- Tables of Results
- List of Responding Institutions
- Summary of Mailings and Replies

1. Introduction

In 1995, the Technical Committee of the International Association of Sound and Audiovisual Archives (IASA) carried out a *Survey of Endangered Audio Carriers* at the request of UNESCO. The results confirmed some fears about the rate of decay of carriers of recorded sound and allayed others. The results were also of great assistance to the IASA Technical Committee in drafting advice for archives and libraries holding collections of recorded sounds.

The information provided by the 1995 Survey has proved so useful that UNESCO approached IASA in 2002 to repeat the exercise to see how the situation has developed over the intervening years. In addition, UNESCO asked that the range of carriers covered be extended to include some video and photographic media. UNESCO was also interested in information about the spread of digitization both as a means of improving access to collections and as a preservation tool. A major force driving the spread of digitization is the increasing obsolescence of many of the machines required to play the historic recordings in collections. Questions about both of these topics were added to the basic questionnaire.

The answers to these two additional questions are very varied. Many replies are effectively asking for advice on specific points and the members of the IASA Technical Committee will be asked to respond with these on an individual basis.

The Survey is not intended to be an accurate, scientific piece of research. It asks the respondents to use their knowledge of their collections to estimate the quantities of their holdings that fall into each of three, loose categories - *In Good Condition*, *Giving Some Concern* and *Obviously Decaying*. It is hoped, however, that by comparing the results of the 1995 Survey with the results of the current Survey, a better picture of the rate of decay of the various carriers can be obtained. This, in turn, will enable the IASA Technical Committee to improve its advice to the custodians of recorded sounds and images about the priorities of preservation.

2. Responding Collections

About 2100 questionnaires have been distributed and, because replies are still arriving, this report is based upon the first 118 replies received. A second edition of the report will be prepared in a few months time. The current response of 118 replies gives a response rate of 5.6% which is lower than the response rate of 16.5 % from the 1995 Survey. Eighteen institutions have replied to both the 1995 and the 2003 Surveys. There are many demands on the time of custodians of collections. It is no surprise, therefore, to have a low response rate. Even allowing for "Questionnaire Fatigue", it is disappointing to have such a low rate of reply compared with the response to the 1995 Survey.

The collections that did respond are to be thanked. In many cases it is clear that much work went into completing the questionnaire. A list of collections that responded is attached together with a summary by country. The Reference Number given for each collection is used to identify the collection in the results sheet for each carrier. The address list used was not comprehensive. In particular the small, but important, specialist collections in fields such as linguistics and anthropology are under-represented. It is hoped that this group of collections will, with the help of content related NGOs, appear in larger numbers in any future Survey.

3. Supplementary Questions

As with the 1995 Survey, it is clear from the replies to the supplementary questions that many institutions lack adequate technical support. Some training workshops and courses are run under the auspices of the Information Society Division but these are insufficient to meet all the demand. For many people, the answer has to lie with text guides and videos. The range of subjects covered by these is, at the moment,

not wide enough to meet all needs. They can also be difficult to find. Placing material on the Internet is a solution for many, but not all, people. The spread of computers and reliable telecommunications is not yet as wide as is often imaged by people in developed countries.

In many cases the level of technical knowledge required is not high but the difficulties of tracing the information can be daunting for someone who is overwhelmed by the day-to-day tasks of administering a collection. The UNESCO Memory of the World Programme, and in particular its Sub-Committee on Technology (SCoT), is working to provide a series of guides to various technical aspects of collection management but with, as far as possible, the technical jargon omitted. It is intended that the texts will be available on the UNESCO web-site and as UNESCO printed documents.

The subjects covered will include a guide to the methodology of digitization of various audiovisual carriers and advice about dealing with equipment obsolescence. For smaller collections it is likely that, rather than set up a transfer laboratory of their own, paying a better equipped institution or commercial company to undertake the work of transferring sounds and images to new carriers will be the most effective and economic method.

The IASA Technical Committee is also active. In September 2001, the TC published the second edition of *The Safeguarding of the Audio Heritage: Ethics, Principles and Preservation Strategy* and the TC is currently writing a guide to the practical problems of digitization for many audiovisual carriers.

4. Survey Results for Each Carrier

The results of the Survey are presented in a series of tables - one for each carrier. A text commentary is also included but readers may wish to draw their own conclusions from the figures in the tables. The 2003 Survey lists 32 types of carrier against the 21 listed in 1995.

