stigmatization as Moorish and African, the hypothetical subject of French colonial rule. His demoiselles perform their primitiveness on several levels: as Iberian, as Moorish denizens of a contemporary harem, as naked sex workers in the French national context (wrapped in that inverted flag). Picasso suggested this complex theme of oscillating national and ethnic identities on a page of the sketchbook he used during the completion of *Demoiselles*, on the verso of a study for the final 'neo-African' figure. On this small sheet, Picasso has written in decorative script: 'Barcelona... France... Malaga... Madrid... Ravignan' and, below, the artist signed 'Monsieur ARRRRRRR' probably in homage to the French anarchist playwright Alfred Jarry.[1] In this context, Spain (Barcelona where he grew up, Malaga where he was born, Madrid the home of the Prado Museum) becomes the 'other' for France, where Picasso's studio is located (on the

Rue Ravignan). Spain here is nothing less than the Moorish portal to Africa, the dark gateway to the colonized, humiliated people of the sun. But in the eyes of imperial power, the subjugated 'other' always threatens to become the future. Picasso's *Demoiselles* claims that position.

The green and blue striations on the heads of these neo-Africans demonstrated by their 'coloured' qualities that they were not, for Picasso, pictures of real African masks (coloured examples of which were not then available), but 'coloured' peoples' masks in general. Although they did not belong to any particular African culture (such as Kota, Baga, Fang, Bambara, Gelede, or Dahomean), the demoiselles' disjointed faces combined the styles of many different African cultures to attain a syncretic, pictorial (i.e. Western) identity. But in doing so, Picasso's great achievement was to critique Western figurative tradition from within, by having his figures burst like invaders from behind the curtains, swivelling their heads to confront us with a malefic and challenging stare. The *Demoiselles d'Avignon* exemplified a type of modernism designed to destabilize notions of national culture, while using the very symbols (racial, ethnic, gender, political) of national identity to fuel its critique. The fact that Picasso depicts his neo-African as twisting and tearing the fabric of the *tricolour* suggests that French culture must be conquered. African culture, which represents the 'other' for Picasso in his own country of origin, is presented here ostentatiously, as violently different from France's civilization – yet crucial to it's modern future. Picasso's provocative mixing of nations and identities forces us to view the African contribution to modern art, not just formally (the much-praised sculptural qualities of African forms were appropriated by cubism) but economically, politically, and erotically, as subjugated figures of desire. The *Demoiselles* breaks with the past, but only to perpetuate the old subject of modernism and nationhood: French tales of noble savages and revolutions, told as both national and available to universal man, would now become wilfully hybrid in the disconnected, syncretic crucible of this great 'exorcism' painting.

## The driving metaphor: avant-garde

Developing within the context of French modernism and exemplified by paintings such as *Les Demoiselles d'Avignon*, the cultural enhancement of the best modern art as avant-garde reached a peak in the first half of the twentieth century. The military connotations of this French expression were appropriate, coming from a period marked by a succession of skirmishes and revolutions that culminated in the First World War. Against the bulky reality of early twentieth-century warfare – massed phalanxes of troops and machines moving in large formations – the avant-garde was synonymous with those solitary scouts who moved ahead of the mass, scanning the horizon for danger and opportunities. But also suggested in the metaphor of the artist as 'scout' is the certainty that the military avant-garde worked (like Picasso's sailor) as the representative and agent of the king or state. Moving solitarily through the underbrush at the campaign's 'cutting edge,' the scout's advance knowledge was intended to facilitate victory – the triumph of the sponsoring nation on the world's political (and cultural) stage.

Picasso was one of the first to understand the perils and pleasures of this vanguard structure – victory in modernism

goes to whoever is the first to stake a claim. Notwithstanding Picasso's intense collaboration with French painter Georges Braque, the Spaniard was notoriously leery of allowing too many clever aspiring artists to see what he was working on, lest he jeopardize his leading position at the forefront of modernism. Nonetheless, toward the end of 1913, Picasso allowed the Lithuanian sculptor Jacques Lipchitz to bring an unknown Russian, fresh out of art school, to Picasso's studio (relocated to the Boulevard Raspail). Recorded in photographs taken at the time, the workspace was a modernist *ensemble* – African masks jostled for space with cubist canvases, paper collages and an entirely new genre of cubist-constructed sculpture. Particularly striking were these paper, sheet metal, or wooden assembled sculptures in which representational three-dimensional models of objects were juxtaposed with radically abstracted three- and two-dimensional signs, all installed against the wall and hovering dynamically between the formerly stable categories of 'relief' and 'picture.' *Guitar* of 1912 (Plate 148) was perhaps the most important of such objects to emerge from Picasso's studio (none of the other works has survived). Informed by the radical inversions typical of an African Grebo mask in which the sculptor transforms sunken eyes and mouths into geometric protuberances, Picasso constructed a representation of a musical instrument, whose illusionism relies on the switching of a negative space (the guitar's sound hole) into a positive geometric form (the projecting cylinder at the guitar's centre). Cues from African art were crucial for cubism's genesis, and sculptures and paintings combined these lessons with indigenous French traditions of caricature and philosophies of experiential time (such as Henri Bergson's notions of flux and simultaneity). In developing cubist painting and collage, Picasso and Braque had already mastered this hybrid approach to representation; in *Guitar*, Picasso merely brought such discoveries into sculpture. The hermetic investigations of high analytic cubism, as this style was called, achieved a crucial breakthrough in the formal language of modern art – a breakthrough dependent on a rejection of mimetic 'imitation' (staple of the academic oil painting tradition) in favour of 'signification' – a free manipulation of the signs for the world's objects and ideas. A mouth could be a cylinder, a slit, a line, a hole, or a word; an object could reside in the same pictorial and conceptual plane as a mathematical formula.

Overwhelmed by what he saw careening off the walls in Picasso's studio, Lipchitz's young Russian friend begged Picasso to be hired as his assistant. When Picasso refused, the story goes, the would-be apprentice wandered outside, 'suddenly sat down on the pavement … and mumbled, "There's something behind it … I'll break his neck."' thus plotting the skirmish to foil his better-armed opponent.[2] Eventually abandoning dreams of violence after many more visits, our avant-garde scout Vladimir Tatlin returned to his homeland, where he became the founder and most important practitioner of his country's national modern style, Russian constructivism.

So begins the second emblematic moment of our narrative of modernism, nationalism, and internationalism. An Eastern European Jew takes a student of Russian icon painting to meet a Spanish artist in his Paris studio, where forms from Iberian sculpture, African masks, French art and philosophy stimulated a new conception of space. If, as we have argued, Picasso remained a conflicted player in the complex field of geo-political signs and symbols, Tatlin's

goals became clear after the Russian Revolution: 'an opportunity emerges of uniting purely artistic forms with utilitarian intentions ... which stimulate us to inventions in our work of creating a new world'.[3] Avant-garde proved the most powerful metaphor possible for the role Russian artists sought. In Tatlin's Promethean travels, the fire of modernism had been stolen, and it would be used to forge the new citizen-subject of the collective state.

Tatlin, of course, was not entirely unprepared for what he encountered in Picasso's studio – otherwise, why would he have attempted to go there? An unhappy and disrupted childhood had led him to an early career as a sailor; his work as an icon painter and several aborted courses of formal art study finally brought him to the Peredvizhniki (Wanderers) Group, whose goal was to create 'an art relevant to Russian reality [and] contemporary conditions'.[4] The requisite restlessness and aspirations of modern artists to participate in the production of a new national style were thus already in place when Tatlin was introduced to the ideas of cubism by Mikhail Larionov and Natalia Goncharova, then leaders in Moscow's contemporary art world. Cubist paintings could be seen in the Shchukin Collection and in various loan exhibitions that travelled to Russia before Tatlin left for Paris.

Thus, before his revelation in the presence of Picasso's sculpture, Tatlin knew some of the experimental cubist techniques of collage and *papier collé*, in which disparate materials (paper, cloth, wallpaper, tinfoil, rope) were fixed to a flat support, with the resulting surface contradicting the imported semiotic bits. Tatlin's self-portrait of 1911 – in which he depicts himself as a sailor – reveals none of these techniques. It resembles more the graphic, curvilinear style of Russian icons than it does of cubism's innovations (Plate 149) and bears almost no relation to the radical constructions Tatlin would produce after his fateful visits to Picasso's studio. Those later 'corner reliefs' and 'counter-reliefs' incorporated curved sheets of iron, wires, sections of glass, and planes of wood – all intersecting at angles, with the whole mounted to perch weightlessly in the corner of a room, like a flying machine in equilibrium.

Just as Picasso had created a perceived heritage from antiquity (Iberian sculpture) or primitive art (African masks) with the latest influences of 'high' culture (Cézanne, French philosophy), so Tatlin and his proponents found ways to connect these innovative modern constructions with both the icon-painting of Tatlin's past, and the international future of Russian art. Describing the traditional icon – a devotional image of the Virgin Mary painted on a wooden panel overlaid with precious metals, jewels, hinges and screws – a contemporary critic identified the links connecting such a sacred Russian object with the cubist art of collage: 'The real world is introduced into [the icon's] creation only through the assemblage and incrustation of real, tangible objects. And this seems to produce a combat between two worlds, the inner ... and outer'.[5] Nothing could be more urgent for young artists working in Russia than the need to relate the traditional inner world of Russian orthodox Christianity, the dominant source of a national folk style, to an emerging outer world of modern urbanism and political change, represented by French cubism. Tatlin and his followers drew some of their ideas from (and contributed others to) the Italian futurists, who were also struggling to modernize legacies of religious art by evoking technological innovation. Although occasionally also

labelled 'futurist', the Russians sought their own names for Tatlin's work and for the new movement in Russia as a whole. Some fought for an etymologically Russian word, *postroenie* (built-up), rather than the foreign-based word *konstruktsiya* (constructed). However, no name was adopted universally until after the Revolution, when 'constructivism' emerged as the Western label for the extraordinary experiments in art and nation-building that were taking place in the former Russian empire.

The disasters and disruptions prompted by the First World War, which gave the metaphor of the avant-garde its new international currency, also marked the destruction of the Russian empire along with many others. Replaced initially by a democracy (the February Revolution), leadership shifted violently once again with the October Revolution and became reasonably stable only after the Bolshevik Party took power in November 1917. However, civil war and counter-revolutionary insurgency was rife. In this unstable atmosphere, artists such as Tatlin were burdened with heavy responsibilities: they were asked to use their art to build a new national and political consciousness, buttressed by new governmental culture institutions such as the People's Commissariat for Enlightenment (Narkompros). For a variety of reasons (probably the most important being the enduring leftist leanings of most of the Russian artists who considered themselves part of the avant-garde), the young group of innovative artists (Larionov, Goncharova, Tatlin, and others) seemed to have predicted the future, which they were now invited to oversee. Avant-garde became more than a metaphor: the troops were looking directly for leadership from those who seemed to have forged new paths. Looking back at the developments leading up to that extraordinary moment, Kasimir Malevich could easily agree: 'cubism and futurism were revolutionary movements in art, anticipating the revolution in the economic and political life of 1917.'[6] Some artists assumed the active role of leaders and agitators (poet and dramatist Vladimir Mayakovsky declared, 'The streets are our brushes, the squares our palettes')[7] while others sought the shelter of the new state bureaucracies to pursue a more classically modern art of easels and studios. The most ambitious young Moscow artists, the ones most fervently engaged in efforts to build a new form of collectivist subjectivity, formed the journal *LEF* (*Left Front of the Arts*). *LEF*'s programme called for a focus on the nation, but others sought the dissolution of all forms of petty nationalism through an international workers' revolution. The following is an excerpt from *LEF*'s 'Declaration: Comrades, Organizers of Life!': 'So-called Artists! ... Exercise your artistic strength to engirdle cities until you are able to take part in the whole of global construction! Give the world new colours and outlines! ... We summon the "leftists," the revolutionary *futurists*, who have given the streets and squares their art; the *productivists*, who have relied on the inspiration of factory dynamos; the *constructivists*, who have substituted the processing of material for the mysticism of creation ... Down with the boundaries of countries and of studios!'[8]

But if *LEF*'s poets, writers, dramaturges and visual artists were excited by the prospect of a transnational unity with other avant-gardists and 'experimentalists' in the arts (a dream that pervades modernism, with its roots in Enlightenment notions of the 'universal rights of man'), political leaders were more concerned with the pressing

problems arising within the shaky boundaries of the new union of republics. From the beginning, there was division along these lines: *modernism*, as a cluster of avant-garde styles, was associated with *internationalism*, and those who reached outside the Soviet Union's borders; by contrast, *modernization* could be accomplished with (indeed, seemed perhaps to necessitate) more traditional representational art that harkened back to the recognizable vocabulary of a pre-revolutionary past, the vestiges of which might be useful for forging a new national present. Whether modernism could, or should, be kept separate from modernization was at issue. But the avant-garde's long-standing association with bohemia, anarchism, socialism, and other avowedly 'anti-bourgeois' beliefs and practices initially gave practicing avant-garde artists an ideological edge when the tide turned against the czarist *ancien régime*.

Thus, internationalists like Leon Trotsky (whom we might call 'modernists') looked to intellectuals and artists for production of new art forms that might at first appear shockingly new. At the same time, the reins of power were beginning to be placed in the hands of others (whom we can call 'modernizers'), such as Vladimir Lenin, who claimed that that only a small number of Mayakovsky's experimental poems should be published 'for libraries and eccentrics'. Already in *LEF*'s call for the abolition of mysticism and the studio, demarcation lines were being drawn between the respected but increasingly isolated (modernist) artist and the new, collective, materialist, factory-oriented (modernizing) artist of post-Revolutionary Russia. Avant-gardism was not enough (it was argued) as long as it remained isolated in modernism's traditional studio-based *l'art pour l'art* programme. Artists such as Tatlin may have been eager to lead, but not everyone was comfortable with his studio-based visions of 'creating a new world'. Tatlin himself was forced to present his experiments as 'productive' and 'material,' not merely formal or aesthetic. Ironically, the most productive and material of his projects, his most famous and powerfully propagandistic work, was never built.

Tatlin's famous project for the Monument to the Third International (Plate 150) remains the artist's most visionary articulation of modernism's aspiration to create a new world and its subjects (to 'organize life,' as *LEF*'s editors had put it). The models and sketches for this structure present all the complex goals that characterize modernism and the split between its national and international goals. Designed to rise 400 metres above Moscow, Tatlin's tower would have been the tallest structure in Europe, serving as a highly visible emblem of international communism and industrialization. It would have become a landmark and emblem of the young nation. Although it promised to be the most significant monument of the 'heroic' period of Russian constructivism, the symbolic tensions in Tatlin's Tower, as it came to be known, could never be resolved, and it remains a ghost of modernism's lost visionary past.

The most obvious initial sources for Tatlin's tower are the period's cutting-edge engineering technological advances, such as those employed by engineer Gustave Eiffel to commemorate the centenary of the French Revolution in Paris some 20 years earlier. Indeed, when it was first displayed, Tatlin's model bore a banner reading 'Engineers, create new forms!' But appropriately enough for a former icon-painter who would communicate to a nation formerly unified (if only tenuously) by religion, Tatlin's tower makes a biblical reference as well. In its slightly tilted, spiralling form, there is a suggestion of earlier artists' visions of the tower of Babel, particularly the spiralling version painted by the sixteenth-century Netherlandish master Pieter Bruegel. The amalgamation between industrial forms and biblical Babel is telling, for it summarizes European modernism's aspirations for a global future and its inevitable ancient entanglement in multilingualism. In the biblical tale and in subsequent legends, Babel was the bustling home to a thousand incompatible tongues, an early metropolis whose ambitious leaders aimed to rule through impressive architecture – an act of hubris eventually punished by God. Paris's Eiffel Tower was regarded with a combination of envy and outrage by revolutionary Russians, who felt it demonstrated similar hubris. In a poem titled 'Paris,' Mayakovsky urged the Eiffel Tower to relocate to the true home of revolution, for

> Here you are far much more needed.
> Steel-shining, Smoke piercing,
> We would greet you.

Consequently, the appropriateness of Eiffel's modern style for the brand of international communism supported by Tatlin was called into question. Both Babel and engineering marvel, Tatlin's tower teetered on the edge of a god-provoking hubris (100 meters higher than Eiffel's tower, and more functional as well). Not surprisingly, Mayakovsky greeted Tatlin's tower with exhilarated approval, as 'the first monument without a beard' and 'the first object of October'![9]

Tatlin's aims for the tower shifted from a national to international scope over time – from its beginnings as a planned monument to the Russian Revolution, it became a bold declaration of solidarity with the international goals of the Communist party. Tatlin's tower was commissioned as part of Lenin's 1918 Plan for Monumental Propaganda, in which czarist monuments were to be destroyed and replaced by revolutionary monuments. Hastily installed realistic monuments with plenty of beards were soon erected in squares throughout the union – but Tatlin, as head of the Moscow division responsible for implementing Lenin's plan, submitted a very different proposal. Rather than abide by the rules of the existing bureaucratic state jury system, he advised adopting an 'international review' of outsiders to choose among competitors to build 'free monuments in a socialist state'. He called for a buffer of foreigners to mediate between the 'nation' (or union of republics) and an 'international' vanguard art community. According to Tatlin's vision, the resulting structures would not only celebrate the Russian Revolution (as Lenin desired), but would also serve as pioneering examples of a radically international commission system. They would be 'monuments to a relationship between the state and art that has not existed until now'.[10]

This new relationship – which remained unrealized, since neither tower nor international review panel materialized – would have reversed the customary power relationship between patron (state) and commissioned artist (much as it reversed prevailing modernist idioms of a structure sheathed in a skin of glass). Loaded with broadcast technologies and outfitted with constantly rotating glass rooms for 'agitation' sessions and propaganda, Tatlin's structure would indeed have opened a new path. Rather

than a vehicle for the nation's voice, the independent modern artist according to Tatlin's vision spoke both to nation (through Russian-language propaganda) and to the world at large, through an international vocabulary of forms and cutting-edge technologies. Choosing to emphasize the future rather than to commemorate the past and to celebrate Russia's significance for the world rather than its intrinsic meaning, Tatlin reconceived his project sometime in 1920. It would henceforth serve as a 'Monument to the Third Communist International,' self-consciously rejecting Lenin's plan for retrospective commemoration and proposing instead a sign of the future, a dynamic transmitter of revolution whose form and programme would reach across the union's borders to ignite the world.

Scaling his Babel to the universe, Tatlin designed the tower's separate levels to rotate at different cosmological and historical speeds, with the top section, 'which rotates at the speed of one revolution per day,' reserved for projections onto clouds, the transmission of worldwide telegrams, radio broadcasts, and the production of 'proclamations, pamphlets and manifestos – in short, all the means for informing the international proletariat'.[11] It seemed obvious to Tatlin and the other visionary members of those calling themselves 'avant-garde' that the only truly international formal language, the only sign system that could transcend Babel's curse of linguistic incommensurability, would be found not in oil paints and canvas, but in the impersonal hum of a dynamo or an oil derrick tuned to a universal pitch.

The stamp of Euro-American sensibilities can be discerned in the tower's struts and radio antennae, which undoubtedly echoed the particular 'rotational hyperboloid' ships' masts that Tatlin would have seen when he served in the merchant marine from 1902 to 1908 (these fashionable American structures, with their twisting, conical openwork for rigging and equipment, were incorporated with much fanfare onto two Russian dreadnoughts in 1911). At the time, such engineering forms were thought to be free of 'national style'. Neutral, functional, and 'scientific', they had no apparent typologies of ornament that would have pinned them to a provincial or national context. Yet lingering anxiety about their 'American' origins would haunt artists borrowing industrial forms. And even in the example of Tatlin's tower, it became clear that such forms were not devoid of symbolism – national or otherwise. Their very 'stylelessness' became symbolic. The techno-scientific modernism inherent in engineering motifs, although not sufficient to secure success for Tatlin's vision of a 'free art in a socialist state', was clear to Tatlin's supporters, as suggested by Victor Shklovsky's comment that Tatlin's tower was built of 'iron, glass, and revolution'.[12]

When German avant-gardists celebrated Tatlin at the Berlin Dada Fair in 1920, they drew similar conclusions from the structure's implications for art, holding up a poster that read: 'Die Kunst ist tot – Es lebe die neue Maschinenkunst TATLINS' ('Art is dead, Tatlin's new machine art lives'). But as dadaists themselves realized, this interpretation of the revolutionary implications of the 'art of the machine' was a conscious attempt to impose the stamp of 'revolution' on forms that could also be perceived as the results of very different types of economic governance (e.g. parliamentary democracy, or industrial capitalism). At the very least, such industrial forms were already deeply associated with capitalism's dynamic upstart, the United States and its Taylorism and Fordism, which were viewed with

ambivalence in the USSR. This problem emerged immediately after the Russian Revolution and was clearly stated in nationalistic terms – how to modernize the Soviet Union without Americanizing it? The problem influenced Tatlin's choice of an engineering vocabulary. Particularly when tied to abstraction, issues of industrialization became divorced from the production lines and electrification programmes that Lenin endorsed (modernization) and entered more symbolic realms (modernism). Thus one critic derided Tatlin's designs as 'super-American urbanistic plans, in which all houses would give way to Tatlinian towers'.[13] Mayakovsky struggled to save the symbols of modernization from such representations by 'primitivizing' their perceived American sources (a classic modernist move, as we have seen). Just as Picasso incorporated 'savagery' and 'exorcism' from African art in order to minimize his aesthetic and conceptual debt to their forms, so Mayakovsky mocked American technological modernism in order to make it possible for the more highly evolved communists to appropriate it: 'No, New York is not modern.... Mere machinery, subways, skyscrapers and the like do not make a true industrial civilization ... [New York] is a giant accident stumbled upon by children, not the full-grown, mature product of men who *understand what they wanted and planned it like artists*. When our industrial age comes in Russia it will be different – it will be planned – it will be conscious'.[14]

Perhaps the 'mature' use of industrial tools could be seen as scientific, progressive, and neutral, but clearly the use of symbolic industrial forms (even if 'planned ... like artists') still provoked some anxiety not only in Russia, but throughout Europe. In France it was dubbed *americanisme*, in Germany, *Machinenkunst*. Everywhere the appeal of this mechano-morphic vocabulary was tempered with a fear that identities (national, cultural, ethnic, individual) might simply disappear in the new technological blast furnace of (mostly American) engineering. Mayakovsky's famous manifesto demanding that the Russian classics be 'thrown overboard from the steamship of modernity' echoed appeals from other parts of the world where artists felt burdened by European traditions. But each of these appeals simultaneously revealed a growing nationalist anxiety. Could metaphors of modernist steamships be dissociated from America's growing dominance among the fleets of 'titanic' luxury crafts? In throwing off the classics, would the cultures in question simply be exchanging one local variety for another (albeit a more technological one)? Italian futurists, British vorticists, German Bauhaüsler, and international dadaists all looked to the machine to demolish a burdensome past and to jettison the worst of their national traditions. At the same time, those banned national traditions often appeared as stowaways on 'the steamship of modernity' – vernaculars that seem to constitute the discourse of nation underlying the Babel of modernism's international speech.

## Techno-scientific modernism and the nation state

As in the case of Tatlin's Monument to the Third International, the scores of movements that embraced different aspects of an industrial style in the 1910s and 1920s sparked a great deal of anxiety over the appropriate role of this new style in the modernization of the nation state. Did

the adoption of new technologies require a new type of subjectivity? Would a new form vocabulary and a new relationship to materials be needed to build a new industrialized society? Were the capitalist entrepreneurs of the United States, who expanded the technologies of industrializing Europe, merely ignorant children (as Mayakovsky had implied)? Or was there something dangerously sophisticated in their technological 'play', something endemic and pernicious in the systematization, routinization, and mechanization that Fordism and Taylorization required?

Artists addressed these questions early on. Often living quite literally in the social and geographical fringes of the developing urban centres, the avant-garde cultivated a sort of alienation resulting from a sensitivity to the boundaries between nature and culture, city and country, human and machine; such contrasts were particularly evident in the periphery of urban centres during and after the Industrial Revolution. Clearly, not all artists welcomed the evident inevitability of the Machine Age. Even those who sought to participate in an international avant-garde did not agree on the ultimate benefits of modernity's infatuation with technology.

Artists outside France, in particular, developed avant-garde movements that actively resisted technological modernism – but they nonetheless participated in the radical formal experiments of their time. Non-objective painting, for example, was developed by Tatlin's contemporary, Russian-born Wassily Kandinsky, who taught in Munich and developed a theory of 'spiritual' resonance for certain forms and colours that were believed to take the soul to a higher plane of existence. Coming together under romantic titles such as *Die Blaue Reiter* (The Blue Rider) and *Die Brücke* (The Bridge), other artists (known collectively as 'German expressionists') took the modern fascination with 'primitive' art to a new level, where the art of children and Africans were both seen as signposts of a sought-after purity and antidotes to the technological city-system. 'The African considers his idol the comprehensible form … of an abstract concept' wrote the Munich painter August Macke, 'Everywhere, forms speak in a sublime language right in the face of European aesthetics. …The joys, the sorrows of man, of nations, lie behind the inscriptions, paintings, temples, cathedrals, and masks'.[15]

The 'joys and sorrows … of nations' were of great interest to artists in Germany, a country whose status as a nation was so recent, and apparently in desperate need of symbolic reinforcement. Philosophical traditions of German idealism permeated the German expressionist painters' resistance to techno-modernism and motivated their search for purity in nature and 'the primitive'; such themes also resonated with the long drive towards cultural nationalism that had begun in the eighteenth century in the writings of Johann Gottfried von Herder. The intellectual dominance of France had for centuries stimulated the various German-speaking nations' interest in Enlightenment rationalism. Intellectuals in the young German nation correspondingly rejected the 'top-down' rationality of technology and engineering (supposedly dominant in France), and artists celebrated the 'bottom-up' primitivism of France's colonial 'others' (Africans) and Germany's own 'natives' (*das Volk*). This of course created considerable tension since the forms used by the German expressionists were occasionally borrowed from other peoples' visual culture (particularly Africans'), rather than

from some rediscovered native German idiom. As the painter Emil Nolde speculated in 1912, 'Absolute originality, the intense and often grotesque expression of power and life in very simple forms – that may be why we like these works of native art'.[16] But maintaining their interest in African art forms (standard procedure for would-be-modernists in the early part of the twentieth century) would prove dangerous for modern artists in interwar Germany. The search for appropriate forms of cultural nationalism became politicized by the Nazis in the 1930s, and primitive modernism was excoriated and banned. In spite of his membership in the Nazi party, Nolde, like others in the German expressionist movement, was among the artists whose works were featured in the famous *Entartete Kunst* (Degenerate Art) exhibition of 1937. Although Nolde endured, others were forced to emigrate, perpetuating the nomadic character that was seemingly endemic to modern art.

Those who took the route of a more technologically oriented modernism fared no better under the pervasive grip of German fascism. Artists of the progressive Bauhaus school for architecture and applied arts were also forced out by the Nazis. But the Bauhäusler were condemned as 'bolshevists', whereas expressionists had been deemed atavistic. Expressionists had been ridiculed, but the Bauhaus artists were genuinely feared. The very *inter*nationalism of the Bauhaus drew the fascist leadership's wrath and provided a political entry point for the Nazis' attacks. Modern engineering technology was not the problem; rather how to apply it to nativist philosophy became the ideological challenge.

The Nazis' use of machine imagery was complex. They militarized bodies into machines, designing exercise regimens and marching formations that emphasized a hardened and regulated masculine physique, arranged like war material. Yet at the same time, the Nazi leadership derided Bauhaus artists' stripped-down mechano-morphic functionalism as 'pan-Semitic' and 'non-Aryan'. Ultimately, a tenuous balance was achieved between the nationalist (racist) claim that Teutons were the first technicians, and an aesthetic programme of old-fashioned representational art. Elsewhere in Europe, machine styles would be deployed more consistently in navigating the national/international currents of modernism, even if they often had to reckon with the mass culture of the United States.

Machine-age New York fuelled many early twentieth-century machine styles, particularly as the dislocations of world war (and later fascism) made it a haven for foreign émigrés. Cuban-French painter Francis Picabia made the following statement on his first trip to New York (where he ended up after defecting from the French Army): 'Almost immediately upon coming to America it hit me … The machine has become more than a mere adjunct of life. It is really a part of human life … perhaps the very soul … I have enlisted the machinery of the modern world, and introduced it into my studio.'[17]

Together with French artist Marcel Duchamp (who had given Picabia one of his own early machine-paintings: a cubist-inspired work featuring mechanical and biomorphic elements and dubbed *Mariée [Bride]*), Picabia defined a new and harsher modern sensibility via the machine. Initially, this new sensibility was perceived to be American, yet wittily erotic: one 1915 line drawing by Picabia depicts a sparkplug as a nude young American girl; Duchamp's famous 1917 'statement' was an up-ended piece of American

plumbing, a urinal dubbed *Fountain*. Another object to emerge from the avant-garde was a collaboration between the expatriate Baroness Else von Freytag-Loringhoven and an American painter named Morton Schamberg: a length of curving plumbing placed in a mitre box, titled *God*. In phase with anarchist artist groups in Zurich and Berlin, the Manhattan clique were later celebrated as 'New York dada,' while European dada explored the 'anti-art' implications of *Machinenkunst*. But as scholars have noted, most native-born Americans eschewed these metaphoric manipulations of their machines, depicting industrial objects in a way that claimed the crisp lines and exaggerations of scale found in commercial advertisements – but with less of the Europeans' irony, gender play, or subversive intent. Inevitably, the foreigners at the heart of 'New York dada,' and affiliated dadaists elsewhere, would each present variations on the mechano-morphic theme that counteracted or echoed their national affiliations and anti-nationalist commitments. Most pursued an ambivalent love affair with things mechano-morphic and American, but as in the subsequent surrealism movement, their works seemed largely to neutralize any claims of 'nation' through an unremitting eroticism or direct and furious anarchist critique. Some dada artists fused the primitivism of an earlier modernism with more up-to-date technology. Note, for example, the collages of Berlin dadaist Hannah Höch, who combined ethnographic photographs of African masks and corporate logos in her montages. Rather than replace the government or form its new citizens, the anarchist modernists who came together through dadasim sought to revolutionize the individual human imagination and to render it less vulnerable to the claims of the bureaucratic nation state.

A less critical re-use of machine forms and of nation emerged from the Italian futurists, who adopted mechano-morphic images and nationalist rhetoric with a vengeance. Former symbolist poet Filippo Tommaso Marinetti inaugurated the movement in his extraordinary *Manifesto of Futurism*, published in the Paris newspaper *Le Figaro* in 1909. Fusing a celebration of the machine with a repudiation of the classical legacy, Marinetti wrote: 'We affirm that the world's magnificence has been enriched by a new beauty: the beauty of speed.... a roaring car that seems to ride on grapeshot is more beautiful than the *Victory of Samothrace*. ...We will destroy the museums, libraries, academies of every kind ... Museums: cemeteries!'[18] Like Picasso, Marinetti staged his attack in France's cultural capital, the very city where the Hellenistic statue from Samothrace was enshrined (at the Louvre in Paris). And like his Spanish predecessor (Picasso) and German contemporaries (Nolde, Höch), Marinetti looked to Africa in his search for modernism's future. Describing the automobile excursion that propelled him toward revelation even as it landed him in a ditch, the presumptuous futurist merged a tribute to factory discharge with a memory of his African wet nurse: 'O maternal ditch, almost full of muddy water! Fair factory drain! I gulped down your nourishing sludge; and I remembered the blessed black breast of my Sudanese nurse.'

Italy, like Russia and to a certain extent Germany, was at the fringes of the rapidly developing European centre, becoming 'ethnic' in comparison with the colonial ambitions of a France or England (with none of the past imperial glories of Portugal, Spain, or the Netherlands), playing 'catch-up' with its own imperialist forays into Libya and Ethiopia. At the time of Marinetti's writing, there was

already a tenuous Italian presence in the Anglo-Egyptian condominium over Sudan, through Roman Catholic priests who had established missions in the southern region (where tribal black Africans were the primary inhabitants, rather than the more urban Arab Muslims in the northern Sudan). These church missions maintained the few schools and organizations that linked the south with Europe (otherwise closed by Britain from trade and communication), and it is likely that Marinetti's childhood nurse came to Italy thanks to these missions. In his exhilarated narrative of 'baptism' after his car crash, Marinetti smashes together mothers, machines, and borders, combining the person of a 'blessed' but colonized 'other' with the dark flux of Italy's lurching modernization (waste in a factory ditch). Unlike the critical, anti-state anarchism of the (northern) European dadaists, Marinetti and his futurist followers crusaded on behalf of Italy's expansionist policies. Initially anarchists, they eventually became fascists. Yet even in that first epiphanic (and anarchist) moment, national aspirations are mixed with concerns about border dwellers (Italian or Sudanese) and dreams of transcendence (technological). As we have argued, modernism embraces varying impulses toward and away from national cohesiveness. Italian futurism brought these issues sharply into focus.

The visual forms spurred by Marinetti's futurism deeply influenced Russian constructivism and even helped to spread cubism. Marinetti wrote: 'we will sing of the multicoloured, polyphonic tides of revolution in the modern capitals; we will sing of the vibrant nightly fervour of arsenals and shipyards blazing with violent electric moons ... and the sleek flight of planes whose propellers chatter in the wind'.[19] The works of futurist artists, such as Carlo Carrà and Umberto Boccioni, illustrated Marinetti's spirited appeal by depicting urban scenes and objects with broken forms and surfaces that appeared whipped by wind or pierced by analytic rays. Often composed with predominantly curving, diagonal 'force-lines,' futurist paintings drew upon the decorative arts' preoccupation with streamlining and abstract repetitive forms. Dynamic forces and events were expressed with brushstrokes divided into scintillating flecks of colour, and different moments of daily life were depicted simultaneously. Both characteristics bore a French pedigree: the style borrowed elements of French divisionism and pointillism, and the simultaneousness echoed French philosopher Henri Bergson's famous theories of flux and becoming. In modernizing Italy, however, these artistic and philosophical commitments took on an enthusiastically technological and nationalist twist. 'Who can still believe in the opacity of bodies,' asked Boccioni and the other futurists, 'since our sharpened and multiplied sensitiveness has already penetrated the obscure manifestations of the medium?'[20] This sharpened and multiplied sensibility was initially mobilized for anarchist ends, although war was, from the beginning, glorified as the 'sole hygiene of the world', and some of the futurists' artistic activities included demonstrating against neutral alliances. When the futurists' calls for intervention met with success, and Italy joined the war against Germany, futurist artists committed themselves to profoundly nationalist ends – as became explicit in the futurist journal *Lacerba*, which concluded its last issue in 1915 with the statement: 'From this moment on, we are one thing only: Italians'.

The new commitment to Italy's role in an international theatre appears most notably in Carlo Carrà's works of

1914–1915, such as a line drawing he titled *After the Marne, Joffre Visited the Front in an Automobile* (published in March 1915 as part of his bellicose book *Guerrapittura*), and the complex composition known as *Manifestazione interventista (Interventionist Demonstration)* (Plate 151). In the line drawing from *Guerrapittura*, Carrà celebrates the victories of French Marshall Joseph Joffré, who had triumphed over the Germans in the battle of the Marne in 1914 – a futurist-looking cone (Joffré's 'penetrating angle') aims at a pair of dour-looking parallelepipeds, themselves connected by dotted lines to a sinister black Iron Cross. The more complex and slightly larger work (also translated as *Interventionist Manifesto*), shows Carrà drawing heavily on the new technique of cubist collage, which he had observed that spring after visiting Paris (and Picasso). Yet in place of analytic cubism's stable triangular compositions that allude to the framing edge, Carrà's small collage seems to explode outward from the centre (like Bernini's great Roman altarpiece, the *Ecstasy of St Teresa*), threatening to violate the boundaries of its support. Indeed, other futurist works follow exactly this formal strategy (notably, Giacomo Balla's *Abstract Speed + Sound*, from 1913–1914, or Gino Severini's *Plastic Rhythm of July 14th* from 1913) – the internal, painted compositions of these futurist canvases are extended beyond the frame with diagonal lines and licks of paint. In his *Interventionist* collage, Carrà stops short of moving beyond the frame. But his image nonetheless produces all of the expanding, propulsive energy of the typical futurist canvas. What few horizontal bits of text there are (i.e. 'Piazza' and 'Strada', 'geometriche città moderne' and 'Rumori') seem lost in a helical vortex that expands like a blast from a megaphone, a rapidly cycling airplane propeller, or an oncoming train.

Despite Carrà's inspirational stay in Paris, after which he strongly suggested to his friend and fellow futurist Severini that 'We should … transfer our tents to this capital of the world,' he was also tempted to carry on his struggle in Italy, as the *Interventionist Manifesto* (completed in July after his return) attests. More futurist and nationalist than most of his other works, Carrà's collage seemingly anticipates Marinetti's injunction later that year to 'try to live the war pictorially'.[21] The word *Italia* is at the very centre of the swirling collage, with '*audacia*' directly above it; *evviva* (hurrah!) circles the centre in expanding rings of highly visible white lettering on a black ground. Italian flags crop up, and a tricolour scheme is repeated throughout.

But the image is more than the sum of these celebratory nationalist bits. First of all, the overall tricolour scheme is *not* that of the two small Italian flags, which lie flat in rectangles of requisite green, white and red. In the dynamic composition around these small, somewhat subordinated national icons, the dominant colours are *black, yellow* and *red* – a clear reference to the German flag. Supporting this reading, directly opposite one of the Italian flags is the large German word 'TOT.' The other flag is associated with the English word 'SPORTS.' Small newsprint clippings of a flower, a boot, a bowl of fruit, a marching drum appear to be meaningless, yet they reinforce the visual rhythm of the work, which constitutes a blast of contrapuntal letters, forms, and colours that defy a linear 'reading.' The verbal/formal vortex is the visual equivalent of the bellicose poems and manifestos of futurism's literary production.

In the *Interventionist Manifesto*, Carrà explicitly refers to these poems and labours to establish a sort of visual onomatopoeia, particularly Marinetti's *Zang Tumb Tuum*, the 1912 war epic whose title was intended to evoke the sound of exploding shells. Published in an innovative typeset edition in 1914 and excerpted in *Lacerba* (whose title makes its own appearance at the upper left of Carrà's composition), the title of this work appears along the upper left diagonal of Carrà's collage. Clearly, Carrà's inflammatory collage was inspired by Marinetti's poetry. Like the Futurist Manifesto, the text of Marinetti's *Zang Tumb Tuum* was originally written in French, implicitly appealing to the French modernist tradition as exemplified by the poet Stéphane Mallarmé. Marinetti had explicitly attacked Mallarmé in his 1913 broadside the 'Destruction of Syntax'. In opposition to Mallarmé, Marinetti called for a dramatic public performance of poetry; indeed, after translating his noisy poem into Italian, Marinetti performed portions of it in public no fewer than twenty times from 1913 to 1914.[22] The themes we have examined in the struggle between modernism and modernization were acted out yet again, in this movement from private to public. Marinetti rejected what he saw as the intensely individualistic and internalized symbolist aesthetics of French modernism, seeking instead an immediate public impact upon his culture, as incontrovertible as modernization, as direct as war. Marinetti attempted to duplicate the chaos and cacophony of his public readings in typographic form by using chaotic page design and a motley variety of typefaces. Following his own manifesto for the 'Destruction of Syntax', he used verbs only in the infinitive, isolated adjectives from nouns, mixed font sizes and scattered words and type across the page. Through these disjunctions and affronts to the reader, Marinetti sought to deny what he called the 'literary I', and replace it with a new futurist subject, a 'multiplied man' of restless and mobile attention, not *ego* but *ago* (the Italian word for a mechanical pointer or indicator needle on a measuring device).

Carrà's small collage did not lend itself to the same kind of performance as Marinetti's poem, but its intent was similar. Like the Soviets, Carrà and the other futurists yearned to harness the growing power of the mass media: newspapers, posters, and advertisements that would carry more than mere advertisements. But the futurists as yet had no overall international politics to which they could attach their ambitious formal experiments – no Communist International offered to take their forms beyond the Babel of competing nations and foreign tongues, no skyward-reaching towers rose to take them to the global aerial perspective. The futurist model, then, remained a Nietzschean one – a theatre on the ground (its actors mired, perhaps, in Marinetti's factory ditch) in which the agonistic choices were, to quote Mussolini, to 'march, or rot.' The nearly hopeless disparity in power between the aspiring Italian nationalists and their big brothers to the northeast was signalled in Carrà's own collage. It is the colours of the German flag that form the larger compositional vortex within which the small Italian *tricolour* must swim (or sink) – a sense of national doom that seemed prescient, in retrospect. For after enthusiastically signing up for that great 'hygienic' conflagration, scores of Italian futurist painters and poets met their end in the ignominious trenches, including the great sculptor Umberto Boccioni, and the visionary architect Antonio Sant'Elia. The enthusiasm for Fascism manifested by those who survived the Great War has rendered the legacy of Italian futurism troubling for most historians of modern art.

The Fascist leanings of the futurists should not surprise us, however. Fascism in Italy, which preceded the rise of the Nazi regime in Germany by a decade, was both more tolerant of aesthetic diversity and more tolerated by intellectuals and artists of all varieties. As scholars of modern Italian art have argued, Fascist culture *was* Italian culture during the *ventennio* (the Fascist party's two-decade rule), dominating all public discourse and supporting styles as diverse as geometric abstraction, futurism, expressionism, and neoclassical academic painting. Even the still-life painter Giorgio Morandi, beloved by moderns for his 'devout study of slight yet critical shifts in the weight of counterbalancing forms,' placed his unassuming art at the service of the *Strapaese* (*stra* + *paese*, or 'supercountry') movement, one of the most important rural branches of Fascism. *Strapaese* fought for the protection of the traditional 'expressions of the race', as Fascist Mino Maccari put it, preserving these racial traditions from corruption by 'fashion, foreign thought, and modernist civilization'.[23] The taint of Fascism cannot be used to condemn all Italian moderns and anti-moderns. The point is to refuse once and for all the equation of modernism in the visual arts (or anti-modernism, for that matter) with internationalism, progressivism, or left-wing avant-gardism. Both modernism and its opposition have always depended on the political context and been interpreted on a local level. For the purposes of this chapter, we can simply assert once again that wherever it appears, modernism is permeated with the local and specific politics of nationalism, a dominant twentieth-century discourse with which all artists contended through the century, with varying degrees of consciousness and/or success.

Whether grounded in nationalism or aspiring to internationalism, modern artists remained conflicted in their hopes throughout this period. Tatlin, either consciously or unconsciously, had inscribed Babel in the form of his International monument, and Carrà, too, summoned linguistic cacophony and played out the struggle of national wills in his visual manifesto. The only generalization that can be made to characterize the historical development from the moment of *Les Demoiselles* to the First World War period of Carrà's *Manifesto* and Tatlin's post-war monument, is that there seems to have been a movement from Picasso's individualized theatrics – his performance of alternately gendered, racialized, and nationalized identities – to Tatlin's and Carrà's more collective aspirations. Envisioning Babel or a theatre of war presupposes a collection of voices, none of which can speak for the multiplied and assembled subjects of the modern urban city or the nation that proposes to contain them.

## Internal exiles: surrealism and the public mind

In 1929, a group of artists, writers, and intellectuals published the 'Surrealist Map of the World' in the French revue *Variétés*. Map-making is a quintessentially nationalist project, but the surrealists attempted a critical inversion. The equator, an imaginary line defined as the great circle around the Earth's circumference, is here a meandering path that curves below 'Hawai' (sic) and above 'Archipel Bismarck.' While the northern hemisphere still dominates, the United States disappears entirely, squeezed between Mexico, Labrador, and an oversized Alaska. Only two cities – Paris and Constantinople – are visible, but their countries cannot

be identified, crowded in the one case by Germany and 'Autriche-Hongrie,' in the other by Russia and Africa. The African continent itself is surprisingly small in the surrealists' map, considering its importance to the earlier cubist painters (and its appearance in the futurist Manifesto in the person of Marinetti's Sudanese nurse). Although the terms *l'art primitif* and *l'art negre* were still used fairly interchangeably (neither making the distinction between objects originating from Africa and Oceania), the balance had clearly shifted in the tastes of Western artists. Henceforth Oceanic cultures assumed far greater importance. Surrealists disdained what the cubists had found in the largely monochromatic sculptural traditions of Africa. Instead, the reigning artists and intellectuals of the 1920s conceived a passion for the intensely symbolic, allegorical, and polychromatic decorations from the Pacific Rim.

Reflecting Europeans' obsession for these so-called fetishes (objects of trade, worship, and everyday use produced in supposedly 'primitive' societies), the surrealist map emphasizes the lands of these faraway people and objects. The surrealists' universe orbits around the Marquesas, the Solomon Islands, the New Hebrides, the Philippines, and New Guinea (all named not by the people who lived there, but by the conquering colonials who mapped them); islands known by more exotic names are also featured: Timor, Bali, Java, Sumatra, Borneo, Celebes.

Celebes is unfamiliar to the present-day reader. Better known to its inhabitants as Sulawesi, Celebes was the name Portuguese traders gave to this island in the eastern part of the Malay Archipelago (now part of the Republic of Indonesia). The name was probably coined from a Latinate root (*cele*) meaning 'secret,' but it also evokes an obscure Old English word (cele/ceil/seal) for 'happiness' as these two attributes of tropical life were most appreciated by modernist artists (from Paul Gauguin and Emil Nolde to the surrealists). Some actually came in person to such island sites, following droves of colonial soldiers and administrators, church missionaries, European anthropologists, adventurers and government trade officials. But most artists never attempted to actually see such places firsthand. Their experience ended with the exotic flavour of names and objects brought to 'the centre' (whether that centre was constructed as Paris, Berlin, Amsterdam, Vienna, or Zurich) – objects such as masks, architectural and nautical ornaments, clubs, staffs, kitchen implements, and occasional free-standing figures surrounded by rumours, anthropological treatises, and printed images of distant people and beliefs. Celebes was typical, then, in being known by most Europeans first as a faraway place, second as a cluster of exotic people and rituals, and lastly as a particular style captured by artists.

Certainly Max Ernst had never visited the actual island of Celebes/Sulawesi, and probably had little sense of the objects it might have produced, when he titled a 1921 painting *Celebes (Der Elefant von Celebes)* (Plate 152). At a time when the anarchic energies of dada had begun to subside but the goals of surrealism had yet to be formally articulated, and when the seemingly senseless destruction of war had only barely given way to the exhausted despair called peace, the painting presented an imaginary world that turned away from politics toward a different, purely psychological concept: the dream.

The dream acquired a special status at the time – not merely among proto-surrealists such as Ernst, but among

legions of anthropologists, psychologists, and philosophers of the industrialized West (the ones writing about the distant cultures they termed 'primitive'). Writers such as James Frazer (*The Golden Bough*, 1890) and French anthropologists such as Lucien Lévy-Bruhl (*La mentalité primitif*, *How Natives Think*, 1910) shared a conviction that dreams provided a window onto a spiritual universe that had once been common to all humans (the 'primitive' supposedly preserved a link to the spirit that had been lost in the progression toward modernity). Sigmund Freud's *Interpretation of Dreams* (1905) and *Totem and Taboo* (1913) drew on Frazer and Lévy-Bruhl. Freud combined anthropological research with his own medical training, positing relations between newly identified structures of the individual mind (the unconscious and subconscious), which he linked to an earlier 'primitive' mindset revealed by dreams. In the unauthorized extension of these theories by Freud's apostle (and later apostate) Carl Jung, the narratives constructed by the dreamer were linked to a 'collective unconscious' that could somehow be shared (and understood) by all of humankind. The tension between these two views of dreaming – as a deeply private affair or as a universal image-based language – characterized surrealism from the beginning and underlined its ambivalence toward that other partial universalism: nation.

As a young German university student reading psychology and philosophy in Bonn before the outbreak of war, Ernst was familiar with these competing theories of culture and mind. He was drawn to the sciences of the mind because of their attempts to understand dreams, seeing them not (as the Romantics and symbolists had) as a source of poetic imagery, but in a new and rational way. Perhaps the young Ernst also hoped to resolve some of his own problems, stemming from an unhappy childhood marred by an autocratic father and the death of a sister (in later memoirs he acknowledged as much). Throughout his university career, Ernst the young rationalist also painted, wrote art reviews, and began to contact other young artists publishing in the Berlin journal *Der Sturm*. Then his world suddenly collapsed. War was declared: 'Max must enlist. Field artillery. Four months in [barracks] then out into this shit.' Ernst's sense of the total collapse of rationalism in the madness of world war is captured in such later autobiographical musings as: 'Max Ernst died on 1 August 1914. He returned to life on 11 November 1918, a young man who wanted to become a magician and discover the myths of his time.'[24] For a former lieutenant promoted from the ranks of the Totenhopt Husaren (Death's Head Hussars), magic and myth came to seem far preferable to reality – whether it be the remembered reality of war, or the post-war reality of British-occupied Cologne.

The declared goal of magic and myth was close to dada, a new movement with whose founders Ernst had been friends before the war, and whom he now called 'Dadafex Maximus' ('Dadamax' for short). Dada's left-wing nihilism had emerged in a neutral Switzerland in 1916. It then erupted in Berlin (where its members risked imprisonment and death during the war) and had a brief New York episode. Although initially quite political, the ex-soldier Ernst loosened Dada's bulldog grip on the real world's insanity, substituting a more inner-directed search for another world. When he first exhibited the new paintings – including *Celebes* – in Paris, he described his new strategy of interiority as 'mise sous whisky marin,' viewing the world as if from an inebriating, disorienting sea.[25] Such sentiments could still resonate with Ernst's old friend Hans Arp's statement that dada hoped 'to do away with fraudulent reasonableness and substitute the natural, unreasonable order of things'[26] – but Ernst's unreasonableness aimed neither at visible nature, nor at the 'real'. Reality, in his post-Freudian view, was precisely the problem. *Celebes* aimed to make visual the parapraxes and narrative disjunctions that the psychoanalyst uses to probe beneath the illusion of the real, to assist the patient in arriving at the underlying pathology of his suffering. Ernst contributed by making the emerging vocabulary of psychoanalysis a central part of what would become the canon of surrealistic painting. Within the leap from private psychological significance to public art, the discourse of nation would return.

Ernst painted *Celebes* three years before poet André Breton published his 'official' Surrealist Manifesto, and it played a key role in forming the sensibilities of the writers and thinkers who came to support the movement. (Indeed, Ernst's collages had been the subject of Breton's first essay on art in the spring of 1921.) In the 1924 manifesto, Breton called for 'Psychic automatism in its pure state … Dictated by thought, in the absence of any control exercised by reason, exempt from any aesthetic or moral concern'.[27] Ernst never achieved the free-wheeling appearance of automatism in his art (and is therefore consigned in the Manifesto to a supporting role, one of the many precursors who retained 'a certain number of preconceived ideas' and failed to '[hear] the Surrealist voice').[28] Nonetheless, his painting was so resonant with the developing tenets of surrealism that when the young French poet Paul Eluard saw it during his first meeting with Ernst, he bought it immediately. Eluard became the first person to purchase a work by the 'Dadamax' from Cologne, transporting tangible proof of Ernst's private/public vision to Paris.

Despite Eluard's endorsement of Ernst as a painter of the future, *Celebes* turns its back on the major innovations of modernism as developed by the cubo-futurists. The painting resorts to the devices of academic realism to construct a kind of landscape. This comes as a surprise in any progressive account of modern art. In such an account, the cubists' fragmented and flattened space became further pulverized by the Italian futurists, until, as we saw in Carrà's pasted-paper assemblage, the picture plane was an explosive, centrifugal metaphor for the theatre of war itself. Moving up in a twisted spiral in Tatlin's tower, or expanding outward from the compressed and flattened plane in futurism, modernist space before surrealism was shallow and dynamic. Suddenly, in Ernst's paintings of 1921, it became frozen and still. In the sombre quiet of this post-war canvas, Ernst made no effort to resurrect a fallen hero, or even nostalgically to mourn one. Indeed, the first look of *Celebes* reveals an enormous and enigmatically obscene rump. Whatever sense we may now make of it, in 1921 the 'elephant' *Celebes* clearly functioned for Paul Eluard as the perfect emblem of whatever future remained for European culture – behind a figure of mockery (my ass!), the viewer confronted an ambiguous and interior journey, seemingly to the heart of madness and darkness alike.

In the grotesque company of the Death's Head Hussars, Ernst had faced off against Eluard across the lines at Verdun. Yet in their subsequent meeting, there was no need for *détente* for a negotiated amelioration of conflict between *Frosch* and *Boche*. For both artists, the wartime confrontation

stood as a token of the kinds of nationalism that dada, and subsequently surrealism, yearned to destroy. As Ernst experienced it, the imagined unity of Wilhelmine Germany, best expressed by its military, was always already fractured by the cultural rifts between Prussians and Rhinelanders in the ranks, or later, between stay-at-home-patriots and freshly minted anarchists back from the trenches. In Eluard's France, the imagined monolith of French modernism was similarly riddled with social and rhetorical splits between the immigrant artists forming the supposedly *déracinés* School of Paris, possessed by 'crazy' abstraction and expressionist brushwork, and the *terroirs* (native French) realist painters canonized as the true-blooded sons of the *Ecole Française*.[29] In many ways, *Celebes* bridged these gaps on both sides. Its very *anti*-modernism may have helped secure it a foothold in Eluard's (and France's) visual culture, for its air of sober realism (if only in service of an as-yet-unnamed *surrealism*) fit the general 'Return to Order' of post-war painting in Paris, a rejection of the immigrant-fuelled styles of expressionistic abstraction that many Frenchmen felt had 'gone too far'. Similarly, Ernst's stylistic sobriety signalled a turn away from the politics that had characterized war-time dadaism, toward the *Neue Sachlichkeit* (New Objectivity) emerging as Germany's version of a return to order (albeit an order following only the logic of dreams).

The United States also witnessed a turn toward a cooler style, and Italy saw the emergence of a new 'metaphysical realism' in work by Giorgio de Chirico just after the war. Of course, any more-than-cursory inspection of *Celebes* would reveal its complication of the chillingly quotidian verism of *Neue Sachlichkeit*, its contradiction of the optimism of American precisionism, and its rejection of the nationalist values of the *Ecole Française* (the de Chirico paintings Ernst saw in 1919 were the only 'realist' works he acknowledged as deeply influential). But on the surface (the veneer of the painting's smooth finish), Ernst's painting fit the newly hard-edged return to representational illusionism and encouraged the importing and transfer of its more subversive intentions.

Ernst's path to the other world of *Celebes* (and to Paris's international stage) was paved with such stylistic negotiations, reflecting the bitter experience of a disastrous military career defending *Deutsche Kultur*. Wounded twice, the artist miraculously avoided being killed in the slaughter; he made a number of small abstract watercolours referring to the Great War (*Battle of the Fish*, and *The Spindle's Victory*, both from 1917). Disillusionment with the inadequacy of such art in addressing 'reality' (past or present) led to Ernst's few real-world political engagements – such as the moment in 1919 when he stood at the factory gates in Cologne distributing copies of his socialist friend Johannes Baargeld's periodical *Der Ventilator*, or the time the two broke up a reactionary patriotic theatre production, or put up an exhibition behind a urinal, where one of Ernst's works came equipped with an axe to facilitate its own destruction. The restrictions imposed by the British military occupying Cologne (which banned *Der Ventilator*), and the activities of local German police (who closed the exhibition), worked to silence such dada manifestations. Baargeld's and Ernst's provocations had been calculated to stir things up; not surprisingly, the lid came down, and Ernst turned to his 'sous whisky marin'. Thus a certain amount of self-censorship also lies behind the frozen silence of *Celebes*. Without a

doubt, *Celebes* marks the beginning of the end of Ernst's dada period. The turn in the direction of France (and internationalism), validated by Eluard's purchase of the painting, was confirmed by Ernst's own move to Paris shortly afterward.

In art history terms, Ernst's return to academic modes of representation was a rejection of dadaism's cubo-futurist heritage – a move away from the radical, anti-Renaissance flatness of cubism, and a return to modes of composition and illusionism made comprehensible through centuries of Western classical perspective. Crucial in demonstrating the effectiveness of such a reversion, as noted above, was de Chirico's 1912–1918 work, which Ernst considered significant. De Chirico's use of distorted perspective, his depictions of strangely lit empty urban squares, were the product of an Italian interpretation of German thoughts on classical Italian architecture – specifically, Friedrich Nietzsche's descriptions in *Ecce Homo* of the vast empty piazza of Turin. However, where de Chirico relied on the pre-Renaissance cityscapes of Lorenzetti to capture Nietzsche's mood, Ernst retained the narrative disjunctions characteristic of cubism – presumably to connect with a more modern reality. Steeped in dadaist techniques of collage and photomontage, Ernst found the inspiration for paintings such as *Celebes* in cut and reassembled images he took from catalogues, scientific journals, and anthropology texts. Many of these sources filter into our subconscious associations with the picture, and indeed, they may be rendered subconscious (that is, 'invisible') only by the completion of the painting – the smoothing over and erasures resulting from Ernst's use of the traditional painting techniques.

Just before *Celebes*, Ernst produced *Fiat Modes*, a suite of lithographs conceived as a homage to de Chirico. The German war veteran recycled the Italian painter's mannequins and triangulated perspectives, but decorated them with Freudian anxieties. The work poses a question – 'Let there be Fashions,' or, by suggestion, What is the future of art? Like Walter Benjamin's magisterial ruminations on modernism in the nineteenth-century shopping arcades of Paris, Ernst's prints takes place in a dislocated cityscape of transparent shop windows and tilted floors. Mannish suits are measured on female dress forms, a symptom of the changing 'mode' of gender politics and artistic fashions. The dress forms and couturiers cohabit with recombined segments of storefront mannequins (or artists' figurines) and grotesque combinations of stumps and nubs, resonating with Ernst's contemporary works, which appropriated medical images of braces and prostheses. In what is perhaps the most telling page in the *Fiat Modes* suite, a tiny silhouette, marked as female, appears inside an enormous structure (a department store display window?) viewed from a distance by a clownishly fat figure with bare feet and exposed, drooping male genitals. The genitals appear again in place of the nose for this armless figure, referring to Freud's famous study of a patient's psychological associations between nose and phallus in the context of castration anxiety. The man's line of vision is diagrammed, beginning with his limp phallus-nose and following a path set out by a pointing hand, under a banner (painted backwards as a shop sign seen from the inside) that reads: 'zur neuenkunst? D D'.[30]

Is this man speaking to wider issues, such as the future of German (*D*) and possibly also dada (*D*) art? The defeat of

German militarism in the war is suggested in this symbol of deflated masculinity, and castration anxiety is seen as a crisis for the nation's culture. Critiques of nationalist revival (already raised, as we have seen, in Ernst's and Baargeld's disruption of the monarchist play) appear on the cover page of *Fiat Modes*, which features a tall mechanical tower topped with a flag. The theme of manipulated flags reappears here, for this is not the German flag, but a banner bearing a star and a crescent – reminiscent of Muslim symbols on the national flags of Turkey, Pakistan, Tunisia, Singapore and Malaysia. The fragile-looking industrial tower is converted, symbolically, to a minaret. Far from some escape into the maternal-paternal colonialism of a Marinetti (who had linked the black waste from an Italian factory to the breast of his Sudanese nurse), Ernst seems merely to have been reaching for some different flag under which to muster the disaffected troops of the European avant-garde, something other than the German-French-British and sometime Italian and American heraldry so visible during the latest cataclysmic conflict. Ernst's choice of an Islamic other, like his choice of elephants and *Celebes*, is not random, even if its specific significance may be elusive. It is as if by evoking a third reference, he can escape the return of cyclical history. But it remained an imaginary escape in 1919; the tower is a slender tracery of iron, seen from a distance. Before achieving a deeply desired displacement to Paris (and then a move to the American Southwest during the Second World War), Ernst envisioned only internal exile. Confined to Cologne, he could just barely imagine a new (German? or international Dada?) art.

Although Eluard endorsed the internationalism of *Celebes*, by the act of acquiring it for his Parisian apartment, the painting merely presents the conflicts of nations, rather than resolving or transcending them. The central, mechanical 'elephant' evokes a military spectre, an alien juggernaut nonetheless rendered German/Wagnerian by its Teutonic horns. Its malevolent superstructure suggests a grimly engineered orchestra (a red piano, a harp, an organ pipe?) – conflated with the parallel symbols of a watchtower. The monstrosity of the 'elephant' lies in the mixed military metaphor: through the seemingly ribbed and collapsible nature of the creature's phallic member, by the fleshy eye/breasts at the end of the proboscis, and finally, by the small piece of clothing worn by the horrific probe.

In the alchemy of paint, the serrated white appendage near the lobed end of the phallic trunk is both skirt and/or collar, cloth and/or steel, stiffened lace and/or functional metallic gear. As 'skirt,' it plays the role of the French maid's apron taken from pornographic sources – the perky white cloth that barely covers (and hence signifies) the forbidden locus of desire and dread. As collar, it reverts to the golden age of Dutch portraiture, when dignitaries commissioned portraits adorned with costly white lacy handiwork. As metallic steel gear, it completes the conversion of this phallic woman into the ultimate military spectre – an armoured, hardened drill bit whose extending probe and blackness only hints at the fearfully obvious hole at her very core.

We have worked within the limitations of what can be observed within the painting's imagery and that which is suggested by its title (both configured as being 'on the surface') – scanning the way the canvas is painted, the placement of its imagery, the evocations of otherness in name and place – to find references to a particular configuration of the 'real' at the moment of its creation.

Scholars of Ernst and surrealism have gone farther, connecting the 'elephant' with the visual appearance of French gasmasks, in which a rubbery breathing tube moves down to a shiny chamber of steel for filtering air.[31] The beast may also be a reference to the biblical figure of Behemoth (illustrated in French tradition as an elephant): 'his bones are as tubes of brass; his limbs are like bars of iron' (Job 40.18). In contemporary accounts of Behemoth – specifically, one by French poet and critic Guillaume Apollinaire, whom Eluard knew – Behemoth is self-created: 'I am the dictator. Here the voice of Behemoth, without origin … unique, immobile, and … immortal'.[32] In this analysis, Ernst's Behemoth looks ahead to the rise of Hitler, back to the abuses of the Kaiser, but also sideways to the wartime chauvinism of Apollinaire himself.[33] Yet these internecine European conflicts are not the only ones depicted in *Celebes*. It is significant that this cross-gendered, self-created mechanical dictator should be so black that its ridiculed yet still-terrifying power should be thrown into relief by the beckoning of a decapitated white female, her ivory-skinned inducements reminiscent of many other works of European Orientalism (from Shakespeare's *Othello* to Delacroix's *Sardanapalus* and Ingres's odalisques).

The blackness of the beast reinforces the notion of the 'other', proclaimed by the painting's title. Scholars eventually discovered that Ernst's 'elephant' – besides making an allusion to a scurrilous bit of Germanic doggerel[34] – was modelled on an enormous, two-legged communal corn bin, built of clay by the Konkombwa people of southern Sudan. Ernst had found the image in an illustration for a British anthropological journal, surrounded by scientific reports on a colonial outpost. Many substitutions were effected in Ernst's conversion from photo to painting: evocations of metal to represent earth, steel for straw, shine for wattle, and black for pale clay. In the photograph, the earthen Konkombwa corn bin merges seamlessly with the dusty, pale ground, but in Ernst's painted rendition, the structure is darkened and thrown into sharp relief against a desolate ochre ground. The 'Africa' of clay corn bins was not enough; *black* Africa was needed. A smaller painting Ernst made just before *Celebes* may shed some light on the various readings.

*The Emperor of Wahaua (Der Kaiser von Wahaua)* was finished in 1920, and now hangs in the Folkwang Museum in Essen. This little-known painting has never been explicitly linked with *Celebes*, yet it clearly forms a symbolic template for the more famous painting. The emperor (recall Behemoth, 'dictator … without origin') is here a slight figure with African features and mahogany-coloured skin, swathed in an enormous black garment fitted with stiff, gleaming white cuffs and a starched white collar reminiscent of the skirt/collar of *Celebes*. A tall crown or turban sits on his head, and he holds a staff with a golden orb. A larger bluish ball is on the floor nearby. To the left of the figure teeters a tricoloured (red, white and blue) platform that stands miraculously on one side. On the table stands a strange assemblage of biomechanical parts in red and greyish-blue, culminating in a lidless blue eye (a more organic version of *Celebes's* 'watchtower'). Far beyond this structure, on the horizon, a distant snow-covered mountain can be seen. Just above the elaborate headdress worn by the emperor, seemingly emerging from some vent in the tabletop structure (or emanating from the emperor's head) is a bubble in which a smiling white female applies powder to her face. The

African emperor turns his back to all of this, fixing our gaze with a calm and unreadable stare.

This 'Emperor' is linked to the most famous of African kings, the holy wise man (magus) whose bones were supposedly preserved in the cathedral of Ernst's native Cologne. This 'savage' who saw the light of Christ and turned his royal steps toward worship brings the black bulk of *Celebes* into a full hermeneutic play of obscure meanings: nature and culture, animal and divine, sexualized despot and pious pilgrim, Orientalist 'other' and revered origin of the local cult of the national church. Max Ernst, reborn in a grim post-war Germany, taking his inspiration from various sources (de Chirico, medical journals, catalogues of prostheses, anthropology texts, poetry, dreams, religion, and dada collage), achieved the paradox of surrealism *avant la lettre*: an inner vision revealed to a public mind. Black Africa and Indonesia are appropriated, on the one hand, for the stock role of the 'other' in Western European painting, creating a location (at once specific and 'imaginary') to Ernst's vision of a desolate foreign nightmare populated by pale women and menacing military men. On the other hand, as for Picasso earlier in the century, the exotic and powerful other is also punishment and/or alternate identity for the nation/self – particularly that self that begins the process of making art by seeking a way out of the corrupted culture of modernity, through a pilgrimage to another place.

It is obvious from Ernst's own paintings, that in post-First World War Germany, an African king was representative not only of the wise men supposedly interred in Cologne's cathedral: he was also the inhabitant of the colonies coveted by England, France, Italy, and Portugal. Here we should recall that Germany's bid for a tenuous hold on East Africa was curtailed, once and for all, by the Treaty of Versailles. It is significant that the 1919 copy of *Der Ventilator* that Ernst handed out at the factory gates with his friend Baargeld printed the following stream-of-consciousness emission from a certain Macchab (the name of a Biblical spirit who occasionally appeared to one of Ernst's occultist friends in Cologne): 'Caution advised, sham corpse follows. Nubia's highways, likewise caravanserais in western and eastern Sudan, already polluted. Annual realization of Mecca questioned this year ... Repeated auto-castration of the Negus, incredible effects: thousands of Christian lip-servers from all parts of the Abyssinian Empire fanaticized'.[35]

The same uncomfortable connection of ruled (African) and ruler (Emperor) in the paintings, led one of the French dadaists at the opening of Ernst's second Parisian exhibition to conduct 'mock tours' of the installation 'dressed in blackface as the President of Liberia'.[36] The subaltern is summoned to terrify, to mock, to unsettle, to educate, to shame and even degrade those present. And in the process, the notion of nation is also criticized.

The essential truths of nation as *Heimat* will not hold up, and efforts to subdue the colonized as a way of articulating national essence will be threatened by the return of the repressed, the eruption of the 'native' into *Kultur*, the discovery of the German Kurtz at the heart of darkness (to refer to Conrad's influential novel). This return of the repressed 'other' could manifest itself in concrete political terms, or in a constantly troubled cultural imaginary – the latter being the field of inquiry chosen by the surrealists. The lasting power of surrealism resulted from this paradoxical position – a vantage point from which the artist could become an internal exile and a commentator on the relations between the psyche and the modernizing nations of a shrinking world.

## POLITICS AND ABSTRACTION

### *Guerre* and *Guernica*: paroxysms of nationalism

As we have seen in the case of an individual (Ernst) and the larger stylistic shift from dadaism to surrealism, mechano-morphic art and abstraction in general lost their appeal for European modernists after World War I. A kind of 'return to order' surfaced in France, Italy, Germany and England, and the US 'objectivity' replaced expressionism as a valued term: Germany's Neue Sachlichkeit painters produced sober, realistic images of urban life, Italian Strapaese ('super-country') artists praised the reflections of peasant life that appeared in Morandi's paintings of simple bottles and bowls (held to materialize the 'dust of Tuscany' revered by rural Fascists), and France – keeper of the flame for avant-gardes the world over – produced a form of reactionary modernism in artists of the Ecole Française, who sought to distance themselves from the productions of a 'pan-Semitic' school of Paris and the nascent surrealistic movement. Surrealists were attracted to this return to order (evidenced by Ernst's return to the representational images of an imaginary world), but were never as flagrant as right-wing artists who openly touted the supposedly stable truths of 'blood and soil' in their various national schools. These conservative realists were celebrated as the culmination of a move to preserve the glories of French painting for the native French, or Teutonic/Aryan painting for the 'true' Germans, Tuscan verities for the 'true' Italians, heartland 'Regionalism' for Americans, and so forth. Tragically, the self-policing required by these stringent forms of post-First World War nationalism turned into self-hatred for many; thus it was an assimilated German Jew writing in a Paris newspaper (Waldemar George) who articulated the 1930s nativist programme in its most virulent form: 'The moment has come for France to turn in upon herself and to find in her own soil the seeds of her salvation.' Such authors cited Chancellor Hitler's authority to articulate what had gone wrong with French art, and to explain how it had 'lost' its power to communicate to a wide public.[37]

In what scholars of this chilling confluence of nationalism and modern art call a 'parenthesis' in fascism's rise, the countervailing campaign for the Popular Front enabled Léon Blum, an Alsatian of Jewish descent, to be elected the head of the French Government (the Popular Front would also win elections for the Republicans in Spain). It was under Blum's leadership that the last of the great Paris world fairs was organized, just as the Nazi's Degenerate Art exhibition was travelling throughout Germany. As it turned out, the 1937 Exposition Internationale in Paris would be the final opportunity for the nations of the supposedly 'civilized' world to gather before the outbreak of the Second World War. Even at the time, the international fair's simulated universe was seen to stage the rising tensions of a 'war to end all wars' all over again. The setting for the 1937 Exposition Internationale was already studded with architectural remnants of previous extravaganzas, dating back to Napoleon, who had appropriated the area for his son's palace, converting the Champ de Mars from army

training ground to territory for ritual displays of power. The site chosen for the Exposition also included the Palais du Trocadero, built for an 1878 exposition (and the site of the 1907 encounter between Picasso and the 'dusty mannequins' of African ritual art); this structure was modernized and renamed the Palais de Chaillot for the 1937 extravaganza. Flanking the other end of the fairground terminus was the grandiose eighteenth-century Ecole Militaire complex. The centre was marked by the 1889 Exposition's Eiffel Tower, which had served to announce to the entire world France's new role as the capital of world modernism. Eiffel's engineering marvel immediately succeeded in affirming France's leadership of both civilization and modernism (and, as we have seen, it was an explicit stimulus for Tatlin's tower). By design, it had loomed in aggressive technological contrast with the temporary mud-and-stick villages built around its base by 'natives' brought in as part of the nineteenth-century Exposition Universelle.

By 1937, such blatant displays of colonial power relations were muted. Colonies' pavilions had been shunted to the side (quite literally, in an outlying section of the Exposition that referred not to 'empire' but to overseas France). The ruling socialists did not eliminate the colonial section, but simply miniaturized and marginalized it. The colonies were no longer the bustling engines of French economic prosperity (although certainly the closed markets of her colonies helped France delay the effects of a global depression). By 1937, they were merely tourist destinations. By contrast with the nineteenth-century's dramatic hierarchies, skyscraping steel looming over mud architectures, in 1937 one travelled to the overseas pavilions by crossing under the Eiffel Tower and moving laterally, through the 'Centre Régional' with its handicrafts from rural France, to a far-flung France. The visitor passed physically from the crown and centre of French civilization to France *péripherique*. In the other direction, visitors encountered displays of industrial products, while across the river they could view the culmination of technological modernity – modern art.

Many European pavilions were set up not along the edge of the river, but along an axis extending from the Trocadero down the esplanade; the remainder were accessed by crossing under the Eiffel Tower and proceeding southeast across the Champ de Mars toward the military academy. The most aggressive structures flanked the beginning of this axis, facing off across the Trocadero gardens (near the street now known as the Avenue des Nations Unies). In the most famous view of the fair (Plate 153), on one side loomed Albert Speer's neoclassical skyscraper, topped with the emblem of Nazi Germany (aiming to link nation with political party by means of an eagle perched on a giant swastika). On the other side was the USSR's pavilion: Boris Iofan's vaguely art deco progression of ascending masses of stone, culminating in Vera Mukhina's gleaming, stainless-steel sculpture of 'Worker and Collective Farm Woman,' two figures joining their hammer and sickle in a triumphant gesture. The obvious confrontation of the two buildings was planned by the French, who had determined the location of all national pavilions, but an aesthetic battle was waged by Speer, who had gotten his hands on the secret plan for the Soviet pavilion and was determined to surpass it. The architectural and ideological battle was dismissed by cubist painter André Lhote as a clash between 'pretentious stone dragons'; one commentator in *Architectural Record* noted tersely: 'It is this militant pair of pavilions that one sees at

every turn overshadowing the modest efforts of the more numerous democracies'.[38]

Months after the fair's inauguration, one of the democracies' 'modest efforts' opened, tucked into the shadow of the Nazi monolith and nearly invisible to the casual passer-by. The low-lying, inexpensive slab designed by Josep Lluís Sert for the struggling Spanish Republic was a glass-sheathed modernist structure; its open construction of pre-fabricated structural steel (left exposed and painted deep red or white) was fitted out with plywood, rough cement squares and straw matting. It seemed so blatantly anti-*luxe* that some visitors assumed it was unfinished. Guidebooks made no mention of the economic effects of the raging Spanish Civil War and did nothing to acknowledge that the 'nation' in question was a besieged faction of a country whose power had been seized by Nazi-backed Spanish fascists. The Spanish Republicans were socialists whose Popular Front had been democratically elected only one year earlier, but they were struggling to survive against a military uprising supported by soldiers, landowners, clergy, and residual monarchists in Spain, as well as Italian and German fascists abroad. Spain was divided and in dispute: Republicans remained strong only in the Mediterranean south and in the Basque region of the north. Even the ideology of 'nation' had been claimed by the fascist Nationalists (leaving the Republicans little option but to call themselves 'Loyalists' of the true Spain.) The silence of the fair's guidebooks reflected the period's uneasy political climate – for Léon Blum's socialist government had withdrawn French support for the Spanish socialists in the summer of 1936, thereby joining 25 other nations in signing a non-intervention pact. Official fair policy allowed the Spanish Republicans to sneak in with a pavilion, but very little real estate or promotion accompanied that gesture. Unofficially, however, leftist artists and intellectuals in France spearheaded a campaign to win worldwide support for the cause of Republican Spain. Even non-Spanish artists (such as the American sculptor Alexander Calder) came to adorn its empty pavilion, and other avant-garde modernists attempted to make it the best-known icon of the fair.

Spanish artists who had long been working in France were the first to rally to Sert's call for participation in setting up the Spanish pavilion – to make a heroically modern Spain speak before the world. More than any other object of the hundreds at the fair – regional crafts, technological inventions, oil paintings, photomurals, monumental sculptures, and imposing architecture – the commission of Picasso's *Guernica* came to be the emblem of the moment (Plate 154). *Guernica* possessed the further trump card of surviving the fair, and so could assert itself throughout the remainder of the twentieth century, playing an active role in geopolitics even as it retreated into a documented past. Beyond its inherent artistic properties, *Guernica*'s immediate and continuing fame resulted from the confluence of three circumstances: it was the largest painting to date by the world's most famous modern artist, it addressed the world's first act of aerial civilian firebombing, and it reflected a groundswell of leftist outrage at the European abandonment of the Spanish Republic. While the painting's initial fame was secured by its profoundly political context, the painting's semi-abstract form and generalized themes ensured that the masterpiece transcended the historical circumstances of its production in early June of 1937 to become an icon of 'man's inhumanity to man.' Depoliticized to a certain extent by its

own creator, *Guernica* eventually transcended the strictly Spanish context to represent opposition to state violence of any kind.

The fact that *Guernica* lends itself to diverse interpretations is an essential aspect of the painting and its modernism. The painting's message has always been unstable, oscillating productively between a frankly propagandistic outcry against the bombing of a Basque village by foreign fascists, and a complex and ambiguous work of art that employs personal imagery dating back decades in Picasso's career (and centuries in the traditions he employed). What remains extraordinary for the purposes of this chapter is that more than any other work of twentieth-century art, *Guernica* embodies the conflict between international modernism that, by its very nature, must be 'above politics,' and a nationalist context that determines meaning for the work of art in profoundly local ways. That 'nationalist' context for *Guernica* was displaced, but doubly emphasized – firstly, by Picasso's status as an expatriate and his corresponding eagerness to demonstrate loyalty to an 'essential' Spain, and secondly by the eponymous 'nationalism' of Franco's Falangists, whom Picasso and the Republicans opposed. To further complicate matters, the 'essential' Spanishness of Picasso's imagery was constructed in the lingua franca of international modernism, even as it was self-consciously posed against an international encounter of fascists in three countries. Finally, given the painting's nearly total absence of signs that convey a specific twentieth-century time frame, Picasso's commitment to modernism remains coded rather than explicit, conveyed in style and form rather than content.

Given these complexities, it could be argued that *Guernica* merely redraws the lines of nationalism, seeking to contest Franco's artificial 'Nationalism' (which was, after all, deeply linked to 'foreign' fascist powers) by contrasting it with an 'essential' Spain – expressed in references to the bullfight, or the agrarian classicism of horses, oil lamps, and tiled roofs. But it can also be argued that in choosing Picasso for their principal commission, Republican Spain sought an international cosmopolitanism rather than a confirming nationalist essence. The architect Sert, who was instrumental in commissioning Picasso, intended Spain to be seen as explicitly modern against the reactionary forces of Franco's monarcho-fascist block. Whether Sert was satisfied by the result is another matter. Like the work by other nomads we have examined, Picasso's painting exemplified the curious hybrid blend that gives modernism its poignant appeal and conveys its persistent dream of internationalism. Part 'primitive' (seeking alternatives to modernity in Africa and elsewhere) and part 'advanced' (following theories of space-time elaborated by scientists and philosophers deeply affected by the regimentation and technological innovations of modern life), part 'national' (like Tatlin, Carrá and Ernst, marked by a specific linguistic and political past) but also desperately seeking release from provincial origins (in the 'internationale' of communism, the Surrealist International, or 'international style modernism' as a whole), Picasso was a complex figure. *Guernica* revealed the fruits of his complexity and hybrid nature, and the coming-of-age of modernist painting. This historic mural marked a period in which the formal and intentional ambiguities of an image could be seen as fundamentally productive, and in which ambiguity and abstraction (in a 'public' political painting) underscores the crucial role of the *viewer*, who becomes the public subject of an essentially private modern style.

The architects of the Spanish pavilion came to Picasso as pilgrims in January 1937, appealing to him in his new capacity as director-designate of the Prado museum to accept their mural commission. He showed them a series of etchings he had begun after fascists attacked his hometown of Málaga, titled *Dream and Lie of Franco* (*Sueño y Mentira de Franco*) and read his poem on the same theme. They looked at the etchings and saw the bulls and horses that would emerge in *Guernica*, but these farm animals were merely victims of an evil agent (Franco) who dominated almost every frame (but would completely disappear from the painting). Picasso's surrealist, stream-of-consciousness poem reinforced this conflict between the nakedly phallic Franco: 'fandango … of swords of evil-omened polyps … his mouth full of chinch bug jelly of his words' and the innocent mass: 'cries of children, cries of women, cries of birds, cries of flowers, cries of timbers and of stones cries of bricks, cries of furniture'. Picasso read his poem 'with such extraordinary enthusiasm and force and violence' that the commissioners and architects knew he would accept, and they cherished hopes he would produce a rousing and dramatic spectacle for their space. They even managed to collect the money to pay him, rendering the final mural-sized canvas the property of the Spanish Republic; yet it was the painter who controlled the destiny of *Guernica* – even after the artist's death, when Franco struggled to claim the painting as proof of a 'unified' Spain.

Clearly Franco would not have made such efforts if Picasso had incorporated imagery of *Dream and Lie of Franco* into *Guernica*. How and why did the figure of Franco disappear from *Guernica*? To a certain extent, the absence of Franco reflects the skill with which the fascist leader cunningly avoided being implicated in the bombing of Guernica itself. However, Picasso might have also decided to omit any direct representation of Franco based on the demands of international modernism. When Picasso began *Dream and Lie of Franco*, the junta leader was a petty isolated and somewhat ludicrous figure. Like Hitler before the putsch, Franco in January could be mocked as a goofy, polyp-headed pretender, a foolish Don Quixote with his pathetic little crowns, his archaic swords, his medieval banners (held aloft in one frame by a tumescent phallus) and his ineffective steeds (horses that are gutted, exhausted, mangled, or in one case transformed into an immobile pig). But this fool could not play the role of monumental, transcendent, impersonal evil that inspired *Guernica*. In fact, the Franco imagery lost steam even before *Dream and Lie* was completed. At the time of the commissioners' visit in January, the final four plates of the etching remained unfinished. Through April Picasso made other works, read newspapers, talked to friends, and retreated. Seemingly immobilized by the weight of his commission, Picasso left only a few surviving sketches from those first months – they show plans for a large mural on the theme of the artist in his studio, hardly the stuff of modern history painting.

Then there was the galvanizing event – the bombing of the Basque village of Guernica by Nazi and Italian squadrons on 26 April 1937. With this collusion of high-technology foes (a show of Axis power for the benefit of France as well as Republican Spain), Franco's evil was both magnified and diffused, beyond the control of a single despot. As newspaper reports trickled in on the 28 and 29 April, public outrage

increased along with information, and disinformation. Picasso drew his first study on May Day, and the painting *Guernica* was completed in a furious burst of activity over the next five weeks.

The poetry and narratives that accompanied Picasso's painting once it was installed at the Spanish pavilion contributed to the 'public relations problem' that the fascists began to experience as a result of their tactical bombing of civilians that sunny market day. Apparently unaware of Guernica's symbolic importance as centre of ancient Basque traditions of democracy and self-rule, the Germans of the Condor Legion (with the help of one Italian plane) flew their Junkers in a series of sweeps that began with low drops of heavy bombs and hand grenades, followed by a second low pass for blasting escaping civilians, and ended with a number of high fly-overs for dropping incendiary bombs. Despite the fact that no military installations were destroyed (the railroad station and town bridge had been immediately obscured by the dust from the first wave of bombs; the small arms factory outside town was left untouched), Freiherr von Richthofen recorded in his diary that the raid had been a 'complete technical success'; Hermann Goering later testified at Nuremberg that the German leadership was pleased, since they had wanted primarily to test 'experimental fighter units, bombers, and anti-aircraft guns... under combat conditions'.[39] A Basque priest who survived the attack by seeking shelter under trees recalled that 'Even then I realized the terrible purpose [of the fire bombing.] They were dropping incendiary bombs to try to convince the world that the Basques had fired their own city'.[40] The witness came to this chilling realization when German squadrons came back into the smoking ruins to pick up any pieces of aircraft and unexploded bombs that might link them to the attack. Franco in turn began to disseminate the Nationalist version of events: the Basques had set fire to their own ancient capital to drum up support for their cause, destroying their own town hall with its age-old documents and archives, gutting the seat of free democracy long symbolized by their ancient oak, where royalty had stood for centuries to seek allegiance as 'señors,' not kings, of Vizcaya.

Picasso read the other side of the story in the French communist newspaper, *L'Humanité*. Typical of the paper's sarcastic tone was this caption below a photograph of corpses in the charred town: 'Nothing left to chance in the Fascists' atrocious extermination of the non-combatant population.... Above, some women – mothers no doubt – slaughtered during the bombardment'.[41] The progression from *Dream and Lie* to *Guernica* suggests the complexity of Picasso's evolving moral judgments about the war; from the early emphasis on a grotesque leader, the artist shifts to a more general narrative that appears to be entirely about victims. The earlier depiction of Franco disappeared, but the horse and bull also underwent subtle transformations.

In the ancient Mithraic cult of the bullfight engrained in the national imagination in Spain, horse serves man, and both can share the same fate if the bull turns. But the bull, too, can be cast as a victim – the animal is sacrificial totem of man's bestiality, as well as symbol of eternal life-force (there is always another bull to come into the ring). In *Dream and Lie of Franco*, these roles are fairly stable – the bull in every case is an avenging 'spirit of Spain,' confronting the hairy Franco and an equally polyp-headed horse in the two of the last images of the series of etchings (drawn in January before bombing, or painting, had begun). The horse

is both servant of Franco and humankind, bearing up under Franco's pretensions in the series' first frame, nurturing a bearded poet in another, winged victim of Franco, and, finally, conflated with Franco himself in the last frame to be drawn.

In *Guernica* these details are lost. The figures of horse and bull play crucial roles, yet exactly what they signify remains unclear. The horse occupies the painting's central commanding pyramid, together with the figure of the woman reaching with her lamp (sometimes interpreted as 'Truth,' she is the only compositional element to remain perfectly intact from Picasso's first sketch). Intriguingly, the hair of the revolting Franco-polyp from the series of etchings has now been distributed across the surface of the painted horse's skin, as if to perpetuate the horse-as-Franco that Picasso etched in *Dream and Lie*. But the horse is also depicted as universal victim. Sliced open with a gash that extends beyond its body (appearing near the centre of the painting, it dominates the composition and reads as a slash in the canvas itself), the horse is also pierced by a spear that enters behind its neck and grotesquely extrudes through its sagging belly, echoed metaphorically by the animal's screaming, dagger-like tongue. The fear in the horse's tiny-circled eyes is echoed in the bird that squawks on a table behind it (a kitchen table? a market stand? or a sacrificial altar?) The young woman stumbling toward it bears similarly dumbfounded eyes. Her legs are heavy and leaden in paralysis, her shawl and scarf are flapping open, and her bottom is bare as if roused from the outhouse, evoking, 'the commonest and most primitive effect of fear' in the words of Picasso.[42]

Framing the central pyramid and reinforcing the sense of a triptych in the overall composition are two more women. The one on the right falls from a burning building, her back cut by flames; on the left, a mother grieves her dead child in a modern version of the pietà. Stretching across the canvas foreground are the dismembered parts of a warrior: one muscular right arm (with a hand modelled on Picasso's own), a head as bald and frozen as a classical statue's, and another right arm clutching the remains of a shattered spear, which sprouts a ghostly flower from its hilt. Above the monochrome, nightmarish tableau is a single twentieth-century detail – a light bulb – added in the final stages of painting as if in mockery of the omniscient eye of God.

Unlike *Dream and Lie of Franco*, Guernica makes little reference to actual governments, or modern warfare (beyond its title). In the various phases of execution, captured by photographer Dora Maar, we can observe Picasso's systematic elimination of explicit national and political symbols. The light bulb replaced the warrior's upraised fist, bearing a handful of grain silhouetted against the solar disk – the anarchist party salute. Red tears previously dotted the women's faces, possibly a reference to the colour of the republic (red) as opposed to the Fascist 'white'. The victims that previously littered the floor were eliminated, and only an outline remains for each remaining figure (except horse and fallen warrior, whose limbs tangle and intertwine). The sole survivor of this systematic deletion is an arrow, symbol of Franco's Falangist party, inserted between the horse's hind legs, as if to preserve some faint reference to the specifics of the conflict. But it is merely an outline, a ghostly fragment almost lost in the scuffle.

The bull is essential to Picasso's non-declarative statement and to the ambiguities of *Guernica's* actors. As art historian

William Rubin has noted, *Guernica* represents at least three major themes in Picasso's life and art: the Crucifixion, the national ritual of the bullfight, and the mythological tradition of the Minotaur.[43] The *Guernica* bull connects with the last two themes, but although it has always been linked to the Minotaur myth (particularly by analogy with Picasso's similarly composed etching, *Minotauromachy*, from 1935), the *Guernica* bull's lidded, almond eyes reveal that Picasso evokes here the man-headed bull (rather than the bestial Minotaur).[44] The Minotaur was Picasso's emblem of his own satyr-like sexuality, but the man-headed bull refers to a different mythological theme – Zeus's incarnation as a white bull in the mythological founding of Europe. The Europa myth is no less sexual, but it is also divine – and its grand historical sweep is more appropriate to the scale of this painting. The white-headed, almond-eyed bull could well be an impregnating Picasso – but it is Picasso as bearer of a European future. He is present at Guernica but untouched, forced to acknowledge his god-like detachment from this scene of senseless murder, illuminated only by a news-photographer's flashbulb and the guttering flames of war.

Beyond his own literal removal from the conflict, Picasso's distance was rhetorical, as we have seen. He was wary of organized politics in general (his famous post-war commitment to the Communist party notwithstanding). But the apolitical tenor of *Guernica* may have been endemic to a nation struggling with civil war, where 'nation' is an ideology that manifestly fails to alleviate the rage and hatred between neighbours. At the dedication of *Guernica*, one speaker cited the comment of the Republic's President, Manuel Azaña, who had referred to 'a terrible people, the Spanish people, terrible principally to themselves because it is the one people of Europe capable of pricking itself with its own sting'.[45] Picasso seems to have felt that it was too simple merely to condemn Franco or rant at fascists. At the core of Spanish identity, as he constructed it, was the cultural negotiation with violence, reflected in the fact (often remarked upon by Picasso) that the national spectacle of the bullfight was always scheduled immediately after Catholic mass. Ruminating on the subject later, during the intense Allied bombing of Europe in April 1944, Picasso saw both sides as animated by bloodlust. But even then he accorded a special status to the Spanish: 'The Spaniards are alone in their love of violence and cruelty – they love to see it flow, to run: the blood of the horses, the blood of the bulls, the blood of men. Whether they are 'whites' or 'reds', whether priests or communists are tortured and burned there is always the same pleasure in seeing the flow of blood. In that particular realm, no one can top the Spaniards'.[46] *Guernica's* bull was thus extremely complex: Picasso and Zeus, unfeeling animal and god-like witness, distant European and tragic Spanish soul, Mithraic sacrifice and symbol of eternal life, peasant nobility and fascist darkness – even the astrological symbol (Taurus, Hitler's sign). By 1947, pressed to explicitly link the bull to the bestial regression of fascism, Picasso protested: 'But this bull is a bull and this horse is a horse. There's a sort of bird, too, a chicken or a pigeon, I don't remember now exactly what it is, on a table. And this chicken is a chicken. Sure, they're symbols. But it isn't up to the painter to create symbols; otherwise, it would be better if he wrote them out in so many words instead of painting them. The public that looks at the picture must see in the horse and the bull symbols

which it interprets as it understands them. … *It's up to the public to see what it wants to see*'.[47] Picasso's insistence on making the reader determine the painting's meaning was characteristic of his modernism and a crucial component of *Guernica's* fame. It was a complex strategy whose success was compromised on artistic and geopolitical fronts.

Left-wing writers either sought to fix its meaning (referring to the painting as *The Massacre of Guernica*) or denounced its weird abstractions as 'wholly inadequate for the wholesome mentality of the proletariat'. In one of the few reviews in the mainstream press, the architect Le Corbusier stated '[*Guernica*] saw only the backs of the visitors, for they were repelled by it.' The German guidebook to the Exposition internationale described an unnamed painting in the 'Red' pavilion of Spain that seemed 'to represent the dream of a madman, a hodgepodge of parts of bodies that a four-year-old child could have painted'.[48] There was some discussion of removing the canvas and replacing it with a comprehensible social realist work – after all, in the nearby French pavilion, fellow cubist Fernand Léger had sought clarity in his cheerful tribute to the *Transmission of Energy*, by combining photographs in a utopian montage that brought city and country together under the raised fist and rainbow of the Popular Front. The antagonism against the painting by both left and right galvanized a group of artists and writers to come to *Guernica's* defence. They found support from Greek expatriate Christian Zervos and his wife Yvonne, who commandeered a double issue of the international contemporary art journal, *Cahiers d'Art* (edited by M. Zervos), and devoted it to Picasso's painting and to the Republican cause during that summer of 1937. The stakes were very high, and *Guernica* became the new face of an international modernist agenda.

When the Spanish pavilion was dismantled in November, the Republic that had commissioned it was in desperate straits. *Guernica* had stayed with Picasso in Paris, and the collapse of the Republican government in March 1939 rendered him the custodian of a painting he did not legally own. Even before the cause was lost, however, Picasso had shown no compunction to ask anyone in the Republican government what he should do with the painting; as honorary director of the Prado, he was in some sense acting as a government official when he agreed to send the enormous canvas on a world tour. Throughout the war, *Guernica* was a primary fund-raiser for Spanish war relief. Not incidentally, it also proved its mettle as a proselytizing force for international modernism and abstraction in public art.

The strangest chapter in *Guernica's* very public life was the aged Franco's decision to launch a campaign to obtain the painting's 'return' (even though it had always been abroad) to a Spain that it had always avoided. So convincing was Picasso's Spanish identity (despite the fact that the majority of his life and artistic career was spent in France), and so malleable was the aesthetic distance that Picasso had constructed around the Guernica event and painting itself, that by the late 1960s Franco declared that the painting and its maker were national treasures of Spain. The move for *Guernica's* 'return' also gathered force from international modernists in Spain who sought to build bridges to counteract their isolation within the world. But the campaign for the painting's 'return' was no conversion on Franco's part to the beauties of surrealist modernism; it merely represented the slow momentum of a national state

426

LITERARY AND ARTISTIC CULTURE

seeking to maximize its cultural capital. Not coincidentally, it was also part of a plan to neutralize the poisons of the past – a past that Spanish art historians under fascism had already laboured to erase, by claiming that Picasso's painting was 'no longer an illustration of one specific bombardment, but the picture of all bombed cities'.[49] The monumental complexities attending the transfer of *Guernica* to Spain after Picasso's death were slowly resolved after the 'Caudillo,' Franco himself, died a few years later. In 1981, Picasso's lawyer, Roland Dumas, finally agreed that the Spanish Government, though not a republic but a constitutional monarchy, was sufficiently stable to satisfy the conditions Picasso himself had established: that the painting should go to the Prado when civil liberties had been returned to the Spanish people. Even ensconced behind thick plate glass and protected around the clock by an armed guard (defending it from capture by Basque nationalists), the painting's first installation in Madrid signified powerfully that, as the newspaper *El Pais* announced in banner headlines, 'THE WAR HAS ENDED.' The painting's perceived internationalism was balm for the reconciliation and healing of past wounds at *Guernica*'s opening in Madrid, as communist orator 'La Passionata' (Dolores Ibarruri) rubbed shoulders with the Duchess of Alba. But when the Minister of Culture announced: 'Nobody should interpret the work as a flag for any sector – let us look at *Guernica* as a pure and simple rejection of brutal force',[50] that choice of phrasing ('should') revealed that people still needed to be told what to think about it. *Guernica*'s ambiguities remain neither pure nor simple; they alone will prevail.

### Trauma and transcendence

The figured gash in the *Guernica* horse's body (and, by implication, in the canvas) was only the beginning of a process that developed after the end of the Second World War. As part of a larger social body, art was wounded, in some deep metaphorical sense. Fragmented bodies, slashed canvases, and sculptures that looked like excrement or rubble – all enacted trauma in both Europe and Japan. Heroic figurative painting had been urged by social realists on the left and fascists on the right, and thus modernist abstraction was the perceived antidote; still, it needed to evolve to a point where it could be felt as 'expressive' of the post-war condition. Curious hybrids emerged in this evolutionary process, and the body (as art, or in art's production) had a major role to play.

Giuseppe Panza, an Italian art collector who began to purchase works in Paris in the mid-1950s, later commented that 'in some way the Second World War was the end of Europe', and he addressed the pervasive feeling of crisis in the post-war years:

> I felt very deeply the changes taking place after the war. The rationalist vision of life and the idealist philosophy of culture had been popular in Italy. But [the war] was deeply shocking to the belief in man's rational capacities... To see how reason failed totally during the war was a great crisis for European culture.[51]

The First World War had perhaps left a striving for geometric, technocratic modernism intact (recall that the 'International Style' in architecture was born from the rubble of that war, and was celebrated at New York's Museum of Modern Art in the depths of the Great Depression), but the second global conflict had seriously damaged that faith. There were strong victories by the left in the political sphere, but in the arts, production seemed to tap into a deeper mood of despair and anti-rationalism. Colonialist primitivism finally waned, but in its place Northern Europeans sought works by children, art of the insane, and other absolute alternatives to civilization and 'fine art'. Similarly, young Spanish and Italian painters sought one type of 'ground zero' in matter itself (a trend that would also emerge forcefully in Japan). This engagement with inarticulate base material (dirt, sand, mud) was coupled with 'wounds' and signs of trauma in the body of the painting itself: torn canvases, slits in the paint membrane, and surfaces glutted with grit. Both figurative and abstract productions spoke to the general state of abjection – paintings were traumatized objects in need of either burial or repair.

Some of the artists who gained prominence in this period were young non-combatants, growing up into what seemed to be a blasted theatre of rubble and defeat. Others had been painting in an anti-rational vein for decades, but discovered that the world suddenly agreed with their pessimistic views. A self-referential morbidity dominated Continental philosophy, crystallizing as Existentialism, which predominated in Paris and New York in the 1950s. Japanese artists sought alternatives to the state religion of Shinto (corrupted into a nationalist emperor cult during the war), in part through an evolving Zen Buddhism that negotiated with the aggressive individualism of the culture of the occupying Americans. The nearly global aesthetic tendency toward agonistic expression, crusty surfaces, and anti-fine art was packaged neatly in 1952 as 'le mouvement informel' in Michel Tapié's book *Un art autre*; in place of cubism and geometric order would be formlessness.

The work of Jean Fautrier, a minor figurative painter all but forgotten in the wake of abstraction's dominance after the 1950s, helps illuminate the complexities of modernism as it appeared in Paris immediately after the war. Fautrier's best-known works date from the mid-1940s, when the artist's dark vision of human depravity caught up with the public humiliation of Vichy (pro-German) France. Produced in relative isolation, Fautrier's wartime paintings were not exhibited until after V-day in 1945, when they served as templates for public renditions of France's role as victim in fascism's sweep.

Flayed beef, hanging rabbit skins, and a dreaming corpse whose intestines lie open to our fascinated gaze – these were the morbid subjects that occupied Fautrier in the late 1920s. The long Northern traditions of *vanitas* and *memento mori*, which had motivated artists since Rembrandt to capture such raw food-chain realities, mingled in Fautrier's works with surrealism and the nocturnal vision of symbolists such as Odilon Redon. Paradoxically, Fautrier's palette lightened during the war, as he began the series that would be retrospectively titled 'Hostages' (*Otages*). These heavily impastoed paintings began in 1942 with renditions of barely human heads surrounded by monochromatic deposits of plaster and pigmented mineral dust. The 'hostages' in question were understood by Fautrier's post-liberation audience to be those French Resistance fighters (and helpless bystanders) taken by German soldiers (most notably in the village of Oradour-sur-Glane, where Nazi

427

troops killed more than 600 villagers on 10 June 1944). Some of the imagery Fautrier used thus precedes the politicized identity assigned to the paintings (as in Picasso's *Guernica*). As we have seen, the 'reading in' of post-hoc political subtexts was authorized by modernism's increasing demand that meaning be based *within the viewer*. It is as if the identity of these subjects as 'hostages' was called up when Parisian viewers found such imagery and associations to be historically necessary – and not a minute before.

The horrifying seductiveness of Fautrier's abject bodies and heads comes at us slowly and in waves established in part by the inevitable oscillation between word (in the title) and image (floating in the mind's eye, yet also materially grounded). The sex and breasts of a semi-abstract nude he painted in 1943, for example, appear as shimmering veils of russet, rose, and lilac oxides dusted over crusty mounds of white (highly reflective) plaster. But then the monosyllabic *Nu* of the work's title comes back into focus, and we struggle to read a nude body in the forms – our search connecting these tinted calciferous undulations to the grand French tradition of lounging odalisques (Boucher, Fragonard, Ingres, or Fautrier's closest master Matisse). But the body in question emerges as a horrifically amputated torso. Connecting with Fautrier's openly fetishistic works from the 1920s, his nude in 1943 is little more than breasts, belly and sex, without even the vestigial stumps that code for 'classical Venus' in the lexicon of aesthetic violence against the female form. The abjection of this body, its fragmentation, disorder, and stubbornly crude *bassesse*, recalled what theorists such as Georges Bataille (Fautrier's contemporary and one of his collaborators) had used to exemplify formlessness – that refusal to cohere into *belle peinture* (bourgeois preference and great French academic tradition). Bataille saw *bassesse* and the formlessness in social and psychological terms, 'affirming that the universe resembles nothing and is only *formless* … something like a spider or spit'.[52] Rather than merely a pretext for ordered composition (as André Breton would have it), formlessness was a radical challenge to Cartesian rationalism and humanist subjectivity (in place of the classically educated 'cogito' Bataille placed the mute animal 'excreto'). Fautrier flirted with these associations, but of course he did make Art: small cabinet pictures that were framed and sold. As Europeans came to know these paintings, whether grouped as *Otages*, or displayed with works such as the contemporaneous *Dépouille* (whose title translates as 'remains,' as in a corpse), their undeniable duality (between roseate veil of pigment and crusty, excremental base) was seen as expressing the unspeakable – and the war had brought home such a dialectic.

Are the famed 'Otages' any different? Perhaps they are not so cruel, because the sensuality of their surfaces is neither advertised (as in *Nu*) nor sustained. It is immediately cancelled by the violence of the mark – the gashes and incisions performed on that most expressive of all images: the human face. The mutilated faces of these heads immediately invoke monsters: Cyclops, in whom the eyes (seat of the soul) are fused in monstrous singularity (*Head of a Hostage, No. 1*, 1944), or apocalyptic lambs, where eyes multiply into visionary hordes (*Head of a Hostage, No. 14*, 1944). Viewing these heads as anonymous portraits (portraits of individuals made anonymous through violence), we are prepared to apprehend them in a heroic narrative of resistance, death, and immortality through art. But such

heroism does not come forth. If these are portraits, they are stripped to the bone of Being. No Renaissance hats, walking sticks, or views of distant vineyards – we view only disembodied heads, their eyes fixed open in perpetuity or scratched into blindness. These are paintings that require us to observe an individual whose social markers have been peeled away (and thereby subsumed into the rafts of 'displaced persons' massing in post-war Paris at the time they were exhibited). Fautrier's endlessly repeated hostage heads are unsettling in their intimacy, like the nudes – but their ethical address is radically different. Some would argue that their reiteration merely renders banal Nazi murder; others believe that the heads evoke the technological horror of those manufactured deaths.

Fautrier wanted people to believe he painted as a witness, an outsider to the 'other's' trauma; clearly the work of Jean Dubuffet and Wols (expatriate German Wolfgang Schultz, arguably the least known but most important of the *informel* group) could be seen in similar terms. Still other, younger artists seemed to have experienced the rupture of Europe on a more visceral level and worked with the canvas as an abject body, or with sculpture as metaphorical excrement, unworthy of 'art'. Immediately after the war (and before his better-known *Concetto Spaziale* slit canvases of the 1960s), Lucio Fontana produced lumpy, vaguely cubic accretions of gnarled, somewhat repulsive iridescent black ceramic (such as a 1949 work titled *Ceramica spaziale*). Around the same period, fellow Italian Alberto Burri exhibited torn shreds of rags, tenderly stitched together but always failing to cover the painting's ruptured surface, revealing red or brown areas as 'leaching through' the gaps between shrouds. Piero Manzoni was the third member of this Italian group who had briefly banded together to form an artistic collective; he perfectly expressed the shift from this late-1940s aesthetics of abjection to the 1960s discourse of commodity culture, in his infamous mass-produced tins of *Merda d'Artista* (Artist's Shit) in 1961. Confirming this Southern European emphasis on base materialism, Spaniard Antoni Tàpies produced 'matter' paintings built up horizontally on the floor, out of layers of cement, oil, marble dust, latex, sand, gravel, hair, and/or pigment (which is traditionally, after all, only another form of pulverized earth). These dense *tabla* were then scored, scratched, gouged and scoured like the vertical 'walls' with which they were associated as soon as they were hung, vertically, on the gallery or museum wall.

Begun shortly after he returned from a visit to post-war Paris, Tàpies's 'wall' paintings were his central revelation of the 1950s, fulfilling what he came to believe was his destiny and identity ('Tàpies' being Catalan for 'wall'): 'Each canvas [had been] a battlefield on which the wounds were to multiply over and over again, to infinity. And then came the surprise. All that frenetic movement, all that gesticulation [suddenly] came together in a uniform mass. What had been burning ebullition transformed itself on its own into static silence'.[53] Frenetic wounds into silence – this is something like the planned trajectory of *Guernica* (although silence has yet to be completely achieved); it is also analogous to the quiet toil of healing, as platelets and skin cells work to repair the body's integument, torn by violence and war.

Tàpies's approach to nationalism and internationalism was even more complex than Picasso's. He was living under Franco, and whatever patronage was available to him in Spain conformed to the constricted circumstances of that regime. Yet he succeeded in being highly mobile, arranging

exhibitions around the world to produce international contexts in which to show his art. Navigating the space between his isolated country's dour politics and an international modernism that would transcend regionalism, for Tàpies abstraction was a logical choice – it ensured that he would seem 'safe' to export. The 'battlefield' could be neutralized, as Tàpies said – yet its silent politics could be played out in a ghostly version, through a discourse of international modernism and avant-gardism that swirled vaguely around these abstract forms. As Picasso had demonstrated, international fame could give leverage, something even a fascist despot might want – but acquiring that fame required the most delicate rhetorical and artistic skills. Typical of the necessary manoeuvring is the following review, which opens with a grand tribute to Tàpies as master of the 'school of Altamira' (prehistoric, not modern Spain) and quotes the painter's incantatory prose:

> For them, as they stated in their manifesto, the Magdalenian cave of art of the northwest of their country was a symbol 'of living art, of art outside historical time, of art above all nationalism, representative of painting which fused forms and experience and revealed a great capacity for synthesis'.[54]

We can imagine why it would be crucial for an artist working in Franco's Spain of the 1950s to achieve an 'art above all nationalism,' anchored in a chthonic art of the cave dwellers. As with *Guernica*, abstraction and generalization could be a way of avoiding the traps of specific ideologies and local politics. Not surprisingly, we find Tàpies articulating ideas very similar to Picasso's in positing a transfer of meaning to the viewer – a viewer both *outside the canvas* and, increasingly, *outside the country*. The modernist canvas was necessary, but not sufficient cause: 'The painting is simply a "support" that invites the viewer to participate ... So, the "theme" can be found in the painting, or it can reside solely in the mind of the spectator'.[55]

For Northern Europeans, the path was similar, but the results were very different. The relay from meaning-located-in-the-image to meaning-in-the-viewer was a principle for Fautrier, as we have seen – but the reading of a 1942 Hostage painting in terms of a 1944 event at Oradour did not necessitate the level of abstraction that Tàpies seemed to require. Nor was such thorough abstraction needed by the German painter Georg Kern, who experienced a new interest in the truncated heritage of German (figurative) Expressionism in 1958 as a result of seeing American Abstract Expressionist works then touring in 'The New American Painting' exhibition. Inspired by the surging, yet totally non-representational brushstrokes of the paintings from New York, the young Kern changed his name to Baselitz (anchoring himself back to his birthplace or 'chthonic land') and sought his 'roots' in a restored German past. German Expressionism had always been insistently representational (the non-objective painting of Kandinsky was sometimes included into the movement, but inappropriately so) – Baselitz's neo-Expressionism thus surfaced in paintings of the human figure, but like Fautrier's they were abject bodies wholly vulnerable and full of wounds (see Baselitz's dishevelled, pathetic, half-naked Partisans from the mid-1960s). Other Northern Europeans seemed similarly committed to this figurative vein. Even the radical ambitions of the Cobra group (named for the painters'

home towns of Copenhagen, Brussels, and Amsterdam), in their raging manifesto written in a Paris café in November 1948, made their ideas materialize in figurative paintings that ended up looking a great deal like the highly textured graffiti figures of Jean Dubuffet's *l'art brut*.

Dubuffet's flattened 1950s *corps de dame* paintings, together with an American speaking tour on what he called his 'Anti-Cultural Positions' secured his reputation as a primary spokesman for abject, 'low,' unrefined art that could never be placed in the service of nationalism, because it was considered outside the radar of civilization. But even this fiery radical still operated in traditional figurative genres: the nude, the portrait, the still life, and the landscape. And curiously, the abstract/figurative split seemed to organize a post-war European aesthetical and geographical split. Thus, an invisible border can be mapped between figurative *informe* painters such as Dubuffet, Fautrier, Wols, and the Cobra painters of the North, and the more abstract tendencies found in Southern European artists such as Tàpies, Fontana, and Burri. An overarching analysis that views these tendencies within the context of a former theatre of war suggests that this may be more of a gap than a true divide. The canvas may be an abstract form that stands for an abject body (sutured in Burri, wounded but rendered 'silent' in Tàpies) or it may be a compulsive representation of an 'other' who must be simultaneously brought closer and held at bay (flayed in Dubuffet, made anonymous in Fautrier). In either case, the agenda is shared, although the means are divergent. Trauma needed, above all, to be recorded in the pictorial body.

As we have seen, most of these Europeans viewed trauma from the tips of their brushes, keeping formlessness at a discreet distance and making works that could still be framed and hung on a wall (or boxed under a showcase and mounted on a pedestal).

Asians had a profoundly different, much more visceral response to the war's aftermath, particularly in the formerly imperial Axis power, Japan. Japanese reflections on the tumult and trauma of war culture was led by calligraphers as early as 1951 (which was appropriate given calligraphy's position at the pinnacle of Asian artistic and literary culture). Just as Ernst had cast his post-war lot with Parisian surrealism, Japanese calligraphers turned to dissidents in the victor's culture for legitimacy. Consequently, calligraphers eagerly published images of Franz Kline's black-and-white abstractions in their new, avant-garde journal, and advocated a new international modernism that would synthesize East and West (and, one presumes, neutralize the poisonous nationalisms that had so recently divided them). An even more adventurous mixture of experimental approaches to art emerged in an obscure outpost of Japan's post-war art world, around a group known as the 'Gutai' (or 'Concrete') art association that formed around Yoshihara Jiro, an art teacher near Osaka. This *sensei* had moved through surrealism in the 1930s, so there was evidence that he was well tuned to the currents of international (e.g. Western, at this point) modernism. Immediately after the war he painted childlike, figurative canvases that could be compared to Dubuffet. His students coming to form the Gutai group were much more aggressive. They came to *inhabit* abjection, through their own bodily practices, and their art has only grown in importance as art historians and critics of late-twentieth century art gain access to the documentation and theories

behind this crucial chapter of post-war art. In a direct response and challenge to what they were learning about American avant-garde efforts, Gutai artists used their own experience of abjection (a *national* abjection, it should be noted) to produce their own ground zero (one of the avant-garde groups called itself 'Group Zero,' another, 'Zero Dimension') for the building of a new, international, modern art.

Yoshihara, master or *sensei* of the Gutai group, attracted a group of radical students whom he urged to generate 'a quite new, epoch-making idea … not imagined before the war'.[56] When Yoshihara was joined by the members of Group Zero in 1955 (Shiraga Kazuo, Murakami Saburo, Tanaka Atsuko and Kanayama Akira), the group became committed to ephemeral action, with exhibitable objects produced specifically for these events. Actions at the October 1955 'First Gutai Exhibition' (staged in Tokyo) included Murakami's *Paper Tearing*, in which the artist plunged through stacked frames of stretched paper (later exhibited on their own), and Shiraga's *Challenging Mud*, where visitors viewed the artist writhing in a ton of clay that had been dumped in the courtyard of the exhibition hall (the resulting tortured shapes were also to be considered works of art). Murakami's action was particularly symbolic, since the nature-oriented Shinto belief-system (which had been converted into a state religion during the war, with emperor-worship at its heart) held each substance or form to possess a specific *kami*, or 'spirit of the material.' (This reverence for the *kami* expresses itself in the construction of traditional kimono, for example, where bolts of fabric are cut as little as possible in assembling the garment.) The experience of seeing Murakami's body aggressively plunging through carefully stretched screens of paper would provoke a strong sense of violation in a Japanese audience – an impact far greater, one expects, than the elegant incisions of a Fontana or the cruciform scratches of Tàpies.

Japanese reviewers were frankly unprepared for Gutai's actions: 'We were perplexed, as if we were confronting aliens from Mars'.[57] Indeed, although some of the artists pursued an elemental engagement with 'concrete' and basic materials, others (Tanaka and Kanayama) used technology to make a mechanized art that did seem 'Martian' in the context of Japanese hand-made art traditions (tea ceremony, *raku* pottery, literati calligraphy, bamboo architecture, *ikebana*, garden design). Tanaka's *Electric Dress* and Kanayama's 'automatic' paintings (made by little robots drooling paint on a horizontal canvas) were typical of this 'Martian' aesthetic; non-Gutai artist Nakanishi Natsuyuki's motorization of steel clothespins churning on burned cloth was another. For all this frenzied innovation (1955 saw three separate action-exhibitions by the Gutai group), the 'concreteness' of Gutai's achievement lingers primarily in the residual paintings and objects, which remain after actions and viewers have moved on. Shiraga's enormous canvases are particularly rich as emblems of the relationship between abasement and transcendence in Gutai art.

In his statement 'Only Action', Shiraga explains the levelling of form he intended in the series of large abstractions he began around 1955, which continued through the 1960s (Plate 155); both paintings and statement illustrate the way he conceived of body actions as inaugurating a new art: 'when I decided to be "naked", to shed all conventional ideas – forms flew out the window and techniques slipped

off my painting knife and shattered. In front of me lay an austere road to originality.… Let me do it with my hands, with my fingers. Then … it occurred to me: why not feet? Why don't I paint with my feet?'[58] Shiraga's *Challenging Clay* had been one way to act on this imperative to 'be 'naked', quite literally, as the artist dressed only in underwear on that October day in 1955 when he wrestled with the viscous earth. The untitled painting actions that he staged at the second Gutai exhibition the following year pursued the second imperative. Like Jackson Pollock's methods of production (documented in 1951 by photographs of the American artist making his famous skein paintings) – methods with which the Gutai group were familiar, and to which they explicitly compared their activities – Shiraga worked on an enormous horizontal surface, holding onto a rope for balance and smearing earth-coloured pigment with his bare feet. The horizontality (some say 'baseness') of this method, enacted for the visitor, is significant – particularly since Shiraga produced them on the already implicitly horizontal medium of *paper* (here one is reminded of traditional Asian hand scrolls as well as newspapers, books, letters and other reading material). When the results were exhibited alone, the horizontality of the image's origin would often be alluded to with a footprint – sometimes registered in the painting's upper right-hand corner where a title or calligrapher's seal would appear in more traditional objects of Asian art.

The footprints instantly enabled viewers to see that the pictorial surface was horizontal, and at the same time, intimately related to the human element. But the footprint is also associated with blood-coloured, viscous material (we begin to wonder, is it even *paint?*). A most powerful comparison can be made with Jackson Pollock's *Number 1, 1948* (Plate 156), which bears the painter's handprints, stamped on the upper right corner of the painting. Pollock's handprints, emerging from the apparently chaotic storm of drips and lines of paint, assert the painter's identity and volition, serving also as talismanic evocations of Palaeolithic power. Had he known it (and it is very likely that he did), Shiraga would have understood that Pollock's painting was executed through rhythmic movements around a horizontal plane. The substitution of the foot for the hand is the mark of abjection that connects Shiraga's Gutai work to Europeans such as Tàpies, Burri, and Dubuffet (who were quickly enlisted in common cause with the Japanese through exhibitions and publications supervised by French critics such as Michel Tapié). Yet rather than revealing the regression into an abject or infantile state, photographs of Gutai artists performing their actions show the artists exhibiting enormous physical poise, stamina, and control. To the Westerner unfamiliar with these 'body techniques,' they do not appear Martian at all, but *martial* – the discipline moulding Shiraga's half-naked body is akin to judo or Tai Chi, each force met by a counterforce, each limb's movement balanced by a counter-movement. Confirming its intention to assert an Eastern semiotic, there is even a Buddhist reference in Shiraga's footprint – an allusion to traditional renditions of the Buddha's foot as he attained enlightenment, also referenced by Shiraga's mention of his 'austere road'. In these ways the *basesse* of Shiraga's painting action is catapulted to transcendence: by the grace and control he maintains over the prone image, and by the act of re-orienting it to the vertical position for the purposes of Art.

## The 'triumph' of American painting

Fragments of the post-war histories narrated thus far have mentioned the role played in Europe and Japan by the new painting coming out of New York in the late 1940s and early 1950s, variously termed New York school painting (in explicit analogy to the *Ecole de Paris*) or abstract expressionism (tapping into another legacy, that of early twentieth-century German expressionism or its variant in the hands of the Russian abstractionist, Wassily Kandinsky). While it has been strategically important here to discuss the painting of Europe and Japan before implying a prior American avant-gardism, in fact the web of cross-cultural influences was very dense and all but simultaneous. During and after the Occupation, exchange of information took place through magazines, exhibitions, and artists' travel. In terms of strict art-historical 'priority', Pollock is often credited with the primary breakthrough into abstraction, his working methods documented (through artists' magazines as well as mass-media organs such as *Time* and *Life*), transmitted throughout Europe and Japan, where they had an immediate impact. (Of course abstraction existed outside modern Western painting, and there were precedents in early American modernists as well as in Russian art.) The priority claimed for Pollock stems from his mural-sized ambitions, but these were fuelled in turn by Europeans such as Picasso (whose *Guernica* was on view in Manhattan during the war). Pollock and his compatriots in the New York school were more deeply connected to European modernism than any generation before them. Disruptions and fascist persecutions in Europe had brought to New York Max Ernst, André Breton, Piet Mondrian, Fernand Léger, leading surrealist André Masson (who had experimented with 'automatism' in art as early as 1924), a host of other minor surrealists, and Mexican muralist David Siquieros (who railed against bourgeois easel painting and insisted on working on the floor, or directly on the wall). Rather than simply 'copying' these powerful influences, however, New York painters anxiously negotiated with them – desperately aspiring to international recognition even as they sought to appear uniquely 'American' and hence utterly unprecedented on the international stage.

Jackson Pollock gave a pithy summary of abstract expressionist aesthetics years before producing his characteristic non-objective canvases of dripped enamel paint. Pressed by German modernist Hans Hofmann in 1942 to work from nature, Pollock famously retorted, '*I am nature.*' His response reflects the complex mixture of discourses characterizing the New York school: Jungian psychoanalysis, modernist primitivism, existentialism, nationalism, and the romantic sublime. Like most art movements, abstract expressionism had no hard historical or stylistic boundaries, and was named largely after the fact by people other than the artists making the paintings. It seemed to coalesce as an unnamed style only after the Second World War, when a small group of impoverished middle-aged artists came into view with an 'obvious' alternative to provincial realism; their hard-won abstractions emerged as the victors in a complex struggle to find visual form for the post-war American presence in an international world. At the time, the visibility of what came to be known after 1954 as abstract expressionism was taken as proof of the formal and psychological superiority of the art (one textbook was titled *The Triumph of American Painting*). In place of any aesthetic superiority, revisionist historians have looked to the economic and geopolitical ascendancy of the United States to explain the movement's success. But even within the limited context established thus far, we can see that abstract expressionism offered post-war artists, viewers, and promoters a powerful synthesis. Like *Guernica* or the paintings of Tàpies and Shiraga, the style produced increasingly abstract and non-objective paintings that nonetheless bore the marks of cathartic 'expression'. Such a compromise was enormously appealing in the international sphere of Cold War politics. There was nothing programmatic about this (except after the fact). Individual systems were hammered out by formerly left-wing artists working in relative isolation in New York. They sought to chart a noncommittal course for their production, free from the increasingly rigid demands of communism on the left, and the horrifying rise of McCarthyism on the right. Recognizable subject matter was eliminated in their work, in favour of individual symbolic systems and abstract form – but as with their European models (Pollock in particular was obsessed with the priority of Picasso), their chosen abstractions were nonetheless held to be universally accessible through a variety of means that pulverized language and nation in favour of primitive models of 'collective unconsciousness' (the concept of a universal and innate system of symbolic forms promulgated by Swiss analyst Carl Jung) or intuitive emotional response. Such modes had precedents in earlier modern art, but their confluence in abstract expressionism resulted in a style of painting that seemed so unprecedented that few could connect it to previous artistic movements. A certain anxiety of influence may have been in play as New York supporters downplayed links with German expressionism (with its search for the primitive roots of expression), on the one hand, and the utopian geometric abstraction of Russian suprematists and de Stijl painters, (with their theories about the intrinsic expressivity of colour and form), on the other.

Crucial to the formation of abstract expressionists' tenuous collective identity was the background of the US Government's surprisingly socialist response to global depression in the 1930s. The Federal Art Project had been established as part of the Works Progress Administration in 1935, and its administrators acknowledged that 'artist' was a profession worth supporting (a development unprecedented in American culture). The WPA employed immigrant artists (Arshile Gorky, Willem de Kooning), as well as American-born painters (Lee Krasner, Pollock, and Philip Guston) and even critics (Harold Rosenberg), all of whom would contribute to the genesis and codification of the new abstract mode. Although most of the federally funded murals fell in line with prevailing representational styles (featuring heroic workers, churning assembly lines, and rolling farmland), there was room within the programme for abstraction. Works by Europeans such as de Kooning and Gorky already revealed a sophisticated hunger for European modernism, from the cubists' achievement of a shallow, minimally illusionist space to surrealism's innovative biomorphic abstractions. The living presence of expatriated surrealists in New York further reinforced the importance of the unconscious and the role of automatism in stimulating creativity. But where the surrealists had used automatism as a form of suggestion, to initiate the more conscious process of making poetry or drawings, as practised by the abstract expressionists, automatism was valued as an end in itself

(this is the sense of Pollock's 'I am nature' statement). Claims to work from the unconscious were predicated on a continuum between id and organic expression, and Pollock's first poured paintings (begun in 1947) proclaimed both their natural and automatist origins with titles such as *Galaxy*, *Phosphorescence*, and *Vortex*. Pollock's radical process, documented in photographs that purported to show the 'frenzy of creation' rather than the cliché of artist-with-palette, showed him moving his whole body around a horizontal, unprimed canvas, flinging paint in loops and trails in a rhythmic, repetitive, trancelike dance.

The abstract expressionist subject was thus constructed as a visionary, a solitary and possessed individual in a world of mass formations. But the repeating rhythms of Pollock's skeins could also evoke regimes of automated labour (this was how critic Clement Greenberg sensed its modernity). The much-boasted alienation and anguish of the artist was held to resist everything from fascist totalitarianism to an emerging consumer culture; yet the painting could nicely decorate a modern businessman's apartment. The isolated gestural painter was seen as male, white, and above all, free (a subject position that proved problematic for non-males such as Krasner, or non-whites such as Norman Lewis or Wilfredo Lam). The action painter's volcanic productions could then be taken as both proof and guarantor of democratic liberalism and free speech.

This heightened individualism meshed very well with free market ideologies of global capital, serving the mass formations it was imagined to inoculate itself against. This irony is exemplified by the historical overlap of Michel Tapié's 1958 exhibition 'International Art of a New Era: Informel and Gutai,' which juxtaposed works by Pollock, Yoshihara, and Dubuffet and travelled to Paris, Osaka, and New York, and the simultaneous appearance of a 1958 travelling exhibition 'New American Painting,' which brought Pollock and other compatriots throughout European capitals to exemplify American democratic values. Pollock was, in the former, an explicit antagonist of bureaucratic regimentation; in the latter, he was a vivid emissary of democracy's tolerance of expression during the cultural Cold War. In the Tapié exhibition, Pollock was an international rebel (like the others, ostensibly); in the American exhibition, he was the national avatar of cowboy grit. As we have seen, this kind of slippage was the flip side of modern abstraction and its openness to the viewer – even Picasso, whose *Guernica* retained both imagery and geopolitical title, was not able to completely control the interpretations of his canvas or its potential value for opposing ideologies.

These fates could not have been anticipated by the artists working in cultivated bohemian alienation in wartime New York. Automatism was predicated on the revelation of a deeply private interior world, and American artists emphasized this in statements and through their jealously protected 'signature styles'. The optimism of the 1930s vision of an art linked to its public (expressed both by outsiders such as Mexican muralist Siquieros, and by the US Government's own WPA) had not entirely dissipated, however. Both artists and critics forged connections between the private id and a wider sign system, predicated on popular structural anthropologies (Franz Boas, Ruth Benedict, and Sir James Frazer) as well as psychoanalysis (Freud and Jung). The romantic sublime would be key to these connections, but primitivism came first. Pollock's *Number 1, 1948* united both.

Throughout the 1940s, New York abstract painters had emphasized their works' continuities with both archaic Greek myth and Native American belief systems (continuities clearly charted by Freud's Oedipal narratives and *Totem and Taboo*, reflected in the titles of paintings such as Pollock's two *Totems* from 1947). The long tradition of modernist primitivism thus took a slightly different spin in the American context. New York painters felt themselves to be dwelling in a barbarous age, and experienced their thinking as continuous with the supposedly 'primitive' mind – particularly those putatively 'primitive' minds that were not isolated in some colonial periphery, but deeply woven into American beliefs (from the Algonquin-inspired US Constitution to African diasporal jazz). The artists had only positive associations with such Native American or African themes, but the anthropological theories that they turned to were often deeply racist. The supposedly subconscious process of assimilation in which others' ethnic traits became available for a white-dominated national culture were propounded, for example, by Carl Jung, whose 1930 essay 'Your Negroid and Indian Behaviour: The Primitive Elements in the American Mind' is only one example.[59] The European-derived method of automatism, taken in this context, was thought to reveal to American painters a subconscious already formed by national substrates of African or Native American forms. Picasso could 'perform' an identification with Africa to defy the French artistic and colonial establishment, but the abstract expressionists' tropism toward the 'primitive' could be constructed as the very source of national identity. Thus the American abstract painter Barnett Newman, passionately identifying with coastal tribes such as the Kwakiutl, wrote in 1947: 'To [the Kwakiutl artist] a shape was a living thing, a vehicle for an abstract thought-complex, a carrier of the awesome feelings he felt before the terror of the unknowable. [Now] a new force in American painting … is the modern counterpart of the primitive art impulse.' Insisting that their non-objective paintings offered the accessible equivalent of these highly complex ideographic signifiers, Newman continued, 'For here is a group of artists who are not abstract painters, although working in what is known as the abstract style'.[60] As Tàpies had bid for Spanishness with his Altamira school, Newman's international modernism would be American in a constructed primordial sense.

Newman's remark, consistent with the modernist subjectivity we have referred to in this essay, emphasized that readings of various kinds could be made by viewers – the paintings were non-objective, but had *subjects*. To 'gesture' painters such as Franz Kline or Jackson Pollock, the subject of abstract expressionist painting was the grand narrative of the existential act – the subject, in other words, was the modern self. Pollock's hand prints in *Number 1, 1948* spell this out, relating both to the newly discovered smoke-outlined hands found in Palaeolithic caves, and to the symbolic existentialist act of poet André Malraux, who dove dramatically (was it to drown or to swim?) into the Mediterranean Sea. Even the placement of Pollock's handprints is significant – at the upper right of the swirling mass of dripped skeins of paint, they would be read last (by Western viewers who customarily 'read' an image by scanning it left to right). They recreate, quite literally, the reintegration of self through representation, following a harrowing journey of pictorial disintegration and chaos that is part and parcel of the rhetoric of the sublime.

Pollock spoke little, and wrote less. But Newman and others were at great pains to explain the difference between what they described as the 'meaningless' geometric abstraction of Northern European modernists such as Mondrian and Kandinsky and their own (American) project. Pursuing both figurative and 'non-objective' modes of painting (the first known as 'Action' or 'Gesture,' the second as 'Field'), New York school artists shifted over time from an emphasis on primitive totems, to a discourse of isolated existentialist action, to this final stage of cultural mastery via the sublime. In artist-run periodicals of the time, they used Edmund Burke's quintessentially eighteenth-century meditations to develop a crucial contrast between the specious (supposedly European) search for beauty and the noble (supposedly American) quest for the sublime.[61] Acting only from his agonized internal emotions, the American artist was supposed to create objects that provoked a trajectory of terror and ego dissolution, followed by an aesthetic integration of ego in the end. This sublime trajectory was predicated on the same processes of mythologization, individuation, and personal expression that had animated earlier phases of the movement. As Newman summarized it: 'Instead of making *cathedrals* out of Christ, man, or "life," we are making it [sic] out of ourselves, out of our own feelings.'

As used by Newman, 'man' was not simply a neutral term. Newman (who quoted Kant on the subject) saw the sublime as an exclusively masculine pursuit defined in opposition to the 'feminine' search for beauty. Newman's thinking can be seen to culminate in the first of his large-scale works, the 8 × 18 ft. 'field' painting *Vir Heroicus Sublimis* from 1950. A taut horizontal canvas with a smoothly brushed surface of saturated red, *Vir* is punctuated by a few scant verticals of brushier pinks and browns, as well as one narrow strip of unpainted canvas. Newman called these ruptures in the chromatic field 'zips', and many scholars believe that they were stimulated by post-war New York exhibitions of Swiss sculptor Alberto Giacometti's spindly and cadaverous figures – lone existential men standing isolated in the void. Like so many other abstract expressionists, Newman painted as a 'sublime heroic man,' seeking to enact, rather than depict, (his) contemporary existence. 'The self, terrible and constant, is for me the subject matter of painting and sculpture'.[62]

Sublimity was invoked in these paintings not merely through their titles, nor solely through their forms (or formlessness). It was produced *in the viewer* by implicit and explicit identification with the artists' intense process of creation, particularly in the case of Pollock. 'Jackson broke the ice' (as de Kooning had remarked), establishing through his infrequent statements and even less-frequent interviews that 'On the floor … I feel nearer, more a part of the painting, since this way I can … literally be *in* the painting', or 'When I am *in* my painting, I'm not aware of what I'm doing'.[63] Being lost in the act of painting was comparable to being lost in the act of viewing the painting, rescued, in the end, by the tenuous civilizing effects of title, or the decorous culture of gallery and museum. Pollock's dense skeins of enamel, intermittently soaking into the canvas or standing slightly off the surface in taut whipcords of paint, produced shimmering fields that seem to blur in depth (the soaked first layers) and come into sharp focus in the foreground (the later, unabsorbed layers).

The 'field' painters chose a different route to sublimity. Mark Rothko and Newman both attempted to impose viewing conditions designed to maximize the desired state of absorption: Rothko, by grouping canvases together in fugues of subdued colour; Newman by asking visitors to his 1951 exhibition to stand so close to his enormous canvases that the entire field of vision would be saturated by intense colour. Thus deprived of visual focal points, viewers are engulfed by the overwhelming aesthetic experience that eventually triggers an examination of their own identity.