The respondents were asked to list the carriers in three condition categories - *In Good Condition*; *Some Concerns*; and *Obviously Decaying*. The number of carriers from each collection falling into each category is listed in the tables. The total number of carriers in each condition category is given at the foot of the columns. The results are also expressed as percentages of the total number of carriers for both the individual institutions and for the carrier category as a whole. The total number of respondents possessing the particular type of carrier is given at the end of each result sheet.

Where applicable, a summary of the results of the 1995 Survey follows the 2003 results. A number of replies to the 1995 Survey did not provide quantity figures - merely a statement about the condition of the type of carrier. These have been excluded from the tables as they cannot provide a meaningful comparison with the 2003 results. An additional table comparing the results from institutions that replied to both Surveys is also included where applicable.

1. Cylinder Recordings

Cylinder Recordings were made from around 1890 to 1929 and were the earliest mass home entertainment system. Cylinders were also used to make unique recordings and were used for this purpose into the 1950s. Twenty collections reported having a total of 43965 cylinders in their collections - about 45% of the number reported in 1995. Of these, 14.7% were classed as in *Good Condition*, 58.7% as *Giving Some Concern* and 26.6% as *Obviously Decaying*.

This compares with the thirty four collections reporting details of their holdings of Cylinder Recordings in 1995. A total of 96855 cylinders were reported of which over 70% were listed as *Giving Some Concern* or *Obviously Decaying* against over 85% this year.

For the three institutions who took part in both Surveys, there has been a distinct shift in the classification of their Cylinders. In 1995, over 68% were classed in *Good Condition*. In 2003 none were classed in *Good Condition*.

2. Instantaneous (Direct Cut) Discs

There were a number of types of these discs and they are known by a variety of names including instantaneous, direct cut and acetate discs. They were used as a recording medium by broadcasters, commercial organisations, fairground booths and similar operations to record sounds before the advent of tape. Even the BBC used these discs as late as the 1970s. All are unique recordings.

Most consist of a backing disc (often of aluminium but glass, rubber and steel have also been used) coated with a material soft enough to engrave easily but hard enough to withstand being played several times. This coating was usually cellulose nitrate but other polymers were used including the cellulose acetates, hence the common name of "acetate discs".

The nitrate and acetate coatings are the same polymers as used for motion-picture film and exhibit the same chemical decay problems. As with motion picture film, the polymers shrink with the passage of time if the storage humidity is not correct. The resulting tension that builds up between the backing and the coating leads to crazing of the acetate or, in extreme cases, complete separation of the backing and the coating.

A total of 60332 discs from twenty three institutions were reported. - less than 5% of the numbers reported in 1995. Of these, less than 3% were reported as being in *Good Condition*.

In 1995, 1232118 discs were reported by thirty nine institutions. Nearly 90% of the acetate discs were reported as *Giving Some Concern* or *Obviously Decaying* against over 97% this year.

The results for the six institutions that have replied to both Surveys show a distinct move from *Giving Some Concern* to *Obviously Decaying* - from 91.8% *Giving Some Concern* to 13.2% and from 7.6% *Obviously Decaying* to 86.7%.

3. Shellac (Commercial 78s) Discs

There were several types of discs marketed from around 1890 to 1950. Because of the more convenient shape, the shellac disc swiftly supplanted the cylinder for home entertainment. A number of companies manufactured the discs and there are wide variations in the quality of the materials used and in the rotational speed of the discs. Examples of early discs can have replay speeds of between 60 and 100 rpm.

Of the 614936 discs (about 36% of the total reported in 1995) reported by forty one collections, 95% were in *Good Condition*. The equivalent figure in 1995 was 55%.

In 1995, fifty five collections reported holding a total of 1709737 discs of which nearly 45% were listed as *Giving Some Concern* or *Obviously Decaying*.

Thirteen institutions reported holding Shellac Discs in both Surveys. There is a slight shift from in *Good Condition* to *Giving Some Concern* of about 8%.

4. Vinyl Discs

These were introduced in 1948 and are just becoming obsolete - although the demise of the vinyl disc is taking much longer than expected. The category includes EP and LP (both 33⅓ rpm) and 45rpm records.

A total of 1855120 discs were reported by fifty five collections - only 52% of the number reported in 1995. Vinyl Discs are one of the most stable carriers available and over 88% were reported as being in *Good Condition*.

In 1995, fifty eight collections reported holding a total of 3529814 discs of which over 95% were considered to be in *Good Condition*. A number of the collections reported, however, that their concern was not actually decay of the carrier but damage caused by playing the disc - groove wear, scratches etc.

Twelve institutions responded to both Surveys. A comparison of the results shows a small shift from in *Good Condition* to *Giving Some Concern* of between 1 and 2%.

5. Metal Discs

The number reported of this carrier has increased considerably since 1995. The 85 reported then has become 65189 with 65000 of the increase coming from one institution. Because this institutions collection is considered to be in *Good Condition*, the overall verdict for the carrier is the same.

A slightly different story is found when the returns from the one institution holding Metal Discs and responding to both Surveys are compared. In 1995, the Discs were classed as *Giving Some Concern* but in 2003 they are *Obviously Decaying*.

6. Acetate Tape

This was the earliest common type of magnetic tape and was in use from the 1940s to the 1960s. The base is made of cellulose di-acetate or tri-acetate. As with acetate discs it is liable to shrinkage.

A total of 77904 tapes were reported from twenty five institutions - less than 10% of the 1995 total. Since 1995 the opinion of the condition of the tapes has moved towards the *Obviously Decaying* with over 80% of the tapes categorized as not being in *Good Condition*.

In 1995, 784093 tapes were reported by thirty six collections. Nearly 60% of the tapes reported were categorized as *Giving Some Concern* or *Obviously Decaying*.

Comparing the results of the two institutions who answered both Surveys shows no alteration in the way that they categorized their unchanged collections.

7. Polyester Tape

Polyester is the commonest base material for magnetic tape. In addition to its use for 1/4" tape, polyester is used for Compact Audio Cassettes , R-DAT tapes and most computer and video tape formats. This section examines the use of polyester based tape for 1/4 inch audio tape.

A total of forty nine institutions reported holding a total of 2409948 tapes. This is a 11% increase over 1995. About half the tapes were categorized as being in *Good Condition* with 42.5% *Giving Some Concern* thus demonstrating an increase of about 25% in pessimism about the tapes.

In 1995, a total of 2161941 tapes were reported by sixty nine collections with 23% of the tapes reported to be *Giving Some Concern* or *Obviously Decaying*.

Ten institutions replied to both Surveys. Most of the collections registered a small increase in holdings with one collection registering a twelve fold increase. This one large increase may have skewed the overall move of 8% from *Obviously Decaying* to *Good Condition*.

8. PVC Tape

This is also a common type of magnetic tape but its distribution is not as wide as that of polyester tape, being reported from only sixteen institutions. A total of 87732 tapes were reported - about 7% of the 1995 results. About 75% of the tapes were classed as in *Good Condition* with less than 20% classed as *Giving Some Concern*.

In 1995, 1203235 tapes were reported by nineteen collections. From the replies, it would seem that, in 1995, PVC based tape was considered more stable than polyester with less than 2% reported as *Giving Some Concern* or *Obviously Decaying*.

Two institutions responded to both Surveys and a comparison of the results shows that while in 1995, 20% of the tapes were considered to be in *Good Condition* with the remaining 80% *Giving Some Concern*, in 2003, 100% of the tapes were classed as *Giving Some Concern*.

9. Paper Magnetic Audio Tape

The very earliest audio tapes used a paper base as the support for the magnetic coating. Although swiftly superceded by the acetate based tapes, there are some paper based tapes still held in collections.

Three institutions reported a total holding of 38 tapes compared to the 210 tapes reported by two institutions in 1995. In 1995, less than 5% of the tape were in *Good Condition* but in 2003, with a completely different group of collections, 63% were classed as being in *Good Condition*.

10. Audio Cassette

Although the compact audio cassette is not recommended for long-term storage of sounds, it is used by a number of collections because of its small size and low cost. The results, however, underline why it should not be used for archival storage.

Seventy five institutions reported holdings totalling 380202 tapes - an increase of 54% over 1995. Of these, 41% were classed as being in *Good Condition* and nearly 58% as *Giving Some Concern*.

In 1995, 245630 tapes were reported by twenty collections with nearly 23% of the holdings reported being classed as *Giving Some Concern* or *Obviously Decaying*.

Three institutions took part in both Surveys. In 1995, 60% of cassettes were listed as being in *Good Condition* with the remaining 60% listed as *Giving Some Concern*. In 2003, this changed to over 80% *Giving Some Concern* with the rest *Obviously Decaying*.