From the jumble of critical approaches to abstract expressionism during its peak, two divergent interpretations came to dominate, both emerging from the Marxist culture of New York in the 1930s, but with markedly different slants. The first was codified by Harold Rosenberg, who coined the term 'action painting' to describe the risky, existential process captured in the 1951 photographs of Pollock in the process of painting. Describing the canvas as 'an arena in which to act' in 1952, Rosenberg concluded: 'What was to go on the canvas was not a picture but an event'.[64] This existential position had clear resonance with what the Gutai artists would initiate; it also profoundly affected younger artists in the US. For example, Allan Kaprow, who was influenced by Pollock, probably aware of Gutai, and took classes from the avant-garde composer John Cage, introduced an action-oriented art that was known as 'Happenings' in 1958 and evolved into 'performance art', which persisted throughout the rest of the twentieth century. Kaprow's new genre emphasized what he articulated as 'The Legacy of Jackson Pollock:' 'Not satisfied with the *suggestion* through paint of our other senses, we shall utilize the specific substances of sight, sound, movements, people, odors, touch'.[65]

The second interpretation of Pollock's painting emerged as a reaction to this promiscuous mingling of sensuous experiences. In 1940, art critic Clement Greenberg had revisited Gotthold Lessing's *Laokoön*, an eighteenth-century diatribe against confusion within the arts. Greenberg's 1941 response was 'Towards a Newer Laokoön', the first of many influential and controversial pieces in which he argued that modernism, too, was opposed to the confusion resulting from a progressive, even teleological, purification of the arts. In opposition to Rosenberg's later celebration of existential 'action,' Greenberg argued that modernism was responsible for producing appropriate modern subjects. Modernism had to accompany viewers into their experience of a largely urbanized and industrial society, not take them back to imaginary caves. Painting, in Greenberg's formalist view, had a job to do. That job was constrained and intensified by its uniquely visual nature – this was how he celebrated Pollock, whom he described as America's 'greatest living artist' in a British culture magazine in 1947.

Greenberg's teleological view of modernism resonated with the post-war technocrats that managed the Cold War on the American side. Modernism, like democracy, represented progress. It moved in one direction, in pursuit of specific visual qualities including flatness, and in recognition of its aesthetic status as intended for 'eyesight alone'. Greenberg's theories bore curious fruit in the US, provoking the emergence of minimalists and conceptual artists in the late 1960s. These artists took Greenberg's views to a logical extreme, producing what has been termed an 'aesthetic of administration' – a bureaucratization of the senses that resonated rather profoundly with the post-war apparatus of the Pax Americana.[66]

# GLOBAL MODERNISM

## Asian modernism

By the end of the 1990s, it was relatively easy – for someone in Euramerica[67] – to believe that various kinds of modern art work and artists from the non-Euramerican world had been accepted by the art establishment. This seemed to be the case for Asian artists featured in the *Les Magiciens de la Terre* show,[68] at the biennals of Venice and São Paulo, and who were increasingly exhibited in country or area-specific regional shows.[69] Such acceptance might also reflect the incorporation of modern Asian art into the restricting intellectual paradigms of modernity, which were purportedly invented in Euramerica: the position of the centre may have moved, but it remains the centre.

We do not accept either of these premises. Other positions can be brought into focus if we consider two Asian artists of Indian origin and the intellectual musings concerning them. Anish Kapoor is an artist of Indian origin residing in London who has been exhibited at the Venice Biennale in the British pavilion and is the subject of 'major' critical studies by leading Euramerican curators and critics who pride themselves in adopting a global approach. N. N. Rimzon is an Indian artist residing in India who has been exhibited abroad but has received little attention from Euramerican critics despite the fact that his work is related to what is generally accepted as 'Indian'.[70] Yet Rimzon has been exhibited outside both India and Euramerica, in such places as Australia. This example illustrates the differentiation between a vertical, uni-central model of art based on Euramerican canons, and a horizontal, multi-centred discourse between differently constituted centres, none of which claim to constitute a canon.

The difference of position derives ultimately from Euramerica's claim to have invented, and therefore to retain ownership of, modernity. This claim, which could only be valid in a simplistic developmental history, loses its validity the moment we accept that modernity invents itself wherever it is necessary to place the pasts of any given culture or group of cultures into a new context. The principal condition is that these cultures need to – and are capable of – carrying out this process. From this position, it is easy to make the leap to the future-oriented 'relativization' of modernism, or, further, to the complicated and eclectic 're-relativization' of modernity that some call post-modernism. In the specific language of fashion and the street, post-modernism is also called 'retro'.[71] Seen in this light, modernity belongs to Asian artists because they work in societies and cultural discourses that require it. Modernity does not operate by the privilege of transfer from Euramerica or by the valuation of Asian modern art works and artists through their being accepted in Euramerica. Even before we examine the phenomenon of globalization, therefore, we should consider this basic difference in the approach to modernity.

## Affiliation

But if modernity belongs to Asian art cultures because of their own demands, what kind of modernity is it? How did it come into being? How is it to be recognized from inside any particular Asian art culture or from without? If modernity is not 'owned' by the West, does it follow that the kinds of modernity found in some Asian art cultures are radically different or new?

The affiliation of such modernity may be constructed in at least three ways, the full implications of which have yet to be explored. One approach is to see it as a challenge to authority of the established order, that is, as a dialectical relation to the Western world that has imposed modernity. This is the colonial/post-colonial dimension of modernity, according to which modernity is a product of subordination or rejection and revolt. At least theoretically, this implies a lack of authenticity or absence of an internal demand driving Asian modernity since external stimulus is necessary.

A second affiliation involves the grouping of modernities in a family of species derived from an *ur*-species. According to this model, the branches of a tree derive from common ancestors whose different sub-branchings represent (in a Darwinian evolutionary model of development) the adaptations of the species to various conditions in different localities. A variant of this model is to accept the notion of species branching but to view them (in Stephen J. Gould's revisions) not in a hierarchical relationship but in various groupings of variation from the same original set of species that exist *in parallel* and not in 'root' or 'trunk' form.[72]

A third model of affiliation calls for perceiving modernity in art along the lines of heteroglossia (as described by Mikhail Bakhtin),[73] that is different languages in dialogue. According to this model, the dialogistic relation of such art discourses – that is, their perpetual mutual relativization – may be interpreted as a fundamental condition of modernity. Affiliation results because of this common relativization, however such dialogue is achieved. Relativization can operate through the modes provided by colonial domination (India), internal self-development (Japan), and various kinds of quasi-sovereignty, which seek to maintain the unitary identity of discourses even as they are broken down by contact from without (China).

In art history, it has been relatively easy to overlook the different implications of these models, because of the presumed transfer of styles and their ideological constructs from the West to Asia. The transfer and overlaying of technical and symbolic values has diverted attention from the meaning of these transfers (or appropriations) from within, and from the way authenticity has been created for a wholly new and constructed 'tradition' at this interface. 'Tradition' has often been hermeneutically opposed to 'modernity' when the 'traditional' has only been made possible by the 'modern'. But even as the 'modern' has been relativized by its transfer from the West, so the neo-traditional has been secondarily relativized by its constructed discursive difference from the 'modern'. Thus have modern Asian art discourses been constructed: not along the lines of an 'East-West' split but by the process of primary and then secondary relativization, which we will call 'double othering'. This process can act as a relativization or 'othering' between, as exemplified by the distancing of the neo-traditional *Kannon the Compassionate Mother* by Kano Hôgai, 1888, from its 'Japanese' pasts, and further by its separation from the position of near-contemporary Western-style work like *Kannon Riding on a Dragon*, by Harada Naojirô, 1890.[74]

## Histories

Relativization of the past may seem to be the historical position of modernity most easily indicated by the *caesura* in local discourses created by the complete adoption of 'Western' academy realism. In the discourse of interpretation, such a position has tended to make us perceive the onset of modernity as a radically historical disjunction. But on closer examination of the discourse of the art works themselves, it may easily be seen that modernity in several Asian art cultures such as Japan or India did not begin with the transfer of Western-style realism, and indeed had a long prior history in many proto-modern features of local art discourses and structures of the art world.[75] Neither can one ignore the longevity of the links between the pre-histories of modernity in Asia and Euramerica. There is thus neither a caesura in cultural relations nor an absolute rupture in the way art discourses are related to their pasts. It seems that part of the reason why there is a tendency to create such interpretive breaks is that they can be made to duplicate or reflect dichotomies of the Euramerican world, such as imperial/metropolitan and colonial/local. This Manichean world has not been noted for its creation of discursive spaces defined by multiple centres and histories.

Furthermore, what one might call the pervasive Euramerican interpretive mode has tended to see academy realism in a linear series of internal stages such as transfer, assimilation, and transformation. This view has concealed or de-privileged the various kinds of relativization implicit in such processes for an Asian art world and masked the dynamism of appropriation itself. It has concealed how many features of modern discursive change were present inside these transfers. Perhaps the largest shift in art historical interpretation is required by modern Asian art, which requires a move away from the notion of transfer resulting from the dissemination of stylistic models. Interpretation, whether exogenous or endogenous to any art discourse, should take into account the range of relativization processes as they are imbricated within the complex terms: *modernity, modernism, post-modernism*. Any particular stylistic model or congruence among styles is probably the *least* signifying element for the endogenous art discourses involved. More often, there is a kind of co-option by local expressions of international movements, and we would argue that this often occurs very early in the transfer of realism. The direction of this co-option is not principally from the central to the local, which would be the most widespread (and still colonial) perspective. The complexity of this exchange possibly accounts for the perverse late- or post-modernist pleasures to be derived both endogenously and exogenously from Chinese 'popism' of the 1990s such as in the work of Zhang Xiaogang, a discourse which cynically manipulates a surface conventionality in order to sequester a subversive parody safely within.[76]

## Nations

For most Asian cultural discourses, modernism began with the relativization of the past provided by the historical break initiated through colonial or neo-colonial rule. Just as important was the immediate formation of an anti-colonial movement, and corresponding independence struggles toward the founding of a new state. However the new state

claimed dominance over the society and the many cultural discourses within it, such states could legitimately claim to have founded the nation, to have unified its many discourses, and in most cases to have provided the leader of the people. The modernist striving for a desired future articulated between a leader and a people became a frequent subject for pictorial representation. This has historically been so much the case that one might postulate *the* thematic of modern Asian art to have been the allegorizing of the new nation through representations of the new leader, and often of the very people who supported him. There is no doubt that these *male* figures (by male artists) seek to articulate the masculinist privilege of serving the nation.[77] Alongside them stands the *female* figure of the mother, or of multiple types of women as repositories of a variety of national values, or of woman as a leader of the masses in the self-sacrificing figure of a toiling intellectual. These counter-allegories act as feminizing counterparts to the masculine nation-builders, even if such female allegorical figures can only rarely be described as feminist in intention.[78]

Two conditions seem to have changed the possibility for this type of national allegory. One is the success of the movements under or against colonialism, where nationalism (following, in most cases, colonial maps) survived as a strategy for creating a repertory of ideal figures in a national imaginary in a rapidly de-colonizing world. This can result in a kind of semantic exhaustion where the use and re-use of a particular metaphor, like Chairman Mao as Great Helmsman, turns into a saturated metonym, a kind of image coinage whose value resides in the currency system rather than in any particular image. A second, and usually consecutive, condition occurs where the colonial or the reaction against it only survives as a dim echo in a national imagination preoccupied with negotiating the post-colonial terms of its relationship to a globalizing world. Thus stand the agonized, repeated faces of Philippine peasants in works by Alvorado Nunelucio looking out of the frames of their images.[79] Through the slightly hallucinatory effect of their black outlines and primary colours, they flicker like alternative TV pictures, working to subvert the very fractioning forces that place them in a world economy and separate them from their former lateral solidarity as part of a Philippine 'nation'.

## Mediators

Art history, or at least any history of modern art, cannot escape the possibility that it might serve as an unintentional cultural critique. Any exogenous or endogenous construction of a modern, modernist, post-modernist or simply contemporary art in Asia will necessarily favour some kinds of art over others. But in a world promoting close communication between art cultures, the figures who have normally provided these kinds of assessments in various functional domains – critics, curators, journalists, art historians – are always serving to re-position the 'new'. They have an exogenous mediating and consecrating function and are assisted in this task by new patterns of international exchange and communication.

The endogenous role of a critic, curator or dealer in mediating and sometimes forming a group of conceptual perspectives around a cohort of disparately arranged artists is well known in Euramerica. It has also been a significant

feature of Asian modernity, as illustrated by the role played at different times by Geeta Kapur in India, Li Xianting in China or Nakahara Yfsuke in Japan.[80] The important feature of such critics, however well informed they may be about international and exogenous art movements or by their own personal experience, is that they work from within a set of cultural discourses from which they construct their own centre. But the late twentieth century has also seen the advent of more specifically 'interface' critics, curators, and dealers who help to transfer supposedly scarce knowledge and work from the endogenous to the exogenous levels. There is no doubt that these mediators have played a significant role in presenting East Asian art cultures in international art exhibitions, and here the position of Nanjô Fumio (and more recently of Hou Hanru in China) is noteworthy.[81] But if such mediators play an important role in introducing different types of Asian art into Euramerican discourses, which otherwise might ignore them, such 'gatekeepers' also reflect a minority opinion or a selective representation against the very complexity of the endogenous discourses they purport to represent to the exogenous.[82] In other words, for an art history of modernity that includes Asian art as one type of non-Euramerican practices, it would be fallacious to assume this could wholly or even partially be based on the art introduced from such mediators to the international level, even under the ambiguous label of 'contemporary practice'.[83] The difficult but rewarding work of examining from within each endogenous discourse is the basis for an art history of other modernities, not the post-facto hypothesizing of such a history from such works as have been articulated on exogenous levels.

Some will argue that the global, exogenous level of practice, of the distribution of works and of the career-cycling of artists has long ago penetrated the endogenous. Yet, many artists, some the most rooted in their endogenous discourses such as Rabindranath Tagore, have continuously paid attention to the international scene, even though it was previously organized by the same colonialism from which they were attempting to escape. If modernism involves relativization of the past and represents a kind of reflexivity that elevates future orientations to the level of formal subjectivity, and if we were to attribute hermeneutic sovereignty to the global level, then that relativization would disappear or become a mere imitation of itself. This would entail reproducing – even from a supposedly progressive position – the structure of central super-ordination over the local (now abstracted onto a 'global' level), which the rich variety of practice made possible by modernism had the potential to resist, subvert, or at least circumvent. Whatever we consider to be the role of globalizing forces in the late twentieth century, an Asian history of modern art would first have to construct what conceptually and pragmatically links its own discourses to the local.

## COMMODITY-BASED ART AND GLOBAL CULTURE

John Clark claims that the complex dialogue between international modernity and local culture, as well as the process of self-relativization we call 'modernism', have their temporal origin in colonialism. Much of this chapter has alluded to that dynamic process. Returning to the sphere of Euro-American modernism (as defined by Clark), we can see that the exportation of Western values did not terminate with the break-up of colonies in the wake of the Second World War; nor did hybridization cease. On the contrary, US and European efforts to extend capitalist 'spheres of influence' shifted from the military and political arenas to cultural and economic affairs. American abstract expressionism was the official face of liberal democratic tolerance; equally influential, though unofficial, were the brightly packaged commodities and attendant commodity-based art that burgeoned in the pivotal decade of the 1960s.

By 1958, when New York-based artist Robert Rauschenberg used three trademarked beverage bottles in his *Coca-Cola Plan* (Plate 157), their shape was known to a large part of the world's population. Flanked by silvery wings, they form a classical order of fluted commodity caryatids coloured with drips of paint. Below the bottles, Rauschenberg placed a spherical wooden finial marked with horizontal lines and tilted slightly to suggest a globe. Thus, *Coca-Cola Plan* seems to target global fame by riding on the crest of an increasingly worldwide commodity culture (national pride of the US post-war economy).

Rauschenberg's global ambitions were almost immediately endorsed when this assemblage was acquired by Italian Count Giuseppe Panza di Biumo. The cultural space mapped by such exchanges can be described as an 'imagined community' in which nations and indeed, the very notion of the 'inter-national' might be produced. Particularly salient was the non-narrative *iconic* visual culture produced during the decade of the 1960s, which opened a possibility, however brief, for artists to navigate in a modern world without borders, beyond the limits of language, unified by fantasies of plenty emanating from the US and diffused throughout the capitalist 'free world'.

There was an underlying shift in art-world systems that facilitated such fantasies: the sudden emergence of a major art market in New York. Typical of the global infrastructure that this market represented was Italian-born art dealer Leo Castelli, whose New York gallery became a significant contributor to the local and international economy and who served as a model for other dealers who wanted to establish ties with European collectors. Castelli proved that a dealer could produce an imagined international community when he helped Rauschenberg, and the United States, take grand prize at the 1964 Venice Biennale (shortly after Panza had purchased the artist's *Coca-Cola Plan*). The potential internationalism of Rauschenberg's work was inserted into a theatre of nationalist politics and ideology (the national pavilions at the Biennale). The European response to Rauschenberg's victory was little short of outrage, but this was undoubtedly encouraged by Castelli's blatantly provocative publicity campaign that appeared in art magazines during the biennale year. Castelli's advertisement featured a map of Europe studded with names of his gallery's artists, clustered around various art capitols. Probably intended to indicate cities where his artists' works were on view, in the Cold War context, the map was interpreted as a plan for the European 'conquest' of Castelli's army of American artists.

Rauschenberg was a controversial choice to receive the biennale's grand prize, because of his age (39) and the fact that he was relatively unknown in Europe. But as early as 1955, the recurrent themes found in his work had foreshadowed his global ambitions. Against the uncompromising individualism and sublimity that

characterized earlier generations of Euro-American painters, Rauschenberg offered what was described as a 'flatbed aesthetic' – the canvas serving as support to ephemeral objects, images, advertising fragments, and other flotsam and jetsam from a restless world. Like the dada productions to which it was compared, but incomparably more cheerful, Rauschenberg's assemblages had the look of practical devices, a tinkerer's *bricolage*. Perhaps it was the very 'innocence' of these combined works that appealed to government officials eager to champion their country's culture. At the same time, Rauschenberg's works were accessible to a cosmopolitan international audience craving humour. Rauschenberg's ambiguous icon inaugurated a commodity-based art that both mocked American business and looked like friendly votives to its newly 'global' religion.

*Coca-Cola Plan* had been preceded by works that depict global cultural conquest. In *Small Rebus*, for example (from 1956), Rauschenberg placed two facing maps in the middle of the canvas. The left-hand fragment showed a portion of the US (significantly, the 'heartland' so often ideologically presented as the 'true' America), linked visually to a nearby smattering of grey drips and brushstrokes. Juxtaposed on the right (or 'to the East') was a fragment of a map of Europe: the Warsaw Pact countries, veiled under a square of striped gauze fabric. Here, Rauschenberg offered a witty, visual summary of wider arguments being produced in US cultural discourse: the abstract expressionist brushstrokes on the left do not obscure the heartland, but complement and frame it, guiding the gaze. The happy pairing of democracy and abstract art that politicians celebrated in rhetoric found form in paint and collage, facing off against the dark regimentation of artists under the rule of the Soviet bloc (here expressed as a 'block' of fabric constructing a visual prison of black bars). With varying degrees of sophistication, defenders of abstract expressionism had long argued that the seemingly chaotic brushstrokes were neither mad nor 'communistic,' but manly marks of a generously tolerated individualism. Rauschenberg's commentary in *Small Rebus* is more ambivalent – his 'national' brushstrokes are random-looking drips, rendered in an industrial battleship grey.

Similarly, Rauschenberg's fellow artist Jasper Johns (who was then making his 'map' paintings from a template provided by Rauschenberg) produced an ambiguous reading of American freedom. The national style, abstract expressionism, was wedded to the national territory in Johns's seemingly simple transcriptions of a student's map of the continental US. Similarly, Johns's flag paintings presented the pre-1950s American flag – utterly frontal, it was a flag made of paint as much as a painting of a flag. These were clearly nationalist pictures, and indeed, the masthead of the left-wing journal *The Nation* (where Greenberg published his modernist criticism) is clearly visible under the encaustic paint. But Johns's choice of this translucent medium also 'freezes' the abstract expressionist brushstroke, that crucial element in the beloved national style. The free gesture becomes a tidy set of strokes – transportable, replicable, 'canned' pictorial units that can appear as packaged as the commodities Rauschenberg was assembling into art. Johns's repetition of these national subjects-turned-objects (in many painted and printed versions) seemed to confirm the chilly emptiness of their iconic nature.

Ironic or affirmative? The modernist emphasis on meaning-in-the-viewer gave rise to multiple codes. Rooted

in the Cold War climate, the works of these artists' were closely related to the nationalist discourses that were occurring at the most subtle and sophisticated levels of the United States' embattled intellectual community. In trying to define 'the liberating quality of abstract art' for a group of art professionals in 1957, for example, the medieval art historian Meyer Schapiro produced a vision of abstraction closely associated with abstract expressionism (rather than collage, montage, geometry, etc.) – and he located its model of heroic individualism in the paint itself:

> Hence the great importance of the mark, the stroke, the brush, the drip, the quality of the substance of the paint itself, and the surface of the canvas as a texture and field of operation – all ... means of affirming the individual in opposition to the contrary qualities of the ordinary experience of working and doing.[84]

Accordingly the Warsaw Pact artists trapped behind bars within Rauschenberg's map in *Small Rebus* would be perceived as imprisoned by such 'ordinary experiences, of working and doing'.

However, heroic individualism was not the only exported product of American culture: in the 1950s, commodity culture emerged with great economic clout and fuelled passionate Cold War cultural debates. Abstract expressionism was regarded as demonstrating 'the true meaning of free democracy' on the world stage, aligning itself with 'high art' and aspiring to join the grand traditions of European painting. The movements that replaced it – first neo-dada, then pop, appearing in England, Germany, Italy and France as well as the US – troubled intellectuals concerned about the homogenization of unique national styles, not to mention the destabilization of high art by mass culture. (Except perhaps in the Soviet Union, where American pop art could be enjoyed as final proof of bourgeois decadence.) Even in the US, critics blasted pop art for echoing 'the crassness, the vulgarity, [and] the depressing tawdriness of modern advertising art'.[85] In such strident critiques, observers voiced their true fears: that the commodity-based art emerging in the late 1950s would draw unwanted attention to that *other* American export, the commodity itself – now formulated as crucial to the post-war global economy, but no basis for US aspirations to high culture. Rauschenberg was clearly one of the guilty parties in setting the stage for the turn from heroic (and nationally 'American') individualism to the low internationalist impulses behind capitalist commodity culture. But from the perspective of many artists, the globalism embodied by the 1960s commodity was just the ticket – it was all part of the plan (the *Coca-Cola Plan*).

Rauschenberg had called his enigmatic objects 'combine paintings,' as if (like Eli Whitney's cotton gin and the later combine harvester) he had taken French research (here cubist collage and assemblage) and put it into production. Precedents were clearly Braque's and Picasso's cubist collages and assemblages like *Guitar* or the surrealists' experiments with paintings and constructions that combined images and objects in mysterious ways. Rauschenberg stripped these precedents of their poetic eroticism and their evocations of the 'primitive'. He left the aggressive worldliness of his objects intact. Nothing in Rauschenberg's assemblage is not pre-fabricated, except the drawing of the 'Plan' itself, and that 'blueprint' or plan suggests merely a

reproduction of some mass-produced image. Indeed, *Coca-Cola Plan* announces the scale of its ambitions: the indicated dimensions on the sketch at the top would produce a canvas comparable in size to the monumental Pollocks, Rothkos and Klines then touring Europe in the Modern's 'New American Painting' show. The intended image remains unknown (it might even have been empty, as in one of Rauschenberg's earlier White paintings) – but we could imagine satisfying this image with any of Warhol's early 1960s Coca-Cola paintings, their semi-filled iconic bottle forms silk-screened across the canvas in rank and file, like an army of commodities.

Coca-Cola (and its competitor, Pepsi) had conquered the visual culture of Rauschenberg's generation, and business news reports of the 1960s discussed how the two corporations had divided up the globe, one taking China and the other Russia. Warhol declaimed that Coca-Cola provided the class leveller that communism never could: 'It's happening here all by itself without being under a strict government, [so] why can't it work without being communist?', and later, 'the President drinks Coke, Liz Taylor drinks Coke, and just think, you can drink Coke, too.'[86] By 1961, Coca-Cola was sold in 115 countries at the rate of more than 65 million servings a day; *Time* magazine's editors broke precedent to feature Coke on their cover in 1951, reasoning that '[Coca-Cola provides] simpler, sharper evidence than the Marshall Plan or a Voice of America broadcast that the US [has] gone out into the world to stay'.[87] Right after the war, Coca-Cola's ad campaign had incorporated the slogan 'Coca-Cola … along the highway to anywhere.' Increasingly in the post-war frame, 'anywhere' meant *anywhere on earth*.

Clearly, other countries' artists and critics were not so optimistic about the 'Coca-Cola Plan.' Marisol, a Venezuelan sculptor then living in New York, made her simple but devastating critique in the form of a cast of a woman's mouth and nose, displayed with the top third of an up-ended Coca-Cola bottle thrust deep into her mouth. The work's title, *Love*, conveys considerable irony, given the explicit and unequal sexual power mapped onto this consumer/commodity exchange. Equally explicit is Japanese artist Ushio Shinohara's 1964 assemblage *Drink More* (now in the Yokohama art museum). Here, the complementary colours of an American flag (green stripes and orange stars in place of red, white and blue) appear in the background as a plaster hand thrusts a Coke bottle through the canvas. Crude stencilled letters enjoining viewers to 'drink more' reveal the nationalist economy working behind the 'global' facade of commodity culture. This form of critique continued into the 1990s, specifically around the thematic globalization of Coca-Cola, in works by artists such as Wang Guangyi, whose 'Great Castigation Series' from the early 1990s (in particular *Great Castigation Series: Coca-Cola*, 1993) links the ideology industry to the image factories of commodity culture. Wang's canvas displays the icons of Red Chinese revolutionaries in a heroic pose between red revolutionary flag and the red background of the Coca-Cola logo.

These obsessions in relation to a single global commodity icon can be multiplied many times over, forming the tips of many icebergs. But Coca-Cola was perhaps the dominant emblem of global (US) capital. One British art critic, presenting Coke's takeover in the standard terms of its affront to European civilization (although, as we have seen, its reach spread much farther), wrote the following in a 1964 *London Times* article titled 'Art in a Coke Climate':

The point is not whether Coca-Cola culture is wiser and nicer than wine culture: the point is that it is a culture – a set of tribal tastes and customs which implies certain values and attitudes and a conception of what life could ideally mean.... More people having a good time than have ever had a good time before. A taste for vicarious pleasure as well as vicarious cooking. Brand advertising everywhere … A Promethean faith that nature is conquerable … expendability … standardization.[88]

In Rauschenberg's evocation of the Promethean myth, there is no Zeus to challenge his hubris. Rauschenberg's *Coca-Cola Plan* of the late 1950s was anticipatory and naive; by the mid-1960s, artists such as Marisol or Shinohara were more nuanced in their understanding of the double-edges of commodity imagery. Rauschenberg's combine, with its wings unfurled, presents the moral equivalent of wars' victory – an ironic 'junk art' allusion to the triumphant Hellenistic Victory of Samothrace, one of the highlights of the Louvre. It was logical to tie this 'victory' to Coca-Cola's marketing icon. The bottle's shape was patented in 1960, as if in recognition of the increasingly visual and iconic form necessitated for 'corporate identity' to function in a multi-lingual world. In the 1960s, minimalist artists in the US had been drawn to this visual culture of the corporate logotype, seeking the same instant recognition and 'brand-name' identity in their clear, crisp forms.

What is interesting about the use of icons appropriated from American corporate culture throughout this period (and the widespread move toward icon status) was a feature that most artists (including Marisol, Shinohara, and Wang) failed to address – increasingly, *art* obeyed the logic of commodities as well. Modernism's emphasis on individual originality and recognizable artistic 'style' ran parallel to commodity culture's imperative for market share; to be successful, artists from Picasso on had to develop their 'brand.'

In the efforts of American government officials to promote abstract expressionism, a very diverse group of styles was promoted as *national* 'brands.' Rauschenberg had alluded to this dilemma by identifying abstract expressionism as a commodity in its own right, just as exportable and potentially international as Coca-Cola. This point is made deftly and succinctly by the brushstrokes on the bottles above the globe in *Coca-Cola Plan*: these strokes of primary colour on Coca-Cola's advertising ingenuity are themselves advertisements for a certain type of genius. By the time Rauschenberg presented his ironic, quasi-imperialistic plan, commodity and culture had fused more deeply than pop art's worst critics had feared. The new entity – commoditized culture – had come to play perhaps the biggest role of all in the production of a new *inter*national imagination, as the *Coca-Cola Plan*'s owner, Giuseppe Panza, seemed to agree.

Panza's acquisition of *Coca-Cola Plan* suggested that at least one Italian lawyer and businessman could see himself in the aspiring internationalism of American commodity culture and culture-as-commodity, even if he were only sharing the artist's ambivalent irony about that situation. How Panza became convinced that his cultural future lay in the hands of American artists is a case study of the national and international components of an ever-evolving corpus of modern art. In weighing in with Rauschenberg's work, Panza turned his back on the austere struggles of European

painting (he had early bought both Fautrier and Tàpies); by believing Rauschenberg's vision of global triumph, Panza contributed toward that goal.

As Panza well knew, the Italian futurists had announced similar designs on European culture during and after the first World War. After 1945, Italian modernism seemed in even deeper stagnation. Seduced by a posturing imperial Duce and ashamed of their failure to hold on to even the most rudimentary colonial outposts, Italian modernists seemed to have few legitimate pathways to an international future. Post-war Marxism offered no compelling artistic styles, and the sober pre-war realism of an artist such as Giorgio Morandi had been tainted by its exploitation by the Fascist cause. Even the futurists ended up painting landscapes and madonnas. By leaning toward progress, Panza had no affection for these rural pieties, and for the view they seemed to propose of Italy's future as a continuation of its rural past.

Just how bleak cultural prospects appeared to this industrially progressive modern society can be intuited from the name given to the first post-war Italian movement that aspired to international status: *arte povera*. Artists such as Giuseppe Penone, Jannis Kounellis, and Mario Merz explicitly sought to work with simple everyday or natural materials. Despite the success of this group of avant-garde artists, their work reflected a refugee sensibility, more consonant with the abjection of an earlier generation (such as Fautrier, Burri, or Tàpies). The humility of arte povera works (carved potatoes, flayed trees, lettuce, mud igloos) seemed directed at some imagined Italian primitive state rather than the future envisioned by Italy's new managerial elite. Or at least that was Panza's conclusion: 'I saw a lot of work by the *Arte Povera* artists', he recalls. '[They] were interesting to me ... they had an international value.... But ... I decided to remain concentrated on the Americans, not the Italians'.[89]

Encouraging Panza's view of a more technocratic future were erudite Italian industry magazines such as *Civiltà delle Macchine* (The Civilization of Machinery). Here Panza saw his first example of American abstract expressionism, which he immediately bought. Recalling the shock of seeing reproductions of a Franz Kline painting and industrial engineering projects, Panza remarked that the work looked 'like a steel structure, only broken'. It is significant that the essay on Kline explicitly connected this New York school painter to Japanese master calligraphers, declaring: 'Perhaps it is too soon to say how far these images in black and white can go, to what extent they can be symbols and modes of our reality, but we can safely acknowledge them to be our time, our life, our poetry'.[90] The 'our' here is not the Italian citizen *per se*, but the reader of *Civiltà* – an international businessman of the world, seeking a newly global cultural imaginary rather than specifically 'national' forms.

The view of American commodity-based art and art-as-commodity initiating the global 'Coca-Cola Plan' weakened the very substantial critique of US hegemony only touched upon in discussions of Marisol, Shinohara and others. Eventually, such critiques became impossible to ignore, gathering force throughout the 1960s and focusing precisely on the twin fronts of commodity culture and military operations (particularly at a time when the US replaced French colonial administrators in Viet Nam). Panza could explain his Americanophilia by observing that 'in some way the Second World War was the end of Europe',[91] and

Rauschenberg outfitted that cultural imagination with its icon, but the situation was very short-lived. On joint fronts, post-modern and post-colonial art and theory began to empty 'nation' of its infusing power in modern art.

## POST-COLONIAL, POST-MODERN

Many scholars and cultural critics have often viewed Western values and commodity culture as if they blasted from the centre of the capitalist 'free' world out to its neo-colonial fringes. But nowadays, such dynamics are believed to be far more complex. Images and objects began to assume unusual mobility during the 1960s, and the ideologies supposedly inherent in such signs appeared malleable and independent of an instrumental economy. Some French theorists found utopian significance in this shift: Guy Debord examined the 'society of the spectacle'; Michel Foucault, Gilles Deleuze, and others influenced by the revolutionary spirit of May 1968, theorized about dealing with power by manipulating its representations; and Frantz Fanon analysed the colonial mind. Artists were part of such attacks on 'master narratives' (as post-modern theorist Jean-François Lyotard called them), and the nationalism and internationalism embedded in modern art began to fragment as well.

Artists such as Robert Smithson (a 'nomad' from the US) and Hélio Oiticica (a 'nomad' from Brazil) illustrate this development. Such artists definitively disoriented modernism's magisterial gaze and the nationalism it could fuel. These two artists, who worked in New York in the late 1960s unaware of each other's existence, both addressed issues of nation, place, and global commodity culture that artists in Rauschenberg's generation had identified a decade earlier. The works Smithson called 'mirror displacements' (Plate 158) are points of entry into this post-modernist's reflections on space, place, and nation. That same year, Oiticica first transplanted his installation *Tropicália* to London's Whitechapel Art Gallery and confronted the challenge of making tropical culture readable without tourism. Both these 'transplantations' intended to disorientate viewers and turn them quite literally away from complacent *ideés reçues* and from the kinds of certainties produced to secure notions of *nation* – against the cultural ideas routinely produced by tourism, through the consumption of commodities, and via art. Smithson and Oiticica participated in the late 1960s transformation in which artists abandoned what seemed the false promise of *inter*nationalism, and sought a global universalism against language, against the stability of earth, and against constructed fundamental notions such as ethnicity, race, and even time.

Born in rural New Jersey rather than the art capital of New York, Smithson used his knowledge of hinterlands to stage hard-hitting critiques of the centre. Most famously, his *Earthworks*, as he named them, initiated a movement in which artists produced monumental or ephemeral incursions in distant areas that could not be contained by the art world's galleries and museums. Created in deserts, abandoned quarries, frozen rivers, and fallow fields, such site-specific works were part of the crucial late 1960s shift from object to discourse.

As part of this increasing emphasis on conceptualization and documentation (rather than object), Smithson's essays

constituted an integral aspect of his art. His piece in the Yucatan bears images but also words that refer to the colonial place names. The creation of names by the colonial power is presented as a false mirror, and juxtaposed with Smithson's own projects dealing with displacement and fiction. Concerning *The Tourist Guide and Directory of Yucatan-Campeche*, Smithson writes:

> On its cover was a crude drawing depicting the Spaniards initial encounter with the Mayans.... [with the words] 'UY U TAN A KIN PECH' ('*listen how they talk*') EXCLAIMED THE MAYANS ON HEARING THE SPANISH LANGUAGE,... 'YUCATAN CAMPECHE,' REPEATED THE SPANIARDS.[92]

In the primary invocation of 'Yucatan' (a transliterated Mayan phrase that also means 'I don't understand'), Smithson produces the same ambiguities that characterized his site/non-site works executed the previous year. The site/non-site series began in art magazine articles and gallery shows that designated sites at a specific location (e.g. a slate quarry near Bangor, Pennsylvania), and presented their boxed, mapped, and photographic remnants as elements of a non-site that was described as 'removed' from the site and relocated to the urban-based art gallery. The dialectic between centre and periphery became a central issue in Smithson's work. Staged initially as discursive projects, the site/non-site works were recast by the Yucatan essay as elements in an imaginary geographical and transnational context, a globalization of conceptual acts.

Smithson's descriptions of the mirror-displacements, ephemeral installations photographed in Central America's Yucatan peninsula and published in the prestigious American art journal *Artforum*, made it clear that all efforts at mapping and representation are doomed to fail. The mirrors, as shimmering, evanescent inversions and refractions of the surroundings, might seem to be explained by Smithson's magazine text, but that supplement is itself riddled with mirrors and shadowy voices: *Tezcatlipoca* (not Mayan, as Smithson asserts, but Aztec), introduced by Smithson as 'demiurge of the smoking-mirror,' appears in the rear-view mirror of Smithson's rented Dodge Dart to warn, 'All those guide books are of no use ... You must travel at random ... you risk getting lost in the thickets, but that is the only way to make art.'

As such Delphic stagings suggest, Smithson's 'Incidents of Mirror-Travel' can be read as a standard primitive pilgrimage to the primordial Other, much like John Lloyd Stephens's 1843 volumes, *Incidents of Travel in Yucatán* (from which the well-read Smithson borrowed his title). But the Yucatan sites explored by Smithson are hardly primordial Edens. As the artist/author relates, the first displacement was staged on land turned to ash for agriculture; the second deployed in a shallow quarry found in 'a suburb of Uxmal;' the sixth described in conjunction with a Mexican book of matches bearing the art commodity Venus de Milo on one side and Breugel's *The Blind Leading the Blind* on the other. The last mirror displacement, in which the square silver plates of glass are distributed around the roots of a mangrove tree, reminds us of Smithson's commentary on the subject of 'nature:'

> There are those who say 'that's getting close to nature.' But what is meant by such 'nature' is anything but

natural. When the conscious artist perceives 'nature' everywhere he starts detecting falsity in the apparent thickets, in the appearance of the real.... [Art] sustains itself not on differentiation, but de-differentiation, not on creation but decreation, not on nature but denaturalisation.[93]

In this quote, we could replace 'nature' with 'nation.' Smithson's new vision was intended to examine the naming process, traditionally used to designate national or colonial subjects.

In his ignorance of Central American languages and theologies, Smithson was very much an American tourist. Still, even a cursory reading of the Yucatan project suggests how far the viewer has been taken from Rauschenberg's cocky, if ironic, certainties. From an America that imagined itself to be at the centre of a new world order, the master of its culture, the tamer of its wilderness, and the bearer of 'good news' for the world, Smithson's work alludes to a disoriented, displaced nation increasingly aware of the ambiguities at its core. The mirrors here are 'rectangles of uncertainty in the Yucatan,' as Smithson put it, refractions of suburbs and ash heaps, not masterful representations of a pure yet colonized 'nature' that anchors utopian 'nation' in place. In a final globalizing reflection on his own wanderings, the artist notes that other sites in upstate New York and Florida could be connected to the Yucatan displacement sites by means of lines drawn on a map. This classic modern gesture of knowing and owning is immediately jarred by the artist's query:

> Are they totems of a rootless condition that relate to one another? Do they mark a dizzy path from one doubtful point to another? Is this a mode of travel that does not in the least try to establish a coherent coming and going between the here and the there? Perhaps they are dislocated 'North and South poles' marking peripheral places, Polar Regions of the mind ... that have slipped from the geographical moorings of the world's axis. Central points that evade being central.... If you visit the sites... you will find nothing but memory traces, for ... the mirrors are [now] somewhere in New York.... It is the dimension of absence that remains to be found. Yucatan is elsewhere.[94]

As Smithson's works forced viewers to recognize, cherished notions of place, roots, race and nation are nothing more than phantasmagorical projections on a map whose coordinates are vague and blurry. 'Listen how they talk' and 'I don't understand' become names for the Other, but by the late 1960s this artist already knew they could better be used to describe his own uncertainty.

The Brazilian artist Hélio Oiticica is equally intelligent, and complex. By 1965, when Smithson was still flirting with abstract minimal art, Oiticica was just beginning to theorize his extraordinarily embodied, kinetic, and ephemeral *Parangolés*, those reclamations of samba and street performance where, as Oiticica described it, 'the action is the pure expressive manifestation of the work'.[95] Son of an eminent scientist and grandson of an anarchist, Oiticica had a rich and complex background, as well as a distinctly critical relation to the colonial foundation of his own nation. In his important performance works, and in the periodically recreated installation *Tropicália*, Oiticica's

frame of reference was the uneven constructivism of the developing world (whose flaws he knew intimately). His work was inspired by the African-Brazilian samba dancers, and the cast-off constructions of the *favelas*. Transformed by the samba school and the makeshift structures of the Rio shantytown where he lived at the time, Oiticica produced the *Tropicália* installation and the *Parangolé* performance works against the myth of the melting pot of Brazilian culture and against the false stereotypes fabricated by the Brazilian state. It was Oiticica's aim to reveal, as Smithson had, the infinite differences beneath modernism's relations with its Others and the evolving nature of certain dichotomies (nation/other, modernist/primitive, First World/Third World).

Renamed *Eden*, Oiticica's *Tropicália* was installed in London a few years after its inauguration in São Paulo. Like the spontaneous, anonymous constructions the artist photographed in Brazil's urban centres, *Tropicália* was meant to provide a site for what Oiticica called 'Cre-leisure,' (from the Portuguese word meaning 'belief,' *crer*, as well as 'to create'). Visitors laughed as they travelled through Oiticica's fun house, moving in bared feet from straw to sand, from black tents piped with *bossa nova* to translucent scrims, the scent of humid air heavy with leafy plants. 'COME AND GO, STOP, STAY, WANDER, PLAY' were the artist's instructions, but at the end of the visitors' stay in *Tropicália*, in the middle of Oiticica's 'labyrinth,' a television was installed, its screen described by the artist as a cannibal that 'devours the participant, because it is more active than his sensory creating'. In the heart of darkness, then, Oiticica placed not the savage (noble or otherwise), but the sinister light of First World commodity culture with its unequal cultural exchange. What is crucial to the concept of the TV cannibal, however, is Oiticica's theoretical framework: the extraordinary Brazilian response to colonialism known as *antropofagia*. This theory regards modernism in terms of 'hybridization'. But in Brazil in the 1920s, there was nothing gentle or gradual about the process: *antropofagia* referred to a process of *cultural* cannibalism in which the colonized devour elements of the colonizers' culture, both killing and literally incorporating them in a mysterious Dionysian process of transubstantiation.

Anthropophagic transubstantiation implied the transnational as well. For if the nation defines itself through relation to its imagined Others – whether internal Indian savages or external barbarians at the gate – to consume and be consumed in turn establishes a less controllable metabolism. Rather than the alloy envisioned by 'the melting pot', Oiticica and other late artists of the 1960s created an ambiguous molecular dynamic of exchange. When identifying a chunk of Brazilian asphalt as a 'Manhattan Brutalist Object semi-trouvé,' for example, or when making line drawings of snortable cocaine on images of American mass culture icons (in Cosmococa), Oiticica shuffled entire decks of cultural signifiers and imaginary locales. 'Manhattan, USA', installed in his Rio bathroom along with 'Kyoto, Japan', formed Oiticica's response to the nation-mongering then going on at the São Paulo Bienale, one of those periodic opportunities for chauvinism that Robert Smithson had also chosen to boycott some ten years earlier. The exchange of locations and the transvaluation of the commodity were addressed even more deeply by *Cosmococa*, Oiticica's quasi-cinematic participatory performance piece, planned in collaboration with Brazilian

filmmaker Neville d'Almeida in the early 1970s. Images of Marilyn Monroe or African-American rock star Jimi Hendrix were shown wearing 'masks' drawn in lines of cocaine; these images were projected in galleries strung with hammocks for the 'cre-leisure' of gallery visitors. For Oiticica, issues of consumption and commodity were fully addressed by this deeply personal, *antropofagista* commingling of South American narcotics and masked North American celebrity icons, commoditized image to be contemplated and consumed along with the cocaine – both eternally renewed for further consumption.

Other Central and South American artists were exploring this kind of relationship at almost the same time: Colombian Antonio Caro, who used a traditional painted canvas and the Coca-Cola logo to paint his nation's name – the vocabulary of pop used to reveal the illegal 'coca' sustaining his nation's economy and linking it to the First World economy of the North. More conceptually intriguing was the project of Cildo Meireles, another Brazilian, who chose physical Coca-Cola bottles as objects in his 1970 project *Insertes em circuitos ideológicos* (Insertions into Ideological Circuits). Meireles's important project was a powerful example of post-modern appropriation, far earlier than such developments in the US, and a sophisticated piece of conceptual art. Rather than simply take the messages, objects, or icons of the US commodity culture as subjects (as 1980s 'appropriation artists' working out of New York would do), the artist here temporarily 'inserts' his silk-screened message onto the unopened cylinder of locally bottled but internationally sold Coca-Cola. Literally 're-oriented', the product and its message were then reinserted into the circuits of commodity distribution – the cannibal commodity was thus sent forth to 'eat' parts of the ideology in which it was otherwise embalmed.

Perhaps it is not surprising that Brazilians such as Meireles and Oiticica should emerge as such important figures for post-modern artists and theorists, because they were forced to respond to the breakdown of a rationalized urban modernism that had tenuously ruled their country from the 1950s to the early 1970s (the utopian capital of Brasilia providing the public face of this modernity). Its intrusive politics made the US (and its commodities) an obvious target, and post-modernism emerged to codify and consolidate these critical approaches to hegemonic cultural forms.

Post-modernism had its origin as a theoretical term in early theories of modern history elaborated by Federigo de Onis and Arnold Toynbee (although a non-theoretical use of the term appeared as early as 1870 to distinguish post-impressionism from the 'modern' styles before it). Implicit in Onis's and Toynbee's writing was a view that industrialization had achieved a certain saturation and had entered a new phase, reflected in Daniel Bell's formulation of late-twentieth century United States as a post-industrial society. When literary theorist Frederic Jameson began using the term post-modernism, it became increasingly associated with post-colonial politics. As Jameson pointed out, the critique of 'master narratives' expressed by post-modernism, echoed the collapse of the major colonial outposts (in Franco-American Indochina, in French Algeria, and in scores of African republics). Arguably, it is the emergence of post-colonial cultures that have created the greatest rupture in the Western paradigm of modern art.

## VIRTUAL LOCATIONS

Clearly the Internet has provided a new cultural platform and a new forum for the circuits of exchange that have long fascinated modern artists. Crippled by the 'digital divide', the Web's ideology of interactivity and universality has not yet been achieved. But there is surprising resonance between the seeming breakdown of Cold War boundaries in geopolitics (even if that breakdown has produced a myriad of other microborders), and the geocultural whirl of art festivals, biennials, and feverish web-based activity. There is, on the one hand, a distinct air of utopian possibility for the localized producers of visual culture and a sense that if their information is sufficiently compelling it may instantaneously find its way to billions of viewers via the Web. On the other hand, the empowered, moneyed elite that still dominates the market for art and its information continue to seek the 'exotic', which is still constructed in terms of the foreign, the distantly local, the (other-) national. Visiting a website is only part of a global art world experience, which increasingly requires travelling to Guadalajara or Singapore, Sydney or Seoul. This path to 'acquire' worldly experience, to capture that sense of an authentic Other outside modernism's reach, has always mobilized the restless and acquisitive culture of modern art.

Artists, in their dealings with new media, have become aware of the demands of site-specificity in new and intriguing ways. Perry Hoberman, a media artist who produces CD-ROMs as well as interactive electronic installations, has a mailing address in New York, but his correspondence rarely comes from that city. He is more likely to be in Espoo (Finland), Tokyo (Japan), Hull (England), Karlsruhe (Germany) or Barcelona (Spain), tweaking an installation's hardware, software, and sculptural components, and trying to find local technicians and helpers to keep it going. The commissioners of his works seek to place themselves in a vibrant electronic community modelled on internationalism, but sense a new transnational identity in the making. Like the 'global village' envisioned by 1960s media guru Marshall McLuhan, venues for electronic art have more in common with each other than with the local, business, or governmental communities that fund them.

In Hoberman's 1998 installation *El Ball del Fanalet* (*Lightpool*), for example, the artist arrived with little more than a laptop, intending to work with local artists and computer scientists on a site-specific installation commissioned by the Fundaciò Joan Mirò. He knew he wanted to integrate music, a computer programme for sensing motion via infrared signals, and a visual 'virtual ground-plane' with which visitors could interact. The final concept and title for the piece came from a local Catalan tradition: a dance competition (the 'ball del fanalet'), in which couples waltz holding tiny coloured lanterns. The participants remain on the dance floor until the candles in their lanterns go out, and the prize goes to the last couple dancing. Hoberman undoubtedly imagined that a local reference such as this would charm his Spanish audience and gently invite them into an encounter with his work. Before this could happen, however, his hosts experienced acute anxiety – would the piece be perceived as supporting Catalan nationalism, hence inflaming the politics of contemporary Spain? (The flashy multinational venture of the Guggenheim Museum in Bilbao had already aggravated the testy Basque politics of the North.) Hoberman's patrons sought, in short, a link with global, transnational, electronic world culture, and they were unsettled when their artist of choice insisted on weaving the local into what he called his 'sensate environment' of dancing creatures and coloured lights.[96]

As in all the international biennials that have proliferated since the end of the Cold War, there is profound tension between the semiotics of the local and the yearning to take flight and escape into the global. This is the most recent manifestation of the dynamics between nationalism and internationalism in modern art – except the 'local' of post-modern art practice is more likely to be sought at the scale of minority urban communities rather than enormous federated states, and the 'global' is staged positively as a productive fiction, or negatively as merely the latest guise of commodity capital. Increasingly, the most successful artists of the twenty-first century are those who navigate and problematize these borders aggressively, employing deeply layered references that can be interpreted one way in their countries of origin, and a different way altogether in the nomadic world of the biennial and the travelling exhibition.

To take one example: the Chinese artist Xu Bing (now working in New York) was steeped in the rarefied, literati world of calligraphy as a young man. His most extraordinary installation to date is the 1995 *Book from the Sky* (also translated as 'Book of Heaven'), which refers to the Asian culture of calligraphy and fills an enormous space with books and unfurled paper printed with hand-carved ideograms in traditional woodblock forms. Viewers unfamiliar with Chinese marvel at this display of erudition – the stacks of hand-printed books and scrolls, which evoke so many of the ancient Chinese triumphs (e.g. the invention of paper, the ideogram, and the woodblock). The experience for the Chinese reader is quite different. Drawn into the texts, which fail to give way to meaningful words and sentences, the 'native' fails utterly to make sense of these impressive, well-formed characters. The fake ideograms are brilliantly done, requiring more erudition than if they were real (to avoid signifying anything, yet mimicking signification so perfectly, is an unparalleled feat in a language of more than 5,000 characters composed of a limited number of 'brushstrokes'). The post-modern concept of 'double-coding' operates here with a vengeance – native literates, and foreign illiterates, have incommensurable experiences of the same piece.

Wenda Gu, who announced his ambition in 1987 to 'transcend the East and West',[97] works with the same conflicted internationalism as Xu Bing. Gu's installations of ideograms and alphabetic sentences in his United Nations Series, which has been ongoing since 1993, are made of translucent gossamer screens in which apparently legible letters and characters are woven with human hair. Western viewers seek recognizable words among the texts, where the proliferation of cursive Arabic writing and Eastern ideogrammatic systems highlight the relative insignificance of the Roman alphabet when compared with other languages of the world. Even where Roman characters appear, the alphabet fails to form words (at least for the reader limited to English, German, and a few Romance languages). Gu and Bing, both included in recent exhibitions that speculate about the drive toward a 'transnational modernity', stubbornly materialize the *texture* of untranslatable locality to demonstrate the stubbornly non-universal aspects of the

world. Invoking Babel just as Tatlin had at the dawn of the last revolutionary century, these artists operate in the transnational art world by calling attention to blindness and the failure to communicate across linguistic and cultural boundaries. Gu adds the simultaneously touching and somehow forbidden dimension of *hair*, 'harvested' from barber shop floors in the places hosting his installations. The translucent scrims of 'organic' language speak only of an essential grounding in the body – a ground that language pretends to transcend, but may only in the end instantiate. These post-modern artists, then, acknowledge the distance of the 'other', but ensure that the operation of 'othering' occurs on both sides of a shifting divide.

There are many paradoxes in this performance or invocation of the 'other' and its imbrication in the nation, as this essay has investigated. Like a hydra, engagements with the 'other' form many heads that loom throughout the history of modernism. To enumerate them is to summarize the arguments of this text: (1) internationalism is condemned to rewrite (and so reinscribe) nationalism and nation, defining Others as *not* international, but local (corollary: to engage the other nation is to discover one's own nationality, and simultaneously to hybridize it); (2) modernist primitivism constructs its others from substrates that are often already modern, as the sophisticated sculptural forms of African masks already suggested; as John Clark notes, the relativizing of one's own history that constitutes an apprehension of the modern can be found in most 'primitive' but colonized cultures; (3) the success of modernist objects in communicating across national boundaries is often purchased, paradoxically, by embedding them deeper in a nativist discourse (this was the case with *Guernica*, which succeeded in representing a nativist 'Spain' to an audience of international Republican sympathizers); (4) the globalism of commodity culture functions in specifically local ways (as seen with *Coca-Cola Plan* and its Italian collector, as well as Brazilian conceptualists' understanding of their local theoretical framework); (5) the global character of the World Wide Web will change the discursive structures of the art world, but probably not the material status of local artistic 'capital' (as the insistent proliferation of national 'biennials' suggests); (6) the unending dream of internationalism (now 'transnationalism' or 'global culture') creates new vocabularies and institutions for shared discourses (the travelling exhibition, the biennial, the post-modern, the post-colonial, the post-oriental), but those discourses are always inflected and understood from within the specific situations and subjects of local culture.

Although we have moved from modernism to post-modernism, there is no escaping paradox. Nation lurks deep within international aspirations, and the global hovers phantasmagorically above the local site where art is viewed. Post-modernism merely continues the modernist antinomies with which we began. Perhaps the most intriguing development is the hybrid and *antropofagist* relationships in art of the new millennium – art seeks to devour its others in order to transform. We must wait until deep into the new millennium before we can evaluate the results of this molecular exchange. What is certain is that artists will be among the first to experience it.

63.   J. Pollock (1947), in C. A. Jones, *Machine in the Studio: Constructing the Post-war American Artist*, Chicago, IL, 1996, p. 47.

64.   H. Rosenberg (1952), in H. Rosenberg, *The Tradition of the New*, Chicago, IL, 1959, p. 25.

65.   A. Kaprow, 'The Legacy of Jackson Pollock', in *Art News*, No. 57, 1958, p. 56.

66.   B. Buchloh, in A. Alberro and B. Stimson, *Conceptual Art: A Critical Anthology*, Cambridge, MA, 1999, pp. 514–37; see also C. A. Jones, *Eyesight Alone: Clement Greenberg's Modernism and the Bureaucratization of the Senses*, Chicago, IL, 2004.

67.   This terminology, although perhaps unfamiliar, is necessary. Once the non-technological cultural products of 'the West' were adopted, adapted, and transformed outside 'the West', the location of their geographical origin no longer constituted a privileged civilizational autonomy. One pernicious legacy of direct colonialism is that the cultural products transferred to the world from 'the West' are somehow always to be denied their *authenticity* to those who adopted them under its duress in places not in 'the West', at least seen from the position which I shall now locate in *Euramerica* or characterize as *Euramerican*. For fuller exemplification, see my *Modern Asian Art*, Sydney and Honolulu, 1998.

68.   See J.-H. Martin (ed.), *Les magiciens de la terre*, Paris, 1989.

69.   See, e.g., Gao Minglu (ed.), *Inside Out, New Chinese Art*, Berkeley, 1998, for country focus; for area-specific shows see A. Poshyananda et al., *Traditions/Tensions: Contemporary Art In Asia*, New York and Sydney, 1996; for exhibitions in which country or area foci are prominent see Hou Hanru and H. U. Olbrich, *Cities on the Move*, Ostfildern-Ruit, 1997.

70.   For early Rimzon material see A. Dube, catalogue essay for *Seven Young Sculptors*, New Delhi, 1985. See also V. Lynn, 'The Art of N. N. Rimzon', *Art & Asia Pacific*, Vol. 3, No. 2, 1996.

71.   Art historically speaking, modernity, modernism, and postmodernism do not form a series of clear-cut tripartite stages, but tend to overlap, particularly if there is a relative freedom to eclectically modify styles whose sources do not yet operate a bounding hegemony, such as the 'syncretic' architecture of early Meiji Japan.

72.   Darwin's position was as follows: 'Thus modern forms ought, on the theory of natural selection, to stand higher than ancient forms. Is this the case? It seems that this answer must be admitted as true, though difficult of proof', p. 174. in C. Darwin, *The Illustrated Origin of Species*, (abridged and introduced by R. Leakey from 6th edition of 1872, including comments which update Darwin's theories or his evidence), London, 1979. For S. J. Gould, see his *Wonderful Life: The Burgess Shale and the Nature of History*, London, 1989, p. 47: 'The maximum range of anatomical possibilities arises with the first rush of diversification. Later history is a tale of restriction, as most of these early experiments succumb and life settles down to generating endless variants upon a few surviving models'.

73.   Since it seems so directly indicative of the problems raised here, please allow a somewhat lengthy citation from Bakhtin's 'Discourse in the Novel', found in M. M. Bakhtin, *The Dialogic Imagination*, (trans. C. Emerson and M. Holquist), Austin, TX, 1981, p. 284–5: 'But internal dialogization can become such a crucial force for creating form only where individual differences and contradictions are enriched by social heteroglossia, where dialogic reverberations *do not sound in the semantic heights* of the discourse (as happens in rhetorical genres) *but penetrate the deep strata of discourse*, dialogize language itself and the world view a particular language has' [my italics].

74. For a discussion of 'double othering', see J. Clark, 'Yôga in Japan: Model or Exception? Modernity in Japanese Art, 1850s–1940s: an international comparison', *Art History*, Vol. 18, No. 2, June 1995, pp. 253–85. For the relativization of 'othering', see J. Clark, 'Gendai Ajia no Bijutsu gensetsu ni okeru "Taka' ('Othering in Modern Asian Art Discourses') translated into Japanese in a volume edited by Shimamoto Kan, from a Tezukayama Gakuin workshop paper of 1996.

75. See Chapter 2 on 'Prehistories' in J. Clark, *Modern Asian Art*, Sydney, 1998.

76. See J. Clark, 'Histories in the Modern', in G. Murray et al. (eds), *Reckoning with the Past: Contemporary Chinese Painting*, Edinburgh, 1996, pp. 17–20.

77. See, for example, the discussion of 'Chairman Mao goes to Anyuan' in J. Andrews, *Painters and Politics in the People's Republic of China: 1949–1979*, Berkeley, 1994, pp. 338–42.

78. For a feminist understanding of Ravi Varma see G. Kapur, 'Ravi Varma's Unframed Allegory' in R. C. Sharma (ed.), *Raja Ravi Varma: New Perspectives*, New Delhi, 1993.

79. See his work 'Duta Indi Bala' [Land not bullets] in the catalogue of the *First Asia-Pacific Biennale*, Brisbane, 1993, p. 31.

80. Among Geeta Kapur's important earlier writings are *Pictorial Space: A Point of View on Contemporary Indian Art*, New Delhi, 1977; *Contemporary Indian Artists*, New Delhi, 1978 [Souza, Kumar, Padamsee, Husain, Khakhar, Swaminathan]; and *Place for People*, [text for exhibition], Bombay and New Delhi, 1981. Li Xianting's activities may be glimpsed in English through his historical essay in V. C. Doran (ed.), *China's New Art post-1989*, Hong Kong, 1993, and the essay 'The Imprisoned Heart', *Art & Asia Pacific*, Vol. 1, No. 2, 1994. For Nakahara Yûsuke's position, see N. Yûsuke et al., *Europalia 89: Japan in Belgium*, Gent, 1989.

81. See Nanjô Fumio and D. Friis-Hansen, *Transculture*, Tôkyô, 1995. Nanjô was very active in the 1980s in introducing Japanese contempoary art abroad. See in particular, K. Halbreich et al., *Against Nature: Japanese Art in the 1980s*, New York, 1981; Kondô Yukio et al., *Japansicher Kunst der Achziger Jahre*, for the Frankfurter Kunstverein, 1990. Hou Hanru was the Chinese adviser for *Les magiciens de la terre* and has since been active as a curator of modern Chinese art in Europe working from Paris. See his essays 'Departure Lounge Art', *Art & Asia Pacific*, Vol. 1, No. 2, 1994; 'Beyond the Cynical: China avant-garde in the 1990s', *Art & Asia-Pacific*, Vol. 3, No. 1, 1996; 'Towards an "Un-Unofficial Art": De-ideologicalisation of China's Contemporary Art in the 1990s', *Third Text*, No. 34, Spring 1996; 'Entropy; Chinese Artists, Western Art Institutions: A New Internationalism', in J. Fisher (ed.), *Global Visions: Towards a new internationalism in the Visual Arts*, London, 1994; 'De "décrire la réalitié" au "théâtre du monde": L'art Chinois depuis 1979' (trans. J. Lacoste), in H. Belleter (ed.), *Face à l'Histoire*, Paris, 1996. See also *Cities on the Move*, note 5, and his conversation with Gao Minglu in *Inside Out*, op. cit.

82. On 'doorkeeping' see J. Clark, 'Art and its "others" – recent Australian-Asian visual exchanges', M. Dever (ed.), *Australia and Asia: Cultural Transactions*, Surrey, 1997, and also Chapter 11 of my *Modern Asian Art*.

83. Thus catalogues like *Cities on the Move*, in a tendency followed by the recent catalogue *Cream*, G. Williams (ed.), London, 1998 (which declares itself to be 'a portable exhibition in a book'), increasingly resemble telephone books where the artists' works become a kind of conceptual address and the name of the artist a fantastic, unfathomable number.

# PHYSICAL CULTURE AND SPORT

*Clarisse Pereira-Palhinhas*

## INTRODUCTION

Physical culture, physical education, physical exercise, physical and sporting activities are all words that express pursuits that are very closely allied, not to say inextricably linked. Jean-Marie Brohm writes 'the first difficulty that arises in studying sport is pinning down the nature of the subject. Just what is sport?',[1] and he observes that the usual meaning lends itself to a fairly broad definition.

The increase in the number of terms associated with physical and sporting activities is the result of the frequently complex progress and development of these activities throughout the cultural history of humanity. Being an integral part of social life, they reflect society as a whole and play a part in its change and transformation. Their significance varies from one era or society to another. The essence and values that they convey depend on ideological, philosophical, anthropological, economic and technical implications, which vary from one historical period or cultural environment to another. According to some historians, physical activities and sports originated in the distant past, and were linked to activities needed for survival (hunting and battle). German sports historian Gerhard Lukas, for example, saw man essentially as a worker and therefore believed that 'throwing the javelin' was the first sport.

Because the history of physical culture determines that of physical education, it cannot be separated from the history of education, which is directly linked to philosophical and pedagogical presuppositions. It seems that physical culture has always been an integral part of the life of different peoples. Robert Parienté tells us: 'The instinct for sport is no doubt as old as man's first leisure activities and the origin of competition is lost in the mists of time. Rivalry between clans or tribes probably provided the original context enabling a form of physical activity foreshadowing sport to arise. Sport appeared as soon as the idea of play entered into daily life and it gradually freed itself from material constraints and difficulties ... Thousands of years actually had to go by before this state of limbo was left behind and the efforts that were wholly devoted to military discipline, as practised by the Egyptians and Chinese, developed into participation in an autonomous and individualized sporting activity ... the oldest evidence available to archaeologists, apart from the Lascaux hunters' cave paintings, dates back to 3500 BC: the

Nile Valley bas-reliefs depicting man in training – running, jumping, swimming and horse-riding.'[2]

Many authors concur with Robert Parienté in believing that sport originated in antiquity and derived from rituals – chiefly funerary rituals, but also those used in initiation and hierogamic ceremonies. Bernard Jeu, author of several books on the nature of sport, believes that from the earliest days of society, sport was linked to tribal life which is thought to have exercised cultural control by the group over the three major events of coming of age, marriage and death. 'For obvious socio-economic reasons, physical values then become social values. For no less obvious reasons – we are talking about undifferentiated societies with a universal culture – social values are sacred values.'[3]

Taking ancient games, including Homeric sports, as their starting point, two eminent authors have dealt brilliantly with the notion of play and sport. Johan Huizinga in his book *Homo ludens*,[4] and Roger Caillois in *Man, play and games*,[5] put forward ideas and analyses for understanding the phenomenon of sport. The two authors show how culture and play are linked. Caillois maintains that modern civilization arose with the advent of *agon* (competition), and that ordered competition established meritocracy. He also maintains that, of the early civilizations based on the dual concept 'mimicry-ilinx' (simulation and vertigo), Ancient Greece made the transition to become a civilization based on the pairing of *agon-alea* (competition and chance). Huizinga notes that there is a link between *agon* and *agonia*, which initially meant 'competition' and later acquired the additional meaning 'struggle of the soul' or 'anguish', an important aspect of sport, given the uncertainty of victory. Sport is said to help reduce the anguish inspired by everyday existence and questioning about the purpose of life and the meaning of death. Authors such as G. R. Luschen and P. Seppanen also consider that sport can reduce anguish in our modern societies as it did in ancient society.

According to Raymond Thomas, 'In ancient Greece, many temples specialized in divination. Oracles were consulted. People sought to know the future and so reduce the role of chance.... In modern times, competitions are still associated with gambling (horse racing and football pools). The most popular sports are those that leave room for chance, football in particular. On the other hand, the athlete tries to reduce the role of chance in his performance by

training.'[6] Worry over the chance effects of imponderables in any sporting event and fear of the unpredictable are all to be found in different cultures.

In the view of Bernard Jeu, author of *La vraie nature du sport*, there is a line of continuity running through pagan ceremonies (worship of the Greek, Inca or Egyptian gods, for example), the popular games derived from them and the practice of modern sports. Many of the rural games played in medieval Europe are regarded as relics of pagan ceremonies, and games such as *soule* or *choule* (in France) and *calcio* in Italy are thought to be the forerunners of rugby and football. Allen Guttmann, in his book *From Ritual to Record*, maintains that sport, beginning as a ritual in ancient societies, became a competitive system with the advent of modern societies based on efficiency.

There would thus appear to be some kinship between ancient and modern sport, a line of continuity, a thread running through different ages. James Riordan, analysing sport in the countries of the former Soviet bloc, makes the following comment: 'Sport has the same function as religious ritual in that it serves to develop what Durkheim calls cohesion, solidarity, integration, discipline and emotional euphoria.'[7]

For other theorists, this continuity is now being broken by modern sport, which they consider to be linked to the industrial system and the laws governing it; in that context it emerges as a category of its own. P. Laguillaumie, for example, writes: 'Not only is the emergence of modern sport – i.e. sport practised in certain types of organized situation, radically different from those of antiquity – a historical phenomenon dating from the advent of bourgeois industrial mechanization during the ascendant phase of capitalism, not only did the global development of sport follow the global development of capitalism, but also, and most important of all, its internal organization, structures, forms and content are now essentially bourgeois.'[8] They feel that the principle of productivity is triumphant in modern sport; measurement, quantification, setting of new records, speed are its basic characteristics, mirroring those of the industrial system that produced it.

On the other hand, some modern sports specialists refuse to see anything more than a trans-historic phenomenon here; in their view, physical exercise has always existed and they feel that modern sport is no different from what went before.

Allen Guttmann, however, spells out seven specific characteristics of sport in modern society, as compared with sport in the ancient world: (a) secularism: sport is no longer associated with religious ceremonies; (b) equality of opportunity: games are open to everybody; (c) specialization of roles; (d) rationalization: sport is subject to strict rules; (e) bureaucratization; (f) quantification: modern sporting performance is measured; and (g) setting of new records: there are winners, a new record is set.

## ORIGINS OF PHYSICAL ACTIVITIES FROM ANCIENT TIMES TO THE NINETEENTH AND TWENTIETH CENTURIES

### Ancient Greece

The American school of cultural anthropology sees culture as a pattern, which is impressed upon the mentality of every person within a given cultural sphere through education and learning. There is therefore a 'cultural basis for personality' or 'basic personality', which is the distinctive psychological configuration of the members of a particular society, manifesting itself in a certain life style. Because physical culture is an integral part of the general culture of any given society, its specific features and mode of development differ from one period or people to another.

Education is defined as 'a set of measures intended to develop the physical, intellectual and moral faculties of the child, adolescent and/or adult, in order to prepare them for social life ... Educational institutions and practice are closely related to social systems, their role being to hand down a culture and a body of knowledge and also to provide for social and economic development'.[9]

Not until we come to Ancient Greek civilization do we find the first concrete and theoretical evidence of a genuine educational system, one in which a pedagogical and methodical approach was adopted. Ancient Greece attached great importance to a form of education that inculcated the ideals of society into the child: discipline and strength in warlike Sparta, a sense of beauty and rhetorical style required by the citizen in the democratic city of Athens.

In the fourth century BC, the first educational institutions were established: *palestrae* and *gymnasia*, where the adolescent trained his mind and body. He subsequently undertook ephebic service, i.e. military service and civic education. In the *Iliad* and the *Odyssey*, the epic poet Homer describes the martial and athletic feats of Ulysses with many interesting details, and Book XXIII of the *Iliad* depicts the games organized for the funeral of Patroclus. 'The events include chariot racing, boxing, pankration, running, fencing, throwing the discus and archery. They clearly foreshadow the programme of Olympic events that developed from the first Olympiad onwards'.[10] The first Olympic Games were held in 776 BC, when the name of the Greek athlete Koroebos was carved in stone after he had won the race from the stadium to Olympia; 776 BC is therefore the official date for the birth of sport in Greece.

The word *athlete* comes from *athlon*, a Greek word meaning both 'contest' and 'what is to be won in the contest', the original prize being a crown of wild olive leaves.[11] It should be noted, however, that the sports *athlon* originated in the Mediterranean world around the sixteenth century BC, and that the Cretans had been enjoying running, *pankration* and bullfighting ever since that time. The bas-reliefs of Knossos and the sculpted vases of Aghia Triada show many details of athletic life in Crete.[12] Sport contests in Olympia were both religious and patriotic ceremonies. They were dedicated to the gods Zeus, Poseidon, Hercules and Apollo, and to the goddess Hera. Bertrand During explains: 'The Greeks did not speak of "games" but of "things Olympian", which touch upon the sacred and illustrate the seriousness of competitions that are all about coming closer to the perfection of the gods. The central value is that of courage, which enables competitors to attain the heroic: if we cannot be eternal we can still be glorious.'[13]

### The Roman Empire and the Middle Ages

In the Roman Empire, where all education had initially been provided by the family, the Greek model was adopted for the training of the mind: reading, writing, arithmetic,

Greek and Latin literature, and initiation in the art of public speaking. But physical education was somewhat neglected since the Romans preferred the barbaric games of the circuses where they cheered on the slaves as they slaughtered each other. The Olympic Games were regarded as a source of paganism and were abolished by Emperor Theodosius, a Christian convert. The new theocracy was therefore one reason why the Olympic Games disappeared for many centuries.

Medieval Europe, the successor to the Roman Empire, perpetuated the old educational model while Christianizing its content, following the example of Saint Augustine, and providing a systematic framework for the liberal arts of Hellenistic origin.

But, 'paradoxically, it was Christianity which, having dug the grave of ancient sport, was to invent modern sport … Indeed, the Middle Ages provided an essential boost … Admittedly, the great concern of the Middle Ages was not so much to be learned as to be strong. The first priority was self-defence; people died young and were less attached to life than they are today. They risked their lives for pleasure, for what was really at stake at tournaments were the lives of the competitors. Kings and popes consequently issued numerous decrees forbidding jousting on account of the pointless deaths it caused … Games were like war and war was like a game. Jousting and fencing were practised on a very wide scale by the nobility'.[14] From the eleventh century onwards, the passion for violent games and exercises throughout medieval Europe lasted a very long time. The lance, the spear, the mace, the bow, the crossbow and the halberd were all used in bloody contests. The numerous duels are described in epic narratives. In France in the eleventh century, the game of *soule*, also known as *choule*, became immensely popular. This was played with a ball made of wood or leather, filled with straw or bran or blown up with air, and was the forerunner of football and rugby. *Soule* – a people's game, although it was also very popular with the clergy and even with nobles and kings – pitted entire villages against each other for several days amid scenes of extreme violence. Many young people died during the game since no holds were barred. '*Soule* was thus the dominant sport in twelfth-century France. It was imported from the continent to England, where it was soon to become known as football.'[15] 'The Middle Ages saw the development of other forerunners of modern games, such as the *jeu de paume*, whose relation to tennis is obvious in that it called for much the same sort of space. Paris had 250 *jeu de paume* courts at the end of the sixteenth century. *Calcio* was a Florentine ball game (*calcio florentino*).'[16] Hence the name of the Italian football federation, founded in 1898: *Federazione Italiana Gioco Calcio* or *Federcalcio*. The transformation of traditional games into modern sports highlights the close link between the notion of play and that of sport. 'The word "sport" is thought to be derived from the old French word "desport" (disport or entertainment) and we know that in Rabelais the verb "desporter" means to disport or enjoy oneself … The word "sport" appears in French in 1820, and refers initially to such activities as racing and betting, fishing, hunting, polo, fencing, golf, cricket, boating, i.e. the many fashionable leisure pursuits practised at seaside resorts, many of them in imitation of Great Britain.'[17] Hence the widely held view, propounded notably by the sociologist Norbert Elias, that sport was born in the United Kingdom, the result of the Industrial Revolution and urbanization,

and part of the long process of cultivating civilized behaviour and controlling violence. However, the dispute between the French and the English over the invention of the word 'sport' continues to this day. Another tradition looks to the English word 'sport', in the sense of hunting, which dates back to the sixteenth century. The word in its modern sense was only recognized by the Académie française in 1878.

Michel Bouet describes the end of the medieval system of martial games as follows: 'However, what was lost in this way were the knightly martial exercises. The popular games wrestling, *soule* and *crosse* were still played, particularly by the peasantry. And in the expanding towns, the need to train citizens for defence gave rise to some form of archery militia. In addition, the *jeu de paume* was taken up by a large number of city dwellers, as it provided the exercise they were beginning to feel the need for and could be practised within a restricted space.'[18]

## The sixteenth to the eighteenth century and the schools of gymnastics

The period from the sixteenth to the eighteenth centuries includes the Renaissance, when people joined with Montaigne in stressing the necessary relationship between training and pragmatism, in which travel was a way of educating. With the advent of the Jesuit colleges came the first educational 'methods'. In Reformation countries, the availability of the Bible in the vernacular meant that the lower strata of society could be educated. In Catholic countries, the mission to educate the Christian people was taken up by John Baptist de la Salle and the Brothers of the Christian Schools with the establishment of free elementary schools (*petites écoles*).

In Great Britain, the Protestant schools came to advocate a form of education designed to produce the 'muscular Christian', one who was strong and in good physical health. This trend continued to develop right up to the nineteenth century, when sporting practices born in British schools spread to other countries. The eighteenth century, the age of the Enlightenment, saw a systematic review of education, typified by Jean-Jacques Rousseau's *Emile*, which extolled the merits of a healthy childhood and adolescence resulting from physical exercise in the open air. Meanwhile, in continental Europe, increasing emphasis was being given to the role of the school in developing the physical abilities of future citizens. Physical exercise within the restricted and often closed confines of the school encouraged the institutionalization of 'gymnastics'. The European armies considered gymnastics as an essential part of the training of the individual, who was regarded first and foremost as a citizen, ready to defend his homeland, and the official status they gave to gymnastics was in marked contrast to the liberal, recreational and social character of British sport. The reaction to the French Revolution and the Napoleonic Empire gave a particular boost to gymnastics in Germany. In 1793, Johann GutsMuth wrote the first treatise on gymnastics for young people. In 1811, Friedrich Ludwig Jahn founded a gymnastics club, the *Turnplatz*, with a view to combating the 'degeneration of the race' and developing a sense of patriotism.

There are many reasons why gymnastics found it difficult to break free from the context of conscription, given that the social climate in continental Europe was decidedly nationalistic

and militaristic. At that time, the culture of gymnastics was dominated by two major schools of thought:

1. Swedish Gymnastics devised by Per Henrick Ling (1776–1839), which were to contribute to the simultaneous development of mind and body and had four objectives: educational, military, medical and aesthetic.
2. German Gymnastics passed down from Jahn, which placed great emphasis on the use of equipment.

The debate over the relative merits of Swedish and German gymnastics was to continue until 1920.

In France, gymnastics took a particular turn owing to the experiments of Colonel Francesco Amoros (a naturalized Frenchman of Spanish origin), who was regarded as a follower of Pestalozzi (a Swiss) and Jahn (a German). His keen interest in medicine and human mechanics led him to adopt scientific methods, including the physiological record cards of Dr Verdier and the dynamometer to measure muscular effort. He set up several gymnasiums, including the Grenelle 'gymnase normal' – civil and military – in 1819, which was over-equipped with apparatus. The French army adopted the Amoros method for the military gymnastics training school at Joinville-le-Pont, which was established in 1852. A decree of 1869 made gymnastics compulsory in schools and teacher training colleges. The 1902 military regulations introduced Swedish gymnastics into barracks. In this way the outlines of a standard and normative form of gymnastics were established in France, exemplified by school gymnastics which represented a harmonious synthesis of the Swedish and German methods.

### Great Britain and the sporting revolution of the nineteenth century

The nineteenth century saw the general democratization of education in Western Europe. It was the century in which, at widely differing dates from country to country, state education systems were introduced. In France, this democratization dates from Jules Ferry's law of 1882, which made education compulsory and free throughout the Republic. The rapid spread and democratization of sport throughout France then followed as a result of the massive increase in schooling and the rise in the number of associations. The British played an essential role in inventing modern sports, in making them known and getting them adopted in Western Europe, and in changing attitudes towards physical culture.

In Great Britain and the United States in the mid-nineteenth century, an entertainment industry grew up, offering spectator sports and new leisure activities open to everybody. A taste for holidays, travel, leisure pursuits and amateur sports developed.

'Between 1828 and 1842, the Headmaster of Rugby School, Thomas Arnold, shaped the minds of young Englishmen. His originality consisted in making sport an element in character formation: the pupil learned to appreciate the importance of self-discipline. Sport became a major plank in moral education and, closely associated with study, it rapidly became the cornerstone of all British education on which the power of the kingdom and the empire was largely based.'[19] In 1841, the Englishman Thomas Cook organized his first trip, and the Swiss author and cartoonist, Rudolph Töpffer, published his book

*Voyages en Zig-Zag.* 'School games are codified in English schools by teachers like Thomas Arnold: football, rugby, polo, boxing, swimming and athletics are the main ones listed in this way and rugby is, in the words of J.P. Bodis, the great educational sport of Great Britain.'[20] Legend has it that in 1823, a pupil at Rugby School, William Webb Ellis, pushed the ball into the opponent's goal with his hand and thus invented what was soon to be known as rugby football, after the name of the town where it originated.

In 1850, the public schools, the universities and large towns were equipped with gymnasiums. The first British sports federations were established: the Rugby Football Union (1871), the Scottish Football Union (1873), the Amateur Athletic Association (1880) and the Northern Rugby Union (1895). Other European countries decided to follow Great Britain's example and set up their own federations, and the Italian Football Federation or Federcalcio was set up in 1898, the Union des Sociétés Françaises de Course à Pied in 1870, and the Deutscher Fussball-Bund in 1900.

The English sporting vocabulary also gained ground: jockey, turf, pedigree, running footmen, riding-coat and sportsman (in the sense of horse-riding enthusiast). British engineers working on the construction of railway lines and commercial employees were responsible for founding the first sports clubs in Europe and on the route to India. They were established in Mauritius as early as 1812, and between 1855 and 1892 in Belgium, the Netherlands, France, Switzerland and Russia. The Juventus Club in Turin (Italy) was established in 1897. In France, the pupils at the Lycée Michelet in Vanves founded the Olympique in 1870, those of the Lycée Condorcet established the Racing Club in 1882, and those at the Lycée Saint-Louis founded Le Stade in the *Jardin des Tuileries* in 1883. Modern sport was now regarded as a means of instilling discipline and sound morals; it reflected a resolve to 'civilize' traditional games by imposing rules and regulations in an attempt to rechannel aggression and violence, bringing players together in federations and clubs, organizing regional and then international competitions and championships. The year 1885 saw the birth of professional football in England.

### Rise of American sports and birth of handball in Europe

The United States, a decolonized nation wishing to assert its individuality, created its own sports, such as American football and also baseball, which was to become the sport that symbolized the nation. In December 1891, James Naismith, a physical education teacher at the Young Men's Christian Association (YMCA) in Springfield, Massachusetts, invented basketball, an indoor ball game, to occupy students during the long winter months. The game rapidly spread to other countries via the YMCA's worldwide network, and young people were playing basketball as early as 1892 in Canada, 1893 in France, 1897 in Bohemia, 1904 in Turkey and 1905 in Russia. In the United States, the first professional basketball league was formed in 1949. The 'Dream Team', formed in 1992 with Michael Jordan as captain, comprised all the stars of American basketball and made a huge impact internationally.

At a YMCA event in 1895, the Reverend William G. Morgan, a former student of James Naismith and head of Physical Education at Holyoke College (Massachusetts),

demonstrated a ball game involving volleying a ball back and forth, which therefore took the name *volleyball*. Having spread through the YMCA network, volleyball became very successful in the United States and other countries in the Americas, such as Canada, Brazil and Cuba, and even as far afield as Asia, where it was taken up in China, Japan and India. These two ball games gained prominence in Europe during the First World War. In the course of the twentieth century, basketball and volleyball gradually spread all over the five continents. The FIBA (International Basketball Federation) and the FIVB (International Volleyball Federation) were established in 1932 and 1947 respectively.

Baseball and American football have not really caught on in other countries, apart from Cuba and Japan after 1945, following the spread of American culture to the Land of the Rising Sun. Baseball, which was often played in military camps during the American Civil War, 'became the national game because it perfectly mirrors the structure of American civilization; it is an outdoor sport in which performance can be measured.'[21]

Handball was invented in Czechoslovakia in 1892 by J. Klenker, who devised a ball game called Česka Hazena, similar to modern seven-a-side handball, but played in the open air. In Denmark, in 1898, H. Nielsen promoted seven-a-side handball, which was played indoors because of the severe cold. Germany developed an eleven-a-side version, modelled on rugby and football. In 1919, Karl Schllenz laid down rules: goal area barred to players other than goalkeeper; movement with the ball limited; and some contact authorized. Adopted as a complementary sport by basketball and athletics federations, handball's own amateur international federation was established in 1928 when the Olympic Games were held in Amsterdam. In 1946 the federation became the International Handball Federation and set up its headquarters in Stockholm.

## THE REVIVAL OF THE OLYMPIC GAMES

### Baron de Coubertin and internationalism in sport

At the end of the nineteenth century and in the twentieth century, sport in France and subsequently throughout the world was marked by the fascinating and passionate figure of Pierre De Fredi, Baron de Coubertin (Plate 159), born on 1 January 1863. In 1883, Pierre de Coubertin went to England, having read many books on teaching methods being used across the Channel, particularly Taine's *Notes sur l'Angleterre*. 'There he visited many schools, met a lot of important people and returned to France dazzled by what he had seen. From then on, his whole mind was focused on the phenomenon of sport in education.'[22] In 1886, totally won over to English ways, he took up his pen to write *La réforme sociale*, in which he proposed a reform of French education. At the age of 25, as Secretary of the Committee for the Preparation of Physical Exercises in Education, he was granted in 1888 an audience by President Sadi Carnot, who listened carefully to his ideas. That same year a journalist, Pascal Grousset, established the National League of Physical Education, whose avowed goal was to combat the 'Anglomania' of Coubertin's Committee, nicknamed the Jules Simon Committee after the Minister of Education. Many eminent figures were members of the League,

including Marcellin Berthelot, Clémenceau, Pasteur and Jules Verne. Nevertheless in 1889, Coubertin was appointed France's representative to a congress on physical exercise held in Boston, Massachusetts.

On his return, he worked with even greater determination on his planned reform of the whole French education system. Then, in the course of 1889, he sent a thesis on the moral dimension of athletics to the *Association pour l'Avancement des Sciences*. At the end of 1889, Georges de Saint-Clair transformed the Union des Sociétés Françaises de Course à Pied into the Union des Sociétés Françaises de Sports Athlétiques (USFSA), to which he wanted to affiliate the school associations inspired and in many cases actually established by Coubertin. In 1890, the reform of French education was finally decreed and Physical Education and Sport were incorporated into the curriculum.

In 1891, Pierre de Coubertin transformed the Jules Simon Committee into the Conseil Supérieur de l'Education Physique. Father Didon, principal of Arcueil College, and one of his admirers and disciples, had the words 'Citius, Altius, Fortius' (faster, higher, stronger) embroidered on the pennant of his school club. These words were to become particularly famous, since they were chosen by Coubertin as the motto of the Olympic Games. On 25 November 1892, at an official ceremony presided over by the President of the Republic and held in the Great Amphitheatre of the old Sorbonne in Paris, Coubertin launched the idea of establishing 'the Olympic Games of the Modern Era'. Admittedly, the idea was not a new one. As early as 1834 Gustav Schartau had supervised the organization of the Scandinavian games, which were inspired by the Games of Ancient Greece. In 1850, an unsuccessful attempt to revive the games was made by a rich Greek tradesman, Evangelios Zappas. Inspired by the dream of a Greek renaissance, he organized an Olympic competition but lost a lot of money and achieved very little. In 1869 in Great Britain, the Much Wenlock 'Olympic Games' were held. None of these initiatives came to anything, however. Between 1874 and 1881, archaeological excavations carried out in Olympia by the German archaeologist Ernst Curtius had once again drawn attention to the ancient site of the Greek Games. A series of articles by Philippe Daryl, the pseudonym of Pascal Grousset, also helped promote the idea of a modern version of the Olympic Games.

International tension made Coubertin responsive to pacifist ideas, and in *Pédagogie Sportive* he wrote: 'Effort is the supreme joy; success is not an end but an incitement to aim higher; the individual has value only in relation to humanity as a whole.'[23] Coubertin's views would very soon be heard well beyond the frontiers of France and his hopes were expressed in the following terms: 'The time has come for international sport to play a new role in the world. Germany has dug up what remains of Olympia, why should France not succeed in restoring its splendour?'[24]

### The revival of the Olympic Games: Establishment of the IOC

The revival of the Olympic Games was at last officially pronounced on 23 June 1894 in the Great Amphitheatre of the new Sorbonne by the international congress of universities and sporting bodies convened for the purpose. An International Olympic Committee (IOC) was set up

comprising six members. Coubertin was its president from 1896 to 1925. He nominated the other members – a Greek, a Swede, a Russian, a Hungarian and an Argentinian – and they drafted an Olympic Charter. Later, the make-up of the IOC was to change. 'Why did I revive the Olympic Games? To ennoble and strengthen sports, to ensure that they would be independent and long-lasting, and thus to enable them better to fulfil the educational role incumbent upon them in the modern world. And for the glorification of the individual athlete, whose existence is necessary for the muscular activity of the community, and whose prowess is necessary for the maintenance of a general spirit of competition.'[25]

Coubertin saw himself as one 'rebelling' against the 'worm-eaten philosophy' of the social and educational order and decided to create a new system of education for his own country and a new form of dialogue between all the countries in the world through sport. He expressed the wish that the first of the genuinely international, modern Olympic Games should be held in Paris in 1901. However, he gave way to the Greek Government, which was accorded the honour of hosting the first international games in Athens from 5 to 13 April 1896 on the site of the ancient games. A Greek patron from Alexandria, Averoff, financed the reconstruction of the stadium built in the fourth century BC, and other costs were subsidized by the Greek Government with the aid of a public subscription and sales of commemorative stamps. Built on the side of Mount Hymette, the stadium is entirely of marble and is U-shaped.

### First new event: the marathon

Two hundred and thirty Greek and 81 foreign athletes competed at the Greek games. The programme comprised nine disciplines and 43 events, including a new one: the *marathon*. This event was conceived and suggested by the French philologist, Michel Bréal, in honour of the valiant soldier Philipides, who ran 42 kilometres from the town of Marathon to bring news of the victory over the Persians (490 BC) to Athens, and thus became the symbol of a nation and of a supreme mission. In 1895, 'Bréal wrote to Coubertin to tell him he would be giving a silver cup to the runner who, having set off from Marathon, reached Athens the first'.[26]

'After the Frenchman Albin Lermusiaux and the Australian Edwin Flack had dropped out, having taken turns to set the pace, Spiridon Louys, the "water-carrier from Amaroussi", a working-class district of Athens, won the marathon on 10 April, causing an explosion of nationalist feeling.'[27] 'A cannon shot boomed out and 60,000 hearts beat as one. At first there was blank silence, and then a shout of joy. Louys entered the stadium. His final lap was both agony and bliss. Two Greeks lifted him from the ground, hoisted him onto their shoulders and carried him to the King. Greece was reborn.'[28] Coubertin, applying 'sports psychology' before it had been invented, assessed the hero's success in the following terms: 'Spirodon was a fine-looking shepherd dressed in a common *fustanella* and a complete stranger to scientific training methods. He prepared himself for the race by prayer and fasting and is said to have spent the previous night in front of icons lit with candles. From then on I was convinced that the mind played a much more powerful role in sport than is normally believed.'[29]

And so began the legend of the modern games, to which numerous new events were to be added in the course of the twentieth century. The very first champion of the modern era, however, was the American James Connolly. He covered 13.71 m in the triple jump, beating the Frenchman Alexandre Tuffere's performance (12.7 m) by more than one metre.

## THE OLYMPIC GAMES FROM 1900 TO TODAY

It was decided that the modern Olympic Games, like those of Ancient Greece, should be held every four years. During the first games in Athens, the idea of making Greece the site of all future Olympic Games was widely mooted, but Coubertin was afraid that Athens would be unable to bear such a financial and organizational burden every four years. 'At the banquet given at the close of the Athens games of 1896, he therefore proposed that all major cities throughout the world should host the games in turn.'[30] But the organizers were frequently tempted to establish a permanent site for the games, owing to the exorbitant cost of providing facilities in keeping with requirements. Hitler proposed Germany for this purpose after the Berlin Olympics of 1936; then, after the Montreal games of 1976, the idea of a permanent site close to Olympia was again considered, though without any practical steps being taken to date. Given the scale of the economic benefits and the prestige conferred by the games, a great number of candidate cities continue to vie for this privilege. Rome is the only city ever to have asked for the games to be relocated. It gave up the task of hosting the Fourth Olympiad owing to force of circumstances (the eruption of Vesuvius in 1906) and the 1908 Games were reassigned to London.

The second Olympic Games were held in Paris in 1900, on the site of the Universal Exhibition, with the participation of 24 Olympic Committees and 1,225 athletes, including for the first time 19 women. The first female gold medallist was the British tennis player Charlotte Cooper. The organizers of the exhibition spread the competitions over five months, an arrangement not in keeping with the Olympic character of the events.

The same mistake was made in the United States at the Third Olympiad of 1904 in Saint-Louis, where events were spread over more than four and a half months and were lost amid the chaos of the Universal Exhibition. These games were attended by only 11 nations and 496 athletes. The London Games of 1908 were truly international, with 2,059 athletes from 22 nations. At these games, archers Willy and Lottie Dod became the first brother and sister medallists, and for the first time an athlete – Dorando Pietri, a marathon runner from Capri – was disqualified for drug-taking.

At the Stockholm Olympics of 1912, the growing appeal of the games was confirmed as they were attended by 28 nations and 2,541 athletes (including 57 women), and there were 102 events. These games were a model of efficiency, since the Swedish hosts officially introduced the use of electronic timing devices, as well as the first loudspeaker system. Sweden refused to allow boxing matches on its territory, which prompted the International Olympic Committee to limit the powers of the host country in

relation to the preparation of the programme for the games. The most popular hero of the 1912 games was Jim Thorpe, a Native American from Oklahoma. Thorpe won the five pentathlon events and broke the world record in the 10 decathlon events.

## Olympic protocol becomes more elaborate

The 1920 games in Antwerp, Belgium, were the first to fly the Olympic flag with its five rings (representing the five continents), and to require athletes to take an oath. At the age of 72, Swedish marksman Oscar Swahn won a silver medal in the team double-shot at a moving target event, becoming the oldest medallist in the history of the games. The games were attended by 29 nations and 2,669 athletes, including 78 women, and featured 154 events. Pierre de Cubertin's motto for the Olympic Games – *Citius, Altius, Fortius* (faster, higher, stronger) – was first introduced at the 1924 Olympics in Paris. The games were fast attracting more nations and gaining more media attention. The number of participating countries rose from 29 in 1920 to 44 in 1924 at the Paris games, which were covered by more than a thousand journalists. The ceremonial aspects were also becoming more marked with each successive Olympiad, and the Paris games saw the introduction of the ritual hoisting of three flags during the closing ceremony: the flag of the International Olympic Committee, that of the host country, and that of the next country to host the games.

The Olympic flame was lit for the first time at the Amsterdam games in 1928, during the opening ceremony, and the Greek delegation led the march-past of athletes with the delegation of the Netherlands, the host nation, bringing up the rear. Greece at the front, host country at the back, was henceforth part of the Olympic protocol. It is thus easy to see how much more elaborate the Olympic ceremonial was becoming, and how it was becoming full of symbolism: official opening of the games by a head of state, carrying of the Olympic flame and lighting of the Olympic fire, Olympic oath sworn by an athlete chosen for his or her achievements, march-past of the National Olympic Committees with the flags of their countries, headed by Greece, and for the first time, in Munich in 1972, the swearing of an oath by officials at the opening ceremony.

## The Winter Olympics

When the IOC instituted the Winter Olympics, the first games were held in Chamonix, France in 1924 (Plate 160). The Winter Olympics are devoted to sports involving movement over snow and ice, the main ones being cross-country skiing, downhill skiing and ski-jumping, the giant slalom (since Oslo, 1952), figure skating (single or in pairs), speed skating, snowboarding (an American invention), bobsleigh, and (by way of team games) ice hockey. The first ski factory was set up in Christiana, the old name for Oslo, in 1886. In 1892 the International Skating Union was established in Scheveningen, in the Netherlands, and the first world figure skating championship was held in Saint Petersburg, Russia, in 1896. From the beginning of the twentieth century, winter holiday resorts such as Saint Moritz (Switzerland), Briançon (Hautes Alpes, France), and Chamonix (France) made a very important contribution

to the development of winter sports and the organization of championships. The nineteenth winter games in Salt Lake City (Utah, United States) in February 2002, brought together more than 2,400 athletes competing in 78 events, figures hitherto unequalled in the history of the Winter Olympics. But the first games of the new millennium were marred by a scandal leading to the resignation or dismissal of a number of members of the IOC who had been denounced by the press for corruption in the vote to designate Sydney (for the 2000 Olympics) and Salt Lake City for the Winter Olympics. This revealed the extent of one of the most undesirable aspects of the commercialization of sport.

## The Paralympic Games

The Paralympic Games were instituted to give thousands of physically or mentally handicapped athletes in the world the opportunity to take part in international competitions. With the introduction of these games, the twentieth century gave sport a new dimension. The main initiator was Ludwig Guttman, a neurosurgeon at Stoke Mandeville Hospital near London, who had the remarkable idea of organizing games for his paraplegic patients, Royal Air Force veterans wounded in combat during the Second World War, to be held in parallel with the London Olympic Games in 1948. On the first day of the London Olympics, just as the games began, he organized the first games for handicapped persons in wheelchairs at his hospital. However, the first Paralympics were not held until 1960, when Rome was host to 300 handicapped athletes.

The Paralympic Games are held after the summer Olympics and are now the second largest sporting event in the world in terms of the number of participants – 5,000 at the Sydney games – emphasizing the need to make better provision for everybody in modern society, since everyone has the same need for joy in life and for self-esteem derived from the appreciation of others. People with different handicaps take part in the games: amputees (lower or upper limbs), tetraplegics or paraplegics in wheelchairs, people with visual handicaps, learning difficulties or certain types of motor deficiency. The sports are highly varied: shooting, archery, athletics, swimming, cycling, table tennis, judo, weight-lifting, sailing, and more. Impressive feats are performed, but they need to be more widely covered in the media if further progress is to be made in breaking down stereotypes and changing behaviour.

## Women's participation in the Olympic Games

After the Amsterdam games (1928) the number of women taking part steadily increased. They were finally authorized to compete in the gymnastics and athletics events, having previously competed only in tennis, golf, figure skating, sailing, swimming, fencing and archery. In Helsinki in 1952, the Soviet Union took part for the first time and its female gymnasts turned out to be particularly impressive. They succeeded in dominating the events for forty years until the Soviet Union split up.

The question of the role of women in sport was highlighted very early on by international organizations such as the Socialist Workers' Sports International (1913),

the International Workers' Association for Sport and Physical Culture (1920), more generally known as the Lucerne Sports International or LSI, the Red Sport International (1921) and their national branches, and also by the vast network of sports and cultural associations linked with the non-Marxist left. Women won the right to vote in 1914 in the United States, in 1919 in Germany, and in 1918 in Great Britain (at the age of 30, then at the age of majority in 1928). Women's sports clubs were set up. In France, the Fédération Sportive et Gymnique du Travail (FSGT), founded in 1934, played an active part in a broad movement to promote a rapid increase in the numbers participating in sport, men as well as women. The combined effects of the democratization of public education, the political emancipation of women and the work of the sports associations and federations gave a tremendous boost to women's sport in the industrialized countries.

Only with the advent of decolonization and national independence did female athletes from Africa and the Middle East emerge to give such dazzling performances at the Olympic Games. Having been only 19 to compete in the 1900 Paris Olympics, the number of women competing in

the Sydney Games in 2000 was 4,069, compared with 6,582 men, an overall percentage of nearly 40 per cent

In May 1999, the former coach of France's national football team, Aimé Jacquet, told a national conference in Paris on women and sport: 'In addition to participating and competing, women still have to secure a place in the administrative field. Their sensitivity, intuition and sense of responsibility should equip them to play a full part in the work of organizational and decision-making bodies. But they are not doing so at the moment'.[31]

Table 10 and Figure 3 show how far women's participation in the Olympic Games has increased since the end of the nineteenth century.

## The first African Games: Brazzaville

The first African Games were held in Brazzaville (Congo) in 1965. An all-purpose stadium – among the first such architectural achievements to be built on this scale in Africa (800 million CFA francs) – had been inaugurated in June 1964 so that the games could be an all-Africa event.

*Table 10* **Male and female athletes participating in the Summer Olympics**

| Year | City | Nations | Athletes | Men | Women | Events |
|------|------|---------|----------|-----|-------|--------|
| 1896 | Athens | 14 | 245 | 245 | 0 | 43 |
| 1900 | Paris | 24 | 1,225 | 1,206 | 19 | 87 |
| 1904 | Saint Louis | 13 | 689 | 681 | 8 | 94 |
| 1908 | London | 22 | 2,035 | 1,999 | 36 | 109 |
| 1912 | Stockholm | 28 | 547 | 2,490 | 57 | 102 |
| 1920 | Antwerp | 29 | 2,669 | 2,591 | 78 | 154 |
| 1924 | Paris | 44 | 3,092 | 2,956 | 136 | 126 |
| 1928 | Amsterdam | 46 | 3,014 | 2,724 | 290 | 109 |
| 1932 | Los Angeles | 37 | 1,408 | 1,280 | 127 | 116 |
| 1936 | Berlin | 49 | 4,066 | 3,738 | 328 | 129 |
| 1948 | London | 59 | 4,099 | 3,714 | 385 | 136 |
| 1952 | Helsinki | 69 | 4,925 | 4,407 | 518 | 149 |
| 1956 | Melbourne | 67 | 3,184 | 2,813 | 371 | 145 |
| 1960 | Rome | 83 | 5,348 | 4,738 | 610 | 150 |
| 1964 | Tokyo | 93 | 5,140 | 4,457 | 683 | 163 |
| 1968 | Mexico City | 112 | 5,530 | 4,750 | 780 | 172 |
| 1972 | Munich | 121 | 7,123 | 6,065 | 1,058 | 195 |
| 1976 | Montreal | 92 | 6,028 | 4,781 | 1,247 | 198 |
| 1980 | Moscow | 80 | 5,217 | 4,093 | 1,124 | 203 |
| 1984 | Los Angeles | 140 | 6,797 | 5,230 | 1,567 | 221 |
| 1988 | Seoul | 159 | 8,465 | 6,279 | 2,186 | 237 |
| 1992 | Barcelona | 169 | 9,367 | 6,659 | 2,708 | 257 |
| 1996 | Atlanta | 197 | 10,320 | 6,797 | 3,523 | 271 |
| 2000 | Sydney | 199 | 10,651 | 6,582 | 4,069 | 300 |

## SPECIFIC SPORTS

### Football

Regarded as the 'king of sports', football, also known as 'soccer' in the United States, is now the most popular sport in the world and is played in all countries without exception, on all five continents, by several million people. No event arouses as much passion and excitement among the population of the whole world as the World Cup. This competition, held every four years, is the best known of all international sporting events, with every country eager to take part in the great 'sporting festival'. This is confirmed by Dominique Lejeune as follows: 'Among the first official steps taken by the new independent States, one of the commonest was application for membership of FIFA (Fédération Internationale de Football Association), which is particularly important to the national self-assertion of such States'.[32]

First held in Uruguay in 1930, the World Cup was the starting point for a confrontation between South America's stylistic virtuosity and Europe's combination of power and method. Brazil, Germany, Italy, Argentina and Uruguay have often been among the winners of the World Cup. In 1960, the World Club Champions Cup was launched as a competition between the best clubs of the different continents. In Europe there are three separate cups: the European League Champions Cup, first organized in 1956; the UEFA Cup established in 1957; and the Cup Winners Cup, established in 1960 for the winners of the national cups in each European country. The CAN, or African Nations Cup for football, is a competition for national teams established in 1957.

South America has been particularly well represented in the World Cup by Brazil, which is the only country to date to have won the prestigious trophy five times (in 1958, 1962, 1970, 1994 and 2002). The best scorers in the World Cup have left their mark: Gerd Muller (Federal Republic of Germany), 14 goals in 1970 and 1974; Just Fontaine (France), 13 goals in 1958; Pelé (Brazil), 12 goals from 1958 to 1970; and Ronaldo (Brazil), 12 goals in 1998 and 2002. The Women's World Cup was first held in China in 1991, where it was won by the United States. It was next held in Sweden in 1995 and won by Norway, and then in the

'Brazzaville' was a decisive step in African sport, and led to the decision to found the Conseil Supérieur du Sport en Afrique (CSSA), even though it was impossible for countries still under colonial rule (Mozambique, Angola, Guinea-Bissau, Cape Verde; and South Africa under apartheid, shunned by Africans), to take part in international meetings. Its Secretary-General was the Congolese Jean-Claude Ganga, working under the patronage of the President of the Republic, Alphonse Massambat Débat, and Avery Brundage (IOC). The object of the CSSA was to encourage the development and diversification of African sport, which was subsequently to enhance the Olympic Games by its participation, as if in answer to Pierre de Coubertin's most fervent wishes. Unfortunately he did not live to see his hopes fulfilled (he died in 1937).

The first black Africans had already made an appearance at the Rome Olympics in 1960. The Ghanaian Ike Quartley took the silver medal in light-welterweight boxing, and the Ethiopian Abebe Bikila, creating the legend of the 'barefoot runner', outran the Moroccan Rhadi Ben Abdesselem, to become the first black African gold medallist. Then in 1964, in Tokyo, Abebe Bikila became the first athlete to win the marathon for a second time (Plate 161). The first African games aroused great enthusiasm and gave a powerful impetus to sport in the young nations of the continent. Athletes from North Africa fought off all contenders to win the swimming and tennis competitions. The second African games were held in Lagos, Nigeria, and in 2000 the seventh African games took place in Johannesburg, South Africa, no longer in the grip of apartheid. At those games, the Cameroon delegation alone numbered 200 participants.

*Table 11* **Winners of the World Cup 1930-2002**

| Year | Place | Winner | Year | Place | Winner |
|------|-------|--------|------|-------|--------|
| 1930 | Uruguay | Uruguay | 1974 | Germany | Germany |
| 1934 | Italy | Italy | 1978 | Argentina | Argentina |
| 1938 | France | Italy | 1982 | Spain | Italy |

| 1970 | Mexico | Brazil | – | – | – |

United States in 1999, where it was won by the American team, who thereby confirmed their world supremacy. The following Women's World Cup was held in 2003 and was won by Germany. Originally to be played in China, the competition was relocated to the United States due to the SARS scare at that time.

There are two other variants of football, which are also very popular in the areas where they are played: American football and Australian football. Although the former has spread beyond the American frontier, the National Football League, with 30 professional teams, is still the most important championship.

## Football, media coverage and violence

Football rapidly became professionalized because of its urban base and the vast amount of media coverage it receives. It has become one of the items of mass radio and television consumption; it is played by a minority of professionals and followed by a huge mass of listeners and viewers. The televising of a football match, nationally or internationally, provides a real 'spectacle', highly colourful and staged using the most sophisticated audiovisual techniques. Football is an amplifier of nationalist, and often chauvinist, sentiment, which rapidly spills over into violence. It causes mobs to gather and exacerbates passions and antagonisms. 'Sport seems to be like a mirror that gives a faithful or distorted image of contemporary society, and there is every chance that sports writing will demonstrate how this mirror works … Sports contests bring into play passionate drives that are deeply embedded in a culture. They provide a particularly effective release for feelings of local or national patriotism.'[33]

Football hooliganism is a recent phenomenon and some sociological analyses suggest that it is often due to the breakdown of the family unit, leading to loss of parental control over young people who then take up with others who are also victims of unemployment and prone to urban delinquency. In the view of Manuel Comeron and Serge Govaert, football hooliganism is a phenomenon 'characterised by aggressive behaviour on the part of an individual or individuals, engendered within the context of a sporting event. The media began to report on the phenomenon in the 1960s with the increase in scenes of violence involving spectators at football matches in Great Britain'.[34] They note that these hooligans are publicity-seekers who like the public attention that they gain through the media.

Christian Pociello believes that the excessive media coverage of football hooligans and skinheads is a contributory factor in the continuation and even the growth of the phenomenon: 'By becoming, as it were, a spectacle within a spectacle, football hooligans are able to give vent to this manic desire to show off, causing a commotion on the terraces, forming vast collective patterns "in order to be seen" or having violent fights with other supporters to feel that they are alive … Television, initially detached and subsequently complicit, clearly caters to this desire by providing a forum.'[35] J. M. Brohm takes a more radical view and feels that football as a spectator sport is by its nature responsible for the violence it engenders: 'Today, it is no more possible to disassociate vandalism, "fan-aticism" and hooliganism from professional football matches than to separate the foam from the beer imbibed in industrial

quantities by the soccer fanatics … The Heysel massacre of May 1985 … showed millions of television viewers throughout Europe the barbarity lurking deep beneath the surface of the sporting event.'[36]

In Northern Ireland, the religious divide between Catholics and Protestants can be seen in the football stadium as in the political arena. In Glasgow, there is more to football than sporting rivalry. A war of religion is fought out between Catholic Celtics and Protestant Rangers and a permanent state of tension reigns between the two camps.[37] Violent supporters in different countries vie with each other in 'eccentricity': British 'hooligans', German skinheads, Italian *tifosi*. At the 1998 World Cup, the British hooligans earned particular attention through their ability to 'export' gratuitous violence. But using football as a pretext for settling the political differences that simmer beneath the surface is common practice all over the world. Examples include 'the football war' between El Salvador and Honduras in 1969, and the upheavals in stadiums in Algeria, China (1988), and countries in sub-Saharan Africa, leading to violent physical confrontation, expulsion and displacement of populations.

According to a Council of Europe table showing violence in football stadiums since the beginning of the century, there have been 965 deaths and more than 5,600 injuries. 'This figure covers every stadium in the world and, given the frequency of national and international competitions, it is not very high although it is most regrettable. It bears no comparison with the figure for victims of other forms of violence over the same period. Leaving aside wars and revolutions, we need only cite criminality, accidents at work and road accidents.'[38] It should be noted that the number of deaths and injuries can also be attributed to the dilapidated or unsafe condition of some stadiums, which has led to the collapse of terraces (Glasgow in 1902 and Bastia in 1992), the collapse of barriers and the breaking of railings (Cairo in 1974), the burning down of a wooden grandstand in Bradford in 1985, and crowd stampedes in which a great many spectators have been trampled, as in Bukavu (Congo, Zaire) in 1974.

However, despite these sporadic manifestations of violence, football is still one of the sports that most brings about fellowship and friendship between individuals and peoples, causing racial barriers to fall.

## Cycling

Cycling was on the programme of the Athens Olympics in 1896, although the women's event was not approved until 1984. Cycling as a sport nevertheless has a long and illustrious history, marked chiefly by the most famous cycling event of all, the Tour de France, which is held every year in the summer. It draws teams of riders from all over the world who compete over a space of three weeks in events that range from 1,000 metre sprints to the race proper in stages. In 1900 the Frenchman Henri Desgrange, a cycling champion during the 1890s, founded the daily publication *Auto-Vélo*, which was well financed and published on yellow paper (hence the practice, introduced after the First World War, of awarding a yellow jersey to the winner of each stage and to the final winner of the Tour). This publication funded the launch in 1903 of a Tour de France covering 2,500 kilometres in six stages, which superseded the old Paris-Roubaix and Paris-Rouen races. The Italian papers

created the Tour of Lombardy in 1905, the Milan-San Remo in 1907 and the Tour of Italy (Giro d'Italia) in 1909. The Belgians launched the Tour de Belgique in 1907.

Cycling is the sport that has caused the most ink to flow about the scandal of doping in sport, ever since the physiotherapist of the Festina team, led by Richard Virenque, was taken in for questioning by customs officials during the 1998 Tour de France. Willy Voet was carrying large quantities of anabolic steroids (classified as performance-enhancing drugs) in his car, as well as a flask of liquid amphetamines. This incident prompted an argument and a huge outcry in the media on the subject of doping in sport and revealed a surprising degree of hypocrisy on the part of the journalists and experts who moved in the world of high-profile sport, of which cycling is a part. The cyclists protested their innocence, but by now it was common knowledge that '100 per cent of the riders who finished a Tour de France used illicit substances and the poor innocents who did not take drugs at this level never saw the finishing line because they never arrived within the time limits'.[39] For a long time, doping remained out of sight, hidden behind a number of scapegoat sports like body-building, weight-lifting and athletics in general, which made the other sports look blameless. What cost Ben Johnson so dearly was that his muscular development was too obvious. But even in the 1970s, when the female swimmers of East Germany were dominant, swimming in particular gave rise to 'the first suspicions that pharmaceuticals were being used to create veritable "athletic machines" in the laboratory'.[40] Nowadays, records are being beaten more and more frequently and, instead of scepticism being aroused, success is attributed to superior training techniques and equipment. Athletes trained to the level required for the increasingly difficult challenges are unable to keep pace because matches and competitions are held too frequently, a problem compounded by jetlag and stress.

The American sprinter Florence Griffith-Joyner died on 21 September 1998 at the age of 38. She had been a triple gold medallist at the Seoul Olympics (100 m, 200 m, and 4 × 100 m), and at the time of her death she had been the 100 m and 200 m world-record holder. She had set out to smash the existing women's 100 m record of 10.5 seconds and did so at the cost of her life. She gave up her career at the height of her glory, hoping to remain in good health after years of doping, but the drugs had taken their toll. Drugs have a disastrous effect on health, causing strain-related injuries in the short term and cancer and heart disease over a longer period.

Nowadays we speak of cycling and doping as a particularly ill-fated 'couple', but all sports seem to be affected by the problem, now almost a routine feature of high-level competition. Drugs provide a means of producing champions within a very short time. They also explain other phenomena, such as the reduction in the upper age limit for a professional footballer from 36 to 32. The practice of doping is a flagrant violation of the stated objectives and ideals of the Olympic movement and is inconsistent with the much-needed democratization of sport in society. It is also at odds with the way in which the image of the body is projected today, i.e. in would-be scientific terms, which pretend to ignore the harmful, toxic and destructive effects of the substances absorbed. Commercial pressures, the desire to set new records and to improve performance at all costs, even at the risk – supposedly a calculated one – of

reducing life expectancy, all of these factors ensure that artifice prevails over nature. It would be good if we could manage to overcome the contradictions between theories that claim to be scientific and the dominant ideology of an economic system that sets a premium on the quest for profit through optimum performance.

## Boxing

Boxing is one of the oldest combat sports in the world. Although it is governed by strict rules designed to protect the boxers, from time to time deaths still occur, giving boxing its reputation as the most violent sport of the twentieth century. There are many who would like to see the sport banned. Sweden, for example, refused to have boxing on the programme of the 1912 Stockholm Olympics. Boxing, in much the same way as football, is one of the great sports, among the most popular because it was originally regarded as the 'sport of the poor' and because it enjoys very wide media coverage. American television began to promote boxing galas as early as 1941, giving the sport a particular style by broadcasting matches as major entertainment to be viewed on giant screens. But then satellites conquered the world (Relay I in December 1962, Telstar, then Relay II). Nowadays, through this power of the media, boxing has taken its place among the sports that generate the most lucrative transactions in the Western world, with the United States in the lead. American television selects the best boxers at all weight classes and makes the public particularly demanding.

At the Rome Olympics, an 18 year-old black American boxer, Cassius Clay, first came to public attention by winning the gold medal in the light-heavyweight category. 'Of all boxers, Cassius Clay is certainly the most good-looking.... His insults destroy the opponent's ego, adding to the damage inflicted by his blows. At every boxing venue in the world, "Muhammad Ali" is idolized.... His opponents, black or white, are like barbarians compared with him. They merely fight for a title; Muhammad Ali defends a style associated with a cause. In this way he is eclipsing the dramatic rise of American boxers, a new generation which is threatening to make the presence of black American boxers in the ring, and the interests of their sponsors, part of the established order. Joe Louis was the idol of black American soldiers fighting in the Second World War. Ali, the rebel, has come to be the expression within the United States of the revolution of people in the Third World, whom faith alone can save.'[41] 'Never has a heavyweight boxer used his power to such devastating, total effect; never has a black boxer made such an event of his reunion with the African continent.... A defender of the weak and the oppressed, a man who refused to fight in the Vietnam war, Clay had an amazing ability to take punishment and could not fail to win in Kinshasa'[42], where he beat George Foreman.

As a result of the system of broadcasting rights, the financial stakes are higher in boxing than anywhere else in the world of sport. The match between Mike Tyson and world heavyweight champion Lennox Lewis on 9 June 2002 in Memphis, Tennessee, featured ringside seats at $2,400, and hotels in Memphis, Shelby County and Tunica County provided 24,000 overnight stays for visitors who had come for the fight.

# SPORT AND POLITICS

## Sport and social class

Politics has always had its place in the stadiums, ever since the days of ancient Olympia. We need only observe that the Panhellenic games provided a truce in the interminable wars and served to unite the Hellenic peoples. Even at that time the dominant ideology set the rules, since foreigners and slaves were banned from competing in the games. Subsequently, and throughout the long history of sport, different social classes have had their own games: noblemen would meet in tournaments and in knightly duels, and peasants from the countryside nearby would play each other at *soule* or *calcio*.

British sport remained aristocratic and bourgeois until the middle of the nineteenth century, when it began to undergo rapid democratization. Sports nevertheless continued to be divided up on a class basis: boxing and football were long left to the working class, whereas rugby, rowing, tennis and athletics were chiefly the preserve of university students. The politicization of sport has been accentuated, however, by the wide attention given to it by the media. Today, at the dawn of the twenty-first century, sport has rapidly become a perfect channel for the transmission of political or even racial values, an object of propaganda, the symbolic embodiment of a nation and its economic, social or military power. Media coverage encourages further politicization of sport. Historically, the organization of major sporting events was a response to ideological presuppositions. Internationally, the years 1919-1920 marked the beginning of the period in which sport was used by the so-called democracies as a political instrument of exclusion or boycott. The victors in the previous war refused to meet the vanquished on the 'neutral territory' of sport, and international sports meetings with defeated or neutral countries were only resumed on condition that they became members of the League of Nations.

## Sport and international relations

In Europe, these international sports events were then further transformed into instruments of foreign policy. 'The resumption of the international sporting calendar was inaugurated by the Interallied Games of 1919. The defeated nations and Bolshevist Russia (which became the Union of Soviet Socialist Republics at the end of 1922 and was banished from the family of nations) were excluded from international competitions for several years. It is worth noting that, of the former belligerents on the side of the central European empires, Germany and Hungary were singled out for special treatment; Austria, Bulgaria and Turkey were admitted to the Paris Olympics in 1924, having been absent from the Antwerp games in 1920.'[43]

A second fundamental feature of this period in the field of international relations was the establishment of a large number of separate socialist sports internationals, the October Revolution having led to a split in international workers' sport. The Socialist Workers' Sports International had been in existence since 1913, having superseded an international socialist physical education association. Other movements were created subsequently: the International Workers' Association for Sport and Physical Culture in France in 1920, and the Red Sport International (RSI) in Moscow in 1921. The founding of the RSI under the aegis of the Communist International was part of the movement to promote world revolution: it was necessary to 'go to the masses', to strive towards winning over the working majority in the long term in order to disengage it from the bourgeois organizations.

'As early as 1920, the French Government adopted a number of measures on top-level sport, which clearly indicate that sport had become a matter of state concern.'[44] The USSR had very few sporting contacts with countries of the capitalist world, particularly during the New Economic Policy (NEP) years, when proletarian physical culture – an aspect of 'Proletkult' (proletarian culture) – was supposed to surpass bourgeois physical culture and sport, considered outdated and even degenerate. In Paris, in 1934, the RSI organized an international meeting of athletes 'opposed to fascism and war', a political/sporting event replacing the Moscow *Spartakiade*.

In the inter-war years, the Italian Fascists regarded athletic training as a preparation for war, and the athlete was seen primarily as a combatant. *Il Duce* encouraged the development of boxing and wrestling and had a decided preference for the martial pursuits of aviation and fencing. In 1931, shortly after the proclamation of the Spanish Republic, Barcelona lost the right to organize the 1936 Olympics. 'Berlin was [therefore] chosen as host city, before the Nazis came to power. As the fateful day approached, a boycott campaign was organized by left-wing activists and some Jewish communities on the grounds that the policy of racial discrimination pursued in Germany was contrary to the principles of the Olympic Games. The influence of politics on sport was blatant.'[45]

## Sport and racism

Hitler's Nazi regime deliberately set out to use sport for political purposes. It accordingly agreed to host the 1936 Olympics, and propaganda head Walther Funk himself stated that the games were an opportunity for propaganda without equal in the entire history of the world. But then the black American athlete Jesse Owens performed his legendary feat of winning four Olympic events: long jump, 100 metres, 200 metres and 4 × 100 metres, thereby cocking a snoot at the racist theories of Nazism. In journalistic circles it was rumoured that Hitler had deliberately left the stand to avoid shaking Owens' hand.

On the question of racism in physical education policy, history tells us that colonialists were filled with 'great fear at the idea that native peoples might share the same physical activities with them'. Racial segregation was explicitly advocated by the French Government in the law of 1930 on Physical Education in the Colonies. 'The acknowledged fear of seeing the master/servant relationship overturned was compounded by fear of contamination. Physical education in the colonies came with its own share of assumptions about hygiene and it seemed advisable to keep European and indigenous populations apart, especially as epidemics of plague, cholera, typhoid, etc. were rife in the colonies … This was a persuasive argument for segregating young people in particular.'[46] Apartheid strategies of varying degrees of subtlety, adapted to each territory, were the characteristic upshot of colonial thinking.

Bernadette Deville-Danthu refers to the unseemly attempt by Marshal Lyautey, the French Resident-General in Morocco, to get Moroccan nationals to take part in the 1924 Olympics in an attempt to use sport to illustrate the policy of semi-autonomy he wished to pursue in the protectorate. 'His request was never followed up by the Metropolitan French authorities.'[47] In 1925, again in Morocco, it was forbidden to organize boxing matches between Europeans and indigenous inhabitants, 'the Europeans having probably not come to terms with the idea that the Senegalese, Battling Siki, had succeeded in stripping the French light-heavyweight champion, Georges Carpentier, of his title in 1922.'[48]

### Terrorism and the Olympics

The darkest time for the Olympics was nevertheless in Munich in 1972, when the Games were the target of a terrorist attack. On the morning of 5 September, eight Palestinian terrorists got into the Olympic village, killed two members of the Israeli team and took nine others hostage. These were subsequently killed, along with five of the terrorists and one policeman. After a 24-hour pause to mourn the victims, the Games were resumed, watched by millions of dismayed television viewers still in a state of shock. The sporting event that was meant to be a celebration of human brotherhood caused the whole world to weep, saddened and grief-stricken by what had happened. The ideals of peace and international solidarity, which had underpinned the creation of the Olympic Games by Pierre de Coubertin, had been utterly confounded.

## THE MEDIA AND THE COMMODIFICATION AND INTERNATIONALIZATION OF SPORT

Although, as we have seen, the first modern competitions date back to the nineteenth century, the move towards commodification, professionalization and internationalization in sport quite clearly began in the twentieth century. The role of the media in these developments appears to be fundamental and the media-sport relationship is regarded both as a love-match (according to former IOC president Juan Antonio Samaranch) and a marriage of convenience.

### The media as the paymasters of sport

Historically, media coverage of physical activities and sports got off to a fairly slow start in the eighteenth century, when it took the form of simple newspaper reports. Subsequently it developed at a dizzying pace, first with the appearance of a multiplicity of specialized sports journals and magazines, then with radio and finally with television. Through its contribution in terms of organization, financing and multifaceted technology, television played an active role in the development of certain sports – the major sports of today – by promoting their transformation into entertainment and their internationalization. The computerization of communications at the end of the twentieth century and the advent of the Internet promise

many more surprises from the 'sports industry' in terms of globalization and output.

In Europe, the first newspaper articles on sport appeared around the middle of the eighteenth century. In 1733, *The Boston Gazette* described the professional boxing match between John Faulconer and Bob Russell. But the first specialized sports journal was not published until 1838, *Bell's Life*, established in England by professional runners. In France, the fortnightly magazine *Le Sport*, targeting an aristocratic public, was first published in 1854. It was followed by *Le Vélo*, founded in 1891 by Pierre Giffard and Paul Rousset, and by Henri Desgrange's *L'Auto-Vélo* in 1900, which was renamed *L'Auto* in 1903, following a trial over breach of copyright. The former organized the first *Tour de France* in 1903 on the initiative of Geo Lefèvre, Desgrange's young collaborator, thereby establishing a new relationship between the media and sports competitions. The sports daily *L'Equipe* founded and organized the Le Mans 24-hour race in 1923. Since then, the sports press has experienced various changes and numerous upsets. Specialized journals are found in increasing numbers in kiosks, some of them being very short-lived, especially today.

### Media coverage and the internationalization of mass sport

'With the advent of radio, sporting events could be experienced live. Time and distance were eliminated and sport took full advantage of this means of mass communication. The use of radio developed in the course of the 1920s, and boxing was one of the sports to benefit from it. In 1921, the Dempsey-Carpentier fight, which brought in more than a million dollars, was broadcast in the United States by KDKA, a station that also provided commentaries on baseball matches.'[49] The invention of the transistor shortly afterwards increased the influence of radio tenfold, and it was this that has since enabled millions of listeners in rural Africa and most developing countries to listen to broadcasts of football matches. With radio came the art of live, multiplex broadcasting, which enabled listeners to follow several football matches or other sporting events live and at the same time. Then came television, which soon was to play a predominant role in the coverage of sport throughout the world, accentuating the trend towards internationalization already begun by radio.

### The major sports as entertainment and commodities

Television took its first steps and grew up, developing its technical capacities as it went, with and through sporting events. As early as 1948, television was on the spot to broadcast the finish of the Tour de France live from the Parc des Princes. Further developments followed, such as the use of the zoom lens in 1954, of the HF camera in 1957, the slow-motion replay in 1967, the split screen, cameras mounted on cars, helicopters or motorcycles (cycle races), and colour and high definition (HDTV). All resources were marshalled to improve the entertainment value of these major sports.

Changes and developments in modern sports are often attributable to the media that organize and promote their

competitions. Following the example set at the end of the nineteenth century by *Le Vélo* and *L'Equipe* (organizers of the first Tour de France and the Le Mans 24-hour race respectively), television has become involved in the organization and funding of sporting events. In the United States in 1986, Ted Turner (President and CEO of the multinational media conglomerate TBS) founded the Goodwill Games. Sport has taken over television screens, the cost of broadcasting rights has soared and some sports bodies have become veritable businesses operating in the industry of sport as entertainment.

'Many firms wish to have their name associated with a competition, a club or an athlete. Sport is of the utmost importance to standard television channels and there are specialized channels entirely devoted to sport. Television broadcast rights account for the bulk of the income used to fund the Olympic Games. They generated $907 million for the Atlanta games, of which only $559 million were received by the Organizing Committee, the rest going to the IOC! As a result, the cost of television rights rose further, accounting for 77 per cent of all income from the 1994 Winter Olympics, and, of course, that provoked tough competition between companies wanting access to the Olympics market. Advertisers accounted for a large percentage of the organizers' income: 38 per cent for the Los Angeles Olympics, 31 per cent for the 1986 World Cup, and 60 per cent for the 1988 Paris-Dakar rally.'[50]

Football spreads beyond the strict framework of competition, and matches are staged in a way so as to satisfy a range of requirements – political, logistical, security, aesthetic, moral and promotional – and also to convey the passion and emotion aroused. The game, the television and radio facilities and the spectators exist in a state of osmosis. 'The sporting event and its reconstitution, the televised show and its consumption, are all intimately connected; so much so that any sense of spontaneity or independence seems quite impossible. We are trying to square a circle that is much more vicious than is imagined, since this long chain of interests, long thought to be conflicting, perpetuates itself so obviously that readers of the sports pages no longer know today whether they are witnesses of, or active contributors to, the mild folly now taking hold.'[51]

**Television adapts sport to its own requirements**

Television refashions or tailors sport to suit its own requirements. It has thus got the federations of many sports to change their regulations and adapt the staging and organization of events to get them to fit in with television's technical, time and commercial requirements (inclusion of advertising breaks).

Television channels pay fortunes for the exclusive rights to broadcast the most prestigious events. Football and the Olympic Games have become important factors in the marketing of television programmes, video recorders, television rental services and sports clothing, especially when the Olympic Games or the World Cup are being held.

The business management of clubs and federations is sometimes transferred to outside sports marketing organizations, as Philippe Bughin explains with reference to international football: 'It is a curious but revealing fact that neither FIFA nor even UEFA have so far ever taken on the kind of sports marketing tasks that the all-powerful private enterprise, the NBA, is able to perform internally.'

'Since 1982, the international football federations have entrusted their business management to ISL Worldwide. This Swiss company, founded in 1982 and active throughout the world, is 90 per cent owned by the powerful ISMM (International Sport Media & Marketing) Group, a world leader in sports management with three hundred international sporting events to its credit, including no less than five world cups, four European championships and six Olympic Games.'[52]

European television channels are investing more and more in the major football clubs. In France, Canal+ owns PSG and M6 controls Girondins Bordeaux. In England, 'British television and media groups are currently acquiring stakes in whole groups of clubs in the Premier League (England's Division 1), in the hope of obtaining broadcasting rights for their matches more easily in the twenty-first century. The benefit to the clubs is obvious since the sale of a minor shareholding earns them millions of pounds, enables them to buy players and increases the price of their shares on the stock exchange'.[53]

The professionalization of sports such as football and rugby is causing a large number of players from the economically weaker countries to move to the more advanced European countries where they can make magnificent careers for themselves and earn vastly better incomes. Players from eastern Europe, Africa and South America are rushing to western Europe to offer their talents to different clubs, and in many cases they are simply being driven by pitiless market forces. Those with the good fortune to be caught up in this new Eldorado can hope for outstanding careers. For many others, it will be just a dream that does not come true. The 2002 World Cup (in the Republic of Korea and Japan) featured a Senegal national squad of which 20 players out of 23 played professionally for European clubs. Such are the paradoxes of the modern professional sports scene. The richest clubs have access to a vast global market of players, who are quite prepared to 'sell themselves' in exchange for the good life, since working and living conditions in their own countries are so difficult.

## PHYSICAL CULTURE AND SPORT AS A NEW WAY OF LIFE

### The sport industry, globalization and cultural cross-fertilization

Western Europe, starting from traditional, ritual and festive games, and passing through the sports revolution that stemmed from the Industrial Revolution, has arrived at games in their modern form – spectacular shows, heavily promoted by the media and reaching every corner of the world.

Football and rugby emerged from the schools and universities of Great Britain, basketball and volleyball came out of the distant lands of America, and these sports, having first made their mark in Europe, gradually spread to the rest of the world. In today's industrialized countries, caught up in the maelstrom of modern cultural trends, the relationship with the body has changed enormously under the combined effect of technical advances in training methods, the greater sophistication of today's audiovisual media, and the

relentless marketing of services in the sports sector and in body care in general.

It must be acknowledged that sport is gradually invading people's everyday lives, both in the so-called 'rich' industrialized countries of the North and in the so-called 'poor' developing countries of the South, and that society worldwide, with some exceptions, is quite clearly developing into a society dominated by leisure sports. This is something that has been fostered by the export of 'cultural industries'.

The change in outlook as many, varied cultures come into contact with each other and interact, the growing influence of the North on the South and East, in regard to individualization, the role of the media, professionalization, commercialization, and so on – all these factors are ushering in a new attitude towards oneself, greater attention to personal well-being and health, a new healthy way of living, and a new 'culture of the body'. The export of leisure sports and the practices associated with them are aspects of a cross-fertilization of cultures observable across the world, an 'inexorable cross-fertilization', as Senagalese writer and President Léopold Sedar Senghor so clearly foresaw. For the influence is reciprocal. It is interesting to see how the industrialized countries, for all their economic and media supremacy, have embraced the 'body cultures' of other continents, such as their martial arts (*judo* and *karate* from Japan, *kung-fu* and *t'ai chi* from China, *tae kwon do* from Korea, *capoeira* from Brazil). The industrialized world has shown an impressive enthusiasm for oriental sports over the past few decades (numerous martial arts federations have been founded), an interest increasingly shared by the rest of the world. Judo was on the programme of the very first African Games in 1965, where many African *judokas* competed, even though judo had only just made its first appearance as an Olympic sport at the 1964 Tokyo games, the first Olympic Games to be held in Asia. The practice of martial arts is often accompanied by initiation in a philosophy, in oriental 'wisdom', which would appear to be a significant benefit in an increasingly violent and selfish world.

We might still look forward to a future programme of Olympic events that includes the Brazilian martial art *capoeira*, of African origin but already well known and widely practised in Europe and throughout the world. Its originality lies in its being a traditional form of wrestling that is practised like a dance to a musical accompaniment played on particular instruments. This traditional wrestling is held in very high esteem in sub-Saharan Africa and is becoming increasingly important as the number of tournaments increases.

Genuine globalization of the sports culture will be achieved if we allow disciplines from every continent their due place, thereby creating an international sports culture that is the result of cross-fertilization, many-sided and varied.

### Democratization of sport and new forms of employment in sport

Since the Second World War, physical activities and sport have become a form of socialization. It is important to stress to what extent educational institutions have played an important part in making sport more democratic; physical education is included on the school curriculum in most countries. In the United States, intensive television coverage is given to American football, baseball and boxing. In Europe and Latin America, television broadcasts football, and in France cycling – especially with the Tour de France – is much promoted.