11. Analogue Audio Multitrack Cartridge Tapes

These were popular for in-car entertainment for a number of years. Two institutions reported holding a total of 180 cartridges of which 75% were considered to be in *Good Condition* with the remainder *Giving Some Concern*.

12. Analogue Audio Multitrack Tapes

Multitrack tapes are the master tapes of recording sessions in commercial music studios. They can have up to 32 parallel tracks of sound on each tape. The music on the tapes has to be re-mixed before being released to the public. Two institutions reported holding a total of 15300 multitrack tapes with over 98% of them being classed as in *Good Condition*.

13. PCM Digital Audio Recording (Pseudo Video)

In the 1980s, the only inexpensive tape recorders with the bandwidth necessary for digital sound recordings were video recorders. The PCM (Pulse Code Modulation) converters took the sound output of a studio desk, digitized it and formatted the data stream to make it look like video to the video recorder - hence the term *Pseudo Video*.

Six institutions reported holding a total of 8140 tapes as against four institutions with 26225 tapes in 1995. Nearly 77% of the tapes are considered to be in *Good Condition*; a drop of 21% from 1995.

14. R-DAT Tape

R-DAT is a helical scan digital tape system using 3.81mm wide tape in an enclosed cassette. As with the CD, the format is also used for recording computer data. R-DAT is not recommended for long-term storage by many experts because of concerns about the life of the format. There are fears that manufacturer's support for the format may be withdrawn relatively suddenly leaving collections with tapes that they cannot play. The format's low penetration into the domestic market means that the vast majority of the machines sold are for professional use. This, however, is a very small number of machines compared to the number of CD players that have been sold.

Twenty nine institutions reported holding R-DAT tapes in 2003 against ten in 1995. The total of 85202 tapes in 1995 had more than doubled in number to 198477. The opinion of the condition of the tapes changed, however, from almost 100% in *Good Condition* in 1995 to 45% in *Good Condition* in 2003.

One institution replied to both Surveys and although its holdings of R-DAT tapes increased substantially, its opinion that the tapes were in *Good Condition* remained unchanged.

15. VHS Video Cassettes

The VHS video format was the winner in the battle with the Sony Betamax format to become the home video tape of choice. It is used both by broadcasters as a recording tape for access copies and by the public for "time-shifting" television programmes. Large numbers of VHS tapes are also sold pre-recorded with feature films.

Sixty eight institutions reported a total of 218480 cassettes - a large increase on the ten institutions who reported 14750 cassettes in 1995. Nearly 70% of the cassettes were reported in *Good Condition* with most of the remainder *Giving Some Concern*.

In 1995, about 54% were considered in *Good Condition* with the remainder of 46% *Giving Some Concern*.

One institution replied to both Surveys. Its holdings nearly trebled but its concerns about the cassettes increased. In 1995, 100% were considered to be in *Good Condition* while in 2003 only 80% were in this category with the remaining 20% *Giving Some Concern*.

16. U-Matic Video Cassettes

The now obsolete U-Matic cassette format was used by many broadcasters for minor news items and other less important material. The format was also heavily used in its later days as a picture editing tool. It was far cheaper to spend time using the relatively inexpensive U-Matic format to make editing decisions rather than tie up the expensive professional 1 inch machines.

Forty one institutions reported a total of 63022 cassettes. Of these about 21% were classed as in *Good Condition*; 42% *Giving Some Concern*; and 36% *Obviously Decaying*.

17. One Inch Analogue Video Tape

This was the main professional video tape format from the 1970s to the 1990s. Almost all the tapes reported will be unique recordings. Four institutions reported a total of 36207 tapes of which about 78% were classed as in *Good Condition*; 17.5% *Giving Some Concern*; and 4% *Obviously Decaying*. It is likely, however, that the biggest danger to this group of recordings will not be the decay of the tape but the obsolescence of the video machines required to play the tapes.

18. Two Inch Analogue Video Tapes

The two inch or quadruplex video tape machines were the first rotating head tape recorders. The original task for the machines was to allow television networks in the USA to time-shift popular live programmes so that they could be transmitted at the same local time in all the time zones across the country. The machines swiftly became used to record programmes in the manner that we are familiar with today. As with most professional formats, the recordings are usually unique thus increasing the need to transfer recordings held on this now obsolete format to new carriers to preserve the material.