'Sport for all' is almost becoming a reality. The twentieth century saw the rise and development of new forms of employment in physical education and sport. State education authorities throughout the world, even in Islamic countries, are the principal employers in this area and are the biggest provider of training for teachers and supervisors. There are thousands of physical education teachers, trainers and instructors. A great diversification is taking place in the science and technology relating to physical activities, and there is no doubt about the enthusiasm that science and technology are generating in this area. There is a growing call for coaches and supervisors in many sports disciplines.

The century also saw the rise of new fields of specialization such as sports journalism and sports medicine, the sociology, psychology and history of sport, as well as sports law, the coaching and management of professional athletes, and the organization of physical activity and sport in thousands of sports centres and leisure parks.

### Sports culture, body culture: a new way of life

The way in which people relate to their body in industrial societies reflects a system of values resulting from a long and complex economic and cultural history. The era of religious taboos, said to have oppressed the body, would seem – contrary to all expectations – to have contributed to a growing interest in it, through a search for freedom. For various reasons, the Church, followed by the military and then doctors, teachers, those with a professional interest in physical activity and experts in various areas (food, clothing, entertainment) have taken the body as an object for study. Nowadays it seems that everyday life is built increasingly around this concern for the body. Bernard Xavier René makes the following observation: 'Among the phenomena that have marked the century we must include the exceptionally greater value placed on the bodily factor. Not only has it assumed an unprecedented status in our civilization, but we also have, as it were, more body than we have ever had ... The body's new status arose from a many-sided concern, branching out and increasing indefinitely, which has steadily extended to all strata of the population and increased with each generation, sometimes to an exaggerated degree, as the century has advanced. Having a body in this context means caring for one's body, attaching importance to it, giving it a value that goes beyond its material composition and changes its significance and its existence'.[54]

From the psychological and individual standpoint, the body is both external and part of ourselves, and it is through the body that our sensations, emotions, desires and pleasures come into play. Every individual perceives himself through his own eyes and through the eyes of others. As a result, the obese, the clumsy, the lethargic, the ill can expect humiliation – intended or not – and possible marginalization, since the perception of the body is more psychologically than biologically based and owes much to the hedonistic impulse.

Highly complex relationships between the individual, the body and the individual's image of the body lie behind certain conflicting, pathological impulses.

Individualism and narcissism rub shoulders. But it is a curious fact that the countries where the body is most lauded are also the ones where it is most badly treated, where the contrasting phenomenon of obesity is gaining ground with all its attendant risks. The United States, for example, the world's leading economic power, where the practice of individual or team sport is supposed to be most widespread, is also the country with the highest level of obesity (three people out of 10). Obesity and health thus represent the two extremes of this most complex body culture.

Is the individual giving up in the face of the enormous diversity of offers and opportunities, which range from simple walking to the practice of yoga and zen and encompass traditional gymnastics and all modern sports, mechanized or not, practised in winter or summer? Will recourse to the aesthetic surgeon's knife, the insertion of rings to regulate appetite, become the new way of life, even though physical exercise is quite sufficient to ensure good health and a good self-image? How then can we fail to ask whether we are making the right choices? How are we to ensure that our bodies are properly looked after?

# EDUCATION

## *Lê Thành Khôi*

The twentieth century has been marked by a number of major political developments that have had a far-reaching impact upon education: the revolutions in Europe, Asia, Latin America and the Caribbean; the liberation of the former colonial countries; and the defeat of fascism in its various guises. After 1945, the West enjoyed a quarter of a century of unprecedented economic expansion, which enabled it to raise living standards in a lasting manner and to democratize its education systems. However, the twentieth century is also the century of scientific and technological developments that have revolutionized the theories, contents, methods and media of education. Inequalities nevertheless remain, and have even increased since economic growth has given way to stagnation and even to regression in some parts of the world. Many countries are burdened with unsuitable education systems which, accompanied by population growth, adversely affect their potential for development. At the dawn of the third millennium, the disintegration of moral, family, religious, and community values under the impact of so-called modernization has ushered in a reign of confusion and uncertainty.

## THE FACTORS OF CHANGE

### The political context

The political sphere can never be dissociated from the social sphere, since it involves the interaction – often accompanied by conflict – of social, economic, religious and other groups which, depending on the nature of the power in place, favours particular classes over others.

The twentieth century started with the Mexican revolution (1910), which was basically an uprising of millions of peasants who had been deprived of their land by the dictatorship of Porfirio Díaz. José Vasconcelos, who was Minister of Education from 1921 to 1924, launched a 'cultural crusade' aimed at teaching young people and adults to read and write, spreading the Spanish language among the Indian population, publishing reading primers and textbooks, and greatly increasing the number of libraries. In 1928, the proportion of children receiving primary schooling in Mexico stood at 46 per cent compared with 27.4 per cent in 1907. It was also at the instigation of Vasconcelos that a 'matrix of mythical images of the nation aimed at enlightening social cadres' came into being: the painters Jose Clemente Orozco, Diego Rivera and David Alfaro Siqueiros decorated schools and public buildings with murals addressed to the people in a bid to educate them in the spirit of the revolution, while at the same time enabling them to discover their Indian roots. However, the 'socialist education' written into the Constitution in 1934 came up against strong resistance from the Catholic Church and a number of intellectuals, and was abandoned in 1946, at the same time that the official political party assumed the name Institutional Revolutionary Party, which signified the end of the revolution.

The Marxist-Leninist revolutions have had a more lasting impact. For many decades, the Russian Revolution of 1917 sustained the hopes of millions of men and women all over the world, while inspiring other revolutions in both education and politics. These 'revolutionary' principles included: mixed, polytechnic public education, continuing uninterrupted from the primary to the higher levels; equality of the sexes; and the right of people to use their own language. Although already applied in the United States, this was the first time in Europe. The Cultural Revolution was an integral part of the political revolution. Lenin said that: 'the victory of the revolution will be consummated only through school … Our work in education consists in overthrowing the bourgeoisie and we state loud and clear that school which is detached from life and politics is a lie and a hypocrisy.' However, he set out to preserve those aspects of bourgeois culture that were 'good', especially science and technology. Illiterate people were not going to develop agriculture and industry. 'People can become Communists only after they have enriched their minds with all the wealth created by humanity.' Workers' universities (*rabfak*) were created for training young workers and peasants. At the same time, a vast literacy campaign was launched with the aim of teaching all people, aged 8 to 50, to read and write either in Russian or in their mother tongue. Scripts were created for peoples whose languages were not written and the illiteracy rate, which had stood at 66 per cent

in 1917, fell to 43 per cent in 1926, and to 11 per cent in 1939. Free compulsory education was introduced in 1930 for a minimum period of four years (seven years in cities and industrial regions).

The first five-year plan (1928–32) linked economic forecasting and the training of specialists for the first time. Planning, which became progressively more elaborate, adopted a twofold approach: planning of general education in accordance with population growth forecasts and the length of compulsory schooling (which was raised to eleven years in 1984), and planning of higher and specialized secondary education in accordance with the needs for skilled personnel. Rapid expansion of education at all levels was ensured through political commitment and planning. In 1914, the Russian Empire had 9.7 million schoolchildren and 127,400 students out of a population of 265 million inhabitants, or 48 students (almost all Russian) for every 100,000 inhabitants. In 1990, this figure had risen to 1,867 students per 100,000 inhabitants, while school enrolment ratios stood at 89 per cent for the 6–11 age group, 96 percent for the 12–16 age group, and 27 per cent for the 20–24 age group. One particularly remarkable feature was the massive strides taken by science and technology in certain fields, as evidenced by the launching of the Sputnik satellite in 1957 and Yuri Gagarin's space flight in 1961.

All the revolutions that claim to have their roots in the socialist ideal have one feature in common: the efforts they have made in education and literacy. In fact, the latter's purpose is not only a social one. It is above all a means of mobilizing the population for revolution and national construction, while at the same time people are learning to write and read political slogans.

In Viet Nam, immediately after the revolution of August 1945, Ho Chi Minh called on the population to accomplish three fundamental tasks: overcome famine, foreign aggression, and ignorance. These were interdependent: as long as a nation is underdeveloped and uneducated, it is an easy prey to imperialism. Conversely, imperialism is responsible for perpetuating underdevelopment and lack of education. A country cannot bring about its economic and social revolution without promoting a cultural revolution. National and social revolution is the driving force behind the development of education, and education in turn strengthens revolution, since education increases the level of political awareness of the people and their participation in the revolution. Peasants learn to read through directives and political and military explanations. When the agrarian reform was launched in 1953, literacy was linked to the class struggle in rural areas. It set out to instil in the peasants an understanding of how the social and economic structure was at the root of their poverty and what advantages they would derive from overthrowing the landowners. In the north of the country, illiteracy was virtually eradicated in 1958, and three years later the revolution brought literacy to the mountain areas inhabited by minority peoples.

Likewise, in 1960, the literacy campaign in Cuba was seen as a wide-ranging revolutionary movement. Some 268,000 young volunteers, workers, students and primary school teachers provided literacy training for more than 700,000 men and women in the space of one year. They had a textbook entitled *Alfabeticemos*, which, after an introductory section, set out 24 themes – covering the revolution, the land and the economy, imperialism and democracy – in conjunction with those in the primer

*Venceremos*. The 15 lessons in the primer also dealt with the problems of the revolution, illustrated by photographs, which helped learners to grasp the spirit and importance of the lessons. The literacy effort was backed up by a propaganda drive that had three main objectives: motivating illiterates by using all possible means, such as the mass media, festivities, demonstrations and awarding diplomas; creating a movement of opinion in order to encourage the largest possible number of persons to enlist as voluntary teachers; and popularizing the broad lines of the campaign. Illiterates were not the only people to receive political instruction through learning to read and write. Literacy workers were also trained; coming generally from the urban middle classes, they gained closer knowledge and understanding of workers and peasants.

When, after the fall of communism in Europe (1989–90), the countries which had adopted that system changed over to a market economy, the impact on education was felt soon thereafter: the polytechnic principle (the linkage of study and productive work), planning and free education were all abandoned (except at the primary level); private and denominational schools rapidly sprang up; and education systems, programmes and teaching methods were reformed, often modelled on those of the United States or Western Europe.

In Iran, the Islamic revolution of 1977–79 stressed the cultural identity of the country, which it said the Shah's regime had corrupted by its policy of Westernization of lifestyle and rapid growth, a policy that had above all profited a minority of privileged people. The Islamic revolution set out to restore the purity of Shi'a Islam in the interpretation given to it by the Ayatollah Khomeini, the guide (*imam*) of the Republic. All aspects of life were accordingly redefined, and the education of younger generations was given special attention. Teaching contents and methods were redesigned; in social science disciplines (history, law, economics, sociology), especially at university, teachers had to take an oath of loyalty and were closely supervised; and co-education was banned (which led to a decline in the enrolment of girls in rural areas lacking in women teachers). Action in the formal education system was heavily backed by propaganda on radio and television, in films, books, posters and murals, which extolled obedience to the Law represented by the government and assimilated any dissension to a revolt against the will of God. Counter-revolution took the opposite direction: since education is a strategic institution, previously existing structures need to be destroyed in order to conform to the new ideology.

In Chile, the military *coup d'état* of 11 September 1973 marked a break with the democratization movement pursued under the Christian Democrat government and subsequently that of Popular Unity, in which education was characterized by the growing participation of the middle and lower-income classes, giving rise to greater social mobility. Universities performed a critical function over and above their traditional educational role, and grassroots education was developed in urban neighbourhoods, chiefly under the impetus of the trade unions. The military government, which was supported by the bourgeoisie, drew on Christian and national values to promote a neo-liberal policy. The objectives of education were to instil love of the homeland and the family and to subscribe to the concept of the unity of the nation and obedience to the state. Teachers and students and programmes and textbooks suspected of

spreading subversive ideas were accordingly 'purged', and school and university establishments came under the strict control of the military authorities. The state only maintained responsibility for basic education, in which children learnt their civic duties. Access to other forms of education was to be a privilege, since it had to be paid for; in other terms, such education was privatized in accordance with market laws. The outcome was a sharp decline in enrolment growth ratios. The crackdown on trade union activities led to the virtual disappearance of 'open' grassroots education. However, this continued in a clandestine and informal form, since the dictatorship was unable to stifle the love of freedom, especially when its neo-liberal policies resulted in the decline of many industries and in rising unemployment and extreme poverty among the most underprivileged sections of the population.

In Western Europe, the First World War had a profound impact on people's minds. Democratic ideas progressed, calling into question a double track education system – one for the masses and the other elitist. Yet, the opposition of conservative forces and the economic crises of the 1920s and 1930s put a halt to this hope for democratic change. Several countries in Europe established authoritarian regimes, which ruled through totalitarianism. In Italy from 1923 onwards, the Fascist regime made the Catholic religion the basis of primary education again, increased the selectivity of secondary schools, abolished transfers between general and technical education, subjected the entire system to strict supervision, and compelled young people to engage in paramilitary training. In Germany, Nazism was even more systematic. For the first time in the history of that country, education was centralized, and syllabuses were revised to give a leading place to the 'science of race', books were banned and burnt, and Jewish teachers and other teachers who refused to take an oath of loyalty were driven out. In Japan, militarism spread ultra-nationalism in schools by instilling in them the 'path of the subject', in other words loyalty towards the emperor, the incarnation of the nation. Defeat, however, was to sweep these regimes aside.

The year 1945 was the starting point for the independence of the formerly colonized countries. In every instance, colonial education had had a twofold purpose: first, to train auxiliary middle-grade personnel for government services and the economy, and second, to extol the civilizing mission of the metropolitan powers and demean indigenous cultures in order to make their subordination more palatable. However, colonization itself, through its own workings, created the elements that were to oppose it. In the first place, it had to contend with the at times passive, but more generally armed, resistance led by the traditional elites. With the spread of the colonial administration and capitalist exploitation, new classes came into being, such as the landowning, industrial or commercial middle class, the proletariat of factories, plantations and mines, and office workers and intellectuals. The Second World War made colonized people understand that European domination could only be defeated using Europe's own means. From Asia to Africa, independence would be won by peaceful means in some instances and by force of arms in others (1945–75).

The outcome everywhere was a spectacular growth in education, which was regarded as a *sine qua non* for satisfying the aspirations of peoples, consolidating independence and increasing economic potential. In the countries of Asia,

which had long had a written literature, national languages (such as Vietnamese and Bahasa Indonesia) replaced the foreign languages imposed by colonization, although some countries, such as India, the Philippines and Malaysia, more or less kept the foreign language in higher education. In Africa, such changes were more difficult to bring about, owing to the absence of written traditions (the local languages involved were progressively Romanized), the large number of different ethnic groups and, in many instances, the limited number of speakers, which increased the cost of preparing and producing textbooks and training teachers, quite apart from the political problem posed by the adoption of a 'national' language in a multi-ethnic state. This is why the countries south of the Sahara kept the languages of the former colonial powers as a vehicular language, while nevertheless more or less 'Africanizing' the teaching of literature, history and geography. The countries of the Maghreb adopted a similar approach, although Arabic was introduced in the first years of schooling.

## Population

Through its growth rate and age and gender distribution, population changes influence school and university enrolment numbers as much as government policies and family demands. In this respect, there is a fundamental difference between the industrialized and less affluent countries.

In Europe, universal schooling grew progressively with industrialization and urban development, at a time when population growth did not exceed 0.5 per cent per year. In the United States, in spite of the massive waves of immigrants, it took place more quickly (except for African-Americans and Native Americans) on account of economic growth. In the first half of the twentieth century, the declining birth rate in these countries gave rise to stagnation, and indeed to a reduction, in enrolment numbers in the primary education system, in spite of the extension of compulsory schooling. After 1945, a short-lived demographic boom subsequently gave way to a further decline in the birth rate, which is now less than 12 per 1,000, so that the natural growth rate is fluctuating around 0.6 per cent. These populations are 'mature', in other words the proportion of old people (65 years of age and upwards), representing some 20 per cent, exceeds that of the school-going population in the 6 to 14-years age-group, which stands at less than 14 per cent.

After the Second World War, 'democratization' was a highly topical issue. The *Universal Declaration of Human Rights* (1948) included the right to education, as did the *Declaration on the Rights of the Child* (1959). All the industrialized countries tried to effect this right, at least in quantitative terms, assisted by unprecedented economic growth for a period of 25 years (1945–70). However, chances were still not all equal at the pre-school level. In 1990, all children aged from 3 to 5 years attended nursery school in Belgium, Denmark, France and Ireland, while between 50 and 60 per cent attended in the United States, the United Kingdom, Japan, Greece, Spain, Portugal and Switzerland, and even smaller numbers attending elsewhere.

Compulsory schooling usually begins at 6 years of age, and sometimes at 5 (as in the Netherlands, the United

Kingdom, Israel and New Zealand) or 7 (in Scandinavia and Switzerland). Primary schooling ends at age 11 or 12. It is followed by a cycle of observation and then streaming (France) or, as practiced in Sweden, primary school is attended for nine years, with optional subjects in the last few years. In other countries, the break comes earlier, at age 9 or 10. This is true of Germany where, after four years of primary school, the pupils are streamed – in principle according to their level, but in reality according to their social background – either into the *Gesamtschule* (and then into the *Gymnasium* and university) or else into the *Realschule* (and middle-grade jobs) or the *Hauptschule*, in other words apprenticeship. Integrated schools are rare.

The demands of families, and especially the growing awareness among people from modest backgrounds that instruction is a factor in social advancement, have been largely instrumental in the extension of compulsory schooling and of secondary and higher education. However, inequalities have not disappeared, especially those suffered by minorities, to which we shall return later.

Since 1970, economic growth has slowed and funding for public education has been cut back. This situation coincides with the decline in fertility and population growth: if this trend continues, birth and death rates will come closer together and population growth will become stationary in 2025. Since 1976, school enrolment numbers at the primary level have no longer been increasing in most industrialized countries and have declined slightly at the secondary level, but are progressing in higher education due to demographic and social factors.

The reduction in enrolment in compulsory schooling will have an impact on the demand for teachers. Some countries will be tempted to reduce the number of teachers and thereby make savings. Rather than expose them to unemployment, others will see an opportunity for improving the quality of education by reducing the pupil/teacher ratio. Still others may redirect the 'surplus' into non-formal education, especially as part of lifelong education.

On the other hand, the growing number of old people, accompanied by a reduction in working hours, a lower retirement age and an increase in free time means that there is a greater demand for cultural education and leisure-time activities from this group. Adult education has been developed to cater to this need, as well as to provide refresher courses and training for workers or young people who have an inadequate educational background. All countries have taken steps in this area, especially the United States, where more than 60 million people, one-third of the population aged 17 and upwards, take part in different education and training programmes mobilizing schools and universities, museums and libraries, and vocational associations and trade unions.

By contrast, in the less developed countries, population growth is still high on account of a declining death rate and a continuing high fertility rate. Sub-Saharan Africa, while being the poorest continent, also has the highest population growth rate, at 2.9 per cent since 1970, and the only one not to decline in the short term. The other regions are in a process of demographic transition, in other words their birth rate has declined over a period of twenty years, with annual population growth falling from 3 to 2.5 per cent in the Arab States, from 2.2 to 1.8 per cent in Latin America and the Caribbean, and from 2.0 to 1.6 per cent in Asia. However, Asia's population accounts for 60 per cent of the world total, which is a considerable absolute figure. In the developed countries, the population growth rate has fallen from 0.7 to 0.4 per cent. Higher population growth means a greater proportion of the population is eligible for schooling: in the developing countries, the 5–14 year-age group accounts for 22 per cent of the population compared with 14 per cent in the developed countries. The education cost burden is accordingly heavier, especially since it has to be financed by a lower proportion of the active population: the 15–64 year-age group accounts for 61 per cent of the population in the developing countries compared with 66 per cent in the developed countries. In other words, 1,000 members of the active population carry the burden of educating 360 children in developing countries compared with only 210 children in the developed countries. The low level of income per inhabitant in developing countries compounds the influence of the population factor.

Another phenomenon whose effects are creating greater difficulties for education in developing countries is the rural exodus. In the industrialized countries, urbanization went hand-in-hand with economic growth, whereas in developing countries it has preceded economic development. In the latter case, urban growth has increased twice as quickly (5 to 6 per cent per year) as the population. This phenomenon is particularly serious, since schooling acts as a stimulant for the rural exodus: young people go to the cities to continue their studies; they have high aspirations and cannot bear the constraints of a village environment, which they regard as being backward. However, their departure deprives rural areas of a large part of their productive resources, since the only people left are women and old people. In the cities, many young people cannot find work and will end up in unemployment or delinquency.

Today, more than 70 per cent of the world's population are living in cities. Urban development is very rapid in Latin America, followed by Asia and, to a lesser degree, by Africa. As slums and shantytowns proliferate (one-third of all city-dwellers already live in them), and housing estates spread, this will create difficult problems for governments in providing young people with the education, work, social and cultural services and leisure time activities to which they are entitled.

All these factors have created an awareness of the need for better understanding population factors with a view to improving the quality of life of individuals and communities. However, perceptions may differ for all sorts of reasons. The first thing that has to be understood is that population growth is both a factor in economic growth and an impediment to that growth. There is too great a tendency to give prominence to the negative aspects of population growth. It is true that when the population gets too large compared with the resources available or is increasing too quickly, the *per capita* income decreases, education costs rise, job opportunities are reduced, urban problems grow worse, and the environment deteriorates. However, population growth is also a source of labour, work and production. The historical development of Europe, the United States and Canada bear witness to this. At the present time in Africa, the economy is stagnating since there is not sufficient labour to develop the land, with young people who have attended school deserting the countryside and leaving only women and old people behind.

Approaches may vary, however. Some countries, for cultural or religious reasons, rule out sex education and the

idea of birth control, and limit their efforts to describing the negative impacts that population growth can have on the quality of life. Curricula and contents also vary depending on the different types of audience, whether they are children, young people or adult men and women in rural or urban areas, or depending on whether the mode of education is formal or non-formal.

Naturally, education alone cannot resolve all problems. It has to be supported by measures in other fields: for example, is it possible to learn to wash oneself if there is no water, or not to strip woodland if the only source of energy is firewood? In the first case, the answer may be to dig wells or bring water from mountain areas by a system of canals (such as the *qanat* in Iran), and in the second case to use solar energy.

The destruction of the environment is not caused only by the number of people (in the South) but above all by industry and automobiles (in the North). What is more, in the North, the Netherlands, where the population density is 350 inhabitants per sq. km, suffers less from pollution than the United States, with its population density of only 22 inhabitants per sq. km. Barry Commoner compiled a set of significant statistics (quoted in the journal *Population*, May–June 1972) on the increase of pollutants compared with that of the population. Over the period 1946–68, growth in the production of non-organic nitrate fertilizers, insecticides, phosphate-enriched detergents, tetraethyl lead and nitrogen oxides (in the automobile industry), and plastic bottles rose from 267 to 846 per cent, while population growth varied only between 30 and 42 per cent.

Many economists in the North and South alike have pointed out that the rich countries, with one-fifth of the world's population, consume more than two-thirds of its resources, a considerable part of which they waste. These resources are taken not only from their own countries but from those of the South as well. For instance, soya bean exports from Brazil (for feeding European cattle) and meat exports from Guatemala, are to the detriment of small farmers, and to the advantage of the local landowning minority and the rich in Western countries: they work hand in glove through the intermediary of multinational corporations in the agro-business sector. Hence, it is often the poor who feed the rich. A genuine international or internationalist education effort should make public opinion in the West aware that it cannot preach in favour of a reduction in economic growth in the South without calling for a change in the lifestyle in the rich industrial countries, especially since a balanced diet is more conducive to good health: Europeans consuming 100 kilos of meat a year would feel much better if they consumed only 30 kilos.

One last problem – which is no less important than the others – needs to be mentioned. This is the co-existence, owing to historical or economic factors, of a large number of ethnic groups in countries where, during the long period of industrial growth following the Second World War, enterprises imported cheap labour from the less developed countries. In Western Europe, for instance, immigrant workers and their families now represent some 15 million people, to which waves of political refugees from Asia and Africa should be added. The proportion of foreign communities as a part of the total population varies from 3 per cent (Norway) to 15 per cent (Switzerland), with Germany and France occupying a midway position (6 to 7 per cent). Regardless of whether the minorities are nationals or immigrants, the attitude of the dominant majority, as reflected in its education system, can spark off reactions going as far as open revolt in cases where they no longer accept inequalities and discrimination. However, there are also instances of antagonism between the minorities themselves for political, economic and religious reasons. Moreover, the integration of Europe is increasing the mobility of people in this part of the world and is making it increasingly a multicultural society, second only to the United States. Regardless of its origins, pluri-culturalism can be a source of both enrichment and tensions, due to differences and prejudices of an ethnic, linguistic, cultural, religious or other nature. A genuine intercultural education policy is becoming an increasingly compelling requirement; thus far education policy has concentrated on assimilating the children of immigrants.

**The economy**

Economic development is essential for providing the physical and financial resources required for the development of education which, in turn, is vital for training the managers and workers needed for the different economic sectors. Conversely, all other things being equal (such as no foreign assistance being provided for the poor countries), economic stagnation or even regression entails difficulties for education.

For twenty-five years after the Second World War, the West enjoyed considerable growth, which resulted in expenditure on education rising faster than GDP and in an increase in school enrolment at all levels (this increase was also boosted by the population boom). In East and West alike, this period was marked by the rapid strides made in economics of education, educational planning and the theory of human capital.

The Soviet economist Stanislas Strumilin was rediscovered. He had been the first, in 1924, to evaluate the profitability of education with a view to guiding planners in their choices. By comparing the wages and productivity of different categories of workers according to their level of instruction – with due regard to their age, occupational experience, qualifications, and so on – he came to the conclusion that education, even of the most elementary kind, made a much greater contribution to economic development than a long period of factory apprenticeship. By increasing the efficiency of workers, it increased the national product, and the expenditure incurred on public education was more than recovered. Slightly later in the West (1935), J. Walsh went back to the concept of capital put forward by William Petty as early as the seventeenth century, and applied it to individuals, whose 'value' was equivalent to the actualized sum total of their earnings during their working lives, which were in turn derived from their level of instruction.

The launching of Sputnik in 1957 had major implications for education. It was interpreted as resulting from the rapid scientific and technical headway the Soviet Union had made through the effort it had invested in education and research. In the United States and Europe this event triggered a whole series of studies on the human factor in development, this term including education, health and organization. The theory of human capital took shape in the United States. Education was not only a consumer item, as it was considered until then, but an investment, since it generated for

individuals benefits that were higher than the costs they incurred, including shortfalls in earnings. Since income proportional to the levels of instruction is a reflection of productivity and society is a sum of individuals, the increase in the stock of instruction is bound to foster economic growth and social equality. Various authors have calculated the contribution of education to the rise in GNP, and this has proved to be higher than that of physical capital.

The theory accordingly legitimized the increase in expenditure on education and in enrolment at all levels, especially in secondary and higher education. In turn, the 'school explosion' caused educational planning to make rapid strides. Formerly confined to the socialist countries, educational planning spread to the West after 1945 owing to the needs of reconstruction and, subsequently, modernization and international competition. In education, planning was a response to increasing enrolment, which followed the population boom after the end of the war, the extension of compulsory schooling, and the growing awareness of families that education fosters social advancement and mobility. In addition, there was the concern to meet the growing demand for skilled personnel. International organizations, such as the OECD (Organisation for Economic Co-operation and Development), the United Nations, and UNESCO in particular, spread the idea of planning in the West and in the world generally. Unlike the mandatory planning in socialist countries, it was merely indicative elsewhere. Whether mandatory or not, planning was accompanied by maps showing the distribution of schools, with a view to reducing regional inequalities. School architecture was renovated so as to serve teaching methods centred on children rather than imposing a single model for everyone. Planning spread from formal school education to vocational training, adult education and non-formal education.

However, the rise in oil prices in 1973, followed by other crises, had lasting effects. With a few exceptions it led to the decline or stagnation of the share of public expenditure devoted to education relative to GNP.

The most serious phenomenon has been the overall increase in unemployment, which has affected women more than men, young people more than adults and those who only had compulsory schooling more than others. On the average, employment rates rise with educational attainment.

In 2002, in most OECD countries, the employment ratio for graduates of tertiary education is markedly higher – around 5 percentage points on average – than that for upper secondary graduates (with the exception of Mexico and New Zealand). The gap in male employment ratios is particularly wide between those with and those without an upper secondary education. Among females, the difference in employment ratios by level of educational attainment is even wider. Employment ratios for females with lower secondary attainment are particularly low, averaging 49 per cent over all OECD countries.[1] The crisis also led to some disenchantment with planning and the collapse of the theory of human capital.

In the South, the most severely affected region is Africa, which is heavily indebted and whose economy is not taking off. The newly industrialized countries of Asia and Latin America, however, are more fortunate, although the drive for profit can lead to a neglect of education, which shows a lower return than industry or trade. In China, for example, the share of GNP devoted to education fell from 2.5 per cent in 1980 to 2.3 per cent in 1991, the same as in 1996. Owing to population growth, the problem of unemployment is bound to grow worse. The number of people who are unemployed or underemployed is currently estimated at 600 million worldwide. The International Labour Organization considers that, in order to absorb unemployment, it would be necessary to create one billion jobs, including 880 million in the developing countries. Because of unemployment, there is a loss of interest in school (Plate 162). In many countries, parents take their children out of school in order to put them to work in the fields, in workshops, in small businesses, and on the street.

The unemployment crisis has triggered a series of reforms in secondary and, above all, higher education. These tend to diversify the streams and types of schools between which transfers are made easier, in order to take account of the different capacities of pupils, and to cater to the different needs of the economy and society. Often, short higher education courses have been introduced with the aim of preparing students for a particular occupation at the level of technician, production engineer, or primary or lower secondary teacher. In order to enable students to combine their studies and their occupation, many universities have established flexible arrangements for admission, class attendance, and awarding diplomas, either by establishing a system of credits that can be capitalized or by making widespread use of correspondence and radio or television courses (the 'Open University').

The decline in public expenditure for education has generally been offset by the increase in school and university fees and the development of private education, which is particularly widespread in the United States, Germany and Japan. In addition, universities are encouraged to secure fresh resources through research contracts with industry and special training programmes. Savings are made by reducing personnel or recruiting part-time teachers, at the risk of reducing the supervision ratio (in France, the student/teacher ratio rose from 20:1 in 1975 to almost 25:1 in 1991, and in Austria from 8.6:1 to 15:1). Efficiency is sought through better management by analysing the unit costs for each level and type of education; by making full use of premises and equipment; by encouraging preventive maintenance, thus saving on later repairs by not waiting for structures and equipment to deteriorate; by using materials

*Table 12* **Public expenditure on education in developing and developed countries** *(Percentage of GNP)*

| Region | 1980 | 1991 | 1997 |
|---|---|---|---|
| Developing countries: | 3.9 | 4.1 | 3.9 |
| Sub-Saharan Africa | 5.2 | 4.6 | 2.9 |
| Arab States | 4.5 | 5.5 | 5.4 |
| Latin America and the Caribbean | 4.1 | 4.2 | 4.6 |
| East Asia/Oceania | 2.8 | 3.4 | 2.3 |
| South Asia | 4.1 | 4.1 | 3.3 |
| Developed countries | 5.4 | 5.3 | 5.1 |

and techniques of local origin in order to reduce construction and fitting-out costs and involve the community; and lastly, by diversifying financing resources, such as by taxing companies and completely or partly doing away with free education and scholarships. In the former socialist countries, only primary or compulsory education has continued to be free, and secondary and higher education now have to be paid for: so much for the market economy.

The oil crisis has added another concern common to developed and developing countries alike: that of the environment, or rather of the ecosystem, in other words the relationship between people and their surroundings. Although the perception of industrial and urban disamenities is not recent, it was not until the 1970s that a new ecological awareness manifested itself in the developed countries and more recently in the developing countries. There is the view now that such disamenities are not incidental to growth, but its unavoidable consequences, which could lead to the destruction of the ecosystem. However, the pursuit of unlimited growth, centred on the unchecked exploitation of nature, is not independent of a certain conception of the world that sees people as the 'masters and possessors of nature', and nature as a machine that can be manipulated by the power of the mind. Education contributes to this attitude: whether it is formal or non-formal, it extols the powers of reason and the pre-eminence of action as fundamental values of a society assimilated to a work organization; it propagates the religion of production and consumption as criteria of civilization and well-being.

In 1972, the Stockholm Conference mooted the idea of 'environmental education' addressed to all, young people and adults alike, in order to make them aware of their responsibility for protecting the environment. It was not envisaged as a discipline, but as an interdisciplinary theme bringing together both the physical and biological aspects of the environment, as well as its economic and socio-cultural aspects, since people form part of the ecosystem. It goes beyond the traditional 'study of the environment', which, since Locke and Rousseau, has endeavoured to take account of children in their environment, with a view to shaping their personalities. Added to this concern is that of developing in both children and adults a planet-wide awareness and responsible attitude towards the management of the environment, the source of all life on earth. The Belgrade Conference (1975) listed several objectives for such an education, including: instilling an awareness of the environment in individuals and groups; prompting them to acquire the behavioural attitudes, skills and capacity to evaluate the training measures and programmes; and involving them in problem-solving. This is therefore not a new 'subject', but 'a dimension and permanent function of education', as defined by the Tbilisi Conference (1977), bringing together biology, history, geography and the economic and social sciences, requiring active methods and working in groups and in the field.

The Rio Conference (1992) took up all these themes by stressing action and respect for and protection of the environment, and the need for continuing education 'from nursery school to faculty' by linking such education to the idea of 'sustainable development'. UNESCO and UNDP (United Nations Development Programme) have held a large number of symposia, produced the review *Connections* and guides for the preparation and evaluation of curricula, launched pilot and experimental projects, and assisted in training or providing refresher courses for teachers. A hundred or so countries have included environmental education in their formal and non-formal teaching programmes. On the whole, the activities are still limited, since this form of education is not compulsory and its interdisciplinarity is difficult to introduce in practice. At the present time, schools have less impact than the extracurricular activities by associations, natural parks, local communities and ecological movements.

## Science and technology

The twentieth century is the century of science and technology, two areas in which constant progress has been made, especially since the Second World War, regardless of fluctuations in the economy. The two give each other mutual support, since the second is an application of the findings of the first, which is governed by the technologies made available to it.

The word science has to be taken in its broadest connotation, so that it includes not only the exact and natural sciences but also the human and social sciences, especially since these have a direct impact on education. Since the end of the nineteenth century, teaching has developed much more rapidly than in all earlier periods, when it was considered as an 'art' and was the subject of philosophical speculation rather than objective studies. This new aspect is characterized by the increasingly large place that 'science', in the measurable and experimental sense of the term, has come to occupy in teaching. In addition, with the growing complexity of phenomena, research, which was long confined to schools, has been broadened to include everything taking place outside them and is having an impact on training. This is how the 'educational sciences' came to be developed: some of them deal with the general factors influencing education (philosophy, history, anthropology, sociology, demography, educational administration and planning) while others deal with its inherent processes (biology, psychology, linguistics, teaching methods). Comparative education is not a discipline but a field of study, which is concerned with both external conditions and internal workings, and adopts a particular approach according to the subject of the research.

Educational psychology first emerged at the end of the nineteenth century with William James (1842–1910), a pragmatist who considered pupils as being 'machines driven by associations' and laid stress on interest as the driving force behind educational advancement. The intelligence test method was founded by Binet and Simon (1905) and developed by Terman and Thorndike with the aim of guiding pupils during their compulsory schooling and, on its completion, to select individuals and give them vocational or military training. The same period saw the emergence of what is currently known as 'new schools' or 'new education' in Europe, and 'progressive education' in the United States. In opposition to the bookish and intellectualist tradition, this new approach required that education of the mind be accompanied by that of character, taste and the body, in a twofold individual and social perspective. The activities of children had to be encouraged in all their forms so that they would participate in their own training and the 'master' would give way to the 'educator', who would act towards them as a guide respecting their personalities, capable of

organizing both group and individual work, laying stress on cooperation rather than competition, on success rather than failure, all in a favourable and suitably equipped school setting. The most influential writer of the first half of the century was John Dewey (1859–1952), who is best known for his phrase 'learning by doing'. In fact, Dewey advocated the combination of play and intellectual and manual work in joint experiments, so that schools would train children in the qualities of initiative, responsibility and adaptability which they will need later in life. Dewey conceived of school not as serving individualist purposes but social ends. Like society, it had to be democratic. However, children were not adults. It was necessary to foster their current interests, their *joie de vivre*, their spontaneity, and the spiritual and moral fulfilment of their personalities, rather than impose utilitarian objectives on them. 'Education is a life process not a preparation for life' (Dewey, *My Pedagogic Creed*).

Dewey influenced Ovide Decroly, who, wanting 'a school for life through life', created the Ecole de l'Hermitage near Brussels in 1907. The school was not expected to prepare children for adult life, but represented a living environment, which would give expression to all their faculties. Because Decroly entered into contact with reality in global terms, he advocated the global method for reading and writing, as well as for all-round psychological training. Teaching was not by subjects but according to centres of interest, which grouped and ordered knowledge likely to arouse the curiosity of children. Each centre was tackled from different angles: observation and measurement, association in space and time, expression in all its forms.

In the same year, Maria Montessori opened the Casa dei bambini in Rome. Combining sensualist hypotheses and the ideas of child observation, freedom and activity, she developed appropriate teaching materials, which, through successive exercises performed in an atmosphere of affectionate relations with the educator, were aimed at the children's motive and sensory training. Montessori left no scope for children's spontaneity, and she closed the classroom to any intrusion from life outside.

The influence of Freud (1856–1939) made itself felt mostly in the years after 1950. His conception of education was derived from his theory of individual psychological development. This is above all governed by emotional development, which is itself governed by drives, the main one being sexual. However, the pleasure principle, which regulates us, comes up against the reality principle because life with others and culture require the regulation of human relations. Educators therefore have to teach children to control their instincts and hence find an optimum between 'the Scylla of inaction and the Charybdis of prohibition'.

In the case of Piaget (1896–1980), education entailed adapting individuals to the surrounding social environment not by teaching them ready-made truths, but by making them understand and learn through action and experimentation in accordance with the laws of mental growth (Plate 163). Piaget distinguished three developmental stages whose order of succession are constant: sensory-motive intelligence in the course of the first two years; concrete operations from 2 to 11 or 12 years; and formal operations from 11 or 12 to 16 years. The move from one stage to the next takes place through assimilation of new objects and the adaptation of action to particular conditions, resulting in equilibrium. Teachers have to guide and constantly stimulate the activity of children, and it is this activity alone that can 'lead to intellectual autonomy'. The pivot is motivation, and without interest, there can be no motivation. Two issues in this theory have given rise to discussion.

The first concerns the role of language in cognitive development. In Piaget's view, children can acquire words without necessarily acquiring logic. On the other hand, according to J. S. Bruner, it is not action but language that develops intelligence, since it makes it possible not only to communicate but also to take the experience into account. A third hypothesis is possible: the existence of a factor that would be the basis of both cognitive and linguistic development.

The second issue concerns the universality of the stages. Considerable intercultural research has confirmed Piaget's sequence, although at the same time it has also shown the importance of the economic and cultural factors disregarded in his theory, such as urban development, cultural integration, schooling, and the physical and intellectual environment. For instance, nomads need spatial concepts, while sedentary farmers give preference to those involving conservation, quantity, weight and volume, because they have to store and trade in their produce. The Arctic Inuit are quicker to acquire the notion of horizontality than the Ebrie of West Africa, while the contrary is true of conservation, with the Australian aborigines occupying a midway position.

Lastly, the performance of the subjects tested may not reflect their skills on account of the conditions of the experiment and the structure of their thought, because each culture places a different value on a particular concept. Piaget gave prominence to formal intelligence, which is bound up with scientific rationality and Western capitalism. This is not the case with other cultures. An uncritical application of these criteria would amount to ethnocentrism.

Schools started to use photographs, films, recordings, records and radio, which was followed, after 1945, by television, teaching machines and computers. The audio-visual media first served as a teaching aid in order to provide additional documentation and create or stimulate the interest of pupils. They can reach a considerable public; the Open University in Britain, which was opened in 1971, has been emulated in many other countries as a way of giving educational access to isolated or disabled people (as in Australia) or to provide more flexible work and study opportunities. According to research, pupils learn more with audio-visual media than with audio or visual media alone, for example when film is associated with other activities (the compilation of documentation in preparation for the film projection, subsequent discussion and supplementary information). The limitations originally imposed in respect of timetables and the continuity of exposition have been removed by tape and video recorders, which have improved learning processes, especially of modern languages, musical studies and forms of oral expression. Video plays an important role in teacher training (micro-teaching), medical education (transmission of surgical operations) and creation (video clips). The audio-visual media are also the subject of teaching since, as stated by the International Commission for the Study of Communication Problems, 'information is easily corrupted into the dissemination of half-truths and even falsehoods, persuasion into manipulation and propaganda'.[2] The role of

teachers is to help develop the critical thinking of their pupils by teaching them that an image is never neutral, any more than a word.

Teaching machines were introduced with programmed education (theoretically, such education can manage without the machines and can use 'scrambled books' instead, but the results are not as good). Teaching machines draw their inspiration from behaviourism and their driving principle is reinforcement, in other words the immediate reward that increases the activity and motivation of the learner. The programmes, which may be 'linear' or 'ramified', are applied in the teaching of mathematics, the sciences, and modern languages, and in vocational training.

Information technology, the latest innovation to influence teaching methods, makes possible not only the remote transmission of knowledge, but also to process, store and distribute it, thereby stepping up intellectual activity, especially since the arrival of the personal computer. Computer-assisted teaching (CAT) has been used above all as a tool for teaching and learning. The weakest pupils seem to benefit the most from this, but the higher the level of education (from primary to higher education) is, the smaller seems to be the benefit that can be drawn from CAT. If the progress made with CAT is far from living up to expectations, this is because there is no theory of learning to explain how computers can or cannot foster the acquisition of knowledge. What they can already do is to adapt teaching to the needs of individual pupils, to their working pace, to the level of their knowledge, and to their cultural backgrounds. Some countries are experimenting with educational software using artificial intelligence processes capable of interpreting, evaluating and correcting the replies of pupils and putting forward personalized learning strategies.

As an academic subject, information technology (IT) was, depending on the country, introduced some 20 to 30 years ago in universities and institutes of technology, and more recently in general secondary education and even primary education. Increasingly the view is that information technology forms part of the basic knowledge that children should learn during their compulsory schooling, especially since they are encouraged to do so by IT's game-playing aspect. In addition, there is a need to prepare them to live and work in an increasingly computerized society whose languages and mechanisms they have to grasp and master. There is also the need to adopt an integrated approach to data-processing techniques and audio-visual media, the first of which call on logic and the second on imagination: the two systems are combined in the inter-active video-disc which makes it possible to introduce illustrated sequences into software.

Third, information technology is used more and more as a management tool. At the level of educational establishments, it is used for keeping accounts, the recording and follow-up of pupils' files and examination marks, the management of libraries and teaching materials, and so on. At the central level, it facilitates the administration of the system as a whole by processing and analysing information flows for the purpose of managing personnel, finances, buildings and equipment, and drawing up projections.

For developing countries, this application of information technology is the easiest to adopt. It requires only a small number of qualified managers, who are increasingly available. With a large number of personnel with limited qualifications, however, there are likely to be problems of storing archives

(lack of premises), mistakes in the compilation and processing of data, and slowness in adopting new procedures. In accounting terms, the assessment for adopting IT is positive (in employment terms, it is a different matter).

The other applications of information technology for education in developing countries are less obvious, except with respect to higher vocational training. The main problem is the lack of software suited to their needs, along with the more general problem that their societies are not yet computerized, except in certain sectors. The demand for an information technology acculturation has therefore not yet made itself felt. The industrialized countries should not be blithely imitated on the pretext that the information technology revolution is unavoidable. For most of the developing countries, the aim is only to train the necessary number of specialists for a given number of activities, but not yet to seek 'computer literacy'.

In both the developed and developing countries, considerable hopes have been placed in technology – i.e. audio-visual media and now computers – in order to democratize education and, at the same time, create or stimulate the interest of learners, and develop their imagination and creativity. Studies show that technology does not replace the teacher, but should be integrated into the overall teaching process in the same manner as books. Distance teaching has made education possible for young people who do not have access to school because of the far-flung nature of the population (e.g. in Australia) or for other reasons. It also serves to provide literacy training for adults (the Telescuola in Italy, the Sutatenza in Colombia, the radio schools of Honduras). Similarly, radio fora or discussion groups in India, Togo, Niger and Senegal have encouraged local education activities. Elsewhere, multi-media systems have improved teacher training. In all these cases, the use of new means has broadened the scope of education and enabled learners to attain the same standard as in conventional schools. In addition, the game-playing aspect of television and now of computers arouses greater interest and motivation in pupils, who as a result learn better. In the experience of Télé-Niger, and above all in Côte d'Ivoire, enrolment numbers have increased and efficiency has improved. In Côte d'Ivoire, from 1968–1969 to 1978–1979, the number of children enrolled in primary education rose from 322,700 pupils to 746,710, with average repetitions falling from 32.4 per cent to 20.5 per cent. Problems arise, however, when they enter secondary education, which remains traditional and highly selective: television encourages oral rather than written expression. On the other hand, new technologies have not levelled out social inequalities since, due to quantitative growth, more people have been left outside the mainstream and these belong to a massive extent to the disadvantaged sections of the population. Other experiences in Europe and North America confirm that technology does not automatically result in democratization. Nowadays, having or not having microcomputers to use is liable to accentuate social differences.

Even in a large country like India (where unit costs are lower than in small countries), television and satellite teaching programmes (SITE: Satellite Instructional Television Equipment) have not lived up to the hopes placed in them of equalizing educational opportunities while improving quality and reducing costs. According to Asok Mitra, they have not succeeded in: (a) increasing

awareness, knowledge and practice of various agricultural innovations; (b) bringing about significant changes in attitudes or practice related to birth control; (c) bringing about desirable changes in social behaviour and political participation, organizational activities or leadership; and (d) substantially increasing self-help capabilities.[3] However, SITE did increase the occupational and economic aspirations of child viewers 'even to unrealistic limits'.

In formal education, radio and television have contributed to increasing the efficiency of science teaching (physics, chemistry, biology, mathematics), especially in rural areas lacking in qualified teachers and equipment. Again according to Mitra, the drawbacks of such a system are: '(a) inflexibility of scheduling; (b) the predetermined and immutable presentation of the message, ruling out the possibility of revision or correction; (c) lack of instant interaction between the person delivering the lesson and the learner; (d) one-shot lessons and a corresponding absence of elucidation and elaboration; (e) frequent lack of graduated structuring from easy to difficult stages; (f) absence of optimum mix of the various media, chiefly instructional and methodological films, radio, television lessons, and traditional media such as the theatre and puppetry; and (g) the disaggregation of target audiences into homogeneous age groups'.[4] These difficulties are also encountered elsewhere, and some of them can be remedied, but the fact remains that it is not possible to dispense with qualified teachers, especially for the design and evaluation of programmes.

However, the media have changed the role of teachers. Traditionally, they were 'those who know about teaching children who do not know'; hence, teaching was based on authority. The learning of democracy at school requires that school become a place for developing a dialogue between teachers and learners, especially when these are young people and adults who have their own experiences and knowledge. This transformation is essential, especially since teachers are not the only people dealing with children who possess knowledge. The flow of information channelled by the media is such that even in rural areas, children can sometimes be better informed on some subjects than teachers. Teachers now have to be organizers, guides and advisers to a greater extent than transmitters of knowledge (which they still remain).

## International relations

Important global factors that influence the evolution of education include not only economic relations governing the development capacities of poor and rich countries, but also international political relations. For example, the settlement of conflicts, the decline in tension and disarmament will liberate resources for education. Cultural relations will foster the mobility of teachers, researchers and students, as well as the exchange of information and experiences; this will build cooperation between institutions for teacher and student exchanges, and for joint research.

The actors on the international scene are states, organizations, enterprises and individuals. They do not all have the same possibilities, although their activities always take place in a certain national and international context. They support each other whenever their interests coincide and clash with each other in the opposite case. The policy of a state may strengthen that of a multinational corporation

when transfers for training purposes promote exports, or may oppose that of an international organization, which is more concerned with education than with profits. Technical assistance personnel may meekly follow the directives of their governments or spread 'subversive' ideas.

In the broadest sense, a country's education is influenced by all the tangible and intangible products circulating in the world: not only ideas and knowledge, books and periodicals, cinema and television, but also capital goods incorporating a particular technology, consumer goods which arouse the desire in people to possess them and which strengthen the cultural model from which they originate, especially among those who have become familiar with them through school. The media play a major role in the propagation of the ideologies of the North: its radio stations occupy 90 per cent of the frequencies and its leading press agencies (Associated Press, Reuters, United Press International, Agence France-Presse and ITAR-TASS) disseminate 80 per cent of all messages.

For 70 years, the international scene was dominated by the competition between the communist and capitalist states, which both sought to win over the greatest possible number of supporters by whatever means. In this regard, ideological propaganda and the training of human resources played an essential role. This accounts for the importance of aid, which performs, in a subtler manner, some of the functions that used to be performed by colonization. In fact, every major power gives preference to its former colonies or its sphere of influence.

Transnational corporations do not deal only with the economy, finance and trade, but also with so-called cultural industries (books and teaching aids, information and leisure activities). Their activities involve the training of workers and managers, and more recently the production of audio-visual and electronic teaching equipment. These corporations cater to their own interests and not necessarily to those of the countries where they are established. Since the technology is generally imported without being adapted to local conditions, the training is also copied from the original model. As a result, a transnational middle class has developed, sharing the ideology of free enterprise, economic rationality and competition, success based on material criteria, and an individualistic way of life geared to consumption.

There are also influential private foundations, many of which emanate from such corporations, as their names indicate (the Ford, Carnegie, Rockefeller foundations). A large number of them finance education projects, such as the educational television series *Sesame Street* (also supported by the American Government), which was broadcast in nearly 90 countries in the 1970s (Plate 164). The programme met with opposition in certain countries: in the United Kingdom the BBC considered that it encouraged a passive attitude among children instead of stimulating their imagination and intelligence; the programme was picked up instead by the rival ITV network. In Peru it was considered incompatible with the country's educational reform (1970) based on dialogue and creative participation.

The so-called 'international' organizations are extremely diverse: they may be intergovernmental or non-governmental in nature, and pursue a variety of aims, which may or may not be disinterested, temporal or spiritual. They may be established in particular regions or cover the whole planet, and have resources of varying importance.

There are intergovernmental organizations that provide assistance for education worldwide, such as United Nations agencies (UNESCO, World Bank, FAO, WHO, UNICEF, etc.), the Council of Europe and the European Union, the OECD (Organisation for Economic Development and Co-operation representing 30 industrialized countries), and the regional development banks (the African, Arab, Asian and Inter-American Banks, etc.).

The most important institution in this field is UNESCO, which was created in 1945 with a mission to contribute to peace in the world through education, science and culture, to which communication was recently added (Plate 165). Originally the Organization had 20 Member States, but this number has now risen to 190, some 20 of which have fewer than 500,000 inhabitants. UNESCO's history has been notably marked by: the Universal Declaration of Human Rights, comprising the right to education, in 1948; the emergence of the term 'development' in 1966 and of 'UNESCO's contribution to a world economic order' in 1974; and the crisis provoked by the establishment of a 'new world information order' in 1980, which led to the withdrawal of the United States (1984) and of Great Britain and Singapore (1985) from the Organization, resulting in a cutback in its budget by one-third. (The US and Great Britain have since rejoined.) In 1988, the World Decade for Cultural Development was launched, and in 1990 a World

*Table 13* **Gross enrolment ratios by sex in sub-Saharan Africa, the Arab States and South Asia**

| Region | All | Male | Female |
|---|---|---|---|
| Sub-Saharan Africa | 76.8 | 84.1 | 69.4 |
| Arab States | 84.7 | 92.1 | 76.9 |
| Southern Asia (including India) | 95.4 | 106.8 | 83.3 |

Conference on Education for All was organized with other United Nations agencies at Jomtien (Thailand). This was followed in 1992 by the creation of two International Commissions, one on Education for the Twenty-First Century and the other on Culture and Development.

The World Conference on Education for All (EFA) in Jomtien (1990) set the goal of universal primary education by the year 2000, a goal that is far from being reached. The UNESCO *World Education Report 2000* states that in 1997 (the last year for which we have global statistics), the gross enrolment ratios averaged 71.5 per cent (male: 80.6 per cent, female: 62.3 per cent) for the least developed countries and for the less developed regions. Latin American and the Caribbean, Eastern Asia/Oceania have ratios exceeding 100 per cent, respectively 113.6 and 118.0 (male and female).

Other United Nations agencies also work to develop education: UNICEF devotes itself to children of the most disadvantaged families in the fields of health, nutrition and education; the International Labour Organization deals with technical, vocational and trade union training, WHO with health training, FAO with agricultural training, etc. The United Nations University in Tokyo is not a university

in the conventional sense with lecturers and students, but the centre of a worldwide network of research and training activities for development purposes.

The World Bank should also be mentioned in this context. After having been created to assist with reconstruction after the Second World War, it became involved in education, first with respect to buildings and equipment and then reforms, with the aim of improving the efficiency of education. The accent has been shifted from secondary and higher education towards primary education, which the World Bank acknowledges as being a prerequisite for increasing the productivity of poorer sections of the population.

There are now more than 3,000 non-governmental organizations (NGOs) in the world providing assistance for education and training. They are extremely varied: in some instances, they are examples of 'cultural imperialism' and in others of selflessness and dedication. The NGOs that are warmly welcomed are those which, instead of importing their own ideas, are capable of listening to what the local population has to say, which start by asking it what its needs are and then design their assistance accordingly. Education also includes informing the poor of their rights in relations with their governments and the ruling classes, as well as of women's rights with regard to men.

Among the non-governmental organizations, religious institutions should not be forgotten. None of these is homogeneous, there are conservatives and progressives, and personalities sometimes play a more important role than structures, not to mention the influence exercised by world events. After Pope John XXIII, during Vatican II (1962–65), declared that 'development [is] the new name of peace', 'liberation theology' was briefly in vogue; the tide has now ebbed with the economic recession.

According to UNESCO's *World Education Report*, assistance to education, in current US dollars, rose from $2.02 billion in 1975 to $6.04 billion in 1990, and $6.63 billion in 1997. The $2.02 billion in 1975 are, in view of inflation, equivalent to $4.99 billion in 1990. In 15 years, assistance has therefore increased by 20.8 per cent, or slightly more than 1 per cent per year. The share of bilateral assistance fell from 70 per cent of the total amount in 1975 to 60 per cent in 1990.

The role of the World Bank became very important: it provided almost one-quarter of the assistance, while that of UNESCO was no more than 1.2 per cent in 1990 compared with 2.8 per cent in 1975. In addition to grants and loans (which do not really represent assistance if the rate exceeds 2 or 3 per cent), the assistance includes the secondment of personnel (teachers and experts) and equipment, and the award of study and training fellowships. According to the same source, the number of students abroad rose from 915,900 in 1980 to 1,177,600 in 1990 (+28.6 per cent), out of whom 757,000 (64 per cent) came from the developing countries and 334,000 (28 per cent) from the developed countries, with the remainder being undetermined. Two tendencies can be observed: a decline in the percentage of students from the developing regions apart from Eastern Asia, and an increase in the percentage of students from the developed countries, virtually all of whom pursue their studies in other developed countries, especially on account of European integration.

To what extent does international assistance benefit the developing countries? In the first place, it is influenced by strategic, commercial and financial considerations more than

474

by disinterested humanism. In addition, statistical computations have shown that, for the World Bank and a country like France (but the example can be extended to other cases), there are significant correlations between the amount of assistance (or loans) and the per capita GDP of the beneficiary countries. This means that the assistance above all benefits the more privileged countries. It accordingly tends to broaden the gaps existing in the 'South'.

What is more, assistance is never free. The cost to the donors is not equivalent to the value for the beneficiary countries, except in the case of direct transfers (such as study fellowships), for several reasons. The first of these is the 'tied' nature of the assistance. Capital expenditure (such as for the construction of schools) is defrayed for the benefit of firms in the donor country, which produce the design, deliver and transport the materials, and send managers to the site; only a small proportion of the assistance benefits local labour and producers. Tied assistance obliges the beneficiary country to pay prices higher than those prevailing on the world market and to defray the transport and insurance costs incurred by the companies of the donor country.

Further, when it comes to the salaries of technical assistance personnel, which account for 70 per cent of all assistance to education, a large part is not spent locally. At least half of the salaries, perhaps even two-thirds, are kept in the country of origin or are repatriated there in the form of savings. In addition, expenditure on consumption itself is concentrated on manufactured products or even food imported from the industrial countries. Hence, only a small proportion of these earnings benefit the local economy.

In addition, the 'value' of technical assistance experts for the countries receiving them is not equal to the remuneration borne by the country sending them, but to their local replacement cost. In addition, in most instances, external assistance entails ancillary costs (accommodation, transport, etc.), which may reach or exceed the expenditure, and which the country would have to defray if it employed its own nationals.

The fact that international assistance finances capital expenditure in foreign exchange tends to favour foreign rather than national enterprises. This results not only in higher costs but also in sumptuous and unsuitable architectural designs because they have been produced in the developed countries. These prestige buildings make a deplorable impression alongside the nearby shanty areas which can be seen in so many cities of the developing countries. The squandering of resources is all the more regrettable in that the buildings are not fully used. UNDP (the United Nations Development Programme) has found that they have a utilization rate of only 20 per cent, and for equipment this rate is only 12 to 15 per cent. Many buildings are closed for four months a year and at 6 in the evening.

Other dangers stem from a naive enthusiasm for innovations, regardless of what they are, without account being taken of the national context. Before projects proposed by bilateral or multilateral assistance are implemented, even on an experimental basis, they should first be studied thoroughly. Pilot experiments often enjoy advantages and possibilities (in terms of funds, personnel and equipment) which the country cannot afford once the external assistance has been withdrawn. Advanced technology (audio-visual programmes, computers, satellites, etc.) demands enormous expenditure on the part of poor countries lacking energy sources and involves risks of financial, technological or

ideological dependence on those supplying both the hardware and software.

The foregoing analysis has shown some of the reasons why the economic return of assistance for education is so low. In the 1960s, the Pearson Commission already considered that for every $100 devoted to technical assistance, there was a probable transfer to the beneficiary country of foreign exchange equivalent to only $20.

For many countries, far from representing a loss, the reduction or halting of international assistance would perhaps be a chance, an opportunity for rethinking their problems, for seeking solutions suited to their national context instead of expecting to receive ready-made solutions from outside. Real solutions are never merely technical; the problems of the young states are above all of a political and cultural nature. Indeed, 'foreign assistance never represents more than an additional contribution or a starting-point. Only the efforts of the population can establish and entrench the basis of growth and can guarantee that it will last'.[5]

## EDUCATION AND DEVELOPMENT

In the first part of this chapter, we considered the global factors that influence education in accordance with trends varying from country to country, and depending on political system, social relations and power structure, and the state of human, financial, scientific and technical resources.

A recurrent theme of the second half of the twentieth century has been the question: To what extent do education policies influence development? The conventional dichotomy between developed and developing countries is largely artificial, since all countries are intent on development, although through different means and resources. In addition, the concept itself is open to many interpretations.

For a long time, the concept of development was reduced to that of 'economic growth' and it was only gradually that the term 'economic and social growth' came to be used. The 'cultural dimension' was introduced more recently, following the failure of most of the countries of the South to emulate the 'capitalist' and 'socialist' models. The latter model, in fact, is bankrupt, while the former is proving incapable of resolving its own problems, such as unemployment, inequalities, violence, the destruction of the environment.

Moreover, the 'development of education' involves not only public or private schooling but also 'non-formal' education organized for specific groups with a view to achieving certain objectives (literacy, for example) and of 'informal' education, which includes learning through work, the mass media, travel, etc.

Because of these many and varied aspects, education, like development, is a contradictory phenomenon, in the sense that it has both positive and negative aspects. But for whom are these aspects positive or negative? It is obvious that the same effects can be positive for some groups and negative for others, that what is negative at one point in time can become positive at another. However, there is also a contradiction between the different dimensions of education. Just like economic growth, it can exacerbate inequalities between cities and the countryside, between regions, between social classes, and between ethnic groups. Economic growth requires the training of qualified specialists, hence the need for selection at the entry to higher education. However, the best applicants do not very often come from

the disadvantaged classes, but from those which are culturally and economically favoured. This was the dilemma of the socialist countries, which finally resolved it by giving priority to the economic sector over social egalitarianism.

There is also opposition between the economic and cultural spheres. Teaching in a widely spoken foreign language gives direct access to international scientific and technological literature. It is therefore a factor in development. However, it will make young people more remote from their cultural roots and will contribute to the brain drain. The consequence is most serious when foreign universities perform such educational activities established in the country, such as the American and French universities in Beirut.

Within formal education itself, there is a major contradiction, in that it is expected to contribute simultaneously to reproducing set social patterns and bringing about change: scientific and technical change in order to increase physical resources; social change because ruling classes everywhere need to renew themselves and integrate the best elements of the other classes, if only to ensure their own legitimacy. Hence selection-conservation based on belonging to a social class has to be supplemented by selection-mobility based on abilities. Do schools perform this second function badly or well? It is the former, if many gifted children from underprivileged classes abandon their studies owing to a lack of resources; it is the latter, if the filtering process allows a small number to advance, but not too many. In other words, school wastage is costly in pedagogical and financial terms, while schools are 'functional' for the privileged classes because they work to their advantage. Moreover, the use of a foreign language is an important factor in selection (as in Africa).

Before examining the relationship between education and 'development' in more detail, a statistical overview is necessary.

## Statistical overview

Whereas the growth in pupil numbers in the first half of the twentieth century was slow because of wars, economic depression and reigning conservatism, the second half saw those numbers grow quickly at all levels until the 1970s,

*Figure 4* **Net enrolment ratios for the 6–23 age group, by region (1970–1990)**

* Refers to developed countries in Asia and Oceania.

when the oil crisis and its consequences appeared. Enrolment continued to rise, but at a lower rate. Similarly, after having increased until the 1980s, illiteracy fell in both numbers and percentages. However, inequalities continue to exist both between countries and within individual countries, between sexes, urban and rural areas, regions, social classes, and ethno-linguistic groups.

Enrolments worldwide rose from 328 million in 1960 to 618 million in 1970, 843 million in 1980 and 975 million in 1990 (excluding pre-primary enrolments). However, the rate of growth gradually slowed down from 88 per cent in 1960–70 to 36 per cent in 1970–80 and to 16 per cent in 1980–90. This rate was naturally not the same in all countries and in all regions or for all levels of education. Figure 4

*Table 14* **Enrolments and gross enrolment ratios, 1990–1997**

| | 1st Level | | 2nd Level | | 3rd Level | |
|---|---|---|---|---|---|---|
| | Millions | Rate | Millions | Rate | Millions | Rate |
| **More developed regions** | | | | | | |
| 1990 | 61.3 | 99.2 | 68.9 | 94.5 | 29.1 | 34.2 |
| 1997 | 62.9 | 103.5 | 75.8 | 108.0 | 34.2 | 61.1 |
| **Countries in transition** | | | | | | |
| 1990 | 29.7 | 97.5 | 38.2 | 91.5 | 10.7 | 36.1 |
| 1997 | 27.4 | 96.7 | 41.1 | 87.0 | 11.0 | 34.0 |
| **Less developed regions** | | | | | | |
| 1990 | 505.9 | 98.9 | 207.9 | 42.1 | 28.8 | 7.1 |
| 1997 | 578.2 | 101.7 | 281.3 | 51.6 | 43.0 | 10.3 |
| **Less developed countries** | | | | | | |
| 1990 | 53.8 | 65.8 | 12.1 | 17.2 | 1.2 | 2.5 |
| 1997 | 68.7 | 71.5 | 16.9 | 19.3 | 1.9 | 3.2 |

*Source:* UNESCO, 2000, *World Education Report 2000*, pp. 115–16

shows trends in net enrolment ratios for the 6–23 age group, by region, for the period 1970–90. The gross ratio is the ratio of the number of pupils at each level, regardless of their age, to the population of the corresponding age group. This is why it may exceed 100 per cent because of repeaters having exceeded the official age. The number of enrolments and the gross ratios by level are given in Table 14.

In the developed countries, enrolments in primary education have fallen since 1970, owing to the decline in population. The developed countries, accounting for 20 per cent of the world's population, represent 18 per cent of enrolments at the 1st level, 30 per cent at the 2nd level, and 55 per cent at the 3rd level. In developed countries, for every 1,000 pupils at the 1st level, there were 802 at the 2nd level and 315 at the 3rd level. The corresponding figures for developing countries are 420 and 57.

The figures in developing countries show the scale of school wastage experienced by many countries, especially in Africa, where the vehicle of teaching is a foreign language. The English-speaking countries, which use local languages to a greater extent in primary education, are less affected than the French-speaking and Portuguese-speaking countries. In addition, it is estimated that there are millions of children who are not enrolled at all, chiefly among girls and young people in rural areas.

A positive factor is the increase in the enrolment of girls, which exceeds that of boys at the secondary and higher levels in the developed countries and is catching up in the developing countries (it is already higher at the secondary level in Latin America and the Caribbean).

The increase in enrolments accounts for the fall in illiteracy. In overall terms, after the number of illiterates aged 15 years and upwards had increased from 700 million in 1950 to 742 million in 1970 and 946 million in 1980, this figure fell to 882 million in 1997, and will decline to around 857 million in 2005. Because of the size of its population (more than half the world figure), East and South Asia have the highest number of illiterates, amounting to 430 million in 1997. Conversely, the developed countries still had 14.2 million illiterates in 1997, of which 9.8 million were women.

The illiteracy rate, which stood at 44 per cent of the adult population in 1950, fell to 32.8 per cent in 1980 and 22 per cent in 1997, In addition to the greater enrolment numbers of young people, this reduction is also due to the decline in population growth. The highest population growth rates are to be found in South Asia (54 per cent), sub-Saharan Africa (53 per cent) and the Arab States (49 per cent). The rate in the developed countries is 3.3 per cent.

Illiteracy always affects women more than men (28 per cent as against 16 per cent in 1997) and rural dwellers more than urban dwellers (on average three times more). Even the industrial countries have discovered, or rediscovered, illiteracy in their midst, not only among immigrant workers, but also in some social categories where people read and write little and gradually become illiterate.

The gap between North and South is again obvious at the financial level. Overall, in current dollars, public

expenditure on education has increased more in the North than in the South: in the less developed countries it rose from US$48.5 billion in 1980 to US$242.4 billion in 1997, an increase of more than 2.5 times; in the developed countries it rose from US$476.1 billion to US$951.1 billion, an increase of approximately 200 per cent. The percentage in relation to GNP varies little between 1980 and 1997: about 5.1 per cent more in the developed regions, and rising from 3.8 per cent to 3.9 per cent in the less developed regions.

While these rates are quite similar, the size of the gap between the absolute figures should not be overlooked, with 84 per cent of the world total for public expenditure on education being dedicated to 26 per cent of the enrolment numbers (the North) and 16 per cent of the total for the other 74 per cent (the South). These figures are evidence of the quantitative and qualitative disparities in level, since cost is largely bound up with quality. In 1997, the developed countries spent an average of US$5,360 per pupil of all levels, while the less developed countries spent US$194. Within the developing countries, there are considerable variations according to the regions: in 1990, the average expenditure ranged from US$252 per pupil in sub-Saharan Africa to US$465 in Latin America and the Caribbean; US$182 in Eastern Asia/Oceania, US$164 in Southern Asia and US$584 in the Arab States. Expenditure also varies considerably according to the level. Higher education is particularly expensive in Africa with regard to its per capita GNP: US$1,611 per student as against US$305 in Southern Asia, US$817 in Eastern Asia/Oceania, US$1,726 in the Arab States, and US$1,169 in Latin America and the Caribbean. The same differentials are found with respect to scientific and technological potential.

Europe's share of the expenditure fell significantly on account of the economic difficulties following the collapse of communism in Eastern Europe. On the other hand, the share of Asia/Oceania made massive strides bound up with the increase in its human potential. This region comprises countries that are already developed (Japan, Australia and New Zealand) or are being rapidly industrialized (e.g. Taiwan, Hong Kong, Singapore, and more recently China, Thailand, Republic of Korea, Malaysia, Indonesia and India). High-technology centres are being established, such as that at Mangalore, the 'Silicon Valley' of India.

### Education and economic development

Economic development is usually defined by the sustainable increase of the overall GNP, or better still, by the per capita GNP, which has been most studied. It can be broadly said that until the late 1960s, the tendency was to emphasize the contribution made by education to economic growth; since then, factors such as its unsuitability and the reproduction of inequalities or dependence have above all been highlighted. Analysis has gone further and deeper. Setting out from an 'external' point of view whereby education is considered as being an economic activity and a statistical aggregate related to the GNP, an attempt has been made to learn more of the internal workings of education and the way in which its structures, contents and methods act on the economy and are influenced by it. In particular, interest has focused on the relationship between training and employment, between learning and working.

In general and theoretical terms, education can be said to be a factor of growth inasmuch as it contributes to:

– The propagation of knowledge and of attitudes conducive to production – economic rationality, technical skills, entrepreneurship, etc. Naturally, this is not sufficient: knowledge has to be applied to production and attitudes reflected in behaviour patterns.
– The raising of the qualifications of the labour force and hence productivity. In the industrial countries, this is often measured in terms of occupational earnings. However, there is no linear correlation between education, qualifications and earnings. This link is biased by an even larger number of factors in the developing countries, especially in Africa, where it is not uncommon for appointments to be made on an ethnic basis. It would be possible, however, to apply cost-benefit analysis to production itself (by evaluating the training costs and examining how training results in an increase in production).
– The training of the different categories of managers (administrative, technical, economic and social) and workers (agricultural, industrial, semi-skilled and skilled).
– The education of consumers, so that they make rational choices between the different sources of supply, with a view to ensuring that the economy allocates resources efficiently.

**Table 17** **Research and development in terms of personnel and expenditure** *(percentage per region)*

| Region | 1980 | | 1990 | |
| --- | --- | --- | --- | --- |
| | Personnel | Expenditure | Personnel | Expenditure |
| North America | 17.6 | 32.1 | 17.8 | 42.8 |

– The provision of training in research and innovation with a view to better resolving the problems of development.

However, education can prove to be a brake on growth because of the following factors:

– the transmission of attitudes inimical to production (contempt for manual work, agriculture, etc.);
– the dissemination of bookish knowledge having no bearing on real life and incapable of being used for development purposes, which can therefore result in the training of the 'graduate unemployed';
– the possible lack of skilled personnel if too many students pursue their studies and if the education system employs too many people who could be used in the productive sector;
– the undue cost of education, which reduces the scope for investment; and
– international assistance, which transmits unsuitable cultural models, imposes high recurrent charges and contributes to the brain drain.

These factors can be seen above all in Africa, chiefly for historical reasons and because of its lack of human and financial resources.

The unsuitability of education for production, which, among other things, results in unemployment, cannot obviously be attributed to the education system alone. The economy, too, is responsible if its rate of growth is very much lower than the enrolment ratio (in which case the economy has a low absorption capacity).

For a long time, the developing countries – and the states and international organizations assisting them – have given priority to secondary and higher education producing qualified managers who increase productivity and make it possible to employ the labour force. The statistical surveys carried out in the developed countries demonstrated this and the theory of human capital was propagated everywhere. The priority given to this was itself linked to a strategy, which laid stress on the modern sector and on industrialization with imported techniques, providing employment for only a limited number of top and middle managers.

Agriculture, which occupies from 60 to 80 per cent of the world's population, was neglected and its stagnation or low growth eventually had an impact on the economy as a whole. As a result, a considerable proportion of the budget, amounting in some cases to as much as 60 per cent, was allocated to secondary and higher education, whereas the numbers in that category did not exceed 20 per cent of the total. Over the period from 1950 to 1970, enrolments tripled at the first level, increased more than five times at the second level and six times at the third level (the high ratios are partly explained by the low starting points). From 1970 to 1990, enrolments increased by 60.3 per cent at the first level, 2.6 times at the second level and 3.9 times at the third level. The priority for secondary and higher education still exists, but the post-primary numbers now form one-third of the total.

It was this 'economics-based' idea that gave rise to the idea of 'functional literacy'. Launched by UNESCO, it was adopted by the World Congress on the Elimination of Illiteracy held in Tehran in 1965 and implemented the following year in the form of an 'Experimental World Literacy Programme' (EWLP), which was carried out with the assistance of UNDP, FAO, ILO and WHO in some

20 countries until 1973. The idea was to make literacy a component of development projects (in reality, this was generally reduced to its economic dimension). The corollaries of 'functionality' were as follows: selectivity of the activities which covered areas of industrialization and agricultural modernization and involved the individuals who were most likely to profit by them and who were therefore the most motivated; intensity of the learning of knowledge and attitudes contributing to development; adaptation to the needs of each category of workers, as a result of which programmes were diversified; integration of education into practical life, the vocational activities of workers and the problems they encountered in facing a proposed change.

In order to draw up a functional literacy programme, a prior study was made of the (agricultural or industrial) environment and of the individuals involved; the next step was making a list of the knowledge needed and laying down the timetable of activities. Theoretically, illiterates were trained to take charge of each of the problems put to them and to study them with the aim of resolving them. In fact, in most cases, the solution was provided to the trainees from the outside and the role of the community organizer consisted solely of prompting them to recognize the merits of the solution and apply it (bedding out rice, harvesting cotton, irrigation, combating diseases and insects, self-management, marketing, etc.).

It was in the course of studying the problem that the workers were taught to read, write and calculate, and that efforts were made to develop their reasoning and understanding capacities. Theoretical training (vocational, technical and scientific, socio-economic, oral and written expression) was accompanied by practical training at the places of work. From the outset, synchronized learning of reading and writing was aimed at developing the ability to perceive simultaneously the symbols and their meaning according to the progressive pattern:

Sentence → word(s) → syllables → letters → syllables word(s) → sentence.

What were the results of the EWLP? In 1974–1975, UNDP (the main funding source) and UNESCO (the main executing agency) carried out an evaluation. This proved to be complex, as was the undertaking itself on account of its novelty and the little experience which national executing agents and foreign advisers had of the subject. Accordingly, the data collected were often of a summary nature and difficult to compare: the tests and criteria varied significantly in degree and subject (reading, writing, calculation, vocational training), from one project to another, and even in a single country from one region to another. In addition, the starting level was different. Roughly one million illiterates were involved, but a varying proportion sat the examinations and an even smaller proportion passed them: 8 per cent in Sudan, 14 per cent in Iran, 21 per cent in United Republic of Tanzania, 23 per cent in Ecuador, and 25 per cent in Ethiopia. The level achieved by the new literates is comparable to that of primary school pupils in the country. Changes were considered favourable in the majority of cases: people showed interest in continuing to learn, seeking information to satisfy their needs, using knowledge to manage their affairs and increase their productivity, wishing to raise living standards rather than

having a large number of children. The cost of the programme was considerable, amounting to more than US$32 million over six years, of which the countries paid two-thirds. Expenditure on individual projects varied between US$600,000 and US$6 million, so that the cost per person enrolled and, above all, the cost per participant having passed the final examination also varied. The latter amounted to US$212 in Ethiopia, US$269 in Sudan, US$300 in Ecuador, US$332 in Iran, as against US$32 in Tanzania. Except for Sudan, this cost was lower than that of primary school enrolment for an equivalent level. It obviously should not be concluded that adult literacy training could replace child education, which performs other functions.

The World Bank for its part compiled data on the relationship between instruction and agricultural productivity, and made the following conclusion in its *World Development Report 1980*[6]: provided that additional inputs required by the adoption of improved cropping techniques were made available, farmers who had attended primary school for four years had an annual output higher on average by 13.2 per cent than that of farmers who did not attend school. The additional output of farmers having attended school but not having access to additional inputs was generally lower, although still considerable. When the increase in production resulting from attendance at school is compared with the cost of schooling, the rates of return bear very favourable comparison with those of investments allocated to other sectors.

In industry, the productivity resulting from both capital and the labour of managers and workers is more difficult to evaluate. It is measured indirectly by wages. However, wages, especially in the developing countries, are not directly linked to the level of instruction but to qualification (arising from age and experience) and to social and political factors (especially in the case of the civil service). While there is no denying that, on average, wages rise with the level of instruction, that level represents a necessary but not sufficient condition for industrial development. Many countries have high economic growth rates in spite of a low level of literacy, whereas the converse is true for others. In Asia, for example, Pakistan, with a literacy rate of 20 per cent, developed its industry by 10 per cent a year over the period from 1960 to 1970, while the economy of Burma, a country with a 65 per cent literacy rate, grew by only 2.8 per cent. Industry requires not only scientific and technological skills but also a spirit of initiative and management capacities, which are not learnt from books but from management itself.

One should not have too narrow a view of relations between education and economic growth. At first sight, elementary education does not concern industrial development as much as secondary and higher education. In reality, it is instrumental in acquiring learning, which will later make vocational and in-service training possible, along with attitudes conducive to work (discipline, emulation).

Similarly, women's education displays a large number of advantages with regard to children's health and nutrition as well as their instruction. It also has an influence on fertility by deferring the age at which women marry and by informing them about reproductive health and similar issues.

Education should not be confined to school but should use all possible forms, in particular in-service training at the place of employment. Apprenticeship is the main form of acquiring qualifications in crafts. In industry, several lines of

research suggest that on-the-job training has perhaps played a more important role than formal education in the rapid strides made by some countries (Japan, South Korea). In the case of some technical occupations, simple literacy training is sufficient to give people the same level of opportunities as elementary schooling.

Another approach tried out by developing countries in order to raise the productivity of education is the association of study and productive work. It derives from the polytechnic ideal formulated by Karl Marx, who considered it not only as a method of social production but as the one and only method of producing complete human beings (*Das Kapital*, Book 1). All countries that drew their inspiration from his thinking endeavoured to put this into practice, first in the Soviet Union and Central Europe, then in the developing countries. Cuba, China and Viet Nam all established schools for part-time work and part-time study, schools associated with production units, not to mention the time devoted in all classes to socially useful work (such as the maintenance of schools or, from a certain age onwards, productive work). To take one example, in Viet Nam the School of Young Socialist Workers of Hoa-Binh was founded in 1958 by the avant-garde youth of this region. As a half-work and half-study school giving a complete education from the first level to higher education, it trained senior officials for the administration, technical services (agronomists, engineers) and cooperatives. On an area of 400 hectares, the pupils cultivated manioc, maize, sweet potatoes and rice. In addition, they reared cattle, pigs, buffaloes and poultry and manufactured manioc flour, liqueurs and alcohol, vermicelli and sauces. There were also mechanical, carpentry and blacksmith's workshops. The school was not only self-sufficient as a result of its earnings, but even brought in revenue for the state, which did not prevent its pupils from equalling those of ordinary schools at examinations. In spite of the value of the experiment, it could not be widely implemented owing to a large number of difficulties: the lack of motivation on the part of teachers, pupils and parents; the negligence of the authorities; the prestige of traditional education; and the financial cost. Attempts to form associations with enterprises came up against resistance because they felt that this would disrupt their operations.

In other countries, the introduction of productive activities in schools often ended in failure for one of the following reasons: over-ambitious objectives, unsuitable or insufficient resources, unprepared teachers, pupils and families, and the lack of linkage with other educational reforms, in particular with the examination system. For instance, if examinations remain traditional and continue to attach great value to book knowledge without taking account of productive work, how can such work motivate pupils and teachers?

The biggest problem – which has already been mentioned and with which all countries, developed and developing alike, have to contend – is unemployment, that is, from the educational point of view, the relationship between training and employment. It is true that unemployment is first of all an economic problem. If the economy does not develop, if it uses production techniques that cut back on labour, it cannot provide sufficient jobs for the young people who leave school each year and come onto the labour market. However, although schools are not primarily responsible for unemployment, they can contribute to it by instilling

*Table 18* **Expenditure on higher education**

| Countries in transition | 40.7 |

*Source*: UNESCO, 2000, *World Education Report 2000*, p. 119

contempt for manual work, by transmitting bookish knowledge having no bearing on life, costing too much and thus absorbing resources that could be directed to more productive sectors. Apart from exceptional cases, these defects are more conspicuous in the South than in the North, because most developing countries have adopted the education systems of the industrialized countries without sufficient adaptation to their own needs.

The new industrial countries of East Asia appear to have adapted their education systems better. This is not a question of quantity. In 1996, for example, China had only 473 students per 100,000 inhabitants, as against 1,767 in Mongolia, 1,895 in Egypt, or 3,117 in Argentina. What is much more important is the level of instruction and qualification of the labour force and managers, their dexterity, their discipline, and the dynamism of the policy of the state and enterprises. Some authors account for the success of the countries of East Asia by one feature they have in common: the heritage of Confucianism which stresses the importance of education and work, a 'community' rather than 'individualist' social style and a 'functionalist' rather than 'political' conception of the state.[7]

In a bid to react to unemployment and the recession, attempts have been made almost everywhere to ensure closer liaison between school and university and the world of work, in some instances by alternating between the two, in others through exchanges of teachers and researchers, or future employment contracts. In terms of streams and contents, the developed countries and some of the developing countries, especially the new industrial countries of Asia and Latin America, are introducing technical and vocational subjects into general instruction and promoting vocational and technical secondary and higher education. In these countries it appears that this form of education 'produces' many fewer unemployed than general education. Also, continuing education is being developed to provide for refresher and further training for the labour force and managers.

What is happening, in fact, is that the scientific and technical revolution is changing, albeit to an unequal degree from one branch to another, the organization of work, the structure of qualifications, and productivity. This is again highlighting the importance of human resources, which had been somewhat blurred by disappointment over the

economic results produced by the enormous expenditure on education during the 1950s and 1960s. Although it is no long believed that there is an automatic causal effect between education and economic growth, international comparisons show that the most competitive countries are those which have best managed to adapt their education and training system to new global developments, in particular dissemination of recent information technologies. On the one hand, these countries are more efficient in replacing a low-skilled labour force in various production and office tasks; on the other, they require a high level of skills for design, direction, and management and control tasks. More than financial expenditure and equipment, it is human capital that determines productivity, not only in terms of instruction but also of initiative, creativity and autonomy.

All governments are concerned with improving the teaching of mathematics and sciences, which are at the base of present-day scientific and technical culture. The research carried out by IEA (International Association for the Evaluation of Educational Performance) shows that the level in these subjects has risen everywhere (except in the United States) among 14-year old pupils in the sciences. Moreover, the enrolment of girls has increased significantly in these disciplines (in Hungary, it even exceeds that of boys, with 63 per cent of the final class in mathematics in 1982 being girls); although their performances are generally lower than those of boys, the differences have declined. The progress made by developing countries in science and mathematics education can also be noted. Thailand, which participated in the two studies on science teaching (1970–71 and 1983–84), has seen its 14-year old pupils equal the score of those in the United States (at 16.5), whereas it had lagged far behind in 1970. The other developing countries obtained the following results: South Korea, 18.1; Hong Kong, 16.4; the Philippines, 11.5. For pupils in the final class in secondary school, Hong Kong came in first, followed by England and Singapore, in chemistry; and by England, Hungary, Japan and Singapore in physics; Singapore came in first in biology, followed by England. There can be no doubt that this progress is partly a factor and effect of economic progress.

### Education and social development

Social development can be defined by the raising of the general standard of living, the satisfaction of the growing material needs of the population, the reduction in inequalities, and the advancement of disadvantaged groups. As already stated earlier, the universal expansion of schooling has not led to the disappearance – even among the most 'developed' countries – of the inequalities between sexes, between urban and rural areas, between geographical regions, between social classes, and between the majority and national or immigrant minorities.

The main causes of this are differences in economic level, political discrimination and the social groups to which people belong. This last-mentioned factor is the most difficult to change since social structures are altered only in the long run.

Academic success, which is taken to mean the level of acquisition in a course of education given over the prescribed period, implies not only access but also survival and final performances. However, neither access nor survival, not to

mention performance, is guaranteed in the poor countries. In the others, survival may be accompanied by repeating and failure to keep up with age groups, in the same way as significant differences in results are observed from primary school onwards. Children from less-privileged classes succeed less well than the others, and this disparity becomes more marked in the course of schooling. In terms of equal success, the chances of carrying on with post-compulsory studies are not the same, since young people from modest family backgrounds have to go to work sooner in order to earn a living. At the higher educational level, data from OECD countries between 1960 and 1970 show that the proportion of working-class children is always lower than the proportion of their fathers in the active population, while the rate of representation of the 'upper-class' children in higher education ranges from 1.5 in the United States to 11 in Spain and Portugal. The latter have twice as many chances of having access to higher education than the former in the United States and the United Kingdom, three times more in Greece, and 18 times more in France.[8] Yet these figures should not obscure the movement of democratization that did occur in higher education: the proportion of workers' children in higher education in the Federal Republic of Germany tripled over the period 1952–76, rising from 4 per cent to 13 per cent; in Sweden, in 1969, they had a 10 per cent chance of acceding to higher education compared with hardly 2 per cent 25 years earlier.[9] However, students from the two different social backgrounds do not turn towards the same disciplines: young people from affluent families tend to choose disciplines that they expect will keep them in their original environment, with high status and earnings (such as medicine, law, and political science). The others are content with less 'prestigious' studies, those that will enable them to work at the same time. This tendency contributes to slowing down the reduction in social inequalities.

The ex-socialist countries had significantly democratized education and at a more rapid pace. However, the disparities have not disappeared. Fewer children of manual workers and peasants enter higher education, especially full-time education, than those of white-collar workers. In the Soviet Union, they formed 34.3 per cent and 23 per cent respectively, as against 70.4 per cent of the secondary school leavers; 45.5 percent and 7.5 per cent against 47 per cent of the higher education students.[10] On average, the children of white-collar workers had 2.8 times more chances of entering full-time higher education[11] than those of manual workers, and 4.3 more chances than those of collective farm workers. In Poland, in 1984, 56 per cent of higher education graduates came from white-collar families, 32 per cent from blue-collar families, and 11 per cent from peasant families; the percentages are reversed for evening classes, at 36 per cent, 56 per cent and 6 per cent respectively.[12]

The South is a very mixed group of countries and the data are inadequate for making generalizations. It seems, however, that the correlation between social background, or rather between the level of instruction of the father, and the success of the child at school, is less tight in developing than in industrialized countries.

For instance, more than half the fathers of higher education students in Buenos Aires (1958) and Cordoba (1961) had not studied or had only completed their primary studies. By contrast, the great majority of them belonged to the middle classes (self-employed, middle-grade managers,

officers and non-commissioned officers: 45 per cent [Buenos Aires] and 43 per cent [Cordoba] respectively) and upper classes (industrialists, businessmen, top managers and professionals: 39 per cent and 44 per cent, respectively). The other students were from a working-class background (9.2 per cent in Buenos Aires and 4.5 per cent in Cordoba) or were not determined.[13] The composition of universities is less elitist in Africa, where social stratification is less marked (but universities are more elitist in that they admit a lower proportion of the age group). In Rwanda, for instance, the children of farmers form 65 per cent of all higher education students. It is true that they are under-represented, since their fathers represent 93 per cent of the active population, but they do make up a considerable portion of higher education enrolments, which is not the case of Latin America. The remainder in Rwanda is distributed as follows: professions and top managers, 6 per cent; middle-managers and teachers, 17 per cent; white-collar workers, 4 per cent; craftsmen and manual workers, 4 per cent; and traders, 4 per cent. However, higher education students represent only 0.3 per cent of the 20 to 24-year age group (compared with 30 per cent in Argentina), and girls represented 11.8 per cent of the enrolments and 9.8 per cent of the graduates in 1981–1982. The level of instruction of the parents is not known, but the vast majority of the peasants and manual workers are illiterate or semi-illiterate.[14]

What are the factors of success at school? They can be divided into three groups according to whether they relate to the family, school or conditions in the country. These factors are linked together, since success is all the more certain when the culture of the family is closer to that of the school and when its earnings enable young people to continue their studies, but they do not act mechanically: failure is not something that is bound to happen. Their importance varies from society to society: it has been noted that, in many developing countries, rich and poor alike share the same attitudes towards school, which is considered as being the essential, indeed the only, means of social advancement, and they encourage their children in that direction. The respective shares of objective and subjective factors in fostering success are not precisely known. According to the studies conducted by the IEA,[15] it appears that the influence of the social environment tends to decline as the level of education rises, which is explained by the over-selection of children from the lower classes and the progressive cultural levelling-out. On the other hand, the relative influence of the home and school varies with the disciplines. For instance, the level attained by 14-year old pupils in French and English (taught as foreign languages) is more closely bound up with the differences between schools (in other words the quality of the teaching), which is not the case for the sciences, the understanding of texts in the mother tongue, literature and civil instruction.[16]

Ethnic inequalities exist in all countries, but to varying degrees. In the developed countries, these consist of inequalities between the 'majority' and either national or immigrant minorities. In the first case, the best-known example is that of African-Americans in the United States. The Coleman Report *Equality of Educational Opportunity*[17] noted that the grade average of five tests (non-verbal, verbal, reading, mathematics, general knowledge) at the end of secondary schooling (grade 12) was 41.1 for African-Americans as against 52 for Whites. At the same period,

19 per cent of the Whites and 5 per cent of the African-Americans in the 25–29 year age group had obtained a university degree. Since this date, the enrolment of Blacks has made considerable progress and inequality has declined, although it has not disappeared altogether.

Similarly, it was noted in the former Soviet Union that there were differences in the level of instruction of the population according to the republics. In 1989, there were on average 812 people with a higher or secondary level education for 1,000 inhabitants aged 15 and upwards. The figures varied between 753 in Lithuania and 901 in Armenia, with Russia being close to the average with 806 persons. Here, too, progress has been made, especially when drawing comparisons with the beginning of the Soviet Revolution, when national minorities were virtually illiterate.

The most systematic segregation was to be found in South Africa, where the apartheid regime had set up four separate school systems: for Whites, Asians, Coloureds and Africans. The last group was heavily enrolled in primary education, since industry needs an educated labour force, but found themselves being virtually deprived of access to higher education, in other words to high positions, which were reserved for Whites. In India, the caste system has been abolished officially under the Constitution, but it continues to exist in people's minds and in reality: the 'scheduled' or untouchable castes and tribes represent 150 million people, more than one-fifth of the total population, who are disadvantaged from every point of view.

This, generally speaking, is also true of minorities in Africa who live in the interior or mountainous regions. Even in instances where the central government has taken measures in their favour, the reduction in inequalities is taking place very slowly. These inequalities are, in fact, the result of a long historical past, of a modern economy and its accompanying education services concentrated in urban areas at the expense of rural communities and sometimes of the refusal of peoples who are too attached to their traditions to open up to the outside world.

In Latin America, it is towards the Indians, stripped of their land and driven back into the mountain plateaux since the Spanish Conquest, that discrimination is exercised and is made worse by the use of the Spanish language. Yet, in some countries, such as Peru, Guatemala and Bolivia, they form more than half the population.

At the beginning of the twentieth century, Deustua, a Peruvian conservative, claimed: 'What use is there in teaching reading, writing, geography, history and so many other things to these natives, who are not yet human beings?' Seventy years later, the 'general statement' of reform undertaken by the Velasco government (1970) made the following finding, which is also applicable to other countries of Latin America:

'The majority of the population, especially the peasants of the Sierra, has been excluded from the information circuits which would have enabled them to play a fuller part in the national system; by the hermetic nature of the information contained in the circuits given in Spanish, the exclusive national language, the marginalization of these groups has been increased and has become a virtually insurmountable obstacle'.

In the *UNESCO Courier* of March 1979, the Argentine sociologist Hugo Ortega criticized the ethnocentrism and racism conveyed by books published in his country. Everything was presented from the strict 'white' and 'Western' point of view. America was 'discovered', which means 'that the continent, its people and its wealth acquired value only because they were discovered and recognized by the centre of the world, in other words, Europe. It is hardly surprising, then, that civilization (clothes, big ships, white men, and the faculty for naming places and people) should leave America on the sidelines. The earliest inhabitants of the American continent were depicted in a pejorative fashion as half-naked, wild and untamed savages wearing a feathered head-dress, irrational and inferior to the white European … All this amounts to a process of negation and of a kind of cultural genocide'.

The only exception is Mexico: the 1910 revolution recognized the Indian heritage as a component of national history on an equal footing with the Hispanic tradition. The muralists Orozco, Rivera and Siqueiros addressed the people and their cultural heritage directly. A Department of Indian Affairs was created, followed in 1948 by an Indian National Institute, with the aim of studying the problems of Indians and catering to their needs. It organizes literacy and education campaigns that use indigenous languages before going on to Spanish, and provides instruction on agriculture, hygiene and civics. Its action, however, is limited by a low budget and insufficient resources and serves more a purpose of acculturation-deculturation linked to capitalist development rather than genuine cultural pluralism. Compared with the other countries of Latin America, Mexico sets itself apart more by its discourse than actual practice. This is why all over the continent indigenous peoples are rising up in protest, demanding justice and recognition of their existence and their rights. They denounced the celebration of the five hundredth anniversary of the 'discovery' of America in 1492 and turned it into a year of mourning: 'Our History is not yours. It is an unofficial history which did not necessarily start five hundred years ago', declared Rigoberta Menchú, a descendant of the Mayas, who was awarded the Nobel Peace Prize in 1992.

In Africa, the West penetrated the continent from the seaboard and moved towards the interior. People living on the coast were thus the first to have access to modern education, although influences of a sociological nature (the degree of individual mobility in the traditional system) and religious nature (the activity of missionaries, the resistance of Islam) also played their part. For instance, in Ghana in 1960, the south of the country, which represented 47 per cent of the population, accounted for 64 per cent of all boys and 77 per cent of all girls in the secondary education system; the centre (21 per cent of the population), 28 per cent and 20 per cent respectively; and the north (31 per cent of the population), 6 per cent and 2 per cent respectively.[18] Similarly, in Côte d'Ivoire in 1963, there were almost three times as many Agni from the south-east of the country in secondary education than their proportion of the total population, and for the lagoon peoples this figure was two and a half times; as for the centre, the Baoulé represented 19 per cent of the population and 16.6 per cent in secondary education; and in the north, the figures for the Senoufo were 19 per cent and 6.4 per cent only.[19] Madagascar, however, presents an entirely different situation. The Merina of the central plateau, which was the cradle of the ancient Malagasy Kingdom, had themselves introduced schools and the Roman alphabet from the beginning of the nineteenth century, and continue to occupy the preponderant position in education today: while they represent one-

quarter of the population, they account for 70 per cent of enrolments at the primary level and for 60 per cent at the secondary level.

Paradoxically, the policy of national integration that has been pursued since independence has had the effect of making inequalities and tensions worse in many African countries. For example, employment in public services is based on 'merit', yet the main criterion for such merit is the diploma, which gives the advantage to those who have had extensive schooling. Even though enrolment ratios are now progressing more quickly in the interior and in rural areas, absolute numbers are still increasing more in economically advanced and urbanized coastal areas.

The inequalities between urban and rural areas, to which social, regional and ethnic inequalities are partly linked, are also greater in the developing countries than in the developed countries. They stem from a variety of causes: historical, geographical (the scattered population), pedagogical (qualified teachers prefer urban areas for career opportunities, the education of their children, the amenities and leisure-time activities), and perhaps above all social. The governing class lives in the main urban centres; having been trained by the West, this class has adopted its growth model, which gives preference to cities, the symbol of modernity, at the expense of the countryside, which has the image of backwardness. The priority that is thus given to urban infrastructure and services reduces the expenditure on rural development. Yet the rapid growth of cities has its corollary: the even more inordinate growth of shantytowns and of a marginal population whose young people are disadvantaged. It is among these people that absenteeism and dropping-out from school, unemployment and delinquency are most commonly found. Rural schools, which are fewer in number and often do not provide the full programme, cannot take in all the children and only offer an education that is generally limited to three or four years, sometimes even less. This is one of the causes of the school wastage for which figures were given above. These inequalities represent a waste of intellectual potential and money, since three or four years' study is not sufficient to allow children to acquire a lasting knowledge of the mechanisms of reading, writing and calculation. If they live in an environment offering no or little education, they will very soon return to illiteracy.

One last type of inequality, which is by no means the least important, is that between girls and boys. If only figures are considered, this inequality has virtually disappeared in the developed countries, but persists elsewhere, and increases as the education level rises: enrolments for girls range from 45 per cent at the first level to 47 per cent at the second, and 38 per cent at the third. These averages, however, obscure more or less marked disparities depending on the continents and states, and also regions within states.

What has not disappeared and is still universal are the prejudices, stereotypes, discriminatory attitudes and behaviour patterns towards women (known as sexism). This has the effect of demeaning girls and women in relation to boys and men, and reducing their participation in family, occupational, social and public life. Feminist movements were the first to denounce this situation. In order to take appropriate action, UNESCO has supported this struggle by launching a study programme on sexism in children's books and school textbooks, while the United Nations has been mobilizing world opinion by organizing World Conferences on Women in Copenhagen (1980) and Beijing

(1995) under the triple banner of Action for Equality, Development and Peace.

Seven national studies were carried out (in China, France, Kuwait, Norway, Peru, Ukraine and Zambia) and were followed up by regional guides prepared for the Arab world, Asia and the Pacific, North America and Europe. In her synoptic report, Andrée Michel drew a parallel between racism and sexism.[20] The two are the consequence of historical situations and result in legitimizing and maintaining practices of domination, oppression and exploitation towards an ethnic group or a gender that is assumed to be inferior. Women account for half of the world's population, perform 66 per cent of all hours of work (only half of which is remunerated), receive only 10 per cent of world income and own less than 1 per cent of the property. They represent only a tiny minority of 'decision-makers' on a national and international scale.

Stereotypes are everywhere and exercise a constant influence, right from early childhood: in the family, where children perceive the division of labour between their parents, and where the latter have a different attitude towards the former depending on gender (starting at birth, and continuing with food, games, education); in peer groups, which also encourage different activities according to gender; on the labour market, where jobs that are regarded as 'feminine' are less prestigious and less well paid (nurses/doctors, etc.) and where the top posts are usually reserved for men; and in political life, where the inequality of roles is conveyed and amplified by the media. Books for children and adolescents also convey sexist ideologies through images, the presentation of occupations and the ranking of family, social and political orders, and the glorification of heroes who are more often men than women.

Schools, as social institutions, are bound to be affected by the explicit and implicit values and norms of their environment. In fact, they are one of the most effective transmitters of society's values and norms. In particular the exteriorization of male and female roles occurs under the influence of school textbooks, which, like children's books, act through illustrations, references, and their way of dealing with a subject. Regardless of the discipline, whether it be science, literature, history, religion or some other subject, and regardless of the country, there are always more pictures of boys and men than of girls and women, and more male than female references. In Norwegian and French science textbooks, the men are more active and are more often to be seen at places of work or practising sport. Women are represented when it comes to showing electric hair-dryers and bathroom scales. Women are only wives, mothers or housewives. In Peruvian primary school textbooks, men are described as brave, intelligent, patriotic and having a sense of co-operation, while women are obedient and devoted. The home is their privileged place, while the world of work is essentially for men. Similarly, the textbooks used in Zambian primary and secondary schools describe men as being 'more intelligent, more creative, having a greater sense of curiosity, more inventiveness and daring than women … Men take the decisions and lay down the law. Women follow and obey.' In the Arab countries surveyed – Lebanon, Egypt, Saudi Arabia, the People's Democratic Republic of Yemen, Qatar and Kuwait – women are always represented in accordance with the traditional image, dependent on men for their economic welfare and their social status. Weak, sensitive, and submissive, they fulfil their role best by

scrupulously performing the functions and duties expected of a mother, housewife, spouse, and obedient and devoted daughter. Socialist Ukraine is the exception in that it presents almost as many female figures as male, and their individual features are carefully drawn. Women are shown as having positive aspects more often than men. However, the stereotypes have not disappeared altogether. Sometimes the features of each sex are exaggerated to portray activity, efficiency, courage, reason, for one, and passiveness, affection, concern, etc., for the other. In textbooks of other countries, traditional roles are portrayed, such as women in the home or in secondary activities and men as the heads of the family exercising responsibilities.

All these stereotypes transmitted in the family, at school and in society have the effect of giving girls feelings of inferiority, deterring them from scientific and technical studies, and limiting their job aspirations. This means that society is not only not applying the principles of equality of opportunity for men and women, but also depriving itself of considerable intellectual potential.

**Education and cultural development**

Cultural development can be defined as the development of the knowledge, values and attitudes that permit the fulfilment of people's personalities and creative capacities.

Defined in these terms, 'cultural' development cannot be readily distinguished from 'social' development, as the example of the education of girls has just shown. It is both individual and social, since all individuals are members of a society and their development contributes to that of the group as a whole, especially since their whole being with all its different aspects – emotional, intellectual, physical, moral and aesthetic – is involved.

In history, every society, depending on its way of life and communication (oral or written), its religion or ideology, has dwelt on one particular aspect or another. At the present time – owing to the predominance of economic, scientific and technical activities – schools everywhere are to varying

degrees intellectualist, notwithstanding some isolated exceptions. Most schools tend to give priority to cognitive development and make use of authoritarian methods aimed at imposing their views; hence repetition, rather than initiative and criticism, is the rule. The outcome is an imbalance in children's personalities in favour of the conceptual view and to the detriment of imagination and emotion. In addition, schools tend to shed a favourable light on their culture, which is the culture of the dominant class and has little room for other views of the world and society: schools are ethnocentric.

In UNESCO's *Statistical Yearbook 1995*, the heading 'culture and communication' includes the following: book titles published, daily newspapers, cultural paper (newsprint, printing and writing paper), production of long films, number of and seating capacity of fixed cinemas, cinema attendance, radio and television transmitters and receivers. Since 1955, all these indicators have increased in the developing countries and the share of the developed countries has accordingly decreased, although still preponderant. The trend from 1980 to 1990 is shown in Table 19.

It is true that a statistical yearbook, by definition, only provides quantitative data, whose content and relevance should be questioned: the media can inform as much as they can disinform. However, the above list gives a fair reflection of the habitual notion of cultural development, which takes it to be a consequence of economic growth. It is assumed that such growth makes it possible to increase cultural goods and services whose consumption rises with the standard of living. In actual fact, the surveys that were conducted in Canada (1973), France (1974) and in the former Soviet Union show that these cultural goods and services involve only a small minority of the population: 14 per cent in Canada and 10 per cent in France. In Canada, for example, the theatre attracts 10 per cent of the population; opera, less than 2 per cent; ballet, 1 per cent; classical music concerts, 6 per cent; and museums, monuments and art galleries, 8 per cent. On the other hand, more than half the population goes to jazz and pop music concerts, variety performances and circuses, festivals, the

*Table 19*  **Cultural indicators 1980–1990**

| Cultural indicator | 1980 | | 1990 | |
|---|---|---|---|---|
| | Developing countries | Developed countries | Developing countries | Developed countries |
| Number of radio receivers per 1,000 inhabitants | 98 | 879 | 177 | 954 |
| Number of TV receivers per 1,000 inhabitants | 25 | 422 | 56 | 480 |
| Circulation of daily newspapers per 1,000 inhabitants | 37 | 242 | 44 | 331 |
| Publication of books (titles) per million inhabitants | 46 | 490 | 60 | 488 |
| Consumption of cultural paper (excluding newsprint) per inhabitant (in kg) | 1.4 | 26.6 | 3.1 | 47.7 |
| Public libraries: number of volumes per 1,000 inhabitants | 80 | 2,930 | 170 | 3,850 |

cinema and sporting events, and everybody seems to listen to the radio and watch television.[21]

On this last point, regarding radio and television, the situation is the same elsewhere. However, these media are capable of the best and the worst. They make it possible to see and hear invaluable documents of the historical and religious, artistic, literary and musical heritage of humanity, providing a wealth of information and instruction. Unfortunately, this kind of programme represents a minor share of what people listen to or watch, compared with the share dedicated to so-called 'mass' culture, which leads to a deculturation of the public because it is subject to the demands of profitability (and of propaganda, both open and insidious, not only in places where dictatorship reigns), and its contents are of a very poor standard, conveying half-truths or commercial or political lies, myths on democracy, pluralism and their own neutrality, all aiming to blunt the critical spirit and maintain the social *status quo* to the advantage of those who exercise economic and/or political power.

The role of the state in cultural affairs varies with the political system (authoritarian or liberal, centralized or decentralized), the importance of private organizations, the economic level, the level of education of the population, and recognition or not of the right to culture written into the Universal Declaration of Human Rights. Most countries endeavour, with varying degrees of success, to preserve and protect their cultural heritage, foster artistic creation and expression, and encourage reading and the appreciation of artistic, literary and musical works. This is promoted both at school and in society, with the assistance of associations and enterprises, and through the intermediary of the media, museums, libraries, etc. A growing number of schools are also opening up to other cultures.

Education for mutual understanding and peace, which is written into the Universal Declaration of Human Rights, has long formed part of UNESCO's programme. From 1953 onwards, it established a network of Associated Schools whose purpose is to contribute to the Organization's efforts by emphasizing world problems and the role of the United Nations, human rights, knowledge of other countries and their cultures, people and their environment. UNESCO encourages the development of new teaching contents, materials and methods on these themes, the dissemination of information, and agreements and exchanges between participating institutions, for which it provides basic documentation and helps organize workshops and seminars. Starting with 33 secondary schools in 15 states half a century ago, by 1992 the network had grown to more than 28,000 schools at all levels in 114 countries.

In 1968, the International Conference on Public Education meeting in Geneva unanimously adopted the following recommendation:

> Education should help to increase a knowledge of the world and its peoples and to engender attitudes which will enable young people to view other cultures, races and ways of life in a spirit of mutual appreciation and respect. It should make clear the relationship of environment to patterns and standards of living. While providing an objective treatment of differences, including differences in political, economic and social systems, it should bring out the common values, aspirations and needs in the life and conscience of the world's peoples.

> Education should show that the advancement of human knowledge has resulted from the contributions of the various peoples of the world, and that all national cultures have been and continue to be enriched by other cultures.

This recommendation clearly sets out the purposes of education for international understanding. Education on human rights and the rights of peoples is an integral part of this education, since it is not possible to aim for international understanding if these rights are not recognized: it is obviously necessary to define them, examine their origins and their historical development, and see how they are presented in present-day societies. The Universal Declaration of Human Rights has defined human rights, while the rights of peoples have emerged more recently with national liberation struggles and the struggles for economic, social and cultural development. International understanding includes that of immigrant minorities whose culture is demeaned because they are often composed of manual workers doing jobs that are themselves demeaned. The unwillingness to understand different cultures, especially by cultures which regard themselves as 'superior', stems from factors that go by the name of ethnocentrism, ideology, nationalism and racism, In some countries, this holds true for the dominant ethnic group and the attitudes it has towards the ethnic groups it dominates.

How is it possible to provide education for international understanding, respect for cultures, human rights and the rights of peoples and democracy? This effort, which has to include adults and children alike, should be focused on three main areas:

- The training of teachers and adult instructors, particularly those responsible for multi-ethnic classes: Since culture is a whole, the idea is not to separate out a particular characteristic, which is then compared with the corresponding characteristic of a person's own culture, but to see how the culture as a whole functions and how its different elements are interlinked.
- The learning of foreign languages represents an introduction to ways of life and civilizations; moreover, it is an excellent mental exercise and meets the needs of present-day communication.
- The revision of syllabuses and textbooks in order to include the study of the major works of the literatures and arts of humanity, and eliminate stereotypes and the historical bias that impede an objective view of differences, mutual tolerance, and an awareness of universal values and the need of peoples to borrow from each other's culture, which is more important for their life and development than participating in international conflict or war.

In spite of these international recommendations, the question of multicultural education has actually arisen only recently in developed countries. Until the 1960s and 1970s, the prevailing approach was one of unifying culture and education, aiming to address the issue through assimilation. In the United States, a nation of immigrants, the common school was regarded as the melting pot, in which ethnic, linguistic and religious differences were expected to be merged in order to produce an American citizen. What this meant, in fact, was integration into the dominant WASP culture (White Anglo-Saxon Protestant). Similarly, in the multinational Soviet Union, which recognized the right of

each people to cultural autonomy and whose Constitution made no reference to a national language, unification (indeed uniformization) was brought about through the use of Russian in teaching, communist education, ideological control and repression of 'petit-bourgeois nationalism'. In Western Europe, the issue focused on the immigrant workers who came from the South during the major period of expansion after 1945. Regardless of whether the minorities are national or immigrant (and part of the latter may remain immigrant or become 'national'), the differences of language, religion and customs create sources of tension and conflict, which frequently result in violence, especially in periods of depression and unemployment. In the Soviet Union, the resurgence of national and religious sentiments was one of the factors in its collapse. In the United States (Plate 166), the discrimination that persisted following the adoption of the Civil Rights Bill (1964) resulted in the radicalization of demands: the African-Americans, Native Americans, Chicanos, Irish and Jews all vehemently asserted their identity and denounced the injustices of the social system. With one-quarter of the population presently composed of minorities (African-Americans, Native Americans, Latinos, and Asians), it is estimated that this proportion will rise to almost one-half by the year 2050 as a result of their fertility rate being higher than that of Whites. This has led to greater receptiveness on the part of the latter to intercultural communication and exchange, abandoning the *melting pot* ideology and acknowledging that pluralism and tolerance are elements of democracy. Since 1968, the law grants minorities the right to bilingual education: while English has priority, the language of origin enjoys continuous support. However, some groups, chiefly African-Americans, Native Americans and Latinos, are demanding separate schools, or at least different curricula, that will no longer give preference to Eurocentrism but grant an equal place to other cultures, in particular to Africa, and examine the phenomena of oppression, exploitation and racism in American society.

In Europe, the development of multicultural education appears to be less advanced as a result of older and stronger national (nationalist) traditions, the myth of mono-cultural society, and the recent nature of multi-ethnic situations. In this case, the term 'multicultural education' refers primarily to the schooling of immigrant children. Until the 1970s, when immigrants were still few in number in an expanding economy, the policy was one of assimilation combined with some measures to facilitate the learning of the national language. The oil crisis and its consequences brought a halt to immigration (which was offset to some degree by the inflow of political refugees), but did not prevent an increase in the number of pupils from immigrant families. In 1988, they represented between 5 per cent (Netherlands) and 40 per cent (Luxembourg) of the numbers enrolled in primary schools (France and Germany, 12 per cent; Belgium, 10 percent; Sweden 13, per cent).

According to a report to the Council of Europe (1989)[22] the countries which have allocated the most funds to the schooling of children of immigrants (although the overall amount is still modest) are France, the Netherlands, the United Kingdom and Sweden. Policies, however, are very varied. France, with its centralizing and secular traditions, its conception of the 'Republic one and indivisible', where the French language plays a major political role, unloads the languages and cultures of the 'Other' (including those of its

provinces) onto the private sector. State-run schools take in all children on an equal footing without any discrimination and without granting them any special measure according to their origin, apart from newcomers, who can enrol for a year in a (mainly linguistic) introductory or adaptation class. The training and information centres, which train teachers for these classes, occupy a marginal place in the general teacher-training system. Courses on the language and cultures of the countries of origin may be given after school hours by teachers paid by those countries' governments. The principle of equality is formally and strictly respected, but in view of the failure to take account of the specific difficulties of immigrant children, it does not respect their right to be different and contributes to their failure at school or even to their exclusion (the prohibition of the 'Islamic veil' in schools). The Netherlands is the only European country to have included intercultural education as a compulsory subject in teacher training.

With the construction of Europe, which has focused on the economic and political spheres as the basis of its identity, a new issue is emerging. The European Union is now discovering the importance of education, for which no provision was made in the Treaty of Rome (1957), since the European Economic Community was only empowered to deal with training. Rising unemployment and the growing awareness that it is lagging behind the United States and Japan in technology has prompted a new attitude. The single market implies the existence of qualified human resources capable of increasing productivity, to which the mobility of individuals and ideas, in other words reciprocal knowledge, has to contribute. The most dynamic companies are encouraging this approach, as are a variety of European programmes. For example: Comett aims at enhancing high-technology training by encouraging co-operation between universities and industry; Erasmus fosters exchanges of teachers and students, with the logical sequel being the mutual recognition of diplomas (making it possible to become professionally established in another EU country; and Lingua sets out to help enterprises improve the language skills of their employees, to develop language teaching, in particular teacher training, and to intensify exchanges between schools. The Single European Act, signed in Maastricht in 1986, gives the European Community limited jurisdiction in the field of general education. In spite of a large number of resolutions aimed at developing the 'European dimension' in education, teacher training, and teaching materials, and the creation of a Special Unit to organize summer universities, exchanges of teachers (TEX) and networks of trainers (RIF), progress is still slow. Not only are all the nationalist tendencies opposed to multicultural education, but even those in favour of a united Europe interpret it differently.

What has to be noted in the developing countries is the demand for, or assertion of, 'cultural identity'. This comes after a period when the strength of the Western development model prompted the majority of the elites to think that traditional values were out-of-date and incapable of renewing their societies, and that it was thus necessary to adopt and emulate the culture of the West in order to be freed of its domination.

The term 'cultural identity', however, is used in a very vague sense, which is more political than scientific since, strictly speaking, doubts can be raised about the existence of a cultural identity transcending social classes, regions and

ethnic groups (in multi-ethnic states, i.e. virtually everywhere). Political discourse makes use of this term to designate a certain way of thinking, feeling and acting, a certain set of values, attitudes and behaviour patterns which states want to protect from the uniformization of 'mass culture' disseminated by the media on a worldwide scale. In their view, education must strengthen the awareness of belonging to a community while opening up to outside currents. 'Cultural identity' does not mean withdrawal into the self.

It is above all Africa and the Arab States that stress cultural identity. This is probably because, being situated close to Europe, they have been subject to aggression from European imperialism: in particular, the oral tradition of Africa makes its civilization more fragile than others. However, the discourse promoting cultural identity is hardly reflected in reality. African languages, which are an essential factor in culture, are only used in some countries in the first years of primary education or for literacy training. Generally, right from the start, the vehicle of instruction is French, English or Portuguese. Yet language is not only a means of expression and communication, it is at the same time a system of symbols, which binds individuals closely to their group. Hence, the mother tongue is the best vehicle for education, since it enables people to learn more rapidly and better than in a foreign language. The foreign language cuts off children from their environment, the 'elites' from the mass of the population, and contributes to creating 'two nations' within the same country.

It is true that making the mother tongue the language of instruction can also pose objective difficulties: the large number of ethno-linguistic groups, the lack of a written literature, textbooks and teachers, the high costs, etc. Many political figures contend that the use of French, English or Portuguese contributes to national unity, which is debatable and which, in any event, contradicts their declarations in favour of the regeneration of their country's culture and personality. In reality, the problem is social and political. Education in a foreign language favours sections of the population that are acculturated in that language, in other words the socially privileged sections. They use the foreign language as an instrument to select those emerging from other social levels and hence restrict their advancement (in sub-Saharan Africa, 10–30 per cent of children in primary school go on to secondary education).

In the view of many educators, the problem of the democratization of education while maintaining relevance and effectiveness can be resolved by adopting bilingualism. Education would start in the mother tongue. When children have mastered its mechanisms, they would then go on to English, French or Portuguese, which would first be taught as a foreign language before being used as a vehicle in subjects for which the national vehicular language cannot yet be used. This language will continue to be used to explain the foreign language and to link children to their environment. Some countries do not have a clear-cut cultural policy and hardly concern themselves with cultural infrastructures, such as museums, archive services and libraries, or with the preservation of their heritage (by collecting traditions), research and publishing. In schools, culture is above all included in the teaching of history and geography. Art, music and theatre occupy a very small part in the timetable, or no part at all. The teachers who deal with these subjects are usually not very qualified and have

had no training. However, some universities are more active in this area, and the research and publications that have resulted are due more to their initiative than to that of governments.

In the Arab countries, the language does not, at first sight, appear to pose a problem since it has been written for the past 14 centuries as the language of the Koran, the foundation of unity for all Muslims, and as the language of a highly developed culture. The problem is that classical Arabic is different from the spoken language, and this creates difficulties for people from lower-class and rural backgrounds, and also for non-Arab speakers such as Berbers and Black Africans, who sometimes form a substantial proportion of the population (Morocco, Algeria, Mauritania, Sudan). However, the policy of national integration pursued by governments since independence, in reaction to the 'divide and rule' policy of colonization, has ultimately had the effect of more or less excluding minority cultures, and inciting people to demand the right to have their identity recognized.

Another problem arises when a foreign language, English or French, is used as a vehicle for instruction in secondary and higher education, sometimes in primary school (the Maghreb). The consequences from the social standpoint (wastage) are made worse by the fact it is also a 'quasi-official' language in the administration and economy, and this works to the disadvantage of graduates in Arabic. The dilemma is that English or French are essential for giving access to science and technology, which are an integral part of modern culture.

The question of cultural identity is also raised in Latin America, where Porfirio Diaz's phrase concerning Mexico – 'So far from God, so close to the United States!' – can be applied. Yet this explains only some of the difficulties of this continent, where political violence and social injustice have been greater than elsewhere. Although a process of constitutional democratization has been under way since the 1980s, the social and ethnic inequalities (which are often combined) continue to be crucial problems. A growing minority of public opinion has become aware of this, especially after the victory of Castro and the socialist transformation of Cuba, and notably within the Church, which was long associated with the Spanish conquest and with the domination and exploitation of the Indians. Two movements, whose importance lies more in their significance than in their actual dissemination, should be noted: literacy through consciousness-raising and liberation theology.

The first is linked to the Brazilian philosopher Paulo Freire. He starts out from the idea that culture is something created by people through their work. However, illiterates are oppressed (they cannot vote). If education is to be a form of liberation rather than of domestication, it has to make them capable of showing critical awareness in relation to their living conditions. It has to make them discover, by a method based on participation and dialogue, that they are responsible subjects and not passive objects and that they have an active role to play in their environment. The illiterates themselves then feel the need to learn to read and write in order to be able to act more effectively and change reality: literacy training can then begin. It is through self-instruction, progressing from the interior to the exterior through the illiterates' own efforts, with the support of the educator, that the content and the method are merged in a single process.

Instead of in schools, which are by tradition authoritarian, literacy training takes place in *culture circles*. These meet around a coordinator of literacy learners, with whom they draw up an inventory of their verbal universe. It is from this universe, rather than from pre-prepared primers, that they draw on key words. Breaking these key words down into syllables makes it possible, by different combinations of their components, to create other words. The words are chosen not only for their phonetic richness and complexity, but also for their content of real-life experience. Terms like *favela* (shantytown), *chuva* (rain), *arado* (plough), etc., appear in tables showing practical situations and give rise to discussions which prompt the group to 'raise its consciousness' and, concomitantly, to become literate.

Thus, consciousness-raising and literacy go hand-in-hand. Because they have become conscious of their status as *people*, illiterates can critically assimilate the mechanism of forming words and they can thereafter easily elaborate their system of graphic signs. Paulo Freire recounts that, in the first evening of literacy training, one illiterate in Brasilia moved everybody present by saying 'Tu jà lê', the Portuguese equivalent of the phrase 'You are reading already'.

At the same time, the 'Basic Education Movement' of the bishops of Brazil (1961) put forward grassroots education as 'an instrument of human advancement … without evangelical purposes'. This made an improvement to the quality of life of the rural population and 'preserved them from the penetration of ideologies contrary to Christian principles'. Under the influence of progressive groups in the clergy and the active participation of the Catholic University youth movement, the Basic Education Movement adopted both the idea of 'Christian education as a means of social transformation' and the 'consciousness-raising' view of Paulo Freire.

Slightly later, after Vatican II and the encyclical *Populorum progressio* (1967), liberation theology appeared in Peru. Father Gustavo Gutierrez defined its three closely linked dimensions: political liberation from dominant classes and countries; historical liberation; and liberation from sin which is not only individual but also collective. While the Protestant Ecumenical Council of Churches also condemned the 'structural violence coming from the established power', a further step was taken at the Conference of Accra (1977), where the Association for Ecumenical Dialogue of the Theologians of the Third World forcefully asserted that African (Asian, Latin American) theology should 'reject the prefabricated ideas of North Atlantic theology' by aligning with the struggles of the people in 'the resistance against the structures of domination'.

It is against this background that some of the experiences of non-formal education for rural people that were organized by or with associations should be understood. Mention will only be made here of the 'Programa de difusión rural' in Chile, which is particularly interesting since it operated under the dictatorship for several years (1977 to 1981). Radio broadcasts and press articles (e.g. *Cuadernos del Campesino*) focused on the problems of the rural world (production, health, family life) and aimed at 'strengthening the values of solidarity in an environment which exacerbates individualism' and showing that cooperative organizations make it possible for the moderate classes to 'tackle the process of production in better conditions'. In spite of the fact that it was short-lived, the programme provided peasants with information that had previously been inaccessible to them, fostered communication between them through knowledge of the problems of other regions, and developed a critical awareness.

Liberation theology is for the moment still a minority current, and religious authorities on the whole collaborate with government authorities rather than oppose them. However, the pressure of Indian demands has prompted certain governments (Ecuador, Bolivia, Peru, Guatemala, Mexico) to develop bilingual education. Evaluations made of bilingual education show that it has positive effects on the level of acquisition, and that introducing elements of indigenous culture into the programme enhances motivation, resulting in a reduction in wastage. Nonetheless, three obstacles need to be overcome: the lack of standardization in Indian languages; their variations across the country, which entails research to demarcate their areas of application; and, above all, a resistance to the generalization of intercultural education, which is considered to be exclusively for Indians. Countries as a whole, however, should be concerned with fostering a spirit of understanding and respect for the other. Isolating the intercultural dimension from the education system 'perpetuates the vicious circle of marginalization which affects the Indian populations'.[23]

Asia is the continent that has made the most progress in economic terms over the past 30 years. It is also a continent where the environment has seriously deteriorated and where traditional values have suffered the most brutal shock from rampant materialism. All the international conferences of ministers of education have voiced their concern over this and expressed the need to draw up a policy aimed at inculcating ethical, cultural and moral values. The question is how 'tradition' can be reconciled with 'modernization', in other words capitalism, the profit motive, the exaltation of the individual, etc. Moreover, once the values to be taught have been identified, how can they be taught – directly as a 'subject' like literature or mathematics, or indirectly in analyses of situations, case studies or discussions? And is it possible to teach values when reality appears to contradict them (corruption, abuse of power, injustice)?

The problem is easier to resolve when it comes to developing scientific and technical education indispensable for economic growth. To various degrees, all countries seek to adapt the structures, contents and methods of education to the fast-moving changes of technology in order to increase their productivity and their international competitiveness. Stress is laid on the polyvalent nature of education, links with industry, continuous education and the development of research. Project 2000+ aims to create a framework for extending the benefits of 'scientific literacy' to the entire population or at least to the labour force, without which the efforts of managers would be futile. It is known that the transfer of technology is effective only if qualified personnel – who have the necessary knowledge, social and psychological attitudes, and working habits – are available locally, in other words, people who master the technology transferred. However, this transfer provides only short or medium-term solutions, as it transfers knowledge and methods elaborated in the outside world, in that world's conditions. The transfer does not provide the capacity to produce knowledge. Yet such a capacity is essential. Without it, countries will always remain dependent on the outside world, with all the risks of political and economic domination that this entails.

## INFORMATION AND COMMUNICATION

*Rafael Roncagliolo*, coordinator

## 29.1

### A NEW INTERNATIONAL INFORMATION ORDER

*José Antonio Mayobré*

**INFORMATION AMONG NATIONS**

The gathering, processing, possession and – ideally – sharing of information, is the basic lifeline that allows people to organize, survive and perhaps even thrive as members of a community; it also permits nations to communicate with each other, have commercial and cultural intercourse, collaborate among themselves and sometimes avoid war.

Information is at the heart of communication, it is its *raison d'être*. The basic object of communication is to transmit information from one being to another and in transmitting such information to share it, to put it in a common space. Throughout history those who have gathered and processed information have been aware that its possession provides them with the power of knowledge over those who do not have it.

As with individuals, so it is with institutions and nations. The control of information and of the channels used for making it available to others has meant power, and those who hold it have not always been willing to part with it.

One definition states that 'Communication maintains and animates life. It is also the motor and expression of social activity and civilization ... Communication integrates knowledge, organization and power and runs as a thread linking the earliest memory of man to his noblest aspirations through constant striving for a better life.'[1]

According to a most authoritative if still controversial source, communication is at the heart of all social intercourse. Whenever men have come to establish regular relations with one another, the nature of the systems of communication created between them, the forms these have taken and the measure of effectiveness they have attained have largely determined the chances of bringing communities closer together or of making them one, and the prospects for reducing tensions or settling conflicts whenever they have arisen.

M. Amadou-Mahtar M'Bow, the former Director-General of UNESCO, also stated that thanks to the rapid development of communication technologies, every nation now forms part of the day-to-day reality of every other nation. The world continues to become increasingly interdependent. This interdependence however, goes hand in hand with a host of imbalances and sometimes gives rise to grave inequalities, leading to the misunderstandings and manifold hotbeds of tension which combine to keep the world in ferment.

Thus, throughout history, the development of information distribution channels was designed, and took place, in what was fundamentally a unidirectional and unilateral fashion. Information was sent from the seat of the 'mother' nations to the colonies, for the purpose of serving the imperial administration and nationals, and for providing 'knowledge' and 'culture' to those colonials willing to adapt and be assimilated by the dominant culture.

Information from the colonies to the central power was basically designed to further the commercial and political interests of the home power, and took little if any account of the needs and realities of the colonies except where this could further strengthen the imperial hold on the colonial outposts.

And just as all roads led to Rome, so did the telecommunications systems with their cables, lines and other facilities developed during the last half of the nineteenth century and the early years of the twentieth century lead to the dominant political centres and only through them to the nations that would later be known as the Third World.

The first clear warning about the dangers and inequalities inherent in this system came from the United States, where the Associated Press news agency denounced the fact that when Reuters, Havas and Wolff[2] pooled their resources, established complete news agency control of international news and allotted to themselves the news agency exploitation in all the countries of the world, they brought under their

control the power to decide what the people of each nation would be allowed to know of the peoples of other nations and in what shade of meaning the news was to be presented, and that 'International attitudes … developed from the impressions and prejudices aroused by what the news agencies reported'.[3]

The rapid development of new communication technologies after the Second World War and in particular after the 1960s tended to follow the patterns established earlier for the channels allowing the flows of information. With the Cold War and the presence of two dominant and radically divergent ideological models in the world, a debate arose as to the importance of freedom of information and of the free flow of such information.

What was established early on was that information could flow as freely as it wanted, but that the existing infrastructures that allowed this flow made it in practice a one-way current favouring those who controlled the technological means and media, and thus reinforcing and strengthening in fact the situation denounced in the 1940s.

The advent of global radio and, in particular, television changed in many ways the predominance of the print medium and of the agencies, but on the other hand reinforced the position of the central powers in that the new audiovisual media usually bypassed the local political elites to influence mass audiences directly.

At the same time, the economic realities of the media and information industries were leading to a synergistic process where concentration of ownership became the norm at the level of multiple media outlets, thus reinforcing the possibilities for control of message contents and – because of the commercial nature inherent in the way the system was developing in the West – for the predominance of a vision where 'information' was to be considered a product for marketing and profit-making rather than as a social good or even as a human right.

Not until the late 1960s was the concept of communication as a human right advanced. In 1969, the Frenchman Jean D'Arcy wrote that the Universal Declaration of Human Rights would 'have to involve a more ample right than that of the individual's right to information … and that right is the right that the individual has to communicate.'[4]

And as with individuals, so with nations. While communications technology was developing during the 1960s and onward, the world was undergoing a rapid process of decolonization and, over a matter of relatively few years, a host of newly independent nations appeared and quickly became conscious of the role they should play in the international scene.

The creation of the Non-Aligned Movement and of the Group of 77 was a harbinger of a new configuration where the so-called Western and socialist blocs of nations would have to contend with an active and assertive Third World.

## EFFORTS TO ESTABLISH A NEW INTERNATIONAL INFORMATION ORDER

While the debate on the New International Economic Order (NIEO) was reaching its apex in New York during the summer of 1975, with the approval by the seventh extraordinary session of the General Assembly of the United Nations of a Plan of Action for its implementation, the discussion between the nations of the North and the

South was beginning to gather momentum on the matter of information and communication.

These were not new topics on the international agenda. As Nordenstreng has pointed out, the issues were already a subject of concern to the world community by the 1950s and, as regards, for example, the global imbalance of information structures and flows, one could already find clear criteria about them and their effect on diverse cultures early in the century.

The United Nations and UNESCO had addressed the issue of information, approved resolutions in its regard and even called for 'a concrete programme and plan of action in this respect'.[5] In 1953, the UN secretariat had already published a report entitled *Freedom of Information* while UNESCO contributed to the topic with *Encouragement and Development of Independent Domestic Information Enterprises*.[6]

But as the nations of the Third World began to take notice of the limitations imposed on them by the international information and media structures, it became clear that a New International Economic Order could not really become a reality without the parallel creation of a New International Information Order.

As an important student and actor in the process explains, by the early 1970s, the developing countries had accumulated a great deal of political power and economic potential with the assistance of such organizations as the Movement of Non-Aligned countries and OPEC. As a political programme and an intellectual concept, decolonization was well established by this time. But before 1973, the idea of decolonization was not applied in an articulated and authoritative manner to the sphere of information and culture. This occurred at the fourth Conference of Heads of State or Government of the Non-Aligned Countries, in Algiers, when the political declaration of the Conference made the point that 'the activities of imperialism are not confined solely to the political and economic fields, but also cover cultural and social fields' and demanded 'concerted action in the fields of mass communication' as a part of the Action Program for Economic Co-operation.[7]

In 1975, in the context of the seventh extraordinary session of the United Nations General Assembly, convened to discuss the Plan of Action for the NIEO, a group of Third World journalists declared that 'The New International Economic Order requires a new world structure of information and communication.'[8]

According to Nordenstreng, it was in 1976, at the Non-Aligned Symposium of Information, in Tunis, that the phrase 'new international order' was first applied to information. There, in the report of Commission I written by the Peruvian Germán Carnero Roque, it is stated that 'Since information in the world shows a disequilibrium favouring some and ignoring others, it is the duty of the non-aligned countries and the other developing countries to change this situation and obtain the decolonisation of information and initiate a new international order in information.'[9]

## THE ACADEMIC DEBATE

As the political debate took place in international fora, so did the theoretical discussion regarding the various theoretical approaches to communication and its role in society. Until the 1950s and early 1960s academics working in the field of communication had been 'led' or even

overwhelmed by the sheer volume of research coming from what was known as the American 'mass communication research' school, which viewed communication problems from a 'functionalist' point of view and, later, strongly proposed a diffusionist approach according to which the establishment of media in developing countries was simultaneously a sign of and a means for 'progress' – with the latter understood as coded language for approaching the 'American way of life.'

Until the 1960s, UNESCO had favoured the diffusionist approach, with notable figures such as Wilbur Schramm and Daniel Lerner leading the way. But as the decade progressed the influence of the critical thinkers in communication began to make itself more assertive, in particular as related to the relationships between communication, power and social and economic realities.

Researchers from various parts of the world were convened by UNESCO to exchange views and thus began what is arguably one of the most intellectually fruitful, creative and productive moments of UNESCO in the communication field.[10]

New proposals and approaches coming from various individual researchers (Antonio Pasquali, James Dermot Halloran, C. J. Hamelink, H. I. Schiller, among others) and international non-governmental organizations linked to UNESCO, such as the International Association of Communication Researchers (AIERI/IAMCR) and the Fédération Internationale Editeurs de Journaux (FIEJ), as well as the International Communication Association (ICA), the International Press Institute (IPI), the International Organisation of Journalists (OIJ) and a host of others, led to heated debates, confrontations and discussions which soon escaped from the purely academic framework to be inserted into the North-South differences and eventually into the East-West confrontations.

## STRUGGLE FOR A JUST ECONOMIC SYSTEM VERSUS NEO-COLONIALISM IN INFORMATION

The struggle that was initially seen by some as a search for a just economic system versus neo-colonialism in information was clearly more than that; it involved the role of an increasingly powerful mass media, based mostly in a few industrialized nations, and a new and insidious form of transculturalization being used as an instrument of neo-colonialism not just in, but through, the management of information.

Added to these were the basic ideological differences between the Marxist and capitalist camps as to the role the media should play in society, and thus UNESCO became a battlefield, which would witness many struggles in the following years, of which the following developments may provide an example.

## THE MASS MEDIA DECLARATION

As has been seen, the topic of the media and their role in the relations between individuals and between nations had been an important one over the years, and the United Nations had from the start provided an important forum for the discussions and the search for solutions to the various problems posed in this regard.

One of the most polemical manifestations of this came in 1972, when a proposal was presented to the seventeenth session of the UNESCO General Conference by Belarus and the USSR suggesting the preparation of a 'draft declaration concerning the fundamental principles governing the use of the mass information media with a view to strengthening peace and international understanding and combating war, propaganda, racialism and apartheid'.

Two other topics were discussed at this session, which would soon become part of the debates: the promotion of 'Professional standards in the field of the mass media' and the promotion of 'Codes of ethics' for journalists and media. To these would be added later the 'Protection of journalists,' which also generated fierce debate.

It was not until 1978, after much negotiating and conflict-riddled debate had taken place that the twentieth session of the General Conference approved a compromise text proposed by the Director-General as the 'Declaration on Fundamental Principles concerning the Contribution of the Mass Media to Strengthening Peace and International Understanding, to the Promotion of Human Rights and to the Countering of Racialism, Apartheid and Incitement to War.'

The document was the result of a long, arduous and difficult process over several years that had threatened the very unity of UNESCO at the 1976 Conference in Nairobi; the compromise wording was characterized by the Director-General himself as so moderate that 'nobody can expect to find in it, word by word, the exact draft he would like to see. On the other hand, nobody can say that it runs counter, in any profound sense, to the principles to which he is deeply attached.'[11]

What is most striking about this and the ensuing debates, as related by various observers, is the wide gap they revealed between the countries of the socialist East, the capitalist West and those of the Third World, and how the many differing perspectives became at some points bitterly divisive and led to compromises which, in a less charitable view than M'Bow's, left no one happy and no issues truly resolved.

### The McBride Commission and Report

In response to the heated debate and in search of a consensus following the Nairobi General Conference in 1976, the Director-General of UNESCO, M. M'Bow, created an International Commission for the Study of Communication Problems, presided by the noted Irish thinker Sean MacBride.

The Commission's mandate was 'to undertake a review of all the problems of communication in contemporary society seen against the background of technological progress and recent developments in international relations with due regard to their complexity and magnitude'.

### Belgrade and Resolution 21/4.19

Four years later, on the occasion of the twenty-first General Conference, held in Belgrade, the Commission presented its report, published under the title *Many Voices, One World*, to the Director-General who, in turn, informed the conference as to its overall conclusions and recommendations.

In its Resolution 4/19 approved on 21 October 1980, the twenty-first General Conference noted 'with satisfaction' M'Bow's Report and, in its Section IV, considered that 'this new world information and communication order could be based, among other considerations, on ...' and enumerated a list of eleven criteria which were the product of a long and difficult negotiating process which took place during the Conference itself.

The twenty-first General Conference also took note of the recommendations of the International Conference for Co-operation on Activities, Needs and Programmes for Communication Development, which had recommended by consensus the 'establishment, within the framework of UNESCO, of an International Programme for the Development of Communication' and approved the creation of the IPDC.

## THE DEBATE ON COMMUNICATION POLICIES

From the start it had been clear that the objectives sought by the various Member States of UNESCO and favoured by a good part of the dominant academic thinking of the time could not be achieved if governments did not formulate clearly defined communication policies that involved not just matters of journalistic practice and principles, but also the necessary thinking about telecommunications and the new communication technologies that were rapidly developing.

A first Intergovernmental Regional Conference on Communication Policies was convened for Latin America and took place in San José, Costa Rica, but only after a major campaign against it had been developed both in North America and abroad by many members of the private media represented in the Inter American Press Association (SIP/IAPA).[12]

These activities, of course, dampened the enthusiasm initially shown by some of the governments in the region and in some ways affected the results and effectiveness not only of the Costa Rica conference but of the subsequent ones, which took place in Cameroon and in Malaysia.

## THE UNITED STATES AND THE UNITED KINGDOM WITHDRAW FROM UNESCO

In 1984–85, and after what can be seen now as part of a concerted strategy in response to the positions adopted by UNESCO over the previous decade in the field of communication, the United States, the United Kingdom and Singapore withdrew from UNESCO membership. This aggravated considerably the existing financial crisis affecting the Organization and led inevitably to important budget cuts and reductions in personnel.

Particularly affected were the sectors concerned with communication, and especially, the Division charged with the study of communication policies and the free flow of information.

As the end of the century approached, the collapse of the Soviet Union and its system, and the exponential transformations in communication technologies, had produced changes that were totally unforeseen only a few years earlier.

While many of the principles and resolutions approved by the Member States of UNESCO during the 1970s and part of the 1980s still had validity, in particularly those relating to the ethical elements of communication, it was also clear that many had been rendered obsolete by a completely new reality. As a result of these changes, and also in response to the Organization's efforts to reform, the United Kingdom rejoined UNESCO in 1997 and the United States returned in October 2003.

At the beginning of the new millennium, the challenge for communication specialists and thinkers, governments and international organizations such as UNESCO was now the daunting task of conceptualizing and contextualizing technologies and communication means that they could barely imagine.

## THE PRESS AND THE MASS MEDIA

*Rafael Roncagliolo*

As many authors, such as Hobsbawn and Laulan, have pointed out, the nineteenth century was one of the longest ever, but the twentieth century has been one of the shortest. The nineteenth century actually began in 1789 with the French Revolution, ending either around 1914 with the First World War, or in 1918 with the Russian Revolution. The twentieth century, on the other hand, began with the establishment of a new bipolar world order following the First World War and is ending with the disintegration of that very same bipolar system as well as of large ideological movements, wearing down any consensus regarding the great ideals and unproved theories of modernity. The turn of the century has seen an upsurge of new identities, new social movements (women, the environment, and community ventures) as well as new conflicts and civil distress, deeply rooted in ethnic and fundamentalist forces.

From the point of view of the mass media, the twentieth century has been the century of communications and information, par excellence. It started with the consolidation of the popular press – the first cultural industry for the masses – and the expansion of the cinema and radio. It has ended with a new culture – the world of television, the computer, multimedia, and the Internet. Giovanni Sartori refers to the second half of this century as the age of *Homo videns*, while Nicholas Negroponte uses the term *Homo digitalis*.

To illustrate what has occurred with the press and the mass media, the twentieth century could be divided into two parts: the first part (say 1914 to 1945) was the time of the popular press, radio and cinema. The second part (1945–89) was the time of television and the computer, the threshold of the global world of the new millennium. During the first part of this century, Victorian family lifestyles still prevailed, with the family at its centre. During the second half of the century, people began leaning towards a second and complementary lifestyle: individual life.

### 1914–1945: POPULAR PRESS, CINEMA, AND RADIO

Not only did schools develop during the nineteenth century, but also the press. Early in the twentieth century, the two basic components of mass culture and cultural industries were already established: the mass production of messages and advertising as a financial mechanism.

Flichy recalls that a characteristic of the late 1900s was that, for the very first time, industrial production was channelled towards domestic consumers, who until then had been supplied by non-industrial producers. Under these circumstances, newspapers reached hundreds of thousands of readers, piano-making became an industry and the mass consumption of phonographs (Plate 167) and photographic cameras began. Pianos, phonographs, cameras, and telephones (in 1925 one out of every two households in North America had a telephone) became household symbols that were later complemented by the radio, the television, and the computer.

Massive production and consumption are, naturally, based on the growing subordination of cultural industries to advertising. The latter was born in the mid-nineteenth century with the Parisian newspaper *La Presse*, among others. Curiously, the founder of *La Presse*, Emile de Girardin, demanded that the advertisement be 'concise, simple and frank' and that they 'never mask everything'. Nevertheless, throughout the twentieth century, we witnessed the replacement of advertising messages based on information by messages based on seduction. At the end of this process, advertising had been converted into the dominant communication language that moulds other forms of communication.

### POPULAR PRESS

James Gordon Bennett, publisher of *The New York Herald*, stated in 1830 that the press was 'the great organ and pivot of government, society, commerce, finance, religion and all human civilization'.[1] However, the élite press really started turning into the mass media during the early 1830s with the 'penny press,' particularly with the foundation of *The New York Sun* in 1833, which focused on crime and sex and reached a circulation of 10,000 copies a day. *La Presse* and *Le Siecle* appeared in France in 1836, costing 10 cents; in 1863, *Le Petit Journal* was sold at half the price, or 5 cents, reaching a circulation of 350,000 copies in 1869.

The industrialization and increasing volume of expenditure on press advertising at the threshold of the twentieth century gave rise to the very first press barons: Joseph Pulitzer, William Randolph Hearst and E. W. Scripps, who built journalistic empires that turned them into key political agents in the United States. The

power exercised by these barons is illustrated by the story about the dialogue between Hearst and Fredric Remington, his press agent in Cuba early in 1897. Hearst had asked Remington for photographs of the supposed war between the United States and Spain. He received a message from the photographer indicating that there was no war to photograph, to which he replied: 'Please remain. You furnish the pictures and I'll furnish the war'.[2] The truth is that these chains controlled 10 per cent of United States newspapers in 1910 and 40 per cent by 1935.

Over the years, as shown below, both the informative role played by newspapers and their advertising funds were shared first of all with the radio, then television and finally, with the electronic journalism that has recently become completely digital. As a result of this process, by the end of the century declining numbers of people read newspapers and each medium carved out a different niche for itself: people hear news on the radio, confirm it on the television and analyze it in the newspapers.

However, the popular press, radio, and television that characterized communication in the twentieth century were actually invented at the end of the nineteenth century. The war enabled countries to test and develop new inventions in the field of transport (aviation) and communications (radio). During this century, we moved on from mastering the oceans to mastering the air, just as in previous centuries we had moved from the land to the sea during the printing era, according to those who look at human history through the development of media technologies.

## Cinema

The cinema became an extension of nineteenth-century inventions – photography and the phonograph – as a system which in Maxim Gorki's words 'made pictures come alive' and 'which does for the Eye what the phonograph does for the Ear', according to one of its main creators, Thomas Edison.[3]

Although photography dates back to the first pictures taken by Joseph Nicephore-Niepce in 1824, the 1837 daguerreotypes resulting from the cooperation between Niepce and J. M. Daguerre boosted the popularity of the Kodak camera launched by George Eastman in 1898 with the slogan 'You press the button, we do the rest.' The phonograph had also reached mass production and consumer levels as a result of Eldrige Reeves Johnson's introduction of the Victrola in 1906. Sales of these machines reached 96,000 units in 1910. The phonograph began to complement (and sometimes replace) the piano and singsongs at family parties. Later, during the 1920s, the phonograph, the Pianola, and the radio competed for pride of place in the living room. Music became merchandise, thus giving rise to the musical industry.

On 28 December 1895, the brothers Auguste Marie Louis Nicholas and Louis Jean Lumiere invented a machine that was both a camera and a projector. By 1900, they had produced 1,299 short films. During the early 1900s, the pictures began lasting 10 to 15 minutes and westerns and comedies made their appearance. In 1915, D.W. Griffiths presented his three-hour film *The Birth of a Nation*. Even though this film exalted the Ku Klux Klan, it introduced patterns that have become standard in the motion picture industry: close-ups, tracking, cross-cuttings, etc. The first

newsreels were also developed at that time, but were finally overshadowed by television in 1967.

The cinema went through the same industrial concentration process that gave rise to the press barons. In 1909, ten of the greatest producers created the Motion Pictures Patent Company, marking the beginning of Hollywood. Two technical breakthroughs helped to consolidate the popularity of this new art: the first was in 1928, when RCA and Western Electric introduced a sound system that rendered silent motion pictures obsolete. By 1930, the vast majority of the 5,000 films produced were vocal.[4] Seven years later in 1935, the second and decisive breakthrough occurred in the motion picture industry: thanks to a one-million-dollar investment in research and equipment by Technicolor Inc., the first long feature film was produced in full colour: *Becky Sharp*. By then, 40 per cent of the adult population in the United States was going to the cinema at least once a week.[5] The cinema industry had reached its peak (Plate 168).

Attendance at the movies began to decline after the Second World War, even before the expansion of the television industry. Later, television, videotapes, and video games provided a wide range of visual alternatives that negatively affected movie houses. As a result, although more films are shown now than ever before, most of them are not seen in movie houses. Large cinemas that had been built before television made its appearance have now been sub-divided to provide a wider choice of films for fewer spectators. Nowadays, motion pictures are not only shown in movie houses but on the air through television, cable television, pay-per-view, videotapes, and on airlines. Digitalization has contributed greatly to this integration.

## Radio

The press began as a public space with two main goals: to provide information and encourage discussion. Entertainment began playing its role during the nineteenth century, through the popular press. On the other hand, the appearance of radio early in the twentieth century was initially dedicated almost exclusively to entertainment. Jesuit Anchieta made a wireless transmission of the human voice in the Rio de Janeiro Bay in Brazil, before Marconi. Also, a coloured television system was invented in Mexico before the United States systems were patented and marketed. The radio did not appear as the continuation of the newspaper, but as a new domestic appliance for home entertainment purposes, just like the piano and the phonograph before it. 'The radio was to become a household convenience, just like the phonograph, which it would replace for nearly twenty years. Like records, it would provide music to dance to at home'.[6] Consequently, the radio combined the developments of telegraphy and wireless telephony on the one hand, and fulfilled the purpose of the phonograph on the other.

The history of radio and television cannot be mentioned without referring to David Sarnoff, the self-made man who 'one April afternoon received a message about the sinking of the Titanic. He contacted as many ships as he could and informed the press. For seventy-two hours, he was the only link between the shipwrecked people and awestruck America. Was this not, by chance, the anticipated work of a radiophonic reporter?'[7]

The Chief Inspector for the Marconi Wireless Telegraph Company of America, Sarnoff, wrote in a memorandum addressed to his bosses in 1915: 'I have in mind a plan of development which would make radio a household utility in the same sense as the piano or the phonograph … The idea is to bring music into the house by wireless. The receiver could be arranged for several different wavelengths, which should be changeable with the throwing of a single switch or pressing of a single button … The proposition would be especially interesting to farmers and others living in outlying districts removed from cities. By the purchase of a "Radio Music Box", they could enjoy concerts, lectures, music, recitals, etc., which may be going in the nearest city'.[8] The bosses considered this prophetic proposal to be senseless.

Originally, the radio had been an activity for amateurs. By 1922, there were 15,000 transmitters and 250,000 listeners in the United States. These amateurs developed a passion for the radio as a hobby and some of them thought that the radio could become a public service, a passion and concept that persist to this day among amateur radio communities.

After the First World War, the place of those experiences was taken by commercial radio. The first commercial radio station, KDKA, was established in the United States on 2 November 1920 by the Westinghouse firm, which broadcast the results of the presidential elections. Westinghouse had been a major manufacturer of military radios during the war and was seeking a new civilian market for its appliances. Consequently, the radio had two origins that differed considerably from that of the press: (a) it was created for entertainment rather than for broadcasting news, and (b) it appeared with the intention of selling receivers (the hardware preceded the software).

There were 30 radio stations in the United States by 1922 and 500 by 1923. In 1922, 100,000 radio receivers were sold at an average cost of US$50 each. In 1929, more than 4 million receivers had been sold at an average price of US$100 (equivalent to four weeks of average wages). According to the 1930 census, more than half of American households owned a radio and 80 per cent of them listened to it every day.

Radio soon conquered other areas. One of these was the special purpose radio, e.g. police radios. Car radios were another radio development niche. In 1931, only 1 per cent of cars were equipped with a receiver, which is equivalent to 100,000 car radios, less than 3 per cent of all the radio receivers sold that year. However, 700,000 car radios were sold in 1934 and 7.5 million in 1940, which meant that 25 per cent of the cars were equipped with radio receivers. This percentage rose to 75 per cent during the 1960s.

Also unlike the press, which operated in the market with absolute freedom, commercial radios had to transmit through frequencies granted by the government under the obligation to broadcast clean programs 'in the public interest, convenience and necessity' (Communication Act 1934.[9]

The creation of this new means of communication posed a crucial question that prompted lively debates, even in the United States: Who should pay for radio? The recipient, the transmitter, the advertiser or the state? The market and business interests that could not do without this powerful new instrument gave the reply. The first radio advertising spot appeared in 1924. In 1935, more than US$100 million was spent on radio advertising.

Companies producing on a national scale also required nation-wide publicity, hence the emergence of networks, the first of which was the National Broadcasting Company, which made its appearance on 15 November 1926 with 24 stations and an audience of 12 million people. Obviously, the networks required even more advertising as the only means of financing the cost of maintaining the telephone lines that became so essential.

The evolution of invoicing gives an idea of the importance that radio acquired as an advertising instrument in the United States: US$4 million in 1927, US$50 million in 1936, and US$300 million in 1945. The year 1936 is significant in the history of communications, because of three events: the first electoral campaign by radio, the first public opinion polls (Gallup) and the birth of the behaviourist tradition of mass communication research. Paul Lazarsfeld, radio's first social researcher and creator of mass communications research, stated in 1940 that 'Broadcasting in America is done to sell merchandise, and most of the other possible effects of radio become submerged in a strange kind of social mechanism, which brings the commercial effect to its stronger expression'.[10]

Although we are referring to the commercial radio developed in the United States, originally there were three models. The American commercial model governed by economic yield; the European public service model governed by the socio-cultural yield (developed by Giuseppe Richeri), and the government-party political yield model inaugurated by the Radio of the People's Counsel of Commissioners of the Russian Revolution.

The radio continued growing during the post-war period, particularly because of the lower prices and better quality of frequency modulation (FM) and transistor radios. FM began in 1936 with the allocation of a small number of frequencies for experimental purposes, increasing to 600 stations during the post-war period and continuing to grow during the 1960s, boosted by rock and roll and local stations, until 75 per cent of the United States audience was covered during the 1990s. The transistor was invented in Bell Laboratories (1947), giving rise to the appearance of transistor radios in 1954.

After the Second World War, radio preferences were already being shared with the television. 'People tended to listen … not in family groups … The television set had taken over the living room, while the radio had moved into the bedroom, or the car, or even the pocketbook'.[11]

By the end of the century, the radio and all other media have became part of transnational multimedia corporations and have joined the digital world, through Digital Audio Broadcasting.

## 1945–1989: TELEVISION

The existence of television has been imagined ever since the telephone was invented: if the voice could be transmitted through air, why not pictures? As far back as 1879, *Punch* magazine's draftsman George du Maurier had already imagined a couple sitting in their living room following a badminton match on the screen.

The first television system was developed in 1926 by John Logie Baird in the United Kingdom, using a Nipkow disk, a photoelectric cell, and hollow tubes to amplify the signal and a neon light bulb as a receiver. The British Broadcasting Corporation used this primitive system with

only 30 horizontal definition lines, from 1929 until 1937, when the electronic solution was incorporated. France also started broadcasting on 26 April 1935, using a mechanical procedure (180 lines) invented by René Barthelemy, which remained in use until 1938.[12]

At the same time, television was developed in the United States based on cathodic ray tubes (CRT) and the work of Philo T. Farnsworth and Vladimir Zworykin. In 1930, Zworykin left Westinghouse, which had shown little interest in his work with the 'iconoscope,' to join RCA, the main manufacturer of radio receivers, which was then chaired by David Sarnoff, who had written the following in 1923: 'I believe that television … will come to pass in due course … It may be that every broadcast receiver for home use in the future will also be equipped with a television adjunct by which the instrument will make it possible for those at home to see as well as hear what is going on at the broadcast stations'.[13]

RCA began broadcasting experimental television programs in 1935 and made a presentation in New York during the 1939 World Fair, including President Roosevelt's inaugural speech. Television already existed in several countries and the Second World War only temporarily interrupted its spectacular development during the post-war period.

In 1946, only 8,000 homes owned a television in the United States. This number rose to one million in 1949, more than 10 million in 1951 and 45 million in 1960, by which time almost 90 per cent of all American homes had a television set. Naturally, this growth rate continued after 1964, when colour transmissions were fairly generalized.

The same structure and finance guidelines that each country had adopted for radio were followed for television: private TV in the United States (and later in Latin America); public TV in Europe and the rest of the world. This primarily affected radio, given that since 1945 television began absorbing most of the expenditure on advertising as well as previous radio broadcastings of the most important soap operas. The cinema industry was also affected as fewer people attended movie houses; therefore it immediately tried to form a partnership with the television industry, producing TV shows and selling its old films to TV stations.

Colour television made its appearance during the 1950s. There were three image definition standards: NTSC, PAL, and SECAM. The latter two had a larger number of lines and, therefore, a better quality image. Most countries chose European standards (PAL and SECAM), except the majority of Latin American countries and some Asian ones that adopted the American-Japanese standard, NTSC. Consequently, state decisions concerning technological breakthroughs have followed economic and cultural dependence, encouraging some international exchange of cultural products and preventing others. In other words, subordination and isolation were created simultaneously.

By the end of the 1960s, the television market in developed countries appeared to be saturated. However, the demand multiplied during the new decade as a result of a new surge of audio-visual inventions: cable TV, satellite TV and the video recorder (VCR). Cable was in fact an old technology that had been used back in 1948 in remote areas where costly antennae were required in order to receive signals. It was therefore better to invest in a single antenna in each place and distribute the signal to households via cable. Hence the creation of CATV: Community Access Television.

Based on CATV, pay-per-view television made its appearance in 1972. Taking advantage of communication satellites in operation, the first of which was launched in 1964, cable became a business that provided a better signal and created a much higher demand, which will reach its prime once all coaxial cables are replaced by optic fiber. Thus, in the early 1990s, more than 60 million households in the United States were connected to cable and there were more than 1,000 cable television companies. In 1997, two out of every three homes had cable television in Argentina. Thanks to price cuts in this sector of the economy, television stations are sprouting all over the world, consisting of no more than a satellite receiving antenna, a video recorder and, sometimes, a camera.

It was John Logie Baird himself who began video recording in 1926, using 78 r.p.m. records. Since then, numerous attempts were made to produce audio-visual recording devices for commercial purposes, including the first Ampex recorder introduced in 1957 at a cost of US$45,000 per unit. As a result of various commercial experiments, the videotape triumphed over the video-record, making it possible to reduce the size and cost of the units. In 1975, Sony introduced the Beta system, and in 1976, JVC/Matsushita introduced the VHS system, which would become the predominating standard after a few years. By 1978, 400,000 households in the United States already owned VCRs. In 1983, 4.1 million VCR units were sold in that country and this figure almost doubled the following year, reaching nearly 8 million. In 1985, 20 per cent of the homes in the United States were equipped with video recorders. UNESCO provided the estimates in Table 20 for the 10 countries with the highest percentage of homes owning VCRs in 1989.

At the same time, the worldwide expansion of VCR sales and the development of video-rental establishments occurred. Videotapes also contributed greatly to audio-visual globalization (Plate 169) and the evasion of government censures on television. It is estimated that there were 300,000 VCRs in the Soviet Union in 1986.

Breakthroughs continue multiplying. The early 1990s also marked the appearance of the camcorder, a device that combined a television camera with a video recorder, giving rise to the production of home videos. Video games are

*Table 20* **Percentage of households owning VCRs in selected countries**

another milestone of the entertainment industry and the use of the television monitor, although these are now fully integrated with the computer.

As far as television is concerned, the century is ending with High Definition Television (HDTV) projects. As occurred when the colour television system was adopted, discussions have focused on differences between the Japanese standard and the European standard. Clearly, television will also become fully incorporated into the digital era; the main concern is whether there will be enough space for all the voices and images when the new digital frequencies are allocated at the end of the century, not only for the commercial ones but also for community broadcasts that offer an alternate view to complement global views.

Undoubtedly, television is the major communication phenomenon of the twentieth century. It has changed the cultural landscape, encouraging linguistic unification (such as the use of the Italian language in Italy) and given shape to the 'global village' that Canadian communications theorist Marshall McLuhan spoke about. There are many controversies regarding its effects. Giovanni Sartori, one of the political scientists who has spent time analyzing trends in contemporary democracies, is particularly critical of the historical rupture implied by television. He says television 'primarily and fundamentally changes the very nature of communication, transporting the context of the word (printed or through radio broadcasts) to the context of the image .... By the same token, it is clear that television cannot be treated as a mere extension of the communication instruments that preceded it'.[14] According to this political analyst, 'television produces images and undermines concepts, thus causing us to reduce our concentration powers and our ability to understand ... *Homo sapiens* is thus replaced by *Homo videns*. In the latter case, the conceptual language (abstract) is replaced by the perceptive language (concrete), which is infinitely poorer, not only in terms of the number of words, but particularly in terms of the richness of meaning, i.e. the ability to see between the lines (connotative skills)'.

Television appears to have a particularly profound effect on children's education as well as on political democracies. 'Television is a child's first school (the fun school that precedes the boring school)'.[15] At the same time, video-politics have emerged, either overshadowing or replacing the party politics that characterized contemporary democracies until the 1980s. Many philosophers (particularly Pierre Bourdieu and Sartori himself) have expressed their concern about this dimension of television.

In fact, since the first televised electoral campaign – the American elections of 1952 when General Dwight Eisenhower ran against Adlai Stevenson – television has been playing an ever-increasing part in politics. 'In 1980, three-fifths of those surveyed said that TV played a significant part in their deciding whom to vote for in that year's elections, compared to only about two-fifths in 1970'.[16]

The nature of the television language forces people to focus on candidates rather than on programs, on pictures rather than on speeches, on pathos rather than on logos, on seduction rather than on conviction. It is not necessary to form party teams to act as mediators between the candidates and their support base, but to establish good public relations with the media, particularly with television, in order to obtain a decisive political advantage, often without any accountability or social control whatsoever.

## THE THRESHOLD OF THE NEW MILLENNIUM: THE GLOBAL WORLD

The cultural panorama at the end of the twentieth century is a complete novelty. In 1989, there were 600 million television sets in the world. In the United States, 99 per cent of households owned at least one television set and every home had an average of 5 radios (not including car radios) and a personal computer. Naturally, the new means of communication displaced the old. The panorama recorded by UNESCO in 1992 can be seen in Table 21.

Based on the same UNESCO *Yearbook*, the following percentage variations in the consumption of each medium between 1970 and 1990 were estimated: newspapers: 1 per cent; books: 15 per cent; cinema seats: 20 per cent; radio receivers: 116 per cent; television sets: 93 per cent.[17] Such is the new cultural galaxy, which marks the decline of reading (newspapers and books) and mass spectacles (cinema) and the affirmation of electronic media (radio and television).

Amusement and information have become global phenomena. Football has turned into the favourite spectacle on a worldwide scale. Television broadcasts of wars have become a routine in our times, from the Vietnam war,

*Table 21* **Media consumption by region**

| Region | Newspapers* | Books** | Cinema Seats* | Radio Receivers* | TV Sets* |
|---|---|---|---|---|---|
| EUROPE | 332 | 565 | 58 | 699 | 375 |
| NORTH AMERICA | 248 | 392 | 40 | 2017 | 798 |
| OCEANIA | 206 | 454 | 20 | 944 | 375 |
| LATIN AMERICA and the CARIBBEAN | 94 | 96 | 17 | 342 | 164 |
| ASIA | 64 | 74 | 7 | 182 | 64 |
| ARAB STATES | 39 | 29 | 4 | 252 | 102 |
| SUB-SAHARAN AFRICA | 17 | 21 | 3.1 | 148 | 22 |
| WORLDWIDE Average | 111 | 159 | 20 | 342 | 156 |

* Per thousand inhabitants        ** Per million inhabitants

*Source:* Adapted from UNESCO, 1992, *Statistical Yearbook 1992.*

which inspired McLuhan's 'global village', which to the Gulf war announced Baudrillard's 'post-modernity.'

Globalization is becoming increasingly digital. The group of cultural assets comprised by the press, radio and television can now be stored and transported in bits and bytes, through satellites and optic fibers. Consequently, the decision regarding the type of means of communication to be used (press, radio, or TV) can be transported from the transmissions point to the receiving point.

Furthermore, thanks to the Internet, the personal computer, which emerged as a data processing machine, has become a means of communication capable of replacing mail, telephone, and fax and introducing the new videophone experience.

It is the concentration of economic resources that supports globalization. Corporations like Time-Warner, Murdoch, Maxwell, Berlusconi or Havas control an ever greater part of the new multimedia complexes. With the expansion arrives a third type of censorship, commercial censorship, which has come to inherit the old ecclesiastical and state censorship.

The twentieth century is, par excellence, the century of the press and mass media. Consequently, it is also a century in which thoughts have been focused on information and communications, and most of the theories regarding cultural industries and the culture of the masses were conceived in its early decades. The second part of the century gave rise to the consensus that we are going through a revolution of information and communications, expressed in a variety of terms: new information and communication technologies, the third industrial revolution, global village, information highways, telematics, communications, information society, videosphere, post-Fordism, Gatesism, and so on.

Throughout this century, we have witnessed the weakening of public spaces and, at the same time, partial and selective attempts to gain democratic access to knowledge and culture. Cultural industries, whose social effects so fascinated the Frankfurt school from the 1920s onwards, have now become transformed. They moved from being industries of the written word to industries of the image; from comprising a closed list of different products to an endless number of intertwined goods and processes; from transportable objects (books, newspapers, records), to purely communicative messages; from producing for education and leisure time to meeting the demands of daily lifestyles and economic activities. In short, they have become the hubs of the economy and society.

## THE WORLD'S ARCHIVES

*Michel Duchein*

### THE SITUATION OF THE WORLD'S ARCHIVES IN 1914

In 1914, at the outbreak of the First World War, almost all European and American countries had their own national archives, some dating as far back as the eighteenth century, but most to the nineteenth. Legislation and regulations concerning public archives had begun to develop, at least in the countries whose administrations were most advanced. However, many shortcomings still needed to be addressed, particularly in terms of the physical conditions in which archives were stored (few buildings were really suitable) and access for researchers. In many countries, even those with a strong archival tradition, consultation of documents remained subject to very long delays and special permission: this was the case in Austria, Prussia and Russia, for example, not to mention Turkey.

Outside Europe and America, only a few European colonies had organized archives, which were modelled on those in the colonizing country. Here in particular, the physical conditions in which archives were kept were generally deplorable, made worse by the tropical climate.

However, changes were already noticeable. The main principles of archive management, i.e. storage for the archives, the principles of provenance and structure and the *metodo storico* of Italian archivists, were well known and more or less universally accepted (in theory, at least). The manual on archive management compiled by Dutch archivists Muller, Feith and Fruin and published in 1898 had been translated into German, English, French and Italian. An inaugural international congress held in Brussels in 1910 had laid the foundations, if not for an international archive organization, at least for regular collaboration between archivists from numerous, mostly European, countries.

In particular, pressure from historians was beginning to open the way for archives to be made accessible for research and, in several countries, archives were no longer considered the exclusive domain of ancient documents; new items were being added regularly, something that had seldom happened in the nineteenth century.

### THE 1914–1918 WAR AND ITS CONSEQUENCES FOR ARCHIVES

Many archives were destroyed during the 1914–1918 war, particularly in Belgium and northern France. Other, less well-known, archives were destroyed in the former Ottoman Empire and Eastern Europe. In particular, however, the great political upheavals in Europe led to huge quantities of archives being transferred between the former empires and the new countries that replaced them.

The victors and historians were particularly interested in the archives of Austria-Hungary. They were transferred in accordance with the treaties of Saint-Germain-en-Laye, Trianon and Sèvres (1919–20), following the principle that collections should be kept together, although in some cases their distribution on the basis of 'territorial relevance' resulted in the new countries taking possession of documents originally owned by former administrations located in other countries. Certain disputes over these documents remain unresolved even today.

National archives were immediately created in all the countries established under the 1919 and 1920 treaties, with laws passed to establish their legal status and conditions of access; in the 1930s more than ever, archives were considered a national symbol and an attribute of sovereignty.

1 June 1918 is a landmark date, the day Lenin signed the famous decree which was to govern the organization of the archives of the future Soviet Union until 1991. The principle, which was revolutionary in all senses of the term, was that all the country's archives should constitute a 'single collection', owned by the people. On the basis of this principle, the archives were highly centralized and regulated in great detail. This decree, which was inspired by the French law of 1794, stated that all documents from the 'single collection' were freely accessible; however, under the dictatorship of Stalin and his successors, such openness proved to be a complete illusion, since the Soviet archives remained among the world's most inaccessible until the break-up of the USSR.

### THE INTERWAR YEARS

As far as archives are concerned, the twenty years that elapsed between the two world wars were particularly marked by a growing awareness of the needs of the administration and of modern historians. Nineteenth-century archivists were primarily interested in ancient archives; they failed to see the need to add to the collections or to sort and classify more recent documents. It was during the 1930s that, in most countries, these questions were addressed by theoretical studies and practical applications for the very first time. In particular, the frequency with

which recent documents were archived was regulated virtually everywhere and rules were drawn up concerning the sorting of the documents to be kept. The creation of the United States National Archives in 1934 is characteristic of this new-found awareness.

As a result of these developments, several archive management manuals were published, some of which are still considered classics today (e.g. Sir Hilary Jenkinson, 1922, Eugenio Casanova, 1928). Several countries drafted laws establishing the legal status of public archives, which previously had not always been clearly defined.

Historical research also changed radically in the years leading up to the Second World War. Partly under the influence of the Marxist school, more and more emphasis was placed on the study of economic and social structures, which meant consulting types of document that had rarely been used up to that point: accounts, fiscal archives and documents drawn up by notaries, as well as bank, industrial and commercial archives. Not without difficulty archivists were forced to adapt their methods in order to meet these new demands; ancient archives were no longer the only ones in demand, and this phenomenon gathered momentum after the war.

## THE SECOND WORLD WAR

First and foremost, the Second World War was a period when many archives were destroyed, not only in Europe – Poland, Belgium, the Netherlands, France, Italy, Germany, the Balkans, USSR – but also in Asia and the Pacific (Plate 170). The loss of the archives of the Kingdom of Naples, in 1942, deprived the southern half of Italy of its historical heritage dating back to the Middle Ages (while, in a sort of prologue to the Second World War, many Spanish archives were destroyed during the 1936–1939 civil war).

However, quite apart from these losses, the 1939–1945 war had very long-term consequences for the future of the world's archives. In particular, the war generated masses of documents of all different kinds, produced by various bodies – military, economic and political – in all the warring countries and those that were occupied. The global nature of the war, which involved increasingly complex technologies, led to previously unimaginable increases in documentary production; management of the documents created problems completely disproportionate to any that had ever been experienced before.

Even before the war was over, two countries took the initiative of studying the problem systematically: the Grigg Committee in Great Britain and the Hoover Commission in the United States evaluated all the relevant war archives. They reached identical conclusions: in order to deal with these documents, special institutions had to be created to act as intermediaries between the bodies that produced them and the archive departments themselves. These institutions, known as 'records centers', 'intermediate repositories' or 'dépôts de pré-archivage', which were set up in many countries from the 1950s onwards, now form the basis of the most advanced modern archiving systems.

In 1964, the American archivist Schellenberg deduced from the Grigg and Hoover reports the theory that archives could be divided into 'three ages' (current, intermediate and final or historical archives). This system was universally adopted and is now one of the basic principles of world archive management.

## ARCHIVES ACROSS THE WORLD

One of the basic historical phenomena of the second half of the twentieth century was decolonization, during which numerous states emerged from previous colonial empires. With a very small number of exceptions, these new states have all created their own national archives and archive laws. Nowadays, archives enjoy legal status in every country of the world, although that does not mean they are well organized in every case.

Dividing the archives between the newly independent countries and the old colonial powers was no easy task. Different systems were used, depending on how the archives had been organized before independence and on pre-existing colonial structures. As a rule (although there are exceptions), archives that were created in the countries themselves by colonial administrations stayed put, while those set up by the governments of the colonial powers were kept in the former home territories. In some cases, particularly Algeria, which was not legally a colony but part of metropolitan France, the distribution of archives was a source of conflict, although it was usually resolved amicably following independence. A round table was organized in Cagliari (Sardinia) in 1977 to discuss these issues and draw up principles, which are now more or less universally accepted.

After the previous abortive efforts in Brussels in 1910, the founding of UNESCO in 1946 enabled archivists from all countries to form a common organization, the International Council on Archives (ICA/CIA), a non-governmental organization (NGO) established in 1948 and based in Paris. The ICA/CIA holds an international congress every four years (the last two were in Beijing in 1996 and Seville in 2000) and an international round table every year (CITRA: the last was held in Budapest in 1999), the proceedings of which are published. It also produces two multilingual reviews – *Archivum* since 1951 and *Janus* since 1985 – as well as manuals and *Studies*. Its various technical committees cover all issues connected with modern archiving. It currently has approximately 1,300 members (archive institutions, archivists' associations and individuals) from more than 160 different countries.

Another international archiving initiative is the series of *RAMP Studies*, which have been published since 1977 by UNESCO and the ICA/CIA. A further global publication is the large collection of *Guides to the Sources for the History of Nations*, which cover all five continents and which have been published by the ICA/CIA since 1970.

The fact that virtually every country in the world has national archives and archive laws does not, however, mean that archive management and accessibility are the same everywhere: far from it! The way in which archives are organized is closely linked to the particular country's governmental, administrative and legal system. For example, archives tend to be decentralized in federal states but centralized in unitary states. The influence that national archives have over regional and local archives varies from country to country. Similarly, the extent to which rules on the management of current and intermediate archives are binding depends on the country concerned.

It would therefore be illusory to think that archives could be managed in the same way throughout the world. As a legacy of the past and a reflection of the present, archives have their own personality. However, it is at least possible to try to standardize certain methods: classification,

description and communication to researchers, for example. The ICA/CIA is working towards this goal; the ISAD General International Standard on Archival Documents for archival description, which has been adopted by numerous countries since 1993, is a promising first step.

## NEW TECHNOLOGIES AND ARCHIVES

Since the end of the Second World War, the threat to archives posed by technological advances has been increasing year by year, to the point where their future is now in serious doubt.

Until around 1960, all archives produced and stored in the world were composed of paper documents (or, in rare cases, parchment). Suitable precautions were taken to ensure they were preserved and used correctly. These days, however, more and more documents are being created on new media (film, magnetic tape, electronic media, laser discs) and can be stored and accessed only by using machines (machine readable records) that evolve extremely quickly; and as a result, the documents themselves are in danger either of disappearing in the short or longer term because of the fragility of the medium on which they are stored or, more probably, of becoming unusable when the machines required to read them become defunct.

Today, most archive documents can still be consulted in paper form, although this is becoming increasingly rare for many technical, financial, demographic and other documents, which now exist only in electronic form. These issues are currently being discussed at international level (congresses, round tables, symposia, etc.) and have by no means all been resolved; in fact, they are a growing source of concern as technological progress accelerates. Nobody can predict with any certainty what archives will consist of a century or even half a century from now.

On the positive side, modern technologies (particularly digitization) at least make it easier to preserve and use traditional archives, which is definitely a step in the right direction. Technical advances in the construction and equipment of archive buildings, which have grown in number over the last fifty years, also contrast greatly with the previous half-century.

## VOCATIONAL TRAINING OF ARCHIVISTS

For a long time, until the mid-twentieth century, the distinction between the professions of archivist and librarian was very blurred in many new countries; in too many cases, vocational training therefore tended to focus more on library management than on that of archives.

Moreover, in countries with strong archival traditions, such as Germany, Spain, France, the United Kingdom and Italy, vocational training for archivists was almost always based on historical sciences, palaeography, diplomacy, history of law, with little attention paid to modern archives.

Since the 1950s, however, there have been two main developments that have challenged this tradition: the professionalization of archivists, with archive management now generally considered a science *sui generis*, and the

modernization of their training. Depending on the country, archive management may be taught in universities, in archival institutions themselves, or in specialized schools. In many countries, archivists' associations play a vital role in the way this training is organized and in the drafting and dissemination of professional standards.

Unfortunately, not all countries currently provide high-level training in archive management. The ICA/CIA does try to coordinate training at the international level, but there is no escaping the fact that, in many developing countries, the lack of competent archivists is a serious handicap for the future of archives.

## ARCHIVES FOR CITIZENS

Until after the Second World War, archives functioned almost exclusively as the memory of administrative bodies and a source for historical research. In principle, they were accessible to all citizens, but in reality they were only ever consulted by historians, and, in every country, documents were made accessible only after fairly long waiting periods (50, 60 or even 100 years).

A real psychological revolution took place from the 1960s onwards, linked to the affirmation of the democratic right to information and to the growing public interest in contemporary history. An international congress of archivists, held in Washington in 1966, stressed the need for greater openness. In 1966, the United States Freedom of Information Act, by proclaiming the principle of free access for citizens to administrative documents (which was subsequently imitated by most democratic countries), opened up a new era in the history of archives, which ceased to be the exclusive domain of historians and other academic researchers.

Nevertheless, in order to protect people's privacy and states' legitimate interests (public security, etc.), some categories of document may still be consulted only after a certain period of time, in most countries 20 or even 30 years, apart from a few exceptions stipulated in national laws.

## FUTURE PROSPECTS

The legal status of archives is recognized virtually everywhere, whether they are public archives (owned by states and public authorities) or private collections (owned by individuals, companies and private-law bodies). However, much remains to be done, particularly in countries with no archival tradition, to ensure that the institutions actually abide by the principles enshrined in the law.

In particular, a significant effort is needed to construct and renovate suitable buildings in order to create a proper environment for the preservation and public consultation of documents.

Vocational training for archivists should also be more widely available and geared to the historical, administrative, legal and climatic contexts of the different regions of the world.

In particular, the accelerating emergence of documents stored on new media, which can be accessed only by using machines that are constantly evolving, poses problems which may radically transform the nature of archives in the next half-century.

The fate of the whole historical memory of nations, peoples and all of humanity depends on the answers that are found to these difficult questions.

## BIBLIOGRAPHY

No single publication covers all that is dealt with in this chapter. However, most countries have their own manuals or archival reviews which detail the development of archives since 1914.

General bibliographies can be found in the publications of the International Council on Archives (ICA/CIA, 60 rue des Francs-Bourgeois, 75942 Paris Cedex 03), particularly the *Archivum* and *Janus* periodicals and the series of International Conferences of the Round Table on Archives (CITRA), held since 1954.

Volume XLIV of *Archivum* (1999), entitled *Basic Archival Problems: Strategies for Development*, contains a complete bibliography of the *RAMP Studies*, a list of archival reviews throughout the world and archival bibliographical resources on the Internet.

All legislative texts concerning archives throughout the world until 1994 were published in 8 volumes of *Archivum* (Vols. 11, 17, 19, 20, 21, 28, 40 and 41).

Finally, a recent publication containing 22 essential studies (in English and French) on archival culture, the international organization of archives and the legal principles for the international transfer of archives was written by the former Secretary General of ICA/CIA, Charles Kecskemeti: *Sovereignty, Disputed Claims, Professional Culture: Essays on Archival Policies* (Brussels, Archives et Bibliothèques de Belgique, 4 boulevard de l'Empereur, B-1000 Brussels).

# 29.3.2

## LIBRARY DEVELOPMENT

*Pamela Spence Richards*

### NINETEENTH-CENTURY LEGACIES

By the end of the First World War, three major trends had emerged to influence the development of modern libraries: The French tradition, originating in the seventeenth century of princely libraries that collected cultural treasures for a prescribed elite; the German academic research library tradition arising from the needs of eighteenth-century enlightenment scholarship; and the Anglo-American tradition of tax-supported free public libraries, greatly stimulated at the beginning of the century by the philanthropy of Andrew Carnegie (1835–1919). Each of these traditions had influences outside the areas of their immediate origins: The French influence was strong in Spain and Latin America; German academic libraries set the standards not only for Eastern Europe but for American academic library development; and the Anglo-American free public library was widely copied in Scandinavia as well as influencing public library development in Northern and Western Europe. The nineteenth century had also seen the founding and blossoming in Europe and the Americas of national libraries as symbols of national cultural identity and as important vehicles in the reproduction of culture. A number of these national libraries participated in international exchanges of government and scientific publications. A parallel development was the founding of national associations of professional librarians (the first being the American Library Association in 1876) and the establishment of book classification and cataloguing standards (such as Melville Dewey's 1876 Decimal Classification and the 1908 Anglo-American Cataloguing Code in the English-speaking world, the 1899 Prussian Instructions in Germany, and the Universal Decimal Classification System published between 1904 and 1907 by the Belgian Paul Otlet). Over a century after its creation, the Dewey Decimal Classification had become the most widely disseminated classification scheme in the world, used in more than 130 countries and translated into some thirty languages. By 1918 specific national norms of librarianship had been extended through the colonial systems of the British, French and Spanish empires, leaving imprints, which still endure. Professional norms of standardization in cataloguing and classification – especially through decimal classification systems – had in the first decades of this century spread to all the industrializing countries, including Japan.

### THE 1920s

The economic consequences of the First World War enormously retarded the rebuilding of international scholarly and scientific networks such as publishing and interlibrary exchanges, as did a sustained international boycott against German science and scholarship that prevailed until Germany joined the League of Nations in 1926. The important contribution of science to weaponry during the First World War awakened government interest in scientific library development in Great Britain, Germany and the new Soviet Union, each of which established government-supported agencies for the acquisition and distribution of foreign scientific publications to their research libraries: in Great Britain the Department of Scientific and Industrial Research (1916), in Germany the *Notgemeinschaft der deutschen Wissenschaft* (1920) and in the Soviet Union the Office of Foreign Science and Technology (1920). Germany's economic crisis compelled its research libraries to develop a national cooperative acquisitions programme, run by the *Notgemeinschaft*, as well as an efficient national interlibrary loan system (1924). The introduction of standardized cataloguing in a number of countries permitted the planning of national union catalogues listing the combined holdings of the nation's research libraries. One such national union catalogue began at the Library of Congress as a card catalogue in the 1930s. The first published national union catalogue was that of Germany, which brought out 14 volumes before 1939. With these national union catalogues, and with the appearance of annual commercial publishers' lists in a number of countries, the achievement of national bibliographic control – a record of the nation's published production as well as of its library holdings – came closer to realization.

The Russian Revolution of 1917 breathed new energy into many philosophical issues surrounding public librarianship. Millions of volumes confiscated from the old Tsarist aristocracy and its institutions were made available to Russian readers for the first time. The Soviet leadership developed a distinctive new style of library professionalism, differing radically from previous models. In the Anglo-American sphere, the task of the tax-supported library as it developed in the late nineteenth century was to respond to the reading desires of the local community supporting the library. The Soviets, faced with a largely illiterate population,

which the central government hoped to politicize through reading, developed the concept of 'partisan librarianship'. After intensive work in literacy training for the masses, the 'partisan librarian' used the library to raise the 'socialist consciousness' of the citizens through carefully selected readings. The 'objective' approach of Western librarianship was denounced as a fraudulent method of disguising a bourgeois ideological agenda. The Soviets recognized the central role of the public library in public opinion formation and encouraged librarians to participate actively in the struggle for socialism. As part of this new approach, the Soviets, with the encouragement and support of Lenin's wife Nadezhda Krupskaia, introduced many innovations in public librarianship, including the widespread establishment of factory and trade-union libraries and the general use of public libraries as centres for adult education in foreign languages, technology and general culture. Library collection development was overseen by a central Soviet cultural agency to ensure the exclusion of literature which might work against the regime's Marxist policies, which included the official policy of 'scientific atheism'. From the late 1920s libraries and librarianship were important cogs in the centrally controlled ideological machinery of the Soviet state, which partially explains the extraordinary dynamism of Soviet literacy training and library development before the Second World War.

But in North America library development after the First World War proceeded with little assistance from the central government except for the continued maintenance of a medical library for the US Army and of a national agricultural library. The traditional pattern of private and local financial support for academic and public libraries led to enormous variation and inequities in library service and permitted the exclusion of Americans of African descent from most library facilities in the southern states. The most important stimulant for library development both nationally and internationally at this time were the Carnegie and Rockefeller foundations. The Carnegie Corporation, founded by steel magnate Andrew Carnegie in 1911, had built over 2,000 public and academic libraries in the English-speaking world before 1917 but concentrated after the Second World War on library education, including the subsidizing of foreign students' education at American library schools. The Rockefeller Foundation, founded in 1913 by the oil baron John D. Rockefeller, concentrated primarily on the sciences and assisted in the reconstruction and rehabilitation of a number of scientific research libraries in Europe after 1918, including several in Germany. Finally, the founding in London in 1927 of the International Federation of Library Associations (IFLA) under the aegis of the League of Nations marked the formal rededication of the library profession to international cooperation that had been suspended at the outbreak of war in 1914.

## THE 1930s

The worldwide economic crisis, which began in 1929, heightened interest in techniques of photographic reproduction, which could lessen the costs of the acquisition, storage and dissemination of library materials. After the invention of microfilm in 1929, this technology dominated the imagination of library planners for two decades. Research libraries serving scientists whose main reading matter was current journals rather than books focused on the possibilities of microfilm for interlibrary loans and for achieving total bibliographic control of scientific subject areas. A branch of librarianship calling itself 'documentation' – focusing on documents rather than on books – assumed leadership in the development of photographic techniques for storage and dissemination. The International Federation of Documentation (FID), founded in 1895 by the Belgian Paul Otlet (1868–1944), became the locus of these developments and in 1937 staged a conference in Paris at which the newest technologies of photo reproduction were exhibited. At the conference the writer H. G. Wells told the assembled documentalists that their work with microfilm made it possible to realize his concept of the 'world brain', in which the complete records of civilization would be stored for easy access by all mankind.

The assumption of power by the National Socialists in Germany had a dramatic impact on library development both in Europe and elsewhere. A law of 1933 firing all Jews and socialists from German civil service positions created a diaspora of German librarians which would influence library development in other countries, particularly Turkey, whose leader Mustafa Kemal invited German scholar refugees to help him build a modern secular educational infrastructure, including modern libraries – the great medieval tradition of libraries in the Arab world having been stifled by the Ottomans' banning of printing until 1729. The National Socialists, who saw the Germans as 'culture bearers' to the rest of the world, attached much importance to their own public and research libraries as symbols and servants of 'Aryan' culture. Because they recognized the role of libraries in strengthening and reproducing culture, they were particularly destructive of libraries in those countries under their occupation whose cultures they held in contempt.

## THE 1940s

The first five years of this decade were some of the blackest in the history of libraries, due largely to the policy of cultural genocide carried out by German and Japanese troops in many of the countries they invaded. The Slavic countries in Eastern Europe suffered devastating losses. The official figure accepted at the Nuremberg Trials in 1945 for book destruction at the hands of the Germans was 100 million volumes in the Soviet Union alone. Belarus lost 95 per cent of all its holdings. The Polish National Library was burned to the ground. Chinese losses at the hands of the Japanese were also staggering – of the over 5,000 libraries existing in China before the Japanese invasion in 1937, only 943 survived in 1943 – and there was major library destruction in the last years of the war from aerial bombardment in both Germany and Japan.

One of the most important outcomes of the war in the sphere of library development was the Sovietization of libraries in those Eastern European countries which came under Soviet post-war occupation and which afterwards were ruled by one-party socialist governments. In these countries partisan librarianship was introduced to support socialism, public and research libraries were placed under the central administration of ministries of culture guided by Marxist ideology, and the concept of 'differentiated readership', developed in the Soviet Union, was used to

restrict the general public's access to materials deemed harmful to socialism. After the victory of the communists in China in 1949, a similar process took place on the Chinese mainland.

For the world at large, the most important development of the decade was the founding in 1946 of the United Nations Educational, Scientific and Cultural Organization (UNESCO), whose strong library development programmes would help to rebuild war-ravaged libraries and spread the techniques of modern librarianship to emerging nations everywhere. UNESCO's Constitution charged it with assuring the conservation and protection of the world's heritage of books, encouraging the exchange of publications, and 'initiating methods of international cooperation calculated to give the people of all countries access to the printed and published materials produced in any of them'.

## THE 1950s AND 1960s

As new sovereign nations began to emerge from colonialism in the decades following the Second World War, UNESCO became the major vehicle through which the principles and practices of modern library development were disseminated worldwide. Through consultant missions, pilot projects, publications and meetings it supported the building of library networks, archives and information systems from the early 1950s on. UNESCO's early emphasis was on public library development. A cycle of regional seminars on this topic was conducted from 1951 to 1962. Major pilot projects were begun in Delhi (1951), Medellín, Colombia (1954), Enugu, Nigeria (1957), and Abidjan, Ivory Coast (1963). By the late 1960s UNESCO began to prioritize education and training for librarianship, especially in the developing regions. UNESCO-supported regional library and information education programmes begun in Senegal and Uganda in 1963 were soon integrated into universities. UNESCO also assisted in the establishment of other university-level schools in Indonesia, Morocco, Jamaica, the Philippines, China, Venezuela, Ethiopia and Nigeria. The British Council and the United States Information Agency, both of which maintained large networks of demonstration libraries in the developing world, also offered international assistance in library development during this period. In China the new communist leadership used Soviet models to widen literacy and broaden public library activities in the 1950s and early 1960s, greatly expanding the public's access to the written record. (These positive developments in Chinese librarianship would come to a dramatic ten-year halt in 1966 with the beginning of the Cultural Revolution and its attendant mass destruction of China's cultural heritage.)

By the 1960s the Cold War between the Western capitalist countries and the socialist countries aligned with the Soviet Union began to have its own impact on library development in both camps, as each prioritized the circulation of up-to-date information to its scientists. In the Soviet Union the work of the All-Union Institute of Scientific and Technical Information (VINITI) in centralizing the collection, and in abstracting and disseminating of the world's published scientific information was a model for many countries seeking to keep their scientists current at the least cost. In the West abstracting services like *Chemical Abstracts* and *Index Medicus* operated increasingly as global archiving services of subject areas as well as current awareness services. The launching of the Soviet Sputnik in 1957 further accelerated spending on scientific libraries and information dissemination in the West: In 1959 the West German Technical Information Library (TIB) was opened in Hanover; in the United Kingdom the National Lending Library for Science and Technology (now the British Library Document Supply Centre) at Boston Spa was opened in 1962. In the United States the National Library of Medicine was opened outside of Washington, DC in 1969. It was during the 1960s that the attention of documentalists switched definitively from photo reprography (microfilm) to the potential of machine-readable electronic information. The term 'information science' was now used to describe research into the electronic collection, storage and dissemination of machine-readable information. The crucial development had taken place at the United States Library of Congress in the mid-1960s – the creation of the Library of Congress MARC (Machine Readable Cataloguing) format for communicating bibliographic data in machine-readable form. This new capability for converting, maintaining, and distributing bibliographic information soon became the standard format for sharing data about books and other research materials. The possibility of worldwide application was recognized, and in 1973, two years after the MARC format structure became an official national standard in 1971, it became an international standard as well.

## THE 1970s AND 1980s

These may be considered the decades of the most dynamic library development in the twentieth century, both on the level of international standardization and cooperation and on the technological front. UNESCO was at its most active in the 1970s. By the 1970s UNESCO's programme emphasis had shifted from public library development to overall national planning and promotion in the developing countries. A study conducted by UNESCO and the International Council of Scientific Unions (ICSU) led to the establishment in 1972 of the UNISIST programme fostering cooperation in the scientific and technological information field. A 1974 intergovernmental conference proposed the development of coordinated national scientific and technical information systems (NATIS), which would ultimately become the basis for UNISIST. NATIS was based on the principle that the best information on printed materials could be supplied by the countries in which they were produced. In 1977 NATIS and UNISIST were merged into UNESCO's General Information Programme (GIP). Guidance on policy and planning for developing countries was offered by guidelines, the conduct of national surveys of information resources and seminars. At the same time education and training for the information professions was strengthened by UNESCO, which collaborated with the International Federation of Library Associations (IFLA), the International Federation for Documentation (FID) and the International Council on Archives (ICA) in activities to further standardize professional education, especially in developing regions. UNESCO also supported the continuing education of professionals already in the field. Between 1977 and 1987 more than 100 courses were offered under contract with organizations and institutions

to 2,500 participants, with UNESCO covering part of the costs. But the withdrawal from UNESCO in 1984 of the United States and the United Kingdom meant that many of the GIP library development programmes had to be reduced to a fraction of their former size.

An important factor stimulating library development during the 1970s and 1980s was the increased involvement of the Soviet Union in supporting planning and training in less-developed countries in the socialist bloc, notably in Cuba and Viet Nam. Between 1974 and 1991 thousands of students from Latin America, Africa and Asia were educated at faculties of library and information science in the USSR, returning to their countries with an awareness of world standards in the field. The Soviet Union also supported from the early 1970s on its own International System of Scientific and Technical Information (MSNTI), developed in line with UNESCO's NATIS. The Soviets intended their international system to demonstrate the Soviet experience in information centralization, as well as international Soviet-led collaboration in information science. Furthermore, MSNTI was intended to compensate for the inability of hard-currency-poor socialist countries to pay for multiple copies of expensive Western journals.

In the West, these decades were characterized by: (1) the gradual but ultimately massive adoption of electronic technologies for routine library functions such as circulation and cataloguing; (2) the switching to electronic formats of traditional indexing tools such as *Index Medicus* (which in 1971 began operating as the online retrieval system MEDLINE); (3) the development of commercial host services providing software and telecommunications support offering remote users access to hundreds of databases (the largest such host being DIALOG, set up in the United States in 1972); (4) and the establishment of electronic library networks to permit individual libraries to share acquisitions and cataloguing information and to facilitate interlibrary loan. An important pioneer network was the Ohio College Library Center (now OCLC), founded in 1967. In 1971 it began online operations, making the Library of Congress's MARC cataloguing records available to member libraries as well as those cataloguing records created by member libraries. By 1977 OCLC was serving libraries in most of the continental United States and by 1990 it had extended the power of the computer and access to a multinational union catalogue to many libraries in Europe and Asia. Since then, other regions of the world have developed electronic library utilities similar to OCLC. The largest of these is the Dutch PICA system, serving libraries in a number of Northern European nations. By the end of the 1980s the attractiveness of electronic technology for libraries and the increasingly economical commercial availability of these technologies through personal computers had become the chief determinants of the future path of international library development. But the expense of these technologies, and the extent to which they depended on the existence of viable national communications infrastructures, increased the information gap between rich and poor countries.

## THE 1990s

For the library profession worldwide the most important phenomena of this last decade of the twentieth century have been: (1) the dissolution of the Soviet Union in 1991 and of all the library development programmes it fostered at home and abroad; (2) the global accessibility of the Internet and the World Wide Web; and (3) the development of digital libraries accessible by computer. The end of the Cold War was characterized not only by the massive pullout of Soviet aid to library planning in many emerging countries, but also by the switching of the focus of American library development aid from these countries to the republics of the former Soviet Union. In the industrialized world, the information-gathering behaviour of millions of citizens was changed by the availability from their home computers of the vast resources of the Internet – a network of networks which links up a global agglomeration of computer resources for public access. By 1997 the Internet comprised 25,000 networks, over 45 million users and was still growing exponentially. Originally designed by the US Department of Defence for its own scientists in the 1960s, the Internet has experienced phenomenal growth since 1990, and has attracted private and business users in great numbers. One of the most-used Internet services is the World Wide Web (WWW), with its Mosaic software for browsing documents on the Web's servers sited anywhere in the world. The WWW was started by the European Centre for Nuclear Research (CERN), using a form of hypermedia navigation. The easy accessibility of the Internet to any computer user with a modem poses enormous challenges to indigenous cultures and to the libraries which have traditionally stimulated and supported those cultures. Like satellite-broadcast television, Internet access has proven extremely difficult to control by sovereign governments wanting to restrict citizen exposure to alternative life-styles, which these governments regard as culturally threatening.

By the mid-1990s many libraries in industrialized countries were digitizing their conventional print collections so as to make them available electronically on the Internet. The creation and use of digital libraries is similar to the creation and use of traditional public libraries, since digital libraries contain information collected and organized on behalf of a community of users to supply the information needs of that community. Just as was the case with traditional libraries, digital libraries contain information in many formats and media and have been organized by corporate services, private institutions, government agencies, non-governmental organizations, volunteer groups, and religious and political organizations, among other creator groups. The revolution in practice is caused by the fact that the community for which the digital library is organized is a virtual one and may in fact be physically distributed all over the globe, along with the information it accesses. And the community's interaction is likewise virtual, not taking place within organizationally definable walls. Thus the entire environment of information-seeking, interaction and supply has moved into places that seem far beyond the influence of the librarians – into the office, the dormitory, the laboratory, the living room, public spaces. A number of methods have been developed within the global library profession to meet the challenge of digital libraries. There are several arguments for the continued maintenance of the library as a physical space, one of the most compelling being that most information is still not digitized but is available only in paper format. Another argument is based on the premise that digitized information is still inherently difficult to access, and the availability of professional assistance – in the person of a professional librarian – is vital. Currently the

most popular argument among public librarians, because of its obvious political and financial advantages, is that exactly because of the wonders of digitally available libraries, access to these riches must be made available through publicly funded libraries to all the country's citizens. This is the argument that underlies the US Library of Congress's 1994 decision to digitize the nation's 'patrimony', both print and graphic, through its National Digital Library. Many other cultural treasure-houses, such as the Vatican Library in Rome, have also begun digitizing their precious collections for worldwide access. By the late 1990s, librarians in the industrialized world had laid claim to the Information Revolution as part of their sphere, and were transforming their libraries into sources of electronic connectedness to the world's digitized information supply. The greatest challenge of the new century is that of extending this connectedness to libraries in the developing world.

## THE DEVELOPMENT OF THE WORLD'S MUSEUMS

*Sid Ahmed Baghli*

### FROM 1914–1945

By 1914, museums were already highly respected institutions. In Europe and even America, some were venerable centenarians. These sacred temples, such as the Hermitage in St. Petersburg, the British Museum in London, the Louvre in Paris, the Prado in Madrid and the National Museum of Rio de Janeiro, possessed a valuable, jealously guarded cultural heritage. The museum was considered an institution that safeguarded works of art, archaeological collections and items of natural history.[1]

Preservation was paramount; technical and scientific collections were few and far between[2] and the educational aspect had not yet been recognized. People requiring access to the British Museum had to submit a written application complete with titles, wait for it to be assessed in order finally to receive authorization and then wait for several more months before being granted the privilege of visiting the museum![3] Following the terrible attacks carried out during the First World War, Western European museums came to a standstill. However, the October Revolution of 1917 had a profound influence on the development of museums in the East.

### The Soviet Union and Eastern European countries

Lenin created a state-run 'school of museums and heritage', whose main objectives were to preserve the cultural heritage and to contribute to education in science and art through museums.

In 1917, there were some 150 museums in the new Union of Soviet Socialist Republics (USSR). This figure rose to 400 in 1923 and to more than 1,100 in 1970. Historical museums underwent some major changes in terms of their content, presentation and public access. In 1977, there were approximately 1,400 state museums in the Soviet Union, nine times more than in 1917. By then, museums were specializing in fields such as art, archaeology, history and science and technology. The Polytechnic Museum of Moscow is an example of a large multidisciplinary museum. Museums attach great importance to the October Revolution and to the 'heroic struggle of the peoples of the Soviet Union during the national wars'.

The other former peoples' democracies in Europe also supported the development of their museums. Archaeological museums in Germany and Poland, open-air museums in Romania and industrial museums in Yugoslavia have been particularly successful.

The following figures represent the number of museums in certain socialist countries: USSR: 1,400 in 1977, 1,800 in 1985; German Democratic Republic: 700 in 1973, 748 in 1985; Poland: 657 in 1974, 750 in 1985; Romania: 331 in 1973, 331 in 1985.

### Western Europe and the United States

The rest of Europe, which boasts an impressive number of museums, took a little longer before it began gradually to implement reforms following the harsh criticisms made over several decades concerning these 'luxury attics', 'art graveyards' or 'retirement homes for the dead'.[4]

Dutch and Swedish museums were among the first to experiment with ways of making museums more accessible to the public and to young people in particular. They began to implement the first educational programmes. Between 1945 and 1963, the Stedelijk Museum in Amsterdam provided huge impetus to modern museology and later to 'open-air museums', which became a model that was followed all over the world.

Although art, archaeological and historical museums in particular still tended to hold exhibitions, the number of exhibitions varied. Large museums such as the Louvre in Paris introduced new techniques of lighting and of displaying certain masterpieces to the public.

A new type of interdisciplinary museum, the eco-museum, was also born during this period. 'An eco-museum is a mirror which a society chooses for itself; a museum of space, time and the whole human race', explained museologist Georges Henri Rivière. It provides an overall vision of humankind in its natural and sociocultural environment. Examples include the French eco-museums of La GrandeLande and Le Creusot-Monceau les Mines.

The following figures[5] give an idea of the increase in numbers of museums between the 1970s and 1980s. Federal Republic of Germany: 1,550 in 1975, 2,415 in 1985; Canada: 471 in 1976, 1,515 in 1985; Denmark: 300 in 1976, 331 in 1985; United States: 4,988 in 1976, 6,120 in 1985; France: 1,250 in 1977, 1,921 in 1985; Japan: 407 in 1976, 807 in 1985; Norway: 320 in 1976, 359 in 1985; Netherlands: 483 in 1976, 793 in 1985.

In the United States of America, museums of 'primitive art' began to appear at the same time as modern art and contemporary art museums. In the late 1950s, renowned architect Frank Lloyd Wright completed the Guggenheim Museum in New York, an immense snail shell with a reinforced concrete spiral inside, forming a gently sloping exhibition area six storeys high. 'Geology' and 'biology' museums became particularly popular in North America.

Europe remains the 'master' of the world's museums. Thanks to their number, wealth, variety and age, European collections are particularly important, since they represent virtually the whole of the global heritage. Germany, France (Plate 171) and the United Kingdom hold the lion's share in this respect.[6]

## THE GULF BETWEEN DEVELOPED AND DEVELOPING COUNTRIES

The growing gap between affluent countries and the poor Third World nations is largely due to the underdevelopment that created colossal debts of thousands of billions of dollars at the end of the 1960s.

The 500 museums spread across the whole of the African continent represent barely 2 per cent of the world's museums and less than half the number found in some Western European countries.

Despite their cultural wealth, the museums inherited from the colonial era bore a Western stamp that was far removed from national realities and aspirations. They were mainly European-style museums with an ethnographic flavour, often created to satisfy the administrative and mercenary colonial aristocracy.[7] The President of Mali, Alpha Oumar Konaré, later said that Western museum styles, which were out-of-date and inappropriate, should be 'killed off' and rethought in today's Africa. Fortunately, following independence, museums were designed in original, often ingenious ways, taking into account available resources and local needs. Mexico, India and Niger, among others, worked miracles in this respect. Through a slow but deep-seated process, changes were gradually made in order to place museums in the service of society. At the beginning of the century, the Egyptian Museum in Cairo was built to replace the Museum of Egyptian Antiquities, which dated back to 1857. Established in 1959, the Open-Air Museum of Niamey (Niger) was an authentically African museum, bearing witness to native customs. The Museums Association of Tropical Africa (AMAT-MATA), founded in 1959, included members from 22 African States (English- and French-speaking) by 1962.

Museums in developing countries did not really start to become known across the world until the 1960s, thanks to international museum campaigns organized by UNESCO and ICOM. Latin American and Asian countries began to reorganize their museums long before the African nations, which were still suffering from the legacy of colonialism and economic problems.

Argentina, Brazil, Chile, Cuba, Mexico and Peru are among the countries that actively improved their museum policies in terms of staff training and publications. UNESCO and ICOM worked closely together to organize the international museum campaign in 1956, which included seminars and round tables.

It was after the Second World War and decolonization that Asian museums began to grow, thanks to UNESCO and the Asia Pacific Regional Organization set up by ICOM. Art and archaeological museums were the most common, particularly in India and Thailand. In 1966, Iraq opened its huge national museum, equipped with a restoration laboratory, in Baghdad

## THE SUCCESS OF MUSEUMS IN THE SERVICE OF SOCIETY (1968–1990)

After 1960 and particularly the events of May 1968, museums were increasingly being examined under the microscope by professionals themselves. Artists, art critics and students across Europe called for the closure of 'middle-class', antiquated museums. They thought their collections should be scattered around in public places. 'Put the Mona Lisa in the metro!' they shouted in Paris.

The ICOM General Conference in 1971 accepted the principle of democratization, while the 1974 ICOM Conference in Copenhagen resolved to make every effort to promote the democratization and development of 'museums in the service of society'.

Indeed, museums began to embrace art, cinema, theatre and music and, in particular, became more accessible to local communities and young people. Pontus Hulten, art historian and curator of the Moderna Museet in Stockholm and later of modern art museums in Los Angeles and Paris, was constantly striving for museums to become 'the ideal place for communication, exchange, dissemination and reflection'.[8]

These developments, which affected all museums in every country, led to a real democratization, so that they became 'a dynamic instrument of a living culture'. Despite the serious socio-economic problems they faced, African museums grew and changed during the 1980s and 1990s as local museums were opened, collections were built up, exhibitions were organized and an increasingly skilled and active professional network was established.[9] All the strategic development work that was carried out ensured that new museums were created to meet the needs and match the real circumstances prevailing in Africa.

The remarkable round table held in Santiago, Chile, in 1972 highlighted the importance of the social role of Latin American museums and the reasons for creating a new type of museum: the integral museum, which was a kind of region-specific eco-museum.

A number of superb museums emerged in Mexico in the 1990s: half a dozen large museums were established, devoted to pre-Hispanic art, the history of Mexico City, Mexican anthropology, modern art and natural history. The museum of anthropology, which expresses the wealth of cultural identity, is an architectural and museological masterpiece. In Brazil, meanwhile, the modern art museum in Rio de Janeiro has also been very successful.

There are numerous natural history museums, but the most fashionable are the science and advanced technology museums, as well as planetariums, which have become extremely popular in Calcutta, New Delhi, Bombay, Nagpur and Lucknow. In 1970, Pakistan modernized its national museum. The national museum in Doha (Qatar) opened in 1976.

In fact, in the countries of the Near East, India and China, the cradle of the most ancient civilizations, the development of museums really took off during the 1980s.

The ecological, sociocultural and scientific concerns of museologists in France, Canada, Africa and Latin America led to the creation of a large international eco-museum movement during the 1980s. Mention should also be made of the large geology museum in London, which, in 1972, began to tell the story of the Earth, using a spectacular model of the galaxies.[10]

More than half of the museums in the United States of America are historical museums. Science and technology museums are the second most common, with art museums in third place.

According to a survey carried out in 1980, 68 per cent of Americans were in the habit of visiting museums. With its 16 museums in Washington D.C., the Smithsonian Institution alone was attracting 25 million visitors each year, a figure that climbed to 30 million by 2000! The Metropolitan Museum of Art in New York received more than 6 million visitors in 1980. At that time, a new museum was opening every three days in the United States.

The rapid development of museums led to the creation of new institutions in Japan: 'peace museums', such as those in Kyoto and Kawasaki. They described the grave legacy of the 1945 atomic bomb, although they gave an optimistic vision of the future. Understanding between peoples, tolerance and trust are expressions of this 'culture of peace' that is so dear to UNESCO. The same approach is adopted by the Museum of Tolerance in Los Angeles, which offers a futuristic presentation stimulating visitors' senses of taste, smell, touch, sight and hearing.

The Museum of Modern Art in Wakayama, Japan, built in 1994, dared to combine modern architecture with a traditional roof. In the same spirit as that which underpinned the construction of the Museum of Civilizations in Ottawa, Canada, in 1980, the Australian Museum in Sydney and the Te Papa Tongarewa museum in New Zealand provide a perspective of history that expresses the many viewpoints of aboriginals alongside those of Europeans, in a dialogue of peace.

## NEW MUSEUMS, NEW PERSPECTIVES SINCE 1991

The last decade of the millennium was marked by political, social and economic upheavals at the global level, which held back the development of museums in Eastern Europe and some developing countries.

In 1997, the national museum in Beirut, Lebanon, was reopened and the Nubia Museum in Aswan, Egypt, was inaugurated. The new national museum in Riyadh, Saudi Arabia, which was opened at the beginning of 1999, was established in collaboration with experts from the Royal Ontario Museum, offering a vast panorama of the country's tradition, culture and history.

The Getty Foundation used new technologies when it invested a billion dollars to build the Getty Center in Los Angeles, which opened in 1997; it is a grandiose fine arts museum resembling the Acropolis, and looks down over the city and the Pacific Ocean.

New information technologies offer museums tremendous possibilities for attracting visitors. Every day, for example, more than 4,000 people consult the Japanese website of the Louvre, which has become the most frequently visited museum on the Internet, ahead of the Metropolitan Museum in New York and the British Museum in London.

Is there a danger that the Internet, which makes museums accessible to people all over the world, might seriously reduce visitor numbers? In fact, 'in the emerging landscape of online images, the appetite for the original will only deepen, as people of all ages become better acquainted with the works of art'.[11]

The sheer scale of this virtual universe will increase museums' clientele, the only danger being that they may all look alike, whatever their geographical location, size, wealth or prestige. Will these virtual sites not constitute excellent means of preventing theft, looting and trafficking of museum exhibits and items of the cultural heritage?

# THE INFORMATION REVOLUTION
## TECHNOLOGY, METHODOLOGY AND INDUSTRY

*Michel Cartier*

## INTRODUCTION

It is impossible to fully describe the present revolution in information and communications technologies (ICTs), just as it is impossible to describe a train speeding along its track. At best, we can talk about its speed and its composition, what it seems to be carrying and its apparent direction. There are two main problems to adequately describing the many phenomena involved, and particularly their interrelationships. The first difficulty lies in describing how machines and technology have developed (*hardware*); the list of these inventions from 1945 to the present is long and relatively well known, but it is also rather insignificant because they converged to form new, more sophisticated systems several years later (Table 22). It is difficult to describe the evolutionary mechanisms that lead them eventually to converge. By the same token, the evolution of software and content has been insufficiently analysed to date. The second difficulty is that of describing the revolution produced in our societies by new communications devices, the Internet and CD-ROMs for example, and their impacts on all societies.

The concepts of information and information technologies have changed enormously over the past several decades, to the point where they now play a central role in the socio-economic systems of industrialized nations and are gradually assuming the same importance in developing countries.

Prior to the 1940s, information was synonymous with the acquisition of knowledge; in the 1950s there came the notion of controlling machines (cybernetics); after that, came the collection and processing of data, and recently, digital processing. During this time, information technologies metamorphosed into mass media around 1945, with the addition of a parallel stream of mainframe computers around 1960 and personal computers starting in 1980. Today, ICTs have emerged through the convergence of mass media and audiovisual technologies with computer science and telecommunications techniques, and particularly with a new element, which is changing the entire communications horizon: interactivity. Since 1945, change has been extremely rapid on all levels, as the following brief summary shows:
- The *nature of information*: from the acquisition of knowledge to digital data processing
- The *description of information*: from analysis of the real to simulated or virtual situations

- The *type of information*: from printed text to multimedia screen images
- The *volume of information*: from scarcity to a state of information overload
- The *type of user*: from several hundred experts to millions of users of the Internet, CD-ROMS or video games
- The *nature of the systems*: from mass media with no interactivity to systems which allow navigation in cyberspace.

The context of socio-economic discontinuity that we are now experiencing is accelerating all these changes. They reflect our society's need for new tools to help it adapt to both discontinuity and change. The following is a brief analysis of some of these tools: information, ICTs, the information highways and the content industry.

## INFORMATION

One of the problems created by the arrival of ICTs is the circulation of too much unsorted, unsynthesized information. The challenge of all these messages with vague, extremely mixed origins and destinations is to articulate units of knowledge in a reference system, to offer an organization whose structure allows storage, indexation and particularly retrieval based on the different criteria and search heuristics of multiple users. The systems we have used to date have processed data but now they must treat information; this calls for a redefinition of information. A piece of data has only two dimensions, 0 and 1, while information has four: subject, object (or properties), and the space and time in which it is current. Its treatment therefore requires a multidisciplinary approach drawing on psychology, sociology, computer science, and particularly in the case of documentation, on cognition.

In order to survive, human beings must communicate constantly: that is, exchange information within a society composed of various environments in a given time and space. They even manage to construct a model of this society in their heads, and their languages and cultures reflect this construction. For both its provider and its user, information is more than simply what is perceived in a message, it provides the material that helps construct society. Information is no longer the province of a specialized domain; it has become a basic strategic resource for society

*Table 22* **The evolution of ICTs**

| | Technologies | Information |
|---|---|---|
| **From 1900, particularly since 1945** | Printing<br>Photography<br>Film<br>Telephony (first generation)<br>Radio | *Content:*<br>audio and visual processing of raw data<br>*Interface:*<br>none |
| **1960** | Television<br>Cable television<br>Audiovisual<br>Satellites<br>Computers (mainframes) | *Content:*<br>analog processing of large volumes of organized data<br>*Interface:*<br>simple |
| **1980** | Personal computers<br>Desktop publishing<br>Photocopiers and fax<br>Electronic games<br>Video cameras and recorders | *Content:*<br>mixed (half analog, half digital) processing of personalized information<br>*Interface:*<br>more complex |

Note: The dates given above apply only to North America and refer to the period of mass commercialization rather than dates of invention.

as a whole. Within society, information is a phenomenon which is simultaneously economic (*news as a marketable commodity*), technical (*its content and form change with the nature of the medium*), social (*it refers to target groups*), political (*it implies power relationships*), and cultural (*it uses a particular social symbolism*). All major developments now depend on access to and use of information: virtually all new machines are machines whose purpose is information or communication. Henceforth, we must analyse information as a simultaneously economic, technical, social, political and cultural phenomenon, and the information society as one based on the industrialization of information.

**The value-added era**

The products of the new economy are termed 'value-added'. This value is that of the knowledge brought to bear in transforming a product, or data. It usually has important cultural connotations: user-friendliness, ease of access, cultural or linguistic adaptation, or mediatization of content. In an information society, the additional value is increasingly integrated in content that gives access to additional resources: applications, services, programmes, software and documentation in general.

**Information overload**

Since 1945, the development of distribution technologies has caused the volume of information to grow exponentially.[1]

We are not necessarily better informed just because more information is available, however. On the contrary, the increasing volume of information can lead to a narrowing of focus by citizens, encouraging 'tunnel vision'. The information one wants is often difficult to identify and retrieve from the mass of varied, unsorted information available; this leads to a phenomenon of 'exformation', that is, an accumulation of information which goes untreated due to lack of time and competent personnel. This tidal wave does not always reach its destination. ICTs and information highways are not much help; instead, they tend to participate in the creation of the 'information wall'.

**The emerging primacy of interactive visual information**

Over the past hundred years, the transition from lithography to photography and then to film, television and interactive electronic services has caused the emergence of an interactive visual culture in the West. Film and television had already brought the image to the fore of contemporary culture, but

*Figure* 5 **Information overload or the 'information wall'**

In North America between 1975 and 1991 the critical mass of electronically processed information increased dramatically:
– the number of servers increased from 301 to 7,637 (24 times);
– the number of entries increased from 311 to 6,291 (20 times);
– the number of providers increased from 200 to 2,372 (12 times);
– the number of vendors increased from 105 to 933 (8 times), each selling more than one service.
A similar exponential curve applies to the number of users of information highways; it has grown from several hundred in the early 1960s to over 30 million in 1994. As of September 2004, there were 812,931,592 Internet users in the world, with Asia (247,898,314 users) and Europe (230,886,424 users) outperforming North America (222,165,659 users).
*Source*: www.Internetworldstats.com/stats.
Faced with increasing volumes of information, it becomes impossible to process it without more sophisticated access and improved interface, navigation, and formatting. The transition from a situation of scarcity to one of overabundance will completely transform consumers' expectations.

they relied on mass diffusion, whereas ICTs now offer interactive visual communication.

Another very important transition: photography and film preserved the physical reality of things, offering the spectator the appearance of immortality; nowadays, ICTs transform the nature of contact between human beings and reality by offering simulations and 'virtual realities'. Before, the real was never questioned; today, with computerized imagery, the criteria of reality is *what seems* real and not *what is* real; interactive visual culture is becoming the kingdom of appearances. Three characteristics explain the emergence of this new interactive visual culture:

– digitization, which decomposes images and sound into micro-elements which can be reassembled at will to imitate reality or create fantasies;
– zapping, which allows information to be fragmented, demonstrating that scenarios are less and less constrained to follow chains of meaning;
– interactivity, which, by bringing technology and culture together, puts culture at the forefront of the development of user interfaces.

## INFORMATION AND COMMUNICATION TECHNOLOGIES (ICTs)

Faced with the sudden appearance of information highways,[2] philosophers are asking the following question: will information highways develop in a context of continuity or one of rupture? The question may appear academic to some. Nevertheless, if we believe that the evolution of our world is proceeding normally we should make certain decisions (deregulation of telecommunications for example); if we forecast that our world will be completely different in a decade, however, much more fundamental decisions must be made, such as changing our school systems, for example. The forces of change are difficult to manage, not only because they are new, but also because they are operating on a global scale and their capacity for upheaval appears stronger than any short-term hope for stability. The coming transition promises a rupture with the past; its positive aspects lie in its possibilities for innovation. But periods of transition are delicate and decision-makers will not be allowed any margin for error or naivety.

ICTs, particularly information highways, are the vehicles for the coming transition, just as the alphabet and the printing press were vehicles for important changes in the past. We move from one world to another when time and space change so much that our culture is modified, and when the new tools that society gives itself to facilitate the transition change its members' ways of thinking. These new tools are not responsible for social change, as is generally believed; rather, social and demographic transformations incite societies to create new tools that will enable them to better meet the challenges created by major changes, felt first in industrialized nations, and eventually in all countries. These challenges include:

– the entry into the workforce of millions of youth familiar with ICTs;
– the massive penetration of personal computers into the home;
– the digitalization of information technologies;
– the convergence of technologies with image and interactivity, etc.

The rise of major entertainment corporations and the emergence of information highways affect the state. We may be faced with the deconstruction of the nation state as an internal and external expression of identity, to the profit of both higher (large common markets) and lower (nationalisms) levels. One of the challenges of the twenty-first century will be to unify the large formations alongside the multiplication of minorities who want to affirm their identities. Industrialized nations recently recognized that ICTs and information highways have become a critical sector for their continued survival and modernity. In fact, one of the ruptures in the structure of our civilization is located in the typology of intelligence: extreme decentralization of knowledge and intelligence made possible by decentralization, which is facilitated by new information and communication systems that institutions use to reconstruct themselves.

Around the globe, the promise of a brighter future has withered. Today's society is tired. Its structures, like used motor parts, are unable to supply the performances we expect from them. The explosion of ICTs is the indication of a decisive stage for the world at a crossroads, a crossroads where many factors are entangled: societal, political, economic, and technological. Information highways, which

*Table 23* **New technology and media in the West: three stages of development**

| Author | Stage 1 | Stage 2 | Stage 3 |
|---|---|---|---|
| Alvin Toffler | Agrarian wave characterized by the occupation of territory | Industrial wave, characterized by mass production | A third wave characterized by information |
| Régis Debray | logosphere | graphosphere | videosphere |
| Marshall McLuhan | traditional galaxy | Gutenberg galaxy | Marconi galaxy |
| Luc de Brabandere | The aqueduct, a support for agrarian society | The Oleoduct (pipeline), a support for an energy-based society | The infoduct, a support for an information society |
| Joël de Rosnay | Agricultural revolution: renewable energy | Industrial revolution: concentrated energy | Information revolution: info-energies |

*Source:* Adapted from UNESCO, 1992, *Statistical Yearbook 1992*, UNESCO, Paris.

are both a support and a consequence of the society that uses them, will become the loudspeakers of these mutations, which they help accelerate and intensify for better or worse. They have already become a world event, a sign of things to come and, even in industrialized nations, a major concern of government, because they change strategic balances, and thus power relationships.

Although they label them differently, authors have described three stages of historical development in the West, as these relate to new technology or media (Table 23).

Each stage represents a leap in both the quality and quantity of information, a 'mediamorphosis'.[3] The transition from one stage to the next is made possible by the development of new media tools: writing, the printing press, and ICTs, which include information highways. These new tools have generated three communication codes, alphabets, typographical codes and mediacodes respectively, that is, new ways of mediatizing content that have changed our way of thinking.

If Gutenberg made us all readers and Xerox made us all editors, the personal computer transforms us into information producers and interactive media makes us all consumers.[4]

Certain beliefs are widely held in the field, and decision-makers often base decisions affecting our future on them. It is important to analyse these myths, which are often the result of media hype, because they are partially responsible for our present sluggishness.

This is more false than true. It is true that equipment and networks are undergoing rapid change. On the other hand, the software field is developing more slowly than forecast, while agreement on international standards is proceeding at a snail's pace. As for sociocultural acceptance of these new systems, it would be more appropriate to talk about resistance.

The cost of electronic circuits is truly low now, and the cost of personal computers is also decreasing year after year.[5] On the other hand, the cost of mediatizing content, which must be considered in determining total real costs, is rarely analysed in depth.

The society we live in today produces and diffuses more information than all previous societies together. A tidal wave of information is engulfing the mass media and information highways; we cannot, however, be certain that all this information reaches its target public, for several reasons:

- Not only are networks not universally accessible, but when they are, they are often incompatible, as has been the case with telephony and cable distribution for example.
- Present information sources are not credible; the mass media in particular are often perceived as rumour mongers.
- The user's capacity to absorb and interpret information remains limited, a situation that is aggravated by 'unfriendly' interfaces.

The progressive installation of the information society supposes an agenda. Many researchers have identified the various transitions (or paradigms) that we are living through, but unfortunately their reflections do not accord sufficient weight to the enormous social resistance or to certain historical factors; consequently, the conditions for these transitions and their time frame have not been properly analysed. We must specify our time frame for making these enormous investments profitable – investments that will be higher than we can presently foresee. Following are certain conditions for these transitions over the next two years.

## INFORMATION HIGHWAYS

The information highway is an intangible and immaterial subject, a mobilizing concept that evokes such strong images in our society that it is becoming a myth:[6] People feel that it will be the primary force behind the economic development of the twenty-first century.[7] The information highway has become a shared metaphor for the bonding of industries, which until recently had no common language: today they all speak digital. The term designates a unique concept, which refers to a number of groups of actors and several types of information highway, each serving different clients and markets. At the present time, there are a lot of near misses, traffic jams and even vehicles leaving the road; the development of ICTs and the early days of the electronic superhighway in particular are like a rodeo or an obstacle course.

The information highway is the result of the integration of a family of technologies that will become a new medium for business and domestic teletransactions It brings together various media elements that have traditionally been separate: data, voice, images and diagrams; it generates major economies of scale because of new critical masses of users and applications supported by complete digitization. It includes three principal elements, which are, in descending order of importance: the consumer, information and the technologies.

*Table 24* **Evolution of the information society**

| Past Transitions | New Transitions | Conditions |
| --- | --- | --- |
| Production economy | Knowledge economy | **Choice of niches** |
| National markets | Continental markets | |
| Manufacturing society | Information society | |
| Institutional structures | Network structures | **Reorganization of organizations** |
| Disappearance of permanent jobs (primary and secondary sectors) | Creation of new types of jobs (tertiary sector) | **Ongoing training in new competencies** |
| Technological convergence | Media convergence | **User-friendly** |
| Container | Content | **interactivity** |
| Broadcast | Narrowcast | |
| Expert system users | Novice general public | |
| Mass medium | Pay per view | **ICT literacy** |
| Textual access | Multimedia access | |
| Paper support | Electronic support | |
| Static document | Dynamic document | |
| National culture (given geographic territory) | Culture of affiliation (virtual territory) | **Cultural industry and industry of language** |

The information highway represents a new stage in the development of the emerging information society. It can be defined as follows, according to the three tertiary poles:[8]
 – Technical definition: a high-speed network, created by the convergence of telecommunications, computer and audiovisual technologies, linking existing networks and creating new ones, to form not one highway but several;
 – Economic definition: an international marketplace, composed of various distribution spheres in which clients consume content and business and domestic services;
 – Social definition: a new circuit between the information and service provider and the teleconsumer, that is, between supply and demand.

The information highway era began with electronics in the 1970s. It is organized differently than in previous eras, which were founded on matter and energy, rather than constructing a new world of time and space combined. Information highways are metaphors for a global organization which processes and exchanges information. Functionally, networking ensures flexible (thanks to multiple paths), cheaper and less expensive communication between consumers. It is based on existing infrastructures (data networks, satellites), known supports (copper wire, coaxial cable, fiber optics), knowledge (digitization, compression), and techniques that are being developed (ATM, etc.). Infrastructure is like a backbone. Once you have infrastructure, the whole economy follows. The slogan of its promoters seems to be 'Faster! Smaller! Cheaper!'

Virtually all discussions of information highways start with a description of the technology, and unfortunately most of then stop there. Furthermore, official reports repeat essentially the same dominant ideology:
 – *We have to build the networks first, because they will generate* (magically?) *content*. This is the ideology of the primacy of infrastructure over content.

 – *We have to act fast, because the whole world is lagging behind the United States.* This is the ideology of the primacy of short-term projects over longer-term planning of the type of society we want.

**Base architecture**

An information highway is a network of networks that communicate with each other via telephone lines, coaxial cable, fiber optics, specialized high-speed lines, broadcast transmissions and satellites, which link a variety of elements:
 – A backbone of high-speed central networks called wide area networks ($WAN$), high throughput lines, satellite information highways, teleports, stations with large parabolic antennas.
 – Local networks: routers, local hosts and servers ($MAN$, $LAN$) each with an electronic name and address.
 – A communication device: a computer, modem, memory (magnetic, optical, PCMCIA, etc.), printer, or in certain cases a television equipped with a set-top box,[9] keyboard.
 – Protocols and software in the gateways: telecommunications (e.g. TCI/IP), coding/decoding, sorting, classification and research (e.g. Archie, Gopher, WWW), access, etc.
 – Basic services (in the client-server mode): connection to local networks, electronic file transfer, electronic mail, etc.
 – Content: resources, applications, documentation, software and other services.
Information highways have certain characteristics:
 – Open standards: their specifications must be available to everyone and in certain cases be made public;
 – Interoperability: they must allow communication between a variety of disparate systems;
 – Standardized access: books can be easily found in libraries because there is a standard consultation mode. Similarly, non-standard documents on

information highways will make life difficult for users as well as for systems.

Documents transmitted on information highways must also have certain technological characteristics:

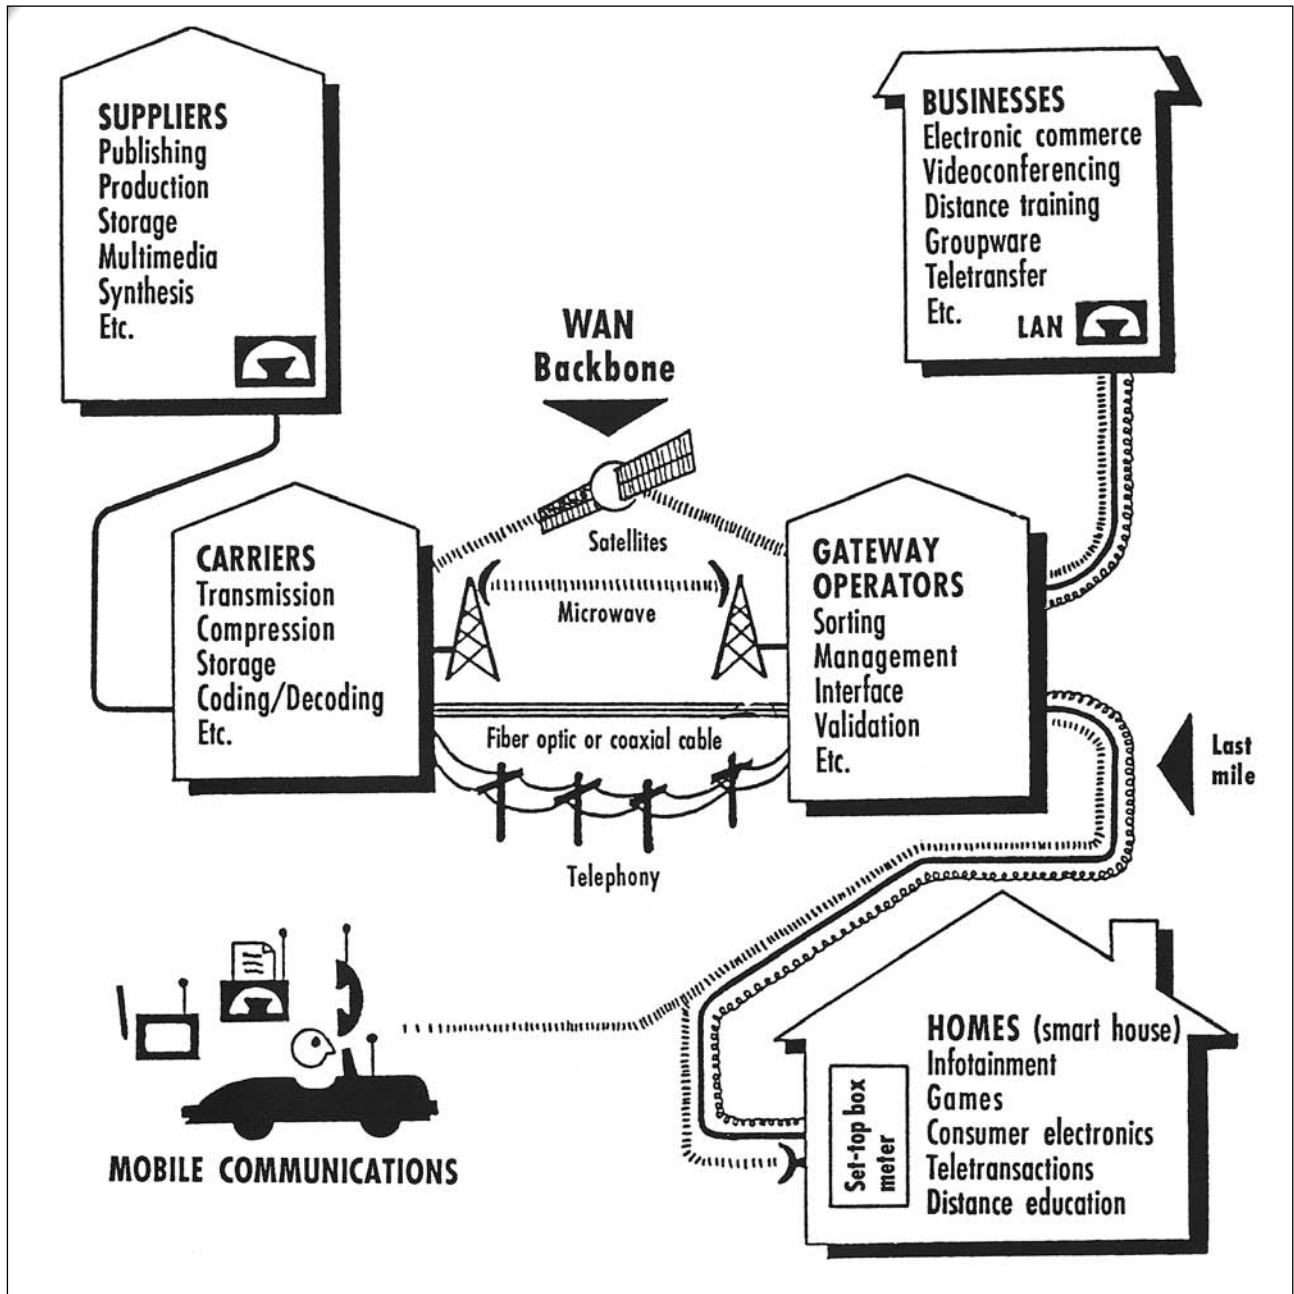
– we must be able to digitize them and store them in computer memory;
– we must be able to re-edit them in different ways: they must therefore be more flexible than their paper counterparts;

– they must be digital to facilitate their rapid, low cost redistribution;
– they must be accompanied by instructions for their multimedia or plurimedia use, as applicable.

## THE CONTENT INDUSTRY[10]

Before they became a technological adventure, information highways were an American project whose objective was to allow the industry players (in the major entertainment

*Figure 6* **The anatomy of information highways**



This diagram illustrates, the central core or backbone of the information highway, which uses a variety of technical solutions: satellites, fiber optic or coaxial cable, or telephones. According to whether they are directed to homes, businesses or mobile communication stations, information highways adapt to different environments, markets or consumers. The whole forms a new medium particularly suited to residential or professional teletransactions. It is the battlefield of the major American entertainment corporations.

corporations) to take control of the content industry worldwide by the turn of the century. They would be the electronic marketplaces of the information society, an immaterial society in which information and knowledge are carried by electronic bits that can be copied over and over again. These bits form the economic base of this industry and the backbone of this society.

This industry develops in waves, each a hybrid that encompasses what has gone before. The phase that is starting now is the result of technological (digitization, and particularly compression) and media (hypertext and multimedia) convergence. This evolution causes the convergence of many activities in information highways and generates new types of economic relationships:

- new exports generated by the continentalization of markets;
- the reconversion of much content that was previously transmitted using analog technologies;
- derivative products, since there are close ties between *on-line* and *off-line* products; and
- tourism.

These activities also have a direct impact on certain noncommercial elements that are nevertheless essential to society:

- the evolution of language and culture, essential for the adaptation of people's ways of thinking to social and technological mutations.

This industry ensures the design, production, management and distribution of information to meet the needs of the emerging information society. It is based on 'grey matter' rather than capital, raw materials or energy, and its structure is more complex and more fluid than that of traditional industries. It emerges as the triumph of liberalism and capitalism, the liberalization of commercial trade across national boundaries and the arrival of new capital investment by new actors who are attracted by potential profits. This industry is developing through simultaneous economic, industrial and technological integration brought about by the creation of alliances between major players. Information highways cause a shift from a market of traditional manufactured products based on offer (*technology push*) to a market based on demand for information (*demand pull*), which becomes the currency of the new economy. This economy is gaining strength with the emergence of electronic marketplaces where increasing numbers of exchanges of all sorts are taking place. Its characteristics:

- a quaternary sector;[11]
- sudden, almost phenomenal spurts of growth in specific niches, frequent deep restructuring and rationalization;
- an emphasis on added value;
- a new socio-economic model;
- methods of payment (such as set-top box/meters) adapted to ICTs (source authentication, validation of demand);
- data encryption;
- activities in real time.

The characteristics of its content are as follows:

- Interactive content: This content requires a human presence. Because of interactivity, the messages are less and less a chain of data and more and more an open, adaptable process. This interactivity may be more or less complex. Another novelty: the screen becomes an element of the message (icons, multiple windows.)

- Content kits: The consumer does not want to be drowned in 500 channels but is looking for a bit of information to compare with others and respond to. The nature of content is changing; gone are the long chains of screen images; content is fragmented in a mosaic of elements whose meaning is reconstructed at will by the user.
- New technical reception: Content is transmitted digitally and no longer through traditional analog channels such as film or television.
- Multimedia content: Thanks to hypertext, texts, sound and images are converging. An artificial mental space is being both created and used by the participation of media designers and consumer/users.
- Distributed content: The value of products is increasingly a function of the cost of their distribution and marketing: cost of distribution per bit, market forecasts, publicity.

The new techniques that this industry's promoters must master are:

- compression, which after sampling, compacts data that is not useful or is less significant than the original signals, in order to occupy as little space as possible in computer memory or on transmission bandwidths ;
- portability, which allows content to adapt to various norms and thus to circulate through different systems;
- encryption, which encodes a message so that it can only be read by the target receiver;
- bi-directionality, which allows a telematic system to transmit information in both directions, thus facilitating interactivity and two-way communication.

**A world market**

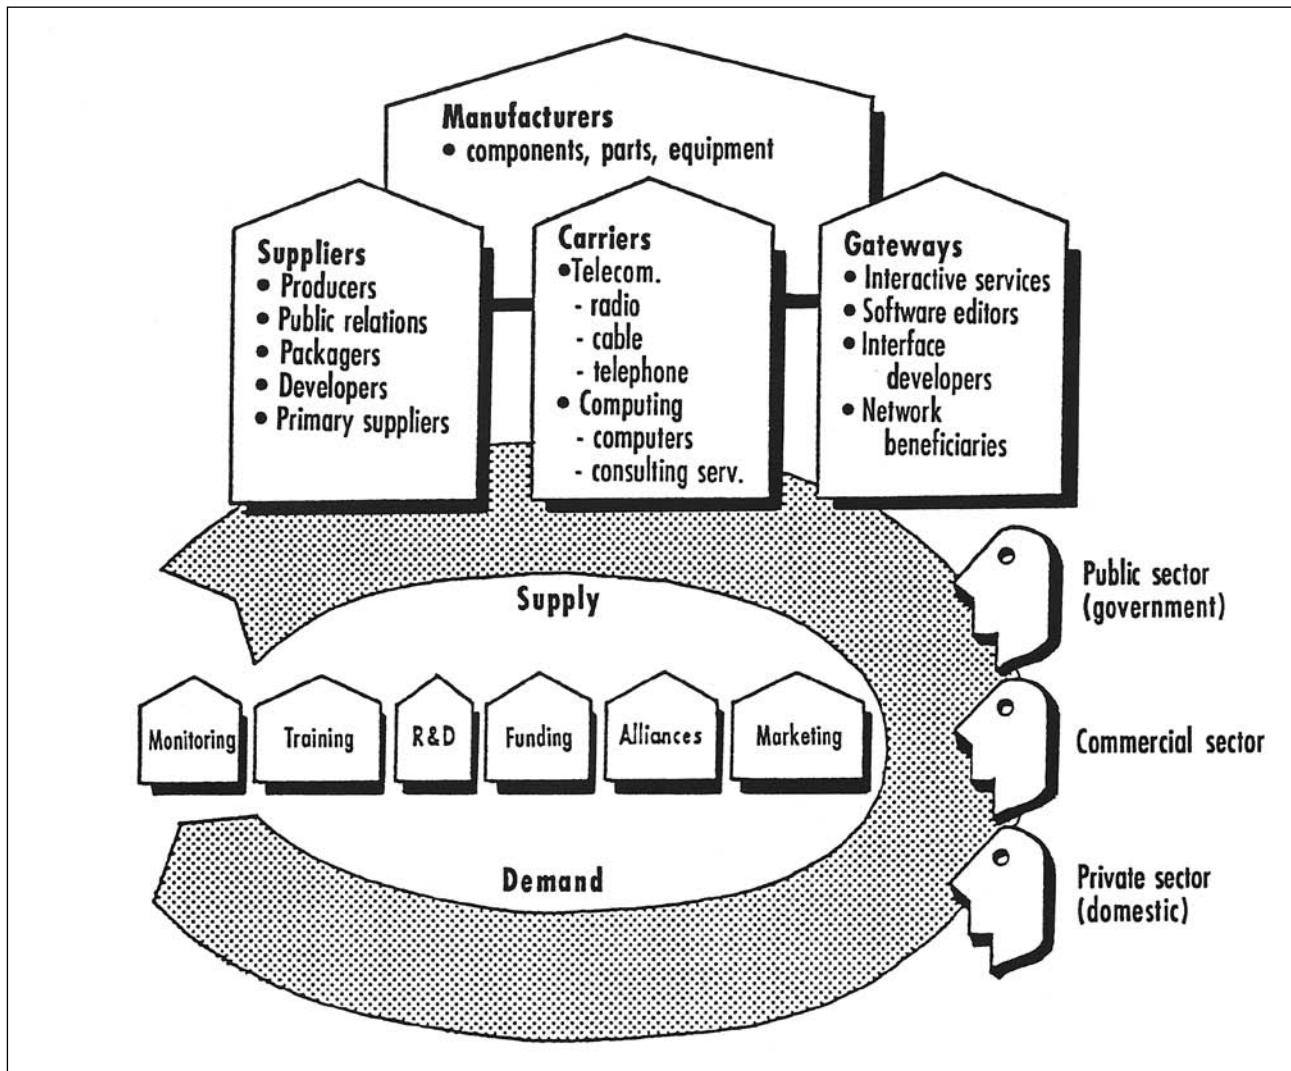
Twenty years before the organization of the ad hoc Clinton-Gore US presidential campaign committee, which launched the Information Superhighway, many spokespeople in the industry had tried to attract Americans' attention to their industry as the market of the century. These attempts were highly publicized. 'This is by all odds the most important, lucrative marketplace of the twenty-first century.'[12] In 1994, its total income was approximately $400 billion of the world total of $900 billion; if information highways succeed in capturing only a part of this market at the outset, it will have been worth it. Revenues generated by this mega industry were projected to exceed 3 trillion dollars worldwide by the year 2001.[13]

The 'mega-majors'[14] have clearly identified the market of the century: the sale of information to offices and homes throughout the industrialized world; their motto has become *Anyone, Anywhere, Anytime*. Alliances are being arranged to take control of the world information industry by the turn of the century: 'Within five years, the whole world will be organized into two or three camps, four at the most.'[15]

**An industry that will fundamentally change our society**

A lot has been written about the mutations ICTs cause in our societies, yet it is economic transformations made possible by these technologies that will change our society the most

*Figure* 7 **Organization of the content industry**



- —This complex, hybrid industry develops from both the content and the container. A growing number of formerly isolated actors are found in closer and closer association.
- —Certain actors supply, transport and deliver content to consumers. All are supported by manufacturers, which provide components and equipment.
- —The industry has three target sectors: public or governmental, commercial, and private or domestic.
- —This industry requires supporting actions from society: monitoring of technological developments and strategies, a sufficiently trained workforce, basic and applied R&D, funding of these activities, the development of alliances, and dynamic marketing.
- —All these activities and investments will require the increasing integration of actors, both private and governmental, to confront the major entertainment corporations.

fundamentally. Not only will its development be more costly than forecast, it will also produce unforeseen consequences for both the citizen/consumer and the state, because the space and time in which state, citizen and new markets are operating are different from what they were before 1990.

This economy will be global, that is beyond all control, since the mega-majors are not accountable for their actions; they need not respect the principles of legitimacy that apply to relationships between the citizen and the state. 'Everywhere, national champions become international networks with no particular attachment to any nation.'[16] As the state has ceded a part of its jurisdiction, and has consequently become weaker, these new masters of the world will control the key elements of power in their field: access to funding, markets and new

technologies. This industry will be a new anonymous, stateless power. Furthermore, few question the consequences of such a scenario, although they are foreseeable: dilution of the state resulting in a decrease in services (health, education, environment), the emergence of a new class of the info-rich, and the end of free trade to the advantage of the major entertainment corporations.

## NOTES

1. In industrial society, the volume of scientific and technical information increases by 13 per cent annually, whereas in an information society this rate increases to 40 per cent.

2. *Information Highway, net, web, cyberspace, electronic frontier*, etc.

3. Expression coined by Joël de Rosnay in *L'homme symbiotique (Symbiotic Man)*.

4. Inspired by Marshall McLuhan.

5. According to Joyce's Law: At equal power, the cost of computing falls by half every ten year*s*, although this apparent improvement cancels itself out with the need to add new 'options' and additional memory in order to use increasingly sophisticated software when buying a new computer.

6. The myth of a cyberspace that gives users the impression that they are in the same room as the person they are communicating with. This myth was inspired by William Gibson's 1984 novel, *Neuromancer*. In Gibson's words, 'There's some kind of actual space behind the screen. Some place that you can't see but you know is there.'

7. Each economic cycle is characterized by the emergence of an activity that drives growth: railways around 1800, the automobile around 1900, services in the 1980s, etc. See the research of Kenneth J. Arrow.

8. A tertiary society has three poles: social, economic, and technological.

9. Set-top box that counts and charges for rights to information or a service on a pay per use basis.

10. Also called the information industry, cultural industry, digital industry.

11. All economic activity can be classed in three sectors. The tertiary sector includes services and, more generally, all activities that cannot be classed in the two other sectors. In order to clarify this 'catch-all' tertiary sector, we have baptized services related to the communication and transmission of information the 'quaternary sector'.

12. US Vice-President Al Gore, *Time*, April 12, 1993.

13. Hypothesis supplied by John Sculley, former president of Apple.

14. The new masters of the world (see the book by the same title, 1995) are Bill Gates of Microsoft, Disney's Michael Eisner, Ted Turner of CNN, Rupert Murdoch of News Corp., Barry Diller of QVC, Frank Biondi of Viacom, John Malone of TCI, Gerald Levin of Time Warner, Conrad Black of Hollinger, Steven Spielberg of DreamWorks, and the presidents of Sony, AT&T, Matsushita, Bertelsmann, etc.

15. Craig McCaw, then president of McCaw Cellular Communications, *The Wall Street Journal*, 10 May 1993.

16. Robert Reich in *The Globalized Economy*.

# DEVELOPMENT OF INTERNATIONAL LANGUAGES

*David Dalby*

## INTRODUCTION

By 'international languages' we designate all those languages that have served during the twentieth century as important means of communication among the populations and/or governments of several different countries or nation-states.

As peoples have spread around the world, they have taken their languages with them, each of those languages having normally been in contact with one or more others, in a system of permanent influence and frequent replacement. The spoken languages of humanity have always formed part of a continuous system of communication around the inhabited parts of the globe, although until modern times this system was composed of long sequences of fragile links among bilingual speakers of individual pairs of languages. This worldwide linguistic system, or logosphere,[1] has been strengthened by the gradual development of written languages during the last five millennia, by the much more rapid explosion of printing that began five centuries ago, and by the telecommunications revolution of the twentieth century.

Gutenberg's printing revolution in the fifteenth century helped stimulate ideas of adventure and exploration, and before the end of that century Columbus and his successors had closed the last gap between the eastward and westward extremes of the logosphere, across the Atlantic Ocean. The way was then open to the worldwide expansion of a handful of European languages, as well as to the parallel development of creoles partly derived from those languages, leaving linguistic imprints around the globe along the pathways of colonial empire.

In considering the history of individual languages within the logosphere, great care should be taken not to confuse languages with peoples, or even languages with cultures. Individual languages are of course endowed with whatever specialized vocabulary may be required for the cultural and other interests of their speakers, often including items inherited from written sources or copied from other languages, and it is also evident that each language and each local variety of a language has a central role to play in the ethnic or social identification of its native speakers. On the other hand, languages are functional means of communication that are intrinsically neutral, and which may be used to convey noble or ignoble ideas depending on those who speak or write them. So it is that the languages spread most widely in the world have been used to organize slavery,

genocide and the trafficking of arms or drugs, but have also been the means for promoting and diffusing the common ideals of liberty and justice and for dispensing humanitarian aid. It should also be borne in mind that peaceful relationships among different language communities have usually been associated with gradual linguistic change and exchange, whereas war and violence have frequently led to the more abrupt replacement of one or more languages by another.

The most rapid development in the history of the logosphere took place during the twentieth century, and is discussed below in terms of the geographical extension of individual languages, without indulging in speculation about how many million people may speak or understand each of these languages. The main purpose of our discussion is to determine which languages have provided means of wide communication among different ethnic groups, nation-states and continents, and it will be convenient to review the history of their development during the twentieth century in terms of three key dates:

- 1914, marking the end of a period of Global Colonization by the major European powers, during which the use of their respective languages had been widened and strengthened throughout the world;
- 1945, marking the end of the period of the two World Wars and the beginning of the period of Global Decolonization and the Cold War;
- 1989, marking the end of the Cold War.

## THE SITUATION IN 1914

The use of international languages in 1914 mirrored the extent of the eleven corresponding empires which together covered vast areas of Europe, Africa, Asia and Oceania, and previously the whole of the Americas. In alphabetical order, the linguistic role of each of these empires can be summarized as follows.

- The British Empire had accompanied the use of the English language from the British Isles to all the continents, where English had established itself (together with the creoles derived from it) as the most widely spoken language of North America, the Caribbean and Australasia. It had also taken root as a colonial language in parts of western, eastern and southern Africa and across wide areas of southern

Asia and Oceania, as well as in Hong Kong. The growing economic power of the USA, originally a federation of Britain's North American colonies, was already adding weight to the worldwide power of the English language. Unfortunately, the spread of this language was associated in some areas, especially North America and Australia, with the displacement and dispersal – even genocide – of many smaller language-communities.

– The French and Belgian empires had together helped to spread the French language from Europe to every other continent (western and central Africa, south-eastern Asia, Oceania, French Guiana in South America), including its continued use in former French colonies in North America (in Quebec, and to a lesser extent in the Canadian Maritime Provinces and Louisiana). This international diffusion of French was reinforced by its long-standing use as the international language of diplomacy and of European elitist culture (as used, for example, in the aristocratic societies of Russia and Poland). More popular, creolized forms of French had established themselves in areas as far apart as the islands of the Caribbean and Indian Ocean. In many parts of France itself, and in adjacent areas of Belgium and Switzerland, other related and unrelated languages (like Provençal or Walloon or Breton or Basque, referred to disparagingly in French as 'patois') continued to be spoken, but compulsory education and military conscription had been doing much to reinforce the use of French in all areas and in all social classes.

– The German and Austro-Hungarian empires together ensured the primacy of the German language over a vast area of Europe, from Alsace and Lorraine in the west to the Baltic Sea in the north, the Carpathian Mountains in the east and the Adriatic Sea in the south. The German empire had also carried the German language to Africa (Togo, Cameroon, Tanganyika, Rwanda, Burundi and South-West Africa) and to Australasia (New Guinea and islands of the western Pacific), while largely Protestant émigrés had established German-speaking communities around the world, especially in Russian Asia and in the Americas.

– The Japanese empire, the most recently created of the ten colonial empires, had already carried the administrative use of the Japanese language to the linguistically related Ryukyu Islands, to Taiwan, to Korea and Manchuria, and to southern Sakhalin Island.

– The maritime Netherlands Empire had maintained the use of the Dutch language in what is now Indonesia (the Netherlands East Indies) and in parts of the Caribbean (the Netherlands West Indies, together with the colony of Surinam in South America). Closely related Flemish forms of the Dutch language, largely from what is now Belgium, had been carried by émigrés to southern Africa, where they evolved as the first language (Afrikaans) of the emigré's descendants, as well as of many people of mixed descent, especially in Cape Province (where the language is known also as Kaaps).

– The Portuguese empire had formerly included Brazil, which by 1914 already accounted for more speakers of the Portuguese language than Portugal itself. The empire still included countries in Africa, where the use of Portuguese, and of Portuguese-based creoles as a first language, had been established for centuries (former Portuguese Guinea and the islands of Cape Verde, São Tomé and Principé). In Angola and Mozambique, Portuguese was used by settlers and administrators, and was also in the Pacific, in East Timor and Macao. Vestiges of Portuguese creole survived in India, Ceylon and Malaya.

– The Russian empire had carried the Russian language, spoken by settlers and administrators, eastward beyond the confines of Europe into central and north-eastern Asia and also westward into Poland and Finland. In North America, it had been displaced by English from its brief foothold in Alaska, sold by Russia to the USA in 1867. The isolation of a vast region of Europe and Asia, dominated by the Russian language and protected by a *cordon sanitaire* of police and customs controls, had begun almost a century before First World War (Tsar Nicholas I, from 1825) although the French language was used extensively by the Russian aristocracy as their own elitist language within the tsarist empire.

– The Ottoman Empire carried the Turkish language far into Europe from the fifteenth century, reaching the gates of Vienna in 1529, but had been in decline during subsequent centuries. Turkish withdrawal from the Balkans was already well underway by 1914. Over the remaining parts of the Ottoman Empire in south-west Asia (the 'Middle East') and through the former Ottoman possessions in North Africa, the Arabic language remained the dominant linguistic link.

– The Spanish empire had ceased to exist before 1914, apart from footholds in north-east and Equatorial Africa, but it had left the Castilian – or Spanish – language as the major language of communication from the south-west frontier states of the USA as far as the southern tip of Chile and Argentine. With the exception of the three Guyanas, the whole continent of South America was by now dominated by the two very closely related languages of Spanish and Portuguese, both associated – like English – with the frequent dispersal or genocide of smaller language-communities. In the Pacific, Spain's cession of the Philippines to the USA in 1896 led to the rapid replacement of Spanish by English as the external language of administration and Western education.

Of these eleven empires associated with the international spread of nine languages, two were already moribund: the Spanish and the Turkish empires. It was the decline of the Turkish Empire which precipitated the onset of the World Wars from 1914, leading directly or indirectly to the collapse of the other ten empires over the next seventy-five years. Significantly, the linguistic impact of this collapse was far less than the political, and all the above languages are still playing a significant international role at the beginning of the twenty-first century.

An important linguistic legacy of the colonial empires has been the many creole languages around the world, which have drawn their lexicon from metropolitan European languages, but their syntax and phonology from African or other non-European languages. Those based lexically on

English and French are the most widely distributed, and have remained international throughout the twentieth century, in the sense that their national varieties are often inter-intelligible. One group of English-based creoles is found in the Caribbean and West Africa, and another in Oceania, and the French-based creoles are spoken mainly in the Caribbean and the Indian Ocean.

## THE GEOLINGUISTIC IMPACT OF THE WORLD WARS: 1914–1945

In linguistic terms, the period of the world wars saw German-speaking Europe opposed to most of French-speaking, English-speaking and Russian-speaking Europe, with multilingual Switzerland remaining a neutral 'island'. The global extension of the conflict came to involve most other major languages and most other parts of the world. The linguistic changes brought about during this period can be discussed in terms of the following international languages, in alphabetical order:

– The Arabic language, in its modern standardized form, gained in international importance during the inter-war period, with the progressive independence of Arabic-speaking countries, first from the Ottoman Empire and then from Britain and France (Egypt in 1922, Iraq in 1932, Syria and Lebanon in 1943–45). The Arab League was founded in 1944–45, just before the end of Second World War.

– The English language began to replace French as the major language of international communication from the end of the First World War, and assumed new importance in continental Europe after the Allied landings in Italy and France during the Second World War. Until 1919, French had been the generally recognized diplomatic language for international treaties, but in that year the Treaty of Versailles was drawn up as a bilingual document, in English as well as in French. The colonial empire administered through the use of English was also expanded by mandates received from the League of Nations after the First World War, when a number of colonies passed from German to British, South African, Australian or American control (west Togo, west Cameroon, Tanganyika, South-West Africa, east New Guinea and parts of Melanesia). A number of Arabic-speaking countries also passed from Turkish to temporary British rule (Iraq, Palestine, Transjordan), while Egypt was administered as a British protectorate from 1914 to 1922.

– The French language benefited likewise from mandates at the end of the First World War, with the transfer to French or Belgian control of several German colonies in Africa (east Togo, east Cameroon, Rwanda and Burundi) and with the transfer to French control of two Turkish colonies (Lebanon and Syria). From 1919, the French language was reimposed as the judicial and educational language of Alsace-Lorraine (previously German, from 1871).

– The German language lost its worldwide importance with Germany's loss of all its colonies in Africa and Oceania during or after the First World War. During the Second World War it enjoyed a brief expansion as the language of the Third Reich and was then the dominant language throughout most of Europe. Violent reaction at the end of that war led to the expulsion of many German-speaking communities from eastern Europe, including some who had been settled there for centuries, as well as the second reimposition of French as the judicial and educational language of Alsace-Lorraine (temporarily German, 1940–44).

– The Italian language, established in Somalia and Eritrea as a colonial language from the late nineteenth century, was extended more widely in Africa with the conquest of Libya, completed in 1932, and of Ethiopia, completed in 1936. This expansion was short-lived, however, all these colonies being occupied by the Allies in 1941-1942.

– The Japanese language, during and after the First World War, replaced German as the administrative language of the Marshall, Marianne and Caroline Islands. Before and during the Second World War, it was carried by conquest to Inner Mongolia and north-east China, to Hainan and the south China coast, French Indo-China, Thailand, Burma, British Malaya, the Dutch East Indies, the Philippines and the western Pacific. This sudden expansion was short-lived, however, and ended with the collapse of the Japanese empire in 1945.

In the closing months of the Second World War (San Francisco, April to June 1945) the United Nations Organization was established and the following six international languages were accepted as its official languages (in alphabetical order): Arabic, Chinese, English, French, Russian and Spanish. Among these, English and French became the working languages of the UN administration.

## THE GEOLINGUISTIC CONSEQUENCES OF DECOLONIZATION AND THE COLD WAR: 1946–1989

– The Arabic language was strengthened in its international role after the end of the First World War by the independence of further Arabic-speaking or partly Arabic-speaking states from French, Spanish and British control (including Libya in 1951, Sudan, Morocco and Tunisia in 1956, Chad and Mauritania in 1960, Algeria in 1962).

– The Chinese (Mandarin or putonghua) language, with the highest number of speakers in the world, is spoken largely within China itself, including Taiwan. This gives it an extension through a large part of Asia, from the Himalayas to the frontiers of Siberia and from the frontiers of Kazakhstan to the Pacific coast, including non-Chinese-speaking areas to which the language has been carried by administrators and settlers (Tibet, Xinjiang and Inner Mongolia, with parts of Qinghai, Sichuan, Yunnan and Guangxi). Chinese (Mandarin) is an official language also in Singapore. From 1945, Chinese assumed global status as one of the official languages of the UN and has been consistently used as such by the representatives of the People's Republic of China since they took over the UN seat for China in 1972. The most widely spoken variety of Chinese outside China has been Cantonese (or Yue), which has continued to spread with its speakers from southern China, including Hong Kong,

throughout the Pacific and Australasia and to southern Africa, North America and Western Europe.

– The Dutch language, established as a colonial language in both the Caribbean and Oceania since the seventeenth century, lost much of its international importance with the loss in 1949 of the Dutch East Indies, which had already been occupied by Japan from 1942 to 1945. When this vast chain of islands became independent as Indonesia, the use of Dutch was replaced by Indonesian as the national language and by English for contact with the outside world. Standard Dutch has nevertheless remained the official language of the Netherlands, of Belgium (jointly with French and German), of Surinam and the Netherlands West Indies, while its close relative Afrikaans is still widely spoken in South Africa and Namibia.

– The English language, already more widely used around the world than any other language, increased rather than decreased in importance during the period when Britain's colonial empire was dismantled. The process began with the independence of India in 1947, when the Indian government looked forward to the replacement of English by Hindi. In fact, however, the multilingualism of India, plus the opposition to Hindi expressed by speakers of many other, especially Dravidian, languages, led to English continuing to be the principal vehicular language of that federal country.

– The French language has a unique position within the logosphere, as the only language to enjoy such wide distribution as an administrative and vehicular language on the basis of such a relatively small extension as a mother tongue. Apart from an area in Europe bounded by the English Channel, the Mediterranean, the Pyrenees and the Alps, and a second area in North America along the banks of the St Lawrence River, the French language is spoken around the world primarily as a second language. The linguistic loyalty of former French and Belgian colonies in Africa, encouraged by France's policy of economic and – where necessary – military support, has ensured that French remains the second most widely used language in the debates of the United Nations.

– The German language, including standard 'high' German and a wide variety of regional forms, remains numerically the most important mother tongue in Europe, excluding Russia. It is today spoken as a majority or minority language over wide areas of western Europe, including Germany, Austria, Switzerland, eastern Belgium, Luxembourg, northern Italy and eastern France, and marginally in southern Denmark. Its use by German-speaking minorities in Eastern Europe and central Asia has been greatly reduced, but not eliminated. German is still used by many Protestant religious communities who emigrated from Europe in recent centuries to the Americas and Australia.

– The Hindi and Urdu languages, associated respectively with the Hindu and Muslim religions and alphabets, are largely inter-intelligible in their spoken form. They gained importance with the independence of India and Pakistan, respectively, but their spread throughout the subcontinent was checked by opposition from the speakers of other major languages in the area, including the Dravidian languages of southern India, and Bengali in eastern Pakistan (now Bangladesh). Hindi has benefited from the modern cultural force of a strong film industry.

– The Italian language, after the independence of Somalia in 1960, has retained only a vestigial presence in north-eastern Africa, but continues to provide a link between Italy and Switzerland, where it is an official language alongside German and French.

– The Japanese language, despite the end of the short-lived Japanese empire, has benefited from the post-war economic success of Japan, and is now studied as a foreign language in many parts of the world, especially in Australasia and the Pacific.

– The Malay and Indonesian languages are inter-intelligible, and represent a modern standardization of the Malay vehicular language long used for maritime trading purposes, and encouraged by the British and the Dutch, throughout wide multilingual areas of South-East Asia and the Indonesian islands. Since the independence of Indonesia, when Indonesian filled the vacuum left by Dutch, the use of Malay and Indonesian extends today from the Malaysian Peninsula to Irian Jaya (western New Guinea).

– The Portuguese language has continued to decline in importance in the eastern half of the globe, with the loss of the Portuguese colony of East Timor and the gradual disappearance of Portuguese-based creoles. Portuguese is still used as an administrative and educational language in Portugal's former African colonies, although English and French have become more important as languages of communication with the outside world, especially with neighbouring states. As a transatlantic language, however, Portuguese appears to have a permanent role to play as the national language of both Brazil and Portugal.

– The Russian language benefited from the allied victory in the Second World War, and from the ensuing Cold War, in the extension of its sphere of influence from the Soviet Union to its political satellites, especially in Eastern Europe, where it was generally a compulsory subject in schools. The sealing-off of an important part of the world dominated by the Russian language was continued in the form of the notorious Iron Curtain, a barrier to international communication, which was eventually undermined by the telecommunications revolution.

– The Spanish language has become more limited in its worldwide spread as the result of its dwindling historical influence in the Pacific (the Philippines) and in north-west Africa (Morocco and the eastern Sahara). It has, however, strengthened its position as the most widespread language in the Americas with the growth of the Spanish-speaking minority in the United States, following immigration from Mexico, Cuba, Puerto Rico and elsewhere.

– The Swahili language has gained in importance since the independence of colonial Africa and is the only African language south of the Sahara that has such international extension. Formerly encouraged by the German and the British administrations as a vehicular language in East Africa, Swahili is now the official language of the United Republic of Tanzania and is used also to a lesser extent, but with local variations, in

Kenya, Uganda, Rwanda, Burundi, eastern Zaire, northern Mozambique and the Comoro Islands. It should be noted that Swahili is a Bantu language very heavily influenced by loanwords from Arabic, in the same way that another international language, English, has been very heavily influenced by loanwords from French.

## THE GEOLINGUISTIC CONSEQUENCES OF THE END OF THE COLD WAR

From 1946 to 1989, the Iron Curtain in Europe represented a major barrier to international communication and understanding, its removal being symbolized by the opening of the Berlin Wall in November 1989. The period from 1990 can thus be regarded as a new era of international communication, in which individuals can now converse freely and instantaneously between any two parts of the world.

Since the ending of the Cold War, specific international languages have been affected in the following ways:
– The worldwide spread of the English language has been reinforced by the collapse of the Soviet Union, and English has enjoyed increased study and use as a foreign language in the countries of the former Soviet bloc. The rapid worldwide growth of information technology (IT), including the Internet, has also favoured the use of English as the world's principal vehicular language.
– The German language has also gained in strength and international acceptability from the reunification of Germany and from the renewed use of German as a vehicular language in parts of Eastern Europe.
– The Russian language is still widely used within and among the former states of the Soviet Union, outside Russia itself, and increased contact between Russia and the West has led to a growth in interest in Russian as a foreign language. It has been largely eclipsed, however, in the educational systems of the former Soviet satellites of Eastern Europe, including the Baltic States.
– The Turkish language has benefited from the opening up of frontiers between peoples speaking closely related and largely inter-intelligible Turkic languages – in Turkey itself, and in Azerbaijan, Kazakhstan, Turkmenistan, Uzbekistan and Kirgyzstan, as well as in adjacent areas of Russia and even north-western China.

The use of information technology has been accelerating rapidly since 1990, including the development of the Internet and World Wide Web, and it is evident that the forerunners of this technology (radio, television, telephone, fax, video-recording, etc.) constituted a major element in fomenting political revolution in the Soviet Union and among its allies. Since Hitler's manipulation of radio communication in the 1930s, it has become increasingly difficult for governments to prevent the flow of information through their national frontiers, and this has marked an important, irreversible stage in the general evolution of human communication and political government.

Just as languages should not be confused with peoples and cultures, so international languages should not be confused with their countries of origin. At the end of the twentieth century, international languages are at the disposal of any person who wishes to communicate with another part of the world.

## CONCLUSION

The twentieth century has witnessed the rapid progression of the telecommunications revolution, from the manual telephone to electronic mail, and the increasing integration of all the products of that revolution: instant long-distant communication, computerization and word processing, recording and transmission of sound and image. The human voice has been liberated for the first time from the constraints of time and space, and the spoken word can now compete in international communication with its derivative, the written word. Writing has also undergone a radical development, the rigid framework of the page having evolved towards the fluid medium of the screen, and the printing machine having become a common part of the domestic and business scene.

Although all languages benefit potentially from the effects of the telecommunications revolution, it is inevitable that the establishment of more effective and more rapid communication among the peoples and nations of the world will favour the development and wider use of English and a few other international languages over that of more localized languages. This development has aroused fears for the future, not only of less widely used languages, but also of ethnic and national cultures, which risk being diluted or changed through the open doors of wider international communication.

The domination of the world by mainly European colonial powers until the end of the Second World War is reflected linguistically by the continued domination of international communication by languages originating in Europe. Of all the international languages discussed above, over half are members of the same Indo-European language family, including eight European languages plus Hindi and Urdu in Asia. No less than four European languages (English, French, Russian and Spanish) are included among the six official languages of the UN.

The eight European languages that have enjoyed an international role during the twentieth century have all been associated with European and modern American cultures, although they are not synonymous with those cultures. The strongest of those cultures is that associated jointly with the English and French languages, which have often served to represent two facets of the same internationalized 'Western' culture: English as a favoured vehicle for its more popular manifestations (sports, fast-foods and beer, popular music) and French as the traditional vehicle for its more elitist aspects (haute cuisine, vintage wines and champagne, fashions and perfumes). Both languages have served as vehicles for the spread of Western-style political culture.