A total of 27134 tapes were reported from four institutions. The majority of the tapes - over 85% of the total - were considered to be in *Good Condition*.

19. Betacam SP Video Tapes

This format was developed by Sony from the domestic Betamax format for professional use. Nine institutions reported a total of 136443 tapes of which over 96% were classed as in *Good Condition*.

20. Non Professional Analogue Video Tapes (Other than VHS)

Several non-professional video tape formats were reported by one or two institutions. They have been grouped together here for convenience. Six institutions reported a total of 1289 tapes of which the majority (86%) were *Giving Some Concern*.

21. Digital Video Tapes

A number of competing digital video tape formats have been developed for the professional market in the last twenty years. Many of the returns did not specify which format was held so, as with no. 20 above, the returns have been grouped together for convenience. A total of twenty one institutions hold a total of 83833 tapes of which over 93% are classed as being in *Good Condition*.

22. Audio Compact Discs

This was the first digital recording that became popular with the public and, in other variants, is used for storing computer data and images. It has the advantage for archival collections of being a non-contact playback system - hence without mechanical wear - and being non-erasable.

Fifty two collections reported holding audio CDs. Of the 1128400 discs reported, over 95% were considered to be in *Good Condition*.

In 1995, a total of 318311 discs were reported from twenty institutions. Two collections expressed concerns about CDs but these totalled 25% of the reported holdings.

Of the four collections responding to both Surveys, all but one have increased their holdings. The overall view of the conditions of the discs shows a shift of about 20% from in *Good Condition* to *Giving Some Concern*.

23. Recordable Compact Discs

In 1995, these were still very new and no institution reported holding any. The position has changed considerably with Recordable CDs being held by forty eight institutions. A total of 193062 discs were reported with nearly 87% considered to be in *Good Condition*.

However, a note of warning must be placed here. The early CD-Rs were carefully made and expensive to buy. The reliability was high. As the manufacture and use of blank CD-Rs has rapidly increased and the price has dropped considerably, the reliability has deteriorated. The IASA Technical Committee does not recommend the use of standard CD-Rs for middle or long term preservation use. Discs made to a higher standard are available from a few manufacturers and offer greater security, but at an increased price. Even these higher standard discs should, however, be subject to a regular programme of checking changes in error rate to detect problems before they become catastrophic.

24. Video Discs

The Laser Video Disc was an early attempt to provide a format that was easier to use at home than video tape cassettes. In 1995, one institution reported holding 700 discs which were considered to be in *Good Condition*.

In 2003, twenty one institutions have reported a total of 8242 discs of which about 30% are classed as in *Good Condition* and over 63% are *Giving Some Concern*.

25. DVD Discs

This new digital format, a variant of the compact disc and aimed at the domestic market, was reported by twenty nine institutions who held a total of 13180 discs. Over 96% of the discs were classed as in *Good Condition* with only two institutions having concerns about the format.

No institutions reported holding any of the recordable version of the DVD. The IASA Technical Committee has similar concerns about the use of recordable DVDs for archival purposes as were previously expressed about Recordable Compact Discs.

26. Mini Discs

This is another variant of the compact disc and is available with pre-recorded music as well as in a recordable format. As its name implies, it is physically smaller than the CD but holds as much music. This is achieved by heavy data reduction based on psycho-acoustic principles (perceptual coding) to reduce the quantity of data stored on the disc. The recording can appear to be identical to the original when replayed but, because of the data reduction, elements of the original sound are missing. This makes it inadvisable to use the mini disc as an archival format.

Fifteen institutions reported holding a total of 8326 discs of which almost 100% were classed as being in *Good Condition*.

27. Still Photographs

Still photographs, made using a number of different processes in many different formats, are held by the

majority of sound and image collections. They range from a few ancillary items to major collections in their own right. Of all the formats holding sounds and images, still photographs are probably the most common. Yet they are frequently poorly stored and conserved.

Fifty two institutions reported holding still photographs - a total of 15,673,700 images. Of these, about 76% were classed as being in *Good Condition* with about 18% *Giving Some Concern*.

28. Movies

Moving images were, with hindsight, a logical development from still photographs. A number of names have been used for the format including movies, films, cinema features etc. since the Lumiere brothers showed their first film in Paris. Many now standard *genres* such as documentaries and travelogues were first explored using photographic movie film.