It is perhaps not surprising that the most vigorous opposition to the spread of international languages has come from speakers of other widely used languages, whose position in the world is perceived as threatened by the advance of their rivals. The strongest reaction against the worldwide spread of English has thus come from the francophone (French-speaking) community of nations, especially from France itself and Quebec. Both these countries have passed legislation to protect the French language against the increasing influence of English within their own borders: France from 1975 (Bas-Lauriol law) and Quebec from 1977 (charte de la langue française). At the time of writing (1996), the latest legislation on this

subject in Paris has been designed to ensure that a certain percentage of vocal music broadcast within France is in the French language.

From the purely practical point of view, in a multilingual world where communications across national frontiers have been growing at an ever-increasing rate, there has been a manifest need for a universal world language. Early in the twentieth century, there could still be some debate as to whether French or English might best serve such a role, or even an artificial language like Esperanto, but by the end of the century only English has the necessary worldwide spread. Its international usage is gaining momentum as the first foreign language in the majority of national educational systems, and as the now generally accepted language in such vital areas as the control of aviation. Even at a more modest level, it has been found that French and German children, for example, when visiting each other on linguistic exchange-visits, will often converse in English rather than in French or German, since the French children have usually studied more English than German, and vice versa.

On the other hand, localized languages are the means of expressing ethnic and cultural identities, and in certain cases have proved remarkably resistant to pressure from more powerful international languages. A notable example is provided by Welsh, which has been maintained as the mother tongue of a relatively small population (around half a million in the 1990s) on the very island from which English has spread around the world, and only a hundred miles distant from Shakespeare's birthplace in Stratford-on-Avon, the heartland of the English language. Similarly, in France, where a policy of linguistic unity has been pursued for two centuries, a rich variety of local languages – as mentioned above – have survived the pressures of an educational system based exclusively on French.

Among the non-European countries freed from colonial rule since the Second World War, some of the strongest reactions against their former colonial languages came from the multilingual states of India (independent from Great Britain in 1947), Indonesia (independent from the Netherlands in 1949) and the United Republic of Tanzania (independent from Great Britain in 1961).

Although the original constitution of independent India looked forward to the replacement of English by Hindi as the sole official language for the whole country, opposition from speakers of other languages led to the abandoning of this objective in 1967. English, still only spoken by a minority of the population of India, remains nevertheless the most widespread vehicular language throughout that country. In the case of Indonesian and Swahili, established as official languages to replace Dutch in Indonesia and English in Tanzania, respectively, the situation was different in that neither of these vehicular languages represented a dominant ethnic and cultural group within the country, in contrast to Hindi in India. Although there has been some internal opposition to the imposition of each of these two national languages since independence, their use has presented less of an ethnic and cultural problem than in India. In all three cases, English has retained an important role, especially for communication with the outside world.

Throughout the twentieth century, it has been generally accepted that the language in the world with the greatest number of speakers is Chinese (Mandarin), concentrated in central and eastern Asia. With the increasing study and use of English as a second language throughout the world, however, it appears probable that the total number of speakers of that international language will have exceeded even those of Chinese (Mandarin) by the end of the twentieth century, and will have reached a billion individuals (one thousand million) early in the next century.

In the context of the expansion of English and other international languages during this century, much has been written and broadcast about the numerous 'smaller' languages presently in danger of extinction throughout the world, although it is important that this danger should not obscure attention to the much more sombre reality of the extinction of actual peoples, as has occurred this century in several parts of the world. In the case of speakers whose own physical existence is not threatened, the will to preserve their language can only come from within their own community, and it is encouraging that so many small language communities have succeeded in preserving their own linguistic heritage during the twentieth century, in all continents. They deserve every possible support.

The telecommunications revolution has changed traditional relationships among countries and individuals, and has provided the means for new solidarities across the face of the globe. While international languages can now be beamed to worldwide audiences, videotapes and local stations can also be used to link separated communities of speakers of scattered languages, and to serve the needs of speakers of isolated languages.

## HUMAN MOBILITY, CULTURAL INTERACTION AND TOURISM

*Miquel de Moragas* and *Carles Tudurí*

### INTRODUCTION

Tourism – voluntary human movement for cultural purposes, chiefly of a recreational nature – has become one of the social phenomena most representative of the transformation taking place at the end of the twentieth century. In 1950, the number of people who had made international journeys was put at about 25 million. In the closing years of the century, the number was calculated at 700 million.

The World Tourism Organization (WTO) estimates that tourism involves 3.5 per cent of the world's population and that this figure may rise to 7 per cent in the next 10 years.[1]

The phenomenon is thus a large-scale one, but not really universal or broadly based. Almost all travellers are citizens of the wealthiest and most developed countries on the planet. It is significant that these figures – these limitations – are almost identical to the estimates for future Internet penetration in the world, the forecast being that 5 per cent of the world's population will have access to this technology by 2005.

Travel and tourism involve a variety of essential factors in today's society: cultural factors (identity, heritage, education, communication), economic factors (balance of payments, new types of business, the labour market, the indirect development of industrial sectors), political factors (diplomacy, public assistance, planning, cooperation among sectors) and other very important factors such as transport, telecommunication networks and environmental protection.

### A TYPOLOGY OF TRAVEL AND TOURISM IN TODAY'S SOCIETY

Leaving aside remoter historical precedents, which in Europe go back to the earliest voyages of the Greeks and Romans or the pilgrimages of the high Middle Ages, mass tourism began to emerge only with the development of modern communications in the nineteenth century, and was consolidated only after the Second World War.

The motives leading people to travel as tourists have evolved to create a situation whose typology is now very diverse, with variables that include the duration, distance, form of transport, social group or social and cultural objectives of the journey. WTO divides the reasons for travelling into the following types: leisure, recreation and holidaymaking; visits to relatives and friends; business and professional; medical treatment; religion and pilgrimages; other.

If we confine ourselves strictly to tourism and the criteria that guide the tourist industry in the provision of services, we might use the following, rather more detailed typology for the main categories.

*Sun and sand:* This is the leading tourist segment, and the one that was almost wholly responsible for consolidating mass tourism, as the large volume of customers served gave the industry the opportunity to apply economies of scale. As costs fell, tourism as a form of leisure came to involve large sections of society in the developed countries.

*Ecotourism:* A rapidly growing sector, based on visits to high-value natural areas, adventure travel, and wildlife observation. It is mainly carried out in Latin America and Africa. Annual turnover is put at US\$335 million, which represents almost 10 per cent of total tourism turnover.[2] So-called rural tourism could be included in this category.

*Cultural tourism:* This includes a wide range of pursuits: art, music, theatre, ethnology, archaeology, gastronomy. It is often a supplement to tourism of some other kind, such as sun and sand or conferences, which many destinations try to incorporate into their main attractions.

*Conferences, conventions and incentive travel:* A strongly growing sector. Although usually included in the business travel category, gatherings of this type, especially in the case of incentive trips, involve the kind of sightseeing and tourist activities that individual business travellers do not habitually carry out.

*Senior travel:* As older people in the more developed societies have broadened and altered their habits and customs, a segment has been created that is of great interest to the tourist industry, since in many cases their activities can be transferred to the low season. In some European countries, such as Spain, there are subsidized programmes designed in part to enable older people to travel within their own country.

*Sports tourism:* The main purpose of travel is to carry out a particular sporting activity, such as golf, skiing, cycling, water sports, hunting and fishing, adventure sports, tennis, etc. In these cases people travel in search of the best facilities and a suitable climate for the activity concerned.

*Religious travel:* The largest movements are the great pilgrimages to Rome and Santiago de Compostela, in the case of Christians, and to Mecca, in the case of Muslims, although this category also includes visits to other sacred places such as the Holy Land in Israel and sites where miracles are believed to have occurred, such as Lourdes. Rome expects to receive about 20 million visitors for the 'holy year' in 2000.

*Cruises:* This segment dates back almost to the earliest days of tourism, but was not popularized until a few years ago, when costs and prices came down. The route between Alaska and the Caribbean, the Mediterranean and northern Europe are the main areas travelled by cruise liners, some of which are built to carry 3,000 passengers.

*Theme parks:* A form of vacation that is growing very strongly as the century nears its end, the main destination being Orlando in the United States where there are more than 20 major theme parks, including those of Disney and Universal Studios. In addition to traditional parks, which are essentially based on cartoon characters (Disney World, Parc Astérix in France), other types include parks focusing on images and technology (Futuroscope in France), animals (Sea World) and the cinema (Universal Studios). In the United States alone, 300 million people visited an amusement park in 1998.[3] Las Vegas, a destination that could be regarded as one huge theme park, received a total of 30.6 million visitors in 1998, over 13 per cent of them international tourists.[4]

*Celebratory travel:* This category can be used to describe journeys that are carried out to celebrate special occasions and that, consequently, no individual would make more than a few times. They might include honeymoons, anniversaries and study trips, each of which has its own special features.

*Attendance at major events:* Universal exhibitions, the Olympic Games, football world cups are major events which not only attract a large number of visitors, but which establish values and rationales for promoting the places hosting them as major tourist destinations.

*Other forms:* There are many other forms of tourism that are hard to classify. Sex tourism, for example, is something that has a particular impact on certain countries, although obviously it is not promoted as such; quite the opposite, in fact, as there are numerous organizations seeking to eradicate it. At the other extreme is solidarity tourism, with some NGOs organizing stays in Third World countries to promote interaction between cultures. Looking perhaps overconfidently ahead, it is even possible to make bookings for space tourism, and there is a Bureau of Atomic Tourism,[5] which organizes visits to places affected by nuclear explosions. There are also companies that arrange 'reality tours', including visits to ravaged or polluted places, prisons, etc.

**Main trends**

As the industry and its customers mature, some very substantial changes are taking place in the tourism sector. For example, the reasons for travelling are no longer mutually exclusive, as people are not looking to satisfy just a single desire. A tourist booking a journey to a particular area may be looking primarily for sun and sand, for example, but may be interested in the cultural or ecotourism opportunities that the destination also provides. The trend of demand is determining the versatility of supply. All this means that one of the main strategies now being followed by destinations is to diversify supply, both to attract new customers and to keep existing ones.

Destinations are also striving to extend the tourist season so that visitors are spread more evenly throughout the year and infrastructure use is maximized. Another key trend is for holidays to be broken up into a number of shorter trips. This is boosting activities like short city breaks and brief visits to carry out some particular activity (skiing, golf, hunting, shopping). Lastly, it is becoming more and more common for business and leisure activities (art, sport, gastronomy) to be combined in a single journey.

## TOURISM AT THE TURN OF THE CENTURY: PRINCIPAL MOVEMENTS

In quantitative terms, tourism surpassed migration as the main driving force of human movement at the end of the twentieth century. However, as of 1999, it was estimated that there were 120 million emigrants in the world, or more than 2.5 per cent of the world's population and 4.5 per cent of that of the developed countries. Between 1990 and 1995, the developed countries received net migration of about 10.9 million people. During those same five years, Europe received 1.1 million immigrants a year and North America about 960,000, while between 1995 and 2000 the annual figure was expected to be 989,000 in the case of Europe and 930,000 in that of North America.[6] In 1998 the number of tourist journeys was 625 million, with annual growth of about 5 per cent over the last decade. As Table 25 shows, the growth of the sector in the last 45 years has been quite spectacular, with the number of 'arrivals' increasing from 25.3 million in 1950 to 625 million in 1998. This represents growth of 2,470 per cent, or a 24-fold increase over those years. Figures issued by the World Tourism Organization (WTO) showed that international tourism in 2000 grew by 45 million arrivals. Several Mediterranean countries and new destinations like Turkey, Croatia and Bulgaria were especially successful. China showed strong growth in 2002 of more than 10 per cent. The WTO also projected a record 60 million international visitors would come to the USA in 2006, a 32 per cent increase over 2001.

The economic dimension of this phenomenon and the revenue generated by it have, if anything, grown even more strongly, with turnover rising from US$2.1 billion in 1950 to US$445 billion in 1998, an increase of 21,190 per cent. These data do not include domestic tourism, that undertaken by travellers within their own countries, which is calculated to exceed international tourism by a factor of 10. The World Travel and Tourism Council (WTTC) estimates that tourism and related activities generated US$3.5 trillion worldwide in 1999. In Europe in 2003, the European Travel Commission estimated that tourism and related revenues amounted to 249 billion euros for that year alone.

The opportunity to create wealth without the need for major infrastructure, and the growth in purchasing power and free time among certain sections of society, have meant that tourist numbers are continuing to rise, albeit to a more moderate degree than in previous decades. In addition, the countries of the so-called Third World are featuring more and more prominently as both recipients and sources of tourism.

### Destinations and countries of origin

Thus, in 1998 Europe received a total of 372.5 million tourists, or 59.6 per cent of the world total. The American continent was in second place with 120.2 million (19.2 per cent of the total), and East Asia and the Pacific were third with 86.9 million (13.9 per cent). The remaining regions of the world were a long way behind, with Africa receiving 24.9 million tourists (4 per cent), the Middle East 15.6 million (2.5 per cent) and South Asia 5.1 million (0.8 per cent).

*Table 25* **International tourist arrivals and revenue worldwide, 1950–1998** *(expressed in millions of visitors and US dollars)*

| Year | Arrivals | Visitor Index (1950=100) (*) | Revenue | Revenue Index (1950=100) (**) |
|------|----------|---------|---------|---------|
| 1950 | 25.3 | 100 | 2,100 | 100 |
| 1960 | 69.3 | 274 | 6,867 | 327 |
| 1970 | 165.7 | 656 | 17,900 | 800 |
| 1980 | 286.2 | 1,132 | 105,198 | 5,009 |
| 1990 | 459.2 | 1,816 | 264,714 | 10,398 |
| 1995 | 561.0 | 2,218 | 380,693 | 18,128 |
| 1998 | 625.0 | 2,470 | 445,000 | 21,190 |

The great majority of the main tourist destinations are developed countries. The variety of tourist activity is reflected in the diversity of supply among the three leading countries. Much of what France offers tourists is based on culture and the attraction of its capital (Paris), which receives some 14.2 million international tourists and 10.2 million domestic ones each year. A large proportion of visitors to Spain are still attracted by the country's extensive sun and sand tourist infrastructure, despite efforts to diversify by offering culture and sports as tourist attractions. The Balearic and Canary Islands, for example, received 16 million tourists between them in 1998, as against the 3 million or so visiting Madrid. The United States owes its potential to its great diversity of attractions, among them its main cities. New York, for instance, received 33 million visitors in 1997, 6.1 million of them foreign and 26.9 million domestic. Los Angeles received 23.5 million visitors in the same year, 5.8 million of whom were international, while Florida, which is home to Orlando, a city with numerous theme parks, received 37.2 million visitors in 1997, 3.5 million of them from abroad.

As regards the countries supplying the largest numbers of international tourists, Table 26 shows that the first places are all taken by the members of the G-7, the group of the world's richest countries.[7] These seven countries account for 53.6 per cent of all tourist spending in the world, while receiving 41.8 per cent of all revenues. This means that the tourism balance of payments and income is negative in the developed countries (by about US$58 billion in 1997), while in the less developed economies it is highly positive (US$62.156 billion in 1997). The case of Mexico is one of the most striking, as in 1997 the country's tourism trade balance was in surplus by US$3.701 billion, with revenue of US$7.593 billion being only partially offset by outgoings of

*Table 26* **Spending on international tourism by country**

| Country | Expenditure* 1997 | % Change 1996 -1997 | % of Total Expenditures 1997 |
|---------|---------|---------|---------|
| United States | 51,220 | 5.6 | 13.6 |
| Germany | 46,200 | −9.4 | 12.2 |
| Japan | 33,041 | −10.8 | 8.7 |
| United Kingdom | 27,710 | 9.5 | 7.3 |
| Italy | 16,631 | 5.2 | 4.4 |
| France | 16,576 | −6.6 | 4.4 |
| Canada | 11,304 | 1.9 | 3.0 |
| Austria | 10,992 | −6.9 | 2.9 |
| Netherlands | 10,232 | −11.5 | 2.7 |
| China | 10,166 | 127.2 | 2.7 |
| Russian Fed. | 10,113 | −1.5 | 2.7 |
| Belgium | 8,275 | −11.3 | 2.2 |
| Switzerland | 6,904 | −8.8 | 2.2 |

*Source:* WTO.

US$3.89 billion. In Cuba, revenue in that same year was US$1.35 billion, a sum that can largely be set down as a surplus, since the number of people travelling abroad from the country is very small.[8]

Consequently, tourism is of vital importance to poor countries, particularly in certain cases such as those of Cuba, the Dominican Republic and Jamaica, where it generates a large proportion of national income. This importance is increasing by the year, since less economically developed regions (such as Africa, the Middle East and Asia) are seeing faster tourism growth than the developed countries.

Over the last 10 years (1989–98), the number of visitors to the Middle East and the East Asia and Pacific area has grown at a rate of 6.9 per cent a year. In the case of Africa the figure is 6.8 per cent a year, and in that of South Asia it is 5.9 per cent a year. By contrast, Europe has grown by only 3.8 per cent a year and the American continent by 3.7 per cent.

**Forecasts**

WTO itself expects that by 2010 the European share of international arrivals will have fallen to 50.8 per cent from the 1970 figure of 68.1 per cent, a drop of 17.3 percentage points, while the Asia and the Pacific region will have increased its share by the same amount, from 3 per cent to 20.3 per cent. Africa will also have achieved an increase of 2.6 points by that same year, with a share of 3.8 per cent.

Thus, WTO predicts that by 2020 China will be the world's leading destination, with 130 million travellers, while Hong Kong will be in fifth place with 56.5 million. In between will be the three leading tourism powers of today: France, the United States and Spain.

Poorer countries will also be contributing more travellers to this international tourist flow, although the numbers will still be relatively small. Thus, in 2020 the main countries of origin will still be the same, except that China will have emerged in fourth place and the Russian Federation will be in tenth place. The contributions of Thailand and Singapore will also increase strikingly. The tourist spending of China rose by 127 per cent in 1997, which took the country from twenty-second place in the ranking to tenth in just one year. The burgeoning of tourism from some other countries with great potential, such as the Russian Federation, is taking longer than the tourism sector itself was anticipating a few years ago, owing in this particular case to the domestic political crises the country is experiencing.

Thus, if expectations about international tourist flows are confirmed, developing countries will be playing an ever more important role in tourism, both as recipients and, above all, as sources of tourism.

## ECONOMIC AND SOCIAL ASPECTS OF TOURISM

One of the most striking aspects of modern tourism is undoubtedly its economic importance and its ability to create jobs. WTO estimates that about 100 million people worldwide are employed in this sector, which accounts for about 10 per cent of world gross domestic product (GDP). Where employment is concerned, jobs are being created 1.5 times faster in the tourist industry than in any other. The tourism sector generated 8 per cent of world exports in 1997, and 30 per cent of service sector exports. The World Travel and Tourism Council (WTTC), which represents the leading companies in the sector, depicts the situation in an even more favourable light, calculating that tourism is responsible for 190 million jobs worldwide, or 8 per cent of total employment, and accounts for 11.7 per cent of GDP. It estimates that the sector will generate 5.5 million jobs a year up to 2010. As regards GDP, the figure put forward is US$3.5 trillion. Also according WTTC figures, 698 million people travelled to a foreign country in 2000, spending more than US$478 billion. International tourism revenues combined with passenger transport accounted for

*Table 27* **Economic impact of tourism (1999)**

US$575 billion – making tourism the world's number one export earner, ahead even of automotive products, chemicals, petroleum and food.

In most countries, the work of developing tourism involves different government departments, essentially those responsible for infrastructure, cultural heritage and the environment, although the size of the sector means that this involvement is extending to more and more public and private actors who understand the importance of tourism promotion policies and the value that these can add.

The growing socio-economic importance of tourism resulted in the creation of the World Tourism Organization,[9] which commenced operations in 1975. By 1999, it had a membership of 138 countries and more than 350 affiliate members representing local governments, tourism trade associations and companies in the sector. WTO has been an executive agency of the United Nations Development Programme since 1976, and its primary objective is 'through tourism … to stimulate economic growth and job creation, provide incentives for protecting the environment and cultural heritage, and promote peace, prosperity and respect for human rights'. To this end, it is actively involved in compiling tourism statistics, holding conferences, publishing research and sponsoring specific tourism policy proposals.

## The impact on developed countries

This has led numerous countries and supranational bodies to implement specific tourism policies with a view to stimulating this activity and encouraging its positive effects. The European Union, for example, while it has not elected to set up a specific directorate general for tourism, notwithstanding the importance of the industry to the EU economy, has launched a number of programmes to develop the sector, such as *Philoxenia*, or to create data transmission networks that serve its needs (MINTOUR and *Intourisme*).[10] It has also provided the sector with structural funds that have enabled transport infrastructure and environmental improvement works to be undertaken, with a positive effect on tourism.

Tourism is one of the leading economic sectors in Europe. It is estimated to employ 9 million people directly in the European Union, or 6 per cent of the total workforce, a figure that is expected to rise to 9 per cent over the coming years. As Table 27 shows, WTTC calculates that tourism accounts for 14.1 per cent of GDP and 14.5 per cent of employment in the European Union.[11]

Spain depends more heavily on tourism than any other country in the European Union, with 22.7 per cent of the country's GDP and 24.3 per cent of jobs being generated by the industry, according to WTTC. In exceptionally tourist-oriented regions, such as the Balearic Islands, the service sector, largely catering for tourism, generates 84 per cent of GDP. Thanks to this activity, per capita income in the islands is above the European average, and the unemployment rate is well below the national average.

In the North American continent, the turnover of the tourist industry is also very large, accounting for 11.8 per cent of GDP and 11.9 per cent of employment. In the United States, tourism accounts for 12.1 per cent of GDP and 13.2 per cent of employment, while the figures for Canada are slightly higher, at 13.6 per cent and 14.9 per cent respectively.

Tourism also plays a vital role in Oceania, providing 14.7 per cent of GDP and 16 per cent of employment. The two largest countries in the area, Australia and New Zealand, are major magnets for tourism and their industries account for 13.8 per cent and 16.9 per cent of GDP respectively.

## The impact on developing countries

Tourism is seen as an opportunity to stimulate development in areas that face obstacles to the creation of wealth through the industrial sector. The new jobs and foreign currency that tourism brings, and the opportunities it offers to develop new infrastructure, are the main attractions for these countries.

Developing tourism involves the creation of infrastructure and facilities (airports, highways, sewage systems) that can help to improve living conditions for those who inhabit tourist destinations, although in a good many cases the benefits brought by tourism have not translated into improvements for the local population. Likewise, tourism offers an opportunity to capitalize on existing cultural and natural resources, generating the revenue needed for conservation and improvement work. Programmes to revive places of historical and natural interest, such as the designation of World Heritage sites by UNESCO, have helped reinvigorate many cities in the Third World that have found ways of generating revenue from tourism.

The Caribbean is an example of tourism's importance, since in this region tourism generates as much as 20.6 per cent of GDP and 15.8 per cent of employment. In the smaller tourist islands (Aruba, Bahamas, Barbados, the Cayman Islands), tourism accounts for more than 50 per cent of GDP and similar percentages of employment. Even in the larger islands, tourism is hardly less important to national economies. The shares of GDP and employment it accounts for are, respectively, 14.9 per cent and 13.2 per cent in Cuba, 22.1 per cent and 19 per cent in the Dominican Republic and 35.7 per cent and 28.2 per cent in Jamaica.[12]

The ease with which some resources can be exploited for tourism purposes (beaches, natural areas, cultural attractions), compared to the greater difficulties usually entailed by industrial development, is stimulating the development of this activity in Third World countries. In many cases, however, it is left to foreign investors from richer countries to create facilities for travellers, and it is their large hotel chains that usually take the lead in fostering tourism in these places. Spanish hotel chains, for example, play a vital role in tourism operations in certain areas of the Caribbean (Dominican Republic, Cuba and the Maya Riviera in Mexico), investing heavily in the construction of large luxury tourism complexes. Companies from the United States and other powers have also played a very large role in the development of the hotel trade, in both cities and holiday resorts. There are cases, therefore, where the development of tourism has not resulted in major improvements for the local population, since local private companies and public authorities have played only a very small role in such growth.

One result of all this has been the creation of luxury tourist ghettos in very poor regions. Striking examples of such places, from which the local population is virtually debarred except when it is called upon to provide labour, are

to be found in the three countries mentioned above, and in many other countries of the Caribbean and the Third World. Varadero in Cuba, Playa Bávaro and Puerto Plata in the Dominican Republic and Playa del Carmen in Mexico are a few examples. In these areas, furthermore, tourist complexes market an 'all inclusive' system, which means that tourists virtually never leave their hotels throughout their stay, or do so only to go on planned excursions.

## The adverse effects of tourism

Despite everything that has been said, the development of tourism is not without its costs. Tourism can make severe demands on land, so that uncontrolled development may result in very adverse effects on the area where it takes place, leading to irreversible changes in the environment and landscape.

Thus, for example, much of the Mediterranean coastline has sustained this kind of impact, and it has been most substantial in those areas that were the first to develop, such as certain parts of the Côte d'Azur, the Balearics, the Costa Brava, the Costa del Sol, and the Italian Riviera, where tons of concrete in the form of hotels have transformed the shoreline. Acapulco, Miami, Rio de Janeiro and many other places on the American continent have also sustained a very serious impact on their landscapes. At present, the development of the Maya Riviera in Mexico, stretching from Cancún almost to Belize, is also attracting strong criticism from environmental groups because of its impact on a natural area of outstanding value.

Furthermore, when millions of people visit certain natural and cultural attractions, the effects may be the opposite of what the exploitation of these resources was originally intended to achieve, such as conservation and improvement. The crowds visiting the Maya and Aztec pyramids of Mexico have caused them damage, for example, while excursions to view dolphins, whales or the hatching of particular animals can also have a negative influence on certain ecosystems.

These negative consequences have given rise to the concept of 'sustainable tourism', the aim of which is to harmonize tourism with its surroundings. Tourism has thus been included in the Agenda 21 programme[13] as one of the few industries capable of creating an economic incentive for environmental conservation, provided that it is managed with a view to sustainable development.

## INFORMATION AND COMMUNICATION

Tourism is inseparable from information and communication. The whole industry is ultimately based on the psychological motivations that lead people to travel, to look beyond the home for whatever they have begun to imagine in their own surroundings. The motivations for tourism arise out of information and would be inexplicable if various cultural factors were not taken into consideration: education, the media, the tourism industry itself and its use of advertising and promotion.

The tourism-culture-communication nexus has not aroused the academic interest it deserves, however. By way of introduction, we shall make some observations here on the many fields of interest that arise from these interconnections.

## Travel books and tourist guides

Travel has captured the imagination of writers since earliest times. Numerous authors have given the best of themselves to travel writing. It is not until travel began to take place on a mass scale, however, that we can properly speak of 'tourist guides'. Little by little, these gained ground in travel literature. Now, at the close of the century, most tourists preparing to visit a country begin their journey in the company of one of the guides produced by the major publishing houses. Let's Go, Michelin, Footprint and Lonely Planet are some of the most popular guide collections, with publications on a large number of tourist destinations.

The main difference between travel books and tourist guides is that the former seek to provide readers with a literary re-creation of a journey, while the latter aim to supply them with a body of useful information to orient their travels. From the reader's point of view, the essential difference lies in the fact that travel books are read for their literary value without there necessarily being any intention to make the journey described, while guides are normally acquired once the decision has been taken to visit the destination they cover.

Books are no longer the only format for travel guides, however. The major tourist destinations now have video guides as well. Furthermore, while there have been travel programmes on television for many years now, the appearance of cable and satellite television has allowed specialist travel channels to appear (*Travel* in the United Kingdom, for example, and *Viajar* in Spain). These broadcast documentaries are cast in the form of travel guides, one example being those of the Lonely Planet production company.

## The promotional image

As the industry sees it, the image of the tourism product is the global perception of tourism opportunities available that is formed in the mind of the potential traveller by a range of information processes.

A large number of communication resources are involved in these processes: the education system, the media, promotional brochures, promotional videos and CD-ROMs, videotext, travel guides, global distribution systems, travel agencies, advertising by tour operators, attendance at fairs, personal contacts, national tourism offices and foreign embassies and, most recently, the Internet. These sources of information can be supplemented at the point of destination by information offices, media, electronic information booths, brochures and personal contacts with guides and tour operators, tourism staff and so on.

The impact and economic importance of tourism have led both the private and public sectors to invest substantially in promotional activities aimed at influencing this process of image formation. Thus, in 1997, national agencies promoting tourism spent a total of US$1.08 billion,[14] a figure that does not include spending by the regional bodies, which in many countries, such as Spain and the United States, carry out the bulk of public promotion work.

This concern to improve the image of destinations is due to the importance of potential travellers' decision-making

processes. Tourism differs from other products in that it cannot be inspected at first hand by the buyer and is a composite of several services provided by companies that are often located in different countries. These promotional images have to compete with all sorts of messages put out by other sources with greater penetration and credibility, such as personal contacts, news and the cinema.

The messages sent out by destinations are not homogeneous, as they can originate from a large number of actors in the tourism process. Thus, at a first level, communication of this kind may originate from the local industry and public-sector promotional agencies. At a second level in the process are industry intermediaries, the travel agencies and tour operators, while at the final level are the communications media, which relay information from all the above actors.

The promotional image is characterized, obviously, by its exclusive focus on the positive aspects of the destination, while the negative aspects can be found, along with the positive ones, in information from independent sources such as news, films, travel books, personal contacts, etc.

As a number of studies have shown,[15] changing the image of a tourist destination is an extraordinarily slow process, despite all the money that may be poured into it. In cases where dramatic, violent events occur, such as terrorist attacks, coups d'état and natural disasters, or where the destination hosts events that receive wide international coverage (Olympic Games, football World Cups, universal exhibitions), change may be quicker, however.[16] In the case of some destinations, such as Florida and Egypt, it has taken years for tourism levels to recover after tourists have been murdered, despite the resources expended in the effort to improve their image. The same thing happened with China after the events in Tiananmen Square.[17]

### The advent of the Internet

The introduction and development of new information technologies has had a major impact on tourist information. These new technologies have been seen by tourist destinations and companies as an opportunity to make direct contact with potential customers more effectively and at lower cost, in a process that has been termed 'disintermediation'.

Thus, the platforms where communication normally takes place in the world of tourism, such as large fairs, have had to share this role with new ones, such as the Internet and data transmission networks applied to tourism.

Printed brochures are under threat from multimedia CD-ROMs, which have certain advantages such as the ability to include sounds and moving images in presentations, something that can enhance the interest of their contents.

As already mentioned, digital satellite and cable television have opened the way for channels specializing in tourism, but also for tour operators selling exclusively their own products on a television channel, one example being TV Travel Shop (United Kingdom). In some countries, teletext is also a very important tourism sales device.

The Internet is unquestionably destined to play a crucial role in tourist organization and information in the future. Already, all the major search engines (Yahoo, Infoseek, AOL, Olé, etc.) include a tourism or travel section on their front pages. Use of the Internet to choose destinations, transport systems, hotels, restaurants and activities will grow over the coming years. This will require a major effort by all tourism actors, as they will need to adapt their current information formats to the new generation of digital communications.

## THE CULTURAL DIMENSION: WORLD DESTINATIONS FOR LOCAL IMAGINATIONS

The cultural dimensions of tourism are to be sought in the values (meanings) that determine the social practices of this phenomenon in the modern world. What are the motives, the stimuli, that impel people to travel to or stay in other places for tourist purposes? Who conditions these values, and how? Where do they originate?

Travel in our time, like mass culture and communication, is very different from what it was in previous eras when what predominated were risk, adventure and rites of passage. The mystique of pilgrimages in the Middle Ages, or the adventure of discovery in modern times, are examples that show how far most of the cultural practices of modern tourism have moved away from those of earlier times.

It is not unusual to find today's tourist advertising campaigns dwelling on concepts like 'getting away', 'leaving it all behind' or 'taking a break'. Increasingly, tourist travel is being promoted as a way of escaping from one's 'own world of work'.[18] Less and less is it seen as a rite of interaction, in the sense of opening up to new cultural experiences. Modern tourism is associated to an ever greater extent with the satisfaction and pleasure of holiday situations. Adventure sports are the exception that confirms the rule.

Globalization (of design, consumption and symbology) has made the same type of commodities available in the farthest flung parts of the world, settings tailored to the tastes and needs of Western travellers that leave very little space for the representation of local differences.

This situation, which has been termed the 'McDonaldization of society',[19] is particularly evident in the case of business travel, which accounts for about 40 per cent of all travellers' movements in the world. Business travellers, like sun and sand travellers, pass through airports, taxis, hotels, restaurants, bars and conference halls that are all designed to the same criteria of comfort and profitability.

As is generally the case with modern culture, this phenomenon needs to be interpreted in the light of the new dialectic between the global and the local.

The culture of the destination is not necessarily the culture that the traveller will encounter upon arrival. Any part of the globe can now be the setting for standard Western tourist culture, or even the traveller's own local culture. Even visits to emblematic places end up being made outside of the context that gave birth to them. Many tourist practices involve a change of physical territory but not of cultural territory. This is the result not just of modern forms of air travel, which seem to destroy any perception of the real distance and route covered, but also of the introduction of a few (Western) standard settings everywhere in the world. Airports, airport corridors, bars, duty-free shops, shopping centres and hotel chains are significant examples of this cosmopolitan continuum that stretches around the globe.

The spread of golf courses, with green fairways and hills in arid zones, is one of the most startling examples of this stage-setting, this transposition not only of symbolic referents but also of social practices from one's own local context to another local context.

This tendency towards globalization and the resulting concealment of the destination's local cultures is being reinforced still further by new communication technologies, and particularly by satellite technology, which enables travellers to carry on connecting to their local television stations from any hotel in the world.

This 'semanticization' of tourism is also being influenced by the process of convergence between the tourist industry and the multinational communication industries. Theme parks such as Disneyland are striking examples of this convergence, where film fiction becomes 'reality fiction'.

Indeed, Walt Disney is no longer just a communication multinational but a tourism multinational as well. Besides its theme parks, it owns hotels, cruise liners and even a 'theme' island, situated in the Bahamas, for its cruise passengers. Universal also has large theme parks, one of them in Orlando. Sony has stated its readiness to make a forceful entry into the world of tourism.

In these circumstances, the place of destination, the accommodation available and the local culture tend to become less relevant, with greater importance being attached to pre-packaged themes or better climate and environmental conditions. Sun and theming, rather than interpersonal communication and interaction with the local culture, seem to be the determining factors in mass tourism consumption at the present time.

This accounts for such emblematic cases as that of the hotels and beaches of Varadero, where it can be said that some travellers go to Cuba 'without passing through Cuba', or that of Mallorca, where a British visitor can eat baked beans on toast for breakfast, stroll along streets full of English signs, enjoy a Manchester-Liverpool football match in the pub and dance to the latest music in a discotheque where the DJ has a London accent.

## Tourism: local referents and cultural interaction

Intercultural analyses[20] reveal how important an individual's own cultural influences are in the interpretation of cultures. These interpretations also account for the behaviour of those who participate in mass tourism today. Consequently, it can be said that the desire to travel originates not just in the destination culture but also, or chiefly, in the culture of origin.

The typology of tourism given earlier sets out differences in the referents sought by travellers (third age tourism, holidaymaking, business travel, youth tourism), but all these referents can be resolved into a limited number of patterns.

The desire to travel arises out of some type of 'dream' constructed by the cultural apparatus of each society: education, religion, media (cinema, television, celebrity magazines), promotional campaigns, etc. But these dreams are increasingly being induced by promotional strategies designed to benefit the major tourist circuits.

Historical and cultural referents remain important as motives for travel. But 'experiences' are what are essential. The traveller cannot leave Rome without 'doing' the Sistine Chapel, or Barcelona without standing in front of Gaudí's buildings, or Paris without visiting the Louvre.

Tourists are interested most especially in experiencing the sensation (the ritual?) of having been in the emblematic places of the world: the Trevi Fountain, Sugar Loaf Mountain, the Eiffel Tower, the Empire State Building, the Berlin Wall, the Tower of London, the Plaza de Mayo, the Bridge of Sighs, Lenin's tomb, the Sagrada Familia, the Pyramids. These places are of different types, some being artistic or historical in nature while others are urban landmarks, and they differ greatly in their meaning and artistic value. What they do have in common, however, is the symbolic value of identification with a different and exceptional place. These are fleeting visits, but they are enough to provide the background for a family photograph, to construct the memory 'of having been there' which is perpetuated, finally, through the purchase of 'souvenirs' of some kind, authentic expressions of kitsch.

Tourist guides mark these great sites with multiple stars. But these stars are now shared with other, less historic referents from the cinema, television, celebrity magazines or more recent literary traditions. As an anecdotal example, we may mention the case of a bar in Madrid where the following humorous notice can be read: 'Hemingway never came to this bar'.

The scheduling of travel at holiday times and the new cultural forms of leisure in more developed societies, combined with the cult of the body, have lent increasing importance to another of the great referents of the tourist dream: the climatic and environmental referent, chiefly sun and sand, the culture of heat and skin pigmentation. It is true that these referents are combined with historical or artistic ones, but it is no less true that in many instances they are the only value or referent for tourism that is conducted thousands of miles from home and is virtually bereft of contact with the indigenous population and its culture.

## National images for tourists

Because of all these factors, the production of symbols to represent cities, countries and regions in the world tourism market has taken on greater and greater importance.

The aim of these campaigns has to be to attract visitors, appealing to their imagination without violating the image of the indigenous populations themselves. All kinds of conflicts and discrepancies arise between the tourist image that is projected for each country and its actual image, whether it is the personality of its inhabitants, the characteristics of its townscape or its natural features that are involved.

This production and selection of symbols to identify tourist destinations has become one of the great issues of modern cultural policies, owing to the numerous symbolic and economic implications it entails.

Modern tourism determines a country's image in terms of what it has to offer tourists, forcing it to adapt its identifying features to the conditions of its tourist market, so that certain aspects are given priority over others. This is the case with Australia and its relationship with Japan, or the European Union in the way internal tourism is promoted, or Mexico in relation to visitors from the United States.

## Opportunities and difficulties for intercultural dialogue

Tourism, therefore, represents a great array of risks and opportunities, and is a primary focus of the new cultural policies. The way ahead must be to strengthen the agents of cultural permeability between visitors and visited (services, taxi drivers, hoteliers, shopkeepers, musicians) and to avoid unsustainable tourism models, represented by the walls of the new tourist ghettos whose basis is the exploitation of territory without any beneficial interaction among all the different parties involved.

Above all, this great mass phenomenon needs to be harnessed for the promotion of interculturality. This will unquestionably mean drawing on all the potential of the cultural heritage, which, as UNESCO has observed on various occasions,[21] constitutes the main cultural dimension of tourism.

Furthermore, tourism policies and the resources that can be generated through them should allow the poorest countries to create their own cultural policies and defend their heritage. The process of convergence between culture and tourism should not be left solely in the hands of the large multinationals referred to here, but should become one of the priority objectives of modern cultural policies.

## THE INDIVIDUAL AND INFORMATION TECHNOLOGIES

*Jörg Becker*

## INTRODUCTION

In the Northern industrial democracies, the prevailing wisdom is that the principles laid down in declarations of human rights and individual constitutions are based on the dignity of the individual. The latter is the be-all and end-all of political theory. Historically, the individual is the result of the emancipation of the bourgeoisie from the feudal order – through the Renaissance in Italy, the Protestant Reformation in Germany, and the 1789 Revolution in France. In the eighteenth century, political philosophy discovered the self, which possesses autonomy, uniqueness, and dignity. Against this background, the individual is conceived of as an independent being, capable of reason and will. Linked to the concept of the individual is that of privacy. This Latinate word appears in German for the first time in the sixteenth century, in the age of Luther, and specifically refers to that sphere of life which is divided off from the state. In these countries, the prevailing wisdom is that the individual's private sphere is to be protected from interference by the state. This is the main idea behind both George Orwell's *Nineteen Eighty-Four* (1949), with its omnipresent Big Brother, and the many data protection laws that have been passed since the beginning of the 1970s.

The degree to which the concepts of the individual and of privacy are presently undergoing a historical change is made clear by the French cultural historian Philippe Ariès in his work *Histoire de la Vie Privée* (1985–87): the term 'individualism' appeared in Europe only as late as 1850. Following the work of the German sociologist Max Weber, the historical growth in individualism is synonymous with the process of modernization and civilization. On the one side of the dichotomy between traditionality and rationalization stand concepts such as family, stability, low political participation and inward orientation, while on the other, that of modernity, stand concepts such as individual, mobility, high political participation and outward orientation. At the present time in Europe, the tradition of the Weberian modernization theory is represented by the English social scientist Antony Giddens and by the German sociologist Ulrich Beck.

A political philosophy that places the individual at the centre of its deliberations finds itself the target of criticism from a number of directions: (1) All schools of contemporary sociology start out from the premise that the individual, in the social sense of the term, can only realize the specific expression of its genetic potential as a social being – as a personality – through society; (2) empirically it is debatable whether increasing modernization entails increasing individualization; it is conceivable that an empirically determined increase in individualization is simply based on selective perception and self-fulfilling prophesies on the part of the researchers; (3) from a normative perspective too, it is debatable whether an increase in individualization is desirable, since such a development could lead to the so-called hedonism trap.

But the gravest objection is that a political philosophy based on the individual is Eurocentric, both de facto and from a normative point of view. Neither ancient Greece nor Islamic law, neither the cosmic philosophies of India, nor Japanese and Chinese ethics, recognize individual entitlement under law. Rather, the individual is recognized not as an autonomous being but as a member of the community, and only as such does the individual enjoy political rights. In the human rights debate, this has led to the Universal Declaration of Human Rights (1948) being augmented by social rights, through the two pacts of 1966, the one on civil and political rights and the other on economic, social and cultural rights. The Vienna Human Rights Conference of 1993 also recognizes the coexistence of individual and social rights.

The German social philosopher Theodor W. Adorno has insisted on maintaining the vision that individual freedom be the highest norm worth striving for. Yet with equal emphasis he has insisted that the consumerist character of capitalism destroys all individuality and that under capitalist conditions there can be no free unfolding of individual potential.

All developments in information technology and the mass media which touch on the dignity of the individual must be considered within this area of conflict between individual, society and state.

## PRIVACY

Data protection raises the problem as to the conditions under which society's conduct in the information field can be made acceptable to the members of that society. Whereas this problem was first recognized as being socially relevant under eighteenth century absolutism, it is the ancient legal

institutions of a priest's duty to remain silent and medical confidentiality that may serve as the historically most important precedents for the current debate on electronic data processing and privacy. In the field of medicine the Hippocratic oath (named after the Greek doctor Hippocrates, 460–377 BC) includes the rule of medical confidentiality. In the history of the Church, the seal of confession became important as the Church went over to receiving confessions of non-public sins in private. Historically, this change can be dated by a decree of Charles the Great in the early ninth century. A definitive regulation in canonical law took place at the Lateran Council of 1215, at which life-long imprisonment was decreed for violation of the seal of confession. During the Spanish Inquisition, in the thirteenth century, the debate between theologians and canonical lawyers over the seal of confession came to a crisis because the problem arose as to whether the seal of confession applied to heretics too.

In this area of conflict between silence and speech, between secrecy and transparency, between privacy and openness, historical precedents for the current debate on data protection may be seen not only in protective laws but also in basic principles concerning what is public information. In this respect mention must be made of the first Swedish press law of 1766, which for the first time both admitted and regulated access to public documents.

In most industrial countries, the data protection laws that have existed since the early 1970s are to be understood as a reaction to technology, specifically to electronic data processing. This is by no means a natural consequence. For instance, the data protection laws passed in Hungary in the early 1980s were not a reaction to technology but the expression of a political struggle to assert legal and civil rights against a centralized one-party state. This fact has, incidentally, led to the creation of something unique to Hungarian law. The country's data protection laws apply not only to natural and legal persons but also to organizations not having a legal personality, i.e. to citizens' action groups and above all to human rights groups, for it is precisely the status of the latter which these laws were designed to protect.

The first data protection law in the world was passed in the German federal state of Hesse in 1971. Together with the German Federal Data Protection Act of 1977, it owes much to the foregoing debate on privacy in the USA. As is the case with the US Privacy Act of 1974, most data protection laws are oriented towards the rights of the individual. They are understood to be a concretization of the national constitution of the country in question, specifying that which in many constitutions is covered by such terms as the free development of personality or the dignity of the individual.

Most data protection laws conform to the following basic principles with respect to the area in which they are operative and are applied:

- The laws regulate only the protection of personal data.
- For the most part, the laws regulate not how such data are handled in general but how their misuse is to be avoided.
- They refer only to electronic data processing and exclude records and collections of records on paper.
- In many laws, the concept of protection is not litigable. Yet what is considered worthy of protection includes in particular data on health, on illegal acts, and on religious and political views.
- The laws regulate data processing by the authorities and by natural and legal persons, thus interfering in a range of social relationships.
- As interpreted by most data protection laws, personal data refer only to natural persons. In some countries, data protection laws also extend to legal persons.

In 1983, the Federal Constitutional Court of the Federal Republic of Germany passed down a decision of general principle on the relationship of data protection to the constitution. For two reasons, this decision is of outstanding significance for the position of the individual vis-à-vis the state. Through this decision, the court created the so-called right of each citizen to informational self-determination. According to this decision, a democratic society can exist only if each citizen knows 'who knows what, when, and under what circumstances about him or her.' In addition, what is new about this decision is its shifting of the burden of proof. It is not the legitimacy of the authority to process personal data, but rather the legitimacy of the authority to make use of such data without, or even against, the permission of those affected, that must now be specifically established.

The whole debate on data protection is, first of all, for the most part a product of the 1970s and early 1980s. Secondly it essentially starts out from a Western European legal and constitutional understanding of the individual and the latter's human dignity. In North America the debate on data protection resulted in the US Privacy Act of 1974 and the Canadian Privacy Act of 1983. Right from the beginning, this debate had less status in North America than it has had in Western Europe. At the end of the 1970s, the US Congressional Privacy Protection Study Commission established that the Privacy Act was de facto meaningless. Kevin G. Wilson advanced a similar argument: in the interests of efficiency and control, government bureaucracies and the commercial interests of the privately owned information industry have overshadowed any legal right to privacy.[1] David Banisar even went so far as to say that the privacy policy of the US Government has, since the seventies, 'fallen into a coma'.[2]

In 1995, the European Parliament and the European Union promulgated a Directive on the protection of individuals with regard to the processing of personal data and on the free movement of such data. This Directive obligates member countries to regulate the collection and transmission of personal data not only within their own states, but also to other member states within the European Union. As such, the Directive sparked an immediate international controversy. The focus of contention was Articles 25 and 26, which regulate the transmission of data to non-member states. This Directive was and is of such great significance because its Article 25 regulates the international information market in a completely new way. According to this Directive, the international transmission of personal data must be restricted in those cases in which the recipient, non-EU country does not have an 'adequate' policy on the privacy rights of the individual, even if this call subverts international trade. Put simply, the EU's position is 'no privacy, no trade'. This position brought a storm of American and Japanese protests down on the EU. Behind this controversy is not simply an apparently obvious conflict between individual rights and international

trade interests. The fact is rather that Europeans see privacy as a human right, whereas Americans see it merely as a civil right.

Most philosophies of data protection have to be seen against the background of technological developments. More precisely, they reflect natural rights concepts concerning the protection of the individual from the Big Brother state – concepts which arose in the 1970s against the background of the kind of mainframe electronic data processing that had been around since the 1950s. Such individual rights to self-protection may have been effective against stand-alone computers, but in the face of online global networks they are increasingly losing any function they had. The following examples illustrate some of the current difficulties in data protection:

- In the Northern industrial countries, video surveillance of public spaces and rooms is increasing at an ever-faster rate. At the end of the 1990s, Great Britain is probably the leader in the video surveillance of cities; a total of 500 urban councils have now installed full video coverage of their streets (Plate 172).
- In Germany at the end of the 1990s, several firms began to photograph all the houses in selected communes and to store these photographs in three-dimensional electronic databases.
- Interactive online networks and infrastructures strengthen the new direct marketing and list broker sectors. By comparing a range of data, it is now possible to identify individuals according to age, estimated income, profession, hobby and interests. Such trends are encouraged by the global growth in personal smart cards. The global market for smart cards was expected to top $4.2 billion in 2002.
- The storing of data obtained from DNA analysis – so-called genetic fingerprinting – in modern criminology, with all the resources of medicine and computer technology at its command, runs the danger of using personality and risk profiles to create a 'transparent individual'.

High-resolution cameras on board surveillance satellites can now achieve a resolution of 1 metre by 1 metre, i.e. a camera positioned in space can recognize a point on earth when it is only 1 metre from the next point. Since the end of the 1990s, one can buy pictures from such surveillance satellites on the open market. The neighbour's garden can be observed from space just as well as a political demonstration, traffic jams, or a close-combat battle in the desert in a future Gulf War.

If one takes a look at Sweden, one notes very clearly that a complex dialectical relationship exists between secrecy and transparency. On the one hand, there can be no other country in the world in which the state has such comprehensive informational access to its citizens, as is the case in Sweden. The system of personal identity numbers created in 1964 accompanies every citizen in every administrative act from the cradle to the grave. But at the same time, Sweden is the one country on earth in which personal data protection is especially intensively cultivated. The increase both in transparent information and in secret information to be kept away from the public eye is characteristic of the general intensification of information, its communication and its exchange. Philippe Ariès has called Sweden a 'transparent' society. In it individual data protection and individual data control are

one and the same: they are an expression of a deeply hedonistic society.

Although almost every country on earth now includes the right to privacy in its constitution, in many places such legal entitlements are more a concession to international norms than they are anchored in the country's culture.

## CENSORSHIP

If one understands by censorship, in general, control over people's opinions backed up by force, then censorship has always existed throughout history. Taking, for instance, the drastic example of book-burning as a specific form of post-censorship, one finds that the first case of such destruction of written documents took place under the Chinese emperor Shi Huangdi in the year 213 BC. (Books on agriculture and medicine were spared from destruction, and furthermore one copy of each text burnt was deposited in the state library of Emperor Shi Huangdi.)

As a controlling means to exclude undesirable publications and to keep the rest in line with state ideology, a pre-censorship has existed in Europe, in the Catholic Church, since 1515. State censorship was established in all European countries at approximately the same time.

In the era of bourgeois emancipation in Europe, when feudal structures were being cast off in the eighteenth and nineteenth centuries, the struggle against censorship and for freedom of speech and the press took top priority. For this reason, the First Amendment to the Constitution was passed in the USA in 1791. To this very day, in Americans' understanding of constitutional priorities, freedom of speech is more important than, for instance, the dignity of the individual, in contrast to many European constitutions. And for this reason Americans' understanding of what is meant by freedom of speech goes much further than in most other countries. For instance the publication of fascist and racist hate literature is just as much protected by the First Amendment as is the public burning of the national flag.

In Great Britain, press censorship was abolished as early as 1694; in France it was swept away by the 1789 Revolution, although Napoleon introduced a press control system, which was extremely similar to censorship. In Germany and Austria, censorship was finally removed in 1848 (although admittedly it was, in the subsequent period of restoration, replaced by such mechanisms as licences, the depositing of securities, and newspaper stamps). During the First World War, censorship was reintroduced in nearly all belligerent countries. Naturally, such censorship measures have existed de facto during wartime throughout the twentieth century, even in the present.

In political philosophy, the question of censorship has been a subject of fierce debate in this area of conflict between individual freedom of information and social responsibility for a long time. Three quotations from classic philosophers illustrate this controversy.

In his *Areopagitica (For the Liberty of Unlicensed Printing)* (1644), John Milton wrote: 'There is yet behind of what I purposed to lay open, the incredible losse, and detriment that this plot of licensing puts us to, more then if some enemy at sea should stop up all our havens and ports, and creeks, it hinders and retards the importation of our richest Merchandize, Truth … I mean not tolerated Popery, and

open superstition, which ... it self should be extirpate ... That also which is impious or evil absolutely either against faith or manners no law can possibly permit, that intends not to unlaw it self.'

Over 200 years later, in his treatise *On Liberty* (1859), John Stuart Mill formulated a similar liberal position:

If all mankind, minus one, were of one opinion, and only one person were of the contrary opinion, mankind would be no more justified in silencing that one person, than he, if he had the power, would be justified in silencing mankind. Were an opinion a personal possession of no value except to the owner; if to be obstructed in the enjoyment of it were simply a private injury, it would make some difference whether the injury was inflicted on a few persons or on many. But the peculiar evil of silencing an opinion is, that it is robbing the human race; posterity as well as the existing generation; those who dissent from the opinion still more than those who hold it. If the opinion is right, they are deprived of the opportunity of exchanging error for truth; if wrong, they lose, what is almost as great a benefit, the clearer perception and livelier impression of truth, produced by its collision with error.

And naturally, it was none other than Karl Marx who took up arms against such a liberal attitude to censorship. His starting point was not individual freedom of speech but the profit interests of newspaper publishers. Thus it is no wonder that he criticizes the contemporary French press in the following terms: 'The French press is not too free; it is not free enough. Although it is subject to no intellectual censorship, it is subject to a material one, the depositing of large monetary securities. It thus functions according to material laws precisely because it has been dragged out of its true sphere into the sphere of large-scale trade speculations.'

This difference between a liberal approach to censorship and one based on a theory of social responsibility is to this very day the cause of differing constitutional opinions on press censorship and freedom of speech in many countries. In the countries of the former Council for Mutual Economic Assistance (CMEA) and in most developing countries, the social responsibility theory is far more important than any based on liberal principles.

But censorship need not only be organized directly by the state; it can also function via other mechanisms: (1) In an act of self-censorship, the communicator (journalist, film producer, newspaper editor) voluntarily distances himself from certain topics, or refrains from publishing certain pictures; (2) in an act of group censorship, a moral, political or economic pressure group intervenes in order to prevent or restrict the dissemination of information; (3) volunteer organs of self-control (press councils, codes of ethics laid down by publishers' or journalists' associations) do not see themselves as exercising censorship, although they do indeed regulate the selection of topics and of content.

The increasing significance of human rights in international politics in the last third of the twentieth century has caused the question of censorship to grow in importance globally. Increasingly more organizations around the world collect and publish data on censorship and on the political persecution of journalists, including the International Press Institute, the International PEN Club, the *Index on Censorship* journal, the French organization Reporters sans frontières, and the World Association of Newspapers. The latter, for instance, has stated that in 1998 there were 117 journalists in prison around the world, and that in that year a total of 28 journalists were murdered.

Without doubt, the mechanisms of censorship are also partly dependent on technology. In general it is true that digital global networking facilitates both censorship and avoidance of censorship. Whoever participates as an individual in an interactive electronic network leaves behind a digital fingerprint, and can be localized and even subject to individual electronic censorship. The opposite is of course also true: state censorship is scarcely capable of stopping a skilled network guerrilla.

At the end of the 1990s, precisely with reference to the Internet, there were numerous attempts made in many countries to prevent, repress or censor certain subject matter on the Web. Germany has laws prohibiting pornography and racism in cyberspace (1997), and Australia requires self-censorship by Internet Service Providers (1996). There are Japanese laws against Internet offences (1996). In China, Internet subscribers must register with the authorities (1996), and in Cuba there is control over individual access (1996). Malaysia monitors Internet contents (1996). Both the Philippines and the Republic of Korea enacted Internet censorship measures in 1996.

The digitalization of information allows content to be manipulated in an infinite number of ways. Digital photography allows a single image to be created from 500 individual images or more. During a live broadcast of a sports event taking place in Western Europe to an Islamic country, it is possible to cover up the open décolleté of a woman sitting in the grandstand. Both examples (which are from actual practice at the end of the 1990s) show that such concepts as censorship, manipulation, consideration for cultural sensibilities, or optimal targeting of a particular audience without loss of intensity due to scattering, are by no means clearly separable.

## PROPAGANDA

In 1621, under Pope Gregory XV, the Catholic Church set up a commission with the title *Congregatio cardinalium de propaganda fide* – i.e. a commission for the propagation of the Christian faith among so-called heretics and heathens. But the history of the current meaning of the word propaganda, derived from the Latin *propagare* (to propagate or spread), begins only in the era of Bismarck, in the latter third of the nineteenth century. In other words, propaganda is closely linked with technological progress in the history of the media. Both the means of delivering and the effectiveness of propaganda have grown and evolved from innovations in printing and the beginnings of film in the last century, to the beginnings of radio and TV in the 1920s and 1930s, to the digitalized multimedia world that exists at the end of the twentieth century. The twentieth century is a century of propaganda.

The structure and history of mass media propaganda are closely bound up with wars, with German fascism, with the Soviet Union under Stalin, and later with the Cold War. The First World War saw an initial flourishing of propaganda. In both France and Germany, war publications projected images of the enemy based on counterfeit

photographs and pictures – in newspapers, on postcards, and above all in the form of caricatures.

The beginnings of radio in the early 1920s also saw the birth of international broadcasting, which was from the start closely tied to political propaganda. The history of international broadcasting may be divided into the following four phases: (1) colonial broadcasting (1927–32); (2) european war and propaganda broadcasting (1933–48); (3) Cold War broadcasting (1949–89); (4) commercialization, and hate and crisis radio (1989–today).

Colonial radio began with the first broadcast by Radio PCJJ from Eindhoven in the Netherlands on 1 July 1927. It was followed by Radio Moscow and the German Weltrundfunksender (both 1929), the French Radio Colonial and Radio Vaticana (both 1931), and the BBC (1932).

Although the term propaganda has negative connotations in most languages, being interpreted as an unadmitted or even secret intent on the part of the communicators to influence the opinion of an audience without the latter's being aware of this influence, the German fascists employed the term positively. As of 1933, Joseph Goebbels' official title was *Reichsminister für Volksaufklärung und Propaganda*. The propaganda of the German fascists took the form of a rigorous bringing into line of all media. However, contrary to widely held opinion, radio was scarcely used as an instrument of explicit political propaganda during the Nazi period (1933–45). On the contrary, both radio and film were reserved mainly for entertainment purposes. The famous film theoretician Siegfried Kracauer bases his 1947 theory of the 'political in the unpolitical' on this politically motivated media policy.

It is by no means a coincidence that what today are called the communication sciences began in the middle of the Second World War, in the USA, as propaganda research. The basis of this research was a simple stimulus-response model involving a sender and a receiver, which was developed and used for both political and commercial advertising campaigns.

A definition of the Cold War would be impossible without the concept of propaganda. In contrast to a 'hot' war, i.e. a shooting war, political propaganda was the be-all and end-all of the Cold War. And once again, in this era international broadcasting played an outstanding role. Between 1948 and 1949 alone, the CMEA countries quintupled the number of their international broadcasts, and the US stations pushed the BBC from the top of the international broadcasting league, until they in their turn were overtaken by the Soviet international broadcasting stations at the end of the 1970s. The logic of the Cold War also made it a proxy war between the USA and the USSR for developing countries. Thus this period of international broadcasting saw above all a flourishing of international broadcasting stations in developing countries, led by Radio

*Table 28* **Activities by public relations agencies in wars, 1967–1993**

| Year | Client | Activity | PR Agency |
|---|---|---|---|
| 1967 | Biafran provincial government | PR campaign led by American opinion makers to support Biafran independence | Ruder Finn Global Public Affairs (USA) |
| 1968 | Nigerian central government in Lagos | Improvement of own image in the European press vis-à-vis the Biafran secessionists | Galitzine & Partners (Great Britain) |
| 1985 | UNITA rebels in Angola under Jonas Savimbi | Improvement of UNITA image in US press | Black & Manafort (USA) |
| 1986 | Marxist government of Angola | Improvement of Marxist government of Angola's image in US press | Gray & Co (USA) |
| 1990 | Government of Kuwait | PR campaign against Iraq, creation of negative image of Iraq in the press | Hill & Knowlton (Great Britain) |
| 1991 and 1992 | Government of Croatia | PR campaign among US politicians, government members and officials, media counselling, organization of tours for politicians, support for Croatian war aims | Ruder Finn Global Public Affairs (USA) |
| 1991 | Provincial government of Kosovo | Pro-Albanian PR campaign in the international media | Ruder Finn Global Public Affairs (USA) |
| 1992 | Government of Bosnia-Herzegovina | Contact with media, founding of Bosnia Crisis Communication Centre, organization of press conferences, international correspondence for the government, placing of leading articles in *New York Times* | Ruder Finn Global Public Affairs (USA) |
| 1993 | Government of Croatia | Intervention with American media politicians and scientists on behalf of Croatian war policy | Ruder Finn Global Public Affairs (USA) |

Beijing, Radio Cairo, Radio Pjongyang, Radio Havana, and Radio Tirana.

The latter third of the twentieth century has seen a hitherto undreamed of increase in propaganda through the development of a new business sector: governments waging war have commissioned public relations agencies to manipulate the global press and to mislead global public opinion. Table 28 lists the most important activities of this nature since the 1960s. One of the most outstanding examples of this kind of propaganda work was the testimony of the Kuwaiti girl Nayirah at a hearing before the US Congress in the spring of 1991 on Iraqi human rights violations in Kuwait in August 1990. The girl testified that Iraqi soldiers had thrown babies out of incubators in a Kuwaiti hospital. Whereas this 'incubator story' contributed to legitimizing US Gulf war policy, today we know that it was nothing more than a professionally prepared performance put on by a public relations agency that received a fee for its work. And incidentally, Nayirah was later revealed to be the daughter of the Kuwaiti ambassador to the United States.[3]

## CONTROL

According to the legend, Dionysos I of Syracuse (404–367 BC) possessed a whole range of surveillance and control instruments to keep an eye on communication. For instance, he is said to have listened in on conversations between prisoners in his dungeons, by means of long subterranean passages with special acoustic qualities that led into his house. He is also said to have set up megaphones in large stores, which were used to communicate orders. Everywhere in his palace, so it is said, there were speaking trumpets built into the walls which conveyed all conversations taking place there to his agents, such that the ruler was always informed of what was currently preoccupying his courtiers.

In other words, then as now the media are technical instruments with a dual-use character; as is the case with all technologies, the media are always a means of control and rationalization in a comprehensive sense. They can be used in both a communicatively liberating and a communicatively repressive manner, with concomitantly different effects. In this connection, Oliver Cromwell's 1657 justification for enforcing use of the state postal system is notorious: 'The post will be one of the best means of discovering and preventing dangerous and loathsome attacks against the Commonwealth.' Here too it is clear that there exists a systematic connection between free and controlled communication.

What is true for the British postal system under Oliver Cromwell is of course also true for later information technology. For instance, in 1920 the US Senate learned that all telegrams between the USA and Great Britain were being read by the British, on the orders of the British Admiralty in London. The background to this affair was as simple as it was alarming: the British Government had granted the American telegraph company in question the right to conduct its business, only on condition that it agree to the British Secret Service's plan of surveillance. This example of American-British information control is the classical precedent for the Echelon project of the late 1990s. In 1998 the Scientific and Technological Options Assessment Program of the European Parliament published

a study on Echelon. The latter is a surveillance and control system for the routine global tapping of fax, telex, email and telephone communication by United States secret services. In the Echelon project, the USA works together with the police and military forces of other countries.

Historically there has always been a very intimate relationship between communication and the military. The latter has helped to create a whole range of new information technologies and media, for which it has itself had an insatiable need. And in peacetime, though much more so in wartime, the military has controlled civilian communication structures.

Thus it is no wonder that it was the Swedish ministry of defence that in 1979 for the first time drew global attention to the growing vulnerability of modern computer networks. The notion of deliberately destroying computer networks has given rise to what has been dubbed at the end of the 1990s the 'information war'. In future wars, it will not so much be a question of causing the enemy material damage but of deliberately destroying his information structure. The focus of war will be, precisely, information war.

After the anonymous terrorist attacks on the World Trade Center in New York and the American Defence Ministry in Washington on 11 September 2001, many states greatly intensified their surveillance measures and information controls. Since then, civil rights in the USA have been drastically curtailed by the Patriot Act. This act grants the state great possibilities in the realm of information technologies for bugging telephone calls and reading e-mails, prosecuting computer hackers inside (and outside) the USA. It also considerably restricts the Freedom of Information Act, which, until now, has allowed citizens access to view government files. In Germany too, state control of information has been increased. Between 1995 and 2001 official surveillance of private telephone calls has increased five-fold with currently about 22,000 surveillance cases per year (needless to say without a parallel five-fold increase in the number of successfully investigated crimes). In view of such trends, the German philosopher Jürgen Habermas speaks of a 'restriction of the constitutional rights of one's own citizens'.

Information control is by definition especially difficult to establish in those cases in which it apparently takes place with the agreement of those who are being controlled. In the mass media, this is illustrated by the TV series *Big Brother*, which began in the Netherlands in 1999. In this series, 24 cameras register for 24 hours a day the activities of 'volunteers' in a closed living area. At regular intervals, TV viewers force one of the participants to leave the living space and end the game, voting by telephone or via the Internet. Are the TV viewers controlling the game? What is the difference between players and viewers? Which party is the more cynical? Experts are labelling this type of TV programme 'sensation', 'stress', or 'clink TV' – it is has already been exported with great success. Control through information technology and the mass media takes place independently of whether power is exercised by government or by private industry. Above all, it takes place in people's everyday lives. In industrial countries in the closing years of the twentieth century, socialization means above all media socialization. As agents of socialization, the mass media make a significant contribution to members of society's ability to comply with a range of social norms and role expectations, as they pass through social learning processes.

Integration as a concept can scarcely be separated from socialization. The mass media are the most important agents for integrating social communication. This is especially true of many young nation states who achieved independence only after the 1960s.

Admittedly, social control through the mass media has proved to be problematic in many ways. Firstly, a shifting of the socialization process from primary to secondary (media) experiences increases alienation; secondly the contents of media offerings are ethically questionable. Thus as early as the 1970s, Luis Ramiro Beltrán, the 'father' of Latin American communications theory, established that the following twelve elements constitute the basic norms of the world of TV: individualism, elitism, racism, materialism, adventurism, conservatism, conformism, defeatism, belief in fate, fixation on authority, romanticism and aggression. The large increase in the number of TV channels since the 1980s has probably led to a strengthening of these twelve basic media elements, rather than to plurality. For it is a sobering observation that the multiplication of TV channels has not led to an enrichment in terms of content but simply to a multiplication of the same old content.

Whereas up into the 1980s social control exercised via the mass media was demonstrably the result, effect and function of conscious political action on the part of state and government, the deregulation of the mass media under the pretence of neo-liberalism is bringing this state of affairs to an end. By pursuing a policy of deregulation, politics is voluntarily handing over control of the mass media to the markets.

## ACCESS

First of all, rights of access to information are quite old, and secondly, they are derived from two differing legal traditions. Thus the legal instrument of access to official documents was already recognized in the Swedish press law of 1766. This law exemplifies one of the two legal traditions, namely that of democratic control over government conduct with respect to information. The second legal tradition is based on the development of social rights in the form of participatory rights.

In the European Union, national rights of access to public sources of information exist in Denmark, France, Greece, and the Netherlands. In the Netherlands, such a right of access is even guaranteed by the constitution (Article 110). In the USA, rights of access to certain information sources are regulated by the Privacy Act of 1974 and the Freedom of Information Act of 1977. The 1986 Sandinista constitution of Nicaragua is also interesting in this respect: Article 30 regulates freedom of speech as an individual right; Articles 66 and 67 both include regulation of the right of access to information as a social right. All these laws and constitutions in one way or another regulate the right of access of citizens to collections of information held by the government or by public authorities.

Rights of access to information have the following functions:
- popular control of government and administration;
- transparency in executive conduct;
- endowment of citizens with informational competence.

Even from an economic perspective, rights of access to information are both important and an explosive subject, since in many countries government is still by far the most important and largest producer of information and knowledge, in the following forms:
- public school and university systems;
- offices for collecting statistics;
- the production of information (including concomitant publications) in all areas of public administration;
- extensive R&D activities financed by public funds;
- government activity with reference to patents and standards.

Contrary to popular belief, detailed access rights to information and knowledge in public archives would have considerable advantages for private industry:
- The ambiguous, unstable legal relationship between private and public information markets would become more stable and predictable.
- Public authorities would be forced to take precise stock of their information and knowledge, thus allowing for more effective business practices.
- Clearly formulated rights of access to information would reduce the number of publicly controlled copyrights, since under such clearly defined conditions everybody would have the same right of access to the same information.

Rights of access to information may conflict with other rights (such as rights of personality, data protection rights, industrial secrets, and security interests). As in many other legal areas, so in that of rights of access to information, there is a difference between de jure and de facto rights. For instance, rights of access may be rendered ineffective by prohibitive fees. In addition, rights of access to information assume the existence of a knowledgeable citizenry that is aware of possessing such rights. Thus rights of access can de facto be effectively claimed – with some chance of success – only by a socially privileged class of 'information rich'.

A consideration of rights of access to information are (directly or indirectly) also to be found in all debates on social rights. But there can be no right to development, such as was formulated in a UN document in 1978 by the African expert in international law Kébe M'Baye, if there is no guarantee of access to information. A right of access to information guaranteed in international law becomes more important, and from the point of view of Southern countries more logical, the more the gap between the 'information poor' (developing countries, small countries, national minorities, impoverished sectors of the population in industrialized countries) and the information rich (the USA, the EU, Japan and some fast-developing Asian countries) increases – i.e. in the whole area of high tech. It was precisely against this background that, in the 1970s, lawyers and communication scientists Jean D'Arcy, Desmond Fisher and L. S. Harms developed the legal concept of a 'right to information' as a social participation right, a concept which they later developed into a 'right to communication'. In the MacBride Report *Many Voices, One World*, addressed to UNESCO in 1980, L. S. Harms formulated the case for such rights thus:

> Everyone has the right to communicate: the components of this comprehensive Human Right include but are not limited to the following specific communication rights: (a) a right to assemble, a right to discuss, a right to participate and related *association* rights; (b) a right to inquire, a right

to be informed, a right to inform, and related *information* rights; and (c) a right to culture, a right to choose, a right to privacy, and related human *development* rights. The achievement of a right to communicate would require that communication resources be available for the satisfaction of human communication needs.[4]

From such considerations the MacBride Report came to a single conclusion:

The call for democratization of communication has many connotations, many more than are usually considered. It obviously includes providing more and varied means to more people, but democratization cannot simply be reduced to its quantitative aspects, to additional facilities. It means broader access to existing media by the general public, but access is only a part of the democratization process. It also means broader possibilities for nations, political forces, cultural communities, economic entities, and social groups to interchange information on a more equal footing, without dominance over the weaker partners and without discrimination against anyone. In other words, it implies a change of outlook. There is surely a necessity for more abundant information from a plurality of sources, but if the opportunity to reciprocate is not available, the communication process is not adequately democratic. Without a two-way flow between participants in the process, without the existence of multiple information sources permitting wider selection, without more opportunity for each individual to reach decisions based on a broad awareness of divergent facts and viewpoints, without increased participation by readers, viewers and listeners in the decision-making and programming activities of the media – true democratization will not become a reality.[5]

Rights of access to information are a controversial issue in the conflict between North and South in so far as the developing countries seek to use these rights to guarantee access to the knowledge of the rich industrial countries, whereas the latter vehemently refuse such access as not in accordance with the laws of the market. On this point, it is interesting to note that the legal concept of 'access to data and information' also occurs in the OECD Declaration on Transborder Data Flow of 1985. As the developing countries are not represented in the OECD, the guaranteed rights of access to information in question here have to do with a very different set of interests: the Europeans in the OECD were concerned that they might be cut off from American information sources.

In the world of digitalized electronic networks, problems of access have increased in complexity on at least two levels. First, faced with an information and communications sector, which is expanding at a tremendous rate, the priority of most European constitutions must be to reach a clear understanding as to what are so-called basic services and what are so-called Value Added Network services. It must be a matter of general agreement that basic services be subject to public infrastructure control that has constitutional weight behind it. All citizens should have free access to such basic services. Second, this political problem is accompanied by one of a technological and economic nature. Digital TV is based on three technologies: multiplexing (the digitalization of programme content), navigation (electronic programme guidance) and conditional access (encryption technology). Whoever has sole control over these three technologies can determine which programmes viewers may access. These new technologies considerably complicate the problem of access. In addition, this whole complex of problems has a further influence on economic competition in the digital TV sector.

Ever since the US telecommunications concern AT&T launched its advertising slogan 'One system, one policy, universal service' in 1909, the meaning of the concept 'universal' has never been clear. Does it mean 'everywhere' or 'for everybody'? And is the concept to be interpreted empirically or normatively? Should it be intended as a normative claim, then one would have to examine very carefully whether the right to communication as a basic human right hides nothing other than a desire to create ever-expanding markets.

## CONCLUSION

Information technologies and the mass media have radically altered the relationship between individual and society in the twentieth century; above all they have altered the relationship between intimacy and publicity. The American sociologists Richard Sennett and Christopher Lasch describe these changes in their books *The Fall of Public Man* (1977) and the *Culture of Narcissism* (1979), respectively. By establishing a quasi-intimate relationship to their public via TV, politicians have helped abolish public life and replace it by the tyranny of intimacy.

The twentieth century has been above all a century of news services of the most comprehensive kind. The most important agent in the systematic collecting, reading and accessing of exclusive data has been the state. Its power vis-à-vis the individual has been based on its ability to employ statistical methodology and information technologies in order to collect, store and evaluate data on the entire population as it aged, as it lived and travelled, in sickness and in health. With deregulation of information technologies and the mass media at the end of the twentieth century, and with the emergence of globalized societies, the state and the rationale it embodied are becoming increasingly less efficient. The networking of society, through distributed networks, heterarchical forms of communication, and interactive media is multiplying, individualizing and decentralizing Big Brother. In collecting, reading and accessing information, government authorities must compete with non-government institutions: industrial concerns, organised crime, and terrorist organizations.

In 1956, the Austrian philosopher Günther Anders published his two-volume work *Die Antiquiertheit des Menschen*. Speaking of TV, he coined the term 'mass hermit'. He was referring to television's tendency to create a form of depoliticized individualization. What Anders, writing before the age of TV, conceived of theoretically has after fifty years of mass TV culture become reality. Television, having isolated the individual, has created a breed of mass hermits who are incapable of political engagement. At the end of the twentieth century, the American social scientist Reg Whitaker has spoken not of the mass hermit but of the end of privacy, and the German political scientist Volker Gransow has declared that mass communication is incapable of generating dialogue, having evolved into a form of autism, in which the individual communicates simply with itself.

### SCIENCE AND TECHNOLOGY IN WESTERN EUROPE SINCE 1914

The countries of Western Europe played a leading role in science and technology throughout the twentieth century. Their direct contributions include the invention and production of knowledge, the specification of practices and establishment of norms, technological developments and the creation of high-tech and science-based manufacturing. To assert this much, though, is not to imply that nothing changed in the course of these decades; on the contrary, there were many transformations, both in the importance of Western Europe relative to other countries and regions of the globe, and in the manner in which the production of knowledge was organized and linked with politics, society, the economy, law, and cultural and military concerns. Before 1940, Western Europe's role in the production of scientific and technical knowledge was crucial, and often preponderant; but in the immediate aftermath of the Second World War, it became much more restricted and though still considerable, was no longer dominant. In addition, the manner in which knowledge itself was generated underwent major changes in the course of the century, both in terms of its organization, regulation and assessment, but also regarding the 'products' techno-science proposed, particularly as applied to technology. Not to belabour the point, we could simply observe that the century's first seventy years were characterized by one 'regime' of science production and regulation, while another somewhat different regime took its place during the last thirty years. The first of these regimes may in turn be subdivided into two periods, separated by the Second World War.

The best way to approach the subject in hand, therefore, is to proceed chronologically; and our first task is to show in what ways the first two thirds of the century differ from the last. There are two crucial notions here: (1) during the first period, the production of knowledge was essentially a matter for national governments; it was dominated by the building of (and international equilibrium among) nation states; for the last thirty years, by contrast, it was a much more widely distributed affair, the many parties involved operating in a political and economic world that we may provisionally describe as one of globalization and liberalization; (2) between these two phases, science and technology radically changed their own ways of working; they have shown a great capacity, through IT and biotechnology, for transforming our physical, social and personal worlds, and have accordingly given rise to public dissent (e.g. the vigorous debate on genetically modified organisms [GMOs] in the 1990s) – in contrast to the earlier period's relatively general consensus, which approved of science and indeed on occasion idealized it. We thus have a fairly clear difference between the period 1910–70 and the three following decades, in terms of the production of scientific and technical knowledge, the form such knowledge took, the way it was received by society, and the way it has transformed and complemented our lives.

There are also some very noticeable differences between the century's first four decades and the three that followed the Second World War. The most radical difference between these two periods was something set in motion by the war: the pre-eminence of military considerations in the evolution of science and technology, and the fact that war did not stop, but shifted almost imperceptibly from a 'hot' to a 'cold' war. This entailed a sustained mobilization of the best scientific establishments in East and West; science was deployed both for the creation of new physical devices and also for optimizing the organization of people, processes and systems along operations research lines and transforming the management of both production and administration. Developments in electronics, nuclear technology and materials science led to major transformations in industry, the art of war and everyday life. The role of the state in society (the post-war heyday of the welfare state) and in the economy (as Keynesian policies became standard) reached tremendous proportions.

This chapter will accordingly be arranged in three main sections. The first will expound the idea of a 'regime under which technical and scientific knowledge exists and is produced', over time: it will consist of general observations and some methodological points. The second section will deal with the years from 1900 to 1970; after some description of this crucial period as a whole, distinct subsections will be devoted to its two divisions 1900–40 and 1940–70. The final section will deal with the century's last three decades.

## SCIENCE PRODUCTION AND REGULATION IN SOCIETY

We often speak of science as if it consisted of 'pure' knowledge, which is developed within the special surroundings of academia, and finds (or does not find) applications elsewhere. This perception is fraught with difficulties pertaining to the new knowledge invented in Western Europe some four centuries ago, and particularly so for the hybrid of technology and science that blossomed from the end of the nineteenth century and totally dominated the twentieth. Ever since the moment in the seventeenth century we commonly call the Scientific Revolution, science in the West has been viewed as a means of interacting with the world and a way to master it for practical ends. Ever since this redefining of the way knowledge is acquired and especially the role of experimentation and mathematical formalism that distinguishes 'modern science', the trinity of discovery, instrumentation and invention have been intimately linked. Despite the close interrelations, the reorganization and creation of modern science has never been a single operation (conducted by an institution such as the Royal Society or by an outstanding individual such as Galileo). Nor was it the working out of an explicit, unequivocal or even deliberate programme (e.g. the 'Baconian programme' or the 'mathematization of the world'); nor did it have a single source (the revival of Platonism), or reflect the *implementation* of any coherently pre-conceived project: on the contrary, the mutation was the doing of many participants with at least as many motivations, all aiming independently at their own objectives – but in their interaction generating a shift in the overall economy of knowledge and its production, a radical transformation in the ends pursued and the means employed, a transformation of ourselves as social beings and of our potential, our capacity to act on and make use of the world.

This overall mutation was the doing of the knowledge-producers on the one hand – in universities, naturally, but not exclusively, as there were also the Jesuits, the designers of fortifications and artillery, the researchers in Academies and Observatories, and the worlds of the architect, the naturalist, the navigator and traveller, the progressive agriculturalist – but also of the authorities, temporal and spiritual, on the other hand, all adapting to and profiting from the changes around them in pursuit of their various objectives. These institutions included the princely or royal courts, arsenals and warriors, trading companies and entrepreneurs, philosophers and theologians, politicians and critics. It was the doing of a colonization or penetration of the universities' narrowly defined classical purview, with its particular practice of 'natural philosophy', by new procedures and new approaches. The most important

among these featured the *ingenium* (source of both 'ingenious' and 'engineering' in English), of the mechanical arts in combination with mathematics. Such colonization led to a revolution in the nature of intellectual work, an utter transformation of the ways of thinking and understanding (from those of the academic scholar to those of Galileo, Pascal and Boyle), of the place of mathematics in explication, of the relationship of knowledge to experience – from the everyday *experientia* available to all, the favoured criterion of the Aristotelians' treatises, to the private, contrived *experimentum*, rigorously controlled by devices and mechanisms. It led to a change in the kind of debate acceptable among natural philosophers (from the formal public disputation to Baconian-style reporting of observed 'facts') and in the kind of place where such work must be conducted if it was to be legitimate and 'valid': professional scientific discussion in association with what we recognize now as the laboratory.

These are familiar points, sketched here only in outline; but what we still need to do is to work out the overall structures organizing the production and regulation of knowledge at a given moment in history and a given region of the world. In short, we need to describe the various ways in which the sciences exist within society, the various arrangements or, as we prefer to put it, the various *regimes* under which knowledge exists, is produced and regulated.

The idea of a 'regime' for the production of scientific knowledge is based on two observations. First, the fact that what we include within the scope of the term 'science' is by no means a 'thing', objectively delimited and stable over time, which we need merely describe ('science is a system of mutually consistent statements', say, or 'science is the activity of pure knowing'. No: science (or should we say the sciences? or scientific practice?) is made up of a whole set of relations involving *perceptions* and *issues* which may vary depending on the individual or group; all sorts of products (writings, results, techniques); practices (instrumental, modes of calculation, simulations); values and standards (epistemological, moral, behavioural); institutional surroundings (laboratories, schools of engineering, start-ups); avenues of connection with the political and social world (salons, amateur groups, learned or professional societies) and many other things besides. This concept of a *regime* for the existence and production of knowledge is based, then, on the fact that there is at any given historical moment a particular arrangement of all these elements, and that arrangement takes the form of a certain social understanding and certain practices of production and political management. Science is always embedded within given social and political forms; it depends on and in turn helps to shape the individual and collective existence of human societies, their forms of organization, and their social values.

The idea that there are regimes for the production of knowledge refers therefore to a legitimate structure of such knowledge, to a hierarchy ('mechanics is the most complete science in 1900') and to a way of life in the world. It refers to a particular form of regulation (the peer evaluation system, as opposed, for example, to the setting of science policy by the state) and to a style of social existence (consider the high status of 'pure science' and, by contrast, the promotion of the 'scientific entrepreneur' nowadays). It also refers to an expression of priorities in actual social circumstances, to the fact that the regulation of the world of science (modern

biotechnology, for instance, regulated by new rules for intellectual property) is not independent of the current forms of social or economic regulation. A shift in one register (the state and industry become major commissioners of science in the twentieth century) opens up possible shifts in others (science must develop metrology and cultivate precision to the utmost) – and vice versa (the mechanics of high precision was the precondition, via the provision of accurate machines, for the second industrial revolution; biotechnology radically influences our lives via the pharmaceutical companies and agro-business). Lastly, this idea of regimes governing the production and regulation of knowledge refers to the standards according to which, whatever the register, not only truth and falsehood are predicated, but also, to a great extent, right and wrong, good and evil, the desirable and the undesirable, the noble and the base.[1] It contributes directly to our determination of what is legitimate and good, which governs the relationship between knowing and not-knowing and that between individuals and groups. In short, the notion of 'regime' postulates interdependence among human activities and the existence of systemic effects that never fail to have their impact on the sciences and constrain them to take their place in history.

### Science/technology, industry and governmental regulation within the framework of the nation state: the regime of knowledge from 1914 to the 1970s

This period, which started without any break the last third of the nineteenth century, saw a radical transformation of science and scientific practices, and of what it meant to 'be scientific' or to 'do science'. This was the age in which science developed a new set of production sites and procedures both in the laboratory and in theory. The universities opened up to technology and to industry (a phenomenon accentuated by the First World War); science became a core ingredient in the means of innovation, an essential tool in the arrangements of mass production – and a means of bureaucratic and industrial rationalization. Like other parts of the social organism, the laboratory became a more organized, more hierarchical place where the division of labour prevailed in the form of specialization. Science was taken in hand by national governments and mobilized for the preparation of war; it became an indispensable resource for the building of the nation state. In terms of education, this change meant the end of the Socratic ideal of wisdom so far as the hard sciences were concerned, or at least its marginalization.

This transformation of science meant a change in its purposes, its tools and its standards – and also in the sheer scale of the undertaking (the Bell laboratories were already employing many thousands of people in the 1920s). Indeed, we may speak of the predominance in this period of an academic and industrial science/technology on a massive scale, quite incommensurate with what had gone before; of the rise of a new social and technical construct characterized by three features: an increased efficiency of specialist scientific knowledge, most notably for industrial and military purposes; a concomitant interest in and sharply increased support for the products of science, and scientific activity in general, on the part of the various centres of power; and a proliferation and diversification of

sites at which knowledge and invention were produced, and of forms of dynamic interaction among all those involved, one way or another, in the mobilizing of science.

Thus science was reformulated; and this transformation of scientific practice, this emergence of a new regime for science and technology took place in a close and organic connection with a redefining of economics and politics, of the criteria of social justice – and of what 'the state' is, or ought to be. The primary thrust here, so to speak, was an idea that could perhaps be expressed thus: in the context of a balance of power among nation states engaged in preparing for a coming war (the Second World War, or a nuclear exchange with the USSR, depending on the period), a Science State becomes established, concerned with science, technology and invention for the higher good of the country; a War State, preparing to defend economic, political and imperial interests; a Social State, taking thought for the problem of the dangerous classes and guaranteeing civil peace. The establishment of these three aspects of the state proceeded in parallel: they constitute different facets of a single ambition, different branches of a single enterprise, to be found from Berlin to Paris to London, in Moscow as in New York.

Five particular points will bring these general ideas into better focus:

First, during most of the twentieth century competing nations defined themselves by their capacity for total mobilization, whether for self-preservation or expansion – and that included the mobilization of science and technology. The state was the entity which united the nation, which saw to its mobilization, and which coordinated it internally as well as for action abroad. The state apparatus allied itself with science and industry to prepare for war (on economic or ideological grounds) and to prosecute it successfully once actual fighting broke out. This they did through the production of weapons for the front and the mobilization of economic, social and political forces at home. In certain cases (Weimar Germany, for example) a lack of confidence in the state could lead particular elements, for instance industrialists and academics, to take its place as the embodiment of the nation and provider of its necessary defence.[2]

Mass violence was an object of theory – and indeed practice – during this period scarred by many conflicts both among states and between governments and sections of society: among the manifestations of this violence were the Holocaust, two instances of total war and one of a techno-scientific war many decades long (the Cold War), colonial conflicts that lent themselves to the foulest massacres (the systematic aerial bombardment of civilian populations, though it became a standard practice during the Second World War, was invented to quell revolts by colonial subjects) – and some political regimes that ruled through the everyday use of brutal repression. Violence has not, of course, been confined to the twentieth century; but that century did see a particularly inhuman violence, scientifically organized, technically rationalized, and with the close support of the highest practitioners of science.[3]

Second, during these years the state apparatus occupied a greater place in the general economy of our societies than ever before. True, the liberal creed continued to be reaffirmed; the market remained the predominant form of regulation; but the state became an omnipresent player, intervening with more and more legitimacy to regulate

REGIONAL SECTION

social affairs (with precedents established before 1914) and economic ones (from the 1930s onwards). Through taxation, it drained off an increasing proportion of national income after 1914, and from 1940 especially it became a key player in industry as well as in health policy. Forms of state-organized insurance had already been introduced in Europe by the end of the nineteenth century, through a combination of collective management and social groups with strongly defined subjective identities: the working class, for instance, represented by its trade unions and political parties, and more generally the classes and categories 'invented' – solidified – by the social sciences and the state apparatus, which gave them existence intellectually (in scientific sociology, for instance) and politically (in the operation of the Plan, or through collective bargaining agreements in France during the 1950s and 1960s, for example). For the state, as guarantor of social order and national power, social stability depended on a compromise between the classes, under its own leadership. In short, the state in this period became the arbiter for all of society, at the expense of self-government by civil society. This social state, or 'welfare state' was of course the inseparable reverse side of the 'warfare state', and the necessary condition for its deployment.[4]

Thirdly, over these sixty or seventy years the world of manufacturing was being remade in its objectives as well as in its practices and structures: mass production became the norm, as both products and forms of work were standardized. Factories saw new, scientific ways of organizing work and managing production (Taylorism, Fordism), and offices new ways of handling information and workflow. This was the age of the mega-organization, above all of the great industrial structures relying on science and technology for the basis of their power. The first large-scale industrial systems had, it is true, appeared during the nineteenth century (the railways, for instance); but it was between 1914 and 1970 that they became truly widespread and standard. More generally, these were the years when large-scale systems based on science came to dominate, when economies built on the rational mobilization of knowledge were built, in the laboratory, in the time-and-motion department, and on the assembly line. This movement towards large-scale production involved not only mathematics and the natural sciences, physics, chemistry, biology, medicine and hygiene, agronomy, but also the social and human sciences, including economics and management.[5]

Fourthly, science made its way (not least through the establishment of precise measurement standards) to the very heart of exchange and production, the rational running of huge organizations, and the innovation in product and process that provided the engine for the international economic and military struggle (continuously developing newer devices, designing new industrial or military products, refining production processes – in short, making all activities scientific). There came a certain equilibrium, or division of labour, between open, public science, whose primary seat remained the university, and a private science embedded within enterprises – the two being coordinated by a traffic of star researchers back and forth between the two worlds, and by the actions of the state, which had itself become an impresario of science. Thus a balance arose in the twentieth century among three worlds: science as the 'autonomous' affair of academic savants in universities and institutes of technology; socialized basic research and

standard-setting by governments and state institutions; and research conducted within industry. Lastly, there was a dominant belief in the possibility of a rational and superior point of view which could provide 'the' solution to any problem: with incontestable scientific credentials, and strongly allied to industrialists and to the state apparatus, the Expert ruled supreme.

Fifth, in knowledge itself there were four major trends at work during these years: (a) a tendency in favour of a generalized reductionism, made possible and effective by the mastery of phenomena at very small scales in the laboratory and by new theoretical approaches; these were the characteristic features of the physics of electrons, atoms, nuclei and 'elementary' particles, and later of genetics and molecular biology; (b) an attitude which was very often, under the influence of the industrial and military laboratories, a pragmatic one, prepared to mobilize all available means regardless of the established subject-boundaries of the university; such practices had appeared in industry as early as the closing years of the previous century, but were taken up by governments and by the military after the Second World War (operational research, for example, or the management of major projects that called for a redrawing of the boundaries between disciplines, such as materials science in the 1950s); (c) a greater use of mathematics and formalization procedures in general, and the extension of their realm to the whole of science and technology, and to its management, and eventually to the study and control of society as well; approaches based on statistics and calculation became general in all efforts to grasp reality: model-building, in particular, and later simulation; (d) a tendency in applied research and engineering towards fundamentals, an increasing emphasis on basic, formal science (in electrical engineering, in agriculture), as well as the central and primary role of scientists and engineers in the establishment of a widespread practice of precise measurement.

We shall now clarify these points further by studying two sub-periods in greater depth: one from the 1900s to the 1930s, and the other from the end of the 1930s to the 1970s, including the Second World War.

## From the 1910s to the 1930s: Nation states, the international balance of power, and science[6]

In order to understand the interwar years we need to go back a little further, for it was at the end of the nineteenth century that a new industrial world emerged, one already committed to the latest scientific inventions – the telegraph, chemistry, electricity, electrical technology – and moving towards radio, agricultural chemistry and, before long, materials science. That time also saw the creation of:
  – New teaching establishments: science faculties radically reorganized; additional capacity in the form of newly founded universities, schools and institutes of technology of all kinds, springing up in their hundreds the length and breadth of Europe.
  – New kinds of site and workplace: for instance, the research laboratories that appeared in industrial surroundings in the last decades of the nineteenth century and became the rule after the First World War in many European countries (and also in the United States: the majority of American physicists

were working in such places as early as the 1920s), or the agronomy research centres and 'extension' institutes, or standards centres such as the Physikalisch-Technische Reichsanstalt in Germany or the National Laboratory in England. These research institutions were of capital importance for the new economy, and had the task of developing the essential norms and standards for interconnecting networks, trading in products, the proper functioning of manufacturing processes, and the management of markets in general (definition of units, calibration, technical standards).

– National research agencies financed by the state (and sometimes by industrialists), aimed at socializing a portion of research and what later came to be called development: One example was the Caisse National des Sciences and the later CNRS in France, modelled and remodelled over four decades, which did not attain a final (massive) form until war was looming at the end of the 1930s, with the scientific mobilization of 1938; another was the Kaiser Wilhelm Gesellschaft in Germany, founded in 1911, whose laboratories developed over the following decades and which was joined by other institutions after the defeat of 1918; or the Department of Scientific and Industrial Research in England, a by-product of the war effort, established in 1915 but playing a central role in the interwar period as a coordinator of the country's civil as well as military research; or the Consiglio Nazionale delle Ricerche set up in Italy at the end of the war; and there were others.

– National laboratories, i.e. laboratories set up from scratch by governments in new areas of great technical potential (such as aviation after 1918), and intended to serve as cross-fertilizing links between the two worlds of academia and industry.

Laboratory work, for its part, was transformed: its products (both things and people) became the result of a hierarchically organized professionalism. This was the start, among other things, of the general institution of the teaching laboratory in universities, a place for training the new scientist/technicians, where know-how and mastery of instrumentation were the watchwords. To take just one example, from France at the very start of the century: the Curies' laboratory, remarkable in that the Curies are always quoted as being exemplary practitioners of 'pure' science. What we need to remember is that the Curies built the French radium industry from the ground up. Two years after the discovery of radioactivity, they sought the collaboration of a company, the Société Centrale des Produits Chimiques. André Debierne, the Curies' assistant, set about converting their laboratory techniques into industrial procedures, and was rewarded with a share of the radium salts extracted. Five years later, Marie Curie began working in collaboration with an industrial chemist, Emile Armet de Lisle; this time, it was Jacques Danne, editor of the journal *Le Radium*, who organized production. In 1907, Danne started his own laboratory, manufacturing instruments based on those in the Curie lab; and in 1908 another researcher left to set up the measurement and purification department of a company, this one founded by Henry de Rothschild.

Such behaviour – by no means exceptional in the world of French or other European laboratory-based science – is explained partly by the fact that only industry could provide

the material resources for the systematic practice of scientific research (in this case, radioactive elements of sufficient quality), but also by the fact that the researcher owed a duty to her or his country and its economic development. This requirement is clear in Marie Curie's lectures, when given to engineers, on the design of instruments for use in prospecting and in industrial activities, as well as in the continuing interest in medical applications. Pierre Curie was the first to address radium's biological effects and to work with doctors, while in the early decades of the new century Jacques Danne and other engineers who had been trained at the City of Paris School of Industrial Physics and Chemistry (where Langevin, Pierre Curie and later Joliot also studied) all contributed to the preparation of calibrated sources for medical treatments, and the evaluation of the dosages required for medical applications.

In this period, also, the physical sciences adopted a new approach more concerned with fundamentals; it provided a new conception of scientific research and laboratory practice, tending towards a reduction to underlying entities and a regression to the 'elementary' building-blocks of matter, whose combination should make it possible to explain the macroscopic world of the senses. It was no longer enough for science to study phenomena and construct systems of equations linking macroscopic parameters in order to progress towards a definitive and descriptive body of laws (e.g. Joule's Law relating work, electrical resistance, and the intensity and duration of a phenomenon). On the contrary, science was now opening a whole new Pandora's box, looking with the aid of the new instruments at the underpinnings of our world, on a scale which is not ours and had for that reason been left out of the rational world of earlier centuries' science. No longer was the agenda the mastering of phenomena by dint of finding the right shorthand for the interrelationships among the various macro-components (electric fields and intensities, for example), but the giving of experimentally verifiable meaning to the ancient notions of atoms and corpuscles, catching the infinitely small in the snares of experiment – and taming it, making it useful in its turn.

This work required not only new theoretical tools (quantum mechanics and its attendant philosophical issues were of course at the heart of this reform in the 1920s, from Copenhagen to Cambridge, from Paris to Göttingen) but also a radical transformation of the experimental techniques and standards defining properly conducted work. This was the product of the small-scale physics of the electron, discovered in the last decade of the nineteenth century (first in the Cambridge laboratory of J. J. Thomson and then spreading across Europe early in the new century), the discovery of radioactivity (initially in Paris), and then the physics of the nucleus and its constituents (again at Cambridge, with Rutherford and his circle, but also in Paris with Mme Curie, in Berlin with Otto Hahn and Lise Meitner, in Vienna, and elsewhere); it remained for nearly thirty years (until the emergence of an operational quantum mechanics) a more qualitative, composite physics than the 'precision physics' exemplified by classical optics and electromagnetism. To borrow Carlo Ginzburg's terms, we might say this was a physics governed more by a 'clue-based' paradigm than by a system of precise measurement and exactitude.

The years from the end of the nineteenth century to the 1930s, then, are those of the discovery of the 'particles'

themselves (they were to proliferate into a veritable menagerie after the war) – but, even more, they are the years when experimental techniques and materials were mastered, leading, over these three decades, to vacuum-tube electronics (diodes, triodes, magnetrons and klystrons, which proved vital for radar when war came) – and also to nuclear technology. Even in the century's first two decades, companies were recruiting electron specialists with the deliberate aim of improving telecommunications.[7] The same experimental expertise also led to atomic physics and chemistry (using the Bohr model of the electron cloud, and quantum physics) and to a new science of materials (most perfectly exemplified by the semi-conductors which were at the heart of these projects). More generally, the mix of high theory and practical concerns invaded these laboratories, and a readiness to cross subject boundaries appeared, along with new links among craft skills, industries and universities – the whole ensemble leading to powerful revolutions in scientific knowledge, techniques and industry.

This new way of doing physics, invented in Europe during this period, is (in its metaphysics, its modes of work and of explanation, its techniques, its standards for success or failure) a departure in a new dimension from the phenomenological physics of laws and the physics of precision which dominated the universities at the close of the nineteenth century and was the basis for the industrial revolutions of the telegraph, industrial electricity, and radio.[8] That physics by no means disappeared; on the contrary, it remained at the heart of most applied science until the 1930s, not least in its standard-setting and metrological functions. The techniques of astronomy and physical optics continued to provide the most effective means of defining the calibrations required by the mechanical arts, and mastering them for practical purposes (the interferometers of Fabry and Perot, for instance, as measuring and calibration tools in mechanical engineering before 1940). They were vitally necessary for industry. Nevertheless, another approach had arrived, one which was less concerned with precision and the establishing of standards for industry at the outset, but which would increasingly become, during the 1930s and the war years, the most powerful means yet of transforming the material world: theoretical and experimental physics at atomic and sub-atomic levels. It would do still more: it would go on to increase the scope for human action on the world, and after the war would open the door to a new stage in the history of humanity.

The new approach came later in the biological sciences, not really beginning until after the Second World War. Nevertheless, the early years of the century saw the appearance of genetics (Morgan and his school), the development of statistics in agricultural science, and the general adoption of the Pasteur model closely linking the study of microscopic organisms (bacteria), laboratory practices and laboratory products (serums and vaccines), and social practices of new kinds (the reform of hygiene).

At this point we should clear up one last thing: in the period we are considering here, the world of technology, science and industry was not the only scene of innovation, nor the only world that mattered. This was also a crucial moment in the consolidation of the nation state. It was in fact not only the time when what we like nowadays to call the 'knowledge industries' appeared, but also the moment when the nation was fully deployed and consolidated –

through the teaching of and reflection on history, through labour legislation and social security schemes; but also the moment when it took root in a material way through systematic investment in the technical and scientific fields. In this new world, scientists were no longer 'intellectuals', but professional specialists devoted to their individual subjects and to the pursuit of an advanced and highly specific knowledge. Their training was no longer a matter of passing on the search for knowledge and wisdom; it meant turning out specialists who had rid themselves of anything other than what would make a decisive contribution to the chosen field of practical, goal-oriented research. This was, indeed, the very issue between Ernst Mach and Max Planck in their great debate on the future of science before the First World War.

What we see here, then, is a profound secularization of science and its activities, their embedding deep within the industrial and ideological framework of nation-building. Where science had, at the end of the nineteenth century, been largely a private, local affair (carried on by regional academics and industries, in France for example), it now became the business of the country, of the nation state. In this sense David Edgerton speaks of a 'nationalization' of science, a process through which it became a major issue for the state, on an equal footing with military power and industrial peace: the development of science and technology became a shared concern of politicians, industrialists, and the military, as well as the grandees of science themselves. We can see differences from country to country in the forms this development took (from the organic collaboration in Germany of industrialists, Länder and national government, to France, where innovation in companies still depended mainly on the production designers rather than on separate research departments), but the establishment of a knowledge-based economy became a central issue in struggles for world domination.[9]

### From the end of the 1930s to the 1970s: the Second World War and the Cold War

The mobilization of 1938, the Second World War and the Cold War that followed without a break mark the high point of the integration, begun in the previous period, of industry, science/technology, and the state – with its duties of waging war, maintaining social unity and providing the framework and sustenance for a mobilization of the whole nation. This was the flowering of the welfare state model, the system of protection for the weakest under active government protection; this is the coin whose other side was the 'warfare state', organized on the self-same basis. Both states were powered by science. This is the characteristic we turn to now.

At bottom, the culture of the years 1940–70 was one of constant emergency and permanent mobilization. Driven by a faith in utterly perfectible technology encouraged by the successes of the Second World War, these decades could not imagine that technique allied to science might not be able to solve all problems. This faith was universal throughout the industrial, political and scientific elites, and showed itself in the widespread belief that science was the origin of all technical development, which was in turn the source of industrial, economic and social progress (so ran the theories of the economists of technical change under the

linear development model).[10] The examples it could point to were Los Alamos and the enormous industrial complex set up by DuPont de Nemours to produce the fissile materials needed for the American nuclear programme – and it was this faith which drove research into nuclear fusion in the United States, Great Britain and the USSR until the mid-1950s; it underpinned the pharmaceutical industry's anti-cancer programmes and the scanning of molecules by mass-production methods; it established the policies that reorganized the farming world for ever greater 'productivity'. In every case developments were powered by the belief that coordinated technological and scientific action could, if enough resources were applied, do away with any difficulty and would lead to the solving of all problems, including social ones. These firm beliefs led to increasingly technocratic versions of politics, economics and military strategy, making great use of models and computers.[11]

The culture which thus came to flower during the war was not only a cult of the laboratory solution (technical devices, revolutionary molecules, new seeds). It was just as much a culture of management, of action for which science provided the framework, of subjecting populations to experiments (always thought of as legitimate and modernizing) – it was a culture of analysis and planning, stemming from a central core where those with the greatest power and prestige were those with knowledge: the state and the experts, scientific and industrial. During the Second World War and the Cold War, the military and the industrialists learned that if solutions were to give quick and effective results they must always be technical and logistical, must involve hardware and personnel management. It was the same for health: if the new molecules were to be properly evaluated, and the neutrality of the assessments publicly guaranteed, large-scale treatment trials must be organized. The industry had, it is true, conducted procedures of this type as early as the nineteenth century; but the change in the scale of these activities, the new, centralizing role played by the machinery of the state (often the key actor in decision-making processes because of the war situation), the voluntary mobilization of the best scientific and mathematical brains and the unshakeable trust in the legitimacy of actions taken in the name of Science led to a qualitative change in these programmes and their impact.[12]

The *elites* that supported this movement had in common the fact that they had directly contributed to the war effort. Some, of course, were military officers, especially those from the middle ranks who had been in direct contact with the scientists and engineers, and had been in a position to form an opinion of their methods on the battlefield or in the fight against malaria. Others were supervisors, middle managers, or captains of industry, who had served in Operations Research departments or in the field during the conflict (the obvious example here is, of course, Robert S. McNamara).[13] Then there were the inventor/theoreticians, the systems designers, the technicians thoroughly trained in science, people working in signals processing (Shannon at Bell), on new calculating machines (at IBM), in polymer chemistry (at DuPont), in aviation R&D and missile design (at Douglas Aircraft), in industrial pharmacy or agricultural chemistry. Lastly there were the physicists, mathematicians, logicians, economists, specialists in human, plant and other branches of biology, psychologists and anthropologists, each for a while immersed in the world of war, the world of solutions to be found and made to work as a matter of

urgency. The war offered them virtually unlimited opportunities to do and to invent; it freed them from financial constraints, and allowed them to scheme schemes of extraordinary scope.

These people learned how useful and effective a pragmatic approach could be when only the result mattered, when all imaginable resources were used to the full (from psychology and propaganda to logic and engineering techniques) and no appeal was allowed to any outmoded value system (such as the Comtean hierarchy of branches of knowledge) against the only valid criterion, immediate effectiveness; they learned to define their own problems and solutions, ones that were to be applied rationally even in the face of the opinion of the populations concerned; they learned, above all, the benefits of work distributed within a collectivity, of starting with 'brain-storming' sessions (within a framework of 'think tanks' and 'summer schools'), and the importance of then continuing with meticulous organization. As they did so, they developed a general pattern for action, a *modus operandi* consisting of: (1) precisely define the objective, which must allow progress to be monitored and achievement measured, (2) create a committed action group including all the forms of expertise that might be needed to tackle the problem, no means being ruled out *a priori* (not even for ethical reasons), (3) lay bare the situation in every way made possible by a combination of hardware and software, hard science, engineering science and social science, (4) find the right angle of attack and set out a procedure to be applied for finding a solution, (5) operate on a massive scale, in a coordinated way, mobilizing all available resources, (6) evaluate the results, numerically if possible, at every stage, then move to the next operation. During the 1940s and 1950s this *modus operandi* designed for war became the standard of every properly conducted campaign, whether one was doing physics, organizing treatment trials or reforming social institutions at home or in the colonies.

The invasive 'Proministrative State' (to use Brian Balogh's well-established term),[14] which was a political form of regulation based on a close association between a power centre and the experts it helped to organize into autonomous groups, was therefore to be found not only at the heart of the systems of innovation in manufacturing; it was equally at the heart of the management and reform of social relations and their regulation – at the heart of state power. This new state imposed its definitions and activities over such a wide scope for various reasons, some political (mounting conflicts, the need to enhance and rationalize the management of industrial and political systems that had become huge), others economic (the recession of the 1930s, the policies applied to cope with economic crises, Keynesianism), others ideological (the fight against Communism); but this was above all due, once more, to the Cold War: it was necessary to demonstrate the superiority of one social, political and economic system, that of the free world – and that meant developing forms of a Social State which could serve as a model. Though liberalism might be the official watchword, there was no denying the general situation: that in Western as in Eastern Europe, the lion's share of the national wealth during these years was being absorbed and redistributed by the state.

This Proministrative State is crucial if we are to understand the nature of the social compromise established at this time. In a nutshell, these years showed the characteristics of a wage-earning industrial society in full

growth – providing for a redistribution of income towards wage-earners as well as opportunities of advancement for lower social strata and an extension of social protection and integration (social security and pension regimes, principles for managing industrial conflict.). The future was bright, the outlook one of progress, and the models of consumption, education, and culture were converging. The new working class was enjoying better conditions – was becoming bourgeois, as people say. 'Egalitarian' and democratic projects redefined the main principles of a just polity in the public domain, and an 'anonymous', automatic form of solidarity, most often organized by the state, steadily replaced earlier forms. In all Western European countries the state had the legitimacy to act on a massive scale as regulator and redistributor of goods and services; within a codified framework of industrial relations, and in partnership with social groups organized and represented by trade unions and political parties, the state promoted arrangements for the defence of the weakest and an ideology of reform as a precondition for the advancement of all. This social and political dynamic benefited from economic growth and the development of world trade, and the individual became emancipated at the expense of earlier solidarities (of kinship, neighbourhood, religion). Though markets were still the prime mover in this dynamic, the state intervened far more directly than in the previous phase to correct their disturbing effects, to ensure the cohesion of social organization and drive it forward towards 'modernity'.

Individuals might to some extent free themselves from the most traditional structures of control; but these societies nevertheless remained highly structured into groups that people were subjectively very aware of (it is not, in this sense, illegitimate to say they were still truly 'class societies'); they were also very hierarchical in their functioning and values. The organization of labour, for example, followed in the footsteps of Taylor and Ford, with a clear separation of design and power on the one hand, execution and submission on the other. This top-down mode did not apply solely in business: it was burned into the very notion of the state and of its management of the social nexus. It applied to healthcare regimes, centrally run by professionals and liable to diminish responsible behaviour before long; it applied to the functioning of public administration (where the 'users' had no recognized rights) and in passive and consumerist modes of consumption – whether of material goods, offered in ever greater quantities, or of services such as education. Its counterpart consisted of the statutory and social benefits that guaranteed social protection and some mitigation of social exclusion, a restraint on income disparities, and (relative) stability of employment. Not too much should be made of this feature, however. There was real life in a movement composed of associations, sometimes guided by the representatives of organized social groups (religions, trade unions, works councils) and supported, in terms of infrastructure, by a state which was concerned to add to the collective and political mechanisms of assistance to the most underprivileged. Through such state activity there arose a professionalization of social work, a taking over and rigorous organizing of those aspects of society which functioned as guarantors of solidarity. There was accordingly an inherent ambiguity in these practices: they tended towards a centrally run, 'authoritarian' direction (even though they left the individual some real opportunities to act), but they brought definite advantages to the most deprived.

These decades also mark the high tide of a society that saw itself as composed of groups, in balance and in conflict; such a group identity was reflected in scientific thinking of the day. During the three 'Heroic Decades' (the post-war boom) the social classes were very strongly marked not only in general awareness (for example in working-class pride, in its organizations and associations), but also in the European social sciences: they were the source of very strongly felt identities, fundamental to the social and political imagination, nourishing the life of parties and embodied in people's customs, dress, and amusements; but they also had their existence through the political and social effects of the science of public administration, itself built upon the scientific constructions of sociologists and political scientists; they left their mark on statistics (the obvious use of socio-economic or occupational 'categories'), on forms of social and industrial bargaining, and on the participation of these groups, represented as such, in the running of the state.

Outside the social sciences, the process of reduction to fundamentals reached a new level. It now meant two things: first, a practical ability, developed in the laboratory, to bring to light and manipulate an extraordinary number of elementary particles (in physics) or molecules (in chemistry and biology), an ability first to measure and purify and then to rearrange and make use of these elementary units ('molecular jets' were produced, for example, and genes sequenced). This practical mastery involved highly sophisticated instruments, many practical skills (as in today's biotechnology) and very powerful tools for formal layout and calculation. Secondly, we see sophisticated theoretical constructs built on these micro-entities, theories which guided laboratory practice and so increased its effectiveness severalfold. The physical sciences manipulated (practically and theoretically) artificial, laboratory-produced materials; biology manipulated macromolecules and genes; and the industrial transcription of these instrumental and experimental techniques was present from the very outset. We find, therefore, a constant tension between the highly abstract and the utterly material, a combining of theory and calculation (through models, for instance), and an intimate link between experiment and technique; scientists moved from work on paper to work with calculation resources and then to work at the bench; there was a constant traffic between the laboratory, the standardization of techniques and the production stage, between the most abstract science, the standardized instrumentation and technical development; and one no less constant between academia, industry, and military, administrative or political circles.

These perpetual shifts from one register to another were in fact the result of different but interrelated institutions: nuclear physics in constant contact with industrial laboratories developing lasers; the tools developed by physics technologists moved across and reordered chemistry and biology (the use of spectrographs and NMR techniques in chemical analysis, of electronic microscopes and electrophoresis in basic and industrial biology); social sciences, also, were directly affected (strategic thinking, game theory, systems analysis, psychology). Industrial and military or quasi-military research laboratories were at the heart of the machine (in electronics, materials physics, aeronautics, computers, chemistry, modelling, simulation and pattern-recognition techniques; also in agricultural science, economics and social science, and urban planning). New domains (oceanography, the study of the upper

atmosphere and space science acquired through rocketry), as well as new models of social management and industrial production (organization of the ballistics programmes, the formalization of PERT [Program Evaluation and Review Technique] and, later, PPBS [Planning, Programming and Budgeting System] in management); and, lastly, whole new realms of science and technology came into being, typically featuring close links between universities and the creation of knowledge-based enterprises.

This political and economic application of science for the high purpose of the nation at war, under the strong stimulus provided by governments, was nevertheless still a business carried on primarily by private enterprise. The contradiction is only an apparent or superficial one: all through the century, and most of all during the Cold War, big corporations worked both in their own financial interests and for the higher national good. This is quite clear in the case of France, since the state itself contributed to the creation of these industrial giants (many of them nationalized), and even regarded it as its business to step in when their will faltered (the triumph of Gaullism); it applied also in Germany, where such companies acted both for their own advantage and for the national security – with the blessing and the financial and intellectual support of an interventionist federal government. It is national government policy which explains the growth of these mammoths and provides the key to understanding the period's rapid changes in technical systems (this was the case of transistors, which were made economically profitable only by a policy of steady subsidies financed from United States military budgets over a whole decade). Even today, indeed, in the all-powerful field of ICT, the state and the military are never very far from private corporations, nor the latter from the national interest; we will return to this below.

We may conclude this section by stressing one last point: though the model of the nation state, as defined from the mid-seventeenth century onwards in its dual relationship to a geographical territory on the one hand and an international balance of powers on the other (the regime instituted with the Treaty of Westphalia, now world-wide), retains all its relevance – once democracy bursts upon (or spreads across) the European scene in the nineteenth century it leads to an utterly radical transformation of the state's place in society and, indeed, in the symbolic order. This democratic irruption contributes, of course, to the gradual emergence of the Social State and its growing involvement in the arrangements for education, health and social protection; but it also helps to make this state a 'thing' in its own right, and before long a dominant one, a reality which takes its 'natural' place at the nerve centre of society. At its most extreme, it actually identifies society with the state.

The state did indeed become a managerial apparatus, a rationalizing bureaucratic institution based on scientific thinking and applying scientific or innovative policies – but it did so by occupying an area which soon involved it in providing a structure for the whole of society. The state was a modernizer, anticipating the future, arbitrating among different economic, strategic and social scenarios – and in this sense it became the embodiment of the 'social'. It did indeed take on responsibility for the country's future; it did need to be enlightened; but it was more than that: it was the Nation incarnate, the country making conscious choices, not driven at the mercy of 'hidden' forces, whether of the market or of the irrational urges which impel human action.

Thus the new State encompassed 'civil society', absorbing it while managing and leading it. So the state proves to be the realization of the Enlightenment project, the ideal of self-government; no longer 'a state' with origins in a particular historical time and circumstances, it is now the State: it is what the state always should have been, and constitutes its true essence, finally realized.

It is this 'obvious' realization, and the concomitant 'just polity' of public welfare, which found itself under attack in the last three decades of the century.

## SCIENCE, TECHNOLOGY AND ECONOMIC LIBERALISM: FROM THE 1970s TO THE END OF THE CENTURY

Two major things have changed in the last three decades of the twentieth century: first, the capacity of science and technology (above all, biotechnology) to modify the natural and human world profoundly, leading to growing social concerns; secondly, the regime under which knowledge exists and is produced, as related to economics and politics, with its attendant issues concerning the nature of globalization. We shall start with a brief look at this second aspect.

To start with, we need to recall the 'liberal globalization' which developed in the United States and Great Britain some thirty years ago and subsequently in the rest of the world (including continental Europe through the European Community). With this movement came a redefining of the roles of governments and of business and financial institutions, the rules of the labour market and of social protection, and what the political and economic elite wanted from science. This movement followed an ideological revolution whose two main protagonists were Mrs Thatcher and President Reagan.

More particularly, we may speak of a radical shift in the site of science production (from universities to businesses); of the appearance of new prospective participants; of a more organic involvement between these and the financial markets; but, more than this, of a fundamental change in the rules of the game, a deliberate change brought about by relaxing the age-old rules of intellectual property. The universities and the great industrial laboratories typical of the decades from 1900 to 1970 remain important, of course; but their mode of work and collaboration has undergone a metamorphosis, and they are now supplemented by a thousand institutions providing risk capital, and by structures of partnership among private interests, foundations and public laboratories. We may detail this modification in the link between science, the state and the market by emphasizing six points.

The first transformation concerns intellectual property: the eligibility conditions for taking out patents have been widened to a quite unprecedented scope in recent years; property rights have been granted for increasingly fundamental research prior to any 'invention' in the strict sense (domains regarded until now as belonging to public science, meaning science published in leading scientific journals). The result has been greater opportunity for market control of knowledge. It began with biotechnology (the first patent for a laboratory-designed bacterium was granted in 1980, then one for a genetically modified mouse in 1988; this has now reached the point of patenting DNA

sequences, whose potential application is extremely ill-defined); it has since spread to many other fields, from software to electronic databanks and management methods. This change in patent law has had a decisive impact on the definition of the scientist's social role, on the relationships among knowledge-producers, the market and property rights, on the way knowledge itself is produced – in short, on what kind of an institution science is, or should be, in terms of what is common and what is private.[15]

There are many legal authorities who speak in this connection of a new 'enclosure movement', by which they mean that this kind of law allows a privatization of 'common assets of the mind' (public science) corresponding, many centuries later, to that of the 'commons' or collectively held land in England at the start of the modern age. That movement led to a redistribution of wealth, which had devastating effects on large swathes of the population but was justified by the considerable growth it made possible in overall productive capacity. The extension of private property motivated the new owners to invest, and reduced the chronic over-exploitation of the land. The question now is whether the same process may be expected today – and what the cost will be for the losers.[16]

This first change in the rules of the game in the world of knowledge production was accompanied by a second: it meant a growing number of universities became directly involved in industrial development, increasingly abandoning their role as providers of 'open science' (to use an economists' term indicating academic knowledge as a public asset),[17] and actively participating in the lodging of patents and in exclusive licence agreements on their results, made with businesses of their own choosing. In the United States, the basis of this movement was the set of laws known together as the Bayh-Dole Act (in reference to a major bill passed in 1980), authorizing universities to patent their productions, including those generated with the use of public funds. This movement was growing in the same period as the change in patent policy, was based on the same arguments and was propelled by the same enthusiastic doctrine (that private ownership was a guarantee of greater effectiveness). It led to a vastly different process in the production of knowledge (lawyers become central characters in science and served on the staff of universities) and to conflicts of interest, unknown thirty years before, among different participants in the Science business.[18]

A third aspect that complemented the last and also concerned the transformation of universities was the penetration of many of them by big industrial groups which invested large sums of money in exchange for a privileged position in acquiring the science and know-how produced there: not a few industrialists have endowed university laboratories (or created entirely new ones with lavish foundations) since the end of the 1980s. Encouraged to renew themselves (read 'to bind themselves to the business world', and in particular to accept such offers and the partnership constraints they implied), a great number of universities changed their rules in this direction, and to a large extent, in doing so, changed their nature.[19]

Fourth, as a sequel to this, the last two decades have seen many businesses giving up some of their in-house investment in basic research, and bringing such research more directly under their Development divisions, reducing its independence and freedom of action. This 'Japanese model' was conceptualized in Europe in the 1980s, where it

centred on industrial innovation rather than 'science' (a picture which had great credibility at the time), and the need for quick returns in circumstances increasingly dominated by financial capital led to abandonment of the earlier model of development with its weaker short-term constraints. At the same time public financing for R&D was fairly static or even declining in the 1980s and part of the 1990s: this tendency also was driven by the rampant liberalism of the time, but has generally been reversed today (when the economy is in trouble, governments are always called to the rescue).

The fifth thing to be taken into account is the fully fledged market in science and research subcontracting that grew up over these years, the greatly increased number of new businesses set up on the basis of a laboratory-developed technique, procedure or type of product with high scientific value (this applies particularly to biotechnology and communication electronics) and the net growth in numbers of consultant scientists called in as 'problem-solvers' or providing specialist services to other businesses. Under the impact of the Cold War's end and the political drive for deregulation, all those involved have changed (some radically) their strategies, their forms of involvement and their alliances. In this sense we may say that the research economy is undergoing a major mutation. It has now spread, its internal balance has been transformed, and it has colonized areas previously less dependant on it.[20]

The last point is that there has been no uniform wave of change, moving forward at the same pace everywhere, no well-defined evolutionary front neatly distinguished from its antecedents and applying to the whole world of science and industry. There are large differences between fields; differences also, quite clearly, between countries (the phenomenon is less marked in continental Europe than in the United Kingdom). Innovation continues, for example, to be essentially incremental in origin in the capital goods sector and in aviation, while the pharmaceutical and ICT industries, which employ the most graduates, have multiple channels linking them with academic research and in some cases have developed major in-house divisions for fundamental research.[21]

What are we to conclude from this? That a change is under way in the regime of production, certainly. Historically, 'open' science (that which circulates freely in publications, and is connected with the idea of the public good) and 'private' science (whose results belong to its producers) had been conducted side by side within the framework of the nation state – and it is this balance that has now been called into question. Scientific knowledge is indeed mobilized by industry and the armed forces, but the tendency towards private appropriation had until now been counterbalanced by the social compromise which makes the nation (and the public good) a primary value. University science, technical knowledge and industrial know-how each had their own rationale, but they were mobilized by the great Leviathan, each in its place and in order of battle. And the state kept the emphasis on standards transcending any 'excessive' scope for private property. Symbolically, Science belonged to a protected realm, its core being in institutions whose products were not, as a general rule, liable to become private property. Elsewhere, the great industrial laboratories produced knowledge, often quite fundamental knowledge, that was essential to their business; but even this was very

widely distributed. Many university scientists likewise took out patents between 1900 and 1970; but many of their techniques and results were made public, these patents not leading to the formation of entire domains of research which were 'off limits', as happens today.

It is a shift in this balance that we appear to have been witnessing these last twenty or thirty years. Under the influence of the liberal revolution and the transformation of society, the regime for the production of knowledge centred on academic institutions, and the public welfare values it traditionally upheld has found itself opposed and challenged, to the benefit of the private production of technological and scientific assets. There seem to be fewer means of opposing the rules of the market; and the trend is facilitated by the very nature of the science/technology and the products it develops, especially in the life sciences; it is facilitated, also, by current political and social transformations which affect the value systems and legal framework informing research and invention. Patent legislation has been decisive here: by widening the scope of what could be patented, it was the principal means by which the world of the market managed to shift the previous balance and make marketability the predominant or even the only effective standard. Following the events of 11 September 2001, the United States is once more on a war footing; but this does not mean that the tilt towards a world economic order based on private science need be questioned – though it will have greater support from public funds.

## By way of conclusion: science, risk and democracy today

There is no denying that Western Europe at the end of the twentieth century was marked by lively social concern about science and technology. This situation came about for three main reasons. The first is that science, or more precisely the world of technology and industry to which scientific knowledge is organically linked, has the power to alter our lives in radical and irreversible ways. We need only think of the great global equilibriums (greenhouse effect, holes in the ozone layer, climate change, the environment generally), nuclear technology and the waste issue, industrial accidents such as Bhopal, or, above all, biotechnology, artificially assisted human reproduction, the introduction of genetically modified organisms (GMOs) into the food chain, the possibility of human cloning – and the list goes on. A principal feature of this technological/scientific industry is that it cannot predict, before actually applying its knowledge, all the consequences that might result: in other words, what exactly is altered or displaced by its intervention only comes fully to light after the event.[22]

A second cause of concern have been the crises or scandals that the European countries and indeed the whole world have witnessed over a number of decades and which have made a lasting dent in public confidence in the social and political regulation of science and technology (the AIDS epidemic and the blood transfusion scandal in France, the carcinogenic effects of asbestos, mad cow disease, Chernobyl, the lack of transparency in bringing GMOs onto the market, air pollution, dioxin). Such events have led the victims to refuse to be satisfied any longer with compensation measures, but to demand that criminal law be applied to such matters. This change in public attitudes is broadly related to the social changes in our societies, not least the emergence of better-educated groups that have risen with the new economy and have a different idea of the social nexus and the place of ethics in regulation. The events mentioned above, arriving one after another to generate strong feelings and extensive media reporting, have led to a heightened sensitivity about the procedures and products offered by industrial science and technology, and even to demands for moratoriums and other forms of risk management.

The third reason we may offer for this disenchantment is the fact that responsibilities nowadays appear less clearly articulated: there is a blurring of the boundaries between the various authorities whose task is to guarantee that a proper watch is kept. In Europe this is due to the growing role of the European Commission and the nature of its power (superimposed on the role and power of national governments); and on a world-wide scale it is due to the rise of bodies which, though unelected, nevertheless make rules and regulations that increasingly govern the lives of individuals and nations (such as the WTO); it is due to the growing power of the judiciary (also unelected) in its many manifestations – in short, to the fact that the regulatory powers of the ordinary democratic authorities, those of the nation state, have been drastically eroded.

These are decisive issues, and deserve to be examined and debated in depth – and these debates take place in Europe. We do not disparage the role that experts and scientists should play in such discussions (a central one, almost by definition), but the issues at stake are such that they cannot be the only participants, or the only arbiters. 'Technoscience' and the industrial world linked to it are indeed capable of transforming the natural and social worlds so radically that the issue becomes a thoroughly political one. This is no anti-science demand, but an expression of the will of societies which are both increasingly literate in science and increasingly desirous of controlling their own destinies; and it would be wise to respect such an expression by democratic means. Let us be quite clear: this desire – that society as a whole should be in control of the potential developments offered by science and technology – is not a negative one: in no way does it amount to a denial of the role which science can play. On the contrary, it carries a rich cargo of expectations; and the skill of knowing when and how to intervene is something we all need to learn.

To do so, we need to take three things on board: (1) these new issues arise outside the well-controlled domain of science itself, and can therefore definitely be expected to lack any single or unequivocal solution. Here science is tackling problems it can only imperfectly know (and it needs to learn that there are plenty of things it does not know); (2) these problems are not purely intellectual: they inherently encompass technical, industrial and financial issues and it is therefore mandatory to admit the existence of identifiable interests in the choices made (science does not live cut off from the world in an ivory tower); (3) there are many paths our future could take: they differ according to the degree of civic commitment shown by individuals (the future they want, for themselves and their children) and these individuals' estimates of our capacities, as a society, as scientists, to bring such futures about. Again, the best way of handling this is by as public a debate as possible, without pretending that scientific knowledge alone can settle such issues. With such modesty, science

could speak to great purpose, helping to clarify the alternatives and not, we could then legitimately hope, triggering a violent rejection.

## THE HISTORY OF WESTERN EUROPE SINCE 1914: CULTURAL DEVELOPMENT

The 1914–1918 war, which later lost its unique status and became known as the First World War, was to its contemporaries and above all to its survivors, the Great War. In the historian's mind, it still is. From it there emerged a culture turned upside-down by the violence, individual and collective, that had been unleashed by appeals to the masses and by the systematic recourse to propaganda.[23] Ever since then, culture has been haunted by suspicions about the fragility, the questionable authenticity or the irreversible decline of the values that had held sway before the struggle; there are doubts for the future of the rationalist, humanist and liberal West. The twentieth century was to bear the marks of those doubts, whether we consider it only up to 9 November 1989 when the Berlin Wall came down, or follow it further.

From the Great War also emerged a 'Western Europe', clearly distinguished for three-quarters of a century from another cultural world that consisted at first of the Soviet Union on its own (alone, but considerable) and was then extended by the Second World War to include all the 'countries of the East'. Though distinct from these, 'Western Europe' nevertheless did not lose its main points of difference from the cultural choices of the United States, which had from the start been dominated by a stronger idea of private agency, more business-friendly and less centralized. An in-between geopolitical situation also reveals this part of Europe developing independent cultural experiences of its own which were deeply foreign to the predominant liberalism, most of them harking back to an authoritarian tradition brought more or less up to date; the most visible of all these brought a fundamentally novel choice, the newly forged concept of totalitarianism.

When we look closer, though, we find we cannot reduce the way a society's culture functions to purely or even essentially political determining causes. The economic situation, with its alternating phases of growth and depression and its often massive social effects, cannot help but deeply influence the symbolic issues of concern to the groups of people involved, as the century's last quarter well illustrates: as cultural changes go, the fall of the Berlin Wall was no great turning-point, but must take its place in a long, continuous *fin de siècle* that can be characterized as a widespread movement of questioning or even challenging the progressive values that had been dominant during the previous period. Looking more closely still, it becomes apparent that we need to examine technical developments first, in that it is these which give any age the particular framework for its practices and ways of representing the world, though of course that framework is not, as some early theories of communication science maintained, a mere transcription of them.

We may divide the years into three major periods, each clearly identifiable: a world war period (including both wars, and the years between), then a time of growth, corresponding to what the French sociologist Jean Fourastié[24] called the 'three Heroic Decades', and lastly a *fin*

*de siècle* which is still continuing, in a world which now has to face the effects of the historic events of 11 September.

## THE WORLD WAR PERIOD

The period from 1914 to 1945, dominated by the culture of war, was of course a time of great crisis that went beyond the direct effects of the two wars; but it was also a period shot through from end to end (partly because of this war situation) by a radical upheaval in technology, whose effects were in sum beneficial though this was not immediately clear to the collective awareness.

### 'Technical reproducibility'

This formula was first coined in intellectual discussion by the German philosopher Walter Benjamin in 1936.[25] Since his exile to France (fleeing Nazi anti-Semitism), he had been led to reflect on the status of works of art in a society that would from now on be governed, or even regimented, by this new capacity of the culture's technology to reproduce the same work *ad infinitum*. This promised widespread availability and a certain 'democratization', while at the same time threatening a loss of individuality. Other thinkers, too, noted the problem, though they did not put it so theoretically, systematically or forcefully. Some were optimistic (Jean-Richard Bloch), others pessimistic (Georges Duhamel); and of course the phenomenon was not new. Without going back as far as the invention of writing, nor even to that of printing, there is no doubt that the nineteenth century, from the lithographs of its beginnings to the movies of its close, saw a noticeable acceleration in the tendency. Nevertheless it was this world war period which saw the widespread use of the three techniques that make it the first fully audio-visual age, at least in the modern sense of the term: photojournalism, wireless broadcasting and, to top them all, the talking movies. This period ended with the definitive arrival of the major cultural diffusion technology of the next: television, whose first broadcasts had actually been made in England at the end of the 1920s.

Photography, so far confined to luxury publications and an occasional appearance in the popular press, now came to the fore; in the end it dictated the layout of the mass dailies (*Paris-Soir*) and the illustrated magazines for adult readerships (*Berliner Illustrierte Zeitung*)[26] and for young readers (the *Winckler* and *Del Duca* titles, all either translations or imitations of American comics). In the form of photomontage, it became a propaganda tool regarded as particularly effective in the installation of the great, spectacular exhibitions in which this age so delighted (e.g. the Exhibition of the Fascist Revolution, Rome, 1932).[27]

'W/T' (wireless telephony) proved during the Great War that it could do sterling military duty; once peace returned, it was able to reach a wider public in the form of scheduled programmes which were, depending on the country and the date, run by private enterprise or, increasingly, the public sector, until in a number of countries a monopoly of broadcasting was established. What this meant varied, of course, depending on national conditions, which ranged from a liberal country which insisted on the

independence of the central broadcaster (the British Broadcasting Corporation, or BBC)[28] to a totalitarian regime concerned to ensure a wide uptake of this ever-available conditioning tool that penetrated the whole country, household by household (at the instance of the Nazi state, a People's Wireless was mass-produced and sold at an easily affordable price). On the eve of the Second World War, in which such resources were used systematically by all belligerents, the number of receivers (now called radios) ran into millions in countries like the United Kingdom, Germany and France; so did the numbers going to the cinema, which had been offering talking pictures since the early 1930s.

### Crises

Just as the rise of the silent movies had dealt a fatal blow to a whole genre of popular theatre (often at fairgrounds), so did the even faster spread of the 'talkies' permanently alter the theatre of the middle classes (known in France as the *théâtre de boulevard*), whose plots and actors moved wholesale to the big screen. This cultural shift coincided with the direct effects of the economic crisis that went back to 1929, which by considerably impoverishing the sources of private commissions gave a hard knock to architects and artists as well as live entertainers. There is no doubt, though, that the real problem was one of production and distribution, not of creativity.

The growing mismatch between the education systems set up in the previous century and the social and industrial requirements of a world now dominated by industry and urban interests brought new issues to the fore, and new dissatisfactions. Mass schooling in the form of free compulsory primary education had been achieved in northern European countries, and was well on the way in others; France and certain other countries had added an aspect of ideological modernity (the exclusion of religious matters) that prevailed in the end. However, this solution could not cope with the new problems posed by the self-sufficient but marginalized nature of strictly technical training and by most primary school leavers' lack of access to secondary or, consequently, advanced education: both were still generally reserved for those privileged by wealth or status.

Educators who wanted to modernize teaching methods in a liberating spirit (Maria Montessori, Célestin Freinet), or to lower the barriers between one kind of schooling and another, were for the most part preaching in the wilderness; and the number of teachers in paying institutions were by no means on the increase in all countries over the whole period.[29] The middle and upper classes did, on the other hand, warmly embrace the rapidly expanding Boy Scout and Girl Guide movements, as soon as their methods won over the secular-minded and, above all, the Catholics (despite these movements' Protestant origins). Moreover, all three persuasions also made common cause in organizing activities to enrich the leisure – and the minds – of children and adolescents from the working class: 'youth' became a social entity in its own right, thanks to these ideological strategies; and where they led, the market gradually followed.

The practices arising from this coincidence of vigour and misgivings naturally enough combined eventually in the emergence of the hallmark adjectives of the age: 'mass' (in social terms) and (in politics) 'total'.

### Mass culture

Mass communication media helped strengthen the identity of nation states by speeding up the spread of the centre's ways of doing things and thus its particular values, from a uniform language to common historical myths; but the same cultural technology also tended to weaken national boundaries, and to encourage genres and lifestyles of American invention to take root in those countries most open to outside influences. Thus popular music was subjected to strong influences from the arrival of the first (black or white) American jazz bands in 1917 onwards. First jazz and then swing established themselves in the public ballroom, before more gradually taking over the popular song. They stayed quite separate, on the other hand, from the world of art music, which paid them only the most passing and superficial interest in the early part of this period and then moved off towards other horizons; it was not until just before the Second World War that a small minority of young amateurs laid the foundations of a new art form in alliance with the – likewise fragmentary – movement of the early cineastes, which dated from the 1920s. Similar American tendencies affected the printed matter aimed at young readers in these same countries (France, Belgium, Italy and others); this material seemed destined, just before the war, to align itself with the graphics and narrative patterns that were 'made in the USA'.

Beyond these tendencies which lend themselves to geopolitical explanation, the general development of what was beginning to be called 'mass culture' was driving a standardization of collective habits of symbolic representation in all urban or urbanized societies, in a dialectical association with the copy-cat practices of great numbers who followed the cult of 'the star', a cult all the more strongly established because the star could now be seen and heard everywhere, on cinema screen and radio set. This association of extreme numbers and supreme distinction applied both to the world of the music-hall and that of the cinema at their respective zeniths; and also to that of sport, which was still at the start of its dizzying ascent.

Sport had made its appearance, among the elite, around the middle of the previous century; little by little it had won over the working class, through particular activities which combined social occasions with physical exercise (cycling) or brought spectators together in a stadium to watch an exhibition of physical prowess (athletics), often including team spirit (football, rugby).[30] This evolution can be followed in club memberships and in the rise of the Olympic Games, which imperceptibly took on the status of a political prize of the first order, both for the country of a successful competitor and, above all, for the organizing country (e.g. Berlin, 1936).

### Totalitarian culture

Right-wing totalitarian 'fascist' regimes that were partly the product of this social trend to mass behaviour became established in Italy after 1922 and in Germany from 1933, as well as giving a more or less long-lasting tint to the

political and cultural life of as many as ten other countries, from the Portugal of Salazar's *Estado novo* to the lands subject to Axis domination during the Second World War, and including also the Spain of Generalissimo Franco. These pushed the opportunities for increasing uniformity to their most extreme consequences, for they were also opportunities that helped recruitment to the movements themselves. They took cultural issues very seriously, and were not prepared to leave them to the free play of market forces or of voluntary associations; they invented an arm of government that became increasingly ambitious in its proclaimed scope and increasingly interventionist in its methods. In Italy, for instance, a simple Bureau in charge of monitoring the press grew over a decade into the vast Ministry of Popular Culture, itself only a small version of the government department that Hitler entrusted to Joseph Goebbels in 1933, with the official remit of popular 'enlightenment' (*Volksaufklärung*).

This project led to the systematic turning of all forms of cultural expression into instruments of one purpose: the service of the totalitarian state, the single Party, and their supreme Leader. Architecture and sculpture produced buildings and allegories of colossal size (the Olympic Stadium at Rome, the Berlin Chancellery); music, dance and gymnastics mobilized uniform bodies; the cinema provided sublimity and sublimation through spectacle, whether the ostensible genre was documentary or fiction – indeed, the boundary between the two was kept arbitrary (e.g. in the case of Leni Riefenstahl).

All the same, we should not exaggerate these dictators' obsession with propaganda; they were also careful to give 'pure' entertainment its rightful place, as long as it served the regime's interests by cultivating nationalism and racism, or the cult of authority and heroism. The essential thing was to produce mass behaviour, and to justify devotion to the regime by the quality of the public service rendered, which entailed demonstrating to all ages and all classes the admirable activities of youth and leisure movements such as *Dopolavoro* or *Kraft durch Freude*.

We may well imagine how the forms produced under such strained conditions betrayed corresponding tensions between the forces fighting for order and those defending the established disorder.

## Revolts and revolutions

It is no exaggeration to see in the most radical avant-garde movement of the years immediately after the Great War (provocatively self-baptized 'dada') a direct product of the war itself, both because the movement was born in the middle of that war (and in a neutral country, Switzerland) as an avowed reaction against it, and because at bottom it offered, in its intransigent rejection of established modes of expression, a transposition of the violence of war to the cultural plane. But dada, too, had its antecedents (it extended the provocative methods of futurism) and its successors, giving birth to surrealism in the person of its main disciples, beginning with André Breton, who was joined later by the very founder of dada, Tristan Tzara.

Surrealism's course and fate is illustrative of its whole age: it took shape in the mid-1920s, at the heart of Western Europe as the region began to find its way back towards prosperity and dreamed of international peace assured by the League of Nations, while still unable to recover entirely from its wounds. Here surrealism systematically positioned itself as an organized subversion, freeing the forces of the imagination.[31] It can be seen as a resurgence of romanticism, but this time deeply alien to national feeling; this made it, in a few years, a real international movement, whose effects could be detected from Paris to Belgrade. As the surrealist creed also refused, at least in theory, to recognize the boundaries between the arts or any hierarchy among them, those effects made themselves felt in literature as much as in the visual arts; and here they lasted well beyond the 1930s, when the movement, as an organization, dissolved in schism.

The obstinate attempt of the Breton group to identify its own struggle with that of the Leninist avant-gardes – first Soviet, later Trotskyist – was a political failure; but it illustrates well how these tendencies must be understood as a single whole. And indeed it is as a single whole that their enemies saw them, including those who came to reject (as *kulturbolchevismus* or 'degenerate art') even those other movements that challenged the cultural order inherited from the nineteenth century: continuations of earlier aesthetic revolutions such as abstract art, and, still more recently, the collective endeavours to establish an atonal aesthetic in music (the Vienna School around Arnold Schoenberg), or a vitalist body language (German contemporary dance), or again a functionalist architectural and visual environment (the Bauhaus school). All these trends shared the determination to free themselves from all reference to heritage; they would also, with surrealism, prove later to have been particularly fertile; later, and at the very heavy cost of open persecution by both the Nazi and the Stalinist totalitarian persuasions, they were carried away by the efficiency of the parallel and contemporary return to order.

## Return to order

Immediately after the end of the Great War voices were raised, even among the younger cultural generation, advocating a return to the values of reason and clarity, claiming to oppose some earlier cult of decadence which was more or less associated with symbolism; in a context such as that of French culture, these voices found themselves in harmony with certain stereotypes of the national identity (Jean Cocteau, *Le coq et l'arlequin*). It was the strength, but at the same time the limitation, of such a position that it tended to produce an aesthetic which kept its freshness by means of an artful simplicity: the music of the Groupe des Six is a good instance. One might say the same of the acclamation that greeted the emerging literature of political witness, its authors invested with the image and often the role of intellectual hero, whether their values were of the right (Ernst Jünger, Ernst von Salomon), of the left (Erich-Maria Remarque, André Malraux, Paul Nizan) or oscillating from one to the other (Pierre Drieu La Rochelle, Curzio Malaparte).

As time went by and the economic crisis chafed deeper, with rising danger on the international scene, the tendency turned more and more clearly reactionary. Individuals and groups who still championed traditionalist values (religious or otherwise) were accordingly joined by others coming back into line, whether from the direction of the mild

modernism prevalent just after the war or indeed from among the avant-garde itself, from Giorgio di Chirico to Igor Stravinsky, including the former surrealist Louis Aragon, who made himself the high priest of socialist realism in Western Europe. In architecture, sculpture, painting, the decorative arts and music, neoclassicism was pre-eminent in both public commissions and general approval. It prospered all the more because its flanks were covered by a whole literary and artistic industry that either claimed it was championing European authenticity or, in the same conservative spirit, cultivated exoticism. Exoticism, indeed, was suited to the colonial supremacy that reached its high-water mark in this world war period, and was to ebb so quickly thereafter.

This great Return to the Past had its (apparent) triumph in Europe under the Axis powers in the early 1940s, when Antonio Ferro flourished in Portugal and Giuseppe Bottai in Italy, where the futurist element seemed thoroughly vanquished by academic tendencies. Nor was it absent from the deliberately jingoistic, traditionalist attitude of the whole Resistance culture. Later on, though, it became clear that the defeat of the Axis would have the effect of utterly destroying its legitimacy, for a whole generation.

## THE TURNAROUND

We find the technological potential of the earlier period rediscovered after 1945, but with a thorough-going change of direction due to a radical reversal of the macroeconomic situation.

### New audio-visual drivers

The period made no great fundamental inventions in terms of communication technology: but in this field it is not invention which counts so much as the diffusion that ensures that a technology becomes part of the collective endowment. Just as these decades saw not the invention but the popularization of the automobile (one generation later than in the United States), so in terms of cultural media they witnessed less in the way of qualitative shifts but more in the way of great extensions of quantity, often so dizzyingly great as to amount to the breaking of new ground. Gramophone records, for instance, now came within everyone's reach thanks to the development, at the end of the 1940s, of recording and duplication techniques that made them much less fragile and expensive, utterly transforming the mode of transmission of new popular music styles and, we should not forget, the means of general access to the heritage of so-called classical music which until then had been available only to the concert-going public.[32]

Developments in radio were of the same order, as soon as transistors made much smaller sets generally available during the 1960s; these made listening a more flexible and increasingly gap-filling activity; there is no doubt this was related to the shift in programme style towards the modern dominance of music and news. The change in radio's status was at least equally due, however, to the emergence of a competing medium, television. This, though it did not kill sound broadcasting as some had initially expected – any more than the cinema killed the theatre – did take over some of its functions.[33]

Television broadcasts had been restarted straight after the war in the United Kingdom, and a decade later it had already become a mass medium in that country, through the adoption of a technical standard inferior to the French one. The French option, taken essentially for protectionist reasons, meant that mass penetration took a decade or so longer in France, while the countries of southern Europe had to wait until the end of this period to reach the same stage. Nevertheless, from mid-century onwards all observers recognized the general trend. There has been considerable discussion about the immediately inferred connection between the rise of TV and the simultaneous sharp fall in cinema attendance in these various countries. The relationship was not in fact automatic, as some timing differences in certain countries show (Italy, for example); the spread of car ownership, and the resulting new ways of spending leisure time at weekends, also had a great part to play; but the new forms of entertainment the small screen offered, including films broadcast by or made for TV, did in the end depress cinema attendances, especially once TV could offer colour; and the arrival of the VCR confirmed the trend.

Here again, though, we should really consider a period's cultural equipment as a coherent whole rather than concentrating on any single, supposedly dominant medium. When we do so, we are struck above all by the convergence of the new audio-visual configuration's effects as a re-focusing on individual consumption in private spaces; on the other hand, we must also take into account the simultaneous rise in a number of public, collective cultural practices in other fields: proof, if proof were needed, that sociological cause and effect are never unequivocal in nature.

### Growth

A large portion of these collective practices, or at least of their development, can be attributed to the period's main driving force, which was the economic phenomenon perfectly captured – fuzzy edges and all – by the term 'growth'. Visible in a whole series of indices (output, productivity, trade), this resulted, thanks to the general adoption of welfare state policies, in a thirty-year unbroken rise in incomes for all social groups and, in most countries, a reduction in income inequalities, as well as a decrease in working hours (both official and real) and at the same time an increase in paid holidays. Western European consumption practices were moving away from the satisfaction of basic needs, and a growing share of both money and time came to be spent on cultural purchases; this was confirmed by the new statistics on cultural activity which began to be gathered as a sociology of leisure became established.

Growth applied to cities and towns, also. People's personal ties to rural societies weakened all the more rapidly as those societies were losing their vitality, so as to engender, by the close of the period and in tandem with spreading urban frustrations, a considerable nostalgia for a rural way of life which by now was largely imaginary. The suburbs became the predominant feature of urban agglomerations, and observers and associations alike applied themselves to the needs, real or supposed, of their inhabitants. The combination of large-scale urbanization and the widespread

European emphasis on voluntary public action generated a theory and practice of cultural activity, which greatly added to local resource endowments, from public libraries to multipurpose cultural centres.

The extrapolation of these indices also had a lasting effect on the actual content of the culture transmitted: ideological confrontations, far from diminishing, were simply translated into a conflict of optimisms, as the supposedly dominant culture came under increasing attack for its 'materialism' and the inadequate pace of equal access to cultural resources and cultural expression. This critique crystallized, again towards the end of the phase, in the May 1968 movement in France and similar upheavals in public opinion in the other democracies.

## Hot and cold

Beneath the surface of its political demands, the protest movement derived part of its force from its increasing and strictly cultural aspiration to less authoritarian or even avowedly libertarian conceptions of sexual and gender relationships and the functioning of the family as an institution.

## Liberated behaviour

While the media talked, from the mid-1960s onwards, of a permissive society, quoting examples from Scandinavia or the United Kingdom,[34] statistics show that the same years also saw the start of a major demographic shift that traversed Europe from (roughly) north to south, with parallel and frequently correlated falls in marriage rates, birth rates and fertility rates as well as increases in divorce, cohabitation and single-parent families. The return of liberal democracy in Portugal, Greece and Spain allowed those societies to join this general trend, which in all countries took the same institutional and symbolic forms and for which the term 'cultural revolution' is really no exaggeration.

The cultural productions of the age, from social science to the most popular forms of art, bear witness in the closing years of this period to the successive toppling of taboos which the modernism of the immediate post-war years, whose priority had been the great collective labour of reconstruction and then expansion, had hardly touched, so far as the great mass of the population was concerned: taboos that upheld a male-dominated, patriarchal, heterosexual and matrimonial pattern in private life. Alongside literature and the cinema, a whole world of popular music, mainly American or British in origin or at least influence, from rock'n'roll to pop music, helped to spread a more hedonistic view of the world, increasingly critical of established institutions.

## The Cold War

In the end, all the promise of this entire movement made the period forget just how starkly, in ideological terms, it remained overshadowed until its end and even later, by a deep bipolarity which could be felt not only in its geopolitical affairs but also within its intellectual debates and, accordingly, its cultural productions. Belonging, as by

definition it did, to the Atlantic world, Western Europe had been the first and foremost site of crystallization of a critique of totalitarian culture which was expressed in such identity-defining instances as the meetings of the Congress for Cultural Freedom, reviews such as *Preuves*,[35] and works such as those of George Orwell or Raymond Aron. Every indication, however, was that Marxist influences, though confined to a minority presence in public opinion generally, retained until the very end of this period a predominant role within the intelligentsia, at least in those democracies where such an intelligentsia played a considerable role, such as Italy or France.[36]

In a situation that lent itself to partisan commitment from start to finish, and was in a sense a continuation of the world war by other means, Western consciences found subjects of polemic and occasions for public witness in abundance. The threat to the future resulting from the deployment of nuclear weapons by the two superpowers gave rise to a pacifist movement, at the outset strongly influenced by the Soviet Union. Imperceptibly another issue, closer to home, took over: decolonization, affecting especially the United Kingdom and, still more, France, which was more attached than the United Kingdom to the idea of colonization as integration. At last the process was transposed to the case of Viet Nam, and large swathes of the European intelligentsia joined in criticism of the United States.

The privileged position left vacant by German philosophy, once the leading influence but virtually annihilated following the disaster of 1933, came for a generation to be occupied by France, with reviews such as *Esprit* or *Les Temps Modernes* and the emblematic figures of *l'engagement* such as Emmanuel Mounier, Albert Camus or Jean-Paul Sartre. Sartre's influence, indeed, went beyond the boundaries of that generation, due to his ability to pronounce on all the main issues that concerned the next, as well as being the companion of Simone de Beauvoir, whose *The Second Sex* came to play a seminal role in awakening feminist consciousness around the world.

The emergence at the heart of the debate of what a French demographer, Albert Sauvy, suggested in the 1950s calling the Third World for a while gave particular prominence to those who spoke on this subject (Aimé Césaire, Frantz Fanon, Jean Rouch).[37] Most of the time, however, it was to the intellectual issues internal to European cultures that the main critical works of this period referred, whether artistic such as those of the iconoclastic French or Italian film-makers from Jean-Luc Godard to Francesco Rosi or Marco Bellochio, or intellectual such as those of the philosophers and essayists who, though they could be as different from each other as Ivan Illich, Michel Foucault and Jürgen Habermas, nevertheless did agree in rejecting conformity.

Frequently it is in critical projects of this kind that a period's most representative works are to be found; such projects are positioned, by their authors and by their commentators, in the avant-garde of European cultural production.

## Avant-gardism

Never has this military metaphor so flourished as during this age, fundamentally determining the behaviour not

only of creative people but of their interpreters and their various audiences as well. The post-war years saw the return to grace and the critical and official triumph of the great inventions of earlier generations, from abstract painting and sculpture to atonal music, and including the Bauhaus,[38] which returned to Europe reshaped by the prism of America but quickly seized on as remarkably well suited to the new urban projects. Some of these masters of the new modernism enjoyed a reputation that was, to be sure, restricted (Le Corbusier, Olivier Messiaen) but others ended by becoming popular (Pablo Picasso) and having a profound influence on the new generations.

Far from the limelight, younger artists began to introduce more socially acceptable forms of earlier 'outrages', and with some success, for example in the great town planning programmes, especially in northern Europe, by applying a new, more functionalist conception of everyday objects ('design') making much of Scandinavian and Italian models, or with an electro-acoustic music which in a short time considerably enhanced the available palette of sounds. The 'new novel' rather quickly became unfashionable (though it left enduring traces in academic theory), but the new wave in films captured a wider audience with its aesthetic of slimmed-down resources and ambitions, which by no means ruled out a great sophistication in the results. The critical and commercial success of this group can also be accounted for by technical and economic developments: the formal choices of the new wave corresponded perfectly to the new tools of film-making, while they made themselves attractive to producers by costing less.

This more or less subtle interplay of formal and social forces illustrates the general trend of radicalism; and 'radical' pretty well summarizes the period as a whole. It can readily be seen in a field like the visual arts, where dislike of figurative expression was combined with a re-examination of media, first depriving canvas and paper of their supremacy, and then undermining the conventionally tangible object, and ending with more or less ephemeral manifestations such as the Happening, or conceptual art.

### The death of fine art

In this way, by the time this great, thirty-year progressive trend had run its course, the legitimate arts had turned into so many formal extremes, from land art to Pina Bausch's minimalist choreography; and, no doubt, extremities: things it would be hard to exceed. However, the appearance of pop art at the end of the 1950s (on British soil) reminds us that one form of radicalism was to integrate the vernacular, to assign the so-called minor arts a somewhat less humble place.

The old system of aesthetics, based on a clear distinction between major and minor arts, fine art and decorative arts, or more generally between art and craft, had in fact preserved its coherence and elitism well into the years following the Second World War: we find forms of expression stigmatized as 'popular', 'utilitarian' or 'recent', as the case may be, and in all European countries these were still absent from the prime venues that conferred artistic legitimacy, or at best given only a marginal showing within them. Songs, improvised music, fashion, furniture, photography and film often still had no dedicated institutions to protect and champion their heritage, to

train their professionals, to spread their inventions and to discuss their theory.

The post-war years saw a proliferation of such institutions, often on the initiative of small groups of amateurs who gradually built up a network influential enough, though in some cases only after many years, to persuade the public authorities of the usefulness of what they were doing, and to get financial assistance and official recognition. One of the first to benefit from this trend was the cinema, where much was at stake for the national economy: film libraries were endowed, whether public (the British Film Archive) or private (Cinémathèque française); schools (Centro Sperimentale, IDHEC) and networks of excellence (film clubs, art houses) were founded, as well as critical reviews (*Les Cahiers du cinéma, Positif, Bianco e Nero*).[39] The chronology of this process shows that the construction of this new legitimacy coincided with the more or less complete elimination of the delay between the production of the most innovative work and its institutional recognition, as shown, in particular, by public commissioning and acquisition policies. When the slump came at the end of the century, this two-fold recognition proved able to withstand all retrograde forces.

### The *fin de siècle*

In some ways the period starting with the crisis that was at first called just the 'oil shock' of 1973 might have been a simple return to the depression climate of the 1930s; but the mid-1970s can also be seen as a unique period, now that we appreciate the simultaneity of the fall of Saigon (the high-water mark of Leninist expansion) and the publication in the West of *The Gulag Archipelago*, the first spectacular sign of the upheaval that would vindicate it less than fifteen years later. We need only look at the cultural clues to realize that there was indeed a '1975 Revolution' which marks the arrival of a new world of constant economic malaise associated with an evident acceleration in the freeing of the energies of the individual. This apparent contradiction did not fail to produce ambiguities in its effects on symbolic representation.

### The PC

Viewed from a little distance, the period seems dominated by the primacy of television, measured by some in terms of the growing number of sets, though the number of channels was at least equally significant; the latter was considerably extended by the ending of public broadcasting monopolies and by the appearance first of cable and then of satellite transmission. Widespread ownership of VCRs opened the door to a new way of using the small screen, imperceptibly transforming the television viewer into a schedule producer. If we consider this new domestic apparatus in conjunction with the replacement of the amateur ciné camera (8 mm, then super-8) by the video camera, we can clearly see that after two decades of such evolution the term 'television' is no longer suited to this new pattern: it is no longer only the real-time broadcasting of sound and image which characterizes the equipment and its use, but capacities for manipulation of technologies that are converging towards a 'personal screen', some or all of which the viewers can learn

to master, thus ceasing to be passive spectators – if, indeed, they ever were – and becoming the co-producers of their own media.

This reinterpretation of the tendency is of course confirmed and enhanced when we turn to what will remain the great revolution of these decades, and perhaps of the century, in communication: the computerization of society. Once again the revolution consisted not so much in the principles of the technology, which had been developed from the 1940s to the 1960s, as in its extension to general use, beyond the restricted sphere of military and industrial applications. The cultural revolution was not the computer but the fact that from now on it could be personal.[40]

## Economic crisis

The previous period had given Western societies the confident assurance of a continuously rising curve of prosperity, accompanied by a gradual convergence of models for society. The economic crisis which emerged in the mid-1970s has forced the West into a new era, unprecedented in that it has combined recurrent resurgences of relative growth in particular regions or industries with a degree of social exclusion that has been kept high, and an income distribution that has seen increased inequalities replace the earlier diminishing ones. This last feature was largely due to the rolling back of 'welfare', which so far as culture is concerned took the form of cuts in public spending on cultural purposes (most obvious in the United Kingdom under the Thatcher government and, twenty years later, in Italy under that of Berlusconi). Such cuts were extended to eastern Europe with the collapse of the Soviet-dominated regimes and a sharp lowering of ambitions on the part of state institutions.

As the economic crisis affected a culture and society dominated politically by government intervention (national or local) and in intellectual and aesthetic terms by progressivism, we find initially a resurgence of value systems directly opposite to these. Nationalism and racism accordingly regain a higher profile and a community legitimacy which they had lost since the war, even though the intellectual restructuring of the 'New Right' did not actually make them as dominant now as they had previously been invisible. Liberal culture though, already predominant in Scandinavian and English-speaking countries, now definitely gained the upper hand over Marxist culture among the intellectuals of southern Europe, including those who defined their position in terms of the fight against right-wing dictatorships.

Under the impetus of general shifts in technology and markets, cultural life in Europe appears from this point on to have been subjected to the laws of the market alone, laws which already governed some parts of it, such as painting and sculpture, and had done so for almost a century. A number of countries, including France, however, continued to champion the concept of a more organized cultural life based on the protection of copyright and the legitimacy of public regulation and financing. As we can see from the adoption outside France of central bodies such as Ministries of Culture (the formula has been copied not only in the countries of the south, but also in Germany) or regulatory legislation such as retail price maintenance on books, it is not certain that the trend will continue until all modes of

public regulation have been dislodged, and we may note that the European Union itself, though much concerned to encourage subsidiarity and deregulation, in the end decided, when finalizing the Treaty of Maastricht, to include the cultural sphere in its institutions' new field of competence.

## Leisure planet

Contrary to the expectations that would have resulted from a deterministic extrapolation from earlier periods, European cultural behaviour has continued to develop exponentially, in both geographical and demographical extent, notwithstanding the recession.

## Leisure

The post-war years saw a transition from elitist leisure practices (and accordingly from an elitist conception of leisure as something for the ruling classes) to mass popular leisure practices and corresponding ideas. The new element introduced towards the century's end was not, therefore, the phenomena of mass tourism or sport themselves, but the fact that this trend continued despite the lengthening and deepening of the economic crisis. Though it is true that a significant minority of Europeans continue to live with little or no access to leisure facilities and leisure products, sociological investigations have confirmed that the obstacle is now less economic than cultural. Attendance at cultural venues and consumption of cultural objects have grown steadily throughout the period, with appreciable differences between northern Europe and a lagging south; and it is evident that, when incomes fall, leisure spending (whether of money or of time) is cut back, but not systematically cut out.[41]

The actual content of Europeans' leisure activities have undergone a significant transformation, especially in the practice of the arts, where amateur activity is increasing, and in sports, where sports-ground activities such as athletics have been giving way to physical enjoyment of the natural world in the form of mountain sports, water sports or countryside sports such as rambling, cycling, riding, and so on. This period's leisure activities are marked by at least two traits that echo its intellectual trends: a growing concern for individual autonomy and an equally growing preoccupation with the protection of humanity's physical environment. All this, however, has come to be regarded from a point of view that is more and more explicitly a global one, which of course it has to be.

## Globalization

Acculturation, whether limited to local, bilateral and short-lived exchanges or in the extreme form of a virtual murder of a culture by another, dominant one, has been a constant phenomenon throughout the history of humanity. The novel feature now is the acceleration of traffic in forms and values and, above all, the world-wide character of that traffic nowadays, and its apparently unlimited scale. This universality was the logical result of the general spread of communication and duplication techniques coinciding with

the end of the Cold War and the fall of the last ideological barriers, already sapped from every direction, in the early 1990s. The building of new barriers by various religious fundamentalists, Islamic ones in the lead, has been the most extreme but not the only phenomenon which can be seen as proof of the depth of this penetration, which holistic cultures experience as intolerable.

The globalized culture of the early twenty-first century is by and large a culture of the young.[42] It makes much of musical expression (as it emerged from 1960s rock, but now bursting into a great number of styles all seeking to explore its diversity), and of audio-visual productions. These are in addition to a film industry whose finances depend more and more on adolescent audiences, television serials and soap operas (which became a massive industry during the 1970s) and video games, the main play activity of the 1990s. As the generations succeed each other, such forms naturally grow in respectability.

Interpreting the phenomenon of globalization, though, is still a complex matter. While it has strengthened the dominance of the English language, this is still far from absolute: in response, it has provoked a modernization and diffusion, again on an unprecedented scale, of forms of music that stress identity, from folk to world music. The idea that cultures and ways of life were becoming 'Americanized' has been confirmed in the art market or the film industry, but predates this age, going back to the post-war years in the first case and further, in a great many countries, in the second. On the other hand, *fin de siècle* Western Europe has opened itself to other influences: Japanese, for instance, in the marketplace (cartoons, video games), or the East more generally in aesthetic and, above all, philosophical models. And this Europe which is now, since the fall of the Berlin Wall, on course to expand to the whole of the continent, still has the resources to develop its own particular way of doing things, based on the cherishing and use of a heritage which is in total richer and/or better protected than those of other cultural regions, and on a tradition of public engagement ideally suited to limiting the dangers of 'dumbing down' or standardization. Such effects are often decried as the negative side of globalization; but that phenomenon has also, of course, considerably widened the range of available models and the capacity for spreading culture.

### The great return

'Revisionist' is a term applied to particular issues in the field of political ideology (Marxism, the history of the Holocaust); but it is also a reasonably accurate description of the dominant tendency of this period, characterized in art and in intellectual debate by a return to earlier notions, though as often in the sense of 'revisit' as that of 're-adopt'.

## AVANT-GARDES – IN REVERSE

Such revisionism aimed at a critique of the dominant values of the previous period, questioning Marxism-Leninism or even the essence of Marxism itself (the so-called New Philosophers group in France of the late 1970s); it went deeper still, however, and affected the very direction of artistic research in suggesting, from around that time onwards, that the time had come for a 'post-modern'

project.[43] The formula had become familiar in architecture, where it referred to choices of an anti-functionalist kind, more apparent than structural (Ricardo Boffill); it was subsequently applied to an entire posture which deployed old, traditional forms as the final provocation, possible now that every radical experiment had been tried. However, it could be extended to cover all aspects of a hedonistic, fanciful conception of the relations between an atomized yet globalized society and a creativity that had rejected any hierarchy among the arts, any *a priori* distinction between 'good taste' and whatever the opposite of good taste might be. In the field of contemporary music the modernism of the post-war years has stood its ground better, no doubt because at the same time there is provision, in recordings and concerts, for satisfying the taste of a larger audience through widespread and wide-ranging access to the musical heritage (the success of the Early Music movement, for instance); but the return to traditional forms has finally taken off here as elsewhere via developments of minimalism (Arvo Pärt) or lyricism (Thomas Adès).

Without going to such extremes, the whole of contemporary creative endeavour has been marked for some thirty years by a more and more fashionable return to forms which the post-war generations had solemnly repudiated. In literature the tendency is clear: the story, often in a narcissistic form, has regained its position almost entirely, free from the modernist challenges to subject and plot; it is no less clear in painting and sculpture, where figurative work is to be seen again, though abstract art has not utterly given way: here as elsewhere what we have is not a replacement of one single dominance by another but the replacement of all such universal dominance by a multidimensional explosion which some see as freedom, and others as merely a confused noise.

This revisiting, to savage or celebrate as the case may be, of the avant-garde dogmas of the past is not unconnected with the rise of individualism; it relates to the growing scepticism concerning both the established religions and the great political ideologies which came to take their place and have flourished for two centuries. It casts much light on the corresponding widespread popularity of the Heritage movement, which now prompts the ordinary people of Europe to visit, and on occasion to flock to, their 'sites of memory'.

### Heritage

The movement of 'looking back', often tinged with nostalgia or even a readiness to disparage modern times, has been part of our cultural conversation since the very origins of modernity: significantly enough it was known as the Renaissance. The end of the twentieth century went far towards closing the cycle, by gathering within the scope of retrospection the latest periods and most recent aesthetic movements; these had so far escaped this collective memorializing, with its fund of critical explanation and its results in practical initiatives for museums and monuments: as well as baroque music, there is the vernacular architecture of the nineteenth century, the academic painting and sculpture of the same period, the art deco style, the 1960s, and industrial architecture from any age.

Quite apart from this (in one sense definitive) heaping-up of assets, which makes the Western cultural memory, and

particularly the European one, a treasure-chest with virtually nothing left out (something no age has ever known before), the Heritage phenomenon can also be more crudely measured in figures: decisions to protect monuments or sites, new museum openings, and visitor numbers at such places, now being made more accessible in a number of ways to a public no longer restricted to the inheritors of 'proper' culture. If we also consider the energy with which European societies are re-examining, with a more or less critical intent, their own great identity-defining narratives, then we must conclude that one of the enduring and distinctive characteristics of the period is precisely this: the devotion of a considerable portion of today's energies to that which is not of today's world.

## NOTES

1. This idea we owe to C. Lefort, *Essais sur le politique: XIXᵉ–XXᵉ siècles*, Paris, 1986, p. 9.

## EASTERN AND CENTRAL EUROPE

*Sergeï L. Tikhvinsky*, coordinator

## INTRODUCTION

*Sergeï L. Tikhvinsky*

In February 1917, a year before the end of the First World War, Russia was rocked by revolution: the imperial government broke down. Nicolas II, the last Tsar of the Romanov dynasty, abdicated. The Provisional Government, which represented the interests of the haute bourgeoisie connected with foreign capital and landholding classes, did not manage to lead the country out of the lingering crises. On 25 October of the same year (7 November of the new calendar) the Provisional Government was overthrown in the course of the socialist revolution and power was passed to the All-Russian Congress of Workers' and Soldiers' Deputies, which unanimously adopted two historical decrees: the peace decree ending Russia's participation in the war and the land decree confiscating landlords' estates. These decrees reflected the desire of a vast part of the population. Vladimir Ilyich Lenin – the leader of the Russian Social-Democratic Party (Bolsheviks) – became head of the Soviet government. From 1918 to 1922 Russia was the arena of a bloody civil war accompanied by the armed intervention of 14 foreign countries.

After the end of the war a number of sovereign states emerged in the former Austro-Hungarian and Russian empires: Austria, Hungary, Yugoslavia, Czechoslovakia, Romania, Poland, Finland, Lithuania, Latvia, Estonia. All of them became republics, with varying degrees of democratic liberties. Soviet republics headed by local communists existed for a short period of time in Hungary and Bavaria in 1919. However, in the 1930s under the influence of fascist Italy and Germany and as a result of internal political processes in a number of states of Eastern and Central Europe, dictatorships were established.

As a result of Russia's three-year-long participation in the First World War and especially due to the civil war and foreign intervention, the country lay in ruins: production fell to 14 per cent of pre-First World War levels; casualties of the wars, hunger and epidemics affected 20 million people. In 1922 there were about 7 million homeless children. In the Volga region about 8 million people perished of hunger due to the drought of 1921–1922. Economic problems were finally solved by a New Economic Policy (NEP) proposed by Lenin. This policy envisaged restricted reintroduction of market relations.

In December of 1922, a new Russia had formed the Union of Soviet Socialist Republics (USSR) together with the Ukraine, Belarus and the Trans-Caucasian Federation of Socialist Republics (Georgia, Armenia, Azerbaijan), as well as autonomous republics and districts of Central Asia (Kirghizia, Uzbekistan, Turkmenia, Tajikistan) and Kazakhstan, which in due course also received the status of socialist republics within the USSR. Three Baltic republics (Estonia, Latvia and Lithuania) and Moldavia joined the Soviet Union in 1940. Thus by the time of Nazi Germany's attack in 1941, the Soviet Union was made up of 15 socialist republics.

Though in theory the supreme authority of the country was vested in the Soviets (councils of workers' and peasants' deputies, later on councils of working peoples' deputies), *de facto* it was concentrated in the hands of the Central Committee of the ruling Communist Party – the only political party that was permitted to exist. The leading role of the Communist Party was fixed in the Constitution of the USSR. After Lenin's death in 1924, and following a severe inner-Party struggle, Josef Stalin became the undisputed and unrestricted leader of the Party. He retained his post of General Secretary of the Party until his death in 1953. By the early 1930s Stalin had established his dictatorial rule both in the Party and the state. The process of industrialization of the country and the creation of collective farms (*kolkhoz*) and state farms (*sovkhoz*) was accelerated. The country's economic development was based on the system of state planning (five-year plans) originated by the plan of Russia's electrification (GOELRO) put forward by Lenin in 1919. Industrialization was achieved only by relying on inner resources, mainly at the expense of the peasants. No foreign loans or investments were available. This policy was supported by a majority of the population, as it was

seen as the only means of overcoming the country's backwardness given the unfriendly relations with countries surrounding the USSR. By the end of the 1930s, substantial social achievements had been realized – illiteracy and unemployment were overcome.

By the mid-1920s the Soviet Union was finally recognized by the majority of foreign states (with the exception of the United States of America, which withheld its recognition until 1933). However, the country received no financial or economic assistance from the rest of the world. Moreover the leading Western states often placed an embargo on Soviet exports, and some neighbouring countries like Japan, Poland, Romania, Turkey as well as the warlords of north-east China organized occasional armed provocations on USSR borders. The Anti-Comintern pact signed by Germany and Japan in 1936 was openly directed against the Soviet Union. The Soviet leadership had to accelerate modernization of the armed forces. During the 1930s, thanks to the rapid development of science, education and culture the government succeeded in creating new branches of industry for the production of aircraft, automobiles and tractors, and radio engineering. However, the country's social institutions and creative work were kept under strong ideological control by the Communist Party; and the waves of repression that had already started during the Civil War and were aimed against those who challenged the Party orthodoxy acquired a mass character in 1937. Many millions were sent to labour camps, where they built roads, canals, industrial objects – or perished; many hundreds of thousands were jailed and executed.

As early as 1933, the Soviet government openly warned the world of the threat of coming war and blamed Nazi Germany and militarist Japan as potential aggressors. Collective security plans were drawn up to confront and avoid the menace.

But the policy of 'appeasement' of aggressors carried out by the Western states (Munich Agreement of 1938, British-Japanese agreements of 1938–1939) forced the Soviet government in August of 1939, on the initiative of Germany, to sign a non-aggression pact with her. By this act Stalin expected to win time to prepare the Soviet Union for rebuffing the approaching military menace from Germany. The unprovoked attack by Germany against the Soviet Union on 22 June 1941 led to the eventual formation of an anti-fascist coalition composed of the USSR, the USA and Great Britain. During all four years of the war the Soviet-German front was the main theatre of military operations; by the end of the Second World War some 507 German divisions were defeated by Soviet troops. The Soviet army expelled invaders of its territory, liberated Poland, Austria, Czechoslovakia, Romania, Bulgaria and Hungary, neutralized Finland and victoriously captured Berlin. To fulfil her obligations as an ally of the USA and Great Britain, the Soviet Union also entered the war against Japan and liberated the north-east provinces of China (Manchuria), North Korea, South Sakhalin and Kurile Islands.

The Soviet victory over Germany, which had at its disposal military and strategic resources from many European countries, was the result of the recent social and industrial mobilization of the entire country, of the vastly improved cultural and educational level of its population, and of the successful development of fundamental and applied science.

The war inflicted huge losses on the Soviet Union: 26.6 million people perished; 1,710 towns and settlements were destroyed, in addition to more than 32,000 industrial enterprises, more than 70,000 villages, and about 100,000 *kolkhozes* and *sovkhozes*. The Soviet Union had to carry out the post-war restoration by relying entirely upon her own resources; neither foreign investments nor loans were available from the West. The problems of post-war development of the Soviet economy were aggravated by the worsening of the international situation and the beginning of the Cold War when the North Atlantic Treaty Organization (NATO) was formed in 1949. The Soviet Union was encircled by a network of American military bases, and the Pentagon worked out numerous plans for possible atomic bombardments of Soviet cities. All this forced the USSR government to redirect huge resources for urgent creation of a rocket-launched nuclear defence screen. Nonetheless by the end of the 1950s the country had restored her economy, became a member of the 'atomic club' and made a breakthrough to outer space. In the 1960s the Soviet Union achieved military and strategic parity with the US. All this became possible due to the strict limitation of social expenditures to address problems of a low standard of living: lack of housing, low wages, insufficient medical care, scarcity of consumer goods. Only those investments into science and education connected with defence remained intact.

After the Soviet Army helped liberate the countries of Eastern and Central Europe from German occupation, a number of 'people's democracies' (later proclaimed as 'socialist regimes') were formed. By the end of the Second World War, communists in those countries enjoyed wide popularity due to their self-sacrificing struggle against the German and Italian occupiers. The new authorities proclaimed their goal of building a socialist type of society and copied the Soviet model to varying degrees: both its positive features (social protection for all people, development of education, science, culture, public health, absence of unemployment) and its negative characteristics (command and administrative control over the economy, Communist Party and state interference in all spheres of social life, strict ideological control, and persecution of heterodoxy).

In 1949 the Council of Mutual Economic Assistance (CMEA) was created. Its purpose was to enhance cooperation between socialist countries, integrate their economic systems, and accelerate their scientific and technical progress. Albania, Bulgaria, Hungary, Poland, Romania, the USSR, Czechoslovakia and, later, the German Democratic Republic (GDR), Mongolia, Cuba and Viet Nam joined CMEA. In 1955, in reply to NATO activity, Albania, Bulgaria, Czechoslovakia, Hungary, the GDR, Poland, Romania, and the USSR concluded the Treaty of Friendship, Cooperation and Military Assistance (Warsaw Pact).

In the mid-1950s, after Stalin's death, there began a short period of liberalization of the strict ideological control by Communist parties in the Soviet Union. The icy relations with countries of Western Europe improved somewhat and were said to 'thaw' during this period.

During the administrations of Nikita Khruschev (1953–64) and Leonid Brezhnev (1964–82), military branches of the Soviet economy continued to develop at the expense of civil ones. As a result, during the years of the ninth Five-Year

Plan (1971–75), economic growth stopped and the country relied only on the income derived from its export of oil. The CPSU failed to continue the planned economy, whose self-proclaimed goal was to provide for social justice. The party leadership did not dare to stimulate market relations or competition. Urgent economic and democratic changes could not be realized under prevailing conditions and authoritarian rule of the aging leadership of the Communist Party. The leaders of CPSU lost touch with ordinary Party members and common people and tried by every means to preserve the status quo, avoiding any reforms that might unblock the economic and social stagnation. All forms of protest against the undemocratic system were ruthlessly crushed by the state, many prominent intellectuals were jailed, forcefully sent to mental hospitals or expatriated abroad like Solzhenitsyn, Brodsky, Medvedev, and Schiransky. President Gorbachev's attempts in 1989–91 to introduce some political and market reforms were condemned to failure because he left intact the old political system with its one-party rule and the command-administrative system of managing the economy. In 1991 leaders of a number of republics of the USSR (and first of all the Russian Federation under the leadership of Boris Yeltsin) proclaimed self-determination and state sovereignty of their republics, ignoring the results of the public referendum that took place in the Soviet Union in March 1991 that showed that 76 per cent of the country's population favoured preserving the Soviet Union. In December 1991, the presidents of the Russian Federation, Belarus and the Ukraine declared the dissolution of the Soviet Union and the creation of the Community of Independent States (CIS). Later on Kazakhstan, the republics of Central Asia, the Caucasian republics and Moldavia joined the CIS, but not the Baltic republics. A new Constitution for the Russian Federation passed in 1993, putting an end to the monopoly of the Communist Party in governing the state; the Soviet period of Russian history was over. Independent states formed after disintegration of the Soviet Union became members of the United Nations, and Russia inherited from the former Soviet Union its seat as a permanent member of the UN Security Council.

The protracted crisis of the Soviet system was already visible by the late 1950s and early 1960s in the socialist countries of Central and Eastern Europe. In Hungary as far back as 1956 there was an attempt to free the country from Moscow's tough grip, democratizing society and implementing market reforms. A similar attempt was made in Czechoslovakia in 1968, but both efforts were quashed by force by the Soviet Union and some of its Warsaw Pact

*Map 10* **The break-up of the Soviet Union**

partners. Eventually, disintegration of the Soviet Union provoked a rapid break-up of all the communist-led regimes in Eastern Europe.

The breaking-up of the integral economic, cultural and scientific common space established in the course of centuries between different areas of the former Soviet Union had a perilous effect upon the economy, science, education, culture and public health of the newly independent states; it is still hindering the all-scale application of their market and political reforms.

Drastic budget cuts for fundamental and applied sciences in Russia resulted in the mass emigration of highly trained specialists and engineers to the USA and Europe as part of a continuing brain drain.

# 31.1

# THE SOVIET UNION AND THE RUSSIAN FEDERATION

## *Sergeï L. Tikhvinsky* and *Yuri S. Borissov*

As a united multinational state, the Union of Soviet Socialist Republics (USSR) existed from December 1922 until December 1991. In this chapter we discuss education, science, social science and humanities, literature and art, as these relate to all 15 republics that formed the Soviet Union before its dissolution (Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kirghizia, Latvia, Lithuania, Moldova, Russia, Tajikistan, Turkmenistan, Ukraine, Uzbekistan).

### EDUCATION

The immediate task facing the young Soviet government after its formation on 25 October 1917 – according to the old calendar, or 7 November according to the new one – was the liquidation of the dark and painful heritage of the past: two-thirds of the population was illiterate, two-thirds of adults could neither read nor write. The day after the revolution, Vladimir Lenin, the head of the government, informed Anatoly Lunacharsky, a prominent writer, dramatist and philosopher, that the Central Committee of the Communist Party had appointed him as People's Commissar for Education. 'It is for you to overcome illiteracy in Russia' is what Lenin told him. Two days later the People's Commissariat for Education published an appeal that read: 'Any real democratic power in this country where illiteracy and ignorance prevail must first set itself the task of fighting against this state of unenlightenment. It must try to achieve universal literacy in the shortest period by organizing a network of schools using modern methods of pedagogy and by introducing universal, obligatory and free education ... the struggle against illiteracy and ignorance cannot be restricted only to in-school education for children and youth ... Adults will also be eager to escape from the humiliating state of a person who cannot read and write. Schools for adults must take up a large place in the general scheme of people's education.' Lenin's wife, Nadezhda Krupskaya, a teacher by training, became chief of the adult education section of the People's Commissariat for Education, later becoming deputy People's Commissar. Until the end of her life she worked in the field of *people's education*.

In October 1918, by decree of the government, a whole new spelling system was introduced, which helped in the struggle to combat illiteracy.

The Programme of the Russian Communist Party adopted in 1919 established certain basic school principles: teaching using the native language, co-education of boys and girls, full separation of schools from the Church, and making a seamless connection between teaching and productive public labour. The spread of literacy, the liquidation of cultural backwardness in the outlying areas of the country and the introduction of obligatory general primary and secondary education were considered the indispensable starting points for the country's cultural growth and development of the national economy.

By the end of the Civil War and foreign intervention about seven million children had neither home nor parents. Yet the government was able to overcome the crisis by providing them shelter, clothes, food and schooling in various orphanages.

The struggle against illiteracy was also conducted in the Red Army, which was formed for the most part by illiterate peasants. In order to spread literacy, special theatrical propagandist teams were created, and wall newspapers and posters were issued. During those years a series of amusing posters called 'Windows of Satire of the Russian Telegraph Agency' (ROSTAS) was very popular due to their sharp and witty cartoons and poetic texts. They lashed out against the lack of culture, drunkenness, bureaucracy, bribery and other anti-social phenomena and in an easy form acquainted people with elementary rules of sanitation and hygiene as well as touching upon timely subjects of domestic and foreign policy. The poet Vladimir Mayakovsky, and artists like Mikhael Cheremnykh and Dimitry Moor also participated actively in 'Window's' issues.

Opportunities for raising the standards of literacy and culture were also provided to non-Russian people. Beside Russians, who represented half of the whole population, there were more than 100 large and small non-Russian nations. In all national republics and regions native languages were introduced alongside the official Russian language. For those ethnic groups that did not have national alphabets before the Revolution, written languages were created. Newspapers, magazines and books written in national

languages were published in huge numbers. As a result, by 1932 the total number of literate adults had increased to 90 per cent, and by the beginning of 1939 literacy had reached 95.1 per cent of the total population. Obligatory universal primary education was introduced in 1931. By a decision of the Central Committee of the Communist Party in September 1931 all forms of post-revolutionary ultra-leftist experiments in the field of education were abolished. In the school year 1914/1915 there were 9.6 million pupils enrolled in school; by 1927/1928 there were 11.5 million and in 1940/1941 35.5 million children were attending school. In the year 1956/1957 some 30 million pupils were being trained in general-education schools of the Soviet Union. Alongside the general-education schools, secondary professional schools and technical colleges were also functioning.

Regarding higher education, the programme adopted in 1919 gave wide admittance to high school for all who wanted to study, and especially for workers; it was decided to open recruitment of lecturers in high school to all available personnel; to remove every kind of artificial barrier between new research cadres and old university chairs; and to offer material support to students so that workers and peasants would also have the opportunity to enjoy a high school education. In order to assist common people to prepare for their entry into higher educational institutions a network of so-called 'workers' faculties' (*rabfaks*) was created. In 1955–1956 more than 2 million students were studying in 765 institutions of higher education of the Soviet Union. Widespread and free secondary and higher education was one of the important social achievements of the country. After the Second World War, the doors of all institutes of higher education and universities were opened wider still to include many foreign students, especially from socialist countries and the developing countries of Asia, Africa and Latin America.

During the 1920s and early 1930s pedagogical training was strongly influenced by different ultra-left theories whose followers denied the leading role of the teacher at school, and recommended instead that the teacher could be replaced by 'self-study brigades'. They disseminated popular sociological schemes of 'proletarization' of teaching methods and introduced a decorative badge, 'Arts for Proletarian Children'. Among the major figures in the struggle against such 'leftist' theories were Vasily Aleksandrovich Sukhomlinsky, whose philosophy of education combined teaching with pupils' practical work, and Anton Makarenko, who started the idea of re-educating juvenile delinquents in special children's colonies that combined work with education.

In 1943, the highest pedagogical establishment of the country, the Academy of Pedagogical Sciences, was founded. By 1987 it consisted of 45 full members-academicians, 84 corresponding members, and 15 research institutes grouped in four departments: Theory and History of Pedagogics, Didactics and Private Methods, Psychology and Age Physiology, and Pedagogics and Psychology of Professional and Technical Training. After the disintegration of the USSR, the Academy of Pedagogical Sciences was re-organized into the Russian Academy of Education.

Libraries made an important contribution to raising the educational level of the population. In 1914 there were only 12,800 libraries in Russia and their total fund equalled 8.9 million books, whereas in 1956, libraries numbered 391,952 with the total reserves of 1,352 million books. The most popular libraries were: Moscow State Library, named after Lenin and housing 19 million books, the Libraries of the USSR Academy of Sciences in Moscow and in St. Petersburg, the Library of Moscow State University, the Moscow Library of Foreign Literature, and the many libraries in each of the capitals of the Soviet republics and in their provincial universities.

## MUSEUMS

Museums also attracted state attention. The most prominent were: in St. Petersburg – the Hermitage, Cabinet of Curiosities of the Academy of Sciences, the Russian Museum, the Petropavlovsk Fortress, Petrodvorets, the Winter Palace; in Moscow – the Historical Museum, the Kremlin Museum, the Tretyakov Gallery and the Museum of Fine Arts; the former tsar's country palaces, Kolomenskoe and Tsaritsyno, palaces and private residences of the aristocracy and merchants; in Kiev – ancient monasteries and churches; Echmiadzin in Armenia; Metekh in Georgia; the emir's palaces in Bukhara and Khiva. State support was a big help for organizing ethnographic and history museums all over the country (in Pskov, Krasnoyarsk, Irkutsk, Ekaterinburg), and in the towns of the so-called Gold Ring (Yaroslavl, Rostov, Serpukhov, Souzdal.) Many nature reserves and architectural heritage sites were also established in Kizhi, Lake Baikal, Prioksko-Terrasny Biosphere Reserve, and the Caucasus and Askania-Nova Reserves in the Crimea. Numerous museums were devoted to presenting the life and work of outstanding scientists and artists: Konstantin Tsiolkovsky in Kaluga; the Museum-Reserves of Aleksandr Pushkin in Mikhaylovskoe; Leo Tolstoy's estate in Yasnaya Polyana; Ivan Turgenev in Spasskoe Lutovinovo; A. Chekhov in Yalta; Taras Shevchenko in Kiev; Yanka Kupala in Minsk; Ivan Aivazovsky, the painter of seascapes, in Feodosia; painter Vasili D. Polenov on the Oka River; composer Piotr Ilyich Tchaikovsky, in Klin.

Mass organizations also contributed to raising the general educational and cultural level through a wide network of various cultural and educational enterprises like sports clubs, public parks, palaces and cultural centres. The latter functioned on the basis of amateur talent activity and local initiative. They included a lot of different musical, dramatic, choreographic, chess, and sports activities as well as permanent lecture series on different scientific, cultural and educational topics. Many well-known musicians, singers, painters, and sportsmen began their careers in these circles that were often led by skilful pedagogues. In 1947, the All-Union Scientific and Educational Society named *Znanie* (Knowledge) was organized with branches in every union and autonomous republic. It made an important contribution in the raising of the educational and cultural level of the population.

## SCIENCE

During the years of the Civil War and foreign intervention (1918–24) when the whole population of the country suffered from hunger, the government at the initiative of

the writer Maxim Gorky, formed a committee for the improvement of scientists' way of life. This committee rendered assistance to scientists and artists in need. During these years the government also provided money for the foundation of such large centres of fundamental and applied sciences as the Optic Institute (directed by Dimitri Rozhdestvensky), Institute of Aerodynamics (Nikolai Zhukovsky), Physics-Technical Institute (Abram Ioffe), Radium Institute (Vladimir Vernadsky), and the Institute of Biological Chemistry (Alexei Bakh), as well as chemical, automotive, electrotechnical institutes and a radio engineering laboratory (in Nizhny Novgorod).

In 1925 the Russian Academy of Sciences, which had been founded in 1724, was transformed into the USSR Academy of Sciences. It became the leading and coordinating centre of science in the country. Some important scientific institutions like the Institute of Physiology (headed by Ivan Pavlov, a 1904 winner of the Nobel Prize), Physics-Mathematics Institute (Vladimir Steklov), the Institute of Soil Sciences named after Vasily Dokuchaev, and other previously independent institutions headed by leading specialists in the field were integrated into the Academy. In 1934 the Presidium of the USSR Academy of Sciences moved to Moscow from Leningrad. In the process of industrialization many new scientific-research centres and institutes were established throughout the 1930s. These included the Physical Institute (Sergei Vavilov), Institute of Organic Chemistry (Aleksandr Favorsky and Nikolai Zelinsky), Institute of Problems of Physics (Pyotr Kapitsa), and the Institute of Theoretical Geophysics (Otto Shmidt). The Academy began to organize its branches and departments in various capitals of the union republics – in Siberia, in the Urals, and in the Far East of the Soviet Union. The Academy of Sciences of the Ukrainian SSR had been founded in Kiev as early as 1919, followed by the Academy of Sciences of the Belarussian SSR in Minsk, in 1929. In the period between 1941 and 1961 Academies of Science were organized in all the other republics with the assistance of the USSR Academy of Sciences.

During the war years (1941–45) the entire energy of Soviet science was concentrated on achieving victory. In the course of military actions more than 600 scientific institutions were damaged or destroyed by the German Army, among them the famous Pulkovo and Simeiz observatories (now renamed the Crimean Astrophysical Observatory). Timely evacuation of scientists and scientific institutions from the western parts of the USSR allowed the country to build up new scientific centres in the rear – in the Volga region, in the Urals and Siberia. They fulfilled important tasks given to them by the State Committee for Defence such as ensuring ships' security from magnetic mines, and finding solutions to many military and technical problems. In the country's outlying areas, geologists carried on the search for strategic minerals. These minerals and raw materials were necessary to keep many industries functioning even though the territories were occupied by the enemy. At the urgent request of the Supreme Command of the Soviet Army, the Presidium of the USSR Academy of Sciences formed several special commissions headed by the leading scientists to solve these military and technical problems. The list included: Abram Ioffe, Igor Kurchatov, Aleksandr Aleksandrov, Leon Orbeli, Vladimir Komarov and Alexander Fersman. Close cooperation was established between specialists in the fields of fundamental sciences and scientists, engineers and technologists working in different branches of applied sciences. This cooperation helped to strengthen the military might of the country. During the war years the T-34 tank was created; later it was recognized as the best tank of the Second World War. For the first time in tank-building history, the turret of this tank was produced by electric welding, a process developed by Boris E. Paton, Director of the Institute of Electric Welding of the Ukrainian Academy of Sciences. The best attack plane of the Second World War, the Il-2, (built by Sergei Ilyushin), the TU-2 dive-bomber (built by A. Tupolev) and Pe-2 (built by Vladimir Petlyakov) also appeared during those years. Finally, the multi-rail rocket launcher with the tender name of 'Katyusha' was put into production, along with a very efficient automatic rifle invented by Mikhael Kalashnikov.

In the post-war period one of the most important events in the development of science was the government's decision to build an 'academic town' in Novosibirsk. Even now, 40 years since its founding, it is still an outstanding model of a scientific centre (its initiator and organizer was a leading specialist in mathematics and mechanics, Professor Mikhael Lavrentiev). Later, scientific and technological satellite centres of the Academy of Sciences were also established in towns near Moscow: Pushchino, Chernologolovka, Serpukhov, Troitsk, Dubna, and Zelenograd.

In the early 1970s the number of scientific staff employed by the Soviet Academy of Sciences was about 1 million people; and expenditures for science had increased twelve-fold by comparison with 1950. Also since the 1950s, many thousands of young specialists from socialist and developing countries had been postgraduates of institutes of the Academy of Sciences.

After the disintegration of the Soviet Union, the USSR Academy of Sciences was transformed into the Russian Academy of Sciences. In 1998 it had 458 full members and 677 corresponding members. Its 440 research institutions were attached to 18 departments covering: mathematics, physics and astronomy, engineering, computer sciences, chemistry, biology, geology, oceanography, history, philosophy, sociology and law, economics, international relations, literature and languages.

Below we offer a brief summary of research results in different branches of natural science, social science and the humanities.

Mathematical theory was greatly developed, covering the theory of numbers, functions, differential equations and functional analysis, of optimum control, probability, topology, and mathematical logic. In these fields new directions and approaches are closely connected with the names of Ivan Vinogradov, Andrei Kolmogorov, Alexander Lyapunov, Nikolai Bogoliubovv, Lev Pontryagin. Works by Mikhail Lavrentiev on hydrodynamics, the theory of cumulation, and the physics of explosions and impulsive processes were widely known in the field of applied mathematics. Mstislav Keldysh did outstanding work on the theory of non-self-conjugate operators, prevention of wing flutter, and calculation of cosmic orbits. Leonid Kantorovich was awarded a Nobel Prize in 1975 for his work in economics and mathematics. Alexander Sergei Lebedev is recognized for his contribution to computational technologies.

The most important work on aerodynamics was done by Nikolai Zhukovsky and Sergei Chaplygin, which provided

the basis for new developments in aerodynamics of supersonic velocity, non-linear mechanics, the theory of space flights, the mathematics of elasticity, and the theory of non-linear oscillation. In 1913 the first four-engine airplane was constructed by Igor Sikorsky, who during the Civil War emigrated to the USA.

## SPACE RESEARCH

Space research built upon work done by Konstantin Tsiolkovsky (1857–1935), an early twentieth-century pioneer in rocket propulsion who also proved the possibility of human space travel; Vladimir Vernadsky, whose visionary work on the synthesis of living and inorganic natural bodies is the basis of modern ecology and studies on the biosphere; Alexandr Chizhevsky, one of the founders of heliobiology, which looks at solar effects on human beings; and Vladimir Sukachev, who was one of the founders of biogeocenology, a field combining botany, soils and diversity.

In 1933 the first Soviet stratospheric balloon reached an altitude of 19,000 metres. The practical beginning of research in open space became possible due to the creation of rocket propulsion techniques developed by Fridrich Tsander, and due to their further development by Sergei Korolev, Vladimir Chelomei, and Mikhael Yangel. The first artificial Earth satellite (*Sputnik*) was launched on 4 October 1957. On 12 April 1961 the first manned space flight was undertaken by Yuri Gagarin. In June 1963 the first woman-cosmonaut Valentina Tereshkova made her orbital flight. Manned flights were preceded by a series of medical and biological investigations on the effects of weightlessness on dogs and other living beings (by Vasily Parin, Norair Sisakyan, Oleg Gazenko). A number of orbital stations were built for long duration work on the round-the-Earth orbit. The latest station of the kind *Mir* with a mass of about 40 tons was launched on 20 February 1986 and continued functioning until it was 'retired' in 2001. By then, some twenty-seven teams of Russian cosmonauts and researchers from twelve foreign countries had worked by turns at that station.

Rocket technology was closely connected with national defence. Such mobile intercontinental rockets as *Topol* and *Pioneer* were installed on special tracks invented by Belarussian engineer Boris Schaposhnikov.

In space research, as well as in other branches of Soviet science, one has to mention the unique team spirit of scientists, engineers and technicians, which was due to the Soviet educational system. It had deep roots in old Russia's traditional rural life (*obchina*). This spirit of collectivism, sponsored by the Communist Party, was evident during the Second World War, known in the USSR as the Patriotic War against fascist Germany and, afterwards, during the process of healing the wounds of war.

Progress in cosmic rocket technology allowed the installation of stable radio and telecommunication systems, and investigation of the surface and deep strata of the Earth, the atmosphere, near space, as well as planets and comets in the solar system. In 1966 *Luna 9* was the first spacecraft to achieve a lunar soft landing and to transmit photographic data to Earth; in 1970 *Luna 10* returned to the Earth with some samples of moon soil. *Luna 11* was launched towards the Moon from an Earth-orbiting platform and entered lunar orbit on 28 August 1966.

In 1975 Venus and Vega stations began a complex research of the planet Venus. They lowered several landing apparatuses onto the planet's surface and launched balloons into its atmosphere. Vega also explored the Galley comet.

The Pulkovo and Simeiz Observatories, which were destroyed in the war, were fully restored and a large new astrophysical observatory was built near Bakhchisaray in the Crimea. Observatories in the Crimea, Bjurokan, Shemakha, Estonia and Latvia were equipped with new telescopes. In 1975 an observatory was built in the North Caucasus with a reflector mirror of 6 metres in diameter. The radio telescope RATAN-600, with its ring-shaped reflector and 600-metre surface diameter was also built there. Radio location research of the Moon, Venus, Mercury, Mars and Jupiter were carried out under the leadership of Vladimir Kotelnikov Photos of the back side of the Moon were received from artificial Earth satellites.

Victor Ambartsumyan developed a theory of celestial associations of stars, which confirmed the continuity of the process of star genesis. An hypothesis for the origin of stars and planets was put forward by Otto Shmidt and Vasili Fesenkov. In the 1960s Michaël Molodensky worked out the theory of rotation of the Earth with a liquid nucleus, accepted in 1979 as the basis of a new system of coefficients notation. The theory of radio-emission of supernova remnants was elaborated in the 1950s by Vitali Ginzburg and Yakov Zeldovich. Andrei Severny studied weak magnetic fields of stars. The history of radioastronomy is closely connected with the name of astrophysicist Iosef Shklovsky.

## PHYSICS

To begin with, the theoretical physicists Igor Tamm (Nobel Prize of 1958), Lev Landau (Nobel Prize of 1962), Leonid Mandelshtam, Mikhail Leontovich, Nikolai Bogoliubov and Ilya Frank (Nobel Prize of 1958) all made important contributions to the various branches of modern physics: quantum field theory, plasma and solid state physics, superconductivity, superfluidity and nuclear physics.

In the 1930s Abram Ioffe initiated systematic investigation of transistors, and by the 1950s the main principles of power transmission had been worked out. As early as the 1930s scientists were working to synthesize crystals, which resulted in industrial production of artificial quartz, corundum, sapphires and diamonds. In 1951 Alexei Shubnikov proposed a general theory of symmetry and asymmetry of crystals. In 1975 Alexander L. Vereshchagin published his seminal works on the transformation of hydrogen into metal under super-high pressure.

In the 1920s showers of cosmic rays were discovered by Dimitri Skobeltsyn. In 1940 Georgi Flerov and Konstantin Petrzhak together discovered the phenomenon of spontaneous nuclear fission and developed theories to account for it. During the war years the theory of synchrotron radiation was put forward, along with principles explaining how high energy particle accelerators work.

As early as 1939–41 Yuli Khariton and Yakov Zeldovich carried out the calculation of the nuclear division chain. Under the direction of Igor Kourchatov the first Soviet

cyclotron was constructed in 1939, and in 1946 the first nuclear reactor in Europe was built. He also headed the team that created the first Soviet atomic bomb (1949) and later the thermonuclear bomb (1953). Andrei Sakharov (Nobel Peace Prize of 1975) and Y. Khariton were key contributors.

The problem of guided thermonuclear synthesis was being investigated at this time; the so-called 'Tokomak' system of was devised, which soon became the basis of international thermonuclear research. Alternative ways were proposed to realize a guided thermonuclear reaction– by heating of plasma with a powerful laser beam from a bundle of electron rays.

Research of atomic nuclei and elementary particles was greatly extended when, in the 1970s and 1980s, large accelerators were built. Many new elementary particles were revealed, and experiments done on the proton accelerator in Serpukhov (operational in 1967) allowed scientists to observe and describe the interactions of particles under high-energy conditions. After the underground neutrino observatories were brought into operation research on neutrino physics and astrophysics of particles of super-high energies coming from space progressed greatly.

In the field of optics Serfei Vavilov and his colleagues Igor Tamm, Semen Shubin and Yuri Denisyuk conducted fundamental research on luminescence; they discovered the radiation effect of electrons moving with superlight velocity, known as Vavilov-Cherenkov radiation (Nobel Prize of 1958). In 1931, the quantum theory of photoeffect in metals was worked out by Tamm and Shubin. Denisyuk made a very important contribution to optics through his work on holography with 3D media recording optics in the late 1960s.

In the 1950s quantum electronics came into being. Alexandr Prokhorov and Nikolai Basov (Nobel Prize of 1964) developed molecular generators (masers) and later on quantum generators in the optical diapason of wave length (lasers). Achievements in the field of physics of low and super-low temperatures are connected with the name of Pyotr Kapitsa (Nobel Prize of 1978), who discovered the super-fluctuation of liquid helium.

In the field of marine acoustics, one must mention the achievements of Leonid Brekhovskikh in the field of musical acoustics, and of Leonid Termen, who made the first electric musical instrument – a 'termenvocks' – as long ago as the 1920s.

In the field of radio physics, Soviet scientists studied the propagation of radio waves of different frequencies, statistical radio physics, and investigated the natural environment using radiophysical methods. In 1944 Evgeni Zavoysky opened up the phenomenon of electronic paramagnetic resonance, which gave impetus to research on the structure of solids, liquids and molecules.

Vladimir Zvorykin, who emigrated to the United States in 1919, later developed and patented (1929) an electronic scanning device that became the first practical 'pickup' tube for television. He named it the Iconoscope.

## CHEMISTRY

In the 1920s Lev Chugaev and Nikolai Zelinsky made their mark in the chemistry of composite compounds and the transformation of hydrocarbons and petrochemistry,

respectively. Nikolai Kournakov advanced the methods of physico-chemical analysis.

The discovery of appropriateness of heterogeneous and homogeneous catalysis as well as non-stationary catalytic processes elaborated by Georgi Boreskov gave rise to new and more efficient catalysts. Vladimir Ipatiev, working in the United States from 1930 onwards, was one of the founders of catalytic organic synthesis. In the 1930s Sergei Lebedev elaborated an industrial method for producing synthetic rubber; after which the chemistry of polymers developed rapidly.

In the post-war years chemistry of elemento-organic compounds was another field of intense development (school of Alexander Nesmeyanov), regularly creating organic compounds for most elements of Dimitri Mendeleev's periodic table. The famous Kazan School of Chemistry was founded by Boris A. Arbuzov and made significant contributions to the chemistry of phospho-organic compounds – one of the future branches of elemento-organic chemistry.

Nikolai Semenov made an important contribution to chemical kinetics by first working out a chain theory of chemical reactions, combustion and detonations for which he won a Nobel Prize in 1956. New physical methods of stimulation of chemical reactions by radiation and light laser beams, shock waves and plasma were developed.

Ivan Bardin and Alexandr Baykov and their colleagues succeeded in increasing the efficiency of ferrous and non-ferrous metals, by producing heat- and acid-resistant alloys.

## BIOLOGY

Everyone has heard the names of Ivan Pavlov, a physiologist best known for his studies on conditioning the behaviour of dogs, and Nikolai Vavilov (1887–43), a plant geneticist who traced the origin of cultivated plants. Nikolai Koltsov was an exceptional plant breeder and geneticist. Andrei Belozersky proved the unity of the plant and animal kingdoms. Vladimir Engelgard put forward a biochemical explanation of muscular contraction, while Andrei Bakh worked out the theory of the chemical composition of breathing. Fundamental works on agrochemistry and plant nutrition produced by Dimitri Pryanishnikov and his school are still valued, as is the published work of K. Skryabin.

In the 1920s and 1930s works by Nikolai Vavilov, Nikolai Koltsov, Sergei Chetverikov, and Alexandre Serebrovsky all made an important contribution to genetics. But beginning in the mid-1930s and especially after 1948 Soviet biology and genetics suffered from Party ideology and especially the influence of Trophim. Lysenko, a plant breeder who rejected chromosome theory and supported the doctrine that characteristics acquired through environmental influences are inherited (acquired characteristics). Scientists who opposed his views lost their jobs, were sent to Siberia, or were executed. Thus the whole field of genetics was virtually suspended until 1965.

## EARTH SCIENCES

Earth sciences were closely connected with the planning of the national economy. Geologists made a series of maps

using theoretical prognoses and data from reconnaissance expeditions. These maps guided the search for minerals and for a better understanding of the structure and evolution of the Earth, volcanic activity and tectonics. Rich oil- and gas-fields were found in East Siberia, Turkmenistan and the Caspian Sea; diamonds were discovered in the Yakutia and Arkhangelsk region; and gold in Uzbekistan.

Dmitri Shcherbakov and Alekandr Vinogradov worked successfully in the field of geochemistry. They investigated the Earth's crust using extra-high impulse electric current and drilling a number of super-deep holes – one of which reached the record depth of 12 kilometres. Alexander Peive contributed significantly to the geophysical structure and tectonic dynamics of the Earth's crust and mantle. He examined underwater ranges in the Atlantic and Pacific Oceans and in the Antarctic, discovering powerful counterflows in the Atlantic and Indian Oceans. As far back as 1928 arctic pilots and the icebreaker *Krasin* had participated in the rescue of the Italian expedition of Umberto Nobile, which failed to reach the North Pole in a dirigible airship named *Italia*. In 1932, the Sibiryakov expedition set sail under Otto Shmidt and covered 5,600 kilometres of the North Shipping Route during a single voyage. In 1937 the first Arctic expedition headed by Ivan Papanin landed on a drifting ice field near the North Pole. Between then and 1987 there were 30 similar research units named North Pole. In 1937 Soviet pilots Valeri Chkalov and Mikhail Gromov accomplished non-stop flights of record length from Moscow to the USA over the North Pole. Soviet ship-builders constructed the world's first atomic icebreaker, the *Lenin*. At present, nine atomic icebreakers ensure there is permanent navigation along the North Shipping Route and it is now routine to reach the North Pole safely.

Since 1957 Soviet scientists have been participating in international projects to study Antarctica and have taken part in 44 Antarctic expeditions. One permanent research unit has discovered the existence of a lake lying three-kilometers deep under Antarctic ice.

## ELECTRIC POWER ENGINEERING

The State Plan of Electrification of Russia (GOERLO) envisaged construction of hydroelectric power stations (HPS), thermoelectric power stations working on local fuel (peat), development of electro-consuming industries, and improvement of river navigation. Accordingly, the Volkhov (December 1926) and Dnieper (May 1932) HPS were built. By 1935 the GOERLO Plan was over-fulfilled. By 1940 the total output of electric energy exceeded the GOELRO planned by a factor of 6. By 1982 the Soviet Union held first place in the world in terms of primary commercial power resources (including oil and solid fuel, gas and electrical energy). Cascades of HPS were built on the Volga and Angara Rivers and on many others. Soviet engineers constructed the High Dam at Aswan on the Nile in Egypt during the 1960s. In 1954 the world's first nuclear power station (NPS) was constructed in Obninsk, followed by many others. In 1987, however, after the Chernobyl nuclear power disaster, much more attention was paid to human and environmental safety throughout the energy supply sector.

## ECONOMY

In the early 1920s, the government began to draw up development plans for the national economy; economists, energy specialists, geologists and many other scientists were consulted. The first plan was a five-year State Plan of Electrification of Russia. Since 1929 the Soviet Union continued to develop according to five-year plans, except for one seven-year period from 1959 until 1965. The following guiding principles were common to all: the importance of developing heavy industry and building large industrial complexes; use of the most advanced technologies combined with maximum use of local raw materials and resources; and equal attention to the development of industry and agriculture. In the 1920s, the Russian economist Nikolai Kondratiev identified a price cycle that is 50–60 years long. He used it to predict the depression of the 1930s. Although he worked on the Soviets' first Five-Year Plan, he was imprisoned and died in Siberia.

In the 1950s economists of the so-called 'mathematical school' (Leonid Kantorovich, Vasili Nemchinov, Viktor Novozhilov) concentrated their attention on 'optimal planning'. At the beginning of the 1960s Evsei Liberman and Vladimir Nemchinov proposed reforms directed against strict centralized planning. At the beginning of the 1970s scientists from the Central Economico-Mathematical Institute of the USSR Academy of Sciences (headed by Nikolai Fedorenko) proved that keeping the command-administrative system and economy would lead the country to deadlock and proposed a programme of reforms. But those proposals as well as the reforms proposed by Prime Minister Alexei Kosygin (1904–80) were rejected by the conservative leadership of the Party. The results of Soviet economic science remained unclaimed and the country's economy stagnated.

## PHILOSOPHY

Violent class struggle during the Civil War years and period of foreign intervention (1918–22) left their impact on public life. Communist Party leaders officially proclaimed the necessity to fight against any hostile ideologies or bourgeois and petty bourgeois remnants. In 1922 a large group of prominent dissident philosophers, sociologists, historians, and writers were forcibly deported from the country. They belonged to the liberal wing of public opinion, which had been formed before the war. The most outstanding representatives of liberal philosophy and idealist views were: Petr Struve (neo-Kantian metaphysics), Nikolei Berdyaev and Sergei Bulgakov (religious-philosophic school), Pavel Milyukov (adherent of positivism), Pitirim Sorokin (spoke out in favour of the development of religious culture).

In the 1920s national and religious movements such as Pan-Islamism and Pan-Turkism gained followers among the Muslim population of the country. One of the first decrees of the Soviet administration was the separation of church and state. For the sake of propaganda the government started an extensive anti-religious campaign headed by the 'League of Militant Atheists'. As a result, many churches, mosques and synagogues were closed; and numerous priests were arrested as accomplices of rich peasants (so-called *kulaks* who employed agricultural workers), along with other suspected enemies of socialism. In the beginning of

the 1930s numerous philosophers, historians, writers and artists were charged with belonging to this or that bourgeois or religious group and were persecuted. In due course, the leadership of the Communist Party began to limit extreme, ultra-left, anti-intellectual tendencies. Representatives of these leftist ideas insisted on 'proletarization' of philosophy, history, literature and art. In 1938 a *Short Course on the History of the Communist Party*, edited by Stalin, was published and widely distributed. One chapter written by Stalin himself contained the basic points of Marxist-Leninist philosophy and historical materialism and dialectics. The 'Short Course' was obligatory throughout the education system. Its appearance was dictated by Stalin's desire to standardize public thought and his attempts to prevent any appearance of non-conformism after he had succeeded in rooting out any opposition within the Party. Though in the 'Short Course' several schools of Western European and American philosophy were severely criticized, readers of the 'Short Course' could not go to the original books by foreign authors and had to accept the opinion offered on blind trust At the same time works by Karl Marx, Friedrich Engels and Vladimir Lenin were published in mass copies, giving thinking readers an opportunity to get acquainted thoroughly with Marxist-Leninist theory and historical and dialectical materialism. A lot of prominent Soviet intellectuals, artists and scientists of those years – N. Vavilov, S. Vavilov, V. Vernadsky, A. Ioffe, V. Komarov, N. Kournakov, I. Michurin, O. Shmidt and others – mastered the Marxist methodology and fruitfully used it in their everyday research. After the war, the most important contribution in classical philosophy and aesthetics was made by Aleksandr Losev; Yuri Lotman's work on semiotics also won wide recognition.

During the war against Nazi Germany anti-religious propaganda was stopped by the state, and churches and mosques began to open. But after the war Stalin again introduced new ideological pressure against 'cosmopolitanism' and 'cringing' before the West. Biologists were hounded, while genetics and cybernetics were proclaimed 'pseudo-sciences' and brought to a halt.

When Nikita Khruschev 'dethroned' Stalin, this was not accompanied by any new philosophy. Repression of non-conformists continued (e.g. A. Sakharov's exile, dissidents' deportation from the country or their confinement in mental institutions). Moreover, the ideological battle between dogmatists and realists was extended from the home front to international relations. Dogmatists persisted in believing there could be no compromise between socialist and capitalist systems. Representatives of the realistic school, who borrowed Lenin's thesis about the possibility of peaceful co-existence of states with different social-political systems, insisted that at the end of the twentieth century it was necessary to solve urgent global problems such as safeguarding peace, protecting the environment, and reducing poverty, starvation and epidemics; they believed such goals could be reached only by a common effort of all countries of the world. Late in the 1980s and especially after Russia's proclaiming of sovereignty and the dissolution of the Soviet Union in 1991, Orthodox, Muslim and Buddhist faiths initiated activities in the Russian Federation. Some Russian philosophers returned to the 'Eurasian idea' whereby Russia was viewed as a 'bridge' between civilizations of the West and East. It was a country that had absorbed Byzantine

and Western cultures as well as elements of nomadic tribes, such as the Scythes, Khazars and the Golden Horde.

## HISTORY, ARCHAEOLOGY, ORIENTAL STUDIES

During the Soviet period the study of history was heavily politicized. Certain Marxist historians absolutized the class struggle, describing the historical process schematically (school of Mikhail Pokrovsky). Only in 1934 was history re-introduced in Soviet universities. In 1936 the Communist Academy where historical disciplines had been concentrated was dissolved, to be replaced by the Institute of History as part of the USSR Academy of Sciences.

During the war years attention to the history of the motherland increased: books by professional historians glorifying national patriotism (*Napoleon*, *The Crimean War* by Evgeni Tarle) and by writers of fiction with historical plots (*Genghis-Khan*, *Batu* by Vasili Yan Yanchevetsky) were highly appreciated by readers. After the war Boris Rybakov published a number of books on the history and archaeology of ancient Russia. Miliza Nechkina authored a series of works about the Decembrists' democratic movement in the 1820s; Mikhail Tikhomirov collected and studied Russian medieval manuscripts; Nikolai Druzhinin researched democratic movements of Russia in the late nineteenth and early twentieth centuries. Important work was also done to compile collective historical works, such as the 16-volume *World History*, the 13-volume *Historical Encyclopaedia*, the 5-volume *History of Diplomacy*, and the 2-volume *History of Diplomatic Relations in the Pacific Ocean Region* (edited by Evgeni Zhukov and Aleksandr Guber). In addition, there were five separate editions of a 3-volume *Diplomatic Dictionary*, a 6-volume *History of the Great Patriotic War*, a 16-volume *History of World War Two*, and three editions of the voluminous *Large Soviet Encyclopaedia* edited by Aleksandr Prokhorov. Many scholars contributed to particular geo-cultural areas. There were Sinologists such as Vasili Alekseev, Japanists such as Nikolai Konrad, Indologists (Fedor Scherbatskoy); Arabists (Ifgnat Krachkovsky), Iranists (Evgeni Bertels), Mongolianists (Boris Vladimirtsov), and Africanists (Ivan Potekhin). Nicholas Roerich, the painter, philosopher and historian, and his wife Helen and their sons, Yuri and Sviatoslav, were New Age figures living mainly in India, who contributed to the cultural interaction of East and West.

Archaeologists discovered Palaeolithic and Neolithic sites along the migration routes from Siberia through the Chukot Peninsula and Bering Strait to America. Aleksandr Okladnikov discovered Neolithic settlements in the South Uralsand. B. Rybakov, together with specialists on Indo-European linguistics and toponymics, such as Oleg Trubachev, determined the habitat of proto-Slavic tribes, while Boris Piotrovsky discovered remains of an ancient Urartu civilization in Armenia. Old Russia texts on birch-bark were found during excavations by Artemy Artsikhovsky and Valentin Yanin in Novgorod, Pskov, Staraya Russa, and Tver. About 800 examples of these texts are known. Scythian burials preserved in the permafrost were discovered in the Pazyryk valley. Soviet archaeologists also carried on expeditions to the Nubian Desert (Boris

Piotrovsky), to Syria and Iraq (Rauf Munchaev), where they found settlements from the 7th millenium BC. In Central Asia archaeologists uncovered the site of Nissa, an important centre of the Parthian state, which existed from the third century BC and Neolithic settlements of 8000 to 7000 BC, excavated by Vladimir Masson. The great 20-volume *Archaeology of the USSR* was done under B. Rybakov's leadership.

In the 1980s the opening up of the previously closed state archives gave a great impetus to publishing new historical studies on the USSR and Russia.

## LITERATURE

In the years of the First World War several decadent and anarcho-nihilistic schools prevailed in Russian literature. The most important was a group of poets who were later described as representatives of the 'Silver Age' and included Anna Achmatova, Nikolai Gumilev, Boris Pasternak, Marina Tsvetayeva, and Konstantin Balmont. Some groups, the futurists for instance, demanded 'to throw down Pushkin, Dostoevsky, Tolstoy, from the ship of contemporaneity'. Such destructive tendencies survived in literature during the first years of Soviet power too, and Lenin had to state that Marxism did not give up the most precious achievements of the bourgeois epoch at all but, on the contrary, assimilated and absorbed everything valuable in its several thousand years' development of thought and culture. Speaking before the Young Communist's Congress Lenin emphasized that one can become a communist only having enriched one's memory with the knowledge of all mankind's treasures. In spite of these pronouncements, the ultra-left, nihilistic attitude towards literature and culture of the past was supported by some members of the Communist Party leadership, especially by followers of Leon Trotsky. In 1925 the Russian Association of Proletarian Writers (RAPP) was established. Its members declared their rejection of any cultural heritage of the past, and demanded the establishment of a 'hegemony of the proletariat' in literature. They divided writers into categories according to their class, and, criticized them fiercely as being 'bourgeois', or 'neo-bourgeois' authors. Similar ultra-left activities also affected the fine arts, theatre and cinema, but eventually the ultra-left tendency was condemned and overcome. The overwhelming majority of Russian intellectuals kept up with the traditional culture of the country. In 1932 RAPP was finally dissolved.

Russian poets and writers were among the first to recognize the Revolution: Vladimir Mayakovsky, Sergei Esenin, Aleksandr Blok, Valeri Bryusov, Fedor Gladkov, Konstantin Fedin, Marietta Shaginyan, Dmitri Furmanov, Veniamin Kaverin, Nikolai Tikhonov, Lidia Seyfulina, along with the Ukrainian Pavel Tychina, and the Belarussian Yanka Kupala. Their books influenced the literature of the next generation of writers. For example: Maxim Gorky's *My Universities* (1923) and *The Artamonovs' Business* (1925), V. Ivanov's *Armoured Train 14-69* (1923), D. Furmanov's *Chapaev* (1923), A. Seraphimovich's *Iron Stream* (1924), L. Leonov's *Badgers* (1924), I. Babel's stories, K. Fedin's *Towns and Years* (1924), F. Gladkov's *Cement* (1925). They influenced dramatists too: K. Trenev's *Lyubov*

*Yarovaya* (1926), V. Bill-Belotserkovsky's *Storm* (1930), and V. Vishvevsky's *The First Cavalry Army* (1930). Novels of note include A. Fadeev's *Defeat* (1927), M. Sholokhov's *The Quiet Don* (1928). Important works of the 1920s and 1930s include: M. Gorky's *The Life-Story of Klim Samgin* (1928–37), A. Fadeev's *The Last of the Udege* (1929–36), A. Panferov's *Bruski*, (1928–37), N. Ostrovsky's *How the Steel Was Hardened* (1932–34). The latter became very popular not only in our country but also abroad in China, Cuba and Viet Nam. A number of books explored the theme of industrialization: M. Shaginyan's *Hydrocentral* (1930–31), V. Kataev's *Time, Forward!* (1932), and F. Gladkov's *Energy* (1932–38).

The theme of collectivization of peasants was described vividly in M. Sholokhov's novel *Virgin Lands Cultivated* (1932), Ukrainian dramatist A. Korneichuk's *In the Steppes of the Ukraine* (1941), and the Belarussian Y. Kolas' *Drygva*.

Patriotic and historical themes were also depicted in a number of novels and epics, such as A. N. Tolstoy's *Peter I* (1929–33), S. Sergeev-Tsensky's *Sevastopol Toil* (1937–39), and A. Novikov-Priboy's *Tsushima* (1932–35).

From the position of critical realism Andrei Platonov's novel *Chevengur* should be mentioned, along with two stories by Mikhail Bulgakov, 'Dog's Heart' and 'Fatal Eggs', and Mikhail Zoshchenko, whose short stories mercilessly mocked ultra-left and philistine views.

In 1932, the Union of Soviet Writers was established. It united artists of various tendencies. The Union was headed by Maxim Gorky, who had already gained vast popularity before the Revolution and whose views had much in common with those of the Communists.

Stalin's purges of the 1930s inflicted many casualties among the literati: poet Osip Mandelshtam, dramatist Sergei Tretyakov, writer Isaak Babel, two representatives of the so-called 'peasant literature' – Nikolai Klyuev and Sergei Klychkov – and many others were brutally repressed.

After the Nazi invasion, one-fourth of the members of the Union of Soviet Writers joined the armed forces; during the next four years some 242 writers perished and more than 300 were awarded military decorations, some even becoming heroes of the Soviet Union. During the war years, well-known Russian, Ukrainian, Belarussian, Armenian, Georgian, Jewish, Latvian and other writers created patriotic works. Mussa Djhalil – a Tatar poet imprisoned and later executed by the Nazis – wrote a series of lyric patriotic verses while in his prison cell. Poems and verses by Nikolai Tikhonov, Vera Inber, Olga Bergolts, and the Kazakh bard Dzhambul were devoted to the heroic defence of Leningrad.

In post-war years the theme of the Patriotic War continued to capture the imagination of many writers, such as Konstantin Simonov, Oles Gonchar, Niktor Nekrasov, Vasili Grossman, Viktor Azhaev, and Emanuil Kazakevich. Boris Polevoy's *Tale of the True Man* – devoted to the hero-pilot A. Maresiev, who, despite two artificial limbs, returned to fight against the Germans – made a great impact on the youth.

The growth of conservative ideology in the post-war period severely affected Soviet literature. In August of 1947 the Central Committee of the Party published a directive against heterodoxy. After Stalin's death and official condemnation of his cult in 1956, there was short period of 'thaw' (named after

the title of a story by Ilya Ehrenburg). On the crest of public enthusiasm arose a new literature reflecting the true Soviet reality. In 1956 a well-known literary magazine, *Novy Mir* (New World), edited by the poet Alexander Tvardovsky, published the novel *Not by Bread Alone* by V. Dudintsev, which was aimed at Soviet conservatism and bureaucracy. In 1962, the same magazine issued the story *One Day in the Life of Ivan Denisovich* by Alexander Solzhenitsyn, about the Gulag prison camps. Works by Yuri Trifonov and Andrei Platonov, previously prohibited, were also published in this magazine. Many national newspapers published the verse 'Stalin's Successors', by Evgeni Evtushenko, where the author unmasked those who endeavoured to renew the dictator's cult.

At the same time, together with critical verses by such young poets as Robert Rozhdestvensky, Andrei Voznesensky and Bella Akhmadulina, there appeared in the 1960s and 1970s a voluminous underground literature, called *samizdat*. These unpublished manuscripts and critical works had been rejected by state publishing houses and were circulated clandestinely using photocopies. Different unofficial magazines sprang up; they became famous due to the publication of letters and articles by physicist Andrei Sakharov, who advocated a policy of convergence and that his countrymen borrow the positive aspects of both capitalism and socialism. Historian Roy Medvedev sharply criticized the defects of Soviet democracy and the suppression of 'dissidents' – people who demanded reforms and democratization of the society.

Soviet literature in the twentieth century was multinational and polylingual. During the 50 years between the 1930s and 1980s, 'social realism was the prevailing official art form. It sought to portray a true picture of daily life using a variety of forms and genres that corresponded to the requirements of the national character, Party spirit and social humanism.

During the Soviet period some of the best-known literature – including ancient texts – produced by the different nations of the USSR was 'discovered' when it was translated into Russian. This included books by Ukrainian writers Taras Shevchenko, Ivan Franko, Lesia Ukrainka, Mikhail Kotsyubinsky, Pavel Tychina and Maksim Rylsky; works by the twelth-century writer Nizami Gianjevi, Muhamed Fizouli (fifteenth century), Mirza Akhundov, Sabir Tairzade (Azerbaijan); Alisher Navoi (Uzbekistan); Abu Rudaki, Abulkasim Ferdousi (Tajikistan); Ovanes Tumanyan, Mikhail Nalbandyan, Gabriel Sundukyan (Armenia); the Georgian medieval poem 'Knight in Panther-Skin' by Shota Rustaveli; D. Guramishvili, I. Baratashvili, A. Chavchavadze, A. Tsereteli, Vazha-Pshaveli (Georgia); Makhtumkuli (Turkmenia); Abai Kunanbaev (Kazakhstan); Y. Rainis, A. Upit (Latvia); I. Donelaitis, Y. Zhemaite (Lithuania); I. Kringe (Moldavia). Y. Kupala, Y. Kolas, M. Bogdanovich, F. Bogushevich (Belarus); K. Khetagurov (Ossetia); and the classics of Jewish literature by Sholom Aleikhem, among many others. Many nations of the country that hadn't possessed written languages before the Revolution (Kirghizes, Buryats, Maris) were able to develop their national literatures as did those whose languages were finally written in the 1920s and 1930s (Tuvinians, Adygeis, Nanaians, peoples of the North).

The following authors were accorded anniversary celebrations in Moscow and other big cities: Aleksandr Pushkin, Shota Rustaveli, Nikolai Dobrolyubov, Nikolai Nekrasov, Mikhail Kotsyubinsky, Ivan Franko, Lesia Ukrainka, Kosta Khetagurov. Such events helped promote the literary treasures of the different peoples of the Soviet Union.

Outside the country the following expatriate authors should be noted: Ivan Bunin (Nobel Prize of 1933), Vladimir Nabokov, Decadent writers Dimitri Merezhkovsky and Zinaida Gippius, and Marina Tsvetaeva, who returned to the USSR in 1939. In 1974, Solzhenitsyn (Nobel Prize for 1970) was forcefully deported from the country and returned to Russia only in 1995. In the late 1970s, the poet Joseph Brodsky (Nobel prize of 1987) had to leave the country for the USA.

## MUSIC, BALLET, FOLK ENSEMBLES

The 1920s was a fertile period for composers. Nikolai Myaskovsky created his new symphonies, Reingold Glier composed a historical musical poem called 'Zaporozhians' and the ballet *Red Poppy*, Alexander Glazunov wrote his string quartet, and Mikhail Ippolitov-Ivanov created orchestral suites and symphonic poems. This tradition was extended by Mikhail Glinka, Alexander Borodin, Modest Musorgsky, Nikolai Rimsky-Korsakov and A. Skriabin. Music was also developing in the various Soviet republics: in Ukraine, the second symphony by Lev Revutsky, creation of the 'Dumka' choir, composition of choral works by Nikolai Leontovich; in Georgia, Zakhari Paliashvili and Meliton Balanchivadze; in Armenia, Aleksandr Spendiarov. State musician collectives were also organized: the Russian Folk Choir conducted by Mitrofan Pyatnitsky, the Red Army Ensemble of Song and Dance under the leadership of Aleksandr Aleksandrov, and numerous chamber music ensembles.

Prokofiev, who returned to the Soviet Union from abroad in 1932, composed many of his best-known works during this period: *Romeo and Juliet, Peter and Wolf, Alexander Nevsky*, and Dimitri Shostakovich wrote his 5th symphony and beautiful piano quintet in 1936; however, he was criticized by the authorities for the 'formalism' of his music. Armenian composer Aram Khachaturyan wrote his ballet *Gayane* and various symphonic and piano works; Boris Asafiev composed the ballets *Bakhchisarai Fountaim* and *Flames of Paris*, while Nikolai Myaskovsky continued to work on his symphonic cycle.

The pre-war period also saw much musical activity in the Soviet republics. Composers of note include: Useir Gadzhibekov and Abdul Magornaev (Azerbaijan); Armen Tigranyan (Armenia); Anatoly Bogatyrev, Evgeni Tikotsky and Victor Kosenko (the Ukraine).

Working alongside these musicians of the old generation were a number of young and talented performing artists: Konstantin Igumnov, Aleksandr Goldenveizer, Genrich Neigaijz, Vladimir Sofronitsky, David Oistrakh, Marina Yudina, Petr Stolyarsky, Abram Yampolsky, Semen Kozolupov, Emil Gilels, Yakov Flier, Marina Kozolapova, Galina Barinova and Daniel Shafran.

Popular opera singers of the time included: Leonid Sobinov, Valeria Barsova, Antonina Nejdanova, Dormidont Mikhailov, Ivan Kozlovskiy, Sergei Lemeshev, Feodor Chaliapin, and Pavel Andreev.

During the war years, many composers focused on patriotic and lyric songs: Vasili Soloviev-Sedoy, Boris Mokrousov, Anatoly Novikov, Aleksandr Aleksandrov and Matvey Blanter. After the war, the following composers were active: Rodion Shchedrin, Boris Chaikovsky (Russia); Kara Karaev, Fikret Amirov (Azerbaijan); Otar Taktakishvili, Sulhan Tsintsa-dze (Georgia); Arno Babadzhanyan (Armenia); Veli Mukhatov (Turkmenistan); Aleksandr Sveshnikov, Platon Maiboroda, Grigory Verevka (Ukraine); and Russians Alfred Shnitke, Georgi Sviridov, Isaak Dunaevsky, N. Strelnikov and Y. Milyutin.

Composers and conductors of the Soviet Baltic republics continued to develop their national traditions: A. Lepin, Adolf Skulte, Yanis Ivanov, Margers Zarinsh, Y. Medynsh, Alfred Kalnynsh, and Raimond Pauls. In Lithuania there were Anastas Rachyunas, Yuri Nuzelyunas, Yuri Tallat-Kyalpsh, B. Dvarionas and Stasis Vainyunas. In Estonia, one should mention the composers and conductors Gustav Ernesaks and Artur Kapp. The list of gifted ballet dancers would include: Ekaterina Geltser, Galina Ulanova, Olga Lepeshinskaya, Natalia Dudinskaya, Marina Semenova, Vakhtang Chabukiani, Konstantin Sergeev, Askold Makarov and of ballet masters: Leonid Lavrovsky, Igor Moiseev, Agrippina Vaganova, Yuri Grigorovich and Kasian Goleizovsky. Foreign audiences became acquainted with many Russian and Soviet artists who lived or travelled abroad: composers Sergei Rakhmaninov and Igor Stravinsky; singer Feodor Chaliapin; ballerina Anna Pavlova; dancers Vaslav Nijinsky, Mikael Baryshnikov and Rudolf Nureyev; choreographers George Balanchine and Sergei Diagilev (who organized the Russian Ballet company in Paris); musicians Vladimir Horowitz, Yahudi Menuhin, Lev Oborin, Leonid Kogan, Mstislav Rostropovich, Yuri Bashmet, Vladimir Spivakov, Sviatoslav Richter; singers Dimitri Khvorostovsky, Evgeni Nesternko, Elena Obraztsova; ballerinas Galina Ulanova and Maya Plisetskaya, and conductors Evgeni Svetlanov and Evgeni Mravinsky.

## THEATRE

After the Revolution the government offered assistance to theatres throughout the Soviet Union, and wherever performances were given in national languages.

Besides preserving the traditions of Russian theatres like the Moscow Art Theatre (founded in 1898 by Konstantin Stanislavsky and V. Nemerovich-Danchenko), the Maly Theatre in Moscow, and others in Petrograd and Kiev, new theatres also opened. In 1920–21 the first professional theatres for children were established: the Drama Theatre for Children headed by A. Bryantsev in Petrograd, a musical theatre for children in Moscow (N. Sats), and in 1931, the Central Puppet Theatre (S. Obraztsov).

Performances of the Bolshoi Theatre in Moscow and Mariinsky Theatre in Petersburg, the Theatre of Opera and Ballet in Ekaterinburg, playhouses in Moscow (MHAT and Maly), the Taganka Theatre (Y. Lyubimov), Lenkorn Theatre (M. Zakharov), and the Sovremennik Theatre (G. Volchek), had broad recognition.

The Moiseev Folk Ensemble and the Soviet (Red) Army Choir both toured successfully all over the world, as did many circuses.

## FINE ARTS

Historic and revolutionary themes were reflected in pictures painted by Isaak Brodsky, Mitrofan Grekov, Aleksandr Gerasimov, Boris Kustodiev, Konstantin Yuon, Kuzma Petrov-Vodkin and others during the 1920s. Petr Konchalovsky and Igor Grabar worked in the landscape genre. Newspaper and magazine caricaturists of note included: Dimitri Moor, Viktor Deni, Boris Efimov and Lev Brodaty. A creative group of painter-satirists was formed under the pseudonym Kukryniksy (Mikhail Kupriyanov, Porfiry Krylov, Nikolai Sokolov). The names of Vladimir Favorsky, Aleksandr Kravchenko, and Pavel Pavlinov are connected with block prints.

In the early 1920s art organizations of the ultra-left such as the Russian Association of Proletarian Painters appeared. Being advocates of abstract art and committed to change, they wanted to give up all the art of the past. All of these groups were dissolved in 1932. In the 1930s the portraits by Mikhail Nesterov, Igor Grabar and Aleksandr Gerasimov were widely acknowledged. Martiros Saryan and Sedrak Arakelyan were popular in Armenia, Aleksandr Shovkunenko and Nikolai Samokish in the Ukraine, and Valentin Volkov in Belarus. Well-known book illustrators included: Demian Shmarinov, Evgeni Kibrik, Aleksandr Gerasimov, and Aleksandr Kanevsky.

In the war years the tradition of ROSTA Civil War posters was renewed: 'TASS Windows' appeared with stencilled posters painted by such artists as P. Sokolovsky, N. Radlov, M. Savitsky, and Kukryniksy. The most famous of these were created by D. Shmarinov ('No Oblivion, No Pardon'), A. Pakhomov ('Leningrad in the Days of Blockade'), and A. Kurdov ('On the Roads of War').

Military themes, portraying rank-and-file soldiers and famous generals, continued to be popular, as represented by M. Grekov. Portraitists included P. Korin, A. Shovkunenko, M. Bozhy and G. Stronka.

R. Treuman (Estonia), I. Glazunov and A. Shilov are well known today.

In the field of decorative art, probably the best-known crafts are the lacquered boxes and painted miniatures from the little towns of Palekh, Mstera, Fedoskino and Kholui. Glass, porcelain, wood, mosaic, metal-working, macramé and carpets are other examples of applied arts.

A number of major Russian painters made names for themselves abroad after the Revolution, among the founders of abstract art, including Kasimir Malevich and Vassili Kandinsky. Alexander Benoua and Marc Chagall also achieved international prominence.

Nicolai Andreev's sculpted monuments to A. Hertsen and N. Ogarev in a realistic style in front of Moscow University were among the first works of sculpture between 1918 and 1920. Ivan Shadr created a number of busts of ordinary people in 1922, a work of sculpture named *A Cobble-Stone as a Tool of the Proletariat* and a monument to Lenin in 1927. Later on such sculptors as Matvei Manizer, Sergei Mercurov, Nikolai Tomsky and Lev Kerbel also devoted their energy to creating images of Lenin.

A sculpture titled *Workman and a Collective-Farm Womam* by Vladimir Mukhina was presented during the 1937 World's Fair in 1937. Among contemporary sculptors the name of Ernst Neizvestny – who designed the memorial to the martyrs of Stalin's terror in Magadan – should be mentioned.

## ARCHITECTURE

In 1922, Vladimir Shukhov created a 148-meter-high hyperboloid radio mast in Moscow that is now used for TV and radio transmission. B. Yofan designed the Soviet pavilion at World Fairs in Paris and New York in 1939. A number of architectural designs are associated with the industrialization of the 1930s. Among these are: the Dnepr hydroelectric station and dam, steel mills in Magnitogorsk and Kuznetsk, and various tractor, bearings, and chemical plants, and public housing and sports facilities. In 1930 a granite mausoleum was built for Lenin in Moscow's Red Square according to plans drawn up by Aleksei Shchusev. Shchusev and other leading architects such as Ivan Zholtovsky, Ivan Fomin and Vladimir Gelfraigh worked on many urban projects in Moscow, Leningrad and other cities. New bridges were constructed over the Moscow River during 1936–38. Some stations of the Moscow underground were built during the 1930s and 1940s. In 1933 a 227-km-long channel from Byelomor to the Baltic was completed with the use of forced labour.

Reconstruction of towns, cities and industrial enterprises devastated by German troops was carried out throughout the post-war period, and highrise construction was beginning in Moscow. Erected in 1967, Moscow's Ostankino TV and BC Tower is the second-tallest free-standing building in the world. It has a structural weight of over 55,000 tons.

A large memorial complex can be seen in the Treptov Park of Berlin. There is a 13-metre-high bronze statue: the Soviet soldier holds a small girl and, in his right hand, the sword with which he has broken the Nazi swastika. It was conceived by E. Vuchetich and built by a group of architects from Moscow and Kiev. E. Vuchetich also sculptured a *Statue of the Motherland* on Mamaev Barrow in Volgograd.

Apartment house building began in a number of cities and towns in the late 1950s. A mass housing construction project of five-storied small-flat buildings with a simplified layout managed to relieve the housing crisis for a while. In 1995 a memorial museum of the Great Patriotic War of 1941–45 was opened in Moscow on Poklonnaya Hill. An orthodox church, a mosque and a synagogue were built nearby in commemoration of the war's victims. Construction of Christ the Savior Cathedral was finished in Moscow in 1997; it is the exact copy of the old cathedral blown up in 1934.

## SPORTS

In 1939, the government endorsed the initiative of youth organizations to build an All-Union sporting complex to be 'Ready for Labour and Defence' (GTO). By 1956 more than four million people had trained and met their certification requirements in GTO. Since 1952 Soviet athletes have been taking part in the Olympic Games and set many records, thanks to the support of the state.

The Soviet chess-players' school became widely known all over the world and produced a number of world champions: Aleksandr Alekhin, Mikhail Botvinnik, Mikhail Tahl, Vasili Smyslov, Tigran Petrosyan, Anatoly Karpov, and Garry Kasparov.

## CINEMA

The development of the Soviet cinema is connected with the names of such old masters as Y. Protozanov and S. Yutkevitch. Historic films include Sergei Eisenstein's *Battleship Potemkin* (1925), *October* (1927), *Alexandr Nevsky* (1938), and *Ivan the Terrible* (1945–58); N. Ekk's *A Start in Life* (1931); F. Ermler and S. Yutkevich's *Counter Plane* (1932); the Vasilievs brothers' *Chapaev* (1934); V. Pudovkin's *The Mother* (1926); A. Dovzhenko's *The Arsenal* (1923) and *The Land* (1930); F. Ermler's *The Fragment of Empire* (1929); G. Kozintsev and L. Trauberg's *Maxim's Youth* (1935); E. Dzigan's *We are from Kronstadt*; M. Romm's *Lenin in October*; and G. Alexandrov's *Merry Fellows*, *The Circus*, and *Volga-Volg*. S. Gerasimov and M. Donskoy were successful at shooting screen versions of works by Leo Tolstoy, Anton Chekhov and William Shakespeare.

Andrei Tarkovsky's great lyrical film, based on the life of the icon painter, *Andrey Rublev* is considered a masterpiece. S. Bondarchuk succeeded in creating mass battle scenes and was also known as a actor. Among the masters of documentary cinema should be mentioned R. Karmen, who shot films of the Civil War in Spain and Sino-Japanese War of 1941–45. Many brave cameramen shot historic epic scenes of the battle from the front.

There were many popular actors who achieved fame in the cinema: Boris Babochkin, Boris Chirkov, Boris Shchukin, Nikolai Okhlopkov, Kyubov Orlova, Vera Maretskaya, Tamara Makarova, Nikolai Kryuclikov, Marina Ladynina, Nikolai Cherkasov, Mikhail Zharov, Nikolai Mordvinov, Rostislav Plyatt, Evgeni Leonov, Anatoli Papanov, Yuri Nikulin, Nikolai Simonov, Yulia Borisova and others. Cinema was also developing in the Ukraine (A. Dovzhenko's films), in Georgia (N. Shengelaya, N. Chaurelli), and in Armenia (A. Bek-Nazarov). Famous composers who wrote for the cinema include: Isaac Dunaevsky, Dimitri Kabalevsky, Sergei Prokofiev, Aram Khachaturyan, Tikhon Klirennikov, and Dimitri Shostakovich.

Throughout the post-war years film-making studios were established in the Latvian, Lithuanian and Estonian Soviet Socialist Republics, which did not have their own cinema before. All together thirty-three studios were working in the Soviet Union by the middle of the 1980s. Since the late 1940s there has been cartoon-making and cinema for children. Many Soviet films, beginning with Eisenstein's 1927 masterpiece *Battleship Potemkin*, are recognized as masterpieces by audiences the world over.

## EAST-CENTRAL AND SOUTH-EAST EUROPE

*Alexander S. Stykalin, Victor A. Khorev, František Svátek,
L. Nagy, Nikolai Todorov and A. Chojnowski*

The 1917–1919 revolutions in Russia, Germany and Austria-Hungary as well as the victory of Great Britain, France and the USA in the First World War were determining factors in the new Versailles system of international relations in Eastern and Central Europe. Independent Austria, Hungary and Czechoslovakia were formed on the ruins of the Habsburg Empire. Romania, including Transylvania, was constituted within its borders. The unification of independent Serbia and Montenegro with the territories that had been part of former Austria-Hungary resulted in the creation of the multinational Kingdom of Serbs, Croats and Slovenians (known after 1929 as Yugoslavia). An independent Polish state was resurrected after a hundred years of non-existence.

### EDUCATION AND CULTURE

Historically East-Central Europe and the Balkans reveal sharply contrasting education and communication systems, as well as different levels of scientific progress and intensities of cultural life. For instance, what is today the Czech Republic was the most industrially developed part of the Habsburg Monarchy during the nineteenth century. Reforms of the late eighteenth and early nineteenth centuries put an end to illiteracy, whereas in the 1920s and 1930s, the illiterates in Romania and Yugoslavia came to 40 and 50 per cent respectively, and in Albania to more then 80 per cent. Founded in the fourteenth century, the universities of Prague, Vienna and Krakow for centuries played the role of academic centres, whose reach extended well beyond national borders. In contrast, the first university in Bulgaria was founded only in the 1880s, and in Albania there were no institutions of higher education until after the Second World War. Whereas in Poland theatres flourished already in the seventeenth-century baroque era, in Bulgaria the national theatre culture was not even formed until the early twentieth century, when the National Theatre in Sofia was founded. Residents of Prague had an opportunity to listen to Mozart and Beethoven. On the other hand, the first permanent operatic company in Belgrade dates from 1920, and in Sofia from 1921. In the inter-war period the Czech film studio Barrandov was recognized as being among the most technically advanced in Europe, while in the Balkan countries during the same period the cinema was in an embryonic state. There were also sharp contrasts between the cultural development of different lands within one particular state, as in Austria-Hungary, which finally broke apart in 1918. For ages Prague was not only a centre of Czech culture, but also an important centre of Austro-German culture. In Bosnia, on the other hand, the building of modern cultural infrastructure started only after the country had been annexed by Austria-Hungary in 1908.

These deep historical and cultural differences between East-Central Europe and the Balkans go back as far as the early Middle Ages. The choice between the Catholic Church and Greek Orthodoxy, between the spiritual orientation of Rome or Constantinople, helped determined the character and the way that different European nations were fitting into the world. For example, although Serbs and Croats speak the same languages their religious differences profoundly influenced the process of nation building.

Turkish expansion in the Balkans in the fifteenth to seventeenth centuries was another important factor influencing the development of the two regions. The border between the Ottoman and the Habsburg Empires became the border between two cultures. Long dependence (up to the nineteenth century) upon the Turks, and a tradition of anti-Ottoman liberation movements contributed to the unique historical experience of the Balkan nations. In the present day Balkans, in Bosnia and parts of Bulgaria one can find enormous areas settled by Muslims.

In the nineteenth century, formation of the Czech, Slovak, Croat, Slovenian nations and national cultures in Central Europe was guided by emancipation from the dictates of language – either German or, in the case of the Croats and Slovaks, Hungarian. The process was most successful in the Czech lands, where by 1918 not only were the preconditions for nation statehood already in place, but also for the forming of one of the most advanced political systems in inter-war Europe.

The problems of defining what was the historical specificity of 'Central Europe' and what were its borders are

still controversial (let us mention only the concepts of Jenő Szűcs and Milan Kundera). Certainly Austria belonged to this region, and Habsburg and Vienna played the role of 'bridge to Europe', offering a region-wide cultural centre attracting the representatives of different national cultures (the same role played by such other big cities as Prague or Budapest). German cultural influence should also be mentioned, with its very ambivalent attitude. Besides German culture one should pay tribute to the trans-national significance of Jewish culture. The Jews in Central Europe formed a very creative cultural community whose role has spread far beyond national or regional borders.

Austrian culture, which had always developed in a close interaction with Hungarian and Slavonic cultures, gradually emerged as a culture in its own right, consolidating its specific national features. One can find them already in the second half of the eighteenth century in the music of Josef Hayden and Wolfgang Amadeus Mozart, and then in the first half of the nineteenth century in the music of Franz Schubert, the dramaturgy of Franz Grillparzer, Ferdinand Raimund or Johann Nepomuk Nestroy, and the poetry of Nikolaus Lenau. Austrian nationalism and identity, expressed both in philosophy and the different branches of creative activities, were sometimes caught between the quest for truth in a material world and an attempt to harmonize itself with the transcendental German idea of *Geist*. Austria's failure to become the centre of German unification, Prussia's ousting of Austria from the process of German unification in the 1860s and, finally, the formation of the German Empire in 1871 accelerated the crystallization of Austrian national consciousness (though up to the second half of the twentieth century the majority of Austrians put their German identity before their Austrian one). The sharpness of national and social antagonisms in Austria-Hungary probably intensified the spiritual search in Austro-German culture at the turn of the century. Austria became the native soil for a number of important teachings in European philosophy: Sigmund Freud's psychoanalysis, Edmund Husserl's phenomenology, Rudolf Kassner's physiognomy, Martin Buber's mystical Judaism, Theodor Herzl's philosophical doctrine of Zionism and Ludwig Wittgenstein's analytic philosophy. Each of these made a long-term impact on twentieth-century culture.

From the first decades of the twentieth century Austrian literature entered its Golden Age. Traces of neo-romanticism and symbolism could be found already in the works of Hugo von Hofmannsthal and Arthur Schnitzler. Rainer Maria Rilke, one of the greatest German-language poets of the twentieth century, evolved from impressionism through philosophical symbolism to the 'new subjectivity'. The works of Georg Trakl, Franz Werfel and Gustav Meyrink gave an impetus to the rise of expressionism. Franz Kafka's prose significantly broadened the scope of twentieth-century literature. The crisis and downfall of the Habsburg Monarchy turned Austria into a small country, an event perceived as a tragedy in the national consciousness. This found expression in the world-famous works of Robert Musil, Josef Roth, Hermann Broch, Stefan Zweig and Heimito von Doderer, and such dramatists as Ödön von Horváth and Franz Teodor Csokor. Inter-war Austria was depicted with great talent in the works of the Nobel Prize winner Elias Canetti, who showed how the nation was gradually shifting towards fascism and the *Anschluss* union with Hitler's Germany.

During the twentieth century, Vienna – the city of Mozart, Beethoven, Brahms, Mahler and Strauss – maintained its former stature as a world centre of musical culture. The new Viennese school, namely Arnold Schönberg, Alban Berg and Anton Webern, reformed the musical language by promoting principles of atonality and dodecaphony. Austria gave the world a number of celebrated performers, and one of the greatest conductors of the twentieth century, Herbert von Karajan.

In architecture, the Austrian secession, and in applied arts and painting the creations of artists like Gustav Klimt turned from a local phenomenon into something of international significance. But already before the First World War architecture was turning towards rationalism as a reaction to art nouveau's ornamentalism and fluctuating forms. The new era gave rise to expressionism (Oskar Kokoshka), which became the dominant movement both in German and Austrian painting. If in the Austrian national consciousness the results of the war were associated with the downfall of Austrian greatness, for Czechs and Slovaks the dissolution of the Habsburg Monarchy became a precondition for Czechoslovak statehood. Not only its democratic form of government, but also the country's position at the crossroads of different cultural trends created favourable conditions. Traditional cultural links with German culture were preserved. At the same time the Francophile political orientation of Czechoslovakia's first president, Tomáš G. Masaryk, promoted French cultural influences especially in the fine arts. On the other hand, Prague became one of the main cultural centres of the Russian emigration. Russian scholars like Roman O. Jakobson, Nikolai S. Trubetskoy and P. G. Bogatyriov together with Czech scholars Jan Mukařovsky and Vilém Mathesius played a leading part in the Prague linguistic circle, which contributed to the development of structural linguistics, phonology and poetics.

In the inter-war period Czech literature blossomed with Jaroslav Hašek's satirical prose and Karel Čapek's social fantasies. Czech poetry was very innovative. The principles of 'poetism' and surrealism, maintaining the priority of free association in figurative thinking compared to didacticism and rationality, was theoretically motivated in the internationally supported essays of Karel Teige. These principles strengthened the metaphorical side of poetic language, and its expressive abilities were differently interpreted by such talented poets as Vítězslav Nezval, Vladímir Holan, František Halas, the future Nobel Prize winner Jaroslav Seifert, the Slovak poet Laco Novomeský and others.

Leading theatre directors like Jindrich Honzl and E. F. Burian were searching after new ways of scenic expression. Their works combined satire and the grotesque with elements of stylization and a quest for new musical rhythms.

In the 1920s and 1930s Czech musical culture developed through the compositions of Bedřich Smetana, Antonín Dvořák and Zdeněk Fibich, a time when such older generation composers as Leoš Janáček and Josef Boguslav Foerster were in their heyday. The world famous composer Boguslav Martinů lived abroad but did not break off relations with his homeland. Alois Hába, one of the authors of the quartertone system, was probably the most famous representative of the Czech musical avant-garde. In the 1920s and 1930s in the fine arts the use of the artistic

experience of post-impressionism, expressionism, cubism and fauvism was combined with an interest in folk idioms. The rich traditions of Central-European art nouveau – initially represented by the Viennese secession – were alive in the drawings of Max Švabinský, in the versatile masterpieces of Alfons Mucha, and in the easel-painting and monumental frescoes of Jan Preisler. The painter Emil Filla was strongly influenced by expressionism and later cubism. The sculptor Jan Štursa, in his expressive, dynamic compositions, was influenced by the work of French sculptors Aristide Maillol and Émile Antoine Bourdelle. Brilliant sculptural works of Otto Gutfreund were created under the influence of expressionism and cubism. The great master of illustrations Josef Lada and the painter Václav Špála demonstrated their deep interest in folk art. The painter and pencil artist František Kupka paved new ways in art, gradually shifting from social realism towards abstractionism and non-figurative art. In the 1930s as the fascist threat gained ground in Europe, dramatic themes sounded more and more distinctly in the works of many leading Czech artists. Surrealism became one of the most popular styles, as exemplified by the tragic passion of J. Síma's works.

Czech architects in the inter-war period not only absorbed modern German, French or Dutch influences, but also influenced architects from different countries by their constructivist and cubist experiments in architecture. Among the leading representatives of the twentieth-century Czech architectural school one should mention Jan Kotěra, J. Gočár, P. Janák, K. Honzik, J. B. Fuchs and J. Kroha. In industrially developed and democratic Czechoslovakia there were better conditions for big projects of urban development than in other East-Central European countries, even though many projects were never realized. E. Hobsbawm's famous definition of the twentieth century as 'the age of extremes' is especially true when we speak about inter-war Czechoslovakia, where leftist, socialist tendencies were very strong, and many celebrated artists were drawn to the communist movement. Although the Moscow trials of 1937–38 were condemned by many left-wingers there was philosophical opposition to those artists devoted to the communist ideals from both the partisans of liberalism, and conservatives recruited from among Catholic writers, such as Jan Zahradíček and Jaroslav Durych. Generally speaking, in Czechoslovakia as elsewhere in Europe of the 1920s and 1930s, the artists were deeply involved in ideological battles concerning, for instance, their attitude towards the socialist experiment in the USSR. T. G. Masaryk's Czechoslovakia held first place in Europe not only in the fine arts, but also in education and science. There were noteworthy schools in mathematics, chemistry (Bohuslav Brauner's school), and humanities, Slavonic and comparative linguistics, medieval studies, art history and ethnology. Lubor Niederle's works on the archaeology and early history of Slavs are well known all over the world. Bedřich Hrozný deciphered Cuneiform Hittite and established that the Hittite language belonged to the Indo-European group.

Though the political system in Czechoslovakia – the embodiment of Tomáš Masaryk's political ideas – was very democratic, there was no real equality in rights for different nationalities. Slovakia and Trans-Carpathian Ukraine played the role of agrarian satellites of the highly industrialized Czech lands; living conditions there were much worse, and educational standards much lower than in

other parts of the country. Adherents of the officially supported concept of 'Czechoslovakism' regarded the Slovaks as an integral part of a single Czechoslovakian nation. This could not but affect cultural policy. It is noteworthy that up until the 1930s the main repertoire of the Slovak National Theatre (founded in Bratislava in 1920) was performed in Czech. Nevertheless, after the downfall of Austria-Hungary and the birth of the independent Czechoslovakia conditions for Slovak national culture improved. The Slovak university named after Jan Amos Komenský (Comenius) and the Slovak National Museum, both in Bratislava, played a great part in cultural life. National schools in painting (L'udovit Fulla and others) and music were formed. National literature flourished (Janko Jesenský, Ivan Krasko and others).

Both in Czechoslovakia and Poland, restoration of national statehood created better cultural conditions. At the same time there was a certain continuity with the previous period. Earlier, when the Poles had been deprived of their national statehood, culture was the main factor in preserving national identity in the partitioned country. The reborn state liberated creators from having to shoulder patriotic obligations so they could devote themselves more fully to formal experiments. Hence the importance of the avant-garde in the 1920s and 1930s. The entire work of Stanisław Ignacy Witkiewicz – an artist, novelist and dramatist who earned his fame posthumously – challenged Polish nationalism. At the same time continuity with the previous stage was preserved. Those artists who had played a part in the age of the 'Young Poland' (1890–1918), such as the realistic prose writers Stefan Żeromski, Kazimierz Przerwa Tetmajer and Stanisław Przybyszewski, poets Leopold Staff and Bolesław Lesmian, painters Leon Wyczółkowski, Olga Boznańska, Wojciech Weiss and others continued with their creative activity after their homeland found independance. In 1924 the Nobel Prize for literature was awarded to Władisław Stanisław Reymont, as earlier it was awarded to Henryk Sienkiewicz in 1905.

A positivist strain in Polish culture originated in the 1860s and 1870s but found further expression in the period between the wars. The Lvov-Warsaw neo-positivist school of Tadeusz Kotarbiński, Alfred Tarski, Jósef Łukaszewicz, Kazimierz Ajdukiewicz and others contributed to different branches of knowledge: logical semantics, epistemology, methodology of deductive sciences. The basis of mathematical logic, worked out by the representatives of the school, stimulated progress in mathematics. Especially important are the names of Wacław Sierpińsky, Żymund Janiszewski, Stefan Mazurkiewicz, Stefan Banach and Hugo Steinhaus, who helped to develop modern functional analysis, the theory of orthogonal series, and made innovations in the theory of measure and integration.

At the same time romantic nationalism in Polish culture was still alive and acquired new features. The great composer Karol Szymanowski combined Frederic Chopin's traditions with later innovation in musical language. The international prestige of Polish music was also confirmed by the recognition shown such celebrated performers as the conductor Gregory Fitelberg, pianists Ignacy Paderewski, Leopold Godowski and Jósef Hofman, the violinist Pavel Kochański, and singers Ewa Bandrowska-Turska and Jan Kiepura, who toured the world. The 1930s witnessed the debut of Witold Lutosławski, one of the greatest composers of the second half of the twentieth century. Also undeniable

was the success of Polish ballet: the choreographer Bronisĺawa Nijinska, sister of the famous Ballets Russes dancer Vaslav Nijinsky, worked in Warsaw in the 1930s and contributed to Sergei Diaghilev's Ballet Russe.

The traditions of the Russian theatre were kept up in inter-war Poland by Stanisĺawa Wysocka, Stefan Jaracz, Aleksander Zelwerowicz, Juliusz Osterwa and others. Many of them had worked in Russia before 1918. The neo-romantic style of Stanisĺaw Wyspiański, a key figure of the Young Poland movement that flourished between 1890 and 1914, was developed by the celebrated theatre director Leon Schiller, who sought to synthesize different arts in his theatrical performances.

Witold Gombrowicz and Bruno Schulz, together with Witkiewicz, were paving new ways in literature. Their prose is well known beyond Polish borders. Jarosĺaw Iwaszkiewicz, Zofia Naĺkowska and Maria Dąbrowska wrote in a more traditional, realistic and psychological manner. Polish poetry was characterized by a variety of styles. The group Skamandr (Julian Tuwim and others) was developing classical traditions in a wider sense of the word, including experience drawn from Young Poland artists with their neo-romantic aesthetics. On the eve of the Second World War apocalyptic presentiments were expressed in the lyrics of Konstanty Idelfons Gaĺczyński, Jósef Czechowicz and Meczysĺaw Jastrun. Nobel Prize winner Czesĺaw Miĺosz, the greatest Polish poet of the second half of the twentieth century, had also debuted in the 1930s.

Many opposing tendencies coexisted in the Polish fine arts scene. As in Czechoslovakia, strong French influences were combined with the quest for national elements. The group of formists (Tytus Czyżewski and others) followed the principles of cubism and were influenced by expressionism. Some of its members, such as Zbigniew Pronaszko and Leon Chwistek, were moving to abstractionism and non-figurative art. Others, for example Jan Cybis, searched after new colourist effects. Wĺadisĺaw Skoczylas was the pioneer of Polish xylography or wood engraving. In Tadeusz Makowsky's genre painting there were both cubist elements and naive art. Original interpretations of expressionist experience were characteristic of Felicyan Kowarski in his monumental and socially acute works. The main figure of Polish sculpture from the 1910s to the 1960s was Ksavery Dunikowski, whose works tended to celebrate the heroic and moral values.

Before 1918 Poland was partitioned between the three empires, each with its own educational system and cultural institutions. After the reconstruction of the Polish state there was a great deal of work to standardize education and culture. New universities, polytechnics and high schools were founded. Progress in sciences was closely interwoven with progress in higher education. Besides mathematics, Polish scientists achieved success in physical chemistry (the school of Wojciech Świętosĺawski), experimental physics, physics of low temperatures, thermodynamics, optics, electrochemistry, biochemistry, aerodynamics, empirical mechanics, astronomy and a number of medical disciplines. There was also significant progress in economics, social sciences, ethnology and archaeology. Since history traditionally played an important part in the formation of the national consciousness, history faculties at the universities accumulated great numbers of talented historians. Another prerequisite of national consciousness was language; the problem of its preservation, which was so

acute in partitioned Poland, stimulated progress in linguistics. The works of Jan Baudouin de Courtenay were of great significance for phonology. There was also some progress in Slavonic linguistics, namely dialectology (Kazimierz Nitsh) and comparative indo-europeistics.

Krakow University was an important centre of neo-Thomistic philosophy. Besides the Polish school of neo-positivism there was Roman Ingarden's phenomenological aesthetics. Floryan Witold Znaniecki became one of the founders of empirical sociology. Janusz Korczak contributed pedagogy. Many Polish scholars became famous working abroad: the physicist and chemist Maria Skĺodowska-Curie, who was twice awarded the Nobel Prize, her colleague Kazimierz Fajans, and Bronisĺaw Malinowski, noted for his anthropological theory of functionalism.

In the 1930s, with the growing threat from German fascism, Polish intellectuals were faced with three options: nationalism, liberal democracy or communism. The struggle among the advocates of these three competing tendencies determined the spiritual climate of the Second Republic, especially in the last years of its existence.

The deep contradictions in Polish cultural life in the inter-war period expressed themselves in the disproportion between the high level of scientific progress, elitist schools and artistic culture on the one hand, and cultural backwardness of the popular masses on the other. Some 20 per cent of the adult population was illiterate on the eve of the Second World War. The percentage was even higher among national minorities (the Ukrainians, Belarussians and Lithuanians), who composed one-third of the population in pre-war Poland. Contradictions between the ruling national and ethnic minorities, which found its expression in culture, were also characteristic of other Central-European and Balkan countries: Czechoslovakia, Yugoslavia, Romania and, to an extent, Bulgaria. Unlike Poland, which turned into a multi-national state during the inter-war period, in the above-mentioned countries this contradiction did not disappear after the Second World War. At the same time one should underline that ethnic minorities in those countries were not only a source of tension, but also helped to establish contacts between national cultures insofar as the minorities played the role of mediator.

## CULTURE IN THE POST-WAR PERIOD

The establishment of a new system of international relations in Europe had absolutely different consequences for Hungary than for Czechoslovakia and Poland. As one of the constituent parts of the Dual Monarchy, which not only was sovereign in all home affairs, but also influenced the foreign policy of the Danube Monarchy, Hungary was regarded as a loser in the First World War, an attitude that dominated the Versailles conference, when her post-war borders were being defined. The new boundaries excluded about one-third of the Hungarians, and Hungary, which had previously played a leading role in Central Europe, was now reduced to a smaller state, flanked by bigger neighbours. The process of adaptation to a new geo-political situation, which was extremely painful, dominated spiritual life in inter-war Hungary.

The Hungarian ruling elite tried to compensate for its loss of a leading role in the Danube-Carpathian region by

turning into the main cultural centre of East-Central Europe. The cultural programme of the Horthy regime attempted to create a powerful infrastructure for elitist culture, the building of new universities, high schools, academic institutions, museums and libraries. Flanked by the hostile 'Little Entente' countries, Hungary oriented her foreign policy towards Mussolini's Italy and later, in the 1930s, towards Nazi Germany, which was also deeply dissatisfied with the Versailles system.

After the unsuccessful socialist experiment in 1919 many renowned intellectuals of progressive convictions had to emigrate from Hungary. Among them were György Lukács, the young sociologist Karl Mannheim, a founder of film aesthetics, Béla Balázs, the leader of the Hungarian avant-garde and a founder of film aesthetics, the poet and artist Lajos Kassák, painters and graphic artists Béla Uitz, László Moholy-Nagy and Sándor Bortnyik and many others. Some of them later returned, some never. Despite this emigration of many celebrated Hungarian intellectuals, cultural life in the country was still very intense.

Béla Bartók is by right regarded one of the greatest composers of the twentieth century. He successfully mixed folklore elements with the achievements of Schönberg's new Viennese school. The name of Zoltan Kodály – a composer, a folklorist, a teacher of music – is widely known. Operettas composed by Imre Kálmán and Ferenc Lehár, who worked mainly in Vienna, are popular all over the world. Since the 1930s Hungarian conductors Antal Doráti, George Szell, Sir Georg Solti and others had been conducting the best symphony orchestras of the world. The Hungarian school of pianists and violinists had a very high reputation. Hungarian actors, such as Béla Lugosi or Franziska Gaál, were in demand by the best film studios, including Hollywood. The plays of Ferenc Molnár were performed in many countries.

The vigorous development of Hungarian literature and national culture decreased on the eve of the First World War. The key figure of the first decades of the twentieth century was the poet Endre Ady, who died in 1919. Zsigmond Móriz, Mihály Babics, Dezső Kosztolányi, Gyula Krúdi, Frigyes Karinthy and Árpád Toth, who belonged to the same generation, also participated actively in the literary life of the inter-war period. In the 1920s a new generation came along: the poet Attila József, prose writers Tibor Déri and Sándor Marai, as well as members of the movement of 'national writers' that included the master of the psychological novel László Németh, the poet and prose writer Gyula Illyés and the prose writer Aron Tamási.

The Hungarian fine arts in the period 1900–1930 reflected the same process under way in other countries, namely, a transition from traditional academic salon historicism to the newest trends (from impressionism to surrealism and abstractionism). One should mention the key figure of the Hungarian secession József Rippl-Rónai, the expressionist Károly Kernstock, the fauvist Béla Czóbel and the master painter József Egry. The works of Tivadar Csontváry are characterized by deep originality. In the 1920s some new names appeared: the expressionist Gyula Derkovits, the post-impressionist Aurél Bernáth, and the great monumentalist painter Vilmos Aba-Novák. In the late 1930s the Szentendre School of surrealism was organized by Lajos Vajda and Imre Ámos. There were many talented sculptors at that time who, while respecting academic neo-classical traditions, also searched after new forms of artistic expression (Ferenc Medgyessy, Zsigmond Kisfaludi-Stróbl, Pál Pátzay, Béni Ferenczy and others). Victor Vasarely (Vásárhelyi) the founder of 'optical art', also called op art, became famous working abroad in France. In architecture besides neo-baroque and neo-classicism there were also new trends, such as constructivism and functionalism, represented by Marcel (Lajos) Breuer, who later emigrated to the United States, and others.

Being a small and moderately developed country, Hungary could not spend large amounts of money on expensive scientific investigations, and many leading specialists emigrated. The contribution of Hungarian-born scientists to twentieth-century science is invaluable. Let us mention only a few names, such as the mathematician and cybernetist János Neumann, the 'father' of the American hydrogen bomb Edward Teller, his colleagues nuclear physicists Eugene (Jenő Pál) Wigner and Leó Szilárd, the experimental physicist György Békésy, the founder of holography Dénes Gábor, the aerodynamics expert Theodor Kármán, the chemist Richárd Zsigmondy, biochemist Albert Szent-Györgyi, radiochemist György József Hevesy and the astrophysicist Zoltán Bay. More than ten Nobel Prize winners in sciences were of Hungarian origin. But only Szent-Györgyi had won the prize (in 1937) before he emigrated to the West.