Thirty nine institutions reported holding a total of 408123 films. Of these, nearly 70% were classed as being in *Good Condition* with about 28% *Giving Some Concern*.

In 1995, there was a greater emphasis on purely sound carriers. Only four institutions reported a total of 1100 film sound tracks. These were split equally between *Good Condition* and *Giving Some Concern*. One institution responded to both Surveys. The size of collection reported increased considerably but, overall, it remained in *Good Condition*.

29. Posters

Talks with a number of institutions during the set-up period for the 2003 Survey revealed that many held collections of posters. Advertising posters were, and still are, used as a means of attracting attention to cinema films and artistic events of many types. As with still photographs, posters are frequently overlooked when considering the preservation of sounds and images.

Twenty five institutions reported a total of 298388 posters of which nearly 95% were classed as being in *Good Condition*.

30. Piano Rolls

Piano rolls were popular in the more wealthy homes of the latter half of the 19th Century for home entertainment until the cylinder and gramophone record machines replaced the player pianos.

Nine institutions reported holding 7852 piano rolls. Of these, 34% were classed as being in *Good Condition* with nearly 59% *Giving Some Concern*.

In 1995, five institutions reported holding 7800 rolls which considered to be more at risk with 64% *Obviously Decaying* and 24% Of these, nearly 70% were classed as being in *Good Condition* with about 28% *Giving Some Concern*.

The one institutions that responded to both Surveys reported a 35% increase in its holdings but a decline in the condition of the rolls. From 90% in *Good Condition* in 1995, only 63% were so classed in 2003 with 30% *Giving Some Concerns*.

31. Wire Recordings

Wire Recording machines were an attempt to provide a means of making longer recordings in a more compact form than was possible with magnetic tape. Although not enormously popular because of the

poor quality compared with tape, the format found a niche primarily as a dictating format for business. The format was never used for mass distribution of sounds thus making every recording unique. Machines were still being manufactured in the 1960s by AGA of Sweden and the format survived until being finally killed off by the rise of the audio cassette.

Eleven institutions reported holding a total of 303216 reels of wire recordings of which almost 100% were considered to be in *Good Condition*.

In 1995, ten institutions reported 2451 rolls of which only 11½% were classed as in *Good Condition* with over 81% classed as *Obviously Decaying*.

Two institutions responded to both Surveys. There is a slight shift from 100% in *Good Condition* in 1995 to 97% in 2003.

32. Computer Data Carriers

Three institutions reported on their holdings of Computer Data Carriers - floppy discs, tapes and removable hard discs. They are included in the Survey results primarily as a harbinger of the future for many collections of sounds and images.

The 75454 carriers reported were classed as 93% in *Good Condition* with 6½% *Giving Some Concerns*.

33. Missing Formats

Several carriers that were reported in 1995 have not appeared in the returns for the 2003 Survey. These include the Philips-Miller optical sound recording system of the late 1930s, music box discs and dictating machine formats other than wire recordings. It will be interesting to see, if this Survey is repeated, whether these formats return in the future.

5. Summary

In 1995, it was stated in the Summary that "It is clear that the most endangered carriers are not necessarily the oldest." This Survey reinforces this view. From the Survey results and from practical experience, the acetate, direct cut discs are the recordings most at risk. As with some other formats, this risk is compounded by the fact that the vast majority of acetates are unique recordings.

Other at risk formats that were not used for the commercial distribution of sounds and images include acetate tapes, two inch videotape and wire recordings. The risk can be from the decay of the carrier, as in the case of acetate tape, or the obsolescence of the players as with two inch videotape and wire recordings. It is a sad fact that a carrier in good condition is still useless if a player cannot be found in working order.

The older recording formats - cylinders and 78 rpm discs - were, in the main, used for commercial releases and there is a much greater chance of duplicate copies existing. Although some 78s and cylinders are listed as obviously decaying, the copying priority must, in most cases, be given to the acetate materials. In the case of the acetate discs, substantial numbers are being irretrievably lost each year because the final stage of the decay is unpredictable and catastrophic. The tape decay is a more progressive problem and the tapes can often be restored sufficiently to permit copying.

Survey of Endangered Audiovisual Carriers

ANNEXES TO REPORT

Tables of Results

1. Cylinder Recordings
2. Instantaneous (Direct Cut) Discs
3. Shellac (Commercial 78s) Discs
4. Vinyl Discs