The Miklós Horthy regime was right-wing, authoritarian and non-democratic, and its cultural policy failed to achieve basic changes in drawing the popular masses into elitist culture. That is one reason why the regime was widely criticized by people from opposing philosophical camps, for instance by the 'national writers'. But the problem of providing cultural infrastructure and education at all levels was even more acute in the Balkan countries. The abolition of mass illiteracy was mostly achieved only in the lands that had been integral parts of Austria-Hungary, namely in Croatia and Slovenia (Yugoslavia), and in Transylvania (Romania). The Balkan countries did make progress during the inter-war period; nevertheless, in the 1940s, illiteracy was still a major problem. In the 1920s and 1930s the Balkan countries were more successful in developing sciences and higher education. As usually happens in industrially underdeveloped countries, Balkan universities allowed arts and letters to dominate the natural sciences. At the same time national schools of natural sciences had also been created by the 1940s. A number of scientists and scholars, namely the Serbian geographer Jovan Cvijić, the Romanian microbiologist Victor Babeş, the Serbian linguist Aleksandr Belić, and the Bulgarian medievalist V. Zlatarsky, were members of learned societies. Bulgarian and Bulgarian-born scholars contributed to archaeology and Byzantine studies, and later to various branches of linguistics. A strong school of medievalists was created in Croatia.

Inter-war culture in the Balkan countries is associated with a cohort of world-famous artists, such as the Croat writer Miroslav Krleža, his compatriot Ivan Meštrovic, whose sculpture is full of heroic passion and nationalistic themes, and the Romanian composer and violinist George Enescu. The Serbian prose writer Ivo Andrić, a master of historical novels, was awarded the Nobel Prize in 1961. One of the founders of European abstractionism was the Romanian-born sculptor Constantin Brancusi (Brânkuşi). Although he lived and worked in France, he never broke off relations with his homeland. Two other famous figures of French cultural life – the 'theatre of the absurd' dramatist

Eugene Ionesco (Ionescu), and the patriarch of surrealistic literature Tristan Tzara – were both born in Romania. The Croat Anton Augustinčić and Romanians Dimitre Paciurea, Ion Irimescu and Cornel Medrea were celebrated sculptors. The Bulgarian composer Pancho Vladigerov became popular working in Berlin in the 1920s in cooperation with the great theatre director Max Reinhardt. The outstanding Croat director Branko Gavella directed performances not only in Yugoslavia, but also abroad, in Milan, on the stage of 'La Scala'. The great Serbian comedy-writer Bronislav Nušić was at the peak of his creative ability in the 1920s and 1930s.

In the first half of the twentieth century painting in Slovenia was in its heyday. Yugoslav, especially Croatian, naive art by the group Zemlya, founded by K. Hegedušić, I. Generalić, F. Mraz and others became a significant phenomenon in world culture. Though a certain backwardness of construction engineering hindered the realization of bold architectural projects in the Balkans, in Slovenia Jože Plečnik Meštrovic founded a strong national school in architecture. There were also talented architects in Croatia, for example Viktor Kovačić. In Romania and later in Bulgaria famous vocal schools were created. After the Second World War the Bulgarian singers Boris Khristov, Nikola Gyaurov, Nikola Gyuzelev and others were singing in the world's best opera companies. A number of celebrated violinists, pianists and conductors came from Romania. One of the characteristic features of Yugoslav composers was their quest for stylistic variety. In Bulgaria and Yugoslavia many choirs were flourishing.

Social criticism was characteristic of Romanian literature (Mihail Sadoveanu), painting and graphic art (Corneliu Baba and others). The works of Romanian poets Tudor Arghezi, Lucian Blaga and Octavian Goga, Bulgarian writers Yelin-Pelin, Yordan Yovkov and Anton Srtashimirov, the Serbian poet Desanka Maksimović, the prose writer and poet Miloš Crnjanski, and the Croatian poet Tin Ujević formed the core of national literatures. The Bulgarian fine arts are famous thanks to such painters as Vladimir Dimitrov-Maistora and Dechko Uzunov and the sculptor Ivan Lazarov.

The gap between high culture and mass culture, which strongly influenced relations between artists, their language and the way they saw their mission, was not so pronounced in the Balkans as in Central Europe. The notion that artists have a mission to enlighten and 'awaken' was still deeply rooted. By the same token, in the first half of the twentieth century the ideas of 'pure art' and the autonomy of creative activity were becoming established in the region.

The Second World War caused significant damage to the national cultural institutions of East-Central Europe. A number of museums, libraries, educational institutions and theatres in Warsaw, Budapest and other cultural centres were destroyed. Many celebrated writers, artists, scientists and scholars became victims of the Nazi terror. Some of them had to emigrate. Others joined the anti-fascist movement in their home countries. Some universities in Poland went on working underground. The motif of anti-fascist resistance dominated East-Central European cultures in the late 1930s and early 1940s. Let us mention a characteristic monument of that age, 'The Report with the Loop Around the Neck,' by Julius Fučílc.

The opportunity for a radical democratic change after the victory over fascism was not realized. By the late 1940s in the majority of East-Central European and Balkan countries, communist regimes of the Stalinist type were established. The Soviet military presence and political pressure of the USSR were decisive. But in some countries the period of one-party dictatorship was preceded by a short (two- or three-year) period of anti-fascist coalition, characterized not only by political struggle, but also by a certain political pluralism. One of the main motifs was the rethinking of recent history. The emotional experience of people who had undergone unprecedented upheavals found expression in the Polish psychological novels of the late 1940s (Tadeusz Borowski, Jerzyi Andrzejewski, Stanislaw Dygat, Tadeusz Breza and others), which were deeply influenced by existentialist philosophy. Later, in the 1950s and 1960s this motif was further developed in Polish cinema, as well as in Hungary, Yugoslavia and other countries of East-Central Europe. This theme became dominant in other branches of culture also: the Serbian 'partisan' literature of Branko Čopić, Oskar Davičo and others deserves special mention. Yugoslav, Czechoslovak and Polish artists created brilliant monumental masterpieces in painting and sculpture.

The communist regimes' total ideological control in Eastern Europe had deeply affected the relations between the politically powerful and the artistic intelligentsia. There followed attempts to turn artists into instruments of propaganda and ideological attacks on the population. The dominant concept of socialist realism was obligatory, its postulates prescribed artists a limited number of canons, defining both the content and form of their creations. Most East-Central European countries reduced their cultural contacts with the West. Variety was replaced by forced uniformity and 'masterpieces' of Soviet culture made in accordance with the model of social realism. Even those masters who accepted the idea of social reorganization along socialist lines, tended to submit their activity to the needs of party propaganda. The gradually deepening conflict between artists and the authorities found its ultimate expression in the Polish and, especially, Hungarian revolts of 1956. Later, when other attempts to democratize the system (Czechoslovakia, 1968; Poland, 1968, 1970, 1976, 1980–81) were undertaken, the intellectual elite, including artists, were invariably in the epicentre of events, acting as an alternative political force and exposing themselves to the repressive machine (let us mention persecutions of intellectuals in Poland in 1968, or in Czechoslovakia in 1969–70). Generally speaking, opposition and 'dissident' movements in East-Central European countries were of an intellectual nature, their social base only widening during the height of the crisis, as in Hungary and partly in Poland in 1956, or in Poland in the early 1980s, when the intelligentsia and the working masses demonstrated brilliant unity in their battle against party-bureaucratic socialism.

By the late 1950s and early 1960s as a result of internal political changes in the Soviet Union, the repressive mechanism in most East-Central European countries was slightly relaxed. This inevitably influenced the state of cultural affairs. Thus, sciences and especially social sciences were relatively de-ideologized, while in arts the previous hard line of social realism was replaced with a new concept, more flexible, allowing in some countries a certain variety of formal and stylistic tendencies and leaving some limited space for critical depiction of negative sides of reality. A noteworthy example was Stalin's reign of terror, which drew the attention of many writers of that period.

In Hungary, where the János Kádár regime had learnt a lesson from the events of 1956, the country was looking for a more effective model of socialism, and thus clearly demonstrated how the intelligentsia's resistance to totalitarianism could force the authorities to make concessions, and sometimes quite significant ones in matters of cultural policy. From the 1960s on, the moderate character of Kádár's political regime also created a more liberal cultural policy. The authorities interfered in cultural life only when alternative views seemed to threaten directly the official Marxist ideology. For example, in the early 1970s Kádár found danger in the Lukács school philosophers (A. Heller and others) who reflected on the possibility of a synthesis between democracy and socialism.

Nevertheless, despite undeniable limitations in the sphere of politics and ideology, the Kádár epoch made a remarkable contribution in the development of national culture. The most significant success is associated with the cinema. The works of Miklós Jancsó and István Szabó earned world fame. Films of Zoltán Fábri, Zoltán Huszárik, András Kovács, Marta Mészáros, Károly Makk, István Gaál, Pal Sándor won numerous prizes at international film festivals. The composer György Kurtág, as well as György Ligeti, who lives in Germany, are among the luminaries of modern European music. The achievements of Hungarian choreography in the 1980s and 1990s are associated first of all with the Győr ballet company, headed by the pupil of Maurice Béjart, Ivan Markó, who, together with the Pole Kazimierz Dziewecki are the most interesting figures in modern East-Central European ballet.

In the plastic arts Hungarian sculptors proved to be the most prominent. Jenő Kerényi, Tibor Vilt, B. Megyeri, István Kiss, Imre Varga, E. Saár and others earned world-wide fame. The genre offers great variety ranging from smaller forms to genre compositions with theatrical elements. One of the most well-known artists of the 1960s was Béla Kondor and his pencil drawings. One should also note the achievements of Hungarian artists in monumental painting, tapestry and ceramics (Margit Kovács). The architect Imre Makovec, whose style is a symbiosis of romantic elements with modern construction engineering, merits universal acknowledgement.

In the post-war period there appeared such prominent figures of Hungarian literature as poets Janos Pilinszki and Sándor Weöres, the novelist and playwright I. Erkeny and others. Renowned poets Ferenc Juhász, László Nagy and Sandor Csoóri belong to the 1950s generation. The 1970s also produced many talented writers, for instance Péter Esterházy and György Spiró. And finally we should mention Imre Kertesz, who won the Nobel Prize for literature in 2002.

Hungarian science is associated with discoveries in theoretical physics, optics, organic chemistry, biochemistry, psychology and microbiology. Compared to other East-Central European countries, Hungarian scholars, especially economists and sociologists, enjoyed more favourable working conditions between the 1960s and 1980s. Thus, János Kornai's works on the theory of economic transition were widely published and supported all over the world.

In Czechoslovakia there was significant progress in those sciences that were traditionally highly developed in that country. For example, the chemist Jaroslav Heyrovský was awarded the Nobel Prize in 1959 for his work on polarography. Scientific reform started in the early 1950s, and improved to some extent the institutional, material and technical basis of science in Czechoslovakia and neighbouring countries. On the other hand it resulted in decreasing the scientific potential of universities by causing a gap between science and higher education. The humanities and social sciences suffered especially. After the events of February 1948, when the Czech Communist Party came to power, many people in these fields were deprived of work. In the mid-1960s, together with some political liberalization, some animation was observed in almost all social sciences. After changes in August 1968 many renowned scholars were again removed from their positions, or had to emigrate. Unlike Czechoslovakia, the communist regime in Poland never fully deprived universities of their autonomy. Thus, some prominent representatives of neo-Thomistic and neo-positivist philosophy were able to keep their chairs. Between 1957 and 1962 the Academy of Sciences was headed by Tadeusz Kotarbiński. Since the late 1960s social support for the communist regime in Poland had been running out. The persecutions of ideological opponents resulted in the emigration of philosopher Leszek Kolakowski and other celebrated representatives of the Polish intelligentsia. By the 1980s the influence of Marxism had dwindled to almost nothing. The main opponent of Marxism was Catholic ideology, backed by the Church (kościól) and still very influential.

The same success marked artistic culture during this period. The mid-1950s 'thaw' gave birth to the new school in the Polish cinema. Its heyday in the late 1950s and early 1960s was associated with the films of Andrzej Wajda, Andrzej Munk, Jerzy Kawalerowicz, Aleksander Ford, Jerzy Passendorfer, Jerzy Hoffman and others. By the 1980s, Wajda had become one of the most celebrated film directors in the world. That was about the same time that Krzysztof Zanussi was beginning his career, and Roman Polański, who had emigrated to the United States, was a top director in Hollywood. In the late 1980s one more star appeared – Krzysztof Kieślowski.

Among noteworthy theatre directors of the last few decades are Konrad Swinarski, Kazimierz Dejmek, Ervin Axer and Adam Hanuszkiewicz. One leader of the avant-garde, Jerzy Grotowski, is well known beyond the Polish border. Tadeusz Kantor and Józef Szajna, a brilliant avant-garde director and painter, are well known throughout the world.

Many great composers came to prominence in the 1960s: Witold Lutoslawski, Krzysztof Penderecki, Tomasz Berd, Kazimierz Serocki and Jan Krenc, who is also famous as a conductor.

In the mid-1950s Polish literature was characterized by a variety of styles and produced a number of talented writers. Stanisław Lem became famous for his science fiction. Sławomir Mrożek is well known beyond Poland's borders as a playwright who represents a peculiar branch of the 'theatre of the absurd'. The deeper the crisis of socialism, the greater the role played by the *samizdat* underground press in Poland. It is noteworthy that many of the underground writers were in touch with Polish emigrants, who served as mediators with Western intellectuals.

From the end of the 1950s, Poland's art community was characterized by a variety of movements. The works of pencil artist Tadeusz Kulisiewicz, sculptor Wladyslaw Hasior, the avant-garde painter Jerzy Duda-Gracz and others enriched Polish national culture. Poster graphics became an art form in Poland, as it did in Hungary in 1919.

Polish architects won numerous prizes in international competitions. During the Second World War 80 per cent of Warsaw was completely destroyed, and many other towns also suffered severely. The urgent task of reconstruction – and the limited funds available – stimulated rational tendencies in architecture. Poland, as other East-Central European countries, fell under the influence of contemporary Soviet samples – stylistically eclectic, pompous, excessively decorated buildings – but already in the mid-1950s Polish architecture was shifting towards rationality and simplicity.

As to the sciences, Polish scientists made discoveries in theoretical physics (Leopold Infeld), electronics (Janusz Groszkowski), higher mathematics, medicine and agriculture. The heyday of post-war Czechoslovak culture occurred in the 1960s, when society in general and the intelligentsia in particular believed in the idea of 'socialism with a human face'. The theatre scene was very dynamic: directors Otmar Krejča and Alfred Radok, and the Czech school of set design (Josef Svoboda and others) won renown in the world. The Czech cinema – not only in feature films, but also in animated cartoons – searched after genre and stylistic variety. The Czech school of animated cartoons (Jiří Trnka and Karel Zeman), which developed from the rich traditions of national puppet-shows (J. Skula) is one of the best in the world. After August 1968 many prominent artists had to emigrate (film director Miloš Forman among them), others, like the playwright Václav Havel or the film director Věra Chytilová found obstacles were put in their way. Nevertheless, the development of modern communications and the widening of direct contacts, especially after Helsinki (1975), brought to nought all the authorities' efforts to block channels of communication with the West. There was no spiritual isolation despite the 'iron curtain', and in the 1970s and 1980s Western intellectual tendencies found immediate response in Czechoslovakia, Poland and Hungary due to the *samizdat* too. So, the involving of these countries in the processes of European cultural integration had begun much earlier than the day in 1989 when the Berlin Wall came down.

The Balkan countries, which had concentrated on reducing illiteracy and building schools, were doing well in improving the citizens' cultural level and providing educational opportunities and mass communication for the general population. Specialized institutions for advance studies in natural sciences and humanities were making progress.

Marshall Tito's decision in 1948 for Yugoslavia to break with the Soviet Union necessarily influenced how Yugoslav culture developed. Artists were not always obliged to follow the Party line and political and cultural isolation from the West were gradually overcome. Owing to this, pluralistic tendencies in Yugoslavia manifested themselves earlier than in other socialist countries. From the early 1950s surrealist, abstractionist and, later, post-modern tendencies were each represented in Yugoslav painting. Avant-garde tendencies showed themselves in music, the theatre and cinema. Literature fell under the strong influence of existentialist philosophy. The Zagreb school of animated cartoons, the architect Bogdan Bogdanović's works, Yugoslav monumental sculpture, novels and films devoted to the national-liberation movement during the Second World War – all these contradictory tendencies were part of Yugoslav culture. However, liberalism in cultural policy was relative, and there was still persecution of the activist Milovan Djilas for

his book *The New Class*, as well as prosecution of *Praksis* magazine, edited in Zagreb by a group of philosophers who were adherents of non-orthodox Marxism.

One of the most striking features of the Romanian model of socialism under Ceauşescu was its openly nationalist character. The unapologetic focus on national traditions, with its explicit negation of the Soviet experience, could not help but remove numerous typological similarities with the communist systems in other countries. This found its expression in cultural policy, which became increasingly intolerant and oppressive. The theory of protochronism was a kind of aggressive superiority complex claiming that all more or less significant trends in world culture came from Romania. The recognition accorded Constantin Brancusi, Eugene Ionesco and Tristan Tzara encouraged the Ceauşescu regime to attempt to submit artists to the task of glorifying the ruling clan. Nevertheless, Romanian culture produced a number of true masterpieces in the last few decades. There were incontestable achievements in theatre (the famous theatre and film director Liviu Coulei, the actor Radu Beligan, and especially one of the greatest figures in the modern European theatre, Andrei Şerban), animation (the director Ion Popescu-Gopo), musical performance, sculpture and literature (Marin Sorescu, Dumitru Radu Popescu and others). Romanian and Bulgarian architects won worldwide accolades for their health resort projects on the Black Sea.

In Bulgaria, liberal tendencies in cultural policy began showing themselves in the 1970s and were mainly associated with Lyudmila Zhivkova's activity as the Minister of Culture. In the 1980s, as the popular masses' confidence in the ruling elite was shaken, the latter more and more relied on national traditions. Painters were encouraged to turn to national history, especially Bulgaria's medieval period. The prose of Jordan Radichkov, Yemiliyan Stanev and Pavel Vezhinov, poetry of Elisaveta Bagryana and Valeri Petrov, canvases of Zlatyu Boyadzhiev and others belong in the highest ranks of Bulgarian fine arts in the 1960s to 1980s. Bulgarian documentary films won many prizes at international festivals. The theatre, opera and ballet were of a consistently high level, with traditional chorale singing carefully preserved and Bulgarian opera singers internationally acclaimed.

Albania made significant progress in overcoming mass illiteracy and building up its cultural infrastructure, but the political isolation set in motion in the late 1950s quickly cut off cultural links with the outer world and exerted a negative influence on national culture. It was during the inter-war period that the generation of educated creative artists was brought up in Albania.

Unlike other Balkan countries, Greece had escaped socialist experiments and made good progress in the last two decades. This ancient country, already a cradle of European civilization, has gone on in the twentieth century to make more valuable contributions, including those of the singer Maria Callas, the Nobel Prize-winning poets George Seferis and Odysseus Elitis, the poet Janos Ritsos, novelist Nikos Kazandzakis, sculptor Georgeadis, composer Mikos Teodorakis, film directors Teos Angelopoulos and Michael Cakoyannis, actresses Melina Mercuri, Irena Papas and others. Many of them became famous working abroad.

The formation of independent intellectual communities playing an important role in the ideological preparation of 1989 was accelerated by Mikhail Gorbachev's *perestroika*.

It is too early to evaluate how the great political and economic changes of 1989 influenced the cultural activities and perception of culture in Central and Eastern Europe. One can give only some preliminary notes. On the one hand, widening of democratic freedoms contributed to increasing the diversity of conceptual and stylistic creation. Moreover, one can evaluate positively the importance of opening borders, allowing youth to study abroad, opening access to information, and developing exchange and cooperation among universities and European cultural programmes. European integration is embracing East-Central Europe more and more closely. On the other hand, the role of the state as a sponsor of culture has diminished. It is noteworthy, for instance, that in the early 1990s the annual production of full-length films greatly declined in most East-Central European countries. Sometimes, commercialization lowers the quality of a 'masterpiece', but at the same time following the standards of contemporary Western 'mass culture' East-Central European artists lose out in the competition for expanded markets.

## THE POST-1989 SITUATION

The post-1989 changes had other consequences for culture too. First of all, the communist system had always fulfilled not only the role of ideological guard and censor, but also that of patron, providing both material protection and spiritual inspiration. Some creators even came to view the authorities as the chief audience for their works, more important even than the public. The reduced role of the state as a sponsor of culture also affected the status of many artists. As a result of these changes, the social function of the artist has also changed. Earlier, given the lack of democratic institutions, it was often the artists who played the role of 'spiritual opposition'. With the development of more democratic systems this role was no longer necessary. Today, artists can devote themselves entirely to creative activities and leave politics to the professional politicians. But in this case they must give up their former status as the nation's spiritual leaders.

Both East-Central, and South-Eastern Europe are characterized by close interaction of different cultures, and depending on historical circumstances they alternate between mutual attraction and repulsion. Processes of national disintegration in modern East-Central Europe have taken different forms (Maps 11 and 12). It is hardly possible to compare the break-up of Czechoslovakia with that of Yugoslavia, although both testify to the growth of 'centrifugal' tendencies closely linked with different manifestations of nationalism. But another tendency has also manifested itself – a desire for spiritual integration. It is worth noting that the intelligentsia of the successor-states have sometimes turned to Austria-Hungary for their spiritual models: Kafka's fiction, Rilke's philosophical lyrics, Freud's psychoanalysis and Wittgenstein's analytic philosophy, the new musical language of Schönberg and the Viennese school, and Bartók's musical compositions that incorporate folklore. Other innovative models include the unique mixture of satire and fantasy in Čapek's novels, the inimitable architecture and applied art of the Viennese secession, Masaryk with his desire to combine democracy and socialism on a solid ethical base, and Lukács with his desperate and vain attempt to reanimate classical Marxism using the strength of his

outstanding intellect: these are the bricks upon which the intelligentsia of the region have built their contributions to both national culture in their own country, and world culture.

## NORTH AMERICA

### *Claude Fohlen*

Was the twentieth century the American century, as is commonly said? A close look at the century just ended suggests that there is no denying the continuous and rising influence of the North American continent, which went hand in hand with the shift of the world's centre of gravity from old Europe to the New World. Of course, the appearance of the United States on the world stage, which goes back to the Spanish-American War of 1898, was confirmed by its mediating role between Russia and Japan in 1905. Its participation in the Great War – the first time Americans came to fight on European soil – opened a new era in history because American intervention saved democracy in Europe. In a prophetic article written in 1905, the French historian Henri Hauser said: 'In the last ten years, the tiny democracy formed by Washington has become one of the four or five main factors in world politics ... None of the powers of old Europe, not France, nor England nor Russia nor Germany can fail to be uninterested in this new situation'. And he concluded: 'Henceforth, government of the globe will no longer be a matter for Europe alone'. In fact, Europe had already lost it, since the Americans, on the strength of their military intervention and Wilson's advocacy of 'peace without victory', which was later codified in his Fourteen Points, had imposed themselves as essential arbiters in negotiating the armistice of 11 November 1918 that concluded the war in Europe and then rejecting the Treaty of Versailles.

That intervention heralded the growing influence of the United States in international affairs. While after the war it gave the impression of withdrawing from the international stage, although in reality it never actually did so, its role in the Second World War established its position as one of the two superpowers. It was thanks to the action of the United States that Europe was able to recover and rebuild itself materially. Its presence was felt in every hot spot around the world, where it clashed with the other great power that had also emerged victorious from the war, the USSR (Union of Soviet Social Republics). The conflict between the 'big two' dominated the second half of the twentieth century, in a quite novel form of confrontation, the Cold War, which ended in 1989 with the collapse of the Soviet empire and a totally new situation, a unipolar order.

In only two centuries of existence, 'the tiny American democracy' had become the foremost power in the world.

American preponderance was ensured not only by the country's economic and military power, but also by its institutions, the democratic liberal ideal successively proclaimed by Wilson and Roosevelt, which they tried to export to the world, claiming to follow in the footsteps of the founding fathers, George Washington, Thomas Jefferson and Abraham Lincoln. Americans became the celebrants of a form of government that they believed would bring happiness to all humanity, but it was also through their material culture that American influence came to dominate. The French had put their seal on the eighteenth century, and the British on the nineteenth, but now it was the turn of the Americans to do so for the twentieth century. The 'American way of life' took root on every continent, spreading a language which claimed to be of English origin yet was not English; and spreading a way of living, eating, dressing and spending one's leisure time that bore the strong imprint of its origins and was validated by a neologism, the word *Americanization*. Watching American films changed the behaviour of millions of individuals all over the world, making America at once a whipping boy and a model, a situation that the fall of the Soviet empire reinforced, although it was called into question by the al-Qaeda terrorist attacks of 11 September 2001.

The history of Canada in the twentieth century is inseparable from that of its big southern neighbour. This British dominion moved further and further away from its former allegiance to become an integral part of the North American continent. In 1914, it let itself be drawn along in the wake of the mother-country and entered the struggle against the central empires, but in 1939 it struck out alone, making its own declaration of war a week after Britain did and not hesitating subsequently to place itself deliberately in the American orbit. After the conflict was over, the Canadians established their own citizenship, and adopted the maple leaf as their own flag in place of the Union Jack. In 1994, the symbiosis with the United States was sealed by the free trade treaty (NAFTA) designed to integrate the continental economy. But while, economically, Canada became the rear base partner of the United States (with

87 per cent of its exports going to the US), it was able to preserve its political identity: it remains a member of the British Commonwealth, combining a typically British regime – parliamentary institutions, ministerial responsibility, elections called as needed – with a variant of federalism, all crowned by official bilingualism in French and English. While becoming ever more closely integrated into the continent, Canada was nevertheless able successfully to maintain and develop its own personality, even in the shadow of its neighbour, and sometimes in opposition to it internationally. Its humanitarian and peaceful interventions, which earned its minister of external affairs, Lester Pearson, the Nobel Prize for peace in 1957, made it an active and respected member of the international community.

## IMMIGRATION, SETTLEMENT, POPULATION

Over the century, the territorial configuration of the North American continent hardly altered. In 1949, the British colony of Newfoundland decided to join the Canadian Confederation and become its tenth province. Then after lengthy negotiations, it was finally agreed in 1992 to transfer an area in the Northwest Territories called Nunavut ('Our Land') to the Inuit and other native peoples living in the territories. As for the Americans, in 1959 they extended their borders outside the continent by admitting two new states, Hawaii and Alaska, thereby bringing the number of states to fifty, while also maintaining a hybrid 'commonwealth' status for Puerto Rico.

But what did change dramatically were settlement and population. While Europe grew older as it suffered the full impact of the two world conflicts, the North American continent experienced unprecedented population growth.

A few figures indicate this shift. At the beginning of the twentieth century, the United States had a population of 76 million, and Canada, 5.3 million; by the end of the century, these figures were 285 million and 32 million. Broadly, the population of the United States had grown by a factor of four, and that of Canada by a factor of six. Such examples, very rare not to say unique among the developed countries, merit some discussion.

North America retained and even enhanced its power to attract new people, refuting fears expressed in some quarters at the end of the nineteenth century over the closing of the frontier. The American dream continued to fuel immigration, although its character changed in both countries.

Contrary to earlier patterns, immigration shifted from northern Europe, Britain, Germany and Scandinavia towards southern and eastern Europe. The largest immigrant flows, which poured in during the first two decades of the century, were essentially composed of Italians (including Sicilians), Poles, Russians, Ukrainians, Romanians and Jews from across Europe. There had never been so much immigration as in those years, with numbers rising to over a million for the first time in 1905 and reaching a peak in 1907 and 1914, with 1.2 million. There was talk then of a 'new immigration', since these newcomers were markedly different from those who had come before them in terms of their origins, illiteracy and poverty, and the difficulty of integrating them into their host country.

The integration of these new immigrants into a foreign environment created difficulties that called forth two different responses. Some put their faith in the melting pot, the concept popularized in 1919 by Israel Zangwill's highly successful play of the same name. It was really a slogan designed to persuade newcomers that they could become good Canadians or good Americans, by masking the diversity of the population under a single label. In fact, these newcomers clustered together in ethnic districts, with Oriental Jews on the Lower East Side of New York, Italians in Little Italy in Boston or the Italian district of Toronto, Puerto Ricans in the *barrios*, not to mention Chinese in two of the biggest Chinatowns on the continent, in San Francisco and Vancouver. Thus, within the population, marginalized ethnic groups crystallized whose presence worried the Anglo-Saxon majority of WASPs (White Anglo-Saxon Protestants), worked up by nationalist fervour and anxious to perpetuate the 'Caucasian' values that Social Darwinism was deemed reliably to transmit.

### Restrictions on immigration

The other response was one that sought to slow down and restrict this massive immigration of people seen as different. The idea went back to the nineteenth century, when the massive arrival of Irish people had provoked a rejection that was often marked by violent clashes. On 18 February 1907, Congress approved amending existing immigration legislation that allowed President Roosevelt to issue an executive order stopping the migration of Japanese labourers from Hawaii and Mexico. This was followed by the Gentlemen's Agreement of 1908 – an understanding with Japan that it would discourage emigration at its source. In 1921 Congress passed the Emergency Quota Act, which limited immigration and introduced a distinct ethnic bias towards northern Europeans to the US immigration system. One of the means dreamed up to halt the influx was a literacy test, although the idea met with vetoes by a succession of presidents, especially Woodrow Wilson. The trigger for change came with the Bolshevik Revolution and anarchist threats, which led to the deportation from the United States of several hundred suspects to Europe.

The United States began enforcing a restrictive policy, based on quotas, in 1921 and strengthened it in 1924. Not only was the total number of immigrants limited to 150,000 per year, but each nationality was assigned a quota, based on the 1890 census, taken at a time when Europeans from southern and eastern Europe had yet to arrive. Americans from the rest of the continent were not affected, nor were categories such as teachers, students or ministers of religion. Canada resorted to similar practices using different means. The effects were drastic: between 1911 and 1920, 5.7 million immigrants entered the United States, as against 4.1 million in the succeeding decade, and 530,000 in the 1930s. It was not until the 1970s that their number again rose above 4 million.

This policy remained virtually unchanged for almost half a century, despite the racial, political and ideological persecutions that shook the world. America, deep in crisis and sapped by unemployment, could not and would not open its doors even a fraction, except for a few famous scholars such as Einstein; economics easily won out over humanitarianism. Following the Second World War, although quotas were maintained, modifications opened a special quota for 'displaced persons' and orphans, allowing

the entry into the United States of tens of thousands of European victims. As circumstances required, measures of this sort were applied to other populations deemed to be under threat, including Cubans after Castro came to power (250,000 in the 1970s), or Viet Namese (325,000 in the 1980s). While not so formalized, Canada's immigration policy had also been restrictive – asserting its determination to prefer the British immigrant (over one-third of new arrivals in the first half of the century) and virtually excluding the Chinese. Yet it, too, began to open up new possibilities for non-British immigration, by defining categories that took into account not ethnic criteria but humanitarian and professional ones instead.

## The new approach to immigration

Thus, from the 1960s, both countries saw a radical shift, with the massive arrival of new applicants for admission. Not only were national quotas abandoned in favour of overall quotas for each continent, but Canada opened the way by promoting family reunification and professional skills, with a system of points for assessing the need to attract specialists in specific fields. The results were soon apparent, both quantitatively and qualitatively.

This flood of new immigration surpassed the influx of the early years of the century. The United States admitted 4.5 million immigrants in the 1970s, 7.3 million in the following decade, and 9 million in the last decade: in total, there were 20 million immigrants in the first half of the century, as against 26.6 million in the second. Nothing could slow this flow, which reached an absolute peak of 1.8 million in 1991, or 7.2 per cent of the US total population. And these official figures under-estimate the scale of the movement, since there were also clandestine entries across porous borders. The American dream now exercised its fascination for the poor populations of the South. In Canada, the number of immigrants rose from 130,000 in 1981 to 230,000 ten years later, and in the 1980s 1.3 million of them entered, half in the category of family, in other words coming under family reunification. Despite a fall in the late 1990s, immigration continued to represent a substantial contribution to the North American population, which it helped to transform at the expense of its European roots.

This massive arrival of Asians and Hispanics profoundly altered the continent's ethnic makeup. In the United States in the 1960s, over 1.5 million Central and South Americans were recorded as entering, as against 1.2 million Europeans. But in 1991, only 7.5 per cent of newcomers originated from Europe, against 19.5 per cent from Asia, 51.5 per cent from Mexico, and 4.3 per cent from South America. The proportions were about the same ten years later: 132,000 Europeans, 265,000 Asians, 344,000 North Americans (including 173,000 Mexicans) and 56,000 South Americans. In Canada, there were more immigrants from Asia than from Europe, and there was a striking influx of residents of Hong Kong who settled in British Columbia. The United States saw the massive entry of Mexicans who used every possible means to enter the Eldorado of the North, despite electrified fences and the strengthening of ever-more pervasive surveillance. Trade unions might well complain of unfair competition from the clandestine labour of these illegal immigrants, but nothing could stop them. In

an attempt to put an end to it, President Reagan issued an amnesty that offered citizenship to all illegal aliens; however the experiment failed to clarify the situation and the waves of newcomers continued unabated.

The upshot was that Hispanics became the largest minority, numbering 36.9 million, replacing African Americans, who, hard on their heels, were relegated to second place. If present trends continue, it is clear that Hispanics will play a growing role in the life of the country and that their political clout will increase.

## Internal movements

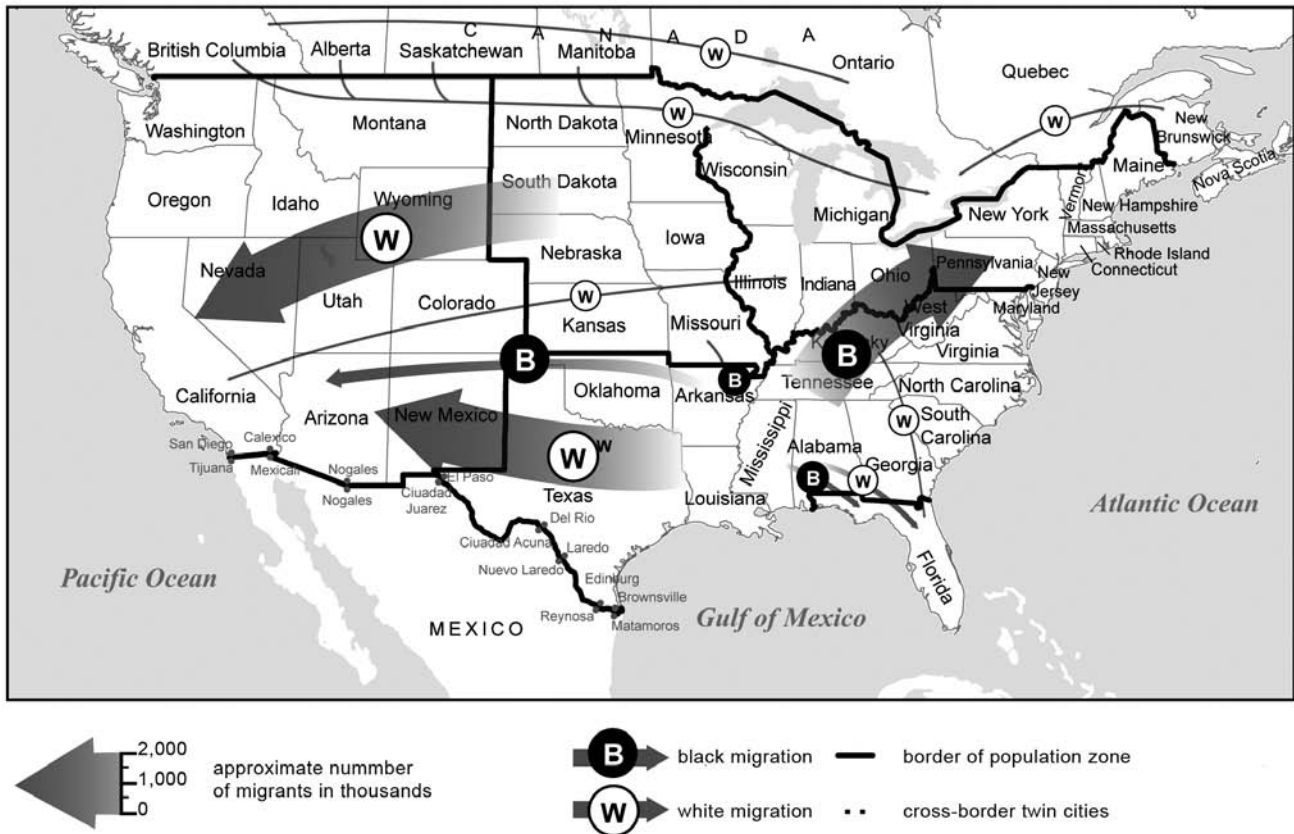
Within the continent, North Americans continued and even accelerated their centuries-old movement from the East to the Southwest (Map 13). Despite the disappearance of the Far West frontier, its dynamic continues: at each decennial census, the United States' centre of gravity continues to shift in a western movement: at the beginning of the twentieth century, it was located in southeast Indiana; half a century later, it was in southern Illinois; by 1998, it was close to St. Louis (Missouri), and, in 2000, near the centre of that state. While such a construction is artificial, it does at least serve to highlight the shift of population, evidenced by the increasing power of the states along the Pacific Rim of the West Coast and along the Gulf of Mexico to the south.

The growth of three coastal states, Washington, Oregon and above all California, has been spectacular. California, whose current population of 34 million is expected to reach 50 million by 2010 (it was 23.6 million in 1980), is now the most populous state in the Union, easily overtaking the oldest states in the East; even New York State (19 million) has been relegated to third position, behind Texas (20.6 million). As a consequence, these peripheral states have gained considerable weight politically, electing the largest number of delegates to Congress in Washington, D.C. On top of this rather traditional shift westward, the period since the Second World War saw a marked move southward, explainable by the attraction of the sun (the Sun Belt), the abundance of resources, whether natural (oil, natural gas) or man-made (Tennessee valley dams), cheap labour due to the initial absence of unionization. These new localities were also favoured by the benefits of air-conditioning. Texas was the main beneficiary, while Florida (fourth-largest state in the Union, with 16 million inhabitants) owes its current prosperity to its beaches, its retirees and Cuban émigrés. By virtue of their demographic and economic importance, California, Texas and Florida became politically dominant in the last third of the twentieth century, providing virtually every president: Lyndon Johnson (Texas), Richard Nixon and Ronald Reagan (California), George H. W. Bush, and George W. Bush (Texas). Jimmy Carter and Bill Clinton can be added to this list, since both come from the Southern states of Georgia and Arkansas respectively. Internal migration benefited the West and the South at the expense of WASPs and the Atlantic coast establishment.

In Canada, where immigrants settled along a line following the border, there was a comparable movement westward, although on an altogether different scale. On the one hand, Toronto replaced Montreal as an economic powerhouse. And, on the other, the two Western provinces,

603

*Map 13*  **Regional migration in North America, 1940–1960**



Adapted from R. Chaliand, 1998, *Atlas du millénaire: La mort des empires 1900–2015*, Hachette, Paris.

Alberta and British Columbia, played a growing role within the Confederation, making Vancouver the undisputed capital of the whole West. There too the political consequences revealed a rejection of the Eastern establishment since it was in the West that all the opposition parties appeared, from the Social Credit Party to Preston Manning's Reform Party, which was formed in 1987, in revolt against Ottawa's domination.

**Urbanization**

Another fundamental shift common to both countries was the phenomenon of urbanization or rather peri-urbanization. What had motivated immigrants up to the nineteenth century were possession of land and access to ownership. For Europeans still widely subject to an Old World regime, land was a major attraction; this pull has recently disappeared, however, leading to rural exodus and the concentration of population in cities or their suburbs. Whereas in Canada in the mid-nineteenth century, only 13 per cent of the population was living in cities, at present three out of four Canadians are settling in urban areas. This urbanization is unevenly distributed across the country, more highly developed in British Columbia, Alberta, Ontario and Quebec than in the Maritime Provinces and the Northwest Territories. These changes led to development of a new approach, in the shape of Census Metropolitan Areas (CMA), treating as a single region cities and their suburbs,

both in the big urban centres, such as Montreal, Ottawa, Toronto and Vancouver and in smaller urban areas, such as Oshawa, not far from Toronto.

This shift is also visible in the United States, where a new way of representing the population according to Standard Metropolitan Areas (SMA) was adopted to keep pace with these changes. SMAs group together both central cities with a population of over 50,000 and the outlying areas over which their activities extend. Currently, there are over 300 such metropolitan areas, embracing almost four-fifths of the total population and varying greatly in size, from the most populous – New York (20 million inhabitants), Los Angeles (15 million) or Chicago (8.5 million) – to the smaller ones in the Midwest or the Rockies. The creation of these metropolitan areas reflects a profound transformation of American demographics and especially the erosion of rural areas. In 1900, rural areas accounted for 67 per cent of the total population, as against fewer than 25 per cent by the end of the century. The attraction of urban centres acted as a magnet, both for newcomers and for Americans already living in the country.

At the same time, the nature of cities was changing. From being places of residence they became centres of tertiary activities. As means of transport developed, better-off households migrated to the residential suburbs (the green suburbs), and abandoned multi-occupancy buildings for individual houses with lawns, gardens and swimming pools. This resulted in the typical American landscape of sprawling suburbs, monotonous in the way they are built, but well

maintained and with plenty of vegetation. The phenomenon started right from the beginning of the century, with the arrival on the market of automobiles that were priced within reach of the pockets of the middle classes as a whole, and not simply those of the wealthiest few. The trend accelerated after the Second World War with the standardization of building techniques. The example was set by the Levittowns, named after William Levitt, the man who created them. In 1947, he launched his first experiment in New York State, where in just four years he built a community of 17,500 houses, designed to shelter 75,000 individuals. By using prefabricated materials that he produced himself at the rate of 30 units a day, a new form of habitat was launched, which won over the middle classes so successfully that Levitt repeated his experiment in several other states. The exodus to peri-urban areas accentuated the emptiness of city centres and downtown areas.

As their occupants left, these districts were taken over by newcomers, immigrants or ethnic minorities. This trend was already apparent at the end of the previous century, but in the twentieth it was accentuated by the attractiveness of these new residential suburbs. This led to a structure peculiar to North America, and more particularly the United States, of a rundown city centre gradually taken over by ghettos, contrasting with pleasant and prosperous suburbs. In reaction against this abandonment, but especially in the East and the industrial cities along the Great Lakes, an effort was made to rehabilitate the centre and to attract well-off residents back in; but, generally speaking, city centres have lost their attractiveness. There was thus a twin process of displacement, from the rural areas and from city centres to peri-urban areas. According to official figures, 50 per cent of Americans change their residence between censuses, in other words every ten years. Thus, the tradition of 'a population on the move' has continued unabated throughout the twentieth century, making Americans one of the most mobile populations among the industrialized nations of the world.

## FROM PROSPERITY TO DEPRESSION

The Americans, emerging victorious from a succession of conflicts, and in a position to impose their views on their allies, aimed to restore the conditions of normalcy as quickly as possible. This meant they often ignored the outside world that had temporally diverted their attention – continuing a line of conduct first drawn in 1799 by their founder, George Washington, and formalized again by President Monroe in the Monroe Doctrine of 1821. Two slogans highlighted this determination: 'return to normalcy' and 'business as usual'. In both, American hopes were cruelly disappointed: the aftermath of war proved to be more difficult than foreseen, with a short period of prosperity abruptly interrupted in 1929 by the longest and deepest depression ever experienced and one that was therefore all the harder to overcome.

Initially, the return to normalcy saw a series of disappointments. Two million 'boys' found themselves in Europe, wanting to get home fast. But the lack of ships meant that this return was slower than expected and was only completed in 1920. In the transit camps and military bases there were scenes of looting, acts of indiscipline and mutinies, which left a stain on the image of the American army in Europe.

Scarcely back home, these men found it hard to get jobs in a period of economic recession. Nothing had been planned for the changeover to a peacetime economy, and the situation was aggravated by the Spanish influenza epidemic and a wave of strikes in the iron and steel industry and the mines and shipyards along the Pacific coast. Jobs left vacant when the men enlisted in the army had been filled by women who were reluctant to give them up, especially as the Nineteenth Amendment now granted them the right to vote, marking their entry on the political stage.

Other causes for concern intruded into this already gloomy atmosphere. The Bolshevik Revolution awakened the 'Red Scare', 'Reds' being suspected of terrorist acts that culminated in the explosion of a bomb outside the Morgan Bank in New York, causing dozens of deaths. Whoever were responsible for it, it provoked a harsh repression, with the deportation to Russia of suspected anarchists, including Alexander Berkman and Emma Goldman, accused of the attempted murder of industrialist Henry Clay Frick, in 1892. The Americans, haunted by the fear of revolution, gave individual rights short shrift, as they would again following the Second World War.

On top of all these causes for concern, there were race riots, the most serious occurring in Chicago and resulting in hundreds of African American casualties. Some people saw in them the hand of the Ku Klux Klan, which had just arisen from the ashes – not in the South, as after the Civil War, but in Ohio. Its members paraded ostentatiously in Washington, at the foot of the Capitol, lumping Blacks, Jews and Catholics together in a common hatred. Defending nativism and sworn enemies of anything that might sully the purity of America, they made their mark on society, as McCarthyism did later during the 1950s. This bigotry came through in the hit films of D. W. Griffith, *Birth of a Nation* (1915) and *Intolerance* (1919). The aftermath of the war was indeed a period full of threats, which helps to explain the country's determination to restrict immigration and its apparent refusal to participate in international affairs.

### The great illusion

The outlook began to look brighter after 1920, as a period of jarring contrasts opened onto the 'roaring twenties'. After the worries and the sacrifices, came enjoyment, pleasure in the ordinary things of everyday life, a relaxation of social mores and a focus on getting rich. The Republicans came back to power, suggesting weariness with reform and a rejection of international engagements. Yet the decade abounded in contradictions, since it opened precisely on a return to morality with the Eighteenth Amendment (followed by the 1919 Volstead Act) forbidding 'the manufacture, sale, or transportation of intoxicating liquor within, the importation thereof into, or the exportation thereof from the United States'. So began the era of Prohibition, supposed to help deal with alcoholism, one of the ills plaguing society, by banning consumption of hard liquors such as whisky. This ban did not come out of the blue, but was part of a long struggle by temperance societies and Puritan denominations against an evil for which non-Anglo-Saxon immigrants were held responsible – the Irish, the Italians, the Slavs and others. This revenge of the Mayflower America against the America of the melting pot was not a mere chance occurrence.

While Prohibition was supposed to open the way for an era of morality, in practice it led to a decade of excess, debauchery and violence. Bars, restaurants, liquor stores and pubs ceased, at least officially, to serve beer, wine and alcohol, but a whole clandestine traffic sprang up underground, with *speakeasies*, where regulars would meet, and a contraband trade that enriched bootleggers. Private individuals began to produce adulterated alcohols, and, above all, a smuggling trade developed with Canada and the West Indies, while cruises to the Bahamas and other places where alcohol consumption was legal became very popular. The struggle for control of this traffic pitted rival gangs and gangsters against one another; they set up their headquarters in Chicago, the ideal entry point to Canada, just across the border, and the focus of crime and violence. Such were these unforeseen consequences of Prohibition that its repeal became a major issue in the presidential election of 1932, before the Twenty-first Amendment repealed the Eighteenth in 1933.

These excesses and violence cannot obliterate the prosperity that Americans enjoyed in these years, buoyed up by technological advances arising from use of the internal combustion engine and practical applications of electricity. Ford founded his automobile company at Dearborn, Michigan, in 1903 and launched his famous Model T in 1909. Before production ceased in 1929 more than 15 million cars had been sold. It was after 1920 that the motor car became an item of mass consumption and ceased to be the privilege of the rich: its price fell from US$1,500 in 1913 to US$760 in 1920 and US$600 in 1929. This long life proved fatal to it, as its main rival, General Motors, reorganized in 1920 along more modern lines, soon accounted for about one-third of American car production, alongside smaller makers such as Chrysler, Hudson and Studebaker. The United States became the leading world car producer, making 4.5 million in 1929, as against 1.9 million in 1920, and Europeans followed the path. The United States alone possessed more cars than the whole of the rest of the world, with a ratio of one car for every five inhabitants, as against one for 43 in Britain and one for 326 in Italy. As a consequence there was a great need to build and improve roads, and in the 1930s the first motorways started to appear in the East of the country. This new infrastructure immediately threatened the supremacy of railways, which until then had played a key role in the development and westward movement of the country.

New applications of electricity were also an important source of useful inventions. During the 1920s, as many dams were built as had been built since the discovery of hydroelectric power, so that by 1930 the whole of urban and suburban America was supplied. Rural America lagged behind because of the high costs of installation, especially in the South, where private companies hesitated to invest. Giant corporations grew up both for the production of electricity and for the manufacture of equipment, engines, lighting, appliances and accessories, with a very high degree of concentration to the benefit of firms such as General Electric or Westinghouse.

The nearly coast-to-coast availability of motor cars and electricity transformed everyday life, encouraging the abandonment of cities in favour of the suburbs and improved material conditions. The American went to work in his Ford or his Chevrolet and at the end of the day returned to the bosom of his family, partly liberated from domestic tasks through the use of household appliances that had become common in middle class homes. A new appliance, the refrigerator, left its mark on the language (frigidaire). An appliance that had an even greater impact on society was the radio, with the first commercial broadcast being made in Pittsburgh in 1920. In order to sell their products, makers of radios set up stations, which were soon taken over by national networks dominated by big broadcasting groups, such as NBC (National Broadcasting Company, 1926) or CBS (Columbia Broadcasting System, 1927). In addition to news and entertainment, the radio carried religious broadcasts, and later became a political instrument. The first medium to rival the newspaper had come into being.

Electricity lay behind the success of cinema, which became the most popular form of entertainment. The 1920s saw the triumph of the silent film, whose studios deserted the East Coast to settle in Hollywood under the clear skies of California. There too, big companies – the majors, as they were known – monopolized production: Paramount, founded in 1912, United Artists, launched in 1921 by D. W. Griffith, Charlie Chaplin and Douglas Fairbanks, Warner Bros (1923) and MGM (Metro-Goldwyn-Mayer, 1924). By then the star system dominated, with the likes of Greta Garbo, Gloria Swanson or Mary Pickford alongside Rudolph Valentino. The appearance of talking cinema, in 1927 with *The Jazz Singer*, revolutionized production and led to the appearance of new stars, while at the same time reinforcing the grip of American studios which, year in year out, showed 500 films, in 23,000 darkened rooms, before some 115 million spectators.

All these practical mass applications required investment capital, which ensured the success of Wall Street. Prosperity appeared to be never-ending, with profits rising year after year, whence the infatuation with the Stock Exchange, with all its excesses, the creation of ghost companies and the exploitation of the public's credulity by crooks. But this stereotype needs to be tempered, since only a minority let itself be attracted by the mirage of easy money. Alongside this luxuriating and rich America there coexisted a more conservative and traditional America well portrayed by Sinclair Lewis in *Main Street* and *Babbitt*, two novels that stigmatized the world of the middle class, the world of the small towns of the Midwest, with its own ways, its narrow conformism and its petty bourgeois prejudices. The weight of tradition was at the centre of many affairs of the time, including the one in 1925, involving a Tennessee high-school teacher by the name of John Scopes. He was charged with violating state law by teaching Darwin's theory of evolution. In Tennessee it was unlawful 'to teach any theory that denies the story of divine creation as taught in the Bible'. Two years later, the execution of Nicola Sacco and Bartolomeo Vanzetti, who were convicted of having murdered the paymaster of a New England firm in 1920, put an end to a *cause célèbre* that had mobilized both Americans and Europeans. It was their misfortune to be both immigrants and anarchists. In the 1928 presidential elections, the Republican Herbert Hoover easily defeated the Democrat Alfred Smith, who was criticized for being a Roman Catholic. However, the most lasting manifestation of this alleged return to traditional values was the drastic restriction of immigration through the introduction of national quotas.

There were also several sectors of the population that prosperity bypassed. After having greatly benefited during and after the war from guaranteed markets for their cereals, meat and cotton, by 1925 farmers were faced with surpluses. Stocks were rising, outlets were closing and prices were in freefall, causing discontent in the farming areas of the Midwest. The Republican administration, faithful to liberalism within and protectionism at the borders, refused to pay any heed to their complaints, thereby risking the loss of their votes. But discontent was also building up in the labour force. Prosperity favoured competition at the expense of unskilled and hence less well-paid wage earners, especially because African Americans, attracted by the shortage of labour in the major industrial areas, took over many jobs previously occupied by immigrants. Moreover, the migration of African Americans was far from over, indeed quite the reverse, creating social tensions in the ghettos of cities like Philadelphia, Boston, Chicago and Detroit. The trade union movement was the victim of this malaise, losing about half its members. The dominant organization, Samuel Gompers' American Federation of Labor, drew its membership from among skilled workers, leaving the majority of workers to their fate or to 'house unions'.

## The crisis

The two engines of prosperity, car-making and construction work, slowed in the closing years of the decade, without anyone paying much attention, since Wall Street continued its dizzying rise. The reasons for this slowdown lay in market saturation and the decline in investment: despite a decline of 22 per cent in car production in 1927, the euphoria persisted.

The spectacular collapse of Wall Street, which in three weeks (October–November 1929) lost over US$30 billion in value, set off panic in financial and banking circles. Despite repeated interventions, the decline continued and even worsened in the following months, reaching bottom in 1933. The Wall Street crash had equally devastating effects on the economy, because it occurred in an already weakened conjuncture and an atmosphere of speculation. By undermining the confidence of Americans, it led automatically to a fall in consumption, which reduced production in every area.

At first sight, it seems that it was the rural areas, which had already suffered falling prices, that were most affected. The fall simply accelerated, making farmers the most spectacular victims of the crisis. Every branch of industry had to cut its output drastically, beginning with the car industry, where Ford laid off 72,000 workers in 1931, and, in turn, business slowed. The most visible effect, and the most worrying, was the increase in unemployment, from 4.5 million in 1930 to 12 million in 1931 and 16 million in 1933, although, in the absence of reliable statistics, these figures understate the reality. Poverty was visible in the cities, where the unemployed attempted to sell apples at street corners and queued at soup kitchens. Unable to pay their rent, they had been evicted from their lodgings and gathered in slums, ironically nicknamed Hoovervilles. The already precarious position of farmers was dramatically aggravated by the wave of drought and sandstorms that ravaged a number of states in the Midwest, forcing them to flee westward, where they hoped to escape the 'dustbowl' and find Eldorado. No one has better told the story of the plight of these 'Okies' than John Steinbeck in *The Grapes of Wrath*.

Distress led to discontent and social unrest. While they awaited the promised bonus, veterans of the 1914 war had set up their camp on the banks of the Anacostia River, near Washington, D.C., whence the name 'Bonus Army'. When Congress refused to pay the bonus, some went home, while others stayed. To restore order, President Hoover called out federal troops who, under the command of General Douglas MacArthur, used cavalry and tanks to disperse the veterans, a few months before the 1932 presidential election.

There have been numerous interpretations of the 1929 crisis, none of which is totally satisfactory. Contemporaries saw it as a logical consequence of the Wall Street crash, but none of the previous crashes – and there had been many – had had such a devastating effect. For John K. Galbraith, 'Had the economy been fundamentally sound in 1929 the effect of the great stock market crash might have been small ... on the contrary it was exceedingly fragile. It was vulnerable to the kind of blow it received from Wall Street'. For Charles Kindleberger the American crisis reflected the collapse of the world economic system as a result of the American refusal to play a stabilizing role. Milton Friedman blamed the monetarist policy of the Federal Reserve which, by raising its rates, tightened the money supply and removed any elasticity that might have assisted a revival. In fact, the American crisis had multiple causes, both endogenous and exogenous, something that contemporaries and actors, attributing a surely excessive role to stock market speculation, were unable to see.

Contrary to a deep-seated myth, the administration did not simply fold its hands in the face of poverty, at either local or federal level. In New York State, which had just elected Franklin D. Roosevelt as governor, his associate, Frances Perkins, worked hard to help the unemployed by paying them relief and opening soup kitchens and shelters for those evicted from their homes. As for the federal government, it took measures designed to halt the fall in farm prices, offer credit to firms in difficulties (Reconstruction Finance Corporation) and help banks (Glass-Steagall Act). Nothing seemed to work, and the crisis persisted.

## The New Deal

It was amid this gloom that the 1932 elections were held, which brought the Democrats to power with their candidate F. D. Roosevelt, who won easily with almost 58 per cent of the votes. On his coat tails, they also won control of both houses of Congress. The Republicans had never suffered such a defeat before, losing 42 of the 48 states, and holding out only in New England, Pennsylvania and Delaware. A new era dawned, the New Deal, to use the expression coined by the new president.

Pragmatism and opportunism were the hallmarks of this experiment, which lasted until 1938. Roosevelt had won by his personality, his persuasiveness, good use of the media and, of course, the fact that the Republicans were worn out after twelve years in office, rather than by the presentation of a programme, a notion quite foreign to his personality. Just 50 years old, he belonged to a well-known

family from Hyde Park, New York, and benefited from the fame of his distant cousin Theodore 'Teddy' Roosevelt, who had served as president of the United States from 1901 to 1909. Franklin D. Roosevelt served as Assistant Secretary of the Navy in 1915, and then in 1920 was the losing candidate for the vice-presidency. Struck down the following year by poliomyelitis, he fought against the paralysis that affected his lower limbs for the rest of his life but, while remaining an invalid, recovered his taste for politics, and was elected Governor of New York in 1928, and re-elected in 1930. The most popular president of the twentieth century, he managed to win re-election three times (1936, 1940, 1944), thus breaking a taboo that dated back to George Washington's having declined to accept a third term in office.

The New Deal saw increased intervention by the federal government in economic and social life, and an enhanced role for the bureaucracy. Alongside the traditional cabinet, which remained very stable during these years, a private group of advisers operated the 'brain trust', in which economists, academics, various experts and businessmen quickly followed one another, depending on what the issue was. The cabinet acted as a facade for what was the real engine of government action, transmitted less through the traditional machinery than through more and more agencies emanating directly from the executive. This marks the beginning of an 'imperial presidency' which gave the president a status previously unknown, except in the time of Lincoln, during the Civil War. And beyond Congress, warm contact was assured between the president and Americans through his Saturday evening 'fireside chats' and White House press conferences. A new style of government came into being, supported by radio; television was yet to come.

The New Deal advanced in stages that reflected not an overall vision, but in response to the pressure of events, the main object being to restore confidence and get Americans back to work. The first measures, in 1933, were taken for the economy, to save the banks, restore credit, stimulate farm and industrial production and sustain prices. They ended in January 1934, with a devaluation of the dollar that was supposed to ensure more flexibility in the economy. At the same time, specific actions were undertaken to reduce unemployment, especially through public works, such as the Tennessee Valley project that developed the whole river basin through flood control and electrification. A second set of measures, a prelude to the welfare state, was launched in 1935; it included the creation of social security, paying of pensions to retirees and benefits to the unemployed. A final set of measures was launched in 1938, which attacked the monopolies held to be partly responsible for the malfunctioning of the economy. In fact, it marked the resumption of a policy specific to the Democratic Party, already partly pursued by Wilson.

Did these measures get the Americans out of trouble? The answer is unclear, for two reasons. The recovery was slow, uneven and disappointing. There was progress, but in 1937, the United States had still not recovered its 1929 level, despite the pick-up of industrial production, the recovery of wholesale prices and, an essential indicator, the rise in national income. Yet unemployment was far from over, since there were still 7.5 million people unemployed. And then, suddenly, the recovery ground to a halt, and the economy once again plunged into recession. Although

previously rejected, Keynesian methods of budget deficits, public expenditure for employment and the opening of new public works projects finally saved the day. At the end of 1938, the president could declare: 'We are once again on the right path'. The following year production recovered its 1929 level, but two black spots persisted: unemployment and trade.

The grim face of this period should not be allowed to conceal one of its brighter aspects, which emerged from the explosion of cultural activities. Contrary to Tocqueville's assertion that Americans were not interested by culture, the novelist Sinclair Lewis was awarded the Nobel Prize for literature in 1930, followed by Eugene O'Neill, Pearl Buck, and, later on, Faulkner, Hemingway and Steinbeck. The Harlem Renaissance confirmed the birth of an African American literature, whose big names were Langston Hughes, Arna Bontemps, William E. B. DuBois and many others. At the same time, after its beginnings in New Orleans and Chicago, jazz exploded thanks to such interpreters as Louis Armstrong, Count Basie, and Benny Goodman. Jazz was also incorporated into more classical works like the compositions of George Gershwin, who, inspired by DuBose Heyward's *Porgy*, composed his *Porgy and Bess* for an all Black cast. Another even more striking facet of this uniquely American cultural trend was its popular productions and musicals, which triumphed on Broadway's stages, not to mention the westerns, rodeos, and all-powerful cinema, where a new generation represented by Charles Laughton, Humphrey Bogart, and Katherine Hepburn was making its way, whereas cartoon movies were popularizing Mickey Mouse, Donald Duck and many other well-known characters.

If the New Deal was not an economic success, it certainly stirred up the country. There was violent opposition to Roosevelt, accused in turn of being either fascist or socialist, and criticizing his interventionism. But his charisma ensured him wide popularity among Americans, confirmed by their increasing participation in elections and symbolized by his triumphant re-election in 1936 when he carried every state except Vermont and Maine. Roosevelt was able to galvanize the American people and restore their confidence, even if the results were mediocre. The federal government doubled the number of civil servants, which proved to be an adequate means of fighting unemployment. But it was in the world of labour that the changes were most felt. Farmers' incomes eventually improved, and workers, following official recognition of trade unions, earned the right to collective bargaining; ever after they could negotiate directly with employers. The trade union movement was democratized, opening up to unskilled workers through the new CIO (Congress of Industrial Organizations), which emerged following a split with the more traditionalist AFL (American Federation of Labor).

## FROM ISOLATION TO INTERVENTION

After its decisive intervention alongside the Allies, the United States returned to its traditional isolationism, confirmed by the Senate's rejection of the Treaty of Versailles, the defeat of the Democrats at the 1920 elections and the signing of a separate peace with Germany.

In fact, this was only a surface appearance, since the reality was more complex. The war had effected a shift in the

economic centre of the world from Europe to America, and New York became the nerve centre of business at the expense of Paris and above all London. This totally transformed the world economy, although the main actors were not truly aware of it. At any event, there was no way the United States, given its creditor position, could remain politically indifferent to what was happening across the Atlantic.

The paradox is, however, that Americans were more present in international relations under Republican administrations than under Democratic ones. In order to ensure their preponderance at sea, following the line laid down by Alfred Mahan, they took the initiative of convening a conference in Washington in 1921 to limit naval armaments, which granted them parity with the United Kingdom – ahead of Japan – and with France and Italy in third position, on the basis of quotas of 5, 3 and 1.75. At the same time, a moratorium on the construction of battleships was declared. While they remained outside the Locarno Pact designed to keep the peace, a rapprochement with Europe began in 1928 with the signing of the Pact of Paris or Kellogg-Briand agreement, which reaffirmed the same principles.

But it was above all in economic affairs that the United States made its presence felt given that it was directly concerned by the question of war debts, associated with those of reparations. Faced with Germany's insolvency and the crisis threatening the international balance, it took the initiative in two plans that bear the names of their American promoters: the Dawes Plan, which proposed scheduling payments under the supervision of an Agent General for Reparations (also an American) and, five years later, the Young Plan. Long before the Marshall Plan, the reconstruction of Europe had become a priority on the other side of the Atlantic. But the economic crisis of 1929 put an end to this collaboration, with President Roosevelt rejecting the proposals of the World Economic Conference that met in London in 1933 on the initiative of the League of Nations, to reach an economic understanding among states. Domestic recovery relegated the international situation to the back burner.

This is what gave rise to the dominant impression of withdrawal from the international stage, although isolationism was never total. Thus, after a break of more than ten years, the United States was the last great power to re-establish relations with the USSR, although without any major results. Conversely, relations improved markedly with the countries of the American continent, thanks to settlement of an old dispute with Mexico, the ending of the protectorate over Cuba and regular participation in pan-American conferences. In trade, the rigours of protectionism were tempered by the signing of bilateral agreements based on reciprocity and a most favoured nation clause. But the dominant concern remained that of observing strict neutrality, whether in relation to Japanese initiatives in Manchuria and China, Italian conquest of Ethiopia, the Spanish Civil War or the outrages of Nazism. To each *coup de force* Congress responded by tightening up neutrality, while entry to the country remained obstinately closed to the victims of persecutions.

The defeat of France in 1940 and the loneliness of the United Kingdom led to a gradual abandonment of the policy of neutrality. The United States now deemed itself directly threatened, both in the Pacific by the Japanese, and in the Atlantic by Germany. These events moved Roosevelt to seek a third term as president. Re-elected with 55 per cent of the votes – fewer than in 1936 (60 per cent), although very comfortably (he carried 38 states and retained the majority in Congress) – he took advantage of this honeymoon period to begin the country's rearmament and support the United Kingdom. Going against a public opinion still hostile to any intervention, he seized the initiative to lead it and impose his views on Congress by measures such as lend-lease. Not hesitating to portray himself as the defender of the free world, he proclaimed the 'Four Freedoms' that were fundamental in a democratic society, and, in the Atlantic Charter, sketched the outlines of the future world.

But it was the surprise attack on Pearl Harbor on 7 December 1941, destroying much of the American fleet and air force, which provoked immediate entry into the war against both Japan and Germany. Traumatized by this blow, opinion rallied behind its president in an outpouring of patriotism and holy union for victory.

## FROM DEFEATS TO VICTORIES

In the six months that followed, the Japanese exploited the surprise effect to the hilt, driving the Americans out of their forward positions in the Pacific, Guam, Wake and the Philippines. After also driving the British, Dutch and French from their colonial positions, they had become the masters of the situation. Despite these initial defeats, the United States, now the lynchpin of the coalition, reorganized itself and prepared to reclaim Allied supremacy by driving the Japanese out.

### A country at war

The country's economy was very efficiently mobilized, following guidelines set out by Roosevelt: 'We must be the great arsenal of democracy … Manufacturers of watches, farm implements, linotypes, cash registers, automobiles, sewing machines, lawn mowers and locomotives are now making fuses, bomb packing crates, telescope mounts, shells, pistols and tanks.' The targets set were ambitious: 125,000 planes, 75,000 tanks, 10 million deadweight tons of shipping by 1943. The production effort was enormous: new factories emerged from the ground in a few weeks and naval shipyards were opened on both coasts, to meet the needs of all the Allies – the British as well as the Soviets.

Two original creations symbolize this reconversion and help explain its ultimate success; the key lay in innovation and standardization. The naval shipyards produced a single type of transport vessel, the 'Liberty ship', constructed out of prefabricated elements assembled by welding, and not soldering, by teams often composed of women only. Initially, assembling them took six months, but by the end of the war it was being done in two weeks. In this way 56 million deadweight tons of ocean transport were built in five years. In the car industry, partly converted to aircraft construction, a new all-purpose vehicle called the 'jeep' was designed to meet all uses, and became the norm. Thanks to the impetus given by the War Production Board (WPB) and despite bottlenecks (the most serious of which involved replacing rubber from Malaya by rubber from Brazil), overall the targets were met, whether for tanks, airplanes or weapons.

Under this War Production Board, which operated until the end of 1945, aided by a large number of agencies, production was organized bureaucratically, using the Great War precedent. A large number of federal agents were recruited to manage the effort; their numbers increased from 1 to 3.3 million in three years. These agencies were responsible for carrying out programmes and controlling prices – to avoid any slippage, illicit profits or illegal deals, as well as to ensure there was no discrimination based on sex or race.

The social implications of this economic mobilization were considerable. The number of wage earners rose from 32 to 41.5 million, 17 million of whom were unskilled labourers, an increase of 30 per cent. Women played a prominent role in this labour force, accounting for 15 million jobs, many of which were previously reserved for men, but also taking their place in new jobs in the tertiary sector. Thus, by 1943, unemployment had completely disappeared to be replaced by a labour shortage, which encouraged the advancement of African American and Hispanic minorities.

Even more than during the First World War, African Americans flocked to the urban industrial areas and California. They often met with resistance and even violence, were offered jobs at lower wages and above all were exploited by slumlords, despite Executive Order 8802 of 1941 that proclaimed: 'There shall be no discrimination in the employment of workers in defence industries or government because of race, creed, colour, or national origin'. The number of African American workers doubled in industry, especially in iron and steel, where they held a third of the jobs, and in shipbuilding on the Pacific coast. Their growing presence in businesses as well as in the public sector created palpable tensions, sometimes leading to riots, as in Detroit, Mobile and Harlem in 1943. It was the same with Chicanos (Mexican Americans) in Los Angeles, where they were involved in clashes with Whites. However, despite this unrest, the participation of ethnic minorities in the war effort had a decisive effect on the transformation of American society.

Other minorities also had their victims. Whereas neither German Americans nor Italian Americans were hassled, Pearl Harbor triggered real hysteria against first (*Isei*) and second (*Nisei*) generation Japanese settled in California, where they were regarded as a threat to public security. Over a hundred thousand of them who lived in the Pacific states were arrested in June 1942 and interned in improvised camps in remote areas of northern California and Wyoming, where nothing had been prepared to receive them. When they were finally allowed to return home, after the end of the war, they often found their property confiscated. It took several decades of litigation for them to win compensation for the injury done to them.

## Strategy and tactics

Military mobilization relied on conscription, instituted even before the beginning of the war for all men aged 18–35, and later extended to 38. Yet once mobilized, African Americans were not treated as full citizens, as strict segregation continued to be enforced in all three arms, particularly in the navy. Of the 20 million Americans liable to be called up, some 15 million were actually enlisted, two-thirds of them

in the army. Of the two hundred divisions originally planned, only 70 were actually constituted. After quick training in camps, most of which were located in the South, which perpetuated the military tradition of the Civil War, they were sent to the various theatres of operation. Special efforts were made to train shock troops such as marines, parachutists and green berets. The American army stood out for the scale of its support services, which absorbed as many men and women as the fighting units.

Strategically, everything had to start from scratch. A unified high command, the Joint Chiefs of Staff, had been constituted in 1939 under General George Marshall. Even before entry into the war, plans had been drawn up. Following the attack on Pearl Harbor, a choice had to be made. As it was going to be necessary to fight on two fronts, three questions arose: Which front should be given priority? How could lines of communication between America and distant theatres be ensured? Should frontal or peripheral offensives be launched? All these questions were discussed at the highest level, in the presence of President Roosevelt as Commander-in-Chief. First there were conferences with the British and Canadians (Argentina in 1941, Arcadia in 1942, Trident and Quadrant in 1943, Quebec in 1944), then with all the Allies, including the Soviets (Tehran in 1943, Yalta in 1945). In addition to strategic choices, these conferences also dealt with political aims. Thus two fateful decisions with important consequences were taken: at Casablanca, in 1943, to impose unconditional surrender on the enemy and, at Yalta, that the USSR should enter into the war against Japan.

The strategic options gave rise to sharp confrontations, which can be traced to differing conceptions among the participants. From the beginning, despite pressure from General Douglas MacArthur, commander of land forces in the Pacific, priority was given to the liberation of Europe, at the expense of the territories conquered by the Japanese. The strategy was bound to be different between Japan and Europe. With regard to the former, the views of the army (MacArthur), whose priority was the reconquest of the Philippines, clashed with those of the navy (Admiral Nimitz), who pushed for reoccupation of the archipelagos by combined operations using 'island hopping' tactics. A compromise was agreed which left Nimitz responsible in the central Pacific, and MacArthur in the southern Pacific. In this sector, the Americans had the advantage of being in sole charge of operations, although this did not eliminate the difficulties arising from both the dogged determination of the Japanese and the harshness of the tropical climate. They regained the upper hand in the central Pacific with the battle of Midway, in June 1942, and, in the south, with the battle of the Coral Sea. Despite these initial successes, the reconquest was exceedingly slow, partly because the high command had thought it could count on cooperation with China, which would have been an excellent springboard for attacks on Japan. This hope never came to anything, because of corruption in the Chinese Government and the civil war ravaging the country. After two years of merciless fighting, the Americans had only reached the outposts of the Japanese archipelago. MacArthur had landed in the Philippines in 1944, after the naval victory at Leyte, but met with fierce resistance there, which was also the case in the Bonin archipelago, where Iwo Jima became the symbol of Japanese determination in the face of American heroism.

In Europe, seen as the priority area, the situation was totally different, since there were the British and Soviets to deal with. Aiming to ensure their lines of communication with the Allies, the Americans remained faithful to their strategy of establishing secure naval bases in the Caribbean, Newfoundland, Iceland and Greenland. The strategic choices related to the opening of a second front, repeatedly called for by the Soviets at the Tehran conference, but the nature, date and location of this remained to be decided. Faced with the might of the German army, a massive attack would be required; this called for both a considerable strike force and the availability of rear areas where the force could be prepared, close to the sites of the future landings. The Canadians' raid on Dieppe in 1942 had revealed the hazards of such an adventure, and in spite of the repeated pressure from the Soviets, the Americans were not ready to venture on before a long preparation period backed by adequate equipment. On this point, they disagreed with the British, who advocated a peripheral strategy that called for attacking Europe's 'soft underbelly' – the Balkans, and then central Europe. In the end, they decided to proceed in successive stages, with, in 1942, Operation Torch in North Africa, and then in 1943 Husky in Sicily and Avalanche in Italy. The twin attacks in 1944 in Normandy (Overlord) and Provence (Anvil) were a success in terms of combined operations, but a strategic failure, in that the German army was able to escape the pincer movement and regroup to launch an attack in mid-winter in the Ardennes that stopped the American advance in its tracks (Battle of the Bulge).

Victory was already in sight when the last conference attended by President Roosevelt met in Yalta to sketch the future outlines of Europe and coordinate the effort against Japan. Concessions were made to Stalin in the Far East in order to gain Soviet support against Japan. Stalin promised secretly to enter the war against Japan within three months of the unconditional surrender of Germany. The United States was in a weak position at the conference, with the Soviets occupying much of the continent and an ailing and exhausted Roosevelt unable to put up much resistance to Stalin's demands on the western borders of the USSR and its advance into central Europe. Yalta signified recognition by the Western Allies of a de facto situation, in which the Soviet army was present in the heart of the continent. Whether they liked it or not, the Americans could only be grateful for Stalin's willingness to help them fight Japan. A few weeks later, Roosevelt died without being able to witness Germany's surrender on 8 May 1945.

**The atomic weapon**

As the war continued in the Pacific, the last bastions of the Japanese defence crumbled one by one. In April 1945, the Americans landed on Okinawa, the closest point to the archipelago, without however being in a position to attack it. The anticipated delay of a year between the surrender of Germany and that of Japan threatened to involve heavy human losses, as the recent past demonstrated. Should the end of hostilities be hastened? The explosion of an atomic bomb on 16 July at Alamogordo in the New Mexican desert showed that the United States possessed the absolute weapon; but should it be used? On 6 August, the *Enola Gay* dropped an atomic bomb on Hiroshima, causing tens of

thousands of civilian casualties, and three days later the city of Nagasaki suffered the same fate.

The dropping of the atomic bomb marked the culmination of a project which went back to 1939 when Einstein, a refugee in the United States, drew Roosevelt's attention to the new prospects opened up by manipulation of the atom: 'This new phenomenon would also lead to the construction of bombs of an extremely powerful type'. Roosevelt was interested in this project, and appointed a committee in late 1939, which was the origin of the top secret project code-named Manhattan and launched two years later. Anti-Semitism and other events in Europe had brought many of the world's best physicists to America, including the Dane Niels Bohr, the Italian Enrico Fermi, the British Leo Szilard and the Hungarian Edward Teller. The first bombardment of an atomic nucleus was achieved in 1941, in a laboratory at the University of Chicago, following by experiments entrusted to three test centres under federal responsibility – Oak Ridge in Tennessee, Hanford in Washington and Los Alamos in New Mexico – where the bomb was designed under the leadership of Robert Oppenheimer. The small circle of those in on the secret that the United States might be overtaken by Germany, pushed for completion of the project; President Truman, who assumed office when Roosevelt died, was not informed until the Potsdam conference in July 1945.

He took full responsibility for this crucial decision, however, which forced the Japanese Government to surrender immediately after the Nagasaki bombing. On 15 August 1945, the war ended in the Pacific.

Nevertheless, once the euphoria of victory had passed, the use of the atomic bomb raised many questions, both moral and tactical. Was it legitimate to use such a terrifying weapon to compel an enemy to yield, even one that was determined, but still close to defeat? Should not a warning have been given first, as civilians associated with the project had suggested? The justification was that Japan was not ready to give in by ordinary means and the fighting would have gone on for a long time. In the atmosphere prevailing at the time, the Allies were anxious to end as quickly as possible a conflict that had already lasted for almost six years and had been as lethal for civilians as for the military. Morally, use of the atomic weapon was objectively highly questionable, but for people at the time, it put an end to a nightmare, even while portending that there might be another. Some have suggested that the Americans had other motives on the eve of the USSR's entry into the war against Japan, hypothesizing that the bomb also served as a warning to its great rival. That reasoning would attribute to President Truman a Machiavellianism that his behaviour belied. A more plausible explanation is the accumulated hatred built up among Americans since the 'Day of Infamy' when Pearl Harbor was bombed in a sneak attack and the harshness of the war in the Pacific. It remains that possession of the atomic weapon undeniably ensured military superiority and thus the political supremacy of the United States in a world that was entering the era of the *pax Americana*.

## THE RISE OF CANADA

When a book that had originally appeared in 1906 with the title *Le Canada, les deux races* was reissued in 1947, the author, sociologist André Siegfried, gave it a new title: *Le*

*Canada, puissance internationale.* This change highlighted Canada's arrival on the international stage. Like the United States, it was a newcomer in the concert of nations, but this came at the end of a long process. Canada had moved from being a dominion of the British Empire to being a member of the Commonwealth, from a semi-colonial stage to independence in successive steps accelerated by its active participation in the two world wars.

The similarity with the United States goes farther than that. Like the United States, its formation was the result of successive waves of immigration from Europe, quadrupling its population over the course of the twentieth century. But it differed in the process of settlement and the origins of its founders.

The settlement of Canada was linear, with the inhabited part no more than a narrow strip stretching along the 49th parallel from ocean to ocean, leaving the remaining territory, the second largest in the world by area, practically empty. Unlike the United States, Canada did not experience any 'frontier', and this feature was confirmed in the twentieth century.

Rather, the origin of its founders, French in Lower Canada (the valley of the St Lawrence and Quebec), and British in Upper Canada (Ontario), imposed the coexistence of two cultures living side my side in mutual ignorance. Far from disappearing, this duality was kept alive by nationalist currents that made Canada a composite state of sharply differentiated regional groupings: the Maritimes, Quebec and Ontario (the 'cradles' of Confederation), the Prairies, the Western Provinces, plus the sub-Arctic territories occupied by the First Nations (Indians and Inuit). Communications between them remained difficult, especially given the distances.

Unity among these highly diverse groupings was ensured by a unique political regime of Confederation. Each of the nine Provinces (later ten following the accession of Newfoundland in 1949) had its own government, with its parliament and its prime minister, according to British tradition, and a governor representing the monarchy. In Ottawa, capital of the Confederation, there was an analogous structure: a governor-general, who appointed the prime minister, responsible to a two-chamber parliament (elected House of Commons, appointed Senate). The constitution still in force was the British North America Act of 1867, under the sole responsibility of Britain's parliament.

## Canada and the world

Canada's entry into the international community was facilitated and accelerated by its role in the two world wars, in which it participated directly, making a considerable human contribution, given a population of only 8 million inhabitants. In 1914, 600,000 men were mobilized, 420,000 of whom saw service overseas, in particular on the French front, on the Somme and in Artois. Twenty-five years later, out of a population of 12 million, one million men and women served in the armed forces and fought in both Europe and Asia. Canadians carried out the bloody Dieppe raid in 1942, which acted as a dry run for the Normandy landings two years later, and played an effective role in the battle of Normandy and the liberation of France and the Low

Countries. In addition, during the Second World War, Canada was transformed into a rear base for both the United States and Britain, producing canons, tanks, aeroplanes and other war materiel and serving as a training base for all the British air units. The conflicts hastened the country's transformation from being a supplier of agricultural staples and raw materials to being a producer of industrial equipment, and precipitated the transformation of society through a massive resort to employing women in war factories. Women won the right to vote in 1920, except in Quebec, where they had to await the end of the Second World War.

The immediate consequence was the entry of Canada into the club of Great Powers. During the First World War, Canadians had fought under British command before securing an autonomous brigade, but in the Second they had their own units in every arm. In 1919, Canada sent its own delegation to the peace conference and occupied a seat at the League of Nations and in the International Labour Office. It was the first step on the path to sovereignty that was completed with the opening of the first foreign legations: even before the establishment of a ministry of external affairs, which only came about in 1946, a legation was opened in Washington in 1920, with others following in Paris and Tokyo. This independence was made official by the Statute of Westminster in 1931, but the British sovereign continued to be represented in Ottawa by the governor-general, who was himself always of British nationality until 1952, when the Canadian Vincent Massey opened the way to the Canadianization of this post, which had in fact become increasingly honorific. A new stage of sovereignty was reached in 1949 with the creation of a Canadian nationality as distinct from British nationality, and the adoption in 1964 of the maple leaf flag in place of the Union Jack. In half a century, Canadians, while remaining loyal members of the Commonwealth, had successfully acquired all the attributes of sovereignty, except for control of their constitution.

## Political life

Political institutions were based on a two-party system, with Conservatives and Liberals alternating in power. The latter, under the leadership of Wilfrid Laurier, the first French-speaking prime minister, held power for almost twenty years early in the century. The dividing-line between these two parties was shifting, since they lacked ideology and had no set territorial base, although Ontario tended to be more conservative. The Liberals were more inclined to reforms, more distanced from the metropolitan power and advocates of free trade, which would draw them closer to their neighbour to the south. But Laurier's moves in this direction ultimately failed, following the Conservatives' refusal to weaken traditional links with the mother country. Following the First World War, a long Liberal period began, dominated by the personality of Louis Mackenzie King, who was prime minister for over twenty years, with an unbroken stretch between 1935 and 1948.

The two-party system was challenged by the sudden emergence on the political stage of the Western provinces: getting no response to their specific aspirations from the two main parties, they manifested their difference by creating regional parties. Farmers in the West were being

hit by the high cost of transporting their agricultural produce to Montreal and Toronto. To counter the omnipotence of the railway companies, they set up cooperatives and unions whose demands were taken up by a Progressive Party, which, in 1921, upset the traditional balance by winning a large number of seats in the Ottawa parliament. From then on regional third parties were a constant feature of Canadian political life. The short-lived Progressives were followed by the CCF (Cooperative Commonwealth Federation), rooted in the Prairies, which portrayed itself as the defender of farmers and workers and called for greater state intervention in the management of the economy and social matters. It was a socialist party, without actually calling itself such, and inaugurated a social-democratic trend that was present in political life right through the century. Conversely, the Social Credit Party, founded in Alberta by an evangelist who was a past master at media manipulation, the Reverend William Aberhart, skilfully mixed evangelism and populism to denounce the financiers and capitalists in the East and call for a 'social credit' that would enable all to enjoy a life of ease. Such language could not fail to please and ensure the success of the Social Credit Party in Alberta and British Columbia, although its short-lived rise was associated with the Great Depression. In this way, the provinces in the West and the Prairies now made their mark on political life.

Canadian society was heavily dependent on the economic situation. Following the First World War, a decade of genuine prosperity opened, marked by a resumption of immigration (over a million arrivals), the return of investors, rising agricultural production in the Prairies, high levels of exports and a general improvement in the population's standard of living. As war had exhausted Britain, Canada turned increasingly to its neighbour to the south, which became the new source of investment, attracted less by the public utilities than by the extraction and processing of raw materials, like the manufacture of paper pulp (Canada is the main supplier of newsprint to the American press), or engineering (the suburbs of Toronto became an annex for the car-makers of Detroit). In the background of this industrialization began exploitation of the vast hydroelectric potential that lay in Canada's natural abundance of water. This development accentuated the contrast between the agricultural provinces in the West and the now industrialized ones in the Centre. Thus, in 1928, the two provinces of Ontario and Quebec alone were responsible for more than three-quarters of industrial production. In terms of trade, dependence on the United States grew steadily at the expense of Britain.

## The Depression

This state of affairs plunged Canada into the gravest crisis it had ever suffered: the 1930s were years of recession, destitution and an explosion of poverty. As an exporter of raw materials (cereals, lumber, metals) and semi-processed products (paper pulp), Canada was a victim of the fall in world prices and the collapse of international trade, which primarily affected wheat and meat producers in the Prairies. After borrowing to equip themselves, farmers saw their incomes fall, leaving them only one way out – to abandon their farms, and perhaps go further west, in the hope of finding work: Canada too had its 'Okies'. As the United States stopped its purchases, it was industry's turn to be affected by the build-up of stocks, devalued and unsaleable, and then the turn of Quebec, Ontario and British Columbia to be hit. The sharp fall in living standards wiped out the gains of the previous period and favoured the successes of third parties, which enjoyed their best years. But the provinces were too poor to react, and the federal government remained impotent and powerless to deal with this depression. The few conventional emergency measures that were adopted, like restricting immigration, raising customs duties, establishing imperial preference within the Commonwealth or setting up work camps, were totally inadequate. A 'little New Deal', directly inspired by Roosevelt's, was launched by the Conservative government of Richard B. Bennett, who resigned himself to intervention through such measures as creation of the Bank of Canada; but some were held unconstitutional by the Privy Council in London and were immediately annulled.

The Great Depression laid bare the weaknesses of the Canadian economy because it was over-dependent on the outside world, but it also showed up the impotence of the federal government. In 1937, the Liberal prime minister Mackenzie King returned to power and, very conscious of its weakness, set up a Royal Commission, known as the Rowell-Sirois Commission (from the names of its chairmen), to draw up proposals to make institutions work more efficiently. For this first revision of the constitution since the 1867 Act, the response, delivered in 1940, was clear: some of the powers held by the provinces in social, economic and fiscal affairs must be transferred to the government in Ottawa, which in particular must be given the right to raise direct taxes, in exchange for compensatory payments. Despite opposition from some provinces (including Quebec) to this transfer of powers, centralization was stepped up and a form of federalism came to dominate political life.

## War and the aftermath

This reorientation coincided with the entry of Canada into the world conflict, which led to profound changes in the country. The needs of war put the whole apparatus of production back to work through its modernization, so that Canada entered the small group of world industrial powers. Full employment, including women, and the accumulation of forced savings, consequent upon the limitation of consumption through rationing, which was reinstated as soon as peace returned, improved the everyday life of Canadians. The Prairies recovered their prosperity through food exports to Europe. Canada's loans to the mother country meant that the Dominion moved from being a debtor to being a creditor nation. Finally, with its Big Neighbour to the south, the conflict sealed a strategic, diplomatic and even scientific collaboration that, among other things, enabled Canada to participate actively in Allied nuclear research.

At the same time, the country embarked deliberately on the creation of a welfare state. This involved the introduction of unemployment insurance, along with family allowances, the beginnings of a bold social policy, added to a system of medical cover and retirement pensions. In this area, Canada, unlike the United States, became one of the most advanced countries in the world. The consequence was the appearance, in both the capital and the provinces, of a predominantly

English-speaking bureaucracy, which played an increasingly important role in the Confederation.

Despite the financial compensation that the provinces now enjoyed, this turn of events was far from being universally well received, especially in Quebec, ever fiercely insistent on its autonomy. Added to these discontents was the old demon of conscription. Although the Canadian Government had committed itself in 1939 not to resort to it – so as not to awaken the dormant nationalism that had burst out in earlier conflicts – the unexpected length of the conflict and the scale of losses forced it to shift its policy. In 1942, following a procedure exceptional in this democratic country, a plebiscite was organized around the principle of conscription. While accepted by two-thirds of Canadians, it was rejected by 71 per cent of Quebeckers (85 per cent of French-speakers). The conscription took a long time to organize and in fact no conscript ever served overseas, but the case showed clearly that far from making it disappear, the war had further accentuated the cleavage between English-speakers and French-speakers, and this cleavage weighed heavily on the country's future

Post-war prosperity enabled Canada to take advantage of the position it had acquired during the hostilities. From being a mere member of the Commonwealth, it became a middle-ranking power, stimulated by the increase in its population, its proximity to the United States and the policy of the federal government.

The growth in population was striking, rising from 11.5 million in 1941 to 17.8 million twenty years later, a rise of almost 50 per cent, unprecedented in Canada. It was a result both of immigration and the baby boom. After years of restrictions and refusal to accept immigrants, including the victims of European dictatorships, immigration reached levels unseen since the early twentieth century, with over 100,000 arrivals a year in the late 1950s, and a total of 2 million between 1946 and 1960. A first wave, made up mostly of Britons, was followed by a flood of Germans, Greeks, Slavs and Italians. Meanwhile, the baby boom ensured that the population was getting younger and opened the way for a new generation that would stimulate economic and cultural activity.

Industry, now oriented towards civilian activities, endeavoured to satisfy the boom in consumer demand. Full employment was practically assured, the standard of living and expectations were rising, and households were buying cars, household appliances and television sets, following the American model. Urbanization also accelerated. Despite the prosperity of the agricultural market, rationalization and mechanization of farms led to a reduction of the rural population, which found itself alongside the immigrants in towns that were ever more populous and spread out. In the twenty years following the war, the proportion of the population that was urban rose from 56 to 76 per cent and, in 1961, the rural labour force accounted for only 10 per cent of those employed. The Montreal agglomeration passed the 2 million mark, but it was now closely followed by that of Toronto. The suburbs were much like those of the United States, with their bungalows, their gardens, and, before long, their swimming pools and their boredom. The city centres mirrored the continent with its characteristic division into ethnic districts, each with its own places of worship, schools, shops and signs in Italian, Yiddish, Greek, or Armenian. Communitarianism made its appearance in all the big cities, with its counterpart of multiculturalism.

This shift affected the various provinces unevenly. Immigrants favoured dynamic, English-speaking areas like Ontario, the most industrialized province, which was their first choice along with British Columbia, which benefited from its opening on the Pacific and an outstanding environment. Alberta, hitherto rather left out, took off rapidly following the discovery of oil in 1947. Meanwhile, the Maritimes lost their strategic and commercial advantages once fuel oil replaced coal: Halifax was abandoned as a staging point, and fishing began its slow decline.

As to Quebec, it was in its period of 'great darkness' (*grande noirceur*), under the sway of the Union Nationale government of Maurice Duplessis, a mixture of conservatism, wheeling and dealing, patronage and corruption. It favoured American investors over British ones, but it also retained its stranglehold, relying on a Catholic clergy that was still powerful, wealthy and omnipresent, especially in education, where it had an absolute monopoly. Montreal was still the biggest city in Canada in terms of population and as an economic centre, one where an English-speaking minority dominated the world of business. But it is possible to detect signs of the changes that were about to occur. Thus, the strike launched in 1949 by Christian (Catholic) trade unionists in the asbestos mines ended in victory for the strikers, backed by journalists, public opinion and even part of the clergy in the wake of the archbishop of Montreal. In contrast to traditional nationalism, intellectual trends were emerging that found an outlet in reviews such as *Cité Libre*, whose contributors openly criticized the sclerosis of power, the clergy's opposition to change and the conservatism of society, and called for Quebec to be opened up to the outside world.

For its part, the federal government embarked on new social programmes that consolidated the welfare state. Ottawa intervened in areas previously reserved for the provinces, enhancing its tax-raising capacities, making grants to universities and launching the great Trans-Canada highway that stretched more than 3,000 miles from Newfoundland to Victoria, B. C. This strengthening of central power was increasingly at the centre of constitutional debates.

Finally, Canada increased its presence on the international stage, participating in 1949 in the creation of NATO, which offered it the advantage of maintaining its links with the former mother-country, while moving closer to the United States. On this basis, Canadian troops were stationed in Germany. It played a much-appreciated role at the United Nations in several peacekeeping operations, in Palestine, on the Indo-Pakistan border and in Korea. Using their position as a former colony, devoid of all territorial ambition, Canadians provided contingents of Blue Helmets, which were generally well received. Above all, Canadian diplomacy took the initiative of mediating in the conflict over the Suez Canal in 1956, helping both the British and French to gain an honourable way out. Canada had become one of the Great Powers in the world.

## PAX AMERICANA OR COLD WAR?

Victory in 1945 gave the United States a dominant position in the post-war world and, contrary to what happened in 1918, it equipped itself with adequate instruments. The broad outlines of this world were worked out in conferences

held between 1940 and 1945, from the Atlantic Charter to the Potsdam talks, and owed much to the ideas of their chief inspiration, Franklin Delano Roosevelt. The main thrust was to avoid the mistakes of the inter-war period, and commit the country boldly to peacekeeping alongside its allies, which explains, given the weakness of Europe, the upheavals in Asia and the implosion of the colonial empires, the role that external relations played in American life from this time onwards. In 150 years the United States had become a world power, facing a single rival, the USSR.

In the logic of unconditional surrender by Germany and Japan, no peace conference followed the end of hostilities: the Americans occupied Germany with the Allies; both countries were deprived of their own governments and subjected to military rule. This was an unprecedented situation, demanded by the Americans not only to ensure peace but also to establish democracy in the defeated countries. This occupation became a permanent feature in the second half of the century, ensuring bases for the victor on every continent.

### The foundations of power

The *pax Americana* rested on two pillars; one was political, based on the United Nations and its specialized agencies, the other was economic and included such institutions as the International Monetary Fund (IMF) and the World Bank.

The idea of correcting the weaknesses of the League of Nations by replacing it with an international organization like the United Nations, appeared in the Atlantic Charter and took its final form in August 1944, at the conferences at Dumbarton Oaks and, following Roosevelt's death, San Francisco. In between, the idea had been approved by the Big Three at Yalta. The UN's structure and distribution of powers reflects the influence of the American Constitution, with an executive represented by the Security Council (11 members, five of them permanent, the United States, the USSR, the United Kingdom, China and France), a legislature in the shape of a general assembly where representatives of all the member states sit, and a judiciary in the form of the International Court of Justice. It was symbolic of the new international order that New York was made the permanent home of the United Nations Secretariat.

It also fell to the United States to prevent the return of the economic disorder of the inter-war period. The international conference at Bretton Woods (July 1944) decided to set up an international monetary system, based in fact on the dollar, which replaced both the gold standard and the gold specie standard. This choice amounted to acknowledging the economic supremacy of the United States, the main holder of gold in the world. To promote monetary stability, the International Monetary Fund and its right arm, the World Bank, were established, both with their headquarters in Washington, in the capital of their main 'shareholder', the United States. At the same time the foundations of an international trade organization were laid to promote the gradual liberalization of trade, with GATT (General Agreement on Tariffs and Trade) and its 'rounds' (Dillon Round, Kennedy Round, Tokyo Round, Uruguay Round, etc.). GATT has now been succeeded by the WTO (World Trade Organization).

For the time being, people were preoccupied by the perils of a reconversion that proved to be more difficult than the one that had followed the Great War. Over 12 million GIs (for 'General Issue') had to be reintegrated into civilian life, all of whom wanted to get home as soon as possible. Things had been changing: thanks to full employment, savings had accumulated out of money that could not be spent because of rationing and strict measures in support of the war effort, whereas now, with the return of peace, demand was expanding and stimulating the economy. Finally, in 1944, a significant gesture had transformed the Office of War Production into the Office of Mobilization and Reconversion. And above all, in the eyes of its leaders, possession of the atomic bomb ensured such a degree of security that it made possible a speedy return to normal life.

### Towards peace

Demobilization was hastened by the fact that mutinies had broken out in Germany and the Philippines. Within a year, the overall armed forces fell from 14.5 to 1.7 million, and, in the army alone, from 8 to 1 million. Return to civilian life was assisted by long-term generous initiatives such as the GI Bill of Rights in 1944, which enabled veterans to study at university and obtain loans to purchase a house or farm. Tens of thousands of veterans were thus able to enter higher education and contribute to the democratization of society.

Economic reconversion was based both on needs and demands that had been put on the back burner during the war. The end of price and wage controls triggered a race between the immediate raising of the former and the rather slower raising of the latter, with waves of strikes in sectors such as oil, motor car manufacture, steel and mining. The effects of the New Deal's social policies were reflected in unprecedented levels of unionization, the number of trade unionists having risen by 65 per cent during the war. Taking advantage of the economic situation, labour organizer Walter Reuther unleashed his United Automobile Workers into the fray, followed by John Lewis and his miners, who stopped work for two months, and finally by railway workers who in the end gave way to the threat of a federal take-over. This violent social explosion upset public opinion, which reacted by sending a Republican majority to Congress in 1946, by adopting drastic measures to put an end to a situation deemed intolerable, and by regulating the right to strike and banning common practices such as the closed shop. Some saw this as an attack on the welfare state.

Meanwhile President Truman openly proclaimed himself faithful to the tradition of his predecessor, by launching his own reform programme called the Fair Deal, which he summed up in these words: 'Every segment of our population and every individual has a right to expect from our government a fair deal'. A minor, although the most promising, aspect of this policy was a new attitude towards minorities, African Americans in particular. A Committee on Civil Rights, appointed by the president, drew up a report entitled 'To secure these rights', which, without going so far as to make concrete proposals, recommended greater protection of individuals by eliminating racial discrimination.

On 26 July 1948 the president took advantage of these recommendations to issue Executive Order 9981, marking an unexpected switch in racial policy by putting an end to segregation in the armed forces. Despite General Bradley's warning that 'The Army is not out to make any social reforms. The Army will not put men of different races in the same companies. It will change that policy when the nation as a whole changes it', only the Marines resisted. In the end, amalgamation was gradually achieved, facilitated by the integration of combat units and operations in Korea, a historic 'first' for the United States.

### Beginnings of the Cold War

However, post-war feelings of victory were quickly undermined by the fear aroused by the USSR's intransigence. As early as 1946, Churchill had sounded the alarm in his Fulton speech, declaring that an 'iron curtain' had come down across Europe. The Americans watched powerless as the Soviets strengthened their grip on the states of eastern Europe, the last to fall being Czechoslovakia in 1948, while in China, despite their diligent effort, they had no choice but to accept the downfall of the government of Chiang Kai Shek in the face of the successes of the communist Mao Zedong Americans were obsessed by the communist peril.

These external events weighed heavily on the domestic situation. Faced with Soviet expansionism, a great debate raged among the leaders. Progressives, whose spokesman was the former vice-president, Henry Wallace, stressed maintaining relations of trust by seeking an agreement with the USSR at any price. Conservatives advocated *roll-back*, resorting to force, which was bound to heighten tensions in a context that was not very favourable to the United States, but to resort to atomic weapons. Realists advocated containment, according to the line set out by George Kennan in an article in the semi-official journal of *Foreign Affairs* in 1947. This was the path Truman chose: 'I believe it must be the policy of the United States to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressures.' This line, a permanent feature during the Cold War, was followed in both economic and political matters.

Faced with the wretchedness of a Europe under continuous Soviet pressure and the slowness of its reconstruction, the Americans decided to offer direct help. In a still-famous speech delivered at Harvard University's Commencement in 1947, secretary of state George Marshall declared: 'It is logical that the United States should do whatever it is able to do to assist in the return of normal economic health in the world, without which there can be no political stability and no assured peace. Our policy is directed not against any country or doctrine but against hunger, poverty, desperation and chaos. Its purpose should be the revival of a working economy in the world so as to permit the emergence of political and social conditions in which free institutions can exist'. The appeal was addressed to all European states without exception; however, when rejection by the USSR led immediately to rejection by all its satellites, the Marshall Plan was limited to Western Europe alone. This plan, comprising both gifts and loans, also included political clauses and the commitment by the sixteen participating countries to work towards their union.

A defensive agreement among five Western states (Britain, France, Belgium, the Netherlands and Luxembourg) followed in 1948. On the initiative of the United States, this agreement was extended the following year by the North Atlantic Treaty signed in Washington between the five and seven other nations (Italy, Norway, Denmark, Iceland, Portugal, Canada and the United States) creating a defence community, NATO (North Atlantic Treaty Organization), with both a political and a diplomatic structure. The door remained open to other members, such as Germany or Spain. The New World was coming to the help of the Old, as also became apparent in America's preponderant role in mounting with the British Government a 321-day airlift to sustain the people of Berlin when they were cut off from the outside world by Soviet blockade.

Defence and security were henceforth at the heart of the political process. Defence was concentrated in a single secretariat, the Pentagon, which brought together under a single authority the permanent high command of the Joint Chiefs of Staff and all the armed forces. A National Security Council (NSC) was set up within the executive branch, assisted by an external intelligence service, the Central Intelligence Agency (CIA). However, the explosion of the first Soviet bomb in 1949 put an end to the illusion of security, and oriented research, spurred on by the physicist Edward Teller, towards the making of an even more powerful bomb, the hydrogen bomb, which was first tested in 1952.

Even possession of atomic weapons did not guarantee the maintenance of peace. On 23 June 1950, troops of the Democratic People's Republic of Korea invaded their southern neighbour. The Americans reacted rapidly, and, even before the UN intervened, entrusted General MacArthur with command of the troops. This aggression heated up the Cold War and the struggle against communism. Following the switch of China into the Soviet sphere, South Korea was regarded as an essential link, one of the dominos destined to contain the advance of Bolshevism into Southeast Asia.

In fact, the Korean War was a longer and more painful experience than foreseen, marked by unexpected twists and turns: a confused retreat at the beginning, followed by a landing and reconquest, and then an offensive that carried the allied troops to the border with China, before a general fallback to a front which became stabilized for two years south of the 38th parallel. The Korean War came at a time when Americans thought peace assured and the impact on them was all the greater because the losses were heavy (33,000 dead, 100,000 wounded). It also brought down the Democratic administration in the 1952 presidential elections, which paved the way for the Republicans, who were united around the prestigious figure of General Dwight D. Eisenhower, the Supreme Commander of the Allied Expeditionary Forces during the Second World War and architect of the D-Day landings. One of his first moves was to conclude an armistice, which actually took things back to where they had started, since the *status quo* endorsed the partition of Korea into two separate states.

A war for nothing, and in any event an immense disappointment because, despite their military superiority, the Americans had been unable to win. One consequence was a build-up of armaments; there were also agreements drawn up for the establishment of bases in the Mediterranean and the Middle East, as well as for admitting Spain, Germany and Turkey into NATO.

## McCarthyism

But the most worrying effects were internal with the renewal of the 'witch-hunt'. It had all begun in 1947, with the introduction of a 'loyalty oath' for federal officials whose purpose was to exclude everyone suspected of links with so-called subversive organizations. While the purge was very limited, a suspicion persisted that saw agents of the Cominform infiltrated into government departments, the media, trade unions and universities. To what extent had Americans betrayed secrets? Who and where were the guilty ones?

The first targets were progressive filmmakers and producers in Hollywood. Many, like Charlie Chaplin, Joseph Losey and Jules Dassin chose to leave the country. Another favourite target was the State Department, suspected of harbouring or having harboured Bolshevik sympathizers. One of the most brilliant New Dealers, Alger Hiss, who had accompanied Roosevelt to Yalta, was accused of having passed secret information to the Soviets; his past as a member of the Communist Party made him an ideal target. Despite the absence of formal proof, he was condemned, and his case allowed a young Congressman from California, Richard Nixon, to begin a long political career. More troubling was the case of the Rosenbergs, accused in 1950 of atomic espionage on behalf of the Soviets. Of foreign origin and known for their leftist sympathies, they were both condemned to death and executed, despite the *cause célèbre* they aroused in America, and even more in Europe, where petitions were signed and demonstrations organized in their favour. Robert Oppenheimer, one of the fathers of the atomic bomb and former director of the research laboratory at Los Alamos, was accused of harbouring communist sympathies and was systematically excluded from sensitive research. He called for international supervision of atomic energy and eventually refused to be associated with research on the hydrogen bomb.

Joseph McCarthy, the junior Senator from Wisconsin who was elected in 1946, has given his name to a current of intolerance based on exploitation of the credulity of a public ready to see plots everywhere. By ruse and lies, he was able to create a climate of suspicion, without ever producing palpable proof of what he was claiming. Fearing reprisals, the media followed him, broadcasting his hearings in the Senate. Once again, the favoured target was the State Department, accused of having betrayed the country's interests through its most respected members, such as General Marshall, as well as the Democratic Party, which assumed the mantle of Roosevelt, the man of Yalta and cordial relations with Stalin. Libraries were purged of works deemed dangerous, teams scoured cultural centres overseas to censor their activities, and individuals hid documents that might compromise them. Immigration control was strengthened by the requirement to swear never to have belonged to the Communist Party or been a member of a 'subversive organization'. A moral panic descended on the country, without the authorities daring to intervene. In the end, it was McCarthy's own excesses that doomed him: the broadcast, on television, of his Congressional hearings revealed the man's coarseness and the emptiness of his evidence. Censured by the Senate, he later took to the bottle and disappeared into obscurity, leaving behind a sombre heritage of fears and denunciations.

Knock-on effects of this period also affected culture, with producers becoming more cautious in order to avoid becoming targets. A few rare individuals had the courage to stand up to the pervasive conformism, such as Arthur Miller, whose 1953 hit, *The Witches of Salem*, drew its plot from a famous historical episode, a witchcraft trial in seventeenth-century Puritan New England, to denounce the spirit of intolerance that McCarthyism was unleashing. Two years later, *A View from the Bridge* reiterated his rejection of communism, a theme that is also found in Fred Zinnemann's film *High Noon*.

Other issues influenced society. The war in Korea had demonstrated the relevance of desegregation in the armed forces, but it remained deeply entrenched in the country. In 1954, the Supreme Court intervened with a decision of supreme importance. *Brown v. Board of Education of Topeka* reversed the 1896 decision in *Plessy v. Ferguson*, and segregation was declared to be unlawful in public schools, because it was a denial of the equal protection of the laws. Such schools were ordered to 'desegregate' with 'all deliberate speed'. This decision provoked great agitation in the Southern states, which refused to give up an age-old practice of strict racial segregation. In Birmingham, in the heart of Alabama, a Black woman, Rosa Parks, refused to give up her seat in a bus, and thereby set off an irreversible chain of events. Her simple act of defiance brought to the forefront a young minister named Martin Luther King, who was a disciple of Thoreau and Gandhi, and an advocate of non-violence. Three years later the 'Black Revolution' began, sparked by the refusal to admit African American children into a high school in Little Rock, Arkansas, where a violent confrontation between supporters and opponents of desegregation was only ended by the intervention of federal troops.

These disturbances coincided with anxieties awakened by the first successes of the Soviets in space. The launching of *Sputnik*, in 1957, followed a month later by *Sputnik 2*, which carried the first living creature, a dog, highlighted the technological and scientific superiority of the great rival. How had the Soviet Union been able to achieve such an exploit, when Americans were convinced of their own superiority, confirmed by their virtual monopoly of Nobel Prizes in physics? Indeed American scientists had been nominated 19 times in the inter-war period, mainly in physics (nine), in medicine (seven), and also in chemistry (three). In the half-century following the Second World War, they accentuated their virtual monopoly, being nominated 29 times in physics, 37 in medicine, and 27 in chemistry, compared with only three for the USSR. It is only fair to point out that several of the winners came originally from foreign countries and, like many others abroad, had been attracted by the facilities of American universities and laboratories. The US had an obvious advantage in computer-based sciences and had put the emphasis on R&D (Research and Development), while the Soviets had favoured fundamental sciences.

Nevertheless, the Soviets had beaten them into space. This shock set off two reactions. Conscious of shortcomings in their education system (many of the best scholars were foreign-born, as had been shown in the development of the atomic bomb), they decided to use grants and scholarships to encourage the teaching of sciences and foreign languages. Above all, they reacted by creating, under civilian and not military control, a specialized

administration, NASA (National Aeronautics and Space Administration), with broad powers and a large budget, entrusted with the task of developing research on space and laying the groundwork for the launching of rockets. Yet it took many years for the United States to catch up and be the first to land on the Moon.

Fidel Castro's accession to power, following his overthrow of dictator Fulgencio Batista in 1959, represented a different threat, one located just a few kilometres off Florida's coast. Democracy had at first seemed to win out on the island, when the nationalization of oil installations, plus loans from the USSR, precipitated a breach. The new regime became more and more anti-American amid moves to a centrally controlled society on the Soviet model, precipitating the emigration of tens of thousands of refugees to the mainland. The island of Cuba threatened to become a forward base of the Soviets, putting them within easy reach of the North American mainland.

These dark moments should not be allowed to obscure the material advances of Americans during those years of prosperity, when the standard of living was rising steadily as a result of continuous growth that only experienced its first hiccups at the end of the period. The middle class, the backbone of society, emerged from it strengthened and enlarged, borne along by the development of education and tertiary activities (middle- and higher-ranking personnel), at the expense of agriculture and industrial jobs, which faced competition from Japan in advanced technology, and from Third World countries for the primary sector. But this prosperity did not benefit either the poorest, whose proportion stagnated at around 22 per cent, nor the Native American and African American minorities. In reality, opulence masked a more and more unequal society, within which a small, rich minority owned almost half the country's assets, worth more than the whole middle class. Social contrasts were thus accentuated, leaving the fate of the most disadvantaged unanswered.

## THE AGE OF PROTEST

Even in the euphoria of the post-war period, the signs of profound changes affecting both the domestic scene and international relations were already perceptible. The beginnings of the Black Revolution, the discovery of poverty, competition in space with the USSR and Castro's presence in Cuba, all these plunged the United States into a series of upheavals.

Externally, the spectre of communism called for an active policy which, far from being limited to territorial issues, extended to arms control and nuclear proliferation, both threats to the fragile balance between the two great powers. More than ever, the domino theory reigned, in the fear that the fall of one or another of them might make the whole edifice collapse. This fear explains the commitment of the Americans to Viet Nam, the ultimatum to Cuba and the opening of negotiations with the USSR on the control of nuclear weapons.

On the domestic scene, the unleashing of the Black Revolution was premonitory of convulsions which engulfed ethnic minorities and social groups one after the other – African Americans, Native Peoples, Hispanics, homosexuals, students, women, etc. Their demands, onto which was grafted the new treatment of poverty, challenged

the values of American society and were the source of a wave of reforms on a scale reminiscent of and even surpassing the New Deal.

These changes took place in the context created by the return to power of the Democrats in 1961, with the young, brilliant, dynamic President John F. Kennedy, who, surrounded by a team of intellectuals and people of action, launched the New Frontier programme. His inaugural speech recalls that of Roosevelt in 1933: 'The torch has been passed to a new generation of Americans'. He called for a 'grand and global alliance [against] the common enemies of man: tyranny, poverty, disease and war itself … The energy, the faith, the devotion which we bring in this endeavour will light our country and all who serve it, and the glow from that fire can truly light the world. And so, my fellow Americans, ask not what your country can do for you, ask what you can do for your country.' Americans were called upon to act, and to extend their action to the world. A myth was thereby created around the personality of the young president, both because he appeared someone out of the ordinary by his willingness to innovate and because his assassination in Dallas made him the martyr of a tragedy that still remains mysterious. While it cannot be denied that he got the country out of a certain torpor and that he thus imprinted on it the taste for action, his achievements remain rather limited.

The war on poverty and the battle for civil rights encapsulate his commitment. The revelation of poverty in a society of abundance owes much to the impact of the book by Michael Harrington, *The Other America*, published in 1962. There was indeed another America, the America of old people who struggled to survive on their pension, the America of the disinherited, the America of the underdeveloped areas, the America of the minorities, the America revealed by the label 'poverty threshold', below which an American could not live a decent life. But lobbies laid siege to Congress, so that the reforms in the end amounted to limited measures in favour of farmers, old people, regions hit by de-industrialization and education.

### The struggle for civil rights

The American Government responded to the Black Revolution with a determination to fight against racial segregation by guaranteeing civil rights to minorities. The way had been set out by associations such as the NAACP (National Association for the Advancement of Colored People), founded in 1909, and CORE (Congress of Racial Equality), founded in Chicago in 1942 to promote the integration of Black Americans attracted by the labour shortage. The first upheavals of the 1950s refined the forms of non-violent action, which ranged from boycotts to sit-ins, such as when African American students insisted on sitting at a Whites-only counter. This precedent was quickly taken up all over the South, where segregation continued to be in force in public establishments, in particular in restaurants. The freedom rides followed, whose chief target was segregation on public transport. Another target was represented by the universities, which remained one of the most tenacious bastions of segregation in the South. The number of incidents rose, forcing many to be admitted under police guard or to give up in the face of such a hostile reception.

The civil rights movement culminated in 1963 with the celebration of the centenary of Lincoln's Proclamation for the Emancipation of Slaves. Following violent incidents in Birmingham, in the heart of the Deep South, some 250,000 people gathered in Washington on 28 August to demonstrate their support for civil rights. Martin Luther King, one of the organizers, gave his most moving speech: 'I have a dream that one day this nation will rise up and live up to the true meaning of its creed: "We hold these truths to be self-evident: that all men are created equal". I have a dream that one day on the red hills of Georgia the sons of former slaves and the sons of former slave owners will be able to sit down together at the table of brotherhood ... I have a dream that my four little children will one day live in a nation where they will not be judged by the colour of their skin but by the content of their character. I have a dream today ... Black men and White men, Jews and Gentiles, Protestants and Catholics, will be able to join hands and sing in the words of the old Black spiritual, "Free at last! Thank God Almighty, we are free at last"'! This prophetic vision electrified the crowd and earned the organizers a reception at the White House. The non-violence movement was then at its peak, as was the popularity of Martin Luther King. But the aftermath was disappointing, as there was no immediate advance. Confrontations, far from being limited to the South, became more numerous, all over the country. African Americans saw no improvement in their everyday lot, indeed quite the reverse, as a hardening was apparent on both sides, and demands grew louder. In those hot summers, it was the turn of the ghettos in the North to burn: Harlem in 1964, the following year Los Angeles and Chicago, Newark (New Jersey) in 1967 and above all Detroit, under martial law for several days, and then again Chicago in 1968, during the Democratic Party convention.

The rising numbers of violent outbreaks reflected the radicalization of the Black Revolution. The assassination of Martin Luther King in Memphis in 1968 marked the turning point. The slogans changed, the rallying call now being 'Black Power' and 'Black is beautiful'. The movement hardened under the influence of Marxist ideas, which attributed all the misfortunes of the Black minority to the evils of capitalism. In California, the Black Panthers emerged in 1966, with Stokely Carmichael and Huey Long advocating violent struggle and separatism. For their part, the Black Muslims defended a strictly community line, which would consist in making Blacks a Muslim nation within the Union. It was from their ranks that emerged one Malcolm X, the only charismatic leader who might have succeeded Martin Luther King, but he too was murdered.

Although high up in Kennedy's New Frontier programme, equal rights met stiff resistance in Congress, and it fell to Lyndon Johnson, the promoter of the Great Society, to get them passed into law. Under President Johnson segregation was outlawed in public places and employers were required to give equal treatment to all workers. All discrimination in the exercise of the right to vote was abolished, and it was placed under federal supervision. In practice, however, two difficulties arose. The first related to admission to schools, where discrimination continued to be applied illegally. Numerous conflicts, often violent, broke out in the North as well as the South, with parents feeling that the admission of minorities lowered the standards of education. The second had to do with Southern Whites' monopoly over elections, thanks to their control of voting rolls. There too, repeated conflicts often accompanied freedom rides aimed to guarantee Blacks the right to vote.

In the end the Black Revolution ran out of steam, revealing the diversity of African American society. A middle class had come into being, made up of public servants, shopkeepers, professionals or businessmen, who dissociated themselves from violence and excesses to move closer to the White majority. At the bottom of the social ladder, the most disadvantaged groups saw their lot worsen, because of unemployment, illiteracy (the ill effects of dropping out of school) and the breakdown of the family unit (single-parent families are proportionally more numerous among Blacks). Despite every effort, the ghettos, far from disappearing, remained at the centre of many social problems, and even criminal networks.

## Other protests

Black Power found an echo in the Red Power of the Native Peoples who fuelled another protest. This forgotten minority, some living on reservations mostly situated in remote areas of the West, but others in cities, had been all but exterminated. During the twentieth century, their numbers underwent a striking revival: from 300,000 in 1900, they grew to 3 million a century later. In 1924, the Indian Citizenship Act gave Native Americans American citizenship and the right to vote. However, they remained marginalized, being placed under the tutelage of the Bureau of Indian Affairs (BIA), notorious for its corruption and inefficiency. In the early 1950s, the government inaugurated a new policy, of so-called 'termination', granting the tribes wide autonomy, which was difficult for them to take on because of their lack of preparation and shortage of money. The second half of the century saw a renaissance of Indian culture, which the cinema provides the best approach to: from being a foe or a victim, the Indian became a hero, even a model. At the same time, protests mounted, which gave rise to spectacular actions, such as the occupation of the islet of Alcatraz in San Francisco Bay, in 1969, of the BIA, in Washington, in 1972, and the siege of Wounded Knee, the high point of Indian resistance, in 1973. This movement, inspired by the works of Vine Deloria and Dee Brown, expressed itself through the AIM (American Indian Movement), founded in 1970, which called for the return of confiscated lands to the Indians. There were increasing numbers of court proceedings, with a number of successes, as in Maine and California. Indian society was becoming more diverse, the most enterprising going into business, especially oil and operating casinos on their own land, while the vast majority continued to eke out a living in poverty and idleness.

Mexican Americans (or Chicanos) too began to protest, especially in the southwestern states, from Texas to California. The rapid development of this area, due to both industry (oil and derivatives) and plantations, attracted labour across a very porous border. Farm workers found a leader in Cesar Chavez, who, between 1964 and 1969, denounced working conditions for agricultural labourers, organized strikes and secured the support of consumers in a boycott of fruit and vegetables from California. The Chicanos' protest underlined the inexorable rise of Spanish-speakers, whose main demand focused on the place of language in education.

Women too played an active role in this wave of protest. They had won the right to vote in federal elections in 1920, but it was not always the same in states and municipalities. They continued to be little represented in active life, whether in politics (among the few exceptions, at the higher level, were Frances Perkins, Labour Secretary from 1933 to 1945, and Eleanor Roosevelt, the First Lady, who acted as such during and after the mandate of her husband), or in business. In the middle class, they were much more involved in clubs and church activities or spent their time managing the household. After the war, where they had played a prominent role in the economy, they lost their jobs and were sent back to their kitchens and babies, victims of their lack of qualification. They complained also of the discrimination they met with in professional life, as well as of their legal inferiority. Things began to change in the 1960s when they entered in colleges and universities in great numbers and obtained degrees qualifying them for active professional lives in medicine or law, research, university teaching, or business. At the same time, the availability of a contraceptive pill made it easier for women to juggle their personal and professional lives. As a consequence, the age of marriage and first pregnancy was gradually postponed, allowing women to get better jobs, higher salaries and extended independence.

Their frustrations were expressed in a pamphlet by Betty Friedan, which appeared in 1963, *The Feminine Mystique*, followed by the creation of NOW (National Organization for Women), whose rallying-cry was: 'to take action to bring women into full participation in the mainstream of American society now.' This was followed by marches, often noisy and colourful, to demand full equality of rights, along with gestures such as 'bra-burning' and the public rejection of underwear, as a symbol of male domination.

The feminist protest met with relative success. More women entered professional life and they gradually rose to responsible positions as lawyers, doctors, academics or executives. One of their key demands, the right to abortion, was won in 1973, by the decision in *Roe v. Wade*. But this aroused anger in religious and conservative circles, which regarded abortion as a crime and organized punitive attacks on clinics and doctors involved in terminating pregnancies. Since then, the issue of abortion has continued to divide American society. On the other hand, although adopted by Congress in 1972, the Twenty-seventh Amendment granting equal rights (ERA, Equal Rights Amendment) failed in 1982 due to lack of ratification by the states before the deadline, with opposition coming chiefly from the more conservative South. In a country that sees itself as the showcase of democracy, women are still not equal to men. A strong sign, however, is their presence in non-combatant units of the army, where in 1980 they accounted for almost 10 per cent of total numbers and by 2003 had risen to nearly 20 per cent.

The cause of defending racial minorities mobilized a section of youth, especially in colleges, and led to serious agitation in some of the most prestigious campuses. Previously confined within the calm of campuses often cut off from the outside world, the new generation, that of the post-war baby boom, reacted against this conformism and found a response in the counter-culture, which drew on both the ideology of the New Left and ideas derived from the Freudian tradition

The New Left grew from the encounter between progressivism and Marxism, as represented in such works

as C. Wright Mill's *Letter to the New Left*, or Paul Goodman's *Growing Up Absurd*. By advocating rejection of the consumer society and of middle-class values, the cult of individualism and the promotion of minorities, in short the right to be different, it linked up with the philosophical line of thought distantly derived from Freud, but in fact owing more to the interpretation given in Herbert Marcuse's *Eros and Civilization* (1956), a book more often cited than read. What the youth of the time got from it was the cult of the body to attain true happiness, at the price of using soft drugs such as marijuana, or even hallucinogenics, such as LSD, and the rejection of all sexual taboos. Many young people were attracted to communal living, preferably far away from any form of civilization, as well as in urban pockets such as Greenwich Village in New York, Venice West in Los Angeles or Haight-Ashbury in San Francisco.

The university protest movement took shape in a movement called the SDS (Students for a Democratic Society), founded in 1960 by two former students of the University of Michigan, Al Haber and Tom Hayden. Hayden was the author of the platform known as the Port Huron Statement, from the name of the city where it was drafted. Its base was participatory democracy, in other words intervention by students in the running of universities. The SDS was very active and noisy on campuses, even if it only won the support of a minority, and took advantage of the popularity of the counter-culture to attack the university hierarchy. But its favourite target was the ROTC (Reserve Officers Training Corps), accused of training personnel for the Viet Nam War. Between 1965 and 1970 there were violent clashes, in California, Michigan, Wisconsin, Harvard, and Columbia (New York City), where the police attacked a building that had been occupied by students, and finally at Kent State (Ohio), where four students were killed in a clash. The centre of protest continued to be in California, because of its proximity to the ports where troops embarked for Viet Nam. This revolt of university youth had lasting consequences that included greater mixing of the sexes, an opening to minorities, the creation of ethnic studies programmes and, more generally, a new stage in the democratization of education.

The demands of minorities found a partial response in the Great Society: in addition to the protection of civil and voting rights, there was social protection for old people (Medicare) and poor people (Medicaid) and the creation of an Equal Employment Opportunity Commission to combat discrimination in employment, not only on the basis of race (African Americans, Indians, Hispanics, Asians), but also of sex (women), giving them equal access to all jobs (public works, minority-owned businesses) and education. It paved the way to a new concept, that of affirmative action, which gave preference to minorities for jobs and admission to universities. This was not deemed contrary to the spirit of the Constitution, given that there were no rigid quotas of admission. Along the same lines, busing was designed to enable disadvantaged children to pursue their education in better schools, even if they were further from their homes. Such were the means to promote racial equality in a society based on a tradition of prejudices.

The Supreme Court upheld the validity of this new course in a famous decision of 1978 (*Bakke vs University of California*), concerning a 'reverse discrimination' case in which a less-qualified minority applicant was admitted to

medical school at the expense of a more qualified White applicant.

Reformist ambitions and the spirit of protest quickly ran up against international realities. Already, in 1961, Kennedy had found himself caught up in the Cuban quagmire after the failure of the Bay of Pigs landing. The following year, the installation of Soviet missiles on the island provoked a serious crisis that almost degenerated into war between the two superpowers. But the decisive game was played out in Viet Nam.

## The Vietnam War

As faithful adepts of the domino theory, the United States had replaced the French in this sensitive area, threatened by communist expansionism. 'I shall not be the president who sees South Viet Nam take the same route as China', once declared Lyndon Johnson. In the early 1960s, the Americans had sent military advisers to help the South Viet Namese set up an army, when a series of incidents drew them into a new phase of containing Vietcong infiltration. Caught up in a vicious circle, they found themselves dragged in deeper and deeper, as the numbers of their troops there rose from 185,000 in 1965 to 536,000 in 1968, on the grounds that they had to face up to the communist threat coming from the north. Despite direct participation in operations on the ground, massive bombardments of cities, the use of defoliants in the jungle to cut off the Ho Chi Minh trail, along which communist forces were infiltrating into the south, the American strategy of massive attack proved ineffective against the adversary's guerrilla war, which inflicted heavy losses (almost 50,000 dead and 300,000 wounded). Public opinion reacted with a wave of massive, violent demonstrations, which brought together, in a single movement, protesters and pacifists, hampering the departure of troops and the loading of equipment in the ports in the West. Once elected president, Richard Nixon opted for a new line, 'Vietnamization', the transfer of responsibilities to the South Viet Namese Government. The American presence fell from 475,000 men in 1969 to 23,500 in 1972, the year that saw the effective end of fighting.

Negotiations, opened in Paris as early as 1968, proved especially delicate for the Americans as they had no cards to play to secure an honourable way out. In May 1972, secretary of state Henry Kissinger announced that peace was at last within reach, but it was only at the beginning of 1973 that an agreement was signed, practically on the basis of the status quo, since it confirmed the continued division of Viet Nam into two states. The agreement was illusory: two years later, the fragile Republic of South Viet Nam collapsed.

The Viet Nam War left an enduring mark on the United States as it was the country's first defeat (apart from the War of 1812). It suffered an unprecedented humiliation that undermined its credit in the eyes of its allies, destroyed the national consensus and confidence in institutions and humiliated the Democratic Party, held responsible for the disaster. The effects were no less harmful economically: for the first time since the New Deal, the dollar, the international monetary standard, had to be devalued by some 25 per cent, throwing into question the whole Bretton Woods system. From now on, the world moved in a system of floating exchange rates that, when combined with repeated oil shocks, led to economic instability and unemployment.

## Watergate

A domestic crisis emerged on top of the international malaise. After President Richard Nixon had been triumphantly re-elected in 1972, he was soon caught up in the Watergate scandal, an unprecedented electoral spying affair at the expense of the Democrats. This affair, which for two years poisoned all political life, became public knowledge thanks to the persistence of several stubborn and curious journalists. Although the president used repeated delaying tactics, the crisis threatened to lead to his impeachment. Rather than face that risk, he decided to resign on 8 August 1974.

That marked the end of a constitutional crisis unprecedented in American history. Presidents had died in office (Harding in 1923, Roosevelt in 1945), others had been assassinated (Lincoln, McKinley, Kennedy), only one (Andrew Johnson) had actually had to face (successfully) trial by impeachment, but none had yet voluntarily resigned to escape prosecution, which was moreover immediately halted by the general pardon granted by his successor, Gerald Ford. This resignation put an end to half a century of 'imperial presidency' or 'presidential republic'. In the future, Congress would take its revenge by strengthening its control and thereby re-establishing the balance, intended by the Constitution, between the legislative and executive branches. Institutions had indeed held up well, but American confidence was profoundly shaken by this long series of tribulations.

Politically, there was a new ball game. The Roosevelt coalition, based on an alliance among Democrats, minorities and progressives, had fallen apart. While up until then, the Democratic Party had had a rock-solid base in the South, which held the Republican Party – the party of Lincoln, the party of abolitionism – responsible for its misfortunes, it now lost this support. The South joined the Republican Party, victorious in the elections at the end of the century in many Southern states, such as Texas or Florida.

But these agitated years were crowned by one major achievement: 'we walked on the Moon'. Galvanized by the initial successes of the Soviets, Kennedy had given a sharp new push to the space programme. NASA devoted us$24 billion to it, employing 300,000 technicians, a project far bigger than the Manhattan Project. There were three successive programmes, Mercury from 1961 to 1964, then Gemini, and finally Apollo, designed to put a man on the Moon. On 16 July 1969, flight *Apollo XI* took off from Cape Kennedy, in Florida, with a Saturn V rocket that carried three astronauts – Neil Armstrong, Michael Collins and Edwin 'Buzz' Aldrin – in a Columbia capsule, along with their lunar module, which separated as the satellite approached to land on the Sea of Tranquillity on 20 July. This exploit, watched by hundreds of thousands of television viewers, unleashed enthusiasm and seemed to inaugurate a new era for humanity, the age of space travel.

In the following years, six more flights were sent to the Moon, and Americans began to coordinate their experiments with those of the Soviets. Thus, in 1975, two rockets, the American Apollo and the Soviet Soyuz, rendezvoused in space by docking with each other, and

then going on to resume their orbit and land separately. For scientists, the results were very rewarding, but these operations were costly and interest in them eventually declined. NASA set itself to studying other technologies, such as orbital stations to serve as platforms for the study of space and reusable shuttles, *Orbiter – Challenger, Discovery, Atlantis* and *Columbia* – which were used to make trips to and from Earth. These tools proved to be very effective, but dangerous, and following the explosion of the *Challenger* shuttle with its crew and because of the high costs of the operations, the space programme was severely cut back. Essentially, only its military aspects continued, and that meant that control of space became a strategic objective, as essential for the future of the United States as control of the seas.

### Fin de siècle

The last two decades of the century saw America faced with a new series of challenges, with alternating successes and setbacks. Americans recovered their confidence with the upbeat presidency of Ronald Reagan and the fall of the Soviet regime. The Cold War was soon no more than a memory and, according to university professor Francis Fukuyama, 'the end of history' was in sight. But was this not simply a deceptive illusion?

The absence of a major economic crisis stimulated technological progress and its practical applications. The country did suffer recessions, the most serious one being in 1982–84, but it was immediately followed by the longest and most sustained period of expansion ever seen. The number of jobs more than doubled, consumption exploded, and the population kept on growing. Innovation played a major role in this boom period. A new industry, the space industry, was born, a field in which the United States reigned supreme. As with the application of nuclear power for electricity production and the use of jet engines in civil aviation, so once again it was defence research that led to civilian applications. But unlike in the USSR, technical progress was put in the service of the consumer.

The most promising innovation was informatics, the first achievements of which date back to mid-century. In the 1960s, assembly line production began, and then, in the 1980s, came personal computers (PCs), which made the computer an indispensable item of equipment in all American homes. Finally, the creation of the Internet totally transformed the world of communication at the expense of the printed word and social relations. Informatics became the engine of the American economy, as electricity and the motor car had been in the 1920s, Silicon Valley and Route 128 supplanted Detroit, and Microsoft, General Electric. The computer became as much a necessity as the motor car, and the Internet as the telephone. A whole industrial sector developed, accompanied by its inevitable subcontracting, which attracted many young dynamic entrepreneurs into software, whose advances ensured the good health of the market. The wave of optimism was such that serious minds went so far as to predict, somewhat prematurely, the end of economic cycles and crises. The financial markets took off, to the greater profit of the golden boys and traders who fuelled the speculative bull market and nurtured the illusion of endless expansion. Quick fortunes were unmade as fast as they had been made. It was

in this 'new economy' based on informatics that the wealth and risk inherent in innovation were concentrated.

American economic supremacy was based on a vigorous commercial policy deliberately focused on trade liberalization, using the World Trade Organization, where the United States found itself in conflict with both Europe and developing countries. At the same time, it was promoting a unified continental market: in 1988, after long negotiations with Canada, an agreement provided for the gradual elimination of tariff barriers between the two countries, which was later extended to the whole North American continent, by the adhesion of Mexico (NAFTA, North American Free Trade Agreement) and with the hope of a rapprochement with the countries of Latin America, some of which were already associated in Mercosur.

Politically, Democrats and Republicans alternated in power, to the advantage of the latter. Among both liberals and conservatives, the welfare state was more and more criticized, in the name of freedom of enterprise and a return to the country's traditional values. It was criticized for being costly, for burdening the budget with useless expense, for hampering individual initiative and for distorting the market economy.

Political parties were losing their influence over citizens, as shown by the steady decline in voter participation in elections. The South became a Republican stronghold, minorities other than African Americans swung between Democrats and Republicans, and options in foreign policy (Israel, the Middle East, etc.) led to swings. The age of protest was over, and new schools of thought had emerged.

The liberal tradition, hitherto all-pervasive in its many variants, and the New Left of the 1960s were overtaken by the rise of neo-conservatism, which took shape in a New Right. This marked more than the arrival of a new generation, it also represented the convergence of a religious revival and a return to the sources. Revivals, a recurrent feature of the American past, met with new fervour, Jerry Falwell replacing Billy Graham before attentive and enthusiastic crowds, whose image was now picked up by television and the electronic church. The favourite targets were divorce, and, in the fashion of the times, homosexuals, abortion and prayer in public schools. This new right drew on the think tanks, of which there were more and more, such as the Brookings Institution, and spread the ideas of Irving Kristol, Norman Podhoretz and Michael Novak on society and the economy. State control, which only served the new class (intellectuals, bureaucrats, functionaries, etc.), must be pruned back in favour of individual energies. Economic thought was renewed by the supply theory: contrary to ideas common since Adam Smith, it is not demand that generates growth but supply. Therefore the consumer must be freed from the burdens put on him, especially taxation, and, to achieve that, state expenditures must be cut back. This represented the repudiation of Keynesianism, and its origin lay in California, where a referendum had successfully put a ceiling on property taxes. In the future, benefits would go, not to the disadvantaged, but to the classes that generated prosperity.

A new approach, deregulation, was thus launched during the presidency of Jimmy Carter, a Democrat, in transport and banking. Air transport was the first to be 'deregulated', and perverse effects were at once apparent, with the closing of the least-profitable routes. The price war certainly benefited consumers, and promoted the rise of low-cost companies, at

the expense of traditional companies, some of the most prestigious of which collapsed in the storm. The sole exception to this deregulation was rail transport, permanently in the red, which was partly reorganized in a covert nationalization, which took a hybrid form in Amtrak. In banking, the distinction, introduced at the time of the New Deal, between deposit banks and commercial banks was abolished, which led to reorganization of this whole sector and bank mergers. Deregulation also put an end to the monopoly of American Telephone and Telegraph (AT&T), thereby totally transforming the telecommunications sector.

The main standing divergence between the two parties was over the extension of medical coverage, regarded as one of the means of fighting poverty. Part of the Great Society programme of Lyndon Johnson was taken up by the two Democratic presidents, Carter and above all Clinton, who fought, vainly, for a further extension and failed in the face of Congressional procrastination and obstruction by the powerful lobby of the American Medical Association.

Ronald Reagan associated his presidency with 'Reaganomics', a policy that consisted in simplifying the tax system and reducing direct taxes for the well-off, by cutting social expenditures and handling responsibility for it over to the states. This was followed by a sharp economic revival, a reduction in unemployment, which fell from a peak of 10 per cent in 1982 to 6 per cent in 1987, a growth rate as high as 3 per cent and the creation of hundreds of thousands of jobs. Reagan was thus credited with the success of a neo-liberal policy, which however excluded the agricultural sector, supported by massive subsidies. One fly in the ointment was the worsening of the trade deficit, which became a permanent feature after 1986 because of a massive rise in imports of manufactured goods, but this deficit was made up by the issue of Treasury bonds, made attractive by the exchange rate of the dollar, which had once again become the dominant currency sought after worldwide.

## From melting pot to salad bowl

Beyond these everyday ups and downs, the recent evolution of American society gives ground for puzzlement, insofar as the melting pot has been relegated to the rank of a myth of another age to be replaced by a new vision, popularly known as the salad bowl, diversity and multiculturalism at the expense of fusion.

In a book published in 1991, the historian Arthur M. Schlesinger, Jr. deplored this *Disuniting of America*, criticizing the moral cowardice of 'a strident multiculturalism' and the way American schools had abandoned their mission of educating a nation. According to him, multiculturalism threatens the very future of democracy because of lack of knowledge of the past and rejection of traditional values. Another historian, David Hollinger, in *Postethnic America: Beyond Multiculturalism* (1995), presents American society as an 'ethno-racial pentagon', with five segments: Indians, Euro-Americans, African Americans, Asian Americans and Latinos. Thus he was taking up, in a slightly different form, the categories of the 1990 census, in which Americans were asked to specify the 'race' to which they belonged, which is a clear indication that this notion was officially recognized. The 2000 census went even further, adding a sixth race, that of Hawaiians, and introducing a new category, that of more than one ethnic origin, as more than 7 million Americans

claim a double origin. Even though that represents barely 3 per cent of the population, the response is still significant of the trend towards laying claim to one's difference.

The debate over multiculturalism has been recently reactivated by Samuel P. Huntington, when speaking to 'the clash of civilizations', in the world as well as in the US. For him, the main threat in this country is the rise of the Hispanic community, which has recently out-numbered the African American (40 versus 36 million). As Hispanics possess a specific culture and speak a different language, Huntington fears for the unity of the country, as he states: 'Will the United States remain a country with a single national language and a core Anglo-Protestant culture? By ignoring this question, Americans acquiesce to their eventual transformation into two peoples with two cultures (Anglo and Hispanic) and two languages (English and Spanish)'. And yet, the trend shows that Hispanics assimilate as quickly as other minorities and that the second generation speaks English rather than Spanish.

Indeed, this debate is not new. The motto *E Pluribus Unum*, which originally symbolized unity in diversity, is now being given a new interpretation, the origins of which can be traced back to the German-American philosopher Horace M. Kallen, who had discussed this particular feature of American society as early as 1924 in his book *Culture and Democracy in the United States: Studies in the Group Psychology of the American Peoples*. In the xenophobic context of the time (rise of nativism, revival of the Ku Klux Klan, restrictive immigration laws) he was already speaking of American peoples, defending the idea of a 'cultural pluralism'. Kallen's aim was to defend immigrant communities, referring to the Declaration of Independence, which proclaimed the equality of all beings, including those who belonged to a different culture, like Blacks or Native Peoples. The notions of double allegiance and multiculturalism are thus already implicit in his analysis, even if they are not officially acknowledged. American society has shifted from the melting pot to the salad bowl. This theme of basic ethnic differences reappeared at several times, especially in the turmoil of the 1960s, and was taken over by various observers, among them Michael Novak, whose *The Rise of Unmeltable Ethnics* (1971) became a best-seller as well as a symbol.

By the end of the century, American society had changed, under the impact of the diversification of immigrants, the push of ethnic or identity demands and the rise of individualism. Anglo-Saxon cultures, which used to serve as mould and reference, is now faced with other successful cultures, African American culture, which has enabled Blacks to recover their pride, or that of Mexican Americans, who assert their singularity above all through their language. More generally, the children of European immigrants, be they Irish, Italian, Greek, Russian, Jewish or other, remain faithful to their own cultural traditions. Finally, the recent immigration of Asians, Viet Namese, Cambodians, Hong Kongers etc. has introduced a new variant into this cultural kaleidoscope. The Fourth of July continues of course to be celebrated as the national festival, but it does not rule out either St Patrick's Day, especially in Chicago, where the river is coloured green in honour of green Erin, or the Chinese New Year in the Chinatowns, or the *Cinco de Mayo* for Mexican Americans, or Columbus Day for Italian Americans, or, more recently, Martin Luther King Day for African Americans.

For years, recognition of multiculturalism was aided by affirmative action, which made it possible to better integrate representatives of minorities into society. It is true that eventually a reaction began to be felt in sensitive states such as California and Texas. But even if its application there has disappeared legally, affirmative action has become a habit, especially in the selection of students and even more in businesses, which have made enormous efforts to diversify their workforce. American society has moved to the stage of multiculturalism, as witnesses the pride in being a hyphenated American.

## The end of the Cold War

Events in the outside world have rather blurred this evolution. When he came to power, Reagan had to erase the humiliation that Americans had just suffered in Iran, where, after the fall of the shah, in 1979, Islamic militants had invaded the American embassy, holding its occupants hostage for several months. After Carter's fiasco in his attempt to secure their freedom, the last of them left Tehran only as the new president took office.

But what Reagan inherited was not by any means all negative. Detente, already initiated under Nixon, had continued under Carter, who had signed the SALT (Strategic Arms Limitation Talks) agreements with the USSR, put an end to the old dispute with the Republic of Panama by handing the Canal Zone over to it on certain conditions, and had got personally involved in the Middle East conflict by sponsoring the Camp David Accords between the Egyptian Sadat and the Israeli Begin. But detente, which seemed finally to be taking root in that sensitive area, was soon called into question by a resurgence of nationalist passions.

Moreover, the USSR's intervention in Afghanistan, in late 1979, had awakened the spectre of Soviet expansion in the rear of the oil-exporting Middle East, unstable as it was and whose main consumers of oil were the Americans. The Cold War seemed to take on a new lease of life, pushing Reagan at once to adopt its style and language, lambasting the 'empire of evil'. In reality, the Republican administration, blinded by decades of Cold War, was so unable to detect the weakening of the Soviet empire that it made no effort at all to take advantage of it. Indeed, quite the reverse, it strengthened its military potential with a massive increase in the defence budget, which ended up higher than during the Viet Nam War. It involved every branch: the navy, which had to confront its Soviet rival in full expansion, the air force, which secured the new bomber it had long been calling for in vain, and the special forces, while Pershing missiles were installed in Europe causing friction within NATO. But the novelty was the launching of a controversial and very expensive project to protect American territory with a nuclear shield, which reignited a ruinous arms race, of questionable effectiveness, and, in the end, fatal to the USSR.

But the coming to power of Gorbachev, and the Reykjavik summit in 1985, relaunched the Soviet-American dialogue. 'It is the beginning of a new relationship', Reagan declared significantly. An agreement was reached on the resumption of talks on limiting conventional and nuclear weapons and renewing cultural relations. When the Soviets left Afghanistan, as the Americans had Viet Nam, Reagan's anti-Sovietism became tempered with realism, the rhetoric of the empire of evil disappeared from his speeches: in 1989, the Berlin Wall came down and the Warsaw Pact was dissolved. This return to detente continued under George Bush, who, in 1991, reached an agreement on arms limitation, and cooperation in space was stepped up.

The collapse of the Soviet empire created a totally novel situation, making the United States the sole superpower in a unipolar world whose security seemed lastingly assured. But that was an illusion, for Iraq's invasion of Kuwait in 1990 challenged the status quo and called forth an immediate reaction from the United States, which, at the head of a coalition empowered by the United Nations, undertook the liberation of Kuwait, while refusing to push as far as Baghdad. The United States was also involved in the long Balkan conflict that followed the disintegration of Yugoslavia; and, as a result of its mediation, a compromise was signed at Dayton. The superpower thus saw itself entrusted with peace missions in various parts of the world, which dragged it willy-nilly into conflicts that were poorly understood by the public. For Americans, the fall of Bolshevism came to mean an increase in interventions that made them into the firemen of the world order.

The persistence of threats led to constantly rising military expenditures at the expense of social ones and the permanent deployment of American troops all over the globe: some 250,000 Americans are permanently stationed in Western Europe, the Balkans, Saudi Arabia, Kuwait, South Korea and Japan, without mentioning the financial aid, for military purposes, given to allies in the Middle East or the war on drugs in Latin America. A virtual American empire has come into being.

And threats of a new kind were emerging from 'rogue states'. Several attacks had already been aimed at American targets abroad: tourists on a cruise in the Mediterranean had been attacked, a bomb had exploded in a Pan Am plane which crashed in Scotland in 1996, a booby-trapped lorry had killed American soldiers in Saudi Arabia in 1998, American embassies in Kenya and the United Republic of Tanzania had been bombed. The source of the evil lay in terrorism, emerging from countries that, for one reason or another, cultivate anti-Americanism.

The United States is now faced with terror on its own soil. In 1994, in New York, a first attack was made on the World Trade Center, a symbol of triumphant capitalism, failing to damage the structure, but causing many casualties. The following year, an explosion destroyed a federal building in Oklahoma City, and again questions were asked as to the motivation for the attack. The sense of insecurity that overtook Americans culminated in the attacks of Tuesday, 11 September 2001, when terrorists hijacked commercial airliners and crashed them into the World Trade Center in New York City. The twin towers collapsed in a cloud of flames and ashes, claiming several thousand lives. Another plane crashed into the Pentagon, setting fire to one of its wings, while a fourth, doubtless intended for the White House, crashed in Pennsylvania. For Americans, it was a declaration of war: they united around their president, George W. Bush, just as they had rallied around Franklin D. Roosevelt after the Japanese attack on Pearl Harbor in 1941. But this time, the enemy was invisible, even though suspicions pointed to small terrorist groups originating from the Middle East, whose mastermind, Osama bin-Laden, was hiding out in Afghanistan. He was immediately

designated as the target for the next American intervention. Did that black Tuesday signify the end of an epoch or the beginning of a new historical era?

Where was the American people at the end of a century that had opened under the twin signs of non-interference in international affairs and the melting pot? Change worldwide propelled the United States, willy-nilly, into a position of responsibility, which it had never sought, to become guardian of one particular international order. As for American society, it has proved de Tocqueville wrong: in his *Democracy in America*, he had deplored the tyranny of the majority. Since then, the minorities have taken their revenge.

## CANADA IN QUEST OF AN IDENTITY

In Canada, the end of the century was overshadowed by upheavals in which the very future of the country was at stake. The nature of Canadian identity was called into question, politically by the 'Quiet Revolution' in Quebec and its impact on federal relations, economically by the country's being so close to the United States, and culturally by the advance of multiculturalism.

### The 'Quiet Revolution' and its aftermath

In Quebec, following the death of Maurice Duplessis in 1959, the electors voted into power, by a small majority, a Liberal government under Jean Lesage, who embarked on a sweeping policy of reforms, the 'Quiet Revolution', as it was labelled by a journalist. This shift was symbolized by a change of vocabulary: henceforth there would be no more talk of 'French Canadians' but of *Québécois*, Quebeckers, and every area was turned upside down by the change.

In terms of administration, a Quebecker state was established by the creation of a bureaucracy recruited not, as hitherto, by the vagaries of patronage, a variant of the American spoils system, but on the basis of competence and merit; the number of ministries was increased and they were made more specialized (including one for external affairs); a bureaucracy was established, and the House of Commons, with its excessively British overtones, was renamed the National Assembly. In the economic sphere, priority was given to the development of natural resources and their exploitation by French-speaking personnel. The creation of Hydro-Québec reflected Quebec's determination to benefit from its vast hydroelectric potential (Manicouagan, James Bay, Great Whale River, etc.) and to become an exporter of electricity. A genuine Quebecker capitalism came into being, with international firms such as Bombardier in aeronautics (de Havilland) and the railways (TGV), or Cascades in paper manufacture. Finally, after the exclusion of the Catholic Church from education, a new educational system was established under the supervision of a ministry of education, which set up junior secondary schools, CEGEPs (Collèges d'Enseignement Général et Professionel), and adopted the California model to set up a network of universities (UQUAM, Université du Québec, in Montreal) covering the whole province. Everywhere the influence of the clergy was in retreat, with places of worship and convents being sold and turned into educational establishments. In just a few years, Quebec lost its conservative face and took a giant leap into modernity.

This shift was rooted in latent nationalist sentiments, sharpened by the flowering of a French-speaking culture, whose attractiveness lay in its novelty, variety and simplicity. Initial popularity came from folk-singers like Félix Leclerc, Robert Charlebois, Gilles Vigneault and Pauline Julie, who made Quebec famous all over the world, novelists like Jacques Godbout, Marie-Claire Blais and Antonine Maillet, who celebrates the epic of the Acadians driven out by the British and returning to their homeland, poets like Gaston Miron, film-makers like Denys Arcand (*Le déclin de l'empire américain*, *The Decline of the American Empire*), painters like Riopelle, dramatists, etc. This flowering restored confidence and pride to French-speakers and fuelled their nationalism.

This nationalism, encouraged by General de Gaulle's resounding 'Vive le Québec libre' in Montreal in 1967, was expressed in several groupings, including the RIN (Rassemblement pour l'Indépendance Nationale), which launched a wave of terrorism in 1970, marked by the kidnapping of a diplomat and the assassination of a minister followed by the declaration of a state of siege in Quebec. There was a confrontation between two emblematic figures, on the one hand René Lévesque, the founder in 1968 of the Parti québécois (PQ), and subsequently its leader, prime minister of the province from 1976 to 1985 and advocate of *sovereignty-association*, an ambiguous formula which implied, depending on the interpretation, independence or autonomy, combined with economic union with Canada; and, on the other, Pierre Elliott Trudeau, leader of the Liberal Party (PL), also a Quebecker, federal prime minister from 1968 to 1984 (with a brief break in 1979–80), and a firm supporter of enlarged federal power, which alone could ensure the country's cohesion in the face of demands from his native province, to which he denied the right to special treatment, which might lead to 'asymmetrical federalism'.

An initial phase of the confrontation was over language use. In 1969, Trudeau had secured the passage of the Official Languages Act, making bilingualism official policy, giving French and English an identical status in public life and in the court proceedings. Canada also agreed to set aside a number of high-level positions for French-speakers, who thus made a much-remarked appearance in the civil service, especially in external affairs. Where French speaking was under-represented, in British Columbia, Manitoba, New Brunswick, the federal government subsidized cultural centres. From then on, Canada was actively engaged in organizing the summits of La Francophonie and followed its work regularly. Quebeckers reacted sharply by making French the sole official language of the province, in public life, education and advertising. Immigrants there were subjected to 'immersion', designed to integrate them better into a French-speaking environment.

In a second phase, Quebec and Canada confronted each other in a debate over the constitution. In his aim of strengthening federal power, Trudeau wanted to 'repatriate' the 1867 British North America Act from London to Ottawa, in order to put an end to colonial status and give the country its own constitution. Quebec opposed this, arguing that this repatriation was an attack on the powers of the provinces. Several inter-provincial conferences were organized, which failed to reach agreement. Finally, repatriation was effected in 1981 and then a new constitution was approved, including a right of amendment, as in the United States, and with a Charter of Rights and Freedoms,

all against Quebec's will: the province found itself then and since in an unprecedented position, still part of the Confederation, although rejecting its constitution.

The last phase, the longest and most confused, centred around the position of Quebec in this Confederation. The PQ, torn between supporters of independence and defenders of sovereignty-association, had organized a first referendum in 1980, which rejected the proposal for association by a majority of 55 per cent. The debate then lay dormant before being taken up in a new referendum fifteen years later, which was also narrowly rejected. Quebeckers thus twice rejected the temptation to venture into the unknown, a reflex that showed both a degree of conservatism in society and the preference of non-French-speakers for the status quo. But the debate was far from over, since, after Trudeau's systematic refusal to acknowledge the specificity of Quebec in a majority English-speaking whole, the malaise persisted.

As soon as it took power in Ottawa, Brian Mulroney's Conservative government (1984–93) endeavoured to escape from this impasse by proposing a compromise, based on the notion of 'distinct society', a formula that had the advantage of preserving political unity while acknowledging the specificity of Quebec. Several inter-provincial conferences discussed it, but the very notion of distinct society was so vague that it was immediately met by hostility from the First Nations, who also asked for a special status. Nevertheless, despite its ambiguity, a platform was cobbled together in the end and submitted for approval to the provinces, which rejected it. One final effort consisted in resorting to a national referendum in 1992, which resulted in another rejection.

## Customs union

The debate on Canada's constitutional future is thus blocked and may well remain so for a long time, since the Liberal government, in power after 1993, has refused to reopen this troublesome dossier. Meanwhile, the nationalist drive in Quebec has waned, Trudeau has retired from politics and none of René Lévesque's successors (he died in 1987) have inherited his charisma. Yet this impassioned debate changed the shape of things, at the expense of the traditional parties, Liberals as well as Conservatives, who lost their credibility in it. The constitutional debate reawakened the old demons pitting East against West, French-speakers against English-speakers, farmers against city-dwellers, centre against periphery. The two-party system was again challenged by the virtual disappearance of the traditional parties in the West. The Social Credit Party there had a distant successor in the NDP (New Democratic Party), led by Ed Broadbent, social-democratic in inspiration, which put down new roots in the Prairies, and even made a short-lived breakthrough in the East, while in British Columbia and Alberta a new grouping made its appearance, Preston Manning's Reform Party, which exploited popular resentment against the centralizing forces of Ottawa and Eastern businessmen, so much so that following the 1993 elections, the Liberal Party found itself the sole national party, and, in a totally unprecedented situation, the official opposition in the House of Commons was represented by a regional party, the Bloc Québécois, the federal counterpart of the provincial PQ.

In the wake of the economic prosperity of the post-war period, growth became more chaotic, with phases of expansion and stagnation, which followed the course of the American business cycle. The devaluation of the US dollar in 1972 had knock-on effects on the Canadian dollar, which cut itself off from it, and the oil crises hit hard, although they did stimulate the exploitation of wells in Alberta. Canada remained closely in step with its neighbour, but a determination emerged to develop a domestic capitalism, with its epicentre now in Toronto. The main beneficiaries of this were telecommunications, as seen in the success of Northern Telecom, the processing of raw materials, with Alcan in aluminium and consumer products associated with cultural productions in the Bronfman empire, built on whisky. Canada took its place among the great economic powers, which earned it admission in 1975 into the very closed circle of the G7, meeting in 1981 near Ottawa.

But Canadian production cannot compete with that of its powerful neighbour. How can a market of only 30 million consumers be compared with one of almost 300 million? Canadian products are expensive, because of the smallness of the domestic market, partly too because of the burden of social insurance contributions unknown to the south. While it brings security, the welfare state has a cost, which is passed on to production. Finally, the economy, even though meeting individual needs plays a growing role, continues to be based largely on the exploitation of raw materials and energy, which involve a degree of complementarity with the United States. The success of the Common Market in Europe provides a precedent and a reference point for what Canadians are seeking, an enlargement of their economic space, while preserving their uniqueness.

Such an idea was not new, since Wilfrid Laurier had already been dreaming of it a century earlier. The paradox is that it was a Conservative government, that of Brian Mulroney, and not a Liberal one, which, after hard bargaining, achieved it in 1988. Business circles had an ambivalent attitude, both wanting an enlargement of the market and fearing competition from their neighbour. For all Canadians, the priority was to maintain their achievements in the area of social security and employment protection. What English-speakers feared most was an invasion by the American media, cinema, music, radio and above all television, with the risk of killing off local production. Among the fiercest opponents too were farmers in the West, who felt disadvantaged vis-à-vis their American counterparts by the higher costs their farms incurred. Paradoxically, French-speaking circles applauded this rapprochement, in which they saw a barrier against 'English-speaking imperialism'. The United States was the leading market for some of their exports, such as electricity and paper pulp.

The agreement, which came into effect in 1989, known as the Free Trade Agreement, envisaged the gradual reduction of customs tariffs between the two countries over a period of ten years and the free movement of persons. Under the name of NAFTA, it was extended to Mexico, meaning the eventual emergence of a common market on the American continent. But it is very different from the Common Market, in that it is limited to trade and involves no common policy or supranational institutions. Canada's sovereignty emerged from this shift unscathed.

## An open society

Like the other industrialized countries, Canada experienced social disturbances, although to a lesser extent than its neighbour. The generation born of the baby boom reacted sharply against the traditionalist society into which it was thrown when it reached adulthood. It drew strength from an unprecedented cultural expansion that completely broke away from its roots, both British and French, while also seeking to free itself from the grip of America. Every area of culture used this renaissance to protest and demand greater openness and more equality.

In the forefront of these protesters were women, who enjoyed the prestige of an exceptional generation of novelists, among them Margaret Atwood, Alice Munro, Mavis Gallant and Margaret Lawrence. Of course, they already had the right to vote, but they were in an inferior position in many areas, especially employment. In 1967, the government convened a Royal Commission on the Status of Women, which delivered its report three years later. Its conclusions concurred with the claims of feminist groups about these discriminatory practices and sexual harassment. Various measures were designed to put an end to them, although their effects would only be felt over the long term. More women were admitted to the public sector, among them Jeanne Sauvé, the first to reach the position of governor-general of Canada, in 1984. Salaries increasingly tended to be more equal, and above all women now occupy a not insignificant position in the world of work.

Trade unionists, very active in some sectors, represented another source of protest. They were fighting to free themselves from both the grip of international unions, at the time dominated by the all-powerful American unions, like the AFL, and, in Quebec, the Catholic Church. A reaction developed, in often violent strikes and confrontations, to 'Canadianize' these organizations, secularize them and make them responsible interlocutors in labour disputes, which continued to be numerous and often bitter.

Protest also came from the 'Indians', known here as 'First Nations'. As in the United States, they made a striking comeback over the century: there are officially 750,000 of them, in addition to 50,000 Inuit in the Far North. Three-quarters of them live on reservations, in wretched conditions, where, for lack of employment, they are plagued by alcohol and drugs. The official attitude, which was one of assimilation, failed, leading to their marginalization in society. There too a change has occurred in recent decades. The spark was the deadly standoff, at Oka, near Montreal, in 1990, between the police and Mohawks, over the appropriation of a sacred wood intended to extend a golf course. Several tribes (known here as bands) claimed land that had been seized from them, like the Cree thrown off their land by the construction works at James Bay, in northern Quebec.

A special case is that of the Inuit, representatives of an ethnic group spread all over the sub-polar zone and more numerous in fact in Siberia. Surviving essentially on fishing and seal hunting, living in igloos, they became well entrenched in the media. Skilful in the game of diplomacy, they were successful in securing recognition of their specific rights and winning autonomy, in 1999, over an area carved out of the Northwest Territories, Nunavut, with its own capital, government and administration, 90 per cent of whose costs are met by the federal government.

Despite the resumption of immigration in the years following the war, Canadian society remained traditional in its foundations, because most newcomers were of European descent. According to the 1961 census, 97 per cent of the inhabitants stated themselves to be of European descent, whereas in 1991, 31 per cent stated that they were of neither British nor French descent. Starting in the 1960s, there was a profound shift in the way immigrants were selected: descent ceased to be the determinant of choice, replaced by professional qualification (skill, complementarity, capital contribution, etc.) or family links (reuniting individuals). In addition, selection was now made before departure, and not on arrival. This meant that the nature of immigrants changed, and the door was wide open for Asians, Viet Namese, Filipinos, Malaysians, Sikhs, as well as other Americans, Haitians, Colombians, etc. The main destination of these new immigrants was the provinces that seemed to them the most attractive, British Columbia, Alberta or Ontario, and urban areas. Thus, in Toronto, almost 40 per cent of the population is made up of immigrants, as against only 20 per cent in Montreal.

In this mosaic, the notion of two founding peoples ceased to have meaning, communitarianism became an integral aspect of the urban scene and the newcomers laid claim to cultural diversity. Canada officially adopted multiculturalism, which has been written into federal legislation since 1971, with its own minister who makes grants to community groups. Recognition of this diversity is regarded as the chief means of maintaining cohesion among cultures that live cheek by jowl but do not mix. Song, theatre and dance troupes thus celebrate Cambodia, Malaysia, the Caribbean or Voodoo.

Following recent upheavals, Canada has been more than ever in quest of an identity that still remains vague. Canadians, including Quebeckers, see themselves above all as North Americans, who have successfully created an original type of society, based on diversity and mutual tolerance. While Canada is still in quest of its identity, it remains the case that, given the pragmatism by all those involved, it has successfully safeguarded and even strengthened its unity, always faithful to its motto, *a mari usque ad mare.*

At the beginning of the twenty-first century, North America is at a crossroads.

### POLITICAL, SOCIAL AND ECONOMIC PROFILE

Latin America is a vague and too all-embracing term, but it is a useful one, allowing us to distinguish the large landmass within the American continent to the south of the Río Grande (the current border between Mexico and the United States). Throughout the nineteenth century the area to the north of this river embraced capitalism and democracy with determination. However, in the area to the south the so-called 'colonial heritage' lived on. In geographical terms, Latin America is a mosaic of bountiful plains, harsh tablelands, mountain chains broken by pleasant valleys and tropical jungle. It is also a mosaic of different ethnic groups; the indigenous base, already complex enough in itself, offers contingents of black Africans, groups of white colonists, mostly from the Iberian peninsula, although the English, French and Dutch are also represented, as well as the different racial mixes which have taken place and continue to occur. It is also a political mosaic made up of numerous republics of varying sizes, most of which were born at the beginning of the nineteenth century, when the strong link which had hitherto joined them to Spain and Portugal was broken, to be replaced by a more subtle but equally firm link tying them to Britain. Such widespread political independence, achieved so early in the century, is not insignificant, particularly in view of the massive process of global colonization, which characterized the nineteenth century. Encouraged by these relations, the region gradually became immersed in the world of capitalism and imperialism, which reached its peak at the end of the nineteenth century.

It was at this time that the great export economies took shape: cereals, wool and beef on the temperate southern plains, coffee in Brazil, Colombia and Costa Rica, sugar in Cuba and along the Peruvian coast and oil in Venezuela. Capital from the metropolitan centres in Britain, the United States and, to a lesser extent, in Germany and France always played a decisive role. It paid for the construction of the railways and ports, silos and meat packing plants. Its presence was felt in trade and finance. In many cases it even controlled the production process such as the copper mines in Peru or the tin mines in Bolivia, the banana plantations in Central America or the sugar plantations in Cuba. It even helped to shore up feeble states, which were supposed to be responsible for maintaining order.

These enterprises flourished and expanded when trading conditions were favourable but toppled in spectacular fashion when the market failed, as occurred with the nitrate market in Chile and rubber in the Brazilian Amazon. The effects were equally disastrous for the natural environment, and for the labour force, because these activities mobilized vast numbers of workers: Italian immigrants in Argentina and Uruguay, the Spanish in Cuba and the Italians and Japanese in Brazil. In other cases, such as the mines in Peru or the coffee plantations in Guatemala, the workforce was drawn from the ancient indigenous communities, and sometimes vast numbers of black workers were shipped from their bases in the Antilles to work on the banana plantations. Slavery disappeared everywhere at the end of the nineteenth century, but more subtle forms of semi-servile dependency lived on in the stock farms and plantations, and even the recent white immigrants were subject to various forms of coercion. In the large cities, such as Buenos Aires (Argentina), Santiago (Chile) and Mexico

City, a nucleus of organized, militant salaried workers developed, lured by opportunities in the ports and nascent services and industries.

In a cyclical and convulsive manner, destroying perhaps as much as it created, Latin America generated great wealth, most of which remained in the hands of the foreign partners, although a certain proportion was also distributed locally. Wherever wealth was distributed locally, society changed, becoming more broad-based and diversified. The gap between the rejuvenated oligarchies and rural and urban workers was gradually filled by a layer of traders, public employees, small manufacturers and educators, who were called the middle classes.

The more traditional societies were governed by their oligarchies as occurred in Argentina. In Brazil, the oligarchies were duly federated within the old Republic, whereas, in the case of Colombia, they were divided into rival factions, which made civil war a way of life. When the oligarchies were weak, their place was taken by authoritarian and sometimes progressive dictatorships. An example of the latter was Porfirio Díaz in Mexico. However, in the more diversified societies the growing demands of the middle classes and the workers created the right conditions for the political formula prevailing in Europe at the time to be adopted: a broad-based democracy where the will of the people was something more than an agreed fiction. Examples of governments with strong popular support were those of Hipólito Yrigoyen in Argentina (1916–22 and 1928–30), José Batlle y Ordóñez in Uruguay (1903–07 and 1911–15), and Arturo Alessandri in Chile (1920–24 and 1925–32). They all used their power to distribute benefits more widely among different sectors of society, making use of the resources of a state that was on the road to becoming a welfare state.

In Mexico, similar demands joined forces with other more explosive ones. There, as in many other places, the inroads being made by the market economy affected the traditional *campesino* class with its deeply rooted indigenous culture and, above all, its strong links to the land. In Mexico the *campesinos* made their voices heard, and their weapons thundered, turning the original call of those who were merely opposed to Porfirio Díaz's re-election into a vast mobilization of the masses. The revolution began in 1910 and lasted, going through various phases, until it was institutionalized at the end of the 1930s. During these three decades a million people died. On the ruins left behind by the revolutionary storm a state was formed which intervened resolutely in the process of reshaping society. It carried out a far-reaching land reform programme under President Lázaro Cárdenas (1934–40), organized the *campesino* class, turning the *campesinos* into its most staunch supporters, promoted and controlled the trade union movement and drafted modern social legislation. The Mexican government nationalized the oil industry and confronted the United States, but never to the point of breaking off relations. It gave a strong boost to capitalist development both in the countryside and in industry, and promoted mass education. Above all, it established an astoundingly stable political system, which defended law and order with zeal but also jealously guarded its claim to popular legitimacy. It was a kind of exclusive meritocracy where the rules of cooption and widespread corruption were, almost up to the present time, clothed in legitimacy under the guise of the vigorous and jealously cultivated revolutionary tradition.

Three events left their mark on the history of Latin America in the twentieth century. The First World War disrupted its economic relations with the world and provoked internal social, political and ideological conflicts. The 1929 economic crisis dealt a fatal blow to the export economies. As well as bringing prices crashing down and precipitating capital flight, the crisis affected state revenues – practically no state managed to avoid political trauma – but, somewhat surprisingly, it triggered the conditions for a leap forward. With the Second World War, the structure of the new society, already modified by the crisis, grew more distinct and, although the post-war period certainly brought some serious economic problems, such as the supply of raw materials and machinery, it also provided the region with unsuspected opportunities and provoked original political responses.

In contrast to the export economies, the pre-existing industrial sector began to flourish, filling in the gap left by imported consumer goods. The shortage of foreign currency as a result of the crisis, which made imports more difficult, contributed to this development, which took advantage of the equipment already in place, the availability of labour and an eager market turned captive by protectionist policies. State-controlled economic policy, which aimed as far as possible to defend its share of the old export market, was accepted unchallenged. This meant that the domestic market became the new engine for economic growth, and the general profile of society was altered as increased demand for industrial workers led to wage rises which, in turn, fostered an increase in demand. In this way, the expansion of the secondary sector compensated to a certain extent for the crisis in the primary sector. The importance of industrial, mostly urban, workers as a social force began to grow.

The Second World War favoured this process of industrialization, which made remarkable progress, but by the 1950s its limitations were becoming apparent. The equipment was beginning to age, fuel and energy were growing increasingly scarce, and production was too expensive and inefficient to compete in foreign markets. The traditional primary exporting sector bore the brunt of responsibility for generating foreign currency, which was insufficient in any case to cover the costs of industrial growth and the generous salaries upon which the domestic market depended. A solution was sought which involved facilitating investment by foreign companies in order to develop the production of fuels, steel, paper, petrochemicals and more sophisticated consumer goods such as cars, offering the enticement of captive markets protected by strong tariff barriers. There was talk of the need for integrated development. Inspired by Raúl Prebisch, the Economic Commission for Latin America upheld this position. The 'development' trend coincided with the United States' offer to join the effort through the Alliance for Progress propounded by President Kennedy in 1960. The results of this second period of industrial growth were patchy. They were successful in Brazil, where the modern industrial core was consolidated, but failed in neighbouring Argentina.

In general, notable changes took place, but they brought new problems. Full employment disappeared as efficient technology was introduced and, as production was oriented towards fulfilling the demands of high- or medium-income sectors, the productive and social fabric began to change, becoming polarized. In particular, this second stage did not solve the balance of payments problems and generated a

new kind of 'dependence', a word with more precise political connotations, which in the 1970s, began to replace 'development'.

The population, which had grown moderately throughout the nineteenth century – with the exception of the areas of mass immigration – expanded dramatically between 1930 and 1940. Mortality, which was traditionally high, plummeted owing to the combined effects of antibiotics, insecticides and vaccination programmes, which eradicated malaria and other epidemic and endemic diseases. This completed the task begun at the beginning of the century in the large cities with the installation of sewage systems and running water. The naturally high fertility rate remained higher than expected and, except in the case of the societies of the Southern Cone, where 'demographic transition' did occur, was unaffected by improvements in living standards or the migration towards the cities. Between 1940 and 1970, the population of Latin America grew from 126 million to 278 million, the highest growth rate in the world, exceeding even that of sub-Saharan Africa. Only in the last two decades has the growth rate slowed somewhat. The effects of the population explosion, and particularly the existence of large cohorts of young people demanding education, employment and services, were numerous and gave rise to conflicts and changes, many of which were already latent in the archaic Latin American system.

In the more traditional rural areas demographic pressure on the land, which was unable to provide a living or even a home for these new contingents, became evident. This problem was aggravated as the capitalist sectors or simply the large landowners rapidly encroached upon the land still held by indigenous communities. This led to violent conflicts. The indigenous world, which until that point had remained isolated and protected, began to suffer all manner of assaults at the hands of modern society – roads, communications, market forces, state regulations – all of which eroded the ancient community links. Political demands also emerged. As in Mexico at the beginning of the century, the *campesinos* in El Salvador, Bolivia and Peru rallied together and demanded to be taken into account, becoming political agents in their own right.

The 'land reform' proposal incorporated all these demands in an ambiguous and contradictory programme. This reform would transform the old agrarian world, affecting both the *campesino* communities and the inefficient, patriarchal landowners who embodied the 'colonial heritage'. This transformation was to turn the rural environment into the great engine of economic development and, at the same time, the sphere where the traditional *campesino* claim to the land would be satisfied. This was one option; in Bolivia, as had occurred earlier in Mexico, these demands were heeded, sacrificing development and even an effective means of keeping the *campesinos* themselves on an inadequate area of land. In other places, such as El Salvador or in Chile under Pinochet, modernization along capitalist lines further hastened the expulsion of the *campesinos*.

The agrarian frontier advanced, encroaching upon new lands, such as the Amazon, which was invaded by Brazil, Bolivia, Peru and Colombia at the expense of the backward, traditional indigenous populations. Perhaps the most efficient and productive agricultural frontier was the cultivation of coca leaf, and more recently poppies, stimulated by the drug trade. Strictly speaking, this has been the most successful export in the latter part of the twentieth century. The benefits reached the *campesinos*, but the price to be paid was that of increased conflict and violence, settled by large armed organizations where the traffickers mingled with ex-guerrilla fighters.

The solution to these conflicts frequently involved an exodus to the cities, which grew significantly as a result. By the end of the twentieth century, 40 per cent of the total population lived in towns of more than 20,000 inhabitants. At first, expulsion from the land was aided by the attraction of finding industrial employment, and later simply the possibility of surviving by doing odd jobs or in the vast 'informal' economic sector, but the exodus was primarily a response to the increased expectations generated by the city itself. However wretched life might be there, urban poverty, which might include possession of a television set, was infinitely more attractive than the prospect of traditional rural poverty. This was not merely an individual decision. In Peru, whole mountain communities carefully planned their transfer to one of the hills around Lima. In other cases, relatives or neighbours summoned new migrants and together they used the tactics of their old subsistence culture to help them in the difficult task of making their way in the city.

In cities such as São Paulo, Mexico City, Santiago, Caracas and Buenos Aires, the slums and shantytowns spread so that the population explosion took the form of concrete and tangible problems. The water, electricity, sewage and hospital services were inadequate for the number of inhabitants of the 'young towns', perhaps so-called because the number of young people was the most outstanding manifestation of the population explosion. Also, there were not enough jobs, and the growing demands on the education system could not be satisfied. They could legitimately be called the urban masses; there were many of them and, apart from the bodies representing the traditional industrial workers, their organizations were not too visible.

Politics underwent profound change. The populist politics of Vargas in Brazil (1930–45 and 1951–54), and Perón in Argentina (1946–55), meant involving the masses from a position of power, giving in to some of their demands, anticipating others, all the while controlling and containing them. Their example was followed by many in different ways, but in every case it proved to be a way of involving the working class as citizens and members of society. This policy often went hand in hand with nationalism. The all-embracing slogan of nationalism was nurtured by traditional anti-imperialism, which had developed in the period between the wars and during the post-war period, but it was mainly a proposal for the effective integration in national life of diverse, splintered societies, such as those where the indigenous communities had reached the twentieth century as vigorous, coherent societies. In many instances, these nationalist, populist policies aimed to mobilize and integrate the traditional *campesino* classes, as the Mexican Revolution had done. This was the aim of Arbenz in Guatemala, the MNR in Bolivia in 1952, and the Peruvian Revolution in 1968.

However these elements were combined, the role of the state was a preponderant one. It had both to foster the organization of workers and *campesinos* and at the same time to control them, promoting social policies and redistributing resources where these were abundant. The state's legitimacy derived more from the democratic forms of plebiscite than from the more traditional forms of liberal

constitutionalism, which were pushed to the limit and then rejected, as occurred in Vargas's *Estado Novo* in 1937. In most cases the Armed Forces acted as guarantor for these political experiments and for the leaders, who behaved more like chieftains than representatives of an institution. They were often described as dictators and they probably were (Map 14). In the second half of the 1950s, many of them fell from power: Perón in Argentina, Rojas Pinilla in Colombia, Ibáñez del Campo in Chile, Pérez Jiménez in Venezuela. The age of the great civil parties had arrived. Democratic Action (Acción Democrática) in Venezuela, National Liberation (Liberación Nacional) in Costa Rica, the Christian Democrats (Democracia Cristiana) in Chile. They took on the responsibility of channelling development and reform along democratic lines, at the same time erecting a stout barrier against communism, opposition to communism being the primary demand of the United States. In Peru, another great party (APRA), under the leadership of Víctor Raúl Haya de la Torre, also aspired to meet this demand, but failed. APRA had arisen earlier as a popular, nationalist, anti-imperialist movement and it attempted to adapt to the prevailing climate by becoming the champion of democracy and anti-communism. However, it did not succeed in overcoming the disapproval with which it was traditionally regarded by the military establishment.

The political scene changed dramatically with the Cuban Revolution, led by Fidel Castro in 1959. Shortly after the triumph of the revolution, the unyieldingly hostile policy of the United States threw Cuba into the Soviet camp, hastening the adoption of the Soviet socialist model. The results were, and still are, subject to interpretation. The great achievements in the fields of education and health care or the democratization of social relationships were not accompanied by significant successes in the field of growth or even in the diversification of the economy. However, for a long time, revolutionary Cuba exercised a tremendous influence on the political imagination of the region, offering an alternative both to the old regimes, which still survived in many places, and to the lukewarm proposals for reform. Furthermore, it offered a practical alternative, rural guerrilla warfare, the insurrectional cell, which was extremely attractive at the time of the Viet Nam War or the student unrest in France in 1968, or in the atmosphere of post-Vatican II, which proclaimed its support for the poor and was interpreted by many 'Third World' priests, such as the Colombian Camilo Torres, as an invitation to join specific struggles. Rural guerrilla warfare took root in many places – Colombia, Venezuela, Peru, and in a number of places in Central America – adding a new dimension to old social conflicts. Then urban guerrilla warfare made its appearance in Montevideo, Buenos Aires and São Paulo. In 1970, this same trend inspired the Chilean democratic left under President Salvador Allende to draft a project for a democratic transition towards socialism. The Cuban message was also present some time later in the 'Sandinista' movement, which triumphed in Nicaragua in 1979, as well as in the Salvadorean and Guatemalan guerrilla movements. In the 1970s, the latter succeeded in mobilizing the *campesino* communities, thus bringing down upon it fierce military repression that was denounced by Rigoberta Menchú, who won the Nobel Peace Prize in 1992. Echoes of the Cuban message are even apparent in the demonic Shining Path (Sendero Luminoso) Movement in Peru,

which isolated the component of pure violence from the more general humanistic proposals, which had inspired the original ideas.

There was a widespread wave of discontent, generated perhaps by dissatisfaction born of promises of development, agrarian reform or democracy, which had remained unfulfilled. Parallel to this, the armed forces set themselves up in every country as the custodians of what, under the influence of the United States, was called the 'ideological frontier', which allowed the enemy to be singled out on the ground and hunted down until annihilated. Such military repression resulted in death, torture and exile on a massive scale, in Brazil after 1968, in Uruguay and Chile after 1973 and in Argentina after 1976.

## The crisis

Throughout the 1970s, Latin America suffered the impact of the oil crisis and then the forced debt crisis in which governments found themselves immersed. Caught in the vice-like grip of a debt which it was impossible to pay, states were defenceless and powerless, being obliged to yield before the decisions of their creditors, coordinated by the International Monetary Fund, at a time when the restructuring of the capitalist world was forcing individual national economies to eliminate tariff barriers. Whole productive sectors succumbed in this confrontation, particularly the industrial sector, while the institutions which had grown up under the welfare state were dismantled by that very state, sometimes with the backing of market forces and sometimes using terror tactics.

While the various national economies thrashed about aimlessly, their respective societies, which had been invigorated by the successive waves of transformation occurring throughout the century, entered a decline that led to a sharp polarization within society, where a small but not insignificant percentage of the population managed to adapt to the new conditions, whereas large sections of society were marginalized. This change is most apparent in the big cities. The great metropolises grew in spectacular fashion, and there are few cities anywhere in the world as huge as Mexico City. The word metropolis has been replaced by the word mega-city to describe this new reality, since inter-city spaces are being gobbled up as the cities grow, soon to merge into one single, sprawling conurbation. This is what is happening along the Argentinian coast from Rosario to La Plata and in Chile between Santiago and Valparaíso. At the same time, urbanization is accentuating the gap between two worlds: on the one hand, the world of those whose high purchasing power allows them to follow the trends prevailing in the global society and, on the other, the vast universe of poverty, unemployment, deprivation and defencelessness. All the things, such as shared education, health-care systems, and even safety and the law, which in more prosperous times had contributed, albeit incompletely and with difficulty, towards social integration and expanding the middle classes, are now split between those services which are adequate for those who can afford to pay for a private clinic, school or private security services and those who must make do with what can be provided by an increasingly niggardly state ever less concerned with the common good. The paradox is that this separation is occurring alongside the tremendous levelling process being generated throughout

the world by the latest technological revolution, the inhabitants of the most exclusive residential suburb and the poorest shantytown hovel may all be watching the latest CNN news broadcast at one and the same time.

Little is known about how social links are rebuilt in the world of the deprived where so many things, from schooling to membership of trade unions, no longer make any sense. Perhaps conditions are ripe for traditional social patterns and survival mechanisms carried over from a not too distant rural experience to flourish. Maybe new forms of religiosity, from basic Catholicism to Pentecostal movements or myriad other rites, will fill the space occupied until recently by political organizations. What we do know is that confidence in the forms of political relations based on liberalism and democracy will not take root easily in such societies.

During the 1980s, Latin America witnessed a vigorous pro-democracy movement, particularly in those countries that had suffered the most under terrorist dictatorships, such as Argentina, Uruguay, Chile and even Paraguay. In many cases, alongside this trend, we find that civil society managed to recover the initiative once again, but this honeymoon did not last long. Dialogue broke down, and from the midst of some of these very societies authoritarian regimes found massive support – as in Peru, for example – whereas elsewhere society grew indifferent to governments which, for their part, shamelessly paraded the corrupt conduct that had previously been practised, on a smaller scale or with greater discretion. Lack of interest in democracy was compounded by a passive questioning of the legitimacy of governments similar to that encountered by the Partido Revolucionario Institucional in Mexico, which was impotent to deal with the challenge posed by the *campesinos* of Chiapas. For the first time its wretchedness has been paraded in public for all to see. Equally representative of these new times is the armed movement accompanying the voice of the *campesinos*, using the name of Emiliano Zapata, which declares that it does not aspire to take power (1970s), but merely to construct a new structure of political relationships. In this, as in many other areas, the uncertainties facing Latin America as it approached the end of the century far outnumbered the certainties, and the prospects are tinged more with anguish than with hope.

## SCIENCE AND TECHNOLOGY

Without going back too far in time, though far enough to get a perspective on the changes that have occurred, it can be said that preoccupation with scientific matters, their significance and repercussions is evident from the early nineteenth century onwards. One of Simón Bolívar's central arguments justifying the emancipation of the colonies was that the metropolis did not allow them to engage in science. This same argument was put forward in several other countries. The alternatives stemming from the civil wars and efforts to consolidate the nation-state are possible explanations for their backwardness compared to the momentum of the Age of Enlightenment seen elsewhere. The modest scientific efforts undertaken, mostly aimed at catching up but including some original contributions, were totally overshadowed by the processes of political organization and the structuring of the universities. Because this is a matter of some importance, it must be pointed out

that, despite a number of attempts in that direction, in Latin America there was no equivalent of the Industrial Revolution, which, at this time, was transforming productive structures in Europe. Neither is it fortuitous that the proponents of an 'industrial' policy for Latin America, such as Sarmiento in Argentina and others, also demanded a scientific policy based on the modernization of existing institutions, the creation of new ones and the recruitment of foreign academics, particularly in the field of natural science.

However, the need for professionals helped shelve basic scientific research, which was nearly always limited to individual efforts or concentrated in inherited or poorly maintained establishments. Nevertheless, it did help alter the cultural climate to some extent, making scientific activity more accessible and sensitive by giving it a certain growing social prestige. On the other hand, in the production and service industries the boost was less significant. Perhaps the incentive derived from the transformation or creation of museums, setting up of astronomical observatories, founding of botanical gardens and laboratories, activities in the field of natural science, and marking of national boundaries – all activities having greater impact at that time. Scientific periodicals in Spanish were scarce, as was the space devoted to science in the press generally. This lethargic situation began to change as the ideas of positivist philosophy linked to 'modernization' began to circulate, and railways, regarded by some as the 'engine of progress', and certain mining and, to a lesser extent, manufacturing activities linked to the transformation of local raw materials began to make their appearance. It should also be remembered that the controversy surrounding the theory of evolution caught the interest of a much wider public than usual.

In very general terms it may also be said that during the early decades of this century scientific research was shelved owing to the lack of flexibility evident in the focus of the universities, which adapted their professional outlook in response to the immediate needs of society and the state. Contrary to general belief, imports of increasingly complex machinery and equipment did not necessarily create the right conditions for local scientific and technical development to get off the ground. In fact, such imports were often instrumental in weakening and postponing such development. During the boom years of apparent prosperity, when imports were encouraged, a pragmatic, utilitarian attitude evolved that worked against the development of scientific research in the long term. On the other hand, certain favourable circumstances should be pointed out. One example is the incentive provided by foreign institutions, which were not always disinterested in their motivation by any means and, in some cases, whose intentions were clearly political. This is true of the contribution made by Germany in the period between the wars to the establishment of an important school of physics at the University of La Plata in Argentina. Germany sent excellent teachers and provided scholarships for postgraduate study. This case has been thoroughly studied and the conclusions may shed light upon other similar situations. After the second post-war period, 'development' ideas triumphed. Owing to their excessive economic bias, they assumed that science and technology would be a natural by-product of development.

Another significant factor was the gradual professionalization of university teachers, which, with the arrival of full-time positions, allowed teachers to devote

time to scientific research. The growing prestige of the natural sciences and advances in medicine, opening up promising avenues of research, fostered the creation of highly specialized institutes that gave rise to the three Argentinian Nobel Prize winners: Bernardo A. Houssay (1887–1971), who won the Nobel Prize in 1947 for his research on the functions of the hypophysis (pituitary gland), including its relationship to hydrocarbon metabolism; Luis Federico Leloir (1906–1987), who won the Nobel Prize for Chemistry in 1970 for his outstanding contributions to understanding the functions of enzymes in the synthesis of polysaccharides; and César Milstein, who won the Nobel Prize in 1984 for his research into monoclonal antibodies. These scientists, along with many other names that might be added, show that the state of Latin American science was often on a par with science abroad.

Gradually a number of institutions arose in Latin America whose aim was to promote activity in basic science: the Asociación Argentina para el Progreso de la Ciencia was founded in 1934, and in 1945 began to publish an important scientific journal, *Ciencia e Investigación*; the Sociedade Brasileira para o progresso da Ciência was founded in 1948; and the Asociación Venezolana para el Avance de la Ciencia (ASOVAC) was founded in 1950. Although, from the second decade of this century onwards, some scientists had already begun to warn of the need to promote science and organize and institutionalize scientific activity, these organizations did not begin to emerge until the middle of the twentieth century. The Conselho Nacional de Pesquisas (CNP, Brazil) was founded in 1951; the Consejo Nacional de Investigaciones Científicas y Técnicas (Argentina) was founded in 1958. Mention must also be made of the appearance, during the following decades in a number of countries, of higher technological institutes associated with research in the fields of agriculture, oil, and atomic energy. The boom in such dynamic branches of science as physics and biology was not unrelated to this climate.

Owing to the financial support provided for these fields and the fixing of priority subjects, the strong European and North American influence was felt not only in activities geared towards physics and the natural sciences, but also in the social sciences which, after the Second World War, attempted to achieve intellectual independence and establish their own personality somewhere between Germanic philosophizing and the pragmatic approach of North America. Specific problems, incompatible with the criteria and orientation imposed by the central countries, prompted this search for autonomy. The so-called population explosion and the model of urbanization, which occurred in Latin America, called for explanations, which the hypotheses and arguments used until that time could not supply.

Whereas foreign academics continued to arrive until the second post-war period – expelled from the Old World as a result of the First World War, the 1930s crisis, the racial and political repercussions of the period between the wars, the Spanish Civil War and the Second World War – this trend was reversed after the middle of the century, and a constant brain drain of considerable proportions was established in the opposite direction. This trend coincided with the growing number of military dictatorships in Latin America, the recovery of the central countries and the spectacular advances in several fields of science and their applications.

The influx of foreign technology also became one of the greatest hindrances to state and private investment in research and development. Great debates concerning the economic and political significance of this trend began then and are still going on. The conclusions reached almost always went unheeded by the business sector, which preferred to go abroad in search of technology, processes and patents.

UNESCO's *World Science Report 1993* carries a valuable study showing the present position of Latin America in relation to other regions, indicating the main problems, analysing budgets, and attempting to quantify scientific production as well as the most important obstacles. 'The progress of science in Latin America is being hampered by a scarcity of human resources, a marked lack of economic resources, the relative isolation of researchers in certain fields of knowledge which are only slightly cultivated, and limited regional and international scientific cooperation'.[1] The lack of human resources, the study continues, is due to three main factors: deficiencies in the education system, scarcity of scholarship assistance and low compensation schemes.

For a number of reasons, scientific and technological research, particularly at basic levels, has lost the vigour that was generated during the twenty years following the Second World War. The evidence of the twentieth century so far shows that the role of private enterprise is almost insignificant and, in view of investment trends, there is no indication that the situation will improve.

Two fundamental factors emphasize the worrying importance of this matter on the eve of the new millennium; the first is the ever-widening breach between the developed countries and the rest of the world, and the second is the growing role of science and technology in the transformation of society. In recent years, both these subjects have generated an abundance of stimulating publications, particularly national and regional studies, as well as other studies of a doctrinaire nature, which have an important contribution to make in the definition of problems and the search for responses to them. We shall simply recall, among other previous works, two valuable collections published by UNESCO, which provide an excellent theoretical starting point. The first of these is *Science and the Factors of Inequality: Lessons of the Past and Hopes for the Future*, written by a broad-based group of intellectuals and compiled by Charles Morazé (1979);[2] and the second is *Domination or Sharing: Endogenous Development and the Transfer of Knowledge* (1983), which reflects the spirit of UNESCO when it says that 'the concept of endogenous development has its place in UNESCO'S programme as a major forum of reflection with regard to the complex and many-sided process of development'.[3] It continues: 'If development is to fulfil people's expectations, it cannot be patterned on an outside model; it must be achieved in accordance with goals and methods freely chosen by each individual society, care being taken to ensure that transfers of knowledge in the social and human sciences, as also in technology, do not impede endogenous development, but, on the contrary, help get it off the ground. With this end in view, the exchange of knowledge should prevail over the mere transfer of knowledge, which runs the risk of producing effects of domination'.

Recent developments in the fields of communications, genetics, physics, and above all developments in the field of

nature conservation, update this discussion in a most dramatic way, highlighting the ever-present risk of Latin America being once again left by the wayside in this new and profound, multi-faceted revolution.

## CULTURE AND THE ARTS

Early in the nineteenth century, taking up an idea that had already made its appearance in the previous century, some thinkers, such as the Argentinian E. Echevarría and Andrés Bello, realized that there was no automatic link between political and mental emancipation. Neither was it enough to reject outmoded colonial ways. It was necessary to rediscover both the geography of Latin America and its human inhabitants in their own right rather than in relation to Europe. Criticism was drafted using tools of European origin, which hindered comprehension of what was characteristic and original. The great challenge was to find different perspectives and to recognize the need to devise new instruments or models, in short, to find an appropriate language. José Luis Romero, a historian, maintained that one of the greatest obstacles always encountered is that of studying new phenomena using old classifications. This is particularly so when change is rapid. The challenge here was to apprehend a 'new world', which was complex and variegated, with all that implies. From the Enlightenment onwards thinkers, artists and sensitive individuals strove, not always aware of what they were trying to achieve, to perceive the originality of the society that was emerging, and to anticipate the course it would take. To do so, it was necessary to abhor 'tradition'. In other words, discovery of reality and assimilation of European trends were interwoven. The critical spirit is strengthened when it is applied in greater depth to creative analysis.

Furthermore, both the Spanish and Portuguese languages were infiltrated by words and expressions taken from the indigenous languages that, in vast regions, have survived up to the present time and, as they are spoken by large numbers of people over a huge area, cannot by any means be regarded as isolated linguistic pockets. Even today, more than five hundred years after the encounter between these two worlds, there are still people who dream of recovering languages such as Quechua or Guarani, to mention only two; we are aware that a rich popular literature exists in these and other indigenous languages. The controversy does not end here. Rather, it is being reopened, in view of the magnitude of the migrations from the country towards the city and of the fact that culture is still not playing the integrating role that was expected of it.

The environment in which this process developed was not satisfactory – geographical dispersion, marked social differences, apparent in high illiteracy rates and a predominantly rural population. This should not be regarded merely as a confrontation between the country and the city but as an attempt to find a synthesis demanding a more uniform society and greater cultural consistency. The perception of the world was also undergoing change; science, initially natural science, was bringing secularization and modernization along in its wake. All this generated great tensions which, it was assumed, could be mitigated by an acculturation process fostered by national policies for integration and education, which would rescue people from marginalization and exclusion, turning them into citizens, producers and consumers.

The size and complexity of a continent such as Latin America as well as the transformations it has undergone defy any attempt to divide history into periods. The divisions used to mark out historical, economic and political events have not always proved useful from the cultural point of view. Some years ago, in an attempt to find a method appropriate to the study of this cultural process, we developed a criterion which, in our view, aids understanding. The periods generally known as the 'colonial period' and 'independence' seem over-schematic and rather vague. They also carry strong connotations of backward traditionalism. In our opinion, cultural development may be divided into three broad areas, namely: imposed culture, accepted culture and criticized culture. The first category, that of 'imposed culture' coincides in general terms with the colonial period, but it outlives that period because it continues beyond the historical division usually made at the beginning of the nineteenth century. The idea of an imposed culture lived on until political emancipation was attained. In the case of Cuba this was at the end of the century. In Brazil, events developed differently from Spanish-speaking countries; slavery was abolished late (1888), the monarchy was abolished the following year, and Brazil made an atypically peaceful transition to a republic. During this period, the prevailing models and values came from outside and the policies implemented were designed to benefit the metropolis. The second period, which we call the period of 'accepted culture', coincides with the beginning of emancipation in the majority of Spanish-speaking countries. This period, which economists were later to call the period of 'outward growth', is marked by closer ties with Western Europe and the United States, whose models, values and fashions were generally accepted as prestigious, and there was little concern with making them compatible with a different reality. The third and final period is that of 'criticized or disputed culture', when the values formulated and accepted during the previous period were gradually rejected, while the ideology of those who denied them was recovered.

Gradually the so-called 'modernizing elites' took the Latin American stage. Their gods were unknown during the previous century – the railroad and in particular the locomotive, steamboat, telegraph and telephone – but they also worshipped something which was more human, although abstract, an implicit project for 'outward growth' which involved joining the international marketplace, where the pound sterling and the gold standard were venerated. This gave rise to relative economic stability often at the same time as economic growth, which attracted waves of investment capital and people. By adopting the ideology of economic liberalism, these countries set out along the road to a kind of 'normality'. They tried to make this ideology compatible with paternalistic and oligarchic attitudes and even with slides into dictatorial and authoritarian regimes, such as that of Porfirio Díaz in Mexico or Antonio Guzmán Blanco in Venezuela. These were the years of 'strong governments', and in almost every case it is apparent that the number of foreign loans increased and public works projects flourished; bridges, roads, public lighting, sanitation projects, railway stations, ports, monumental buildings and parks were built, works of art were acquired abroad, and bad taste abounded among the new urban sectors. The

economy showed the influence of Britain, and France left its mark in the field of culture. That is why there was so much talk of 'efficiency' or 'profit' in the former case and of 'fashion' and 'good taste' in the latter.

At first sight these countries seemed peaceful and prosperous. In any case, these were times of order and promising prospects rather than times of freedom. From afar they offered an immense cornucopia. The ruling classes had allowed themselves to be carried away by the 'madness of speed', as the saying went at that time. Some of them were said to believe that 'Enlightenment is the true engine of progress', which explains the constant preoccupation with educational legislation that was rarely implemented. Inevitably, modernization affected daily life – the home, clothing and entertainment – and people read books and magazines, which they had never done before, and the reading public grew. However, some sensible people murmured under their breath, 'So much luxury and so little social well-being'. In their day, the Mexican Revolution and the University Reform, which started in Córdoba (Argentina), sounded notes of warning, albeit of varying intensity. Criticism of positivism grew.

The renewal of Spanish-language poetry and prose owes a great deal to this movement, which introduced innovations in both vocabulary and syntax. Leaving to one side the best-known forerunners, the most outstanding exponents were the Nicaraguan Rubén Darío and the Uruguayan José Enrique Rodó. It is a strange paradox that these two men from small countries should stretch the limits of the American continent perhaps to an extent unprecedented in our cultural history. But it would be wrong to think that modernism, which a few decades later would in turn be exhausted and reduced to artificial refinements that would be dispersed by the vortex of the avant-garde movements, was strictly a literary movement. It also left its mark in other fields such as painting and music. Some interesting expressions are still to be found on the jackets of many books published on both sides of the Atlantic that preserve for us that style, which we now find melancholic, that has left its mark on homes, furniture and ornaments that have survived real-estate speculation and auction fever.

As we have already pointed out with regard to many other areas, there is a significant difference in chronology between cultural development in Brazil and the rest of Hispanic America. It was some time later that a vigorous, but distinct, form of Brazilian 'modernism' made its presence felt at the now famous Semana de Arte Moderno de São Paulo in 1922. This event ushered in a period of particularly intense cultural activity and aimed to break with the conventions and academic attitudes prevalent at the time. Its effects were felt in literature as well as in music and the visual arts. The way was prepared, among other things, by the translation into Portuguese of the most significant documents of the avant-garde movements of the Old World. This was due primarily to Oswald de Andrade who, together with Manuel Bandeira and Carlos Drummond de Andrade, are normally regarded as the foremost exponents of this movement, which reveals a strongly anti-traditionalist and non-conformist attitude, rejecting the past in the name of a future full of grandeur and repudiating European artifice. Two quotations, taken from Jean Franco, illustrate this position. Rejecting the sway of linguistic conservatism and in support of the renewal of the language, Manuel Bandeira calls for: 'Every word, particularly universal

barbarism. Every construction, particularly abnormal syntax. Every rhythm, particularly those which shun metre'. For his part, O. de Andrade says: 'What are we, people of a thousand origins who have disembarked from different ships, but futurist? We cannot be otherwise.' This attitude is expressed effectively but with humour in the *Manifiesto Antropófago*: 'tupí or not tupí. That is the question'. In the opinion of Ana Pizarro, in the field of the visual arts this attitude is reflected in the famous painting of Tarsila do Amaral, *La negra*.

A significant fact is that the supporters of this nationalist 'modernism', who rejected literary regionalism, were receptive to the growing influence of 'naive' painting and the development of dance music, with its existential rhythms, which are rich expressions of the Brazilian spirit.

In a number of his works, the famous Brazilian critic Antonio Cândido focuses our attention on and analyses the turning point in Latin American cultural life that took place early on with the formulation of optimistic assumptions based on the idea that these were 'young countries', i.e. societies, whose future looked promising, that would be capable of overcoming the difficulties and constraints hampering the development of a bright and fertile future and, on the other hand, the pessimistic anguish born of the realization, already apparent before the middle of the century, that ours are underdeveloped or, more charitably, developing nations. The challenges to be met in the first instance were many, but it was assumed that with optimism and good will these obstacles could be overcome. However, during the second stage the evidence was more disheartening. If some literacy campaigns were relatively successful, these triumphs did not always lead the newly literate to the world of written culture. Instead, and this is shown convincingly by A. Cândido, they fell almost straight away under the influence of radio broadcasts, comics and television. The newly literate remained in a cultural limbo, because they were bereft both of the traditional values and of those that were considered necessary for modernization.

## Literature

Sometimes an apparently incidental comment may reveal a great deal about a situation. Rosalba Campra, in *America Latina: l'identità e la maschera*,[4] relates how in 1960 Roger Callois advised the publisher Gallimard to eliminate the collection *La Croix du Sud* because it had been successful and so was no longer necessary. It was now a part of world literature and should therefore be included in the collection *Du Monde Entier* along with German, Italian, Japanese and North American books. If we are to judge by these remarks, a literature with specific traits had managed to join the mainstream of world literature. In fact, and here the pioneering work of R. Callois must be recognized, this observation reveals a profound change in the importance attributed to Latin American literature, which, through one of the 'cultured languages' of the period, had triumphed and been consolidated. It was no longer necessary to resort to geographical limitations or adjectives or to stress the exotic nature of the works in order to attract readers. In other words, it had overcome its geographical 'confinement'. During the twenty years from 1940 to 1960, the books by a number of authors bore witness to the fact that they were on a par with the best literature being produced anywhere

in the world. 'Segregating' them was therefore not only useless but also even harmful; the reading public and literary critics had already consecrated them alike.

The same may be said of music and the visual arts, although the time scales do not coincide, sometimes anticipating literary movements and sometimes developing later. In the simplest of terms, it may be said that from the First World War onwards, artistic and literary activity in Latin America underwent a profound change: although it continued to be receptive to influences from Europe and North America, it gradually consolidated its own identity which had been developing for several decades. However, it must be recognized that the many *avant-garde* movements from Europe and North America played a leading role from the critical point of view and in the sense that they provided new instruments which helped strip language of old academic trappings and cramping regional movements, allowing new devices to be adopted which, as well as being more original, were also, and more importantly, more authentic.

Without committing the unpardonable offence of omitting the forerunners, clearly a series of socio-economic and cultural factors promoted this change in the cultural climate: a strong trend towards urbanization, a significant reduction in illiteracy rates, the emergence of a new public and the appearance of the means to transmit and broadcast to the existing public, i.e. the establishment of a publishing industry and later the appearance of radio and the recording industry, followed in more recent times by cinema and television. The range of themes gradually expanded and perspectives broadened. It was not merely a matter of portraying rural problems from this or that region or questions raised by the indigenous people in this or that country, the formation of new social groups such as the middle classes, or typical political manifestations such as the existence of dictators. These topics triggered a vast literary production, some of which is of outstanding quality and lasting value. The most salient point is that the aesthetic quality of these works imbued them with a universality, which is all the more significant since they did not set out to achieve it. The artistic yeast had acted as a kind of enriching alchemy.

Another possible method of assessing the importance of Latin American literature would be to enumerate the number of Nobel Prizes won by writers from the region: Gabriela Mistral (1945), Miguel Angel Asturias (1967), Pablo Neruda (1971), Gabriel García Márquez (1982) and Octavio Paz (1990). However, a more effective indicator would probably be to recall that the works of Jorge Luis Borges, Pablo Neruda, G. García Márquez and Octavio Paz are held in great esteem in the halls of universal literature. Not only have they been translated into numerous languages, appearing in the catalogues of the great publishing houses the world over and in academic syllabuses but, more significantly, they have been and continue to be influential. This is confirmed by the number of imitators to be found beyond the confines of the continent. To mention only one, Jorge Luis Borges, who did not receive the Nobel Prize, is a compulsory point of reference in every literary circuit and has numerous 'imitators' from Japan to Germany.

This is not the place to record the history of or even to outline in detail, the most outstanding manifestations of Latin American literature, whether for its intrinsic values or its universal interest. To do so would require us not only to distinguish between a number of movements, which are not always easily distinguishable, but also to provide a summary of the personal development of the various authors, situating them in relation to events in each country and period. It would also be necessary to follow up local influences as well as those coming from beyond the confines of the American continent, the role of the critics, the existence of magazines and publishing houses as well as the changing nature of the public, whether in number, location or tastes. There are also eclipses and rediscoveries, which are not always easy to explain. Consequently, we have opted to select a small number of names, all of whom are true milestones, whose works are known through numerous translations, and the studies dedicated to them. Furthermore, they have already earned their place in world literature and constitute a compulsory point of reference in any conscientious study of cultural development during the twentieth century. We have therefore chosen a sequence that shows the dynamic current running through different nations, periods and a variety of aesthetic movements, quoting only essential dates and, in most cases, mentioning only one work which, in our view, may be regarded as the most significant.

On the other hand, and almost simultaneously, a series of other novels appeared which are today regarded as 'classics', both on account of their lasting value and because they enriched, often in a sensational way, knowledge of the Latin American countryside and its inhabitants in their various dimensions, drawing back veils which had hampered in-depth knowledge of life on the tableland, in the jungle, on the savannah and the pampa, portraying the existence of blacks, Indians, immigrants, rural workers, rubber trappers, miners, fishermen and lumbermen. These were works of exploration, which helped assemble the variegated jigsaw puzzle contributing to a better understanding of these societies. Although some of these novels and short stories were regarded as examples of social, regional or *costumbrista* literature, hindsight shows that they made a valuable contribution to the integration and cultural maturity of the continent. This may explain why today many more recent works sail freely through the waters of universality bearing Latin American flags.

By classics we mean: the novels of Venezuelan Rómulo Gallegos (1884–1969; *Doña Bárbara*, 1926); Colombian José Eustasio Rivera (1888–1929; *La vorágine*, 1924); Argentinian Ricardo Güiraldes (1886–1927; *Don Segundo Sombra*, 1926); the admirable short story writer Uruguayan Horacio Quiroga (1878–1937; *Cuentos de amor, de locura y de muerte*, 1917, and his original *Cuentos de la selva para niños*, 1918). This list could be expanded to include Ecuadorean Jorge Icaza (1906–1978; *Huasipungo*, 1934: although its artistic merits are less outstanding, this classic denouncing the dreadful conditions of the Indian had a tremendous impact on public opinion); the influential Ecuadorean prose writers of the 1930s and Peruvian José María Arguedas (1911–1969; *Los ríos profundos*, 1958: this beautifully written work with its well-structured plot had a strong impact).

Ignoring divisions into generations or schools as well as classifications weighed down by superfluous subtleties, we ought to mention some outstanding names, which, in our view, paved the way for the 'boom' (in Latin American literature, this term refers to the increase in the number of works translated from 1960 onwards, which had a great impact on European and North American readers and critics alike). These were, among others, prominent figures such as Guatemalan Miguel Angel Asturias (1899–1974;

*El señor presidente*, 1946; and *Hombres de maiz* three years later; his early work *Leyendas de Guatemala* merited a prophetic letter from Paul Valéry); Cuban Alejo Carpentier, who coined the happy term, now so widely used, 'magic realism' (1904–1980; *El siglo de las luces*, 1962); Uruguayan Juan Carlos Onetti (1909–1994; *La vida breve*, 1950 with its exasperated realism where he founded the mythical and fictitious town of Santa María); and Cuban José Lezama Lima (1910–1976; *Paradiso*, 1960, regarded by a prestigious critic as a dazzling work).

These and other writers laid the foundations of the so-called boom, the outstanding figures of which were: Colombian Gabriel García Márquez (1928–2005), whose *Cien años de soledad*, 1967, perhaps one of the cornerstones of twentieth-century literature, is a world of magic and dreams where, in the words of R. Xirau, the story is told 'with a realism so precise and so raw that he transforms reality into legend without depriving legend of its charge of reality'; Argentinian Julio Cortázar (1914–1984), whose *Rayuela*, 1963, undertakes its aesthetic adventure in a spirit of innovation; Paraguayan Augusto Roa Bastos (1917–2005; *Yo, el supreme*, 1974); Argentinian Ernesto Sábato (1911–; *Sobre héroes y tumbas*, 1962); and Peruvian Mario Vargas Llosa (1936–; *La guerra del fin del mundo*, 1987). The above, who are all outstanding novelists, were equally significant as short-story writers. In this latter genre we must mention two great Mexican writers: Juan Rulfo (1918–; *El llano en llamas; Pedro Páramo*) and Juan José Arreola (1918; *Confabulario*), as well as Carlos Fuentes (1925–), who has also tried his hand as an essayist.

Contrary to a commonly held view, it was not only in the field of fiction that Latin American literature shone. There are a number of eminent essayists such as Mexican José Vasconcelos (1882–1959); Pedro Henríquez Ureña (1882–1946); Gilberto Freyre (Brazilian, 1900–1987); the unique stylist Mexican Alfonso Reyes (1889–1959); the vigorous and admirable Argentinian Ezequiel Martínez Estrada (1885–1964); the remarkable Venezuelan Mariano Picón Salas (1901–1965); the prolific Colombian Germán Arciniegas (1900–1999) and many others.

As the influence of the modernism of Rubén Darío and his most notable followers, such as Argentinian Leopoldo Lugones (1874–1938) and Uruguayan Julio Herrera y Reissig (1875–1910), waned, poetry fell into disfavour, symbolized by a famous sonnet by Mexican Enrique González Martínez (1871–1952), but was reborn under the strong influence of the avant-garde movements. A series of profoundly lyrical and highly expressive poets emerged with Peruvian César Vallejo (1892–1938; *Trilce*, 1922); Chilean Vicente Huidobro (1893–1948; *Altazor*, 1931); Chilean Pablo Neruda (1904–1973), whose *Residencia en la tierra*, (1933–37) is remarkably intense and moving, whereas *Canto General* (1950) attains a degree of splendour expressing the excesses of nature, humanity and the history of Latin America; the extremely refined Argentinian Ricardo Molinari (1898–1996); and Cuban Nicolás Guillén, who rediscovered the rhythms of Afro-America (1902–1989). Colloquial poetry had a great impact on a wider public. This is the case of Chilean Nicanor Parra (1914–) and Nicaraguan Ernesto Cardenal (1925). Outstanding among all of these are two great poets who were also great prose writers, although they never tried their hand at the novel. We are referring to Argentinian Jorge Luis Borges (1899–1986) and Mexican Octavio Paz (1914–1998). As

has already been pointed out, they are both extremely influential, and they both enjoy uncommon recognition on the part of the reading public. They have imitators throughout the world.

In centuries past the participation of women was scarce. The figure of Sor Juana Inés de la Cruz is really an exception. However, in this century a considerable number of women writers, particularly poets, have emerged. Among them are the Uruguayan poets María Eugenia Vaz Ferreira (1875–1924) and Delmira Agustini (1886–1914); Argentinian Alfonsina Storni (1892–1938); the Chilean Gabriela Mistral (1886–1937), perhaps the best known since she won the Nobel Prize; Dulce María Loynaz (Cuba); Brazilian Cecília Meireles (1901–1964). To these we should add, among others, the prose writer Venezuelan Teresa de la Parra (1891–1936). Belonging to different literary movements, they enjoy fame and recognition, as do the more recent generations. Nowadays gender differences are tending to disappear.

The space available prevents us from dealing in depth with another genre, the theatre. This medium is deeply rooted in both popular and high culture, and theatrical activity in spectacularly variegated forms may be traced all the way back through colonial times to the pre-Hispanic civilizations. The twentieth century has found expression in Latin America through a wide range of performance styles and surprising scenic forms, from the 'popular theatres', as non-professional theatres are known in some countries, to the most daring avant-garde creations involving highly sophisticated productions, and from experimental theatre to theatre for the masses. We shall mention only two names: Uruguayan Florencio Sánchez (1875–1910; with his forceful work *Barranca Abajo*, 1905); and Mexican Rodolfo Usigli (1905–1979; *El Gesticulador*, 1937; *Corona de sombre*, 1947 and *Corona de luz*, 1965). As in the rest of the world, the spread of the cinema, which attracted many authors and actors, was a great challenge, which forced the theatre to redefine its role. It is now emerging triumphant and renewed from this exercise.

Brazil also witnessed an intense and very interesting literary movement, similar in some respects to that which occurred in Spanish-speaking America. Although the Semana de Arte Moderna, to which we have already referred and which denied the past, aspiring to find nourishment in the European avant-garde movements, was a decisive milestone in the renewal of the arts and letters in general, the process would be incomprehensible if certain remarkable forerunners were not taken into account, even though they may belong to different aesthetic and ideological movements. Such is the case of Euclydes da Cunha (1861–1909), author of the classic *Os Sertões* (1902), described by Pedro Henríquez Ureña as 'a sombre tale ... powerfully and brilliantly told', or José Pereyra de Graça Aranha (1868–1931), author of *Canão*, 1902, and a supporter of the young participants in the Semana de Arte. In Mario de Andrade (1843–1945), whose work *Mucanaíma, o Héroi sem nenhum caracter* (1928) is a cornerstone, the movement found its most felicitous exponent and inspired creator, gifted with a sensitivity honed by national and popular motifs.

After the third decade of the century, the economic and political upheavals and intense debates that shook Brazil opened the door to a number of movements, which were looked upon in a new light. Among these was the recovery of the regional dimension which, to a certain extent, stood

in opposition to modernism, which was regarded as being too cosmopolitan. This movement produced great creative figures who managed to project their highly aesthetic works at national and international level. José Lins do Rego's (1901–1957) novelistic cycle on sugar cane, begun in 1932, is regarded by Jean Franco as one of the greatest works of this century. Graciliano Ramos (1892–1953; *Vidas Secas*, 1938, and other novels), continues to enjoy great prestige among critics and the general public as does Rachel de Queirós (1910–2003), and Jorge Amado (1912–2001), whose vast production has sometimes been weakened by his concessions to success. Jorge Amado enjoys great popularity on account of the numerous translations of his books, some of which have been turned into films.

João Guimarães Rosa (1908–1966) was the remarkable author of *Grande Sertão: Veredas*, which, with its 'powerful language and subtle expressiveness', and despite the difficulties involved, has been translated into numerous languages and is favoured by critics on account of the richness of its narrative form as well as its narrative perspectives; it has been compared to James Joyce's *Ulysses*. With great aesthetic sensitivity he takes up the popular and colloquial language of the *sertão*, giving it a universal dimension through his inspired linguistic alchemy.

In a shrewd essay on 'Latin American Literature and the Cultural Industry', the Mexican Carlos Monsivais observes that, after the discovery of popular themes and the appearance of literature on this subject, up to Eustasio Rivera, Rómulo Gallegos, Jorge Icaza and others, literature then moved towards social themes under the influence of the emerging middle classes. He adds that radio, the film and recording industries 'mass produce' certain cultural forms, which are despised by the elites. 'The public replaces the People' or, to put it more directly, *people* are replaced by the *public*. One of the results of this is banalization and, on the other hand, 'cinema idols, radio idols, record idols, concert or stage idols' emerge, promoted by the vested interests linked to the cultural industries with their capacity to colonize minds and invent new heroes: Batman, Superman, etc. Monsivais continues: 'Until then, the "truly popular" lay in the rural domain. From that point onwards, what is authentic has also arisen in the relationship between urban life and the cultural industry', a phenomenon which passed unnoticed for many years, as did another, no less eloquent, factor: 'the higher levels of instruction which go hand in hand with growing levels of misinformation'.

'In mass society, what was popular is perforce becoming a minority concern', concludes Monsivais, but not before issuing a warning that, 'although it may seem spectacular, literature is turning towards popular culture and creating towns like Gabriel García Márquez's Macondo or Juan Rulfo's Comala, which enrich our reality'.

## Publishing

The will to quantify is not exactly a Latin American virtue. This is revealed, among other things, by the fact that it is always difficult to find statistics that are reliable, comparable and relevant. This not inconsiderable obstacle makes it difficult to draw up long-term tables of the number of titles published, on what subjects, the size of the print run, the target public, as well as certain other information that would shed light on this most noble of activities. This deficiency is compounded when we look backwards in time to the nineteenth century. The very commendable contribution of bibliographers can in no way fill this vacuum, since their aims were quite different. Neither can we depend upon qualitative judgements, although they may help us establish some link between prosperity and cultural growth, with the proviso that automatic links, which might distort this complex subject, must be avoided.

The development of publishing must be related to the expansion of schooling, the desire to renew the education systems and the gradual rise in living standards, and also the emergence of an urban middle class in nearly every country. These conditions also promoted the search for a new public without disregarding the social groups that had hitherto constituted the reading public. One of the consequences of this was an exploration of the extreme ends of the market: luxury books for high-income groups and popular books to stimulate the growth of the new reading public. Different sales mechanisms were used for each sector, and the topics covered grew more diversified. Markets beyond the national frontiers were also explored.

The two world wars and the Spanish Civil War favoured the development of publishing in Latin America, which grew and matured in the same way as most other industries filling the gap left by imports. Very soon the companies, which had set up operations in the New World, became 'national', i.e. they began to include authors from the countries where they were based in their catalogues. Later they became 'Latin Americanized', which is to say that their 'stables' were enriched by authors and topics from those countries with which they established trading links. These links were strengthened by opening subsidiaries abroad or improving distribution. Outstanding examples of this process are to be seen in Argentina, Chile, and Mexico and somewhat later in Venezuela. Over time, the lack of a specialized graphics industry and of personnel in the fields of translation, layout, and proofreading was overcome. Some examples will serve to illustrate this somewhat abstract argument. The evolution of various collections shows how translations were gradually replaced by original works written in Spanish, as classic and modern Spanish-language authors were included. This promoted considerable integration.

The work of the Fondo de Cultura Económica in Mexico deserves a paragraph of its own on account of the repercussions that it had. In the initial stages it strongly promoted works in the field of economics, but soon included other disciplines, such as philosophy, anthropology, population studies, history, and Latin American classics. Its influence was so great that it even popularized many words drawn from the technical jargon of these and other disciplines.

The directors of landmark collections, which left an enduring mark on the history of our culture, include outstanding intellectuals from both sides of the Atlantic. Obvious examples are José Gaos, José Medina Echavarría, Francisco Romero, Pedro Henríquez Ureña, Luis and Felipe Jiménez de Asúa, Lorenzo Luzuriaga, Guillermo de Torre, Francisco Ayala, Amado Alonso, as well as many others.

From the middle of this century onwards, the number of publishing houses increased, as did the number of titles published and the size of the print runs. A parallel trend towards specialization is noted: children's literature, dictionaries, encyclopaedias, atlases, textbooks, scholarly

works, the sciences (particularly medicine, law, psychology), art and so on. All this implies a complex round of activities, which it is impossible to sum up, since it requires careful analysis. In any case, two significant experiences deserve a mention, however brief: the appearance on the Latin American market of Editorial de la Universidad de Buenos Aires, and on a more limited, strictly national, scale the achievement of Peruvian pocket editions, which managed to sell tens of thousands of copies of works at a series of 'festivals' when the first editions of five hundred or one thousand copies had still not sold out. Peru is a country with virtually no graphics or publishing tradition. The phenomenon was short-lived, to be sure, but it is certainly worth studying.

About the same time, the now flourishing Brazilian publishing industry began to take off. This process went hand in hand with the on-going trends towards urbanization, industrialization, literacy campaigns and, significantly, a real explosion in secondary and higher education. Here, too, the number of translations decreased in favour of original works. The standard of the graphics is quite remarkable. This is to be seen both in popular editions and in editions for the most demanding bibliophiles.

## Music

What is vaguely termed Latin American 'serious music' has not yet achieved the same impact on the international stage as Latin American literature. Perhaps folkloric and popular manifestations, the latter closely linked to dance, festivals and the more recent activities of the cultural industry which are dealt with in another chapter, have been more fortunate.

The initial difficulties encountered by musical development are understandable: tiny audiences and a lack of musical tradition; few concert halls or permanent, organized orchestras; in short, a lack of professionalization in the field. This was exacerbated by the ascendancy of first Italianate and later French fashions and the sway held by foreign concert virtuosi whose fame prevented local figures from emerging. In other words, although printing and literacy had somehow fostered the reading habit and created a new reading public of some size, these democratizing winds did not blow through the musical world until the middle of the twentieth century. Furthermore, the intermittent pioneering efforts were hindered by a dearth of musical scores and the critics' failure to understand the new trends. Official musical education and private music schools became strongholds of traditionalism, whether of the folkloric or Italianate variety.

However, after the 1920s, the academic approach began to break down for a number of reasons, such as the arrival of European immigrants and exiles; these events have not been properly studied. New reforming trends, such as the avant-garde movements, were then adopted and, as a reaction, cultural nationalism emerged. However indirectly, this fostered a sense of independence among artists which, in turn, created a new climate that eventually produced a number of composers and works of lasting value. These works are still included in the concert repertoire, appear in the record catalogues published in the Old World and are frequently broadcast by radio stations which specialize in this type of music. Luis Héctor Correa reminds us of this

when he points out that the *Encyclopedie de la Pléiade*, which specializes in music and appeared in 1963, did not have a single entry for Latin American music. This unpardonable omission is compounded by the fact that, as we are reminded by the same author, artists such as Heitor Villa-Lobos, Carlos Chávez, Silvestre Revueltas and many others already enjoyed international prestige and, at that time, their names appeared on concert programmes conducted almost always by Europeans who had chosen their compositions.

Parallel to this, a rich and original folklore was emerging whose roots were not solely Hispanic, as some scholars have tried to maintain, but authentic indigenous sources as well as the rich and highly significant contribution of so-called 'black music', i.e. the music of African origin brought by the millions of slaves uprooted from their homeland whose meagre luggage often included some musical instruments. These varied influences brought strength and complexity to existing forms of national music. Thus, the counterpoint between prestigious foreign musical expressions and the presence of new sources of inspiration and different native forms of expression was reinforced. A strong symbiosis occurred, giving rise to such composers as Heitor Villa-Lobos (1887–1959), whose robust works are distinguished by their characteristic rhythm and rich harmony. His *Choros* and numerous other works for piano, guitar, and orchestra as well as his choral works, are all performed to this day, showing that he had transcended the ordinary 'nationalism' of his roots and achieved a sophisticated synthesis where the nationalist component was interwoven with the influence of the avant-garde movements. His powerful inspiration allowed him to confront the already outmoded European rhetoric then in fashion. While nationalism is still apparent in the works of Mozart Camargo Guarnieri (1907–1993) and his followers, it is also clear that they had become trapped by their attempts to intermingle native themes with the trappings of a genre as alien as Italian opera. We are referring particularly to Carlos Gomes's (1836–1896) experiment *El guaraní*.

The tremendous influence of José Vasconcelos from his position at the Ministry of Education successfully encouraged all manner of cultural and artistic expression among the younger generations, which emerged in the heat of the Mexican Revolution. The evidence can be seen in music and the great murals. This dynamic, creative environment produced figures such as Carlos Chávez (1899–1978), who is well known for his *Sinfonía India* (1936) and *Xochipilli Macuilxóchitl* (1940). The latter work is performed using pre-Hispanic instruments. Chávez is the author of a vast repertoire covering every musical genre. He also conducted the Mexico City Symphony Orchestra (1928), and was the Director of the Conservatoire. This provided him with a privileged position in the musical world where he was regarded as a cultured and erudite artist. Silverio Revueltas (1899–1941), on the other hand, who is closer to popular tradition and whose works show social and political overtones, is remembered among other works for *Sensemayá* (1938). Although he died prematurely, his legacy remains in his brilliant compositions for the ballet. He was also an early exponent of music written specifically for a number of films. The works of both these composers were acclaimed not only for their powerful exoticism but also for their intrinsic worth.

At the other end of America we find Alberto Ginastera (1916–1983) who, according to José María Neves, 'is to

Argentina what Villa-Lobos is to Brazil'. His brilliant career as a composer should not overshadow his equally outstanding contribution as a teacher. He headed the Centro Latinoamericano de Altos Estudios Musicales del Instituto Di Tella, where he accorded great importance to experimental and electronic music; and, with the help of scholarships, many of the new generation of Latin American composers now emerging were trained under his influence.

Juan Carlos Paz (Argentinian, 1901–1972), an early exponent and defender of avant-garde musical movements, was a founding member of the Grupo Renovación (1930) and later the Agrupación Nueva Música (1937), taking part in their activities as a composer as well as a student and proponent of dodecaphonic and microtonal music. He also took an interest in concrete and electronic music. He has left a legacy of his pioneering work in a plethora of articles and books.

In Chile, the musical renewal is linked, as in other countries, to the appearance of certain institutions, such as the Bach Society (1917), the Orquesta Sinfónica (1926), the Conservatorio Nacional de Música (1928), the Facultad de Bellas Artes de la Universidad de Chile (1929) and later the National Ballet and Choir. These initiatives, which created a very stimulating climate that had a ripple effect, owe a great deal to the predominant role played by Domingo Santa Cruz Wilson.

Our overview of musical activity should not be limited to the examples mentioned above. Mention should also be made of the emergence of festivals, prizes, contests and the increased opportunities being offered by radio, records, and television as well as the development of outstanding performers, many of whom have taken Europe by storm. The list is long, so by way of example, we shall merely mention the Chilean Claudio Arrau.

The expressions of popular music, which impregnated 'serious' music, particularly in Brazil, deserve a chapter to themselves. Folk music, which became urbanized with the flow of migrants from the country to the city, where it sometimes underwent a profound transformation, attained admirable levels of artistic achievement. This is the case of Atahualpa Yupanqui (Argentinian), Violeta Parra (Chilean), Vinicius de Morães and Chico Buarque de Holanda (both Brazilian), who are known throughout the world. Another case, which is less exceptional than it might seem at first sight, is that of the tango, a dance form that has recently enjoyed great success in Japan. Among the innovators in that genre is Astor Piazzolla, a classically trained composer who, having been criticized and rejected by both camps, has finally gained complete acceptance.

**The visual arts**

With a very few exceptions, it may be said that the Latin American renewal in visual arts began with some outstanding expressions early in the twentieth century. Certainly the visual arts in their many manifestations did not require translation from Spanish and Portuguese. Paris in particular, and other European cities, were a strong attraction with their many schools and teachers, marchands and traditional welcome to artists, so that nearly every artist of note worked there at some time, and many stayed on. Contrary to what occurred with the boom mentioned in previous pages, which took more than fifty years to mature and required enormous

efforts to attain universality, the presence of painting on the world stage was felt very early on, for the aforementioned reasons and owing to the repercussions of Mexican muralism, which constituted a surprising phenomenon both on account of the originality of the works and because of their international renown. Here again we must mention the work of José Vasconcelos during his time at the Ministry of Education in Mexico. In his quest to assert national awareness, he sparked off creative energies. He sensed that the commotion unleashed by the Mexican Revolution would allow him to cast off the fetters of academism, Hispanicism, and costumbrismo and pursue an ambitious synthesis of all these trends, opening the flood gates to new audacities and exploring new uncharted waters where the streams of many different inheritances might flow together, renewed by the currents of the European avant-garde movements. All this took place in a climate of new appetites awakened by the social movements that created a new audience for less individualistic, less esoteric art forms i.e. art that was more 'popular' and accessible. It was the great painters, comparable in this respect to the titans of the Renaissance, who came up with the key. They used huge spaces to express themes of vital importance and their message was transmitted to that wide public. However, it is no coincidence that these artists, so closely identified with their homeland, had also absorbed the ideas of the avant-garde movements of the day in Paris. Their creations were the result of many influences coming together.

José Diego María Rivera (Mexican, 1886–1957), known simply as Diego Rivera in the annals of art history, met Juan Gris and Picasso in Europe at an early stage. He visited dozens of museums and was spellbound by the art of certain periods, particularly the murals by Giotto, Uccello, and Piero della Francesca. When he returned to Mexico he visited the Mayan ruins there, and in 1922, he was commissioned to paint the murals at the Escuela Nacional Preparatoria, a task that he combined with the organization of the Sindicato Revolucionario de Obreros, Técnicos y Plásticos. He rejected easel painting as elitist and defended public art on a grand scale on historical and indigenous themes as the national artistic expression. After that he painted huge works, the murals in the Secretariat for Public Education in Mexico City (1923–28), and the Palacio Nacional. Later he continued with his work in the United States. Rivera's stormy life never separated him from his art, which is remarkable for the quality and quantity of his output, the profusion of canvases, graphics and many controversial theoretical papers.

David Alfaro Siqueiros (1896–1974), who was even more categorical than Rivera, was personally involved in the political life of the Mexican Revolution and later in the Spanish Civil War. From his youth he supported the idea of 'art that synthesized universal themes, new forms and modern materials'. Imprisoned and later deported, he travelled throughout South America, where he left behind works, his teaching and disciples. His murals at the Escuela de Chillán (Chile), in Buenos Aires, and Havanaare are worth remembering. Of the great legacy of works he left to his country and the world of art, we might single out, not without some considerable hesitation, La marcha de la humanidad, painted in 1964.

José Clemente Orozco, another member of the trio representing this movement, painted at Pomona College in California (1930), the New School of Social Research in

New York (1930), the Baker Library at Dartmouth College, New Hampshire (1934), and the Great Hall at Guadalajara University. From his youth he also stood out as an extremely talented illustrator and draughtsman.

Apart from the intrinsic value of the three artists mentioned above, attention must be drawn to the significance of their work, which had an impact almost all over the world. They also had many imitators, though none of these ever attained the inner fire of their masters. Apart from these three, mention should also be made of Rufino Tamayo (1899–1991), an admirer of a less utilitarian and Dionysian aesthetic philosophy, though the influence of popular and folk art are apparent in his work. One of his murals decorates the walls of a conference room in the UNESCO Headquarters in Paris. Belonging to the same movement, but with undisguised differences, is the work of Juan O'Gorman (1905–1982) who, in his youth, was a forward-looking architect and author of the well-known mosaic mural in the Biblioteca Central at the Universidad Autónoma de México.

Frida Kahlo (1907–1954), Rivera's wife, was also an exceptional figure. Her strong personality, talent and strength allowed her to evade all the prevailing influences and tune in to surrealism, which she combined with painting of popular origin, freeing her imagination, which proved capable of creating lasting symbols, and composing her own unmistakable message. She captured her heroic life in a series of self-portraits, which are still among the most sought-after canvases of Latin American painting. Today her fame, which arrived late, is overwhelming.

Emilio Pettoruti (Argentinian, 1892–1972), who studied and worked in Europe for a long time, is regarded as one of the foremost figures of cubism. It certainly took some time before his art, which is refined and severe, attained the recognition it enjoys today, stirring up stormy controversies. A contributor to the magazine *Martín Fierro* (1924), where the spirit of Jorge Luis Borges already prevailed, he left behind an exemplary corpus of works, which is highly sought-after by collectors and museums alike. He also left his autobiography, *Un pintor frente al espejo*, where he tells the story of his human and artistic adventures in Europe and his relations – not always cordial – with the avant-garde movements, but its primary importance lies in the fact that it reveals the reaction of the critics and the public towards the new movements.

The influence of Xul Solar (Argentinian, 1887–1963) came later. He is a somewhat isolated figure in the world of Latin American art. His pictures, almost always small, are related to those of Paul Klee, Wassily Kandinsky, Kasimir Malevich. In the opinion of the critic Damián Bayón, he is an interesting painter because of 'the subtle and intricate fabric of (his pictures) from the point of view of the symbols he uses and his playful, surrealist type humour'.

Joaquín Torres Garcia (Uruguayan, 1874–1949) is undoubtedly one of the most original painters ever produced by America. When he was still young, he worked with Antoni in Spain. Later he took a great interest in prehistoric, particularly pre-Hispanic art, which had a lasting influence on all his later work. His style is known as 'constructive universalism', which is also the title of a voluminous and highly original book in which he expounds his theories. Every fragment of his vast work, part of which was lost in an unfortunate fire which broke out at an exhibition in São Paulo, expresses 'autobiographical, mathematical, metaphysical and spiritual concern'.

Another two Uruguayan painters who deserve mention are Pedro Figari (1861–1936), who fashioned an original style with his Creole market places, *candombes* and the presence of anonymous figures such as gauchos and blacks who animate his canvases. Over the years Figari, who mastered an exceptional palette, won the affection of thousands of admirers.

The vast fresco of Latin American painting is enriched by the valuable contributions of a number of noteworthy Brazilian artists. Although Tarsilia de Amaral (1886–1973), did not take part in the famous Semana de Arte Moderno, since she was in Europe at the time, she was influenced by it, as her anxiety to imbue modernism with a truly national character shows. She was also concerned to consolidate 'a new tropical Brazilian aesthetic philosophy, drawing its strength from the land and celebrating primitive things'.

Lasar Segall (Lithuania 1891–Brazil 1957) was trained in Europe but emigrated to Brazil in 1923. His work tended to reflect human suffering, ranging from the Jewish tragedies of the Old World to a moving vision of reality in his adopted country. However, he never ignored the countryside, which he depicted in a remarkably abstract vision.

Emiliano de Cavalcanti (1897–1976) played an active role in the movement engendered by the Semana de Arte Moderno before spending a long and productive period immersed in the European avant-garde movements. His spiritual development is interesting in view of his lasting interest in politics.

From a very early age, Cândido Torcuato Portinari (1903–1962) was attracted by the Mexican mural. Already in 1939 he was involved in the Ministry of Education building in Rio de Janeiro, designed by Le Corbusier. We shall mention only his frescos in the Library of Congress in Washington (1941–42), and in the United Nations building (1959). His lasting fame was consolidated by portraits and illustrations.

Wilfredo Lam (Cuban, 1902–1982), the son of an Asian father and a black mother, created his own 'pantheon of saints'. He is one of the foremost Latin American painters of all time on account of his highly original style, which was capable of combining the exuberant natural surroundings, recognition of African sources in the culture of his country, his fascination with primitive art and his sensitivity, which is enraptured and logical at one and the same time. *La jungla* (1943), a work inspired primarily by African sculpture and popular expressions of African art, is perhaps one of the highest points in the art of the New World. Lam managed to transpose 'the formal sources of Afro-West-Indian art and the evolution of religious beliefs, which form the basis of so much emotive and spiritual energy in Cuba'.

Among more recent figures, Roberto Sebastián Antonio Matta Echaurren (Chilean, 1911–2002) stands out. A highly original painter, his large-format works are full of abstract and monumental beings 'committing ritualized and bellicose acts', which give expression to a disturbing cosmic vision.

Jesús Rafael Soto (Venezuelan, 1923–2005) is the author of interesting experiments, such as his *penetrables* made up of metal tubes hanging so that the spectators will make them move as they come in. In 1970 he painted a mural for UNESCO.

The Colombian Fernando Botero (1932–) forged his own inimitable style very early on, and over the years he has consolidated it. His figures, particularly his human figures, animals and objects always appear bloated in his pictures

and sculptures, as though they have been blown up. They are enormously popular, and his works, which certain sectors of the public find very attractive, fetch high prices on the international markets.

Oswado Guayasamin (Ecuadorean, 1919–1999) is a prolific painter. He is remembered particularly for *La edad de la ira* (1959–62), which consists of 250 canvases similar to murals. Antonio Berni's (Argentinian, 1905–1981) two series of *collages*, *Juanito Laguna* and *Ramona Montiel*, constitute a harsh criticism of the society emerging around the vast conurbations. The prizes conferred by the Biennale di Venezia (1962) brought him deserved recognition.

All this art is a result of the greater cultural depth and maturity of Latin America, which, in turn, is indicative of its greater spiritual independence. The appearance of contests, galleries, competitions, biennial festivals, exhibitions, museums and schools which did not exist a century ago has undoubtedly played a part in this development, which, in turn, has led to an increase in the number of collectors as well as another interesting fact: although the traditional role of the state as a promoter of culture has decreased, new middle-class groups with less conventional taste have emerged alongside the high-income buyers of works of art.

## Architecture

In Latin America, where architecture was subject to the same influences as other cultural activities, the collapse of a cosmopolitan vision, particularly as a result of the serious socio-political events already mentioned, gave rise to a critical spirit and triggered off the search for new directions to follow. On the one hand there were trends bearing a Hispanic stamp, which sought to revive the colonial spirit, and others, which aimed to salvage indigenist elements or to combine both these trends. Two Argentinian architects stand out among those proposing the reworking of Hispanic and indigenist elements: Angel Guido (1896–1960), and Martín Noel (1888–1963). In the opinion of Ramón Gutiérrez, this movement culminated in the Argentinian Pavilion at the Seville World Fair (1929), and the Teatro Cervantes in Buenos Aires built in the same year. On the other hand, the most recent trends arising in the 'centres' were introduced in a mechanical and ingenuous way without adapting them to the new environment. This meant that building solutions designed for quite different climates were applied automatically in tropical and sub-tropical areas. In short, architectural journals and international congresses imposed their criteria, which were soon adopted. Although these trends almost always proved transitory, they often helped spoil the character of Latin American cities. This trend was reinforced by the presence of foreign architects, many of whom arrived among the great waves of immigrants, whereas others were commissioned to direct one-off projects, which were generally public buildings. To this must be added the widespread distribution of books containing plans and full blueprints, particularly of French and Italian origin, which were usually copied wholesale. Proof of this are the buildings still standing in the popular districts of every city which were built using these models. The fact that architecture schools and faculties came into existence late must also be taken into account. These schools and faculties were almost always offshoots of engineering

faculties and drew their inspiration from European or North American models, e.g. the prestigious Paris Ecole des Beaux-Arts. Construction materials, such as steel, glass and ceramic products, were introduced, displacing local or regional materials, such as the noble brick, which would be 'rediscovered' decades later.

This situation was aggravated by the destruction, in the name of modernity, of veritable architectural jewels inherited from centuries past, which had conferred a strong personality upon the urban landscape. Conditions were ripe for a debate on the nature of 'national architecture', which often strayed into truly eclectic mixtures, giving rise to a chaotic lack of style.

In his *Arquitectura urbana en Iberoamérica*, Ramón Gutiérrez points out a series of factors that illustrate the development of a clearer awareness of the problems existing within the Latin American context and identification of those buildings that are landmarks. Referring to the beginning of the twentieth century, he points out that the most important example of so-called art nouveau construction in the period, known in Mexico as the *Porfiriato*, was the Palacio de Bellas Artes, which was not completed until 1934, although the public competition was held in 1900. The main architectural principles were established by the Italian architect Adamo Boari.

Jumping a few stages and leaving to one side various styles and schools that were distinguished by the prevalence of ornamental elements used in the private construction of banks, ministries, hospitals, cinemas, hotels and cafés, it should be pointed out that certain socio-economic changes had by then restored the importance of the state. Other contributing factors were the synthesis of the characteristics of oligarchic and military governments, and fascist movements with their preference for monumental buildings. Reform movements had arisen earlier in a number of countries. It would be unjust not to mention the modernist movements in Brazil inspired by Mario de Andrade and Gregori Warchavchik, the movements inspired by the *Manifiesto Regionalista* (1926), of the thinker Gilberto Freyre and, above all, the changed intellectual climate.

Finally, the contributions made by the various Panamerican Architectural Congresses (Montevideo, 1920; Santiago, Chile, 1924; Buenos Aires, 1927; and Rio de Janeiro) should not be underestimated. At the latter congress it was recommended that each American nation aim to 'forge its own national architectural tradition'. To a certain extent the presence of one man in Latin America made a decisive contribution, precipitating change in the spirit of the architectural environment. We are referring, of course, to the two trips by Le Corbusier, who visited Rio de Janeiro and Buenos Aires in 1929 and 1936. In Rio he designed the now famous Ministry of Education building. Among other young Brazilians, Lucio Costa and Oscar Niemeyer worked alongside him. In Buenos Aires he drafted Planning Regulations, which for many years were the point of reference for future and frustrated plans. In both cities his lectures were fruitful, and the few buildings planned during his brief stays exemplary.

It is not generally known that at the time when skyscrapers were revered as the ultimate symbols of modernity, the highest buildings in the world were the Salvo Palace in Montevideo (1922–25) and the Kavanagh in Buenos Aires (1933–35). Both these buildings were constructed using

reinforced concrete, which was used because steel, the material traditionally used in this type of building, was in short supply and still not produced in Latin America.

While the large cities, such as Caracas, Mexico City, Rio de Janeiro, Buenos Aires and Bogotá, were mushrooming as a result of the great waves of migrants, more and more plans and blueprints for housing for the poor were produced, but the results were almost always unsatisfactory, even if the slow pace of building is ignored. There was vacillation, inexperience, political weakness and lack of organization among the poor, who did not have much lobbying capacity. These factors should not be considered in isolation from the climate of political instability, which was, and still is, one of the greatest problems and challenges facing Latin American society.

Of all the Mexican buildings, perhaps the most significant was the now famous Museo de Antropología e Historia (1964), designed by Pedro Ramírez Vázquez.

Another very influential public building was the *Ciudad Universitaria* in Caracas, where the great lecture hall houses Calder's paintings. This project was designed by architect Carlos Raúl Villanueva.

Owing to the magnitude of the undertaking, the greatest town planning and architectural project undertaken in Latin America during the twentieth century was the city of Brasilia, whose design reflects a long history with clear political and geopolitical overtones. It was built in response to the idea of constructing a new capital city far from the coast and looking towards the interior, which was isolated and largely unexplored. This new city would also help integrate into national life the vast expanse of millions of square kilometres suffering from the lack of modern communications and therefore condemned to isolation. They were not seeking a magic solution, but they did aim to mobilize the country to turn a myth into reality. One of the builders, Lucio Costa, writes that 'it was a deliberate act of possession, a gesture in the spirit of conquest typical of the cultural tradition'. Leaving the results to one side, recognition must be given to the clear-sighted courage of President Juscelino Kubitchek, who supported this colossal enterprise that later governments of all political hues were forced to continue. Controversy apart, Brasilia, a city that now has two million inhabitants, was based on the organic, holistic concept of two architectural geniuses, Lucio Costa and Oscar Niemeyer. The worldwide impact of this project and the subsequent renown of its creators meant that they were called upon to act as consultants and were commissioned to design cities, universities and public buildings in the United States, Africa and Asia. Latin American architecture thereby joined the vanguard of world architecture.

## EDUCATION

Despite all the obstacles arising as a result of economic change and the political crises that have hampered normal social development, education systems in general have expanded during the second half of the twentieth century. This tremendous expansion has been labelled a 'boom' because of the speed at which it occurred. For example, according to data for 1990 provided by UNESCO's *World Education Report 1993*,[5] gross schooling rates at every level and in every branch of education in Latin America are today above the world average. However, some clarification is required. The first qualification concerns the division into different levels. The second has to do with the enormous disparity between different countries and between the various regions within one country. Such is the case in Brazil, where there are great differences between one area and another owing to the vastness of the territory involved. A less significant point is the reliability and comparability of data. Another more eloquent illustration of this situation may be drawn from the estimates of Pablo Latapie, who analyses the growth of enrolments and school attendance rates between 1960 and 1989 in a report drafted by the International Commission on Education for the Twenty-first Century (the Delors Commission), and based on UNESCO data (*Statistical Yearbook*). The conclusions, expressed in thousands, are as follows: Enrolment in preschool education grew from 983 to 10,017 (growing 10.19 times); primary education expanded from 26,653 to 73,559 (2.75 times); secondary education increased from 4,085 to 21,251 (5.20 times) and higher education enrolment from 573 to 7,257 (12.65 times).

Apart from the demographic, economic, social and other data, which are well known and have been studied in depth, other factors may also shed some light on this phenomenon. One of these is the tradition, with its roots in the Enlightenment, which stresses the importance of education for 'progress'. This idea, which is well rooted in Latin America, was spread by the speeches of certain great politicians and educators in the nineteenth and early twentieth century. These figures were of the opinion that education had a decisive role to play in the process of nation building, which required citizens to be educated. They also believed that education was essential for economic progress, as training would produce workers capable of assimilating the new techniques and procedures arising from the Agricultural and Industrial Revolutions that were changing the face of the central countries, promoting diversification of production and a clear international division of work. Education was also important for 'social progress', promoting upward social mobility and exerting a moralizing or 'civilizing' effect upon behaviour and customs. In short, all kinds of moderating virtues conducive to change were attributed to education. These ideas, which were propounded by B. Juárez, D. F. Sarmiento, A. Bello, J. P. Valera and many others, sparked off a real enthusiasm for education, which took root at every level of society.

Certain countries, where the emerging middle class was taking shape and would be strengthened over time, could build education systems, which often gathered their own momentum, gradually reducing illiteracy and improving schooling rates. However, other countries with large marginalized rural and indigenous populations had to postpone these aspirations until more forceful proposals appeared which, like J. Vasconcelos in revolutionary Mexico in the 1920s, demanded more open cultural and education policies that would benefit the deprived *campesino* classes. Examples included Vasconcelos' 'cultural missions' or *casas del pueblo*. To achieve these aims, forceful and creative literacy campaigns were launched as well as other activities, which today would be classified as non-formal education.

Somewhat later, in Peru, the fruitful proposals of José Carlos Mariátegui in the field of education are worth mentioning, although the Peruvian experiment was limited

to the field of ideas, whereas Vasconcelos, as well as developing his ideas, also implemented them. In the formulation of his ideas, some of which are highly original, he rejected ideas of colonial stamp, which excluded the vast majority of the population of indigenous origin. He also engaged in discussions with the spokespersons of both the 'pragmatic' trends of North American origin and the 'humanistic' tendencies of European origin in order to draft a proposal for a national education scheme, which would include every ethnic and social group within a single school system. He proposed salvaging the pre-Hispanic tradition, upgrading it by modernizing it, and altering the regulations governing land ownership in force at the time. In his view, both these elements were essential if an alternative model were to be achieved which would be all embracing and democratic in a practical sense, promoting the participation of the underprivileged classes of Peru.

Education was regarded as a road to social advancement and prestige. The middle classes, which had developed considerably since the end of the nineteenth century and during the early years of the twentieth century, aided by the emerging trends of urbanization and industrialization, also tried to take full advantage of the fragmented opportunities offered by the system in a bid to breach the portals of the universities, which were the stronghold of the traditional classes. This process, which can be understood more clearly when we realize that it was accompanied by the growing popular movements, reached its zenith in the field of tertiary education with the University Reform implemented in Cordoba (Argentina) in 1918, which spread throughout Latin America at different speeds and with varying intensity depending on the regions. Its basic tenets were university autonomy, the participation of teachers and students in the government of academic institutions, academic freedom, periodic competitive examinations to select teaching personnel, as well as a regime known as 'free teaching', which allowed parallel chairs to exist side by side, broader student intake, free education, modernization of teaching practice, extramural university education, etc. These principles entailed redefining the role of the university, since the scope of these proposals outstripped that of merely turning out professionals, promoting scientific research and maintaining the need to contribute to the effective democratization of society. Such proposals revealed the political implications of the ideas contained in the University Reform and explains why it soon spread rapidly throughout most of Latin America. The spirit of the Reform inspired several generations of leaders, from Víctor Raúl Haya de la Torre to Fidel Castro. Though they were different in many respects, both from the theoretical point of view and in the practical implementation of their proposals, nearly all of them have openly recognized their debt to the University Reform. The struggle of both students and society at large to defend these conquests, which were undermined by authoritarian and military governments, lies at the heart of nearly all the student movements which, in the course of this century, have convulsed higher institutions. The 1968 disturbances in Mexico were among the most serious on account of their political repercussions. Student movements continue to call for more democracy.

It is a practical impossibility to review the ideas and achievements in the field of education on a step-by-step and country-by-country basis. We shall therefore take a leap in time to recall an initiative of outstanding importance, the 'Major Project on the Extension and Improvement of Primary Education in Latin America', which was approved by the General Conference of UNESCO that met in New Delhi in November–December 1956, and was introduced the following year. The results were noteworthy. The number of students rose from 21 million to nearly 32 million in the course of a decade, which means that enrolments grew at a rate of 5.1 per cent per year, when population growth was 2.8 per cent per year, and the number of teachers increased from just over 600,000 to almost a million. At the same time the number of schools increased, state education budgets improved and teacher training was stepped up. Until then, most teachers were untrained and lacked experience and incentives. At successive conferences, meetings and seminars the methods to be used were assessed and perfected, and the aims, which were linked to economic and social development, were defined more clearly. The notion of planning was introduced and statistical systems were improved. Although the aim of universal primary education was not achieved, this continues to be a primary aim, as was confirmed at the Mexico City Conference (1959), which put forward a proposal for total schooling for a period of 10 years by the year 2000.

From then onwards the work of international organizations, such as UNESCO, as well as other regional organizations, with the aid of national contributions, has grown in importance. The view that education is a necessity or an investment rather than a right, or which stresses the link between education and other factors contributing to 'human development', has gained ground. A valuable series of documents and books reflect some of the decisive points, such as the Project 'Development and Education for Latin America and the Caribbean', directed by Germán Rama and sponsored by UNESCO/ECLA/UNDP. The many thousands of pages that make up this document provide descriptions, diagnoses and proposals of great interest.

So as not to dwell too long on this point, we shall simply say that the conclusion of the World Conference on Education for All (Jomtien, Thailand, 1990) is a milestone in the history of education worldwide and is paramount for Latin America, where 155 countries undertook to provide education for all – including both children and adults – and to greatly reduce illiteracy before the year 2000.

Because of their importance, it should be remembered that UNESCO has also published two landmark works. In 1972, it published *Learning to Be* (known as the Faure Report), and twenty-five years later *Learning: The Treasure Within* (1996, known as the Delors Report).[6] The latter points out the most significant world trends: from the local community to world society; from social cohesion to democratic participation and from economic growth to human development. These trends form the basis of its proposal: learning to know, learning to do, learning to live together and learning to be.

We shall now take the liberty of going back in time to take a look at certain other data, which reveal the complexity of these processes.

More important perhaps than the ideas generated by the so-called 'development' movements, with their stress on efficient teaching and their concern for 'training human resources', were so-called 'freedom teaching' and a number of other 'de-schooling' movements that enjoyed some favour

during the 1960s and 1970s, though their influence has largely waned.

Paulo Freire (Brazilian, 1900–1987), the 'prophet of liberation teaching' exerted considerable influence all over Latin America and in Africa, not only through his numerous publications, which have been translated into several languages, but, above all, because of his enthusiastic personal mission which sometimes sparked off authoritarian reactions.

Of lesser significance is the 'de-schooling' movement, which left its mark in the region, where, in any case, it fired a critical spirit and gave rise to debate on many problems that had been neglected or ignored. Although the main exponents of this movement, Ivan Illich and Everett Reimer, were not Latin Americans, it was in Latin America that their ideas attained the greatest, albeit ephemeral, acceptance. The utopian, i.e. ahistorical, nature of their ideas made them less effective as tools in the real world.

At university level, among the many books published and the paucity of projects implemented, the University of Brasilia stands out. An original undertaking, whose characteristics cannot be analysed here, was conceived by Darcy Ribeiro, who is also the author – among many other books – of *La universidad latinoamericana*, which appeared in a number of editions and was translated into several languages, leaving its undeniable mark on a whole generation of educators and politicians. In passing it should be recalled that D. Ribeiro was invited to organize other universities in countries on different continents.

If the Latin American process is to be understood, the long dark years of civil and military dictatorships, which damaged the social fabric and consequently the education systems of most Latin American countries, cannot be ignored. The theories of these regimes were based on such ideas as 'the natural and eternal order', 'hierarchical structures', and 'traditionalism'. At certain times and in certain places, depending on circumstances, they assumed a technocratic hue, or adopted the trappings of economic liberalism devoid of political liberalism, or an outrageous form of social individualism. Being elitist, they were opposed to the expansion of the education system on account of its democratizing effects, and to qualitative change, pluralism, as well as participation in any shape or form. Any kind of educational modernization was suspect. They were also suspicious of the recommendations put forward by international or regional organizations, which they always regarded as tinged with 'Third World' assumptions.

Clearly, for countries whose main output was raw materials, where the population was overwhelmingly rural and change came but slowly, as it did in Latin America at the beginning of the century, primary education was regarded as sufficient and was synonymous with popular education. Generally speaking, primary, basic, elementary, common and popular all meant one and the same thing. When major changes occurred, bringing about an increase in secondary activities and above all in tertiary activities, as well as great migratory trends that gave rise to spontaneous urbanization, it became clear that this objective fell far short of what was required. Worse still, universal primary education had not yet been achieved. As a result, social demands became focused on secondary education, which also underwent profound change. Some explanation is required. Until that time, secondary schools had been regarded as a stepping-stone to the university, where the

traditional ruling classes were educated. It should also be remembered that university education was primarily a male preserve. In other words, the education system had to face the new challenge of an extraordinary increase in enrolment with huge numbers of women demanding access to higher education. This was accompanied by demands for the subjects on offer to be changed. The need for teacher training schools, as well as commercial, technical, industrial and agricultural colleges, was felt. However, before the system had managed to adjust to the new demands at secondary level, enrolments at tertiary level, particularly at universities, began to grow, because the rate of growth in the service sector outstripped that of industry. In recent years it has been shown that industry has not provided the number of jobs expected, partly on account of the introduction of technology and automated equipment that can increase both production and quality in less time. This has led to growing unemployment and frustration among the young.

The foregoing shows how, in Latin America, the whole education system is subject to strong internal tensions. This situation is aggravated when the role of the state is reduced, i.e. when economic resources are scarce and political decision-making is weak. Shrinking salaries and diminishing professional prestige are parallel phenomena.

At the same time, increased enrolments turned the elitist university into a university of the masses, which does not fit the mould of the old structures. Worse still, the university was increasingly oriented towards the training of professionals and was unable to meet the challenge of scientific and technological research, which later began to be transferred to a fourth educational level, that of postgraduate degrees, not always with satisfactory results, particularly as the objectives were not always clearly defined. Lying dormant in the growing number of degrees was the capacity to satisfy not only the 'explosion of knowledge', which is one of the characteristics of modern times, but also to satisfy the ever increasing demands of society. The state, for its part, gradually abandoned the virtual monopoly it had enjoyed in the field of university education in most Latin American countries and, along with it, its hitherto exclusive right to award university degrees for professional purposes. All these factors mean that, the university as an institution must rethink and redefine its role and functions if it is to respond to the challenges of the twenty-first century.

## Final thoughts

The spirit and objectives that have inspired these three sections are twofold. On the one hand, it was our aim to outline, however briefly, the cultural achievements of Latin America, which helped the continent to reach an awareness of itself as a distinct entity and forge its own personality. On the other hand, we wished to explore the significance and extent of these contributions in terms of universal culture. That is to say, we wished to explore in some depth the Latin American identity and its contribution towards the formation of a culture of truly human and planetary dimensions without ignoring, omitting or denying regional, national, local or minority cultures or forgetting 'popular' culture by concentrating too much on so-called 'high' cultures. In other words, it is our view that any culture that excludes local cultural expressions or other internal mixtures

or marginal cultures should be rejected, as should those cultures which attempt to seek refuge in impoverishing cosmopolitan visions.

However useful they may be in other contexts, in our view, data such as the number of television sets per thousand inhabitants, per capita consumption of newsprint or other such information, are an unsatisfactory gauge of true cultural development because they are simply inadequate. However, there is also something disturbing about the current trend. The division into periods, which we suggested at the beginning to facilitate understanding of cultural development in the long term, would seem to demand a fourth period that is not yet in sight. In view of the profound changes taking place the world over and, in the words of French historiographer Fernand Braudel, 'at every level of civilization' it would seem necessary and indeed urgent to surmount the previous stages. However, what we are seeing is a worrying decline in the spirit of this third phase: the critical and creative spirit is being lost, the distinct perception of the world is weakening and there is a regression towards the second phase, and even to the first. This is as a result of the overwhelming effect of a number of factors. However, we shall only single out the spread of the cultural industries and new media platforms that tend towards uniformity and, using formidable technological, economic and even political resources, impose models, values, fashions, trends and patterns that work against the development of local cultures, where even the local languages are often under threat. What we are witnessing is a formidable process of *exclusion* purporting to be *inclusive*.

As phenomena which bind peoples together, cultures must first and foremost respect their own unique characteristics if they are to enter a new, effective universal dimension that is something more than a variation of outmoded debilitating ethnocentric tendencies. In the Hegelian sense of ideas, overcoming does not mean denying, throwing out or concealing. On the contrary, it means salvaging on another level what had been rejected in order to raise it to new heights and imbue it with new meaning.

## AMERICA IN THE WIDER WORLD

America's presence in the wider world was already being felt from the time the Europeans set foot on its shores at the end of the fifteenth century. The nature of that presence has changed and grown until the present day. Now, in the second half of the twentieth century, that presence is truly universal and decisive.

Two milestones mark this development in the course of the twentieth century. The first is the First World War, when the United States of America entered the international stage as a world power and, at the same time, held sway throughout the American continent. The next milestone was the Second World War and the subsequent world scenario, where two great power blocs one led by the United States of America, faced up to one another. The outcome of this confrontation is that the new world order is dominated by a single protagonist, the United States of America. Therefore, it would not seem excessive to regard the twentieth century as the period when America consolidated its presence on the world stage.

## Old and new forms of economic and cultural integration

At the beginning of the twentieth century, three crucial events paved the way for and promoted the integration of America in the wider world. These were the great waves of immigrants from Europe, particularly to North America, the development of the oil industry and the massive industrialization of consumer goods, and the opening of the Panama Canal in 1914.

The participation of Canada and the United States of America in the First World War marked the beginning of a growing trend towards the displacement of the focus of what has been called the Atlantic civilization to the American continent. President Woodrow Wilson's efforts to promote the League of Nations were, however, followed by a period of isolation when the United States of America withdrew somewhat from the European stage. During this time the United States of America devoted its energies to consolidating its sway over the American continent. The imperialistic presence of the United States of America had begun at the end of the nineteenth century under the aegis of the Monroe Doctrine (1823), which was established to discourage Spain's plans for colonial reconquest and later to halt France's modern colonial advance in Mexico. When Spain finally lost its last colonial possession in America in 1898, the United States took advantage of the situation to legitimize repeated interventions of an imperialistic nature in Central America and the Caribbean. However, the great economic crisis of 1929 revealed just how important the role of America in the world economy was. The growing importance of America's presence in the wider world was aided in the field of literature by the appearance of the new North American novel, in the visual arts with the Mexican mural movement, in music with the arrival of jazz and later with the development of the cinema.

Canada and the United States played a major role in the Second World War and Mexico and Brazil a more minor one. This participation opened the door to the decisive presence of America in the world. North America provided direct support for the war effort of the allied democratic front against fascism, but indirect support was provided by Latin America through the supply of strategic raw materials. On the political front, too, support was forthcoming. The Atlantic Charter, signed in 1941 by Franklin Delano Roosevelt and Winston Churchill, marked the beginning of the definitive development of democracy in the world, which, together with the unstoppable trend towards decolonization, which followed the war, is the hallmark of the twentieth century. The creation of the United Nations in San Francisco in 1945, the democratization of Japan and the campaign for European reconstruction through the Marshall Plan (1948), consecrated America's predominant role on the world stage.

The onset of the confrontation known as the Cold War between the two blocs, which Winston Churchill declared inevitable at Fulton, Texas in 1946, the establishment of popular democratic regimes in central and eastern Europe and the triumph of the Chinese Revolution all contributed to the formation of two broad camps; their opposition to each other filled centre stage of the second half of the twentieth century, producing the longest, most deadly, diversified and widespread of the so-called world wars, where Korea and Viet Nam stand out in a whole series of

cruel colonial wars and prolonged guerrilla activity. America has not been absent from a single episode in this confrontation, whether through the open or covert action of the United States of America.

At the same time, Latin America's presence on the world stage has depended upon political events of varying significance and impact. The Mexican Revolution sparked off a considerable ideological debate, the most significant results of which were agrarianism and the industrialization of the oil industry in 1938, which set a precedent. The triumph of the Cuban Revolution in 1959, followed by guerrilla movements in a number of countries in Latin America, brought the confrontation between the two great blocs to American soil.

The fall of autocratic socialism and the resultant socio-political adjustment has laid the foundations for America's role on the world stage to grow still further and become more decisive, although the process of European unification and the development of economic and political power centres in Asia are posing a growing challenge. America is opening up new spheres of influence: in the economic order with the massive industrialization of the leisure industry, in the field of technology with space travel, information technology, electronics and genetic engineering. In the cultural sphere this is reflected in the development of art markets on the American continent and the creative boom in literature, the visual arts and music.

### Regional and international organizations

The creation of regional American organizations was due, above all, to the need to institutionalize the sway of the United States of America continent-wide, although it has also been useful as a means of finding recipes for peaceful coexistence between American states and of opening up important spheres of social and cultural cooperation. It is at the economic level that development of a regional order has proved slow and controversial.

Nowadays, the Organization of American States (OAS), set up in Bogotá in 1948, is a surrogate means of expressing the desire for unification first mooted in 1826, albeit in different terms, at the Congreso Anfictiónico called by Simón Bolívar and held in Panama. Constituted in 1889–90, through the formation of congresses of American States, which gave rise to the Panamerican Union, it is the oldest multi-state organization. Although not always compatible with the consolidation of national sovereignty and the development of democracy in Latin American countries, the OAS has played an important political role as well as promoting and coordinating huge aid programmes in the social, health and cultural spheres.

Other organizations, particularly those set up and developed as a result of the programme known as the Alliance for Progress, launched in 1961, have tried to respond, with varying degrees of success, to the aspirations of Latin American nations for social, economic and political development and to set relations between the United States of America and other states on a more equitable footing. The Latin American Free Trade Association (ALALC), the Inter-American Development Bank (BID) and the Latin American Economic System (SELA) bear witness to the efforts made in the economic and commercial sphere. On a wider political scale, but with important economic implications, the Pacto Andino, signed in 1969, CVARICOM, the Rio Group, MERCOSUR and the North American Free Trade Association are worthy of note. It should be stressed that in the course of the final decades of the century sub-regional agreements express the determination of Latin American countries to join forces in their attempt to find a fair and direct international voice. To this end such organizations have been negotiating with European and other international organizations.

In the world order, the Organization of Petroleum Exporting Countries (OPEC) must be mentioned on account of the profound and far-reaching impact it has had, as well as its truly worldwide nature. In September 1960, the Baghdad Pact was made public in Caracas. This saw the birth of OPEC, based on an idea put forward by Venezuela at the Pan-Arab Congress held in Cairo earlier that year. The producers of coffee, cocoa and bananas have played a considerable role in promoting the world organizations for the regulation of trade in these commodities.

In the sphere of politics and the armed forces, the foremost expression of the American presence in the world is the North Atlantic Treaty Organization (NATO), which was set up in 1949 and was the key to success in the confrontation with the Warsaw Pact.

### Place of Latin America in the new world order

Latin America's capacity to play a direct role in the new world order is still very limited. Those countries that play such a role do so as members of international, regular or specialized organizations and forums. However, in certain areas, such as social concerns, health and environmental issues, Latin America's participation has grown considerably, as occurred at the Rio Conference on the environment.

The survival in Latin America of a government which declares itself to be socialist emblematizes a kind of participation – marginal on account of its dimension – in one facet of the new world order, that of the demise of authoritarian socialism.

The re-establishment, or establishment in some cases and development in others, of democracy in Latin American countries constitutes a highly significant contribution to the widespread aspiration to achieve democracy throughout the world, particularly at a time when efforts are being made to reconvert the authoritarian socialist regimes.

Unfortunately, a new form of international crime has set up headquarters in Latin America. Nowadays, drug trafficking is a lucrative, illicit activity in which the more developed economies participate as excellent consumer markets as well as suppliers of the so-called upstream inputs and beneficiaries of the financial deals derived from this traffic.

### Ideologies and self-awareness – regional and national identity

Overall, it would be true to say that the primary significance of America in terms of ideology has been to develop and implement the broad lines of the socio-political course set in the nineteenth century, i.e. the practice of republicanism and the introduction of democracy, at both the political and social level.

No proof is required of the role of Canada and the United States of America in efforts to uphold these values throughout the world. Their participation in the great world confrontations is eloquent enough. However, Latin America has also made a not inconsiderable contribution to this struggle through its cooperation on the world front, although it is only right to stress that this contribution has been more demanding and significant on the home front.

The democratic vocation of Latin Americans, pulled hither and thither by anti-imperialism and dictatorship, has never ceased to seek its own form of expression. Their self-awareness, which they have always sought to enhance, has had to face up to imperialism, frequently in the shape of armed invasions but also in the guise of fascist-type nationalism and communist pseudo-internationalism. The emergence of movements such as the Popular American Revolutionary Alliance (APRA), founded by Víctor Raúl Haya de la Torre in 1924, Juan Domingo and Evita Perón's *Justicialismo*, and the attempt to Americanize Marxism represented by José Carlos Mariátegui, must be seen as efforts to find a 'Latin American way'.

America's unquestionable dedication to the promotion of democracy has been accompanied in Latin America by an on-going effort to strengthen regional and national identity. At the dawn of the twenty-first century, it would be true to say that awareness of an American identity does exist, but it is now based on the achievement of aims in the social, economic and cultural sphere and not primarily on the attainment and conservation of independence, as was the case during the preceding century. At the same time, Latin American regional awareness has been strengthened as national consciousness has developed. However, only a small number of Latin American states have even attempted to draft a new conceptual model that will allow the indigenous societies in their midst to express themselves freely in social, political and cultural terms. There are hopeful signs that this will change for the better in the early decades of the twenty-first century.

## THE CARIBBEAN

*Hilary McDonald Beckles*

### THE CARIBBEAN AND MODERNITY

In the context of the discourse known as Western modernity, the Caribbean world was the primordial site for its principal ideological contests. Nowhere in the Western world were the contradictory forces of slavery and freedom, privilege and equity, racial domination and ethnic plurality, more keenly contested and openly ventilated. The Caribbean became the place where Enlightenment idealism and rationalism were aggressively pursued and deeply rooted in the harsh reality of a turbulent everyday life.

The script may have been written by the finest of European philosophers, and for a stage to be dominated by performers drawn from their own ethnic and cultural groups. But this expectation took a rather surprising twist. Instead, the stars of the stage were the enslaved Africans, the poor and dispossessed of the plantations, the wretched of the violated Earth, who seized the text, managed the moment, and delivered to a global audience the most revolutionary performance so far seen in the modern world.

The scene of the subversion and upsurge took its initial shape in the fifteenth century with the crime against humanity that chattel slavery represented. It matured with the most dramatic of performances; slaves became senators, chattels became citizens, and exchangeable property became elected presidents. There was no rendition of the script which cast the Caribbean as the site that witnessed humanity at its finest. Uprooting the evil of slavery and delivering upon the space a society dedicated to freedom, equality and justice was the role the Caribbean appropriated for itself. It gave its progeny a remit to remain faithful to this self-vision. The torn and tortured mandate has not been betrayed. The region has stayed the course and remains a site where humanity finds itself challenged to improve upon its best performance.
